Topic Question 1:

Given that the purpose and need are not directly stated, my comments are formulated under the assumption that the park is looking to find a plan for managing the road that best balances QUALITY USER EXPERANCES with PRESERVATION of the park for future generations.

The road primarily serves park visitors who are traveling through the corridor, looking to see wildlife and appreciate the scenic spender of the area. Some visitors travel the road on the way to other destinations within the park, such as String or Jenny Lake or the Visitor center at Moose. This is predominately done from within an automobile. There is no other choice. Given the choice between using transit as is done in Zion, Sequoia, Kings Canyon, Denali Yosemite and other crown jewels of the park system, more visitor will be able to experience the area with fewer impacts to the lands adjacent to the road and to the wildlife that inhabits the area.

For a transit system to truly work it will need to be integrated with the county transit system and serve all of the park roads and perhaps needs to link with a system in Yellowstone. This is clearly a very large undertaking and is not something that will occur in the short term. But in the short term a transit system should be implemented between Teton Village and Moose. This would allow some visitors whose final destination is in the corridor, to leave their automobile at Teton Village or at Moose. This would reduce impacts such as user created parking damage and reduce the number of parking spaces required within the corridor. It would also reduce the noise print of auto travel on the parks natural soundscape. A visitor could depart at one location and board at another opening up opportunities to hike from point to point. Two way transit would be a basic requirement.

For visitor with final destinations on the further side of the corridor, private automobiles would still need to be accommodated until transit can be expanded to serves more of the park. Clearly a two way road will be needed to accommodate this use.

Many park visitors will choose a bicycle as a means of transportation when visiting Grand Teton. The current pathway from Jenny to Moose demonstrates this well. People traveling by bike create virtually no noise or pollution and don't contribute to global warming. Their vehicles when parked take limited space in comparison to a car. The sights, smells and sounds of the park are greatly enhanced for a visitor traveling outside of a car. The plan should do everything possible to encourage people to enjoy the park without a personal automobile. The plan should be a tool that provide transportation choice, and has the ability to influence visitors travel choices, in a way that insures preservation of the parks natural resources.

The plan should include a pathway. The pathway should be design and located so that it is attractive, safe, and convenient to the average active visitor. It should have smooth grades and be located where construction can be accomplish without permanently degrading the adjacent ground and where visitors are less likely to surprise wildlife.

I support the reservation system as the only adaptive traffic control measure. This could be a wonderful solution. We are all accustomed to a broad range of activates that have a limited capacity, such as going out to dinner, seeing a show, staying in a hotel or campground, riding a ferry or taking a plane trip. A reservation system will allow the best balance of access and preservation. The limits can be adjusted by over time as other management techniques are included and new lessons are learned. The reservation idea is great.

Topic Question 2:

Which strategies in the preliminary alternatives do you think would not achieve the purpose and address the need for the plan? Why do you think they should not be carried forward?

Things that won't work are closures, both that prevent through traffic, and daily closures. They are "dumb" management techniques. They would be inflexible and not readily adaptable.

Closing the road to through traffic will not necessary reduce the impact of visitors in the corridor as some will just drive one half of the road in each direction doing an in and out visit, This will increase the amount of noise and pollution each visit will cause. A visitor experience would be degraded because a visitor will not be able to take in the area in a continuous manner but will need to drive from one end to the other to see it all.

The idea of a one way road should not be considered. Changing the road to one way will increase vehicle speeds. Asking visitors to cycle with cars is not inviting to the average park visitors. It will be dangerous. It will do little to get people out of their cars. It will do nothing to enhance visitor experience. It will place traffic demands on other park roads. It will eliminate opportunities for effective transit. This is, and always has been a bad idea.

Topic Question 3:

I support:

• A reservation system to curb peak traffic impacts.

• A Pathway for choice and car trip reduction

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

â€¢ Transit to improve visitor experience, to augment the pathway and for car trip reduction

â€¢ Moving the road to the eastside of the ponds for habitat improvement and to allow the road to remain open when there are grizzlies in the area.

â€¢ Paving the unpaved portion of the road while keeping it slow and rural in nature. The road might be quaint, but is an environmental embarrassment with the amount of chemicals and upkeep required. The fine particles composing the road surface blow away in the wind. Car travel raises dust that coats the trees between rains making them look dull. Paving the road should be done for the environment, not to increase the roads capacity to carry more cars or for faster travel.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Topic Question 1:

Using the NPS format from its Preliminary Alternatives Newsletter, I submit that the following adaptive strategies should be carried forward in a traditional NEPA Proposed Action format:

Traffic Control along

Moose-Wilson Road; None, see Question 3 for this topic. Reasons for suggestion: none of the strategies for this topic listed under Alternatives A-D meet the purpose and need in a fair pro-active manner.

Physical Characteristics of Moose-Wilson Road: Carry forward the strategy from Alternative B because the damage, unsafe conditions, annual chemical applications, diverted traffic, inconveniences, loss of opportunity for some visitors, long-term expenses, noise-air-water pollution, and lack of sustainability are simply not worth the effort to keep a portion of this road dirt and subject to the many problems that it poses in its current form. Pave it like the rest and manage it property (speed, turn outs, no stopping sections, etc). Note, this will likely require consultation with parties from the LSR Preserve transfer agreement.

Moose-Wilson Road Realignment: Carry forward this topic as described under Alternative D especially adding the slow speed, narrow, winding character if the road. This should have been done decades ago, the current alignment reflects poorly on the staff and management of our national park. The road in its current alignment imposes unnecessary impacts to wildlife, fishes, wetlands and other aquatic resources, aesthetics, transportation, and user safety.

Turnouts and Parking: Carry forward a combination of Alternatives C and D. This should be carried

forward because more parking is needed at both ends of the Moose-Wilson Road but more importantly parking at the turnouts needs to be much better defined by clearly allowing only so many cars with no room for cars to make their own spaces and fines for idling waiting for a spot. Enlarging the carrying capacity for some places would be good management, but not at the LSR Preserve either directly (such as Alternative B) or indirectly (van/shuttle drop offs, etc.).

Bicycle Use: Carry forward the strategy for this topic from Alternative D with some reasonable, specific best management measures because a separate pathway for pedestrians and bicyclists would be safer, have much more appeal for use, offer a much better format for resource discovery and appreciation, offers a means to enjoy and use the area without contributing significantly to human safety, air, noise, and visual impacts. A separate pedestrian/bicycle path along the Moose-Wilson Road would be congruent with the other NPS pathways and complete a very scenic, desirable loop for those experiencing GTNP. The potential for wildlife/user conflicts/encounters is a manageable challenge using both temporal and spacial avoidance techniques.

Commercial Activity: Carry forward the strategies described under Alternative C with the caveat that no shuttles or other means of conveyance would have the defacto function of increasing parking at the LSR Preserve. Allowing some managed commercial activities to occur is important to the local community as well as visitors who either can't or don't know how to witness the resources found within this roadway.

Death Canyon: Carry forward the strategies listed under Alternative B because it fits more with the users of that portion of the park and it provides a situation that is better managed than the other alternatives.

Winter Access and Use: Carry forward the strategies listed under Alternative C because the existing length of unplowed road is too short for even a moderate day of snowshoeing or skiing and much of the area that is currently plowed on the northern end affords many opportunities for self discovery that are absent from other portions of the road. Considerations for resident access would need to be developed but could be done under special management permits.

Visitor Use and Experience/Education and Interpretation: Don't carry forward any of the strategies as described under any of the alternatives. See Question 3 response.

Topic Question 2:

First comment: The strategies identified under Alternative B for Turnouts and Parking that would enlarge either the space or the capacity for the LSR Preserve should not be carried forward in any form or format. The LSR Preserve was purposely designed to limit the number of visitors experiencing the Preserve at one time. The carrying capacity for this unique portion of the park is very low. If the number of people using or visiting the Preserve (all of it, including the main building) exceeds that low capacity, it becomes just another pretty place and the reasons for its creation and management will be lost on the hordes. This is simple, don't increase visitor capacity at the LSR or you will destroy the real intent of having this generous gift.

Comment #2: In my comments above I identified the strategies that I think best meet the arguably vague purpose and need for the plan. The ones that I did not identify don't, in my opinion, meet the purpose and need as I understand it (noting that I find the purpose and need at this point in the process poorly articulated and vague). I found myself having to choose elements of actions from the array of strategies provided in order to participate in the NEPA process designed by the NPS.

Topic Question 3:

An alternative approach to Traffic Management along Moose-Wilson Road: Rather than choose any one of the 4 strategy groups identified in your newsletter, please consider this fairly simple approach. Pave the rest of the road (for the reasons I stated above) keeping the alignment/width/visual characteristics and road type of the new road as similar as possible to the existing paved road (slow, scenic, curvy, and not wide). Add several turnouts (using existing turnouts as appropriate and functional) that have room for a specific number of vehicles (passenger sized and types of vehicles as currently qualify, i.e. no trailers, big RVs, etc.), make the spaces at the turnout very recognizable (painted or better partly buried pavers or even partly buried logs) such that it is obvious when all of the spaces are taken. Make it clear at the beginning of the north and south entrances to the Moose-Wilson Road that cars can stop or pull out only at designated areas and that if a turnout is fully occupied, the driver cannot park in the road and wait but must drive on till they either find a spot or return when the road is not so busy. This gives people a chance to see the area even if they can't stop (sorta like the LSR) and anyone using the road to transit between the Granite Entrance and Moose will simply move along without impeding or being impeded by other users. It should also be made clear that speeding (>30 mph or even 25 mph), discourteous driving, illegal parking or stopping will result in being ticketed and if it is a commercial operation (wildlife tours, taxi, tour van, etc.) that their right to use the road for commercial purposes will likely be revoked (perhaps after a warning). This strategy will require that the 'social parking spots' be effectively closed with boulders or logs and that the Park strictly enforces the no-stop, no-parking, no-unauthorized pull outs and other rules of this road. Also, the parking/turnout spots need to be carefully selected so that there is a good potential of seeing or experiencing something of value (albeit at a safe distance) without infringing on use of the habitat by wildlife.

During one 7 year stretch (2001-2008) I drove the Moose-Wilson Road at least twice and sometimes as many as 6 times each day in order to complete work at the LSR Preserve. The above suggestion is a result of enduring 'jams' created by bears, moose, elk, deer, beavers, leaf-peepers, and 'lost souls' parked along side the road just looking/hoping for something to see or photograph. My suggestion is based on setting the road up so that its carrying capacity is more likely to be achieved by the limits of physical function and enforceable rules rather than over-run because of ambiguity or physical changes that discriminate among users. It's the same idea as at the JY (LSR) and its small parking lot; let space, time and patience dictate use levels. Having better, bigger parking lots at both ends would also be helpful especially if people chose to walk or bicycle the route or a portion of it from either end.

Topic Question 4:

Will the upcoming DEIS identify a fully described Proposed Action? Once the analyses of the comments received are completed, will the NPS identify a preferred alternative among the array of No Action, Proposed Action, and alternatives to the Proposed Action? Will there be a workshop or other public venue to discuss potential mitigation measures, ways of implementing chosen strategies, time-lines, and, very importantly, what the interests, concerns, ideas, issues, and suggestions from the several cooperating agencies for this project are/were?

I'm still not certain why supplementing the existing Park Transportation Plan for this road which was clearly addressed in the Final EIS and Record of Decision was not the better, more straight forward, and less expensive means of planning? Supplementing a decision or document allows for changed times and conditions but assumes that the Purpose and Need are still in effect. Has the purpose and need changed so much that a new EIS was needed and if so, why weren't all of the related, connected, and affected aspects of the overall transportation plan addressed in this fairly narrowly scoped proposed project?

Comments: The agreement used to transfer the LSR property to the NPS contains some very specific

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

language regarding changes to the physical setup of the 'Preserve' including the size and limit of the parking lot at the LSR. Enlarging that lot or adding parking nearby in order to accommodate more visitors as proposed under at least two of the alternatives would (in my opinion) be a violation of that agreement. I think that any element of any proposal that clearly violates that agreement should not be considered in the array of alternatives for this project unless modification of the agreement is reached between the NPS and the LSR 'foundation'. This issue goes to the very heart of why the LSR Preserve was established and made accessible to the general public.

Similarly, paving the portion of the Moose-Wilson Road that lies within the LSR Preserve is likely not as much of an issue as providing more parking at the LSR itself but needs to be clearly understood among the appropriate parties.

I think that following the NEPA approach as outlined in the NPS Guidelines, NEPA itself, CEQ Guidelines, and the findings from the huge amount of case law for NEPA would have yielded better and more defensible information from the public involvement process than the free lance approach used here. This may have been useful for gathering information for planning but it seemed quite awkward at this stage for NEPA. I am hopeful that now that the scoping/alternative development process is coming to an end; that some of the other aspects of the NEPA process can focus on the potential for a defined proposed action or an alternative to it to significantly affect the human environment for a variety of disciplines and interests that were not apparent in the preliminary alternatives newsletter. I found the purpose and need statement to be confusing and at times irrelevant to the specific task at hand. This was perhaps my fault but this view was shared by other NEPA specialists with whom I spoke.

Hopefully, some of my input makes sense. As someone very familiar with the project area and its users, I would be more than happy to clarify what I have stated in the likely event that it appears confusing or contradictory.

I know that developing these documents is often a thankless task, requiring much juggling and a thick skin. Thank you for your efforts and opportunities afforded for comment. I look forward to reading your responses to the preliminary alternatives newsletter and the DEIS. Please retain my name as a participant in this process.

Topic Question 1:

Which strategies in the preliminary alternatives do you think should be carried forward to best achieve the purpose and address the need for the plan? Why do you think they should be carried forward?

I am not supportive of any of the four proposed plans.

Topic Question 2:

Which strategies in the preliminary alternatives do you think would not achieve the purpose and address the need for the plan? Why do you think they should not be carried forward?

I do not think there should be any increase in pavement. I do not think there should be any increase in the speed at which vehicles can travel through the Corridor. I do not think there should be any increase in disruption of the habitat or fragmentation within the Corridor and I do not think there should be any large-scale removal of vegetation. I think the Park Service should eliminate commercial use of the Corridor as these vehicles speed and cause congestion.

I do not think that there should be a separate bicycle path. It would require still more habitat destruction and it would increase the number of people moving through the area and even some at speeds in excess of the current speed limit for motor vehicles. With more people racing through the Corridor would increase the likelihood of more human/grizzly conflicts.

Frankly, building a modern road in the Corridor would degrade the role of the Corridor as an area with a

low human footprint.

Topic Question 3:

Are there other strategies that should be included in the preliminary alternatives that are not already presented? If so, which strategies and why should they be considered?

I think the core strategy should be to hew to the mission of the National Park Act as found in the Organic Act of 1916: "...to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

Topic Question 4:

I am an environmentalist living in Northern Virginia. I regularly visit the Greater Yellowstone area and travel through the Moose-Wilson Corridor in particular. Biologically it is the jewel of the Park in jeopardy of being loved to death. Over the years I have seen the vehicle traffic through the Corridor increase dramatically leading to lengthy traffic jams, moose and bear jams. I live in a crowded metro area. I can assure you that if you widen a popular road, cars will fill it to the prior level of traffic and then some. You will have traffic AND a degraded Corridor. I urge you to value that Corridor as a National treasure, not a shortcut to the airport for locals, not a delivery zone for tourist buses, not a place we humans have a right to access with the speed and reliability we demand in so many other aspects of our lives. I urge you to address issues within the Corridor in a manner that conserves the rich biological diversity while making appropriate changes to lessen negative human impacts and never to increase them.

Comments: Thank you for being so thorough in considering options for the Corridor. I urge you to give extra weight to the ecosystem needs in the area as so many areas in our National Parks have been adapted for human needs. Let's tie the benefit of the doubt to the bears and the moose when it comes to the Corridor.

Topic Question 1:

I don't think any changes should be made. I think they got it correct the first time; a lousy unpaved road which means you must drive slowly and will itself limit the number of cars. That means locals and visitors can view the wild beauty.

Topic Question 2:

I am 100% aainst a new dedicated bike path. I am an avid bike rider, at least twice a week. Additionally I am a bike path host in GTNP every Thursday afternoon. I interact with a lot people on the bike path and no one has ever said you need more dedicated bike paths in the area, just the opposite. They say they are so impressed with the number of bike paths we have. I agree that the unpaved portion of the Moose-Wilson is dangerous to ride a bike on and I wouldn't do so. Does every road need a bike path, NO!!! There is a safety factor for bikers if you have a dedicated bike path and that is the bears along the road in the fall and to a lesser degree in the spring as well. Though the path would be East of the current road you would still be at considerable risk for an encounter with a bear. Why in the world would you want to take any chance of this happening? Would the bears know that going East to the bike path is not allowed for bears to do so? Thank you, Robert(Bobby) L. Stein

Topic Question 2:

[REDACTED]
[REDACTED]

Topic Question 4:

I do not think there should be a bike path along the Moose/Wilson Rd or anywhere in the vicinity. I was told 40 years ago by the man running the sleds on the Elk Refuge that the elk were not afraid of the sleds or horses but if a person got out and walked they would scatter. They are also not afraid of cars as we live on a ranch across from the Village and they don't run off when they see our cars. Also moose will charge a person walking and probably a bicycle. And of course it would take more land and disruption to build a path. Actually I'm in favor of leaving it the way it is and taking out the park entrance. Before it was made a park entrance there was not as much traffic especially in the early years we lived here as it was not on the maps as a major road to the park. If we have to have a paved road then I would suggest it be moved close to the dike to disrupt the wildlife as little as possible. I believe that is where the old road was. Those of us that live in or near the Village need a way to get North. It only takes me 30 minutes to get to the airport even with the dirt portion in bad repair and it takes 50 minutes to go through town. That's major in time at 5am and in gas. The Park entrance should never have been put there and it should be taken off the park maps. Nichols who was the superintendent at the time did it to make himself look more important. Please, please - we are paving this beautiful place for the bikers and runners/walkers and they have no business in being in that area. They have enough paths now and the county and town will be building more because they demand it. Keep them off the Moose/Wilson road. Thank you. Robin Lightner

Topic Question 1:

Above all, protect the wildlife habitat...I ask myself "What would Laurance S. Rockefeller do"? I would keep that question in mind when you make a division..There should NOT be a bike path...That is disrupting the movement of wildlife and will be even more of a distraction. I hate to say it but I would pave the road so that it is less bumpy. Riding over the bumps is such a distraction that one can hardly look for wildlife in the area.

Reduce the speed limit.. I tend to lean toward Alternative B but I don't like the idea of a gate and preventing through traffic at peak hours. I do think that by stopping taxis and other commercial traffic that will help with congestion.

Topic Question 2:

I just think keeping it simple works...I would NOT be in favor of a bike bath...If allowed, next we will have skate boarders and skate skiers, then what? All of this activity distracts from the natural environment! Bikers just have to co-exist with cars on the road!

Topic Question 3:

Dave Wipper has the perfect solution..I quote "Reduce speeding throughout the corridor. A time stamped ticket would be given to each vehicle at either end of the Moose Wilson Rd. and then checked at the opposite end. if the vehicle exceeded a predetermined time for transit of the Moose Wilson Rd. then a camera would take a picture of the vehicle's license plate and the Park could issuer a citation

GREAT SUGGESTION DAVE!
comment ID 928569-60898/1787

Topic Question 4:

Relocate the existing Moose Wilson Rd as illustrated in alternative B to allow wildlife better access to the streams and ponds without crossing the current roadway. Pave the unpaved section of Moose Wilson Rd. Eliminate all commercial traffic except wildlife tours.

NO BIKE PATH

Installation of a new ranger station at the north entrance to the Moose Wilson Rd. but before the chapel road..

Install a ticketing and camera system at both entrances!!!

Comments: This stretch of land is a TREASURE to all of us who live in the valley. It should remain a simple corridor and should put wildlife and safety first...It should not be turned into a playground!! I hope you will make the right choice to protect Moose Wilson. This area deserves to remain pristine. To much of our land has been changed for the worse by people who put themselves above what is right for our wildlife...We are all here to see our wild animals, not people on bikes!

Thank you for your consideration of my suggestions!

Most Sincerely,

Debbie Reis

Topic Question 1:

Closing the Moose Wilson road to commercial traffic i.e.. Taxis, wildlife safari trucks and other commercial sight seeing vehicles would go a long way to decreasing traffic and use of the road. Visitors and locals can travel the road in their private autos to view wildlife, get to the LSR or travel back and forth between Moose and Teton Village. 20 years ago it was a rarity to see any traffic in the early morning. Now it is a constant flow starting at 6 am slowed particularly by commercial sightseeing vans.

Changing the route at the north end to connect with the main entrance to Teton National park will also lessen traffic and probably increase revenue, as you will have to pay to enter the north part of the Moose-Wilson road. Taking the road east from the Saw Mill ponds towards the existing park entrance seems like the best idea,

Topic Question 2:

As a 20 year visitor to Jackson Hole and the surrounding area I feel that some of the ideas put forward in these alternatives do not reflect the motto for our National Parks which is "access for all". In addition, some of these ideas do not take into consideration the historical legacy that helped to create this wonderful area of our country.

First of all bikes are a wonderful way to see the area. But not everybody can ride bikes. Closing Moose Wilson road 2 days a week for bike traffic only would make it difficult or impossible for families, elderly and physically impaired to get to the LSR or to the many hiking trails that can really only be reached by this road. Bikes should be allowed to use the Moose-Wilson road.

I would be opposed to a bike path as it would just be added destruction to the habitat that I think we all want to preserve.

As a visitor my first year I was introduced to horseback riding in the Moose Wilson area from Poker Flats to Windy point and all areas in between. This was and is a quiet and incredible way to see the area. Horses are part of the great history of the Jackson Hole Valley and many visitors and locals appreciate the ability to ride the trails available both in the Moose-Wilson system and Teton National park. Hopefully with these alternatives closing more horse trails is not apart of the plan.

Comments: Comments on the Future of the Moose-Wilson Corridor

MISSION STATEMENT: The National Park Service preserves unimpaired the natural and cultural resources and values of the national park system for the enjoyment, education, and inspiration of this and future generations. The Park Service cooperates with partners to extend the benefits of natural and cultural resource conservation and outdoor recreation throughout this country and the world.

I applaud the effort made to study and reflect and then propose the four alternatives for the future of the Moose-Wilson Road. I do not agree with any single one of the approaches but have strong feelings about parts of each. I'm using the NPS Mission Statement as a guiding principle.

I also think that it is important to remind the public that the Moose Wilson Road is in the National Park and should not be considered as part of the Teton County Transportation Plan. Sometimes it seems to me that locals think of GTNP as their park and not part of a National Park system.

Alternative A (No Action)

Keeping the road as a two-way travel corridor makes sense. Trying to control one-way traffic would be challenging and not necessarily beneficial to the wildlife. Also opening the road to motor vehicle use from early/mid-May through October 31 seems like a proper use of the road.

Alternative B

As a seven year volunteer at the LSR Preserve who has spent several hours in the parking lot, I have concerns about creating two parking lots. I believe in the intent of Laurance S. Rockefeller to want visitors to experience a somewhat serene visit to the preserve in contrast to the Jenny Lake area. If adding a second parking area means more people are out on the trails at once, I would be surprised if the Rockefeller Foundation would approve-at least by my understanding of the agreement for the property. Most visitors express their gratitude that the area is not crowded and spending time in the Preserve Center and on the trails is worth the wait in the parking lot.

Providing traveler alerts about the status of the parking lot could be helpful if feasible.

Relocating the trailhead and adding more parking for Death Canyon would be beneficial-especially for the visitors who do not want to wait at the LSR Preserve for parking. Already many people opt for Death Canyon adding to congestion at that trailhead.

If it is cost effective to pave the existing unpaved section with its current alignment and width and speed limit, I would favor this proposal.

I VERY STRONGLY AGREE with all of the proposal to realign the two segments of the northern portion of the road, especially removing the old roadway and restoring that section to natural conditions.

Alternative C

The logistics and the frustration of drivers would make the proposal to close the road to motor vehicles two days a week unfeasible.

I totally agree with the winter access and use plan to plow the road to Sawmill Ponds Overlook leaving the portion from there to Granite Canyon parking area available for cross-country skiing and snowshoeing.

Alternative D

I VERY STRONGLY OBJECT to the proposed multiuse pathway. I believe there are several areas in the park and surrounding areas for people to enjoy biking/ walking, etc. A bike path in the proposed area will create another disturbance for wildlife which is unnecessary and not in accordance with the park's mandate to preserve. I think there are some areas that are sacred and do not need more disturbance. I put wildlife protection before recreational use. The current closure because of grizzlies in the area further convinces me to not create another disturbance.

On a recent trip to Craters of the Moon National Monument, I was taken by some of the words on the signs along the Devil's Orchard walkway:

By congressional mandate, park managers must protect these exceptional volcanic features (insert natural features of GTNP), as well as make them enjoyable for visitors. When "protection" and "enjoyment" seem

at odds which of them do we choose? When enthusiasm today ruins a resource for tomorrow, how do we know what to do?

In this instance, I vote for protection-and a pathway seems to violate that mandate.

I appreciate the opportunity to express my opinions and I hope that in some way they will make a difference. I'm sharing one more quote I copied from Craters of the Moon which succinctly expresses my concerns:

"If we are going to whittle away at the parks, we should recognize at the very beginning that such whittlings are cumulative, and the end result will be mediocrity." Newton Drury, Director, National Park Service, 1940-1951

Respectfully,

Carol Schneebeck

Topic Question 1:

I support Alternative D because it strives to address safely and park wildlife resource concerns, however it needs significantly more work to hit the right balance between these two often-conflicting Park mandates. Please see my comments below.

Topic Question 3:

Many national parks are challenged by their conflicting mandates to manage for people and wildlife. While human use of park resources ebb and flow over time as is the case of the decrease in human use in the Moose-Wilson Road over the last 25 years, generally human use increases, causing incrementally increasing negative impacts on the wildlife. People can write and vote; wildlife can't. Thus, we are and will see an eroding quality of wildlife habitat that will ultimately vanish over time.

A bike path near to the Moose Wilson Road, while essential for safely (and valuable for enriching the park experience - more on this later), will have an incremental negative impact on the area's wildlife. As a way to reverse this general trend and mitigate this specific impact on Moose Wilson Road area wildlife, I recommend that the park balance the scales through mitigating actions to improve wildlife habitat and make this approach a requirement for all future wildlife degrading actions. Wildlife impact and mitigation can and should be measured to ensure that it restores degraded wildlife habitat, removes impacting structures or uses, or removes the chances of future wildlife habitat destruction in a particular area. Here are some suggested actions that may (if measured and fully committed to) balance the impact on critical wildlife species and habitat of a separate and distinct bike path:

- Fully and proactively restore the road bed and adjacent areas once the road is moved. While an obvious point, the chemicals put on the gravel section of road have been killing nearby vegetation for years. Restoration of these areas are an important part of the road restoration project;

- Phase out activity and park service programming in the White Grass Ranch area. The park decided to eliminate these buildings and all activity there many years ago, and now has brought use back to this wildlife-rich corner of the Moose Wilson Road area. Eliminating the construction and associated human activity there could go a long way towards balancing the wildlife-human scales.
- Making the purchase of inholding from willing sellers a high priority for the park with identified proactive actions to advance this initiative.
- Create seasonal or fulltime closures for wildlife in this area of the park.
- Centralize wildlife viewing areas to minimize human- wildlife contact. As any user of this road knows, there are only about 5 places where bears are seen. Creating viewing stations along the new road set way back from those locations could reduce wildlife - human contact.
- Designate a part of GTNP as wilderness.
- Limit seasonally (maybe by a bike count on a reservation-based system), non-recreational bike use of new pathway so that priority is given to family and slow-speed bicyclists. With the construction of the pathway to Jenny Lake I have come to realize that bike use in the park by families, visitors and other slow speed bicyclists is a much more interactive and meaningful way to experience the park than by car. Visitors in cars - closed metal shells - resort to their mobile devices for entertainment, not to understanding and enjoying the park. Get those same people out on bikes and they have a real park experience. The recreational biker is the one for which this new bike path should be designed. It should be specifically designed to encourage that level and type of use.
- Identify other actionable items in this area and elsewhere in the park that would restore and improve wildlife habitat to further offset impacts along this new road and bike path.
- Adopt a park screening process for any new park development that measures its impact on wildlife and requires more than equal mitigation for wildlife.

Comments: Thank you for the opportunity to provide input to the Moose-Wilson Planning process. I am a resident of Jackson, WY. I feel strongly that the decisions made in this planning process should be made in the best interest of Grand Teton National Park's long-term health. The park belongs to the nation, not just the people of Jackson Hole.

I submit my comments in bullet form:

• The Goals and Desired Conditions as stated in the Preliminary Alternatives Newsletter are consistent with the NPS mandate to manage resources to maintain natural values for generations to come.

• The ecotone through which the Moose-Wilson road traverses has greater value to wildlife than any other segment of road in GTNP, as stated by GTNP biologists.

â€¢ The realignment (new road segment in Alternative B) should be a high priority. It will reduce the impact of the current road on wetlands and disruption of the ecotone.

â€¢ Lower speed limits would improve the safety for all users.

â€¢ The proposed separate multiuse pathway as proposed in Alternative D should not be built. This pathway would be detrimental to wildlife by causing further segmentation of available habitat. This area is near elk calving grounds. The space between the current road and the Snake River is relatively narrow, and GTNP has no control over the private lands to the east. The proposed pathway is inconsistent with the stated Goals and Desired Conditions of the planning process.

â€¢ Bicycle use of the road should be considered in terms of impact. Studies show that a person on foot causes more disturbance to ungulates than a person riding in a car. I've worked with the U. S. Forest Service to coordinate a study of the impact of motorized vehicles and people on ungulate populations in the Gros Ventre in early spring and summer during the migration. We observed that a person riding a bicycle has an even greater disturbing effect on wildlife than a person walking. Perhaps that is because a human on a bicycle presents the human form, but moving much faster. I hope GTNP has data on the changes of behavior of elk since the current bike pathway was built. And from a safety standpoint, what is the potential of creating dangerous conflicts between humans and bears?

â€¢ I am in favor of relocating the Death Canyon trailhead to the White Grass Road junction.

Respectfully,

Charles Schneebeck

Topic Question 1:

I believe that the Adaptive Strategy in Alternative B offer the best/most realistic plan of those presented. It would maintain access into this special ecosystem/area of GTNP visitors from both the Moose (north) and Teton Village (south)entrances without making an appointment, etc.. It is not dependent upon the day of the week, it does not eliminate the possibility of access to this area (or even through this area) to motorized vehicles through normal seasonal travel. It does not discriminiate against bicyclists, although I do feel that eventually the separate pathway for hikers/bikers presented in Alternative D should be added. As a handicapped individual, I do not have access to park areas that do not allow motorized vehicles any more. Dual access to the LSR preserve is important to me because they have wonderful settings/etc. for me while the rest of my party hikes the trails. It would be terrible to lose this access to handicapped individuals from either park entrance any day of the week.

Topic Question 2:

Current situation is hazardous for people & animals. Do not think alternatives designating certain days of the week or necessitating appointments is fair to those who are only here for a short time. People coming here to relax should not have to focus on which day of the week it is; appointments will invariably be missed and others lose out because of no-shows. Weather is another uncontrollable factor, which also makes day/time restrictions across the board seem unfair.

Topic Question 4:

- You need the turnout areas for people to be able to stop and see things, not just racing through or endangering others by stopping anywhere they want.
- Would recommend adding the bike/hike path to Alternative B when finances allow. The road is far from

ideal for shared traffic but I do not think handicapped individuals should be discriminated from accessing this road on any day.

Comments: Although my mailing address is currently in CA, I have been visiting GTNP for 37 years and recently bought property in Jackson. This will allow us to spend much more time there after retirement in 2 years. I have had some of my most positive and memorable encounters with wildlife along the Moose-Wilson Road over many, many years.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:
Since I have not studied the preliminary alternatives, I do not feel qualified to comment on this aspect but I do want you to know how much your careful planning for this project means to me.

Comments: Since the Grand Tetons are one of my favorite areas to visit, I just want you to know that every part of that park is "sacred" and plans to preserve its quiet way of life and its precious wildlife from ever encroaching "civilization" with its threats are essential and so vital to its continued existence. PLEASE do everything possible to study and make wise decisions to ensure that happening. Thank you!

Topic Question 4:
Hello

We live in Wilson Wyoming and enjoy the quiet and animal sightings. We wish to keep the Moose-Wilson Road quiet and very slow. We do not support widening and paving that would help only a few to get to their houses in Teton Village. We support the rest of the world that comes here for a wild escape to see bears, owls, and moose and not more paving, more cars, more speed, more hectic life-style. Please save the Moose-Wilson road and avoid more development of the road.

Sincerely,

Kathryn McCance & John Wolfer

Topic Question 1:

The Mosse Wilson road is a treasure in Grand teton National park. The first reaction to the plans presented is no action. However, Alternative A is not a wise use of the resources in the Park. Traffice has gotten out of control and the traffic issue must be addressed. Alternative B does address this issue through traveler alerts and a realignment of the northern section of the road away from critical wetlands. I feel these items should be carried forward to protect the resources of the Park. I also appreciated the re;ocation of the death Canyon trailhead. In winter I agree that the Moose Wilson road should not be groomed. We need to leave this area of the Park as wild as possible. Under ALterbative C , i beleive that leaving the unpaved potion of the road should remain to help slow traffic down an to rtain the more wild character of the area.

Topic Question 2:

Under Alternative D is the idea of a separated bike path. I feel this should be dropped from considration as it will not maintain the character of the resources of the Moose Wilson Area. The Moose Wilson road should not be considered a part of a greater transportation plan for Teton County. This is a National Park and not a playground for local, county or state interests but for all visitors to this tresure of a NAtional Park.

Topic Question 3:

A park service or concessionaire transit system should be considered for the area to cut down on traffic congestion cause by individual motor vehicles and allow for hiking and biking safety in the area. The Park should protect wildlife and wildlife habitat. Protect the resource and values underwhich the National Park service was founded and supported.

Even with the changes to the northern part of the road in alternative B the Moose Wilson Road must be maintain as it presently is, as a small, narrow, slow speed backcountry route.

Topic Question 4:

The Park Service must give the highest priority to protecting wildlife and habitat in this area. There is no other area in the Park with such diversity of wildlife from moose, elk, to predators such as wolves and grizzly bears and many bird species. Please protect the natural resources and values of this wonderful area. Finally, please analyze various management techniques and strategies to provide the most effective ways of protecting the natural resources and values while providing safe wildlife viewing and recreational opportunities for all visitors. One of these strategies is to fully evaluate a public transit system managed by Grand Teton National Park.

Comments: Thank you for the opportunity to comment on the preliminary alternatives for the Moose Wilson road. The most important aspect to me is to protect the resource and values of Grand Teton National Park. Teton County should not be pressuring the Park to provide commuter access and a recreational area for a small but well connected pathway group.

Topic Question 1:
see comment below

Topic Question 2:
see comments below

Topic Question 3:
see comment below

Topic Question 4:
see comment below

Comments: To: National Park Service Moose Wilson Planning Team:

14- September - 2014

Thank you for this opportunity to comment:

I have not read pending NEPA/EIS or ROD therefore refrain from selection of the current possible alternatives.

1) We expect to make decisions based upon most accurate science to evaluate facts.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

â€¢ We also know that activities of wildlife are episodic based upon available food and water and we know that habits, migrations and populations are cyclical therefore "short term" studies may be anomalous in a greater study context over time.

2) Preserve the historic two way passage keeping speeds low and control traffic volumes.

â€¢ IDEA: = A shuttle bus from Granite Creek trail head to LSR to Moose visitor center and back again (with bike racks?) to move more people with fewer vehicle trips?

3) The corridor cannot be fully experienced from "cars", "buses" on foot or by bicycle alone.

â€¢ I would like to see more parking pullouts to allow for photographs, short walks and direct environmental / experiential exploration aligned safely along straight-aways.

â€¢ Because the roadway is curvy and narrow getting out of a vehicle and getting into direct natural experience is currently restricted and/or risky!

4) Some alternatives might unintentionally under serve accessibility for ADA person needs.

â€¢ Their consideration for access suggests paved, separate pathway amenities within the corridor.

5) Commercial traffic, taxis and heavy transit may need to be limited.

â€¢ Folks wishing to see Grand Teton National Park and enjoy this particular corridor is a highest priority to be well served and improved.

6) The Beaver Pond area is hazardous.

â€¢ A realignment bringing relief to wildlife and to create safer multi use passage is an intuitive, common sense work result.

7) Expand a new Death Canyon parking nearer to current Moose Wilson road alignment.

â€¢ Begin trail at new parking area. Snow plow in the winter for winter activities please?

8) Expand and improve parking lot at Granite Canyon.

â€¢ It is often over parked leading to spill out onto the road. Snow plow in the winter for winter activities please?

9) I understand that significant private funding may be available for construction of a separate pathway and for it's ongoing maintenance.

â€¢ Given finite federal budgets, should we provide (?) a multi modal pathway make it as LEAST INVASIVE of habitat as POSSIBLE perhaps immediately adjacent to the road in some stretches and marginally distant from road traffic only when absolutely essential for safety.

10) Take advantage of private funding if and when it can be obtained.

â€ Citizenry benefit when The National Parks are accessible the public benefits when philanthropic resources can both relieve federal budget constraints and allow better outcomes to become realities.

â€ I cite the Craig Thomas Visitor center as a shining example of a public private partnership resulting in an exceptionally valuable access, preservation and teaching tool.

Thank you, Don Frank Jackson Wyoming

Topic Question 1:

None of the alternatives as now proposed address the most important mission of the NPS as it relates to GTNP (a 'wild park' rather than a 'cultural park'), and that is to give highest priority to protecting both the landscape and the wildlife. With the increased use of the Moose-Wilson Corridor by grizzly bears, the need for 'wild space' is more important than ever, more important than use by people. You need an alternative that closes the Moose-Wilson road to through traffic all year round.

I like the strategy that calls for 'realigning the road segment between Sawmill Ponds Overlook and the Death Canyon Road junction, moving the road east of the beaver ponds and removing the old roadway'. This strategy addresses the need to avoid human/wildlife conflicts.

Topic Question 2:

Any alternative that keeps the road open to through vehicle traffic will not achieve the NPS mission to protect the landscape and wildlife in the area. There will be ever-increasing traffic on the Moose-Wilson road as Teton Village grows, and the airport continues to bring more and more people here.

I think the time is now to close the Moose-Wilson road to through vehicle traffic forever. If the Moose-Wilson road is kept open to through traffic under any alternative, it is only a matter of time before special-interest pressure will result in a paved, two-lane or eventually four-lane road, open year-round to through traffic. Better roads mean cars travel at higher speeds, not good for wildlife.

I am against building a new and separate bike path through this sensitive area. There are enough bike paths in the Park now.

Topic Question 3:

1. Permanently close the Moose-Wilson road to through vehicle traffic all year long. This protects wildlife.
2. Remove the section of road between LSR and the Granite Creek trailhead. Narrow that section of removed road to make it more like a trail, accessible to walking and bike traffic, returning the rest to its natural state. Do not pave it. Keep it as natural as possible. Removing this section of road will make it much more difficult for political or special interest pressure to re-open this section of the road in the future. Again, this protects wildlife.
3. Provide 2-way access to LSR and Death Canyon only from the north on the re-routed road that avoids critical wildlife habitat areas. With such intentionally-limited parking space at LSR as a directive of Mr. Laurance Rockefeller, visitors will potentially have to make reservations to park and hike there.
4. Provide 2-way access to Granite Creek trailhead only from the south. Expand the parking area for those who want to hike Granite Creek, or walk or bike north on the 'trail' section that used to be the road.

Topic Question 4:

Grand Teton National Park is a national AND international treasure. Local people always feel their needs should be met before those of people who may or may not ever visit this park. How much tourism infrastructure growth can we sustain before we ruin our treasure of a park that visitors come to experience?

Please think to the future and remember that the main reason people from all over the world come to GTNP is for its wildness, for its open spaces, for its wildlife. Making access incrementally easier and easier will destroy the very special character of this park. Just look at our airport. Bigger and better? Or just bigger and busier? I do not want to see the Moose-Wilson road become a major connector to the highway to Yellowstone. Thank you.

Topic Question 1:

None of them meet a broad range of needs. Each seems to be designed to appeal to a specific group.

So.... Option E....

The road should be open all the time.

There Should be a bike path.

If necessary a portion should be relocated to the sage flats.

It should all be paved.

There should be as many turnouts as necessary for visitors.

Topic Question 2:

As above, each alternative ignores certain needs.

Topic Question 3:

Yes. Pave it. Keep it open 24/7. Add a bike path. Add as muni turnouts as possible.

I do NOT support D because it would phase out horseback riding in the Sawmill Pond area...

The ride to Trail Ranch, White Grass is absolutely beautiful and perfect for horses...it does not conflict with hikers...Let it be.

I support C

My family has vacationed in Jackson Hole, in particular at the R Lazy S since 1988- every year.... We have seen many trails become not available to horses over that time.

PLEASE do not take these trails away.

Forgive my comment made earlier this evening.....I misread the part about horseback riding....

It is my understanding that in D, the sawmill Pond Trails will still be open to commercial horseback riding.

This is a ride that keeps us coming back...Love the trails near White Grass, Trail Ranch...

So- if that is true, I do support D.

I will be returning for a second time later this week...Look forward to hearing the results of this survey..

Sue Masica
Regional Director
National Park Service

RE: FRIENDS OF PATHWAYS COMMENT LETTER ON MOOSE-WILSON CORRIDOR

Submitted online via PEPC
Original mailed

Dear Superintendent Vela and Director Masica,

Thank you for your preliminary alternatives for future management of the Moose-Wilson Road. We appreciate the opportunity for Friends of Pathways to comment on the ways we support the National Park Service and especially Grand Teton National Park.

Friends of Pathways (FOP), a 2,200 member organization dedicated to safe and sustainable trails and pathway systems, is deeply committed to supporting the NPS and GTNP to find specific ways to protect the wild and natural resources of the corridor while enhancing visitor opportunities. We believe the innovations presented in Alternative D would enable the NPS to: 1) mitigate and manage traffic issues while retaining the unique character of the Moose-Wilson road, 2) encourage environmentally sound solutions to address increased corridor visitation, and 3) enhance visitor education and experience in this unique corner of GTNP. We encourage you to study Alternative D as your preferred alternative for this Environmental Impact Study.

As an organization committed to partnerships - with positive track records partnering with local governments, schools, businesses, the US Forest Service and other non-profits - Friends of Pathways comments are based on our resolve to partner with you to ensure solutions which allow for safe and continued public access while respecting and enhancing park values. We support many of the proposals and adaptive strategies in Alternative D, because they balance resource preservation with public use, and will help build a foundation for environmental solutions to traffic and other public use issues throughout the Park.

We will begin with an iteration of why we specifically support Alternative D, and conclude with some specific comments and suggestions for enhancements, as well as comments on Alternatives A, B and C.

Friends of Pathways supports Alternative D, because it will:

1) Reduce traffic volumes

The inclusion of a non-motorized pathway in Alternative D will aid in the reduction of traffic volumes on the Moose-Wilson Road by encouraging more people to ditch the drive and visit the Corridor using human-powered transportation. It would be irresponsible and short-sighted to disregard the pivotal role that non-motorized transportation could play in addressing visitor impacts in the corridor. Enabling more walking, biking, wheelchair, walker use or other non-vehicular travel is an environmentally low-impact way to get people out of cars and is a benefit to the NPS and GTNPs future management.

2) Not Disrupt Park Wildlife

FOP supports the Parks proposal to improve wildlife connectivity and wetlands habitat by realigning the northern section of the Moose-Wilson Road to the sage flat, east of the beaver ponds. We believe this will enhance traffic flow while improving wildlife use of the berry patch hillside and wetlands habitat. Making these habitat improvements will likely reduce the frequency and duration of animal jams and the resulting impacts of cars pulling off the road indiscriminately outside of defined pullouts.

The Moose-Wilson pathway can be placed in an environmentally sensitive way. We are sure that the

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

pathway can be built in harmony and balance with wildlife and the environment. For those that have expressed concern about the presence of heavy equipment in the corridor, FOP points to the fact that GTNP constructed the Laurance S. Rockefeller Preserve and the Cheney Bridge service road within the corridor. These construction projects required considerable amounts of heavy machinery, concrete and building materials, yet they were managed in an environmentally sensitive way. We have not heard any complaints from the public about these park construction projects, nor the improvements at Jenny Lake. The fact is, the Park is very capable of managing these types of projects without environmental degradation.

We know you have heard many voices that worry a pathway will devastate GTNP. To counter these opinions, FOP points to the huge success and minimal impacts of the Moose to Jenny Lake pathway. The Parks own wildlife studies determined that the pathway had negligible effects to wildlife. As well, the former Secretary of Interior gave the pathway the Presidents Americas Great Outdoor award.

Pathways are an important part of the conservation movement in our nation. They are a big picture solution to decreasing dependence on cars, limiting fossil fuel impacts, and engaging citizens in clean and quiet ways to engage with the outdoors. Pathways are paved trails. Trails are compatible with wildlife, as are pathways. Cars have a far greater potential for harming or killing wildlife than a pedestrian or cyclist on a pathway does.

3) Retain the Character of the Moose-Wilson Road

FOP supports keeping the Moose-Wilson Road slow, windy, and narrow. We encourage GTNP to set and enforce slow speeds, and determine road capacity limits to preserve the roads rural character. FOP does not support changing the Moose-Wilson roads two-way access to one-way traffic only, as this will only result in increased driver speeds, increased danger to cyclists and pedestrians, increased fossil fuel consumption, and increased impacts on roads within and surrounding GTNP. One-way drivers are more confident, and without the risk of oncoming traffic, tend to drive faster. This type of scenario is extremely dangerous for cyclists who may travel the road in opposition to traffic flow. While a separate pathway would ameliorate that danger, the fact is, one-way roads have the same environmental consequences as road closures. One-way requirements will force many drivers to make lengthy trips around the park. In this case, a short 7-mile drive would be extended to as much as 40 miles for a visitor who enters the park from one entrance and needs to circle back their original destination. These circle back trips will put more pressure on roads like Spring Gulch, and highways 390 and 89.

4) Promote future stewardship of the Park

The NPS vision for the Centennial celebration of the Park Service should be about protecting the Parks natural resources for another century. On the ground this means encouraging sustainable modes of recreation and transportation within the Park, and inspiring diverse public engagement so future generations will respect, appreciate and support the Parks wild lands and creatures. Just as our country and world is evolving, so should GTNP.

For its long-term sustainability, the NPS needs to engage a diverse, younger generation of supporters. Pathways are one way to engage this demographic. Especially on the Moose-Wilson Road, the iconic experience of walking or biking that corridor outside of a vehicle will last a lifetime - and may result in a lifetime of support for the NPS. If the Park continues to cater to older generations, that tend to be more traditionally car-centric, they will be ignoring a critical opportunity to connect with its future stewards.

5) Enhance Visitor Experience with Human-Powered Transportation Opportunities

As a community defined by outstanding natural beauty and abundant wildlife, Teton County has led the way in building a world-class non-motorized transportation and recreation system. Visitors to both the Park and Jackson Hole are drawn here to have an unparalleled natural experience. More and more of the vacationing public are traveling to destinations where they can escape their everyday dependence on cars and recreate in a natural setting. This is good for our economy, our National Park systems financial sustainability and for our environment. Alternative Ds inclusion of a separate pathway and increased winter recreational opportunities (grooming the unplowed section of the Moose Wilson Road and retaining access for backcountry skiers at Death Canyon parking area) will encourage and enhance the visitor experience without significant impacts to park wildlife or natural resources.

Planning a management system for a natural environment should include inviting people to travel in a more minimalist and environmentally sensitive manner. The preferred alternative should include opportunities to get individuals and families out of vehicles and on a pathway or groomed winter trail, where they can smell the air, feel the breeze, enjoy unbounded views of the scenery and relish the sounds around them. This is the visitor experience that the Park service should emulate, not car-centric but sense-centric.

6) Increase Safe Access in the Park

Some have cited that only 3% of the users on the Moose-Wilson road are cyclists, so there is no reason to defer to this small user group. This statistic only holds merit because the Moose-Wilson road is much too dangerous for the average cyclist to navigate. Most cyclists and pedestrians do not feel comfortable sharing narrow and windy roads with distracted drivers. Certainly this road is not safe for children or less confident cyclists. If you are truly going to be forward thinking in your solutions for getting people out of their cars to experience the Park, then you will have to address the safety of the Moose-Wilson road for non-motorists. A separate pathway will address safety for everyone - able bodied and those with mobility challenges. There is a portion of park visitors that cannot access the park on dirt trails or gravel paths. Their choices are few for experiencing the sights, sounds and solitude the Park has to offer. Arguably, these are the people who may benefit the most from Alternative D.

7) Save Lives

Safety is important. The Jenny Lake pathway was built after a distracted driver killed a 13 year-old cyclist. The north Highway 89 pathway was built after a distracted driver killed a local cyclist and part-time GTNP employee. We dont need another tragedy to substantiate the need for a pathway on the Moose-Wilson Road corridor. When the Hwy 22 pathway is complete in 2016, more cyclists will be riding the 30-mile Grand Loop through the Park via the Moose-Wilson road. There is a 7-mile gap between the existing pathway at Granite guard station and the Moose pathway. Missing links in pathway systems encourage pedestrians and cyclists to take chances on road sections that are not built to accommodate them. This creates a hazard for everyone, drivers included. This gap is a dangerous invitation to ride the road to get to the other separate pathway. This EIS is the opportunity - the imperative need - to plan safely for this inevitability.

Additional Enhancements to Alternative D

FOP believes that Alternative D could be enhanced with several adaptive strategies, most specifically:

1) Identifying and Enforcing Vehicle Capacity Limits to Reduce Traffic Volumes

Alternative D gives GTNP the ability to use traffic data for managing vehicular use of the road and set capacity limits which will retain the corridors rural character and protect its wild, scenic and natural resources. The ability to measure and manage traffic will allow GTNP to be flexible, and responsive to present and future concerns.

FOP supports the idea of a reservation system for managing vehicle capacity on the Moose Wilson road. Gates and closures dont reduce traffic counts by quantifiable means and cause unintended environmental consequences, creating more traffic through mid-point turn-arounds at LSR and long circumnavigations around the Park to get to Moose.

Of the three methods put forth by park management for managing traffic - daily closures, through traffic closures at LSR, or a reservation system, only the reservation system is flexible enough to truly manage traffic volumes up to the Parks self prescribed limits. A reservation system could be devised to be as simple or complex as the Park feels is needed and can change over time, depending on experience or technology changes.

2) Developing a Public Transit Program

FOP supports the establishment of a park transit system through public/private partnerships to further reduce traffic impacts on the Moose-Wilson Road. By working with established public transportation programs in Teton County, the Park can reduce GTNP budget pressures and avoid duplicating costly start-up and infrastructure expenses. FOP envisions a Park transit system that fully engages the visitor, allowing for educational opportunities from the seat of a small bus or sensory learning from a pathway.

Once a road capacity benchmark is established, the community and entities like FOP, Teton Village, the Town of Jackson and Teton County can be engaged partners in helping the Park achieve specific metrics and real traffic reduction on the Moose-Wilson road. To illustrate, if the NPS said 2,000 vehicles are the daily peak limit, then through partnerships, an additional 200-500 vehicles a day could be reduced through comprehensive transit choices and a multi-use pathway. GTNP sets the vehicle numbers and the vehicle reduction goals. Partners assist and help pay to achieve these goals. Under that management approach, the road character is protected through reduced traffic volumes and visitors have expanded opportunities to forego driving. Wildlife benefits, visitors benefit and the Park benefits. If traffic is the problem, then let partnerships, public transit and non-motorized transportation serve as the foundation for solutions.

Public transit could be staged at the Teton Village parking areas, May-October. Small buses or size appropriate shuttles with bike racks would provide a real environmental benefit to park visitors and would offer a preferred alternative to car-jams and difficult driving. Visitors in transit are ready audiences for educational messages - and the Park could design and script those messages to further environmental ethics, stewardship, park values, and opportunities to support the Park Service.

Those who use transit or non-motorized transportation could even be incentivized by not needing a reservation if such a system existed. Transit could be thoughtfully planned and designed proactively for top stops such as Jenny Lake, Craig Thomas Discovery Center, Laurance Rockefeller Scenic Preserve, or Dornans. Such a thoughtful, integrated transit plan could reduce thousands of vehicles weekly, and may be supported in part by the private sector. Alternatives A, B and C all rely heavily on vehicle-based ideas that dont reduce traffic quantifiably, or simply shift vehicle pressures elsewhere. Only Alternative D relies on safe non-motorized innovations and adaptations to manage people outside of vehicles in positive,

progressive ways.

3) Pursuing Private-Public Partnerships for Funding Solutions

At Jenny Lake, funds were raised privately through the GTNP Foundation to pay for \$16 million of improvements for visitor access and experience enhancement. The Environmental Assessment analyzing the Jenny Lake project did not identify fiscal barriers as a detriment to the projects approval or construction. To the contrary, the EA relied on the knowledge that private donations would be utilized.

The same strategy should be implemented for the Alternative D study. The project should be predicated on using private dollars to implement traffic reduction solutions in this Moose-Wilson Corridor EIS - including the pathway construction and maintenance. Private-public partnerships may also help pay for the needed transit. Private dollars can be directed to the GTNP Foundation to support transit management, or partnerships could be established which give GTNP control of the transit management system without having to pay for costs of construction or implementation.

Just as at Jenny Lake, do not let money be the rationale to reject a proposal that will enhance the park significantly. GTNP is located next to one of the most generous communities in the nation. Ask. Partner. FOP is willing to work with the GTNP Foundation to find private dollars for pathway construction and maintenance.

4) One Combined Northern Entrance Station

FOP supports having only one northern entrance station as a way to promote cost savings and streamline road functionality and access. We urge GTNP to study a single entrance station design at the northern entrance for both the Teton Park Road and the Moose-Wilson Road.

5) Preserving Opportunities and Access for Horseback Riding

The southern portion of the study area has a long history of horseback riding use. Where the alignment of the pathway impinges on trails used by equestrians, the horse trail should be realigned and reclaimed in a way that best accommodates both user groups where possible. Consideration should be paid to horse rider safety in locations where horse trails will cross the road and pathway. The parking areas at Sawmill ponds, White Grass Road junction and Poker Flats should continue to accommodate trailer parking.

Review of Other Alternatives:

ALTERNATIVE A

This do nothing strategy would allow for diminished environmental protection of Park values and wildlife, and would do nothing to enhance wildlife habitat, deepen the visitor experience or increase pedestrian or cyclist safety.

ALTERNATIVE B

Gating the middle of the Moose-Wilson Road to prevent through-traffic is a substandard solution with unintended consequences of increasing traffic impacts on both ends of the Moose-Wilson Road, as well as the nearby road systems in and outside of the park. Alternative B encourages cyclists and pedestrians to share the windy and narrow road with cars; not only does this discourage most people from choosing to

cycle, run or walk the road, but it jeopardizes the safety of those who choose to travel that way.

ALTERNATIVE C

Two day road closures as proposed in this Alternative will: 1) be very difficult to manage and communicate to the general public, and 2) have the same unintended consequences of increasing traffic impacts as the closures suggested in Alternative B. Closing the road two days a week does not make this road any safer for pedestrians and cyclists on the other five days that the road remains open. For certain, cyclists and pedestrians will show up to use the road on a day when it isn't closed to cars, and will just take their chances. A separate pathway is the safest way to encourage pedestrians and cyclists. This alternative will also limit historical non-motorized winter access to Death Canyon by only plowing to the Sawmill Ponds. FOP supports healthy human-powered winter recreation, and does not feel that restrictions on these activities are necessary.

In conclusion, finding a balance between preservation and public use, ensuring wildlife and resource protection and enabling a more meaningful visitor experience in the Moose-Wilson corridor are all achievable goals. Well-planned transit systems, realigning sections of the road and consistent non-motorized use by pedestrians and cyclists will positively benefit wildlife and the environment, and reduce traffic impacts in the Moose-Wilson corridor. The strategies outlined in Alternative D, along with other enhancement recommendations FOP has submitted, are forward-thinking and dovetail with national trends to encourage healthy lifestyles and a healthier environment.

Thank you to GTNP and the NPS for this extra opportunity to comment during the scoping process. We are grateful for your consideration and welcome any opportunity to support GTNP and the NPS in achieving balance on the Moose-Wilson Road.

Sincerely,

Katherine Dowson

RE: FRIENDS OF PATHWAYS COMMENT LETTER ON MOOSE-WILSON CORRIDOR

Submitted online via PEPC
Original mailed

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Dear Superintendent Vela and Director Masica,

Thank you for your preliminary alternatives for future management of the Moose-Wilson Road. We appreciate the opportunity for Friends of Pathways to comment on the ways we support the National Park Service and especially Grand Teton National Park.

Friends of Pathways (FOP), a 2,200 member organization dedicated to safe and sustainable trails and pathway systems, is deeply committed to supporting the NPS and GTNP to find specific ways to protect the wild and natural resources of the corridor while enhancing visitor opportunities. We believe the innovations presented in Alternative D would enable the NPS to: 1) mitigate and manage traffic issues while retaining the unique character of the Moose-Wilson road, 2) encourage environmentally sound solutions to address increased corridor visitation, and 3) enhance visitor education and experience in this unique corner of GTNP. We encourage you to study Alternative D as your preferred alternative for this Environmental Impact Study.

As an organization committed to partnerships - with positive track records partnering with local governments, schools, businesses, the US Forest Service and other non-profits - Friends of Pathways comments are based on our resolve to partner with you to ensure solutions which allow for safe and continued public access while respecting and enhancing park values. We support many of the proposals and adaptive strategies in Alternative D, because they balance resource preservation with public use, and will help build a foundation for environmental solutions to traffic and other public use issues throughout the Park.

We will begin with an iteration of why we specifically support Alternative D, and conclude with some specific comments and suggestions for enhancements, as well as comments on Alternatives A, B and C.

Friends of Pathways supports Alternative D, because it will:

1) Reduce traffic volumes

The inclusion of a non-motorized pathway in Alternative D will aid in the reduction of traffic volumes on the Moose-Wilson Road by encouraging more people to ditch the drive and visit the Corridor using human-powered transportation. It would be irresponsible and short-sighted to disregard the pivotal role that non-motorized transportation could play in addressing visitor impacts in the corridor. Enabling more walking, biking, wheelchair, walker use or other non-vehicular travel is an environmentally low-impact way to get people out of cars and is a benefit to the NPS and GTNPs future management.

2) Not Disrupt Park Wildlife

FOP supports the Parks proposal to improve wildlife connectivity and wetlands habitat by realigning the northern section of the Moose-Wilson Road to the sage flat, east of the beaver ponds. We believe this will enhance traffic flow while improving wildlife use of the berry patch hillside and wetlands habitat. Making these habitat improvements will likely reduce the frequency and duration of animal jams and the resulting impacts of cars pulling off the road indiscriminately outside of defined pullouts.

The Moose-Wilson pathway can be placed in an environmentally sensitive way. We are sure that the pathway can be built in harmony and balance with wildlife and the environment. For those that have expressed concern about the presence of heavy equipment in the corridor, FOP points to the fact that GTNP constructed the Laurance S. Rockefeller Preserve and the Cheney Bridge service road within the

corridor. These construction projects required considerable amounts of heavy machinery, concrete and building materials, yet they were managed in an environmentally sensitive way. We have not heard any complaints from the public about these park construction projects, nor the improvements at Jenny Lake. The fact is, the Park is very capable of managing these types of projects without environmental degradation.

We know you have heard many voices that worry a pathway will devastate GTNP. To counter these opinions, FOP points to the huge success and minimal impacts of the Moose to Jenny Lake pathway. The Parks own wildlife studies determined that the pathway had negligible effects to wildlife. As well, the former Secretary of Interior gave the pathway the Presidents Americas Great Outdoor award.

Pathways are an important part of the conservation movement in our nation. They are a big picture solution to decreasing dependence on cars, limiting fossil fuel impacts, and engaging citizens in clean and quiet ways to engage with the outdoors. Pathways are paved trails. Trails are compatible with wildlife, as are pathways. Cars have a far greater potential for harming or killing wildlife than a pedestrian or cyclist on a pathway does.

3) Retain the Character of the Moose-Wilson Road

FOP supports keeping the Moose-Wilson Road slow, windy, and narrow. We encourage GTNP to set and enforce slow speeds, and determine road capacity limits to preserve the roads rural character. FOP does not support changing the Moose-Wilson roads two-way access to one-way traffic only, as this will only result in increased driver speeds, increased danger to cyclists and pedestrians, increased fossil fuel consumption, and increased impacts on roads within and surrounding GTNP. One-way drivers are more confident, and without the risk of oncoming traffic, tend to drive faster. This type of scenario is extremely dangerous for cyclists who may travel the road in opposition to traffic flow. While a separate pathway would ameliorate that danger, the fact is, one-way roads have the same environmental consequences as road closures. One-way requirements will force many drivers to make lengthy trips around the park. In this case, a short 7-mile drive would be extended to as much as 40 miles for a visitor who enters the park from one entrance and needs to circle back their original destination. These circle back trips will put more pressure on roads like Spring Gulch, and highways 390 and 89.

4) Promote future stewardship of the Park

The NPS vision for the Centennial celebration of the Park Service should be about protecting the Parks natural resources for another century. On the ground this means encouraging sustainable modes of recreation and transportation within the Park, and inspiring diverse public engagement so future generations will respect, appreciate and support the Parks wild lands and creatures. Just as our country and world is evolving, so should GTNP.

For its long-term sustainability, the NPS needs to engage a diverse, younger generation of supporters. Pathways are one way to engage this demographic. Especially on the Moose-Wilson Road, the iconic experience of walking or biking that corridor outside of a vehicle will last a lifetime - and may result in a lifetime of support for the NPS. If the Park continues to cater to older generations, that tend to be more traditionally car-centric, they will be ignoring a critical opportunity to connect with its future stewards.

5) Enhance Visitor Experience with Human-Powered Transportation Opportunities

As a community defined by outstanding natural beauty and abundant wildlife, Teton County has lead the

way in building a world-class non-motorized transportation and recreation system. Visitors to both the Park and Jackson Hole are drawn here to have an unparalleled natural experience. More and more of the vacationing public are traveling to destinations where they can escape their everyday dependence on cars and recreate in a natural setting. This is good for our economy, our National Park systems financial sustainability and for our environment. Alternative Ds inclusion of a separate pathway and increased winter recreational opportunities (grooming the unplowed section of the Moose Wilson Road and retaining access for backcountry skiers at Death Canyon parking area) will encourage and enhance the visitor experience without significant impacts to park wildlife or natural resources.

Planning a management system for a natural environment should include inviting people to travel in a more minimalist and environmentally sensitive manner. The preferred alternative should include opportunities to get individuals and families out of vehicles and on a pathway or groomed winter trail, where they can smell the air, feel the breeze, enjoy unbounded views of the scenery and relish the sounds around them. This is the visitor experience that the Park service should emulate, not car-centric but sense-centric.

6) Increase Safe Access in the Park

Some have cited that only 3% of the users on the Moose-Wilson road are cyclists, so there is no reason to defer to this small user group. This statistic only holds merit because the Moose-Wilson road is much too dangerous for the average cyclist to navigate. Most cyclists and pedestrians do not feel comfortable sharing narrow and windy roads with distracted drivers. Certainly this road is not safe for children or less confident cyclists. If you are truly going to be forward thinking in your solutions for getting people out of their cars to experience the Park, then you will have to address the safety of the Moose-Wilson road for non-motorists. A separate pathway will address safety for everyone - able bodied and those with mobility challenges. There is a portion of park visitors that cannot access the park on dirt trails or gravel paths. Their choices are few for experiencing the sights, sounds and solitude the Park has to offer. Arguably, these are the people who may benefit the most from Alternative D.

7) Save Lives

Safety is important. The Jenny Lake pathway was built after a distracted driver killed a 13 year-old cyclist. The north Highway 89 pathway was built after a distracted driver killed a local cyclist and part-time GTNP employee. We dont need another tragedy to substantiate the need for a pathway on the Moose-Wilson Road corridor. When the Hwy 22 pathway is complete in 2016, more cyclists will be riding the 30-mile Grand Loop through the Park via the Moose-Wilson road. There is a 7-mile gap between the existing pathway at Granite guard station and the Moose pathway. Missing links in pathway systems encourage pedestrians and cyclists to take chances on road sections that are not built to accommodate them. This creates a hazard for everyone, drivers included. This gap is a dangerous invitation to ride the road to get to the other separate pathway. This EIS is the opportunity - the imperative need - to plan safely for this inevitability.

Additional Enhancements to Alternative D

FOP believes that Alternative D could be enhanced with several adaptive strategies, most specifically:

1) Identifying and Enforcing Vehicle Capacity Limits to Reduce Traffic Volumes

Alternative D gives GTNP the ability to use traffic data for managing vehicular use of the road and set

capacity limits which will retain the corridors rural character and protect its wild, scenic and natural resources. The ability to measure and manage traffic will allow GTNP to be flexible, and responsive to present and future concerns.

FOP supports the idea of a reservation system for managing vehicle capacity on the Moose Wilson road. Gates and closures dont reduce traffic counts by quantifiable means and cause unintended environmental consequences, creating more traffic through mid-point turn-arounds at LSR and long circumnavigations around the Park to get to Moose.

Of the three methods put forth by park management for managing traffic - daily closures, through traffic closures at LSR, or a reservation system, only the reservation system is flexible enough to truly manage traffic volumes up to the Parks self prescribed limits. A reservation system could be devised to be as simple or complex as the Park feels is needed and can change over time, depending on experience or technology changes.

2) Developing a Public Transit Program

FOP supports the establishment of a park transit system through public/private partnerships to further reduce traffic impacts on the Moose-Wilson Road. By working with established public transportation programs in Teton County, the Park can reduce GTNP budget pressures and avoid duplicating costly start-up and infrastructure expenses. FOP envisions a Park transit system that fully engages the visitor, allowing for educational opportunities from the seat of a small bus or sensory learning from a pathway.

Once a road capacity benchmark is established, the community and entities like FOP, Teton Village, the Town of Jackson and Teton County can be engaged partners in helping the Park achieve specific metrics and real traffic reduction on the Moose-Wilson road. To illustrate, if the NPS said 2,000 vehicles are the daily peak limit, then through partnerships, an additional 200-500 vehicles a day could be reduced through comprehensive transit choices and a multi-use pathway. GTNP sets the vehicle numbers and the vehicle reduction goals. Partners assist and help pay to achieve these goals. Under that management approach, the road character is protected through reduced traffic volumes and visitors have expanded opportunities to forego driving. Wildlife benefits, visitors benefit and the Park benefits. If traffic is the problem, then let partnerships, public transit and non-motorized transportation serve as the foundation for solutions.

Public transit could be staged at the Teton Village parking areas, May-October. Small buses or size appropriate shuttles with bike racks would provide a real environmental benefit to park visitors and would offer a preferred alternative to car-jams and difficult driving. Visitors in transit are ready audiences for educational messages - and the Park could design and script those messages to further environmental ethics, stewardship, park values, and opportunities to support the Park Service.

Those who use transit or non-motorized transportation could even be incentivized by not needing a reservation if such a system existed. Transit could be thoughtfully planned and designed proactively for top stops such as Jenny Lake, Craig Thomas Discovery Center, Laurance Rockefeller Scenic Preserve, or Dornans. Such a thoughtful, integrated transit plan could reduce thousands of vehicles weekly, and may be supported in part by the private sector. Alternatives A, B and C all rely heavily on vehicle-based ideas that dont reduce traffic quantifiably, or simply shift vehicle pressures elsewhere. Only Alternative D relies on safe non-motorized innovations and adaptations to manage people outside of vehicles in positive, progressive ways.

3) Pursuing Private-Public Partnerships for Funding Solutions

At Jenny Lake, funds were raised privately through the GTNP Foundation to pay for \$16 million of improvements for visitor access and experience enhancement. The Environmental Assessment analyzing the Jenny Lake project did not identify fiscal barriers as a detriment to the projects approval or construction. To the contrary, the EA relied on the knowledge that private donations would be utilized.

The same strategy should be implemented for the Alternative D study. The project should be predicated on using private dollars to implement traffic reduction solutions in this Moose-Wilson Corridor EIS - including the pathway construction and maintenance. Private-public partnerships may also help pay for the needed transit. Private dollars can be directed to the GTNP Foundation to support transit management, or partnerships could be established which give GTNP control of the transit management system without having to pay for costs of construction or implementation.

Just as at Jenny Lake, do not let money be the rationale to reject a proposal that will enhance the park significantly. GTNP is located next to one of the most generous communities in the nation. Ask. Partner. FOP is willing to work with the GTNP Foundation to find private dollars for pathway construction and maintenance.

4) One Combined Northern Entrance Station

FOP supports having only one northern entrance station as a way to promote cost savings and streamline road functionality and access. We urge GTNP to study a single entrance station design at the northern entrance for both the Teton Park Road and the Moose-Wilson Road.

5) Preserving Opportunities and Access for Horseback Riding

The southern portion of the study area has a long history of horseback riding use. Where the alignment of the pathway impinges on trails used by equestrians, the horse trail should be realigned and reclaimed in a way that best accommodates both user groups where possible. Consideration should be paid to horse rider safety in locations where horse trails will cross the road and pathway. The parking areas at Sawmill ponds, White Grass Road junction and Poker Flats should continue to accommodate trailer parking.

Review of Other Alternatives:

ALTERNATIVE A

This do nothing strategy would allow for diminished environmental protection of Park values and wildlife, and would do nothing to enhance wildlife habitat, deepen the visitor experience or increase pedestrian or cyclist safety.

ALTERNATIVE B

Gating the middle of the Moose-Wilson Road to prevent through-traffic is a substandard solution with unintended consequences of increasing traffic impacts on both ends of the Moose-Wilson Road, as well as the nearby road systems in and outside of the park. Alternative B encourages cyclists and pedestrians to share the windy and narrow road with cars; not only does this discourage most people from choosing to cycle, run or walk the road, but it jeopardizes the safety of those who choose to travel that way.

ALTERNATIVE C

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Two day road closures as proposed in this Alternative will: 1) be very difficult to manage and communicate to the general public, and 2) have the same unintended consequences of increasing traffic impacts as the closures suggested in Alternative B. Closing the road two days a week does not make this road any safer for pedestrians and cyclists on the other five days that the road remains open. For certain, cyclists and pedestrians will show up to use the road on a day when it isnt closed to cars, and will just take their chances. A separate pathway is the safest way to encourage pedestrians and cyclists. This alternative will also limit historical non-motorized winter access to death canyon by only plowing to the Sawmill Ponds. FOP supports healthy human-powered winter recreation, and does not feel that restrictions on these activities are necessary.

In conclusion, finding a balance between preservation and public use, ensuring wildlife and resource protection and enabling a more meaningful visitor experience in the Moose-Wilson corridor are all achievable goals. Well-planned transit systems, realigning sections of the road and consistent non-motorized use by pedestrians and cyclists will positively benefit wildlife and the environment, and reduce traffic impacts in the Moose-Wilson corridor. The strategies outlined in Alternative D, along with other enhancement recommendations FOP has submitted, are forward-thinking and dovetail with national trends to encourage healthy lifestyles and a healthier environment.

Thank you to GTNP and the NPS for this extra opportunity to comment during the scoping process. We are grateful for your consideration and welcome any opportunity to support GTNP and the NPS in achieving balance on the Moose-Wilson Road.

Sincerely,

Katherine Dowson
Friends of Pathways
Interim Executive Director

Topic Question 1:

I very much like the idea of limiting access to bicycles only a couple of days per week.

Topic Question 2:

I do not think there needs to be better car access to this area- - there is already plenty in the rest of the park, and in Yellowstone. If there is continued demand for car access, perhaps this could be met by protecting more land, rather than by reducing the quality of wilderness in the few spaces we have set aside for this. I did not see an evaluation of the impact on wildlife of increasing human/car access to this area; it could be that an increase would reduce the amount of wildlife people come to see (in addition to increasing noise, etc that bothers human visitors seeking a quiet experience).

I also worry about commercial access to the area on days when individual vehicles are restricted. This needs to be carefully managed, to give access to people who are not able to bike, without unduly privileging those who can pay, and those who run such businesses.

Topic Question 3:

I believe that there should be days on which individual motor vehicles are not allowed in the area. However, I think there also needs to be access on those days for people who cannot/do not want to bike. I would prefer that most of this access be via National Park Service (rather than private contractor) personnel. This could be funded by such means as greater fees levied on those businesses that are allowed to operate in the park (including hotels, etc.) - - they gain quite a lot from being able to operate in land owned by the public, so a significant portion of the fees charged should go back to the public. In particular, any permits issued for commercial businesses in the Moose-Wilson area should be auctioned

off.

Topic Question 4:

I very much like the bicycle-only days. It might be good to ease access to bicycles, eg, by some sort of bike-share system at the entrance to the road.

thanks for the opportunity to comment

Correspondence Text

Topic Question 1:

1) The various proposals to limit traffic by quotas or even by the day seem appropriate. Because people will be less sure of whether the road is open they will seek other options. While I understand that going through Jackson or Spring Creek adds inconvenience and mileage for those in Teton Village, I do not believe it is GTNP's job to solve the county road management issues. The county (and city and state) benefit enormously from GTNP's presence. It is GTNP's responsibility to manage the park resources properly for the future (and current enjoyment, not convenience); it is not GTNP's responsibility to solve the county's traffic problems. That is to say, your approach limiting traffic to ensure the resources are not over-taxed and the people who do drive the road can actually have a park experience, is a good (even if inconvenient) approach. The NPS has used quotas elsewhere, eg Grand Canyon river trips, and although this situation is so intertwined with traffic issues that people can lose perspective, GTNP is correct in not succumbing to the pressure to solve the county traffic problem and instead to stay true to managing its resources.

Topic Question 2:

1) I strongly oppose the addition of a separate multi-use pathway as proposed in Alternative D. This will not only damage more habitat but also increase the potential for problematic human-wildlife interaction.
2) I do not believe additional commercial activities, as envisioned in Alternative D, would achieve the purpose and need of the plan. Commercial activities, once established, can become the tail wagging the dog since the businesses do come to expect a certain amount of access and would be hurt if the circumstances changed and commercial activity needed to cease. Subsequent management changes reducing the presently proposed commercial activity, should the need arise, might meet strong

opposition.

3) I am concerned about the proposals to change the Death Canyon trailhead location as proposed in B and C. I've used the trailhead as both a climber and a hiker. As a hiker I would not be concerned about adding a mile to the hike. However, adding a mile to the front end of the approach to the some of the classic Death Canyon climbing routes does raise some concerns. Climbers start hiking early as it is so that they can do the approach and climb the multi-pitch climbs and get off before afternoon storms hit. With an additional mile to hike, climbers would have to start that much earlier, possibly have more wildlife interactions, or if they didn't start early enough perhaps be dealing with more afternoon storm exposure. Not undo-able of course, but given that the road already exists (and gets significant use, based on my experience trying to get a parking spot there)I would prefer to see improvements to the road to limit its ever-widening as people try to avoid potholes and boulders. Perhaps the White Grass option is a good compromise, I can't say for sure. I don't have enough time prior to the comment deadline to fully consider the options.

Topic Question 4:

As someone who has bicycled the Moose-Wilson road, I do not feel a separate pathway is necessary. The speed people drive is slow enough, people are courteous. There are plenty of bike paths in the county, at this point, providing plenty of options for those who feel they must be on a separate pathway.

Topic Question 1:

As a West Bank resident, I would stay with plan A for the immediate future. However, I would pave the dirt portion. The constant rescraping and chemical dust control is a waste of money. As an avid bicycle rider, I deem the entire road unsafe for bicyclists. The road is narrow, winding and drivers are far too distracted to give adequate attention to bikes. I think that before any radical change to the road plan is adopted a study needs to be made for the feasibility of a north bridge linking an east-west passage to the highway and airport along the south edge of the park. Dramaticly reducing the mileage between Teton Village and the highway means less vehicle exposure to wildlife and less carbon emissions across the valley. It would also make other more restrictive alternatives for the present road more pallitable.

Topic Question 1:

I believe the majority of the strategies identified in Alternative D will help GTNP best achieve their stated goals. Specifically, I think traffic impacts will be reduced significantly by establishing a peak carrying capacity for vehicles on the Moose-Wilson road, and then managing that capacity with a reservation system or other technology. I think that the addition of a separate pathway is critical to encouraging people to NOT drive. Many people drive the corridor to either visit the LSR preserve or to just experience its beauty. Since I live in Wilson, I take the Moose-Wilson road with my family, often to go to String, Phelps or Jenny Lake. A 7 mile pathway would be an incredible incentive to my family, and to many others, to experience the park outside of a car - with the sights, smells and sounds of GTNP. My family and I use the Moose to Jenny Lake pathway frequently, and I am always amazed at the range of people I see out there - many young children, people with hand cycles, even wheelchairs! I hope GTNP will set the standard for more pathways in our national parks - they are a great conservation and education amenity. I have heard some people say that a pathway would harm wildlife, but I believe cars are a lot more dangerous to wildlife than just about anything else in the Park. The park has a car problem, not a bike or pedestrian problem.

I also think the north end of the Moose-Wilson road should be re-aligned as suggested in Alternative D. This is a chronic trouble spot with flooding, and seems to attract car-jams and traffic problems when the bears and beavers are out. Obviously, this area is good habitat for bears in the fall, so re-routing the road may minimize bear/human encounters. That said, I have seen grizzly bears in the Jenny Lake area, Signal Mountain and around Jackson Lake Lodge. Why does the Park keep emphasizing bear issues in the Moose-Wilson area only, when in fact they are in many other more popular areas in the Park as well? I have never seen them shut down Jenny Lake amenities or campgrounds, and there are grizzlies there.

There are grizzly bears on the USFS land outside of the Park, and that agency doesn't shut down roads or access. People need to be educated about traveling in bear country - not shut out. Black bears and grizzly bears exist in Jackson, they don't just live in a small corner of the Park, so it puzzles me that the Park, and many pathway opponents, keep pointing to the fact that grizzlies frequent this area, so a pathway is a bad thing. Grizzlies frequent a lot of places in the park and outside of the park, not just the Moose-Wilson corridor.

Topic Question 2:

I am really against road closures. They are ridiculously hard to manage, especially if they are only on a couple of days a week. Since the M-W road is used by about 70% tourists (non-locals), getting the message to them about a closure will be tough, and they will inevitably drive to the closed gate at Granite, and turn around and drive all the way around to Moose. Even locals will do the same thing. The gates suggested in Alternative B don't make sense if you are trying to reduce traffic impacts, since this will cause a boomerang effect on both ends of the road.

I don't like the idea of have too many signs and kiosks along the road, because I would rather have people learn from the seat of a bike, or a stroller, a wheelchair or their own two feet. If you get people outside of their cars, there is a lot to learn !

Topic Question 3:

Please consider a smart public transit system so people can easily leave their cars behind and get on a shuttle or small bus and enjoy NOT driving in the Park. This is the way of the future. Rather than creating your own park shuttle system, which could be very expensive, maybe you could partner with Teton Village or the START system in Jackson. The Village has a shuttle system that is very well used in the winter, but not used at all in the summer. Perhaps you could lease their vehicles and develop your own transit system for the M-W corridor.

Topic Question 4:

Thank you very much to the NPS and GTNP for this extra opportunity to comment on the Moose-Wilson corridor.

Topic Question 1:

Closing Moose-Wilson road periodically (twice a week) to cars and allowing only pedestrian and bicycle traffic. This would minimize cyclist/vehicle interactions because most cyclists would wait until closure days to ride. It would also allow for quiet and slow wildlife viewing and nature enjoyment, without the feeling of being rushed.

Paving the dirt section: While the dirt road conditions do act to lower speed on the road, especially when it gets horrendous, I think paving it is the clear best option. Policing the road, having radar signs, posting speed limits...all these things would help to lower vehicle speeds. Roads in the town of jackson aren't dirt. People don't drive 60 mph downtown. I think the use of highly visible slow down signs at the pedestrian crossings, along with the posting of a slower speed limit (20mph?) would be enough to limit speeding.

Relocating the winter Death Cyn TH to the White Grass Rd intersection SUMMER ONLY: I agree with this relocation as it will make the summer use of the Death Cyn TH much easier for tourists and remove the parking along the current dirt road, which is excessive and damaging to habitat.

Realignment of the Moose-Wilson Rd south and relocating the Park entry kiosk: I support this because it would benefit the riparian habitat, would greatly reduce the number of parked cars at the beaver dams which make that section of road dangerous and remove the need for desperately needed road maintenance.

I agree that Commercial Vehicles...taxis, tours etc. should not be able to utilize this road for thru traffic. It increases congestion too much.

I believe the self-discovery philosophy is correct. Minimal signage on the landscape, only at trail heads and then only minimal trail signage in the backcountry. The current backcountry signage is excellent. Minimal, but clear and where you need them. One exception is the Sunset Lake area where some signage names do not match map names.

Topic Question 2:

Relocating the winter Death Cyn TH to the White Grass Rd intersection: I disagree with this alternative as the current Death Cyn Rd paved section is quite narrow. With the number of backcountry skiers utilizing this trail head in the winter, I think this road might become dangerous unless it is widened. I do not support widening it.

Closing the Moose-Wilson Rd in winter: This would all but eliminate day use of the Death Canyon TH for backcountry skiers. This trailhead is second only to Bradley Taggart in winter usage and closing it would make a serious impact on the backcountry recreation in the park during the winter months.

Segregated Pathway IF THE ROAD IS PERIODICALLY CLOSED TO VEHICLES: I would be against a separated pathway IF the road was periodically closed (twice a week) to vehicle traffic. If this is the case, then I believe on-road markings (either as painted bike lane or road-share markings) would be sufficient. This would also eliminate the need to encroach farther into critical habitat in order to create a separated bike path. While I feel cycling is a critical component to the future of the Moose Wilson Road, I don't think having a separated bike path outweighs habitat needs.

IF the road was NOT closed twice a week, I would then support a separated pathway, but not one separated by 50 feet. I believe that level of habitat encroachment is too detrimental to warrant. If a separate pathway is done, it should be right next to the road.

Topic Question 3:

I believe the twice a week road closure should affect the road BETWEEN Granite TH and Sawmill ponds. That way tourists can still access Granite TH which is a high use area.

Parking at LSR should be addressed. While the idea of a small parking area reducing the number of people at the area is a good idea in theory, in practice it leads to people not ever enjoying the LSR. As a local resident, I will never waste 20-30 minutes of time waiting in a line of cars to park there. I find it hard to believe a tourist in a mini van full of kids would either. This is another benefit of closing Moose-Wilson Rd to cars twice a week. I envision a lot of people parking at Granite Cyn TH and riding their bikes to enjoy the LSR without the hassle of parking.

I also think an electronic board stating the average wait time at LSR for a spot should be installed at the South Entrance kiosk on Moose-Wilson Rd. That way people who specifically wish to go to LSR can know ahead of time the parking situation and don't have to waste gas and cause congestion unnecessarily.

Also LSR related, there should be a Park shuttle to LSR. Either from an enlarged Granite TH parking lot or from Teton Village. This would alleviate the parking issue and make it a much more attractive destination.

Topic Question 4:

Inner Loop Road closure to passenger vehicles: I know this is pie in the sky, but other national parks have implemented similar closures to cars. (Zion and Yosemite to name a couple) Implementing a shuttle

system for the inner road would have myriad benefits to wildlife, habitat, air quality and the quality of the a visitor's experience. Parking could be done at the visitor's center and shuttle buses would take people into the park stopping at the various trailheads, Jenny Lake, Signal mountain etc. This would wholly eliminate cyclist VS vehicle incidents, give people a stress free way of seeing the park, eliminate parking congestion at Jenny Lake. Visitors driving through the Park toward Yellowstone on northern destinations would simply use the US 189N route.

Comments: If JHCycling.org can be of any help, either in disseminating information or acting as a cycling resource for the Park, please don't hesitate to reach out to us. We are a great resource for reaching the Jackson cycling community and for answering any cycling related questions you might have.

Thanks,

Forest Dramis

Topic Question 1:
Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Topic Question 2:

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

Topic Question 3:

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

importantly, development in areas that have not been previously impacted should be avoided.

Topic Question 4:

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Topic Question 1:

Moose Wilson road is beautiful just the way it is.Re-alignment ,gates,fee stations would ruin the nature experience.

Topic Question 2:

Alternatives B,C,D would all be very expensive,time consuming and disruptive to the ecological well being of the corridor.l

Topic Question 3:

Add a few pullouts and expand the existing pullouts.

Topic Question 4:

My wife and I traveled to the park from Florida to do nature photography along Moose-Wilson road. On wednesday September 10th we photographed a grizzly bear and showed the photo to Ranger Justin Schwabedissen who identified the bear as #760. The park service then closed the road on the 11th and 12th.Was this closure really necessary and will it occur under any of the proposed alternatives in the future.Strangely enough the road was opened to foot traffic but people were not allowed to leave their vehicles before the road was closed.Do any of the proposals allow for the road to remain open in the presence of grizzly bears.It was a major disappointment to be denied use of the road on the last two days of our vacation.

Topic Question 1:

Alternative #1 would do the least amount of damage to the area; as well as allow for its continued deep enjoyment. Why mess with the ecology and traditions of the area?
Leave things alone. What is there now is quite consistent with the goals you set forth.

Topic Question 2:

1. Changing available riding trails will be devastating to the goals you outline. Keep the riding trails open which have given many generations of visitors enjoyable experiences and spectacular memories. That also keeps alive the long-standing equestrian history, dude tradition and culture of this area of the park. You state that you are seeking harmony "with the natural and historic character of the Moose-Wilson corridor." Keeping current riding trails and equestrian access does just that.

2. NOT widening or paving the middle (JY) section of the road is extremely important. Further, do not build more parking areas and turnouts. Taking beautiful, wooded land to widen a road or create parking

lots, is not at all consistent with the goals of preserving this land. You are the stewards of this land for the benefit of this generation and generations to come. Walk as lightly as possible on this land.

3. Widening and/or paving the middle portion of the road will increase vehicle speeds on it. This is an added hazard to the very wildlife you seek to protect.

4. Controlling entry times or closing the road for certain days per week will deprive many people from ever visiting this area. Many tourists are simply passing through. Many of your suggestions would freeze them out of the opportunity of seeing/visiting this rather unspoiled portion of the park. Your job is not to keep people out of the park or cut them off from experiencing this area.

5. Establishing a bike path seems counter intuitive to your statement that "notable increases in potentially dangerous wildlife have been observed." Bicycle riders would be more endangered by "dangerous wildlife" than passengers in a car. Why increase their risks?dude tradition and culture of this area of the park.

Comments: I would remind you that the 1916 act that established your service states: "the Service thus established shall promote and regulate the use of the Federal areas known as national parks....by such means and measures as conform to the fundamental purpose of the said parks.....which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

Topic Question 1:

Alternative D. Would keep Moose-Wilson road open for local traffic and cyclists and would not increase traffic on an already busy highway.

Topic Question 2:

Alternatives B and C. Would increase vehicle traffic on an already busy highway and increase miles traveled by local residents with the increased air pollution.

Topic Question 3:

A seperate Moose-Wilson bike/walking path would keep bikes and pedestrians off the road which would be a major safety concern otherwise.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Isupport Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Park values are best protected under Alternative D, which recognizes that wildlife and park visitors can be thoughtfully managed together, the essence of National Park visitation. Under Alternative D, visitors experience this part of Grand Teton National Park in a way that is respectful of natural resources, informative, inspiring, and safe.

Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular public on a needed pathway.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitably see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway.

Topic Question 3:

A separate Moose-Wilson pathway is a safety need, not a want, an imperative in any Alternative. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Decreasing the increased traffic volumes for the long term is the Park's objective and that is possible only with Alternative D, which uses thoughtful, safer ways to get people out of vehicles and into the outdoors.

Ask for Alternative D to help make meaningful traffic reductions and adaptations so that wildlife can thrive and visitors can have access to their national park.

Correspondence Text

Dear National Park Service:

My name is Peter Seligmann. In 1970 I worked as a researcher assistant on a study by the Craigheads on Grizzly populations of Yellowstone. Then I worked on research studies on birds of prey along the Snake river and Black Tail Butte. My family has owned a small property in the southern corridor since the 1960's. We have experienced the return of elk, moose, raptors, grizzly, martin and great grey owls. Amazingly, these animals have used the same trees, meadows and creeks from generation to generation.

In 1987 I started an organization called Conservation International and have spent decades working on ecosystem management challenges. Without a doubt humanity needs nature to be healthy and without a doubt the condition of ecosystems are deteriorating, despite the best intentions of good people.

Future Americans will judge your decisions on the Grand Teton National Park Moose-Wilson Corridor, by the health of the wildlife and the vitality of the ecosystems. The park must be managed for the benefit of wildlife so that future generations will be able to have an easily accessible connection to the foundation of our nation's prosperity: abundant nature. Teddy Roosevelt made extraordinary decisions at the turn of the 19th century. He protected the national parks from the self interest and short term economic concerns raised by the western congressional delegations. Without his clarity and strength, these parks would not exist. Without your clarity and strength human demand will diminish the diversity and vitality of Grand Teton National Park.

Luckily, the core values that we are obligated to secure, are clear. The Moose Wilson Corridor must be

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

managed to save the ecological and wildlife health. All other uses, from horseback riding, bike riding, automobile traffic must be managed to ensure that the ecological vitality of the park has not been impaired.

The most important required action is to reduce the traffic pressure coming from the south: people looking for the quickest route to Yellowstone or to the headquarters or, depending upon time of day, to the Airport. It would be easy to resolve this by building a bridge across the snake that connects Teton Village to Highway 26. A few families, unfortunately will be impacted. However, the legacy of the park will be protected from the pressure that threatens the health of the wildlife and culture of the Park.

The bridge will divert pressure by redirecting traffic to the airport to Yellowstone and those searching for a speedy trip north. The bridge also could easily include a bike path that could allow bike riders to cross the Snake and connect with the bike route on highway 26.

Additionally, the Moose Wilson road should not be widened or upgraded. Its very character has allowed the wildlife to flourish. Additionally, placing a bike path through this wildlife corridor might satisfy bikers but does not protect the sensitivity of the ecology. There are many ways to see the Park but placing bike riders directly into the path of elk herds, an increasing Grizzly population and returning wolf packs, makes no sense at all.

The Moose Wilson road does need to be re-aligned from the Laurence Rockefeller Reserve to the north. Moving the road to the east of the beaver ponds will protect the wildlife and reduce the conflict between wildlife that move from the mountains to the plains.

Topic Question 1:
See comments below.

Topic Question 2:
See comments below.

Topic Question 3:
See comments below.

Topic Question 4:
See comments below.

Comments: Thank you for the opportunity to comment on your preliminary alternatives for the future of the Moose-Wilson Corridor. I think all the alternatives miss the mark. Not one of them gives enough attention to preserving fundamental park values unimpaired for the enjoyment of future generations.

It's critical in a NEPA planning process that a full range of alternatives be presented and analyzed. All three "action" alternatives in your Preliminary Alternatives Newsletter call for "improving" or paving the unpaved section of the Moose-Wilson Road. This is not a "range" of alternatives. At least one alternative must call for keeping the road unimproved. If you pave the road, or make it nice and smooth with a "stabilized gravel surface," you are inviting more traffic and higher speeds. You are also changing the character of the road and the experience of this corner of the park. Not an inch more of the road should

be paved, and in fact I would support de-paving the entire length of the road. A rough, narrow, winding road would provide a much more authentic experience of historic national park travel (and would restore something of the experience travelers on this road had as recently as 20 or 30 years ago). It would also cut down on traffic, force drivers to slow down, and remove the appeal of the Moose-Wilson Road as a through-way for Teton Village residents racing to the airport. Small NPS- or concessionaire-run shuttle buses could provide transportation to trailheads along the road and to the Rockefeller Visitor Center for anyone not wishing to subject their autos to the potholes and dust. (I am completely serious about this proposal, despite our culture's love of pavement and ever-wider, ever-smoother roads). The road's roughness and unsuitability for delicate cars should be noted on park maps and signs at either end, to forewarn anyone who isn't willing to travel slowly on a dirt road.

Along with restoring the road to a rough and narrow condition, it should be made one-way (preferably from Moose to Poker Flats). These two simple changes would, at little administrative expense, greatly relieve traffic pressure on the road. The complex and no doubt infuriating proposals to force motorists to line up in queues at either end of the road awaiting a space in the hourly quota system, or calling ahead for reservations to drive the road, or memorizing complicated schedules of openings and closings, should be ditched. The new plan should strive for simple, clear solutions that won't force future Park administrators into never-ending headaches, or make life hell for the poor souls who man the entrance stations. The proposal made a few years ago to convert the road to a one-way road was a good, simple, sound idea, despite the howling of local officials.

Of course local officials and businesspeople and would-be commuters will howl if the road is made one-way, and then everyone will get used to it. Imagine what would happen if the Park Service had been plowing the Moose-Wilson Road all winter for years, and then decided to close it in winter. County commissioners would predict the collapse of the Jackson Hole economy, Teton Village businesses would decry their loss of income, State legislators would blast the Park Service for failing to consider the needs of residents and visitors, engineers would predict doom because a critical road linkage would be lost. But, in fact, we're all used to the road being closed for half the year, and the economy is fine, residents somehow survive, it's just the way it is, and nobody suffers. The same would, soon enough, be true if the road were made one-way. We would know it was one-way and would plan accordingly. That would be simpler than the idea of a gate half-way, forcing drivers from both ends to retrace their tracks. Choose simplicity-present an alternative that calls for making the road one-way.

Second, the idea of a separated bike path should be discarded. Especially egregious is the large segment of the proposed pathway looping away from the road and circling east of the Laurance S. Rockefeller Preserve. I assume the reason you drew the bike path in this location is because the Jackson Hole Preserve, Inc., specifically prohibited bike path construction across Preserve land when they crafted the conservation easement encumbering that property?

Why is it, do you think, that the JHPI specifically prohibited relocating or reconfiguring trails within the Preserve? Why did they prohibit construction of any roads, drives, trails, or pathways (Section 4.7, Conservation Easement)? Why did they explicitly exclude bicycles in a list of allowed non-motorized recreational activities on the Preserve (Section 3.8)? Why did they prohibit non-emergency use of bicycles (Section 4.8)? Apparently they knew that any more bike trails (or off-trail bike use) was incompatible with the values the Preserve was set aside to protect. Of course the terms of the easement do not apply to land beyond the boundaries of the Preserve, but the proposal in Alternative D to evade the clear wishes of the Preserve donors by building a new pathway immediately along the eastern border of the Preserve seems to me disrespectful in the extreme of the great gift the Rockefeller family made to the citizens of the United States in donating this remarkable property to the Park Service.

The JHPI clearly understood the negative impacts proliferating trails would have on wildlife, scenic values, and visitors' experience of the Preserve. They had the foresight to limit trail development in order to protect these values. It would be disgraceful for the Park Service to show its appreciation of the gift of the Preserve by sandwiching the southeast corner between an "improved" Moose-Wilson road and a new paved pathway, degrading the scenic and wild character of the lands just east of the Preserve.

The pathway looping around the Rockefeller Preserve shown on the map for Alternative D will be a new intrusion into an area of meadows and forest glades and wetlands that is heavily used by elk, bears, and other wildlife. I have no doubt that riding the bike path will be a pleasurable experience for the people who ride it, but the cost will be paid by the wildlife that now use that area for feeding, hiding, calving, breeding, and living their lives without constantly having to watch out for and run from people. Wild animals flee from people. It's a fact. Bikers may not want to admit this, because they may not see the fleeing animals, and besides that they love wildlife and don't intend to disturb it. But people on pathways and trails disturb wildlife, and displace them from habitat that was previously theirs to use without this disturbance. Given the enormous percentage of the earth that humans have taken for their own use, and the tiny portion remaining where wildlife can still thrive relatively undisturbed, and the magnificent habitat and rich species diversity of this corner of Grand Teton National Park, it would be completely unethical and incompatible with Park values to take yet more habitat from wildlife and claim it for human use.

Besides avoidance of trails by human-averse species, other impacts of pathways on wildlife include:

- Habitat fragmentation

- Edge effects

- Changes in composition and diversity of avian communities

- Changes in abundance and distribution of small mammals

- Increased access along trails for edge-adapted predator species (such as coyotes, red foxes, and raccoons)

- Changes in predator-prey relationships

- Habitat degradation from human trampling of vegetation along pathways and introduction of invasive plant species.

If bikers want to enter the park from the Poker Flats entrance, or enter the Moose-Wilson Corridor from the north, they can use the road. If they view the road as unsafe, they don't have to ride it. There are many hundreds of miles of bike-accessible roads and trails in the national forests surrounding Jackson Hole-it is not the responsibility of the Park Service to provide more, particularly in this wildlife-rich area. It is the responsibility of the Park Service to protect the uniquely diverse and lovely wildlife habitat of this corner of the park.

If the road is one-way for cars, and if speeds are kept slow by roughness of the road or by speed limits, it's not evident that bikers would be any less safe than they would be on a multi-use pathway, where they will have to avoid walkers, families with small children and strollers, roller bladers, etc. Don't forget the tragic death of Ed Henrie, killed on a multi-use pathway along Highway 390 in summer 2006 when he was struck by a speeding bicyclist. Don't forget that following that accident, cyclists pushed to change Wyoming law to allow bikers to use highways even when an adjacent bike path exists (which shows, at the very least, an ambivalence on their part about the relative safety of multi-use pathways versus roads). The chances of a cyclist meeting a bear around a blind corner of the pathway are real. If a portion of the road is kept paved (i.e. from Moose to the LSR Preserve), a bike path could be shown by a stripe on the road, as it is on the one-way portion of the Jenny Lake Road. Striping a dirt road is a more difficult proposition, but

signs could make it clear to motorists that cyclists are sharing the road.

I urge you to write a new alternative that actually protects park values, including intact wildlife habitat and a rustic, low-key visitor experience in this corner of the park. Besides prohibiting "improvement" of the road, making it one-way, and eliminating the separate bike path, this alternative should prohibit guided bike tours or ski or snowshoe tours, prohibit taxis (the need for taxis would be eliminated by the small shuttle buses suggested above), and prohibit winter grooming of the Moose-Wilson Road. Commercial wildlife tours should be strictly limited to help prevent gridlock on the road. Whenever grizzlies are using the area near the road, it should be closed to human access. Parking lots, signs, and kiosks should be kept to a minimum. Finally, permanent Wilderness status for the unroaded portions of the corridor (and all unroaded portions of Grand Teton Park) should be sought.

Such an alternative would still leave open the possibility of future quotas for hourly use etc., if such should become necessary, but for now, keeping the road in a fairly primitive condition and making it one-way would reduce traffic congestion by at least half, and would cut much of the "commuter" and airport traffic. People traveling to the Moose-Wilson Corridor would be going there because they wanted to experience the natural qualities of the area and were willing to put up with some difficulty and inconvenience to get there, not because they see the road as a smooth, quick way to get from the airport to the Village. I think it's the responsibility of the Park Service to strongly resist local demands for bigger, better highways and more recreational facilities, and to devote themselves to protecting the very reasons this area was set aside as a national park-its scenery, its wildlife and habitat, its wildness-in other words, the features that will be so incredibly rare and precious to future generations in an ever more crowded and degraded world.

Thank you for considering these comments.

Ann Harvey

Topic Question 1:
None

Topic Question 2:
Do not stop horseback trail riding in the Sawmill Ponds area and do not build a bike lane on the Moose-Wilson road. I have enjoyed trail riding in the Sawmill Ponds area and feel the area should be left as pristine animal habitat. I do not think bicycles would mix with the abundant wildlife in the area surrounding Moose-Wilson road. Horses do not alarm wildlife...people on bicycles could be potentially dangerous if the unpaved road were paved- -encouraging speeding of cars and bikes. I have seen animals so severely injured they had to be destroyed.

Topic Question 3:
Strategies not viable.

Topic Question 4:
Please preserve the animal habitats as they are, and allow hikers and horseback riders to continue to enjoy the area without detriment to wildlife.

Please please please preserve the wild, natural beauty of the Moose Wilson Road Corridor. Please keep the road rustic, rural and intimate. It is such a special place for wildlife and wildlife viewing. We should keep some intimate sections of the park less developed and built up for varying ways to experience the wildlife.

Keep the MWC intimate and extra adventurous (ie bicycling and hiking and wildlife viewing), not a thoroughfare or cut through!

It has been my favorite place to look for wildlife for many many years and changing its accessibility will only serve to harm the wildlife population and their living habits.

Correspondence Text

Sunday, September 14, 2014

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, and scenic and wildlife values of this special area.

"...to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

- - NPS Organic Act

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a

more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

"In permitting the sacrifice of anything that would be of the slightest value to future visitors to the convenience, bad taste, playfulness, carelessness, or wanton destructiveness of present visitors, we probably yield in each case the interest of uncounted millions to the selfishness of a few individuals."

- - Frederick Law Olmstead

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife, and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

"Every man who appreciates the majesty and beauty of the wilderness and of wild life, should strike hands with the farsighted men who wish to preserve our material resources, in the effort to keep our forests and our game beasts, game-birds, and game-fish- -indeed, all the living creatures of prairie and woodland and seashore- -from wanton destruction. Above all, we should realize that the effort toward this end is essentially a democratic movement."

- - Theodore Roosevelt

Grand Teton National Park is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

"A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise."

- - Aldo Leopold

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,
Christopher Lish

Correspondence Text

Topic Question 1:

I do not have one alternative that I support in it's entirety. I am very much in favor of options that recognize the significant wildlife habitat in this area and that aim to prevent any further habitat fragmentation and traffic. It's a wonderful wildlife watching area and peaceful drive, and protecting the views and wildlife corridors should be the priority. I would like to see the road to the Death Canyon Trailhead left as is - - dirt with light vehicle access to the trailhead, but not paved - - paving there could lead to an overwhelming amount of new traffic, which could result in destruction of the rural nature of the area and would rapidly lead to the need for expanding the impact zone of the parking area, as has happened at areas such as Jenny and String over the years.

Topic Question 2:

I am very opposed to options that include widening the road corridor significantly due to the impact on wildlife and habitat fragmentation. It's a relatively narrow corridor between the forested foothills and the river. We should be figuring out how to minimize impact of expanding human traffic in the corridor, as opposed to adding to the problem by creating new recreational uses in areas visibly frequented by moose, bears, beavers, owls and other species unique to the park. With only 1-3 percent of current vehicles being bicycles, and most of those being local athletes, creating a separated bike path would very much be creating a new use. The resulting new users might include families of bikers being placed in conflict with wildlife and/or the human activity would simply push wildlife away, ruining so much of what makes this a special area.

Topic Question 3:

I would like to see options studied regarding gating the road for two-way traffic each way to the LSR

and/or one way options that would cut down on through traffic to the airport, etc.

Topic Question 4:

I just hope that decisions are made in the best interest of park resources and maintaining the park for future generations - - not to please nearby commercial development and selfish interests of locals, and not caving in to the political pressure from outspoken congressional reps and local elected officials, who are acting on behalf of the special interests. It's important to remember the difference between local and national perspective regarding this national park. Many locals back in the day never wanted the park to be formed to begin with. It's human nature to want to fill personal needs before seeing the big, long-term picture. But this process isn't about personal needs for locals; it's about ensuring the next generation can enjoy the park and its wildlife just like the generation before. As locals, we think of it as our backyard playground, but it's significance and value reaches much higher.

Improvement of the road to provide better access to the area and to the rest of the park from the west side.

Topic Question 2:

Building a separate bicycle path seems a bit extreme for the area. The cost and impact to the natural and historic character would be adversely impacted. Bicyclists should only use the road as it is already there and easier to maintain over time.

I have driven the road, hiked and rode horseback in the area and I find horseback provides one of the best methods of viewing and interacting with nature. Driving, hiking and bicycling do not come even close to what I can see and learn from the back of a horse. So I am a bit puzzled as to why horseback riding would be phased out in the Sawmill pond area. Horseback riding should be expanded, not reduced. Access to the old ranches (Whitegrass) should be encouraged as it helps tell the history of the area.

Topic Question 3:

Encourage more horseback riding in the area. With a knowledgeable guide the history of the area is much more accessible than at the visitor center in Moose and a lot more interesting.

Topic Question 4:

Although I welcome the paving of the dirt portion of the road, I am also concerned that drivers will speed through the area thus endangering the wild life as well as bicyclists and hikers. Retaining the winding nature of the road should help slow down drivers, but, I am not certain that will be enough.

Topic Question 1:
Please amend my previous on-line comments to include this:
I agree with the JHCA on this

The recent report from Utah State University suggests one major impact from traffic is the large number of, and impacts from, visitor created parking along the Moose-Wilson Road. By creating a number of pullouts and strategically preventing visitor-created parking using design features in other places, the park can provide ample visitor opportunity to stop and watch wildlife while also reducing traffic impacts. All alternatives contain management options for creating pullouts. I urge a balanced number and location of pullouts that meet visitor expectations while limiting impacts to habitat along the road. The park should consider strategies that make it safe and easy to visit the Moose-Wilson corridor by bicycle. In so doing, the park should evaluate the potential for harmful encounters between bicyclists and wildlife, especially in a densely forested area with limited sightlines. Appropriate strategies to manage these encounters must be developed to ensure the safety of visitors and park wildlife. The park should consider all strategies to limit commercial use of the corridor by taxis and similar transportation services as indicated in Alternative D. The Moose-Wilson Road is not a county transportation corridor. It is a park destination.

Topic Question 2:
A separate bike path! This is a terrible idea. The Park seems unable to maintain control of the existing musk thistle problem it has on the MW Road ...how many years of noxious and NEW weeds do we need to add to the picture? Once the unpaved Death-to-Granite section gets paved, which it should...THEN NO MORE PAVEMENT is the right thing to do.

Topic Question 3:

Pullouts: Since widening the MW road is not a feasible option, people in cars should be provided with as many pullout spaces as possible, not as few as the Park would like. Even at the main moose pond, the pavement should be re-graded and given its own, long pullout. Each of these should be separately and modestly marked with a 50's style low wooden sign, in keeping with other park signage.

Topic Question 4:

Commercial interpretive tours that focus on providing visitors with an experience of the wildlife and habitat in the corridor such as wildlife tours, horseback or bicycle tours, may be allowed to continue in a way that manages for impact, as with all other human activities in the corridor.

I encourage the park to strongly consider managing the Death Canyon trailhead using the strategy specified in Alternative B. This reduces impacts of visitors along the unpaved section of the road, while allowing ample visitor access to trails and hiking opportunities. Please use the data from the recent studies by Utah State and Penn State to justify and choose the smallest feasible size of the parking lot. Is a parking lot for 60 cars really necessary? This represents a peak number only met for a few hours each day during a brief two-week window, as suggested in the recent Utah State Study.

The ungroomed section of the road from Granite Canyon to Death Canyon provides excellent cross-county and back country skiing opportunities. I urge the park to continue evaluating strategies that retain this ungroomed section, regardless of whether the northern parking lot is moved to the Sawmill Ponds, Murie Ranch or the Death Canyon trailhead.

Preserve and maintain a great experience for visitors to enjoy and appreciate the natural beauty of the corridor. Maintain the rustic, rural and intimate character of the road. Limit any additional impact to the road and corridor from visitor traffic. The MWC is a prime destination well-known locally and nationally as a park destination. Management strategies should preserve the character - intimate wildlife viewing opportunities and a rustic, rural road - that make the MWC such a wonderful destination. I prefer strategies that minimize impacts and maintain the goal of self-discovery for visitors. Too many established vista points and visitor services along the corridor will impair the natural, intimate character of the road.

Comments: The Park, and the Park Service, should consider another option that is even more radical than the one-way-in-both-directions recommendation. That Alternative is more in line with what Laurance would have wanted: fewer vehicles, lower impact, and more exploration. He may not have foreseen the extreme popularity of this corridor.

I want the Park to begin a long-range study of all the impacts and benefits of removing and recycling all the pavement on the MWC, completely closing and restoring the whole road corridor, upon serious recognition of this site's potential status as some kind of "National Ecological Gem". That would coincide with the construction of a wide, unpaved biking/walking interpretive trail to include strategically placed viewing platforms (at each of the ponds)

Jackson Hole's real wealth is not its astronomically priced real estate, it is in the form of the valley's wildlife habitats and corridors. The local economy rests heavily on the guarantee that those will remain permanently healthy, viable, and resilient. Jackson Hole residents love their ungulates, as they always have, and we've done a good job of promoting this natural gift all around the world; hence we are victims of our own success. We now have to do something serious to reduce the traffic flow in the corridor.

I fully support Alternative B and the idea of a daily quota, topping out at 1,000 cars per day in July and August. It can't be in any way confusing to visitors. The quota has to be streaming on line every day all day (as an app) and announced on the local radio multiple times when the quota is reached. This may have the

unintended consequence of creating two rush hour phenomena, with wildlife-watching tour vehicles storming the south entrance between 6 and 7 am. That's already starting to happen.

Therefore I hope the NPS will examine the feasibility of piloting an electric van shuttle system, at least for peak summer hours. I cannot even picture how that would work.

And lastly, since it's on everyone's mind or lips this past month, let's think more in terms of sustainability: Jackson Hole needs a north bridge going directly from the airport to the village. Downtown business owners be damned; they'll have to adapt by starting an online catalog or by relocating to the Village.

This is a tough one. Thanks for including my comments on the Public Record .

Topic Question 1:

I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

Topic Question 2:

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 3:
see Comment ID: 928631-60898/1831

Topic Question 4:
re: Comment ID:928631-60898/1831

I need to correct some of my wording from this comment I made yesterday, re: the possibility of a pathway in the Moose-Wilson corridor;

This corridor is similar to a "back country" experience, we do not see "groomed runs" when skiing the back country :))...please do not create a "paved pathway", I fear for the results of what could be an "invitation" to more wildlife-human encounters.

Comments: Please protect the integrity of this unique Grand Teton Nation Park experience.

Bike pathways are not appropriate everywhere in this valley

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Horse trails and horseback riding access provide the Park visitor with an intimate connection with the Park. It is a "natural connection" with the local wildlife, the beautiful environment, and connects us with the historical and cultural past what created the area. Much of the Park has been explored and was discovered on horseback...and the historical significance of Dude Ranches in this corridor is significant...these Ranches have and still do bring many visitors into the Park .

Topic Question 1:

1. ANY viable alternative should prioritize the preservation of wildlife in natural habitat.
2. There are historic areas along the road, eligible for the National Registry, and ANY viable alternative should prioritize preserving these components.â€œ
3. Even in our relatively short time here (2009) we note, and studies confirm, that auto traffic, local and visitor, continues to increase. It puzzles and disappoints us that bicycle traffic is minimal. We would like to see the following included in the resulting final plan:
 - A. Decrease speed limit
 - B. Continue access to LSR and other historic sites, make the road one way or break into two noncontiguous sections, both ending at these sites.
 - C. Keep parking lots unpaved and located so as to minimize interference with wildlife. Plan ways to discourage/block impromptu roadside parking.
 - D. As an alternative to decreasing traffic volume/parking, consider Park owned and managed transport with guides as per Grand Canyon National Park.

Topic Question 2:

ACTION MUST BE TAKEN!. The alternative to "do nothing" has no viability.

- A. Disallow shuttle, taxi and any other commercial transport from using the road as a "short cut" to Teton

Village or the airport. Think of the Moose Wilson Road as a treasure NOT a throughway!
B. Avoid adding any more pavement.
C. In theory a reservation system may sound intriguing; however, it will prove a nightmare in implementation. Avoid this alternative.
D. The road should be for access to the historic and natural sites, NOT a fast way to travel.

Topic Question 3:

I think bicycles should be encouraged to further reduce the noise of autos but am not sure how to do that.

Topic Question 4:

Thank you.

Topic Question 1:

I do not think there should be a bike path on the Moose Wilson road at all. It would phase out commercial horseback riding on the Sawmill Pond trails, cut down 3000 trees in a pristine wooded area.....potentially cutting off rides to the Whitegrass Ranch, one of the great dude ranches so bikes have a path?

Topic Question 2:

The bottom line is there is no need to have a bike path, there is no historical connection with bikes in the Park as there is with horses and dude ranches to say the least and this plan potentially cuts me off ,on horseback,from Whitegrass ...a very special place.

Topic Question 3:

There doesn't need to be a bike path on the Moose Wilson Road.

Topic Question 4:

If it weren't for the dude ranches, cowboys and horses Grand Teton Park would not be what it is today....to build a bike path on the Moose Wilson corridor is just wrong ...it seems like the tail wags the dog in your county and my Park ,only 3% o park users potentially using bicycle paths: where is the benefit for such a large and disturbing project? The bike community has a brand new bicycle super path ,leave this Moose Wilson corridor alone.....it is such an honor to stay at the R Lazy S and ride horses in the park....the Park should respect the guest ranch culture as one to be preserved and celebrated...Do Not Spend My Tax Dollars on a bike path along the Moose Wilson corridor and please do not phase out commercial horseback riding on the Sawmill Pond trails.

Topic Question 1:

I support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Park values are best protected under Alternative D, which recognizes that wildlife and park visitors can be thoughtfully managed together, the essence of National Park visitation. Under Alternative D, visitors experience this part of Grand Teton National Park in a way that is respectful of natural resources, informative, inspiring, and safe.

Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular public on a needed pathway.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlifethat lives

outside the corridor, especially along area roads like 390, 22 and 89, which will inevitably see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway

Topic Question 3:

A separate Moose-Wilson pathway is a safety need, not a want, an imperative in any Alternative. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Decreasing the increased traffic volumes for the long term is the Park's objective and that is possible only with Alternative D, which uses thoughtful, safer ways to get people out of vehicles and into the outdoors.

Topic Question 1:

Alternative D should be carried forward. I think it is important to keep the Moose Wilson Road open as it is today, adding a pathway to connect the park to Wilson will be an amazing improvement to our current pathways system, and will be much safer than having bikers and pedestrians on the current Moose Wilson Road.

Topic Question 2:

Alternatives B & C do not work. Closures and Gates do not achieve any environmental goals, they increase the distance from the Park to Teton Village/Wilson, which in turn increases fossil fuel consumption, and more potential wildlife impact on the highway.

Topic Question 4:

A pathway from Teton Village to Moose is a must. It will reduce traffic on the Moose Wilson Road, and will provide more non-motorized, slow, safe travel options.

Topic Question 1:

A bike path connecting Teton Village to Moose is the number one priority. As such, preliminary alternative D is the only acceptable alternative, but is not perfect.

Topic Question 2:

Leaving the road as is just makes people angry. It's too congested to really enjoy any wildlife or solitude, and with the growth of Teton Village, it's only going to get more crowded. It needs to be straightened, paved, and perhaps moved lower into the sagebrush. Leave the existing road as a bike path.

Topic Question 3:

Move the road lower into the less sensitive sagebrush. Pave and make it straighter, to account for increasing traffic. The slow, winding road is annoying to people who want to go slowly and look at nature, always being passed by faster traffic, and it's annoying to the faster traffic that has to continually pass the slower traffic. Nobody is happy. The wildlife is in no way "protected". As is, the road is just terrible. Move it, and then leave the existing road as a pedestrian/bike path.

Topic Question 4:

It's time to connect the airport to Teton Village with a second road. This valley is so crowded right now, and it's only going to get worse.

Topic Question 1:

I believe the addition of a stand-alone bike path is the most important strategy to achieve the purpose of the plan. I also believe maintaining two way traffic is critical. I believe a bike path and 2-way traffic coupled with a transportation management plan that encourages visitors to get out of their cars and on to a bike to experience the park is brilliant. I think this can be accomplished while still maintaining the scenic and rural values of this treasured road.

Topic Question 2:

Closure of the road or a shared pathway and road. Safety on bikes is so important, particularly with children. A shared bike path is not the solution.

Topic Question 3:

A separate Moose-Wilson pathway is a necessity.

Topic Question 4:

I think it is critical to not block or close off this amazing access to the Park. As a mother of three young children living in Wilson, I can't think of a better experience than to be able to ride our bikes from Wilson to Moose and safely enjoy and take in the environmental experiences that section of the Park has to offer. Please further study Alternative D as the preferred alternative.

Topic Question 1:

A

Unfortunately I do not believe any of the alternatives adequately satisfy the needs for this corridor. All of them have a portion of what needs to happen, but they also include actions I feel would detriment the overall use of the roadway. Being that I do believe this is an important access road to keep open, I am forced to opt for option A, which is to do nothing.

Topic Question 2:

B:

No dedicated Bike/Walking path created. Death Canyon parking and facilities don't need to be relocated, just add the parking at the junction, and keep the existing facilities. LSR Preserve parking and gate, would disrupt/eliminate the exploring of the park by visitors who wouldn't want to make a one way trip south, or who may want to explore from Teton Village, but now find their way blocked.

C:

Addition of a gate at north end. No road re-alignment. No dedicated Bike/Walk path. No paving of road. Unacceptable closure of road, which would radically disrupt visitation and use.

D:

Reservation system. No paving. Poor re-alignment that requires two north gates.

Topic Question 3:

Sadly portions of what need to happen are sprinkled through all the alternatives. Starting from the North

entrance:

Take the realignment in A and make the road entry align with Chapel Rd, which would make the entrance behind the entry gates, and utilize one gate instead of wasting resources on two separate gates. Add ALL the parking areas proposed in the various versions, there is such a need that there isn't any way to add too many. Everything in plan D, except the reservation system and the north entrance. Pave the last section of the road, it won't cause more traffic, and will make the experience much more pleasant for all. Restrict the road from commercial traffic, and trucks (more than 2 axles)/campers/trailers.

Topic Question 4:

I really wish I could put in for plan D. Having experienced the woes of what a reservation system can do to a trip, I absolutely can not. Please reconsider the alternatives, and come up with a solution that won't disrupt vacationers and tourists, not to mention the locals, who want to be able to spontaneously visit the park. Spend less money by not needlessly moving entire facilities. Utilize systems that don't require creating multiple systems, where one could take care of all (the entry gates). Above all, make the experience safer, and more enjoyable for bikes, walkers, and drivers.

Topic Question 1:
No bike path

Topic Question 2:
Bike path/more pavement

Topic Question 3:
Road from the south only to Granite.
Road from the north only to Rockefeller Preserve

Topic Question 4:
See below

Comments: To: National Park Service/Grand Teton National Park
Fr: Brooke Williams and Terry Tempest Williams.

Dear Sir or Madam:

We live on the Moose-Wilson Road between the Aspens and Teton Village. Our families have been coming to the Tetons for six generations because of the natural beauty found there. Particularly wildlife. We've spent hundreds of hours watching birds and moose and bears (recently, a Great grey owl!) along the Moose-Wilson Corridor over the years and now, while we use the road as a shorter route to Moose,

we would gladly give that up in favor of protecting wildlife and preserving the experience available to visitors which is unique in the world.

For these reasons we support NONE of the alternatives.

A fifth alternative would be to re-align the road going south from Moose, which would stop at the entrance to the Rockefeller Preserve. The road going north from Wilson would be paved and stop at the Granite Canyon Parking Lot. The Road between Granite and the Rockefeller Preserve would be eliminated, the landscape restored to pre-road conditions.

This road is a problem now because the county has not addressed the increases in traffic that are a result of the growth we're experiencing as more and more visitors sense the need to be in a place where they feel part of the natural system. Business owners, now two or three generations separated from those early entrepreneurs who saw the opportunities associated with a wild, National Park, have forgotten why people come to spend money in Teton County in the first place-the natural beauty and the opportunity to experience wildlife engaged in their natural lives. Any changes in traffic/roads must first and foremost protect the sources of that experience.

As for Bicyclists. We are bicyclists. We've been bicyclists since long before the existence of bike paths. While bike paths make bicycling safer, enough is enough. The county has gone crazy over bike paths and no more are needed. We've not seen the numbers, but observation suggests that a tiny percentage of Park visitors are on bikes. If the expenditures per user were calculated, it would be in the tens of thousands of dollars per cyclist, which seems excessive when much more important budget items get ignored. In this case of the Moose-Wilson Corridor, a separate bike path would suggest that the Bike experience is a higher priority than wildlife. Which is ludicrous.

Fifty years from now, it will not be the bike paths that move and inspire us, but the wildlife that remains in place. This is the era of restoration and restraint. Development and paving more paths for our species only is short-sighted and selfish. We are one species among many. Our national parks honor and respect this extended notion of community.. NO MORE BIKE PATHS>

Thank you for this opportunity to comment on this important issue.

Topic Question 1:

Although I like the improvements to parking areas, I don't think the issue of too much traffic has been addressed.

Topic Question 2:

Making the road any easier to use for purposes other than experiencing that unique segment concerns me.

Topic Question 3:

I would like restricted travel. Just a few cars a day can visit.

Topic Question 4:

Look at the issue again, with greatly restricted access so it is not used as a commute route.

Comments: Please leave the Moose-Wilson road as is. One place in the country can have a slow dirt road.

My favorite story on that road: We were living in Wilson, headed for a meeting in Moose, and using the Moose-Wilson Road. We were behind two cars. I was probably reading, but the vehicle in lead of the three cars was particularly annoying, which resulted in Larry and the guy in front of us gesturing and yelling at each other. The guy in front of us pulled over beside the road and jumped out to further articulate his argument with Larry, and my partner pulled right in behind him, parked and jumped out, ready for the row! I was mortified! "A fist fight in the park," I thought. "Oh, that'll be good for our NPS-vendor business."

So while I huddled in the van, the two males loudly discussed their thoughts and views on driving and the Moose-Wilson Road, and lo and behold, they proceeded to talk, laugh and, in parting, shook hands. They both knew it should not be used for travel or commuting.

Back in our vehicles, and proceeded. We soon were in the same situation, behind the same Idaho plates, but it was all different. I thought, you know, this could only happen on the Moose-Wilson Road. Things happen at a different pace here, and it is a good thing. Let's keep it a wildlife road, not a crossroad.

Topic Question 1:

I think that the Moose-Wilson Road should be closed to through traffic as proposed in alternative B; however, I believe that this closure should be permanent, not just at peak hours. I think that having the road closed only at certain times is too complicated and will lead to confusion- if the goal is to reduce overcrowding of the Moose-Wilson Road by preventing its use as a commuter route for locals, then a full-time closure certainly will be more effective.

I think that rerouting the two sections on the north end of the road as proposed in several alternatives makes sense, because this will move traffic away from sensitive habitats.

Finally, I think that moving the Death Canyon trailhead to the White Grass Road junction, as proposed in Alternative B, is a good idea. The road to the current trailhead deteriorates severely after it turns to dirt, and moving the trailhead will make Death Canyon more remote and more desirable as a hiking destination.

Topic Question 2:

I feel strongly that a separate multi-use pathway would be to the great detriment of the Moose-Wilson corridor. Constructing such a path would create an effective barrier to wildlife stretching from the outside of the existing road to the outside of the new pathway; the small strip of habitat between the two would be fragmented to such a degree that large animals would be unable to use it. Because this route transects the transitional zone between the mountain uplands and the river, it is already a barrier to wildlife movement; no development that makes this corridor harder for animals to cross should be pursued. There are plenty of existing bike paths in Jackson Hole, and this is a location too valuable in other aspects to be

commercialized solely for bicyclists' benefit.

I also think that the unpaved section of the Moose-Wilson road should not be improved. This serves as a natural deterrent to excessive travel; paving it would only encourage folks to drive faster. I also believe that improving this section would encourage pro-development interests and open the door to further expansion of the route in the future.

Topic Question 3:

Although I understand how controversial this approach is, I think a one-way road with the other lane converted for bicycle use would accomplish the same ends as closing the road to thru traffic, with the added benefit of providing a safe route for cyclists. Either way, I believe that the Moose-Wilson road should be managed to reduce the amount of use it receives, especially by commuters and those who are using it for purposes other than recreation and wildlife watching. This will not happen if the road is left open to thru traffic going both directions.

Topic Question 4:

The Park Service cannot afford to mess this decision up. I realize that there are powerful interests backing an expansion of the Moose-Wilson road and the construction of a separate multi-use path, but it is the job of the NPS to protect our public treasures and manage them in a way that is beneficial to the public, not to help the millionaires and billionaires living in Jackson commute to the airport. Any significant expansion of the facilities along the Moose-Wilson corridor would be disastrous for the ecology of the area, which is unique in its wildlife viewing opportunities, lack of development, and solitude. There are plenty of other parts of Grand Teton and Yellowstone National Parks which are well-developed and provide trails, interpretive signs, picnic areas, handicap accessible activities, and the lot; please protect this unique section of the park and don't commercialize it as has been done to much of the rest of the park. If the Park Service is serious about protecting the lands over which it holds stewardship, it will realize that further development of the Moose-Wilson corridor is shortsighted and would jeopardize the very qualities that make GTNP spectacular, valuable, and unique. For the good of the park and its wildlife, the people of Wyoming and United States, and the millions of citizens of the world who have visited or will visit Grand Teton, please protect the Moose-Wilson corridor from development and exploitation.

Correspondence Text

Topic Question 1:

I need to start by saying I actively use the Granite Canyon/Poker Flats trails once a week for the last 20 years. I am very familiar with both the trails and road.

I enthusiastically support the Wildlife of the area and preserving the existing character. Short of closing the area to all mechanized travel, I support the following:

No separated bike path

No paving southern portion - slower speeds for cars

I support parking improvements, northern realignment and entrance station changes if the Park Service believes it is in the best interest of the wildlife

I could support closing to autos one or two days a week in summer as a compromise to pathways supporters - but all mechanized use must be limited to the road - this is what the animals expect. The volume of cars is less of a concern to me, as it promotes slower speeds and is more of an inconvenience to the humans who rarely venture beyond the road.

I support minimal changes because this is the one road on the west bank where I do NOT see carcasses every week, year-round.

Topic Question 2:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

NO SEPARATE PAVED BIKE PATH = increases wildlife impacts
NO PAVING UNPAVED SECTION = increases speed and negatively impacts wildlife

Topic Question 4:

Allow the historic trails in the area to remain for use by non-mechanized travel. Take the resources currently being used to eliminate them, instead, to restore health to these trails. The impact to wildlife of non-mechanized trail use in the area is minimal as I have observed consistently over the last 20 years.

Comments: WILDLIFE IMPACTS MOST IMPORTANT
MINIMAL CHANGES TO ROAD
NO SEPARATE BIKE PATH

Topic Question 1:

Gates and reservation system to limit visitation during peak periods.
Rustic, unpaved pathway.
Reroute to avoid key habitat.
Pave and narrow existing dirt portion.

Topic Question 3:

Rustic, unpaved pathway separate from road. Sort of an improved mountain bike type path, wider in some areas out in the flats, narrower in the trees and areas of key habitat. Allows for cross-bikes and younger riders. Far less impact than a paved pathway. Preserves rustic, rugged character of the corridor. Limited motorized traffic and paving the dirt portion would allow fit road bike riders to continue to use the existing road.

Comments: Thank you very much for the opportunity to be part of a very challenging management issue for GTNP. I value your commitment to an open process. Your four draft alternatives provide good options. Some combination of the four should meet the seven goals and desired conditions of the Moose-Wilson Comprehensive Management Plan.

In general:

â€¢ Protect critical habitat by rerouting as suggested in Alternatives B and D (though the map for D isn't drawn such that it reflects what's written).
â€¢ Limit private vehicle visitation through the use of a reservation system and active management at entrance gates.

â€ Enhance the visitor experience by providing for a contiguous human-powered experience of the Moose-Wilson Corridor. This could be an unpaved 'rustic' trail/pathway that accommodates younger riders and cross-bikes.

First, I quibble with your use of 'recreation' in alternative D, as recreation has many shades of gray- sometimes 'recreation' is almost purely for exercise while sometimes it is almost purely for leisure while other times it is almost purely for interacting with and observing nature. A recreational drive is as much recreation as a recreational hike or bike ride. Unless using the road purely as a commute, motorized visitors are recreating as they drive the corridor, even when they don't stop

The overarching question is how to balance visitation (largely for recreation) of the corridor with the protection and restoration of its natural functions, habitat and wildlife. In terms of the preliminary alternatives, the preeminent management issue is balancing goals 3 and 7 of the management goals and desired conditions.

As for natural resources, it's clear from other heavily visited areas in the park that the 'natural function, diversity, complexity and resiliency' (goal 3) of park natural resources are impacted by heavy visitation.

As for visitor experience, it's clear from the LSR Preserve that 'meaningful opportunities to experience and enjoy the rustic character and diverse ecosystems' (goal 7) of park natural resources are improved by allowing human-powered visitation and by limiting access-accomplished at the LSR Preserve through limited parking and active management.

Unfettered motorized visitation proves a threat to the corridor. Gates at either end and a reservation system implemented during peak periods of visitation are key elements in maintaining traffic levels at or below a level that protects both resources and the visitor experience. Rerouting the road away from the richest habitat also appears to be critical for balancing management goals. Transit should be developed in whatever mode the park is able to best accommodate (private concessionaire, partnership with Teton County, some combination).

I believe the human-powered experience of wild ecosystems is far richer than a motorized experience. Physical exertion heightens awareness. Under human power, all portions of the corridor provide an opportunity for close inspection of its rich resources-whether of its flora, fauna or geologic wonders-not just those where one happens to pull off the road. There are many good reasons to encourage and incentivize the human-powered experience of nature. It's not only a more visceral and arguably more memorable experience, but also a healthier experience.

Current conditions (Alternative A) make human-powered travel along the road (whether by foot or by bicycle) at best unpleasant (manageable by adults) at worst dangerous (for families with children). Other human powered experiences include short walks from cars parked at various sites along the road-some improved, many not-or to longer hikes at the LSR Preserve or up canyons, all of which are almost entirely accessed via motorized travel for reasons expressed above. There is not one clearly established route for experiencing the length of the corridor under human power. I believe there should be.

Does the human powered experience require a paved pathway and the commensurate impact on the land? Perhaps not. I believe it's worth examining in the final round of alternatives an improved mountain-bike type trail/pathway (call it a 'rustic pathway'). Many multi-purpose trails exist in the public land around the towns of Jackson and Wilson and accommodate a mix of hikers, joggers, bikers and horseback riders. These trails have far less impact on the land than a full-on paved pathway. The trail could be semi-

improved where needed to accommodate younger riders and cross-bikes. It could vary in width, wider in the flats, narrower in the trees and near the more important habitat. It would preserve the rugged and rustic character of the corridor. Competent road bike riders out for exercise would probably still ride the road, especially if the dirt portion were paved and motorized visitation was limited to a reasonable level (early 2000's type level?).

Another option might be to pave one half of a trail, allowing families with children to bike from one end (perhaps the south end where parking at Teton Village is feasible) to the LSR Preserve and back. The ultimate route of the pathway should be flexible in order to best avoid areas of potential wildlife-human interaction and wildlife habitat.

Other suggestions:

• Pave and narrow the existing dirt portion.

• Don't groom in winter.

• Commercial use otherwise the same as Alt. D.

• Relocate the Death Canyon Trailhead closer to White Grass Ranch to serve both the trailhead and ranch visitors.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

I support Alternative D as the preferred choice because the components are the most natural choice to solve the problems of safety for all entities involved: motorists, wildlife, users of non-motorized vehicles, pedestrians, etc.

Comments: The death of two cyclists in Grand Teton National Park is two too many.

Correspondence Text

Topic Question 1:

While Alternative D comes closest to achieving the mountain's goals of continued access and safety, there are a few qualifiers, but we support retaining the slow, narrow, rural, two-way character of the existing road. The northern section of the road should be realigned as in Alternative D. Death Canyon and White Grass cabin's access should be combined similar to Alternative D. We strongly support non-motorized utilization of the corridor. From a completion of the Park pathway to a safety emphasis, the benefits are indisputable. We support a separated pathway along the entire road alignment from the South Entrance Stations up to a connection with the existing pathway at Moose. Adaptive Strategies specific to bicyclists should be developed and implemented specifically toward resource and wildlife interaction. We stand ready to participate with the National Park Foundation and other private sector individuals to address capital and operations funding for the pathway.

Topic Question 2:

Alternatives B & C would not work as they contain gates and closures which would shift or increase the number of vehicle trips are wide. Alternative A, with no action, is not the right solution as it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Topic Question 3:

Road

- The unpaved portions of the road should be considered for paving but only if desired from a maintenance perspective
- The northern section of the road should be realigned as in Alternatives B and D

- Combine the Moose entrance stations as in Alternative B
- Pullouts should be constructed and maintained
- Road opening in the Spring and closing in the Fall should remain similar to current policy
- Given the winter utilization by Nordic skiers and snow shoe users consider grooming strategies

Bicycle Pathway

- The Park should not be constrained in siting the pathway within 50 feet of the road. Tree removal should be considered along with existing open areas, particularly south of LSR

Adaptive Strategy

- We share the advocacy of limiting the capacity of the road during peak periods through smart traffic strategies that allow for future technological improvements
- We concur that elimination of most commercial traffic is desired
- We support utilizing small appropriately sized vans to encourage transit along and through the corridor. Vehicles should be equipped with bike racks
- We support and encourage a park and ride or park and bike location near the north and south end of the corridor
- We would support working with the Park on the creation of a Park/Ride/Bike that could include an interpretive element at Teton Village

Topic Question 4:

Thank you for the opportunity to comment on the preliminary alternatives for the Moose-Wilson Corridor. Jackson Hole Mountain Resort (JHMR) with Teton Village Association and residents have been active in this important decision making process for over eight years. We have done so from the perspective of environmental sustainability supported by our ISO 14,001 certification which is shared by only one other ski resort in the U.S.

First, let me say we appreciate the way in which the alternatives are presented. Further, and potentially, the Adaptive Management Strategies create an opportunity for partnership to develop together mitigation to achieve the desired goals. Please consider JHMR along with Teton Village as an active and willing partner in achieving reasonable goals that embrace a shared vision.

In closing, JHMR supports Alternative D as modified. We look forward and accept the challenge to assist in the development of effective adaptive management strategies perhaps with a Visitor/Eco-Education and Interpretive Center in cooperation with Grand Teton National Park.

Comments: September 15, 2014

Mr. David Vela
Superintendent
Grand Teton National Park

Re: Moose-Wilson Corridor Alternatives

Dear David,

Thank you for the opportunity to comment on the preliminary alternatives for the Moose-Wilson Corridor. Jackson Hole Mountain Resort (JHMR) with Teton Village Association and residents have been active in this important decision making process for over eight years. We have done so from the

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

perspective of environmental sustainability supported by our ISO 14,001 certification which is shared by only one other ski resort in the U.S. On the ground these policies, including windpower and transportation demand strategies, have made a difference in our community.

First, let me say we appreciate the way in which the alternatives are presented. Further, and potentially, the Adaptive Management Strategies create an opportunity for partnership to develop together mitigation to achieve the desired goals. Please consider JHMR along with Teton Village as an active and willing partner in achieving reasonable goals that embrace a shared vision.

While Alternative D comes closest to achieving our goals of continued access and safety, I want to couple that with qualifiers. Contrary to recent rhetoric about Teton Village experiencing "out of control growth" an accurate account of history will show a reduction in mountain capacity and a downzoning from early Teton Village plans. As a result of substantially upgraded mountain and Village infrastructure recent success has put Teton Village in a better position financially to be an active participant in traffic management and other strategies.

Road

We support retaining the slow, narrow, rural, two-way character of the existing road.

- The unpaved portions of the road should be considered for paving but only if desired from a maintenance perspective.

- The northern section of the road should be realigned as in Alternatives B and D.

- Combine the Moose entrance stations as in Alternative B.

- Pullouts should be constructed and maintained.

- Death Canyon and White Grass cabins' access should be combined similar to Alternative D.

- Road opening in the Spring and closing in the Fall should remain similar to current policy.

- Given the winter utilization by Nordic skiers and snow shoe users consider grooming strategies

Bicycle Pathway

We strongly support non-motorized utilization of the corridor. From a completion of the Park pathway to a safety emphasis, the benefits are indisputable.

- We support a separated pathway along the entire road alignment from the South Entrance Stations up to a connection with the existing pathway at Moose.

- The Park should not be constrained in siting the pathway within 50 feet of the road. Tree removal should be considered along with existing open areas, particularly south of LSR.

- Adaptive Strategies specific to bicyclists should be developed and implemented specifically toward resource and wildlife interaction.

- We stand ready to participate with the National Park Foundation and other private sector individuals to address capital and operations funding for the pathway.

Adaptive Strategy

- We share the advocacy of limiting the capacity of the road during peak periods through smart traffic strategies that allow for future technological improvements.

- We concur that elimination of most commercial traffic is desired.

- We support utilizing small appropriately sized vans to encourage transit along and through the corridor. Vehicles should be equipped with bike racks.

- We support and encourage a park and ride or park and bike location near the north and south end of the corridor.

- We would support working with the Park on the creation of a Park/Ride/Bike that could include an interpretive element at Teton Village.

In closing, JHMR supports Alternative D as modified. We look forward and accept the challenge to assist in the development of effective adaptive management strategies perhaps with a Visitor/Eco-Education and Interpretive Center in cooperation with Grand Teton National Park.

Sincerely,

Jerry Blann
President

Topic Question 1:

I am not familiar with all the plans, but I would suggest paving the rest of Moose Wilson Road and leave as is. We have been coming here for 7 years and actually bought a house in Bondurant. It would be a tragedy to do anything to endanger the surrounding area or wildlife.

Topic Question 2:

To widen the road or put in a bike trail would be a bad idea. With the bears and traffic, there would be an accident waiting to happen with the bikers. I'm sure someone would get hurt or killed. They have enough biking trails in other areas.

Comments: I just hope the beauty and importance of the Moose Wilson road is not ruined.

Topic Question 1:

Strategy D is the most acceptable with a couple of major exceptions. You MUST pave the unpaved section of the Moose-Wilson Road. This is imperative to safe driving and low maintenance. The current road potholes badly after every rain storm. The so called Dust management treatment is totally ineffective and shuts the road several days during prime season. The second exception is the adaptive strategy of the reservation system. The park service has a poor record at effective reservation systems that are customer friendly. This could be done with a cell phone app and a license plate camera/gate to let reservations in.

Topic Question 2:

Alternative A just lets the situation to continue to get worse in every way.

Alternative B ignores the fact that the Moose-Wilson south entrance in the principal entrance for through traffic to the park. Blocking the road is a major problem for the thousands of people who stay in Teton Village and the Aspens and want to go elsewhere in the park.

Alternative C has the same problem as "B" plus it leaves the road unpaved and leaves out the important realignment of the road at the north end.

Topic Question 3:

You did not offer public transit in the corridor for people who choose to use it as a destination rather than a through route. A shuttle service between either end that stops at overlooks and trail heads would be a great way to reduce parking problems.

Topic Question 4:

The whole program seems to try and treat the Moose-Wilson corridor as a destination only rather than a

through route to the rest of the park. For thousands of people staying along the road it is the principal entrance to the park and a THROUGH route to the other equally special places in the park. Acceptance of this is vital to having a solution to the current problems. It is critically important to pave the entire road whatever you do.

I do not feel any proposal solves the Death Canyon access problem. Alternative D addresses this best BUT the problem is that gravel/dirt roads pothole disastrously whenever it rains and it rains EVERY afternoon in the summer. I think you need to seal it to the Whitegrass trailhead.

Comments: I live in Teton Village full time. The south entrance of the Moose-Wilson Road is my principle access to Grand Teton National Park. I use the south entrance several times a week to recreate in the park. I enter mostly by car, sometimes by bicycle and also via foot and in the winter skiis. Bicycle access is EXTREMELY hazardous due to the road not being paved. I would access by bicycle more if the road was paved and/or there was a paved bike path.

I am distressed to note the park seems to consider the Moose-Wilson Road as a destination unto itself rather than access to the rest of the park. I feel the plans should accept the THROUGH nature of the corridor and incorporate destination strategies as well. Closing and restricting are not acceptable solutions. The Teton Village area is growing bringing more and more tourists to the area and these tourists will use the corridor as their PRIME access to the greater park. Ignoring this fact is foolhardy in the planning process as you would be going against the tide.

Topic Question 1:

1. limiting the amount of traffic and the speed.
2. Reduce impact on Wildlife
3. Allow the area to retain it's historic characteristics.
4. Provide a more primitive experience than other parts of the park provide. This is one part of the Park that can allow visitors the chance to experience the wonderful benefit of nature without extensive human intervention. It can give visitors the opportunity to experience a semi-wilderness environment that many would never otherwise see. I have spent a lot of my life in the mountains of the west. The time I have spent there has greatly enriched my soul. I feel extremely luck to have had those experiences and would like everyone to have the opportunity to do the same. The vast majority will never be as lucky as I have been but they can experience it in a small way along the Moose Wilson Corridor if that area is maintained and enhanced as a more primitive area and not allowed to become a short cut for those that main goal is to get from point A to B as quickly as possible.

Topic Question 2:

1. Bicycle paths that are not along the road. It is not in keeping with that area of the park and will take away from the experience for the vast majority.
2. Allowing taxi's. Commercial transportation use, including trucks, should not be allowed in National Parks Guides with proper permits are different.
3. Realignment with the main goal being improved traffic flow. My feeling is that the road should require you to drive slow and be aware of the surroundings. Good design would open up the vistas and wildlife viewing areas in way that would be a surprise and imprint the majesty of the Park in our minds.
4. Closing the road two days a week. This will lead to confusion and frustration by those that are unaware

and are denied access. A reservation system may be necessary in the future but probably not now.
5. No action. Traffic is horrible and dangerous. What should be a highlight of a visit to the Park can turn into a frustrating and stressful experience.

Topic Question 3:

I didn't see one way traffic as an alternative. To me that, combined with some of the low impact strategies, makes sense. I know that a great deal of this discussion is being driven by business interests. I have owned a successful business in Jackson for 25 years. I first visited the Park in the 1940's as a small child and have had a love affair with The Park and Jackson Hole ever since.

One way traffic would, in my opinion, be positive for all business interests. I am aware that there are those in both town and Teton Village that feel that wider and bigger with a bike path will improve business. I fail to see how. improving the road to increase capacity may make it easier for Teton Village residents and visitors to get to the interior of the park but on the other hand if the road was one way those that wanted to see the Moose Wilson Corridor would be exposed to both the Village and Town.

Topic Question 4:

Thanks for the opportunity to comment. This decision is one that I feel will have a tremendous long term affect on the Park and Jackson Hole. Please don't let the short term interests of those lobbying so hard for a pathways and a bigger road be the deciding factor. Once you go down that path it is not reversible. Short term gain at the expense of long term benefit is folly. Grand Teton National Park is the main reason we are all here. The Rockefeller vision saved this valley. Their resources, combined with the thoughtful passion of many, has protected the natural wonder of this place. More is not necessarily better. In this case it defeats what defines us. This is not a place to try and bring crowds. The Moose Wilson corridor can be the gem of the park if we don't love it to death and/or treat it as a transportation corridor.

There are places in the park that are already designed for a lot of people. The project that the Grand Teton National Park Foundation is doing to improve the trails at Jenny Lake will make it easily accessible to most visitors and is appropriate for many reasons. Jenny is so crowded that a parking space is tough to find for most of the year. Having a venue with trails that can be easily navigated by the vast majority of those that visit the Park is important. It allows large numbers to experience the wonders of the Tetons as efficiently as possible.

The wilderness is wonderful for those that take the time and have the ability to reach it. Most will never know what that means. The Moose Wilson corridor can be the bridge between the Jenny Lake experience and the Wilderness.

Jackson Hole is one the of truly magic places in the world and Grand Teton National Park is the heart of Jackson Hole. I'm glad that The Park Service is doing such a thorough and thoughtful job of weighing the alternatives before making changes that will have long term affect on the Park Experience.

Topic Question 1:

Thinking best with Alternative D since it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values , benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of a car.

Topic Question 2:

Gates and closures- B and C don't work. The negative impact of shifted or increase traffic is bad for the environment and bad for wildlife.

Topic Question 3:

A separate Moose-Wilson pathway is a safety need, not a want.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

Alternative A is not the right answer since it does nothing to help wildlife by reducing traffic levels or managing traffic flow.

Subject: Jackson Hole Conservation Alliance's Comments on the Moose-Wilson
Corridor Comprehensive Management Plan Preliminary Alternatives

Dear Superintendent Vela,

The Jackson Hole Conservation Alliance (Alliance) appreciates the opportunity to provide comments on the preliminary alternatives for the Moose-Wilson Corridor Comprehensive Management Plan (plan). The Alliance has a long and positive relationship with Grand Teton National Park (park) and we look

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

forward to working with the park through this process to develop a plan that effectively protects park resources and wildlife, while enhancing the visitor experience.

Below, we answer the four questions posed in the preliminary alternatives newsletter. These guiding beliefs motivate our answers:

Guiding Beliefs

â€¢ The Moose-Wilson corridor (MWC) is a unique part of the Greater Yellowstone Ecosystem and Grand Teton National Park that harbors a diversity of wildlife, habitats, streams, rivers, and scenic resources. It provides an unparalleled chance to experience some of Grand Teton's most spectacular wildlife, habitat, and scenery. The National Park Service has an obligation to protect and preserve these resources and must focus their efforts on doing so.

â€¢ The Moose-Wilson Corridor Comprehensive Management Plan should focus on long-term protection for wildlife and habitat in the Moose-Wilson corridor while making it easy and safe for people to visit this unique area on foot, bicycle, or public transit.

â€¢ The Moose-Wilson corridor is not a transportation corridor for people trying to drive across the county. It is a special place to visit in Grand Teton National Park because of its rich wildlife habitat and abundant recreational opportunities. It is not the park's job to manage county transportation needs.

In addition to our comments on the preliminary alternatives, which follow at the end of this letter, we would also like to comment about the park's goals and desired conditions for the Moose-Wilson corridor.

Description of Desired Conditions for Park Goals

We agree with the park's goals and description of desired conditions for each goal - these accurately capture the state of valuable natural resources in the corridor. We urge the park to explicitly articulate objectives and indicators in relation to desired future conditions. These objectives and indicators will be essential in any adaptive management framework and can be developed with both hard and soft triggers for action. Below, we provide some thoughts that could help guide the development and choice of objectives and indicators.

First, the park seeks, "scenic vistas...to provide visitors with opportunities to be immersed in the intimate natural settings of the corridor which are not diminished by development and continue to foster a sense of discovery."

Is it possible to identify how such scenic vistas will be characterized? At what level of development (e.g., width of road pavement, utility lines, infrastructure development, signs, park facilities, miles of roads, number of cars, etc.) will the natural settings of the corridor begin to become diminished?

Second, the park aims to have, "ecological integrity and processes including natural changes and disturbances, remain unimpeded." Specifically, what are the key ecological processes that the park has identified in this corridor - migration and connectivity, stream and river flows, disturbance regimes? How will the park evaluate the levels of human use (traffic, biking, hiking, etc.) in the corridor that do not adversely impact ecological processes?

Third, the park seeks to ensure that, "individual species and plant and wildlife communities function at natural levels of diversity, distribution and complexity with little human disturbance." The Moose-Wilson corridor supports a wide diversity of several species of local, state, and national conservation concern (from grizzly bears to boreal toads). How will the park continue to monitor the abundance and diversity of these species and their ecological function in the light of increasing human impacts in the area? It is

scientifically challenging to unequivocally demonstrate that human uses are having impacts on wildlife, habitat, and ecological processes, especially within localized areas that are part of larger ecosystems. Please take a precautionary approach to managing human impacts so that we continue to protect wildlife and habitat in the corridor.

Fourth, the park aims to provide visitors with the opportunity to, "understand and appreciate the importance of natural soundscapes and acoustic resources." What level of anthropogenic noise will be tolerated in the corridor? Additionally, recent research shows the significant negative effects of road noise on songbirds. Consider such findings while developing objectives and indicators for managing the natural soundscape of the corridor.

Further, please relate how specific management strategies will help achieve desired future conditions. This will provide a clear rationale for management actions and make it easier to choose those actions that will protect wildlife and habitat while also making it easy and safe for visitors to enjoy and experience the Moose-Wilson corridor.

Overall, by outlining objectives for the corridor, the park can effectively analyze and communicate which strategies help us meet those objectives. Finally, it provides some framework for a comprehensive analysis of the impacts (on all park natural resources and visitor experience) of all strategies.

Analyses of Impacts

Thorough analyses of the strategies proposed in the preliminary alternatives, as well as the strategies that will be considered in the Draft EIS, will provide the facts and data necessary to make informed choices about how we provide appropriate opportunities for visitors to use, experience, and enjoy the corridor while protecting the park's nationally significant resources.

Analyses must consider all of the impacts of proposed actions on the goals and desired future conditions that the park has described. As required, impact analyses must also consider the cumulative effects of any proposed actions.

In particular, we ask the park to analyze how human actions in the corridor, including road traffic and visitors, will affect wildlife habitat, animal behavior, movements and ultimately populations. For instance, there is abundant recent research on the effects of roads on grizzly bears - road density is a significant predictor of increased bear mortality in the Greater Yellowstone Ecosystem. Increasing human use of the corridor, while a positive development from a visitor use perspective, may have negative effects on wildlife. Research from Yellowstone has shown that human activity can displace grizzly bears from prime foraging habitat, with potential negative consequences for bear populations. More generally, how will increased human activity in the corridor affect populations and habitat use of other carnivores such as cougars, lynx or wolverines? We do not know if the Moose-Wilson corridor serves as a connectivity corridor for some of these species, which are of significant conservation concern.

Road and traffic noise also impact avian habitat use. Recent research has shown that road noise can significantly reduce songbird abundance. At a finer scale, road and traffic noise can change species' foraging or anti-predator behavior. If new construction is planned, will the clearing of trees affect cover for nesting of birds?

The presence of the road, and associated human motorized and non-motorized use, can also significantly affect wildlife movement leading to a loss of functional habitat connectivity. More generally, the effect of

roads on habitat fragmentation is well documented.

We ask that the park consider the impacts of the road broadly to include not just the presence of the road, but aspects about its short and long-term use. Several recent scientific articles, including by National Park Service scientists, suggest frameworks for comprehensively considering road impacts (construction, presence, and use) on ecological processes and species populations.

The park has also proposed several strategies in the preliminary alternatives that require adaptive management. The Draft EIS must include appropriate hard and soft triggers for the various adaptive strategies. These triggers must be clearly related to the park's desired future conditions.

Finally, given the long-term nature of this planning effort, the park should attempt to consider both the immediate and ultimate impacts to park resources of any management actions. The EIS analyses should also consider the future impacts of climate change on the corridor and how the Comprehensive Corridor Management plan will ensure ecological integrity and resilience in the corridor to withstand these predicted impacts in the long run.

Lacking these analyses at this point, we are making our recommendations based on currently available preliminary information and what we believe will most effectively leave the wonders of the Moose-Wilson corridor unimpaired for future generations.

Comments on the preliminary alternatives

Question 1:

Which strategies in the preliminary alternatives do you think should be carried forward to best achieve the purpose and address the need for the plan? Why do you think they should be carried forward?

Please carry forward these particular management strategies for further analyses:

• The park should further research all strategies for traffic management in alternatives B, C, and D including limiting through traffic, hourly limits on traffic, and a reservation system.

• The park and almost all constituents agree that traffic is the critical management issue for the corridor. The park should aggressively investigate all methods to reduce traffic and ensure that all vehicular traffic entering the corridor has to pass through a fee station.

• Recent research commissioned by the park has shown that about 2,000 cars use the corridor per day during peak periods. In addition, a significant portion of these cars spend less than an hour in the corridor. These traffic patterns do not conform to the corridor being used primarily as a visitor destination. The park should seek traffic management strategies to reduce the total number of cars in the corridor while encouraging increased length of time each vehicle/group of visitors spends in the corridor to fully experience and appreciate the natural wonders of the corridor.

• The Strategy presented in Alternative B to make the Laurance S. Rockefeller Preserve (LSR) a destination and prevent through traffic is worthy of further consideration, despite the additional impacts of creating an additional road and parking facilities. Please evaluate if this is the least impactful way of managing traffic, while encouraging visits to the LSR Preserve.

• Examine the short and long-term impacts of paving the southern section of the road. While a gravel road may discourage traffic, its impacts in terms of dust and dust-reducing chemicals may, in the long term, be no greater than paving a narrow section of the road in a manner that preserves the rustic character of the road.

• The 2007 transportation plan included a decision to realign part of the northern section of the road away from sensitive wetland habitat. We assume that present conditions with respect to this decision still

warrant realigning the road. Further, realigning the northern entrance of the road (near the Murie Ranch section) to be behind the park entrance station would move the road to less sensitive habitat and reduce the road obstruction for a critical wildlife movement corridor along the Snake River.

â€¢ The recent report from Utah State University suggests one major impact from traffic is the large number of, and impacts from, visitor created parking along the Moose-Wilson Road. By creating a number of pullouts and strategically preventing visitor-created parking using design features in least impactful places, the park can provide ample visitor opportunity to stop and watch wildlife while also reducing traffic impacts, if the park continues to allow auto access. All alternatives contain management options for creating pullouts. We urge a balanced number and location of pullouts that meet visitor expectations while limiting impacts to habitat along the road.

â€¢ The park should consider strategies that make it safe and easy to visit the Moose-Wilson corridor by bicycle. In so doing, the park should evaluate the potential for harmful encounters between bicyclists and wildlife, especially in a densely forested area with limited sightlines. Appropriate strategies to manage these encounters must be developed to ensure the safety of visitors and park wildlife.

â€¢ The park should consider all strategies to limit commercial use of the corridor by taxis and similar transportation services as indicated in Alternative D. The Moose-Wilson Road is not a county transportation corridor. It is a park destination.

â€¢ Commercial interpretive tours that focus on providing visitors with an experience of the wildlife and habitat in the corridor such as wildlife tours, horseback or bicycle tours, may be allowed to continue in a way that manages for impact, as with all other human activities in the corridor.

â€¢ We encourage the park to strongly consider managing the Death Canyon trailhead using the strategy specified in Alternative B. This reduces impacts of visitors along the unpaved section of the road, while allowing ample visitor access to trails and hiking opportunities. Please use the data from the recent studies by Utah State and Penn State to justify and choose the smallest feasible size of the parking lot. Is a parking lot for 60 cars really necessary? This represents a peak number only met for a few hours each day during a brief two-week window, as suggested in the recent Utah State Study.

â€¢ The ungroomed section of the road from Granite Canyon to Death Canyon provides excellent cross-county and back country skiing opportunities. We urge the park to continue evaluating strategies that retain this ungroomed section, regardless of whether the northern parking lot is moved to the Sawmill Ponds, Murie Ranch or the Death Canyon trailhead.

â€¢ Preserve and maintain a great experience for visitors to enjoy and appreciate the natural beauty of the corridor. Maintain the rustic, rural and intimate character of the road. Limit any additional impact to the road and corridor from visitor traffic. The corridor is a prime destination well known locally and nationally as a unique park destination. Management strategies should preserve and maintain the existing character - intimate wildlife viewing opportunities and a rustic, rural road - that make the corridor such a wonderful destination. We prefer strategies that dial back impacts and maintain the goal of self-discovery for visitors. Too many established vista points and visitor services along the corridor will impair the natural, intimate character of the road.

Question 2:

Which strategies in the preliminary alternatives do you think would not achieve the purpose and address the need for the plan? Why do you think they should not be carried forward?

The critical management issue confronting the Moose-Wilson corridor is the increasing human impact in the area, primarily from vehicle traffic. The park must minimize any additional human impacts on the corridor by maximizing the use of existing assets so that traffic is reduced while making it safe and easy for people to visit and enjoy the corridor on foot, bike, or transit.

Given that traffic management is the single biggest issue for the Moose-Wilson corridor and the biggest

impact on both the park and visitor experience, please do NOT carry forward these particular management strategies:

â€¢ No Action is not a feasible option, even though we recognize that it must be analyzed. Doing nothing does not alleviate the critical issue of the number of cars on the Moose-Wilson Road.

â€¢ In addition, several of the alternatives call for adaptive traffic management plans, including closing the road at peak times or hourly limits. While attractive in theory, implementing these strategies may present significant management challenges; for example by creating traffic bottlenecks and putting park personnel in a position to refuse visitors entry that may result in visitor conflicts. These situations may result in negative and unintended impacts to traffic and visitor experience. The park should deeply examine which of these traffic management strategies are feasible and how they can be simplified for management and visitors. For example, the park may consider limiting through traffic for the entire duration of the peak season, say from July 1st to August 15th, rather than attempting to manage traffic on a daily or hourly basis. Despite being more intrusive, simple decisions may be easier to communicate and manage than more complex strategies, making it easier to manage visitor experiences.

â€¢ Alternatives A and C do not propose to realign the northern section of the road away from sensitive wetland habitats. We believe that factors calling for realigning the road as proposed in the 2007 plan still hold and the road should be realigned away from sensitive habitats. The old roadway should be restored to natural conditions.

â€¢ Alternatives A and C allow taxis to use this corridor. The Moose-Wilson Road is not a transportation corridor; it is a park destination. We do not believe taxi transport is in line with park's objectives. Only commercial activities in line with using the Moose-Wilson corridor as a park destination, for instance, interpretive wildlife tours in vehicles, horseback tours or biking tours, should be considered within such a corridor.

â€¢ Grooming the road during the winter is an unnecessary impact. Please do not continue this strategy. Opportunities to ski the road in its ungroomed state are adequate, and may even be more desirable and in line with the corridor as a wild destination.

â€¢ The corridor is a prime destination for visitors locally, nationally and internationally. Strategies must be taken to provide visitors with adequate opportunity to enjoy and experience this corridor by foot, bike, or transit.

â€¢ The park's primary goal is, and must be, to protect the wildlife and habitat resources of the corridor. Strategies that entail any additional impacts on the corridor need to be adequately justified as bringing us closer to a long-term vision of protecting the natural resources of the corridor unimpaired for future generations.

Question 3:

Are there other strategies that should be included in the preliminary alternatives that are not already presented? If so, which strategies and why should they be considered?

As mentioned previously, traffic management is the single biggest issue for the Moose-Wilson corridor as vehicle traffic has the biggest impact on both park resources and the visitor experience.

Therefore, please consider the following additional strategies:

â€¢ More aggressive strategies to reduce vehicle traffic flow through the corridor including:

- o The adaptive management strategies approved in the 2007 transportation plan - already studied and approved - should at a minimum be re-examined. For example, the park had proposed to study the effects of making the road one-way. This may allow accommodating traffic and bicyclists along the existing pavement. Why is this strategy not being further explored?

- o In addition, the park should consider options for redesigning and re-engineering the road in a manner that would physically limit vehicle speeds to under 15 mph, using speed bumps, dips and appropriate

signage. This would discourage short cut trips through the corridor and further encourage use of the corridor as a visitor destination. Park objectives should be to reduce the number of cars in the corridor while increasing the visitor time spent within the corridor to experience and enjoy it.

- o Closing the road at certain times of day, say from dusk to dawn, in order to minimize the impacts of vehicular and other human traffic on wildlife. Closing the road at night provides a clear message that the road is not a transportation corridor, but only a park destination, and would not interfere with park visitor wildlife viewing experience. It would also be good for wildlife.

- o The park should more explicitly consider strategies that encourage people to leave their cars and visit the corridor using human-power. The preliminary information from the Utah State Study shows that a majority of visitors to key destinations in the corridor did not ever leave their car. Providing incentives for people to leave their car and walk, hike, or bike in the corridor makes for a more intimate experience with wildlife and habitat, and fosters greater support of the park in the long-term.

- o The park should explore additional public transit opportunities, like using some type of interpretive tour / transit system that allows people to learn about and experience the corridor while not having to drive a vehicle.

- o Longer-term, we would encourage the park to develop a strategy to provide public transit throughout the entire park. In the future, one should be able to visit Grant Teton National Park without a car.

- o Teton County, Teton Village Association, and START would all be potential local government entities and corporations with whom the park may explore a partnership to provide funding for transit services within the Moose-Wilson corridor and more widely across the park. The park should consider an in-house transit system, managed and operated by the park itself or a park-approved concessionaire.

Question 4:

What other comments or suggestions do you have?

We want to reiterate the fundamental values of the Moose-Wilson corridor and an overarching theme that should guide any park management decision about the Moose-Wilson corridor.

The Moose-Wilson corridor is a unique part of the Greater Yellowstone Ecosystem and Grand Teton National Park that harbors a unique diversity of wildlife, habitats, streams, rivers, and scenic resources. It provides an unparalleled chance to experience some of Grand Teton's most spectacular wildlife, habitat and scenery. The National Park Service has an obligation to protect and preserve these resources for current and future generations and must focus their efforts on doing so.

The park must make it easy and safe for people to visit and enjoy the Moose-Wilson corridor on foot, bike, or any other means. It should not be necessary to have a car to visit the corridor.

It is not the park's job to manage county transportation needs. The Moose-Wilson Road is not a county transportation corridor.

We look forward to a Draft EIS with a preferred alternative that contains aggressive measures to reduce traffic, protect park resources, and makes it easy and safe to visit the Moose-Wilson corridor on foot, bike, or transit.

We look forward to a complete evaluation of impacts on all park resources, both short and long-term cumulative effects, and accounting for climate change. We hope that the park will identify clear management objectives and indicators for the corridor along with hard and soft triggers for any adaptive management strategies.

Overall, we recognize the challenges facing the park in meeting the demands of diverse interests. Ultimately, the park must manage the corridor to meet its stated and legal mandate: protect critical park resources while also making it easy and safe for people to visit and experience this unique corridor with minimal impacts to park resources.

If you have any questions, please do not hesitate to contact us.

Thank you.

Sincerely,
Siva Sundaresan

Topic Question 1:

I support Alternative D. This would be the best use of the Moose Wilson corridor to continue the existing pathway from the Village Road to Moose, connecting the two areas. It would be the least impact on wildlife and the beauty of the area. It would provide locals and tourists to the Valley the enjoyment to beauty of where we live.

Topic Question 2:

The expansion of the road would go against all the principles we all hold so dear to our hearts regarding the preservation of open space and wildlife effects. The closure of the road would only prohibit those that want to enjoy that part of the Park.

Topic Question 3:

Only to keep the building of a pathway quick and efficient.

Topic Question 4:

None.

Topic Question 1:

I believe there are more alternatives than A, B, C, or D. I believe Alternative A best suits the mission of the National Park Service, which is to preserve our lands in a natural state. I believe the corridor should remain in it's present state, and I would support placing restrictions on commercial activity, and would also support all temporary closures ordered by NPS rangers and officials to protect the wildlife during times of high activity.

I strongly support studying an alternate route outside of the GTNP boundaries, such as the construction of a North Bridge to connect Teton Village to the Airport. If done right (with wildlife easements, bridges, tunnels) it would allow for year round use, a paved pedestrian path, and most importantly it would be suitable for commuter traffic, which should not be tolerated on this stretch of road in GTNP. The construction of this bridge is a missing link in our infrastructure, it is crucial for long term planning, and it would alleviate our traffic problems greatly, as well as facilitate mass transit.

Topic Question 2:

I firmly believe that Alternative D is the most detrimental to the park, and would simply encourage even more people and traffic. I do not believe that increasing the carrying capacity of this area would benefit any of the wild lands that were preserved thanks to the foresight of our predecessors. There are plenty of places in this valley to ride a bike on a paved path, and this seasonal road should not be forever compromised simply because it has the support of community organizations such as Friends of Pathways that are well funded and have political ties. I am fully aware that the creation of a paved bike path would be a major project that would permanently alter this area.

I am certain that this congestion problem is strictly related to the fact that there is no alternate route.

Topic Question 3:

Yes, I believe the best long term plan would be to study the possibilities of a North Bridge connector from Teton Village to the Airport, outside of the GTNP boundaries. This would help traffic and mass transit, it would be available to use year round and suitable for commuters. It would be a great way to link the paved bike paths. This new section of road is also about half as long as the 7.7 mile stretch. If this could be achieved, someday the Moose Wilson Road could possibly be for pedestrian use only, which could be a valued attraction for all visitors to the park.

Topic Question 4:

I am thankful that the public's comments are being considered, but I trust the NPS to make this decision. I sincerely hope this decision would be based on preserving the area. I also hope that all other avenues be considered, such as working with WYDOT and our Teton County and Wyoming Government representatives to seek other alternatives outside of GTNP. I sincerely hope that the private landowners in the area of the potential new road would be willing to review these options, and I hope that they could be respectfully approached. These landowners should be rewarded for their sacrifice to better our valley, as it takes serious foresight to realize that this will benefit our valley forever, similar to the deeds of the Rockefellers.

Comments: I recognize that it is not the job of the National Park Service to propose new roadways outside of GTNP, but I believe that if a North Bridge proposal was included as "Alternative E", then it would be the most popular choice. I remain certain that the problems in the Moose Wilson corridor are a result of this missing link in our infrastructure. I strongly believe that Teton County is now ready for this road, and I think that now is the time for our local and state government, WYDOT, Friends of Pathways, and the media to discuss this alternative plan, as opposed to facilitating further unneeded expansions within GTNP.

Comments: Hi:

After listening carefully to all the arguments, we want to support the least impact on the national park, Moose Wilson corridor. We have changed our minds from wanting a bike path and road improvement to wanting the park to stay as natural as possible. We can save our driving and cycling adventures for other areas. Please preserve the area for the wildlife.

Thanks you,

Don and Gwenn Wadsworth

Topic Question 2:
i opt of C or D

Topic Question 3:
my sense is that while many of the strategies do address the current needs - the missing piece is traffic management on behalf of the park personnel. ultimately the moose-wilson corridor IS a roadway and should be administered as such. allowing visitors to park their vehicles in the roadway and exit the vehicles in order to view wildlife is unacceptable. encourage more respect for the animals, and other road users by enforcing basic traffic behavior - park in pull outs or receive a heavy fine.

Topic Question 4:
thanks for opening this to public comment.

Topic Question 1:

I personally support Alternative D - I think this plan allows the best way for humans and wildlife to coexist in this critical habitat corridor. I do think that is, indeed, possible. This is NOT wilderness and for the most part, people do want other people to experience his unique opportunity to live and breathe the same air as these creatures. It's only a for a few months that this is even possible.

Topic Question 2:

I think it's important to alternative means of transportation for visitors...mass transit, foot and bike path. Everyone knows that when they they go hiking/biking in a National Park, there is a chance for bear, deer, elk, moose, etc. This is no different than hiking in the Grand Tetons. I DO not support closures and gates mentioned in several alternatives. This only makes more congestion in other places during the heaviest visited months of the year.

Topic Question 4:

I think Jack Stark's recent letter to the editor in the JHNG sums it up for me. Back in 2005, I was working for Senator Craig Thomas and I remember an article he wrote about the pathways that are now in the park. He said the pathways were "pure poison". I'm sorry - but there is NO evidence that these paths have done anything BUT enhance the visitor's experience in the park. In addition, the Park's own wildlife studies further prove there is no real negative impact on wildlife. My husband, 9 year old daughter and I just rode from Dornan's to Jenny Lake. We all were so happy that we could do this. If I'm riding on the road, I live in constant fear of the texter, phoner, etc. In this device addicted age, the path provides a safe alternative. And it IS an extremely different experience than driving by.....shame on Mr. Stark for wanting me to get behind the wheel, use gas, and drive by. I'd rather smell the smells, see the sights and peddle my

way. And for those I've seen in wheelchairs, it's an amazing experience. Craig Thomas would be so happy to know that he has added so much pleasure for the park visitor.

Comments: From my understanding, the proposed path along the moose Wilson corridor will not be as intrusive as the building of the Rockefeller Center and that proved to have negligible deleterious effects. The existing fiber optic corridors are proof that minimal disturbances don't cause harm to wildlife.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

Comments: We have traveled to the Grand Tetons quite often considering how far away it is from our home and have found it to be one the places we enjoy most. I always make the MW road area a part of our visit, particularly in the hopes of seeing wildlife such as moose, beavers, owls, bears...all of which we have seen at one time or another. It would be an absolute shame to see this area turned into a highly traveled "thruway." To me it is a National Park road and should be treated as such.

Superintendent David Vela

Grand Teton National Park

Dear Sir:

During my tenure as Superintendent of Grand Teton from 1979-2002 it was often suggested that the Park should improve the Moose-Wilson road. The request was always made by those wanting quick access to and from the airport and the west side of the valley. No action was taken in order to preserve the character of the road.

GTNP has made a good start with the planning process to address the alternatives. Alternative B addresses the parking problem at the Death Canyon trailhead and moves the Moose-Wilson road from the sensitive wetlands near Saw Mill Ponds. It also emphasizes retaining the slow speed and the narrow winding character of the road. It does not call for the construction of a separate paved bike trail. The area is actively used by both grizzly and black bears as well as moose. All can be dangerous to bicyclists when sudden encounters occur. The Park has an extensive system of paved trails. Alternative B calls for active traffic management. Such measures as portable warning signs that can be moved as wildlife activity changes, strict speed control, temporary closures and speed dips are examples of such measures. As the planning process proceeds, a wide range of suggestions will be made to reduce and control traffic. An open-air tram that provides public transportation from the Moose Visitor Center to the Rockefeller Preserve would reduce the traffic and parking problem there.

Alternatives A, C and D should be rejected.

Sincerely,

Jack E. Stark

Topic Question 1:

I support all the stated goals and desired conditions.

I favor the Moose-Wilson Road Realignment as described in Alternative B, no matter what other decisions are made. I likewise support paving the unpaved section of the road, as described in Alternative B, regardless of other decisions.

I support reduced speed limits, regardless of other decisions.

Topic Question 2:

I do not think most of the traffic control strategies are workable. People need to know what to expect regarding travel through the corridor.

Topic Question 3:

Shuttle transport in lieu of private motorized travel during peak tourist season.

Topic Question 4:

Please see comments below.

Comments: I urge the NPS to create a new alternative, because I do not think any of the current alternatives will serve to meet all of the stated goals and desired conditions, all of which I support.

Most people familiar with the Moose-Wilson Corridor would agree that traffic management is the biggest problem. The best alternative for managing traffic is to eliminate private motorized vehicles on the road. Banning cars is a move needed now, and it will be needed even more in future years. Run a park service shuttle with stops at the Granite Canyon trailhead, Rockefeller Center, Death Canyon trailhead, and the beaver pond area. Some people may choose to simply ride the shuttle for the entire length of the corridor; others may stop at one or more destinations, catching a later shuttle. Both types of visitors should be accommodated by the shuttle. Shuttles work well in Denali and Zion, the two National Park shuttles that I have used. Like the shuttle in Denali, bus drivers should stop briefly when wildlife is spotted. Wildlife is a major reason why people love to travel through the corridor. However, no one should be allowed off the bus during these brief stops. Loading and unloading of passengers should only be at the designated spots. Parking for private vehicles should be provided at both ends of the corridor, so that people can choose where to start/end their shuttle ride.

If a shuttle is not implemented in lieu of private motorized travel, then I urge the NPS to make the road one-way. This will help with traffic flow and safety, but it would not eliminate the current need for additional parking, which is a big negative to allowing private cars to continue to use the corridor. Needing to wait in line to get a parking place at the Rockefeller Center is a really bad situation (which a shuttle would eliminate). Parking near the Death Canyon trailhead is also a problem.

I do not blithely ask for the road to be one-way-my family lives in Teton Valley, and we often travel to and from GTNP via the Moose-Wilson corridor, because it is shorter for us and eliminates the traffic hassles of Jackson. But if we (and others) want to reach other parts of GTNP, we can take our own car into the park via Jackson and Moose. I also realize that many locals are strongly opposed to making the road one-way. However, this is a national park, and decisions should be based on what is best for the park (in helping it to fulfill its mission), not on the needs of those who live in the immediate vicinity.

I favor the Moose-Wilson Road Realignment as described in Alternative B, no matter what other decisions are made. I likewise support paving the unpaved section of the road, as described in Alternative B, regardless of other decisions.

I am a cyclist, and I love pathways because they are the safest place to bike. However, I am opposed to a separate pathway in the Moose-Wilson Corridor, as proposed in Alternative D. I think it would damage too much of what is already a narrow corridor of plant and animal habitat. Again, I urge the NPS to think first of its mission and base decisions on what is best for a national park.

If a shuttle service is implemented in lieu of private vehicles, and if the unpaved section of the road is paved, then I think bicycles could share the road by striping a bicycle lane that could be used by bicyclists going in both directions. (If the road is widened, then a bike lane could be striped on both sides, but I fear the additional width needed would be detrimental to the natural resources. Still, it might cause less damage than a separated pathway.) Of course that wouldn't create safe bicycling for young children, but there are other places in the park where families can enjoy safe cycling on separated pathways. Not every part of the park has to accommodate every possible use (which is another reason I am opposed to a separated pathway).

If the road becomes a one-way road, then I would support a striped bicycle lane on the right side of the road. Bicyclists have their mirrors set to see cars approaching from behind only if the bikes are to the right of the cars. (This was originally a problem on the inner road between String Lake and Jenny Lake.)

I support reduced speed limits (regardless of other decisions). If a shuttle service is implemented, I suggest

June 1 through September 30. During May and October, allow private motorized vehicles.

Additional bicycle travel on the road should be allowed outside the dates when motorized traffic is allowed. That is, before and after the motorized season (whether that is by shuttle or by private vehicles).

Winter grooming of the corridor should be left open as an option, perhaps made possible by a private-public partnership. Fat tire (aka snow) bikes should be allowed to use the corridor during winter. And of course snowshoeing and ski touring should be allowed.

I think the Commercial Activity as outlined in Alternative B is reasonable. Do not allow taxis (as included in Alt. C). I don't understand the significance of the differences in the first bullet point on Commercial Activity in Alt. B & C. Both seem workable.

I am opposed to the traffic control options in Alternatives B, C and D. A shuttle or one-way traffic are both better options.

Parking needs would be drastically reduced if a shuttle is implemented in lieu of private vehicles during the main tourist season. This would be a huge plus for conservation of natural resources.

Topic Question 1:

Please include a separate paved multi-use pathway. Realign the northern section of road so that is not located in the wetlands. Put one park entrance station at the northern end of the corridor - one station that serves both Teton Park Road and Moose-Wilson Road. Include a transit system to reduce cars.

Why? I want a pathway because I believe that is the future. I want people to exercise, breath fresh air, smell and hear things they don't normally experience because we spend too much time in cars. I want our national parks to inspire people to be outside and be healthy, happy contributors to our world. I want my paraplegic mother who has been in a wheelchair for almost 50 years to experience GTNP from the pathway and not from a car. I want GTNP to do what it can to inspire people to become stewards of the park - and I think a pathway will go a long way in doing that.

It is a no brainer to realign the northern portion of the road - it is what's best for wildlife and for traffic control.

Topic Question 2:

I don't think it is best to close the road for 2 days a week - that does not lend itself to a good visitor experience. It would be confusing to locals and tourists both. We want to invite people into the park, not turn them away.

Putting a gate in the middle of the road and having traffic turn around at LSR is also not a good solution. This will be confusing the visitor and create more traffic jams on Moose-Wilson Road. A gate will cause

people to spend even more time in their cars, because they will be driving more and more through the Town of Jackson and other roads in the park. More cars on the highway equates to more wildlife collisions. We have to encourage people to get out of their cars, not spend more time in them.

I'm not sure why Alternative D has so many pullouts. Is that necessary? If one goal is to decrease traffic, let's not encourage that traffic to hang out on the road with so many pullouts. Common sense says to strategically place a few pullouts on the road.

Topic Question 3:

GTNP can have more partnerships with area organizations. Jackson is a community that likes to help. Let us help you. Whether it is for funding, volunteer labor, or creating a new transit system - this community is here to help and to problem solve. Use the resources that surround you.

And please include a pathway. :-)

Topic Question 4:

I believe in the power of pathways to foster healthy lifestyles, curb dependence on cars, mitigate traffic problems, safeguard pedestrians and cyclists, and expand our appreciation for the natural world. I see things I don't normally see while on a pathway because I'm moving slowly and my senses are alert. I want more Americans to get outside. I know that people from all over the country and even other countries know about our pathway system. They come here to enjoy them. My wish is that GTNP be a leader in how parks are managed, not do things how they have always been done. Let's evolve together and create a spectacular park experience for everyone. I walk and ride on pathways because they bring me joy and make me feel free. There is no better place to feel that than in a national park.

Thank you for being stewards of our beautiful lands. Let's create a new generation of conservationists and stewards by allowing people to have a diverse and healthy park experience.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Correspondence Text

I have lived in Teton County 62 years and especially within Teton Park on a year-round basis. I am now living at River Rock Assisted Living about 2 miles south of town.

Regarding the Mose-Wilson road: Restrict the road at Rockefeller preserve to prevent through traffic. Teton County development impacts should not be imposed on, or accomodated in Teton Park.

All parks are for the benefit and enjoyment of the people. There is much to be seen and noted in this area including bears on occasion, beaver, as well as large animals such as moose and elk. So I suggest traffic speed be no more than 20 miles an hour at all times and possibly checked by radar or NPS on patrol when needed. No motor homes, trucks, motor cycles, or commercial traffic at any time.

If trees and bushes are obscuring the roadway and the driver, cut down when needed. Winter plowing should stop at the White Grass junction. Keep the bridge across the creek in good repair.

There are/were homes off that road that need to be torn down and burned. Namely the Helen Wittmer property and the Leland Curtis property. That's a good job you folks need to do before winter sets in this year!

Thank you for the opportunity to comment on this important item.

Jeannette (Moosie) Woodling

Correspondence Text

Moose-Wilson Preliminary Alternatives
Flip Chart Comments from Public Open House
August 28, 2014

Alternative A

1. No added paving
2. No loss of natural vegetation/habitat
3. No action
4. No through traffic
5. Do not leave as is. Too many issues. Traffic increase and more wildlife using area.
6. Gets my vote
7. 2 way traffic is good
8. No physical changes! (Periodic closings for maintenance is okay)
9. No bike path because of paving and scenic impact/animal impact. Lets have somewhere minimally developed even if traffic is a problem.
10. Some places deserve to be preserved as is. This is one of them!
11. Keep Death Canyon Rd. primitive
12. Off the table - Traffic needs to be limited. Projected to double every 15 years.
13. No further disturbance of any kind! Keep the area the way it is!!
14. Alternative A does not do enough to lower traffic.

15. Yes& to limiting new disturbance, but something needs to be done about big increases in traffic in recent years& This is a special area/important wildlife habitat!
16. Totally agree!! [with arrow to previous comment]
17. Yes! [with arrow to comment 15]
18. Traffic increases are largely due to popularity of LSR - which is great! Road is actually safe - no serious accidents to date. Keep it as it is - its a beautiful natural road and I would only suggest limiting taxi and commercial vehicle use.
19. NO ACTION! Anything is against park service guidelines.
20. No action - allows two directions for those of us N [north] of Moose - after concerts lovely to drive (slow) and see wildlife
21. Definitely keep road narrow, slow, rural character. Seems like northern section isnt aligned in best spot for wildlife - there are beaver benefits to realigning. Thanks!
22. Not my choice, too many conflicts!
23. Increase trails - so people get out of their cars. Needs a Bike PATH!
24. Close road at preserve. Dead-end from Moose and from TV. No through traffic at preserve. Low traffic volume lets bikes share road with with few cars.
25. No through traffic!
26. Keep trailer traffic off, as is because too long for a narrow winding road. No place to turn around.
27. Lots of merit in leaving it alone, but adding a pathway.
28. Traffic noise and congestion = undesirable. Lets not bother wildlife.
29. Unpave the entire road -
 - a. People slow down which protects wildlife
 - b. Less traffic overall
 - c. Still easy to access compared to shutting down the road
 - d. To pay for regrade - increase price to enter and use that money.
30. Keep as it easy, sign to inform visitors that if in a hurry maybe not the way to go.
 - a. Think of animals
 - b. Road has history of dude ranches all along the road - preserve the history of the area.
31. Close it all together!
32. Needs paving and separate pathway
33. Pathway needed for safety and visitor access, experience.
34. Alternative A does NOT work because it doesnt provide for a safe and separate pathway. Please provide cyclists and pedestrians with safe access so they can enjoy the park outside of their car.
35. Alt A does not meet the need to provide safe access for all users.
36. Would not meet the goal of shifting impacts away from sensitive resources on the north half of the corridor.
37. Keep it as is - I would recommend letting people discover the area themselves (self discovery) and not directing people to it
38. It is an historic, beautiful, natural road
39. It is part of the historic culture
40. Would be a mistake to cater to a small % of users (bikes)
41. A solution must be found for the long term. Status quo unsafe for humans (especially outside of a car and for wildlife)
42. Wildlife of utmost importance& if road remains the same - slow traffic with speed bumps& Although Im not aware of wildlife hit on M-W Road keep closed as historically has been closed.
43. No action does not address current and future impacts. Wildlife and desired conditions must be addressed this alt ignores them.
44. 1st bicycle - toured M/W Road in the middle of the day in summer of 89 and not one car passed me. Too bad its now discovered but Id hate to see it improved/developed&

45. If necessary close the M.W. Road to preserve its uniqueness. It is time Teton County address traffic needs created by growth& Maybe its time to once again explore the north bridge option!!!!

46. Yes! [Referring to previous comment]

47. I agree Moose-Wilson corridor is bearing the brunt of Teton County not dealing with traffic issues - Close it for the wildlife. [with arrow to comment 45].

48. No action or close. Remember why people love this area - wildlife - wildness - no commercial guides and cabs.

Correspondence Text

Moose-Wilson Preliminary Alternatives
Flip Chart Comments from Public Open House
August 28, 2014

Alternative B

1. I like location of Death Canyon Trailhead - room for more parking
2. Do we really need to pave road - might encourage more traffic
3. No new pavement
4. No rerouting road - allow buslike vehicle only if traffic is issue - like Grand Canyon / Zion
5. Bikes could ride on existing road
6. No paving
7. Dont pave the road - it encourages speeding
8. Traffic management actions are not visitor friendly - confusing to users
9. Mid-road closure difficult to manage and communicate
10. No need for commercial use. Just people and animals. No paving to make more use.
11. No signage along rd. except periodic speed limit signs.
12. No commercial except necessary rd. maintenance.
13. Control at Chapel Rd. entrance to disallow RVs and Trucks, any large vehicles.
14. Grooming for X-country Skiing/snowshoeing would be wonderful.
15. Like the focus on protecting nat. resources & wildlife.

16. Lower the speed limit for entire rd.
17. No bikepath - dangerous - bears.
18. No bike path see above!
19. Too dangerous for bikes no matter which alternative is used!
20. Extend comment period!
21. Yes, extend comment period!!
22. Emphasis should be on preservation of wildlife habitat, not visitor destination emphasis
23. leave road unpaved!
24. terminology & corridor for visitor destinations is confusing
25. Realignment makes sense for Beaver Ponds Entrance Station. If paving road does not hurt wildlife, its o.k. Traffic control is a good idea but hard to implement, especially for northbound. Would need signs in town at Y, at Stilson and maybe at Village.
26. Realignment - makes no sense for those of us who have travelled for many years appreciating the wildlife on orw drive too and fro from Moose to the Village.
27. No RVs either direction - too big - too dangerous.
28. &or trailers& ditto
29. I oppose paving of this special segment for many reasons including increased speed.
30. Realignment I support - visitors should be able to see the wildlife ideally / trails viewing platforms
31. Support more trails to view area
32. Yes to new Death Canyon TH
33. Yes to improved trails including Death Canyon TH to LSR
34. Yes - do road re-alignments. Do not pave gravel portion. Construct appropriate parking at trailheads. Close road to through traffic at Preserve. Cars from either end to capacity of Preserve parking, shuttles if necessary from north and south. No through motorized vehicles.
35. No to increased pavement. Yes to this [#34 above].
36. No increased pavement please. J
37. Yes to banning taxis
38. - ditto [#37 above]
39. D is preferable, but this is a reasonable option. Yes to limit commercial vehicles. Why to limit commercial horseback riding at Sawmill ponds - historic dude ranch area
40. Yes to restoring wetland function wildlife connectivity.
41. Wooden walkways to pond areas needed
42. _____ and pathway needed
43. Alternative B does not work because it would restrict winter access for backcountry skiers by limiting the plowing. It also is lacking a separate and SAFE pathway. Please keep the slow, rural feel of the road, with a separate pathway.
44. Boardwalk to the ponds! Bike path! More pullouts!
45. Restricting through traffic wouldnt reduce trips - Almost 50% access from North now - that change would just rearrange traffic numbers to keep trips the same. Use Alternative Options - transit, bike path, interpretive trips to reduce traffic counts - # of trips.
46. Suspect that the peak-hour gate system might concentrate traffic and create congestion issues. It would definitely frustrate motorists.
47. No further pavement
48. Gate to monitor thru traffic problematic at best. Traffic mgmt difficult - Reduce speed - yes - Speed bumps - restrict taxis
49. Do not restrict historic horse trails
50. No compromise when protecting wildlife and NPS values
51. Like an adaptive gate near LSR
52. Good that theres no separate bikeway.

53. Would like a bike lane along the road on both sides!
54. Save the original 2-track road making it one way. From the Saw Mill Ponds overlook use the old homesteaders road that goes along the the overlook to the South as the other one way. This would be safer as one drives along the Moose & Beaver ponds - Two way would continue by the LSR. This offers another scenic drive for all.
55. No way out of the question
56. Bikers have plenty of places. Leave this no bikeway - no new pavement.
57. No Bike Path
58. Close at night - open 1 hr before dawn
59. Instead of controlling peak, make it a non-thru road. This will accommodate bikes w/o more pavement!
60. In the absence of a N bridge, thru traffic is important for Teton Village and West bank residents!
61. The gate at LSR should remain closed except for emergencies.
62. New Moose entrance station and MW road realignment good idea.
63. Maintain rural, dirt nature of road south of LSR&
64. Leave gate @ LSR closed (not just during peak) except for park workers emergencies - maybe busses, too.
65. Need to discuss how/why closure date (Fall)
66. No gate needed. Leave road open. Dont limit public access.
67. Dead-end from either direction at LSR w/ gate for emergencies. This is the best strategy to alleviate growing congestion, pressure, use of corridor for commuting rather than for park purposes. Lower traffic use will also make corridor better for bicycle traffic.
68. Good plan to move the Moose entrance station, but keep the M-W road open. Add a bike path. Dont pave the road.
69. No Road pavement - will encourage speed eventual increased use; Like realignment of N entrance - protect wetlands
70. Like the Death Canyon parking - leave the road the way it is.
71. Do not like 2 p-lots for the LSR
72. Like the idea of the new Moose entrance with the new road - moving north for wildlife.
73. Seasonal closure period?
74. Higher speeds risk from paving unpaved section?
75. Need alternative that would make southern section bikes only (Teton Vil to LSR)
76. How long can GTNP accomodate the increasing commuter/local traffic What is the long-term solution.
77. Is this meant as your 'wildlife protection alternative? Falls way short
78. Moving road away from sensitive wildlife areas will greatly reduce traffic and demand. (no more wildlife viewing from autos) which is a good thing
79. Jackson has enough gated communities - please dont put a gate in MW Road. Not a solution. Just exacerbates problem. If there is too much traffic, then use smart transit. Non vehicle transp. to solve problems.
80. Improving unpaved segment good idea only if route updated pullouts added - seperate multi use path must be added for interpretative experience personal interaction
81. Shifting the Moose Pond (???) is a good idea that will help wildlife; figure out a way for visitors to still see moose safely.
82. Add the pathway full length for safety needs and visitor experience enhancement.
83. Gate at LSR terrible plan, go with D instead - model traffic on this Rockefeller Parkway - Big, Negative impacts to GRTE N. 89 Highway!
84. Definitely have to move road away from the Beaver Ponds
85. This plan does not accommodate winter recreationists by closing vehicular traffic off from Death

Canyon TH. I and many others would be very disappointed if this access was cut off.

86. We do not want restricted access in the winter. We do want a separate and safe pathway. Dont force vehicles to drive all the way around, wasting gas and adding to pollution and congestion.

87. This alternative would cause double the traffic problem when gates were closed by making cars sit and idle or worse, turn around and go back the other way or around to get to other side. This wont solve your traffic problems.

88. This option is not safe at all for pedestrians or cyclists on the road - the road realignment is better, however.

89. Support the road realignment, but it still fails to provide safe access for all park users.

90. Support eliminating the redundant White Grass/Death Canyon accesses

91. Against the gate idea. Against restricting horse trails north of LSR. Would like to see horse trailer parking on realigned road.

92. No more paving.

Correspondence Text

Moose-Wilson Preliminary Alternatives
Flip Chart Comments from Public Open House
August 28, 2014

Alternative C

1. Im a photographer and dont like the Sept. 30 closing date.
2. Im a fisherman and dont like the Sept. 30 closing either!
3. I agree with the above. Dont close till Oct.
4. Keep Death Canyon primitive- no pave.
5. Night-time closure- 1 hour before down.
6. 2 days with just bikes penalties everyone else and is unpredictable for wildlife bad option.
7. Ditto, agree!
8. Remain unpaved and improvements as necessary. Pot holes are dangerous.
9. Closures 2 days a week will be very confusing to tourists and residents alike. Many people will arrive at the road and be disappointed to find out it is closed. Will be operationally difficult to manage. Also, using the word balance in the description looks as if it is being sold as a preferred alternative.
10. New proposed entrance station where unusual spring plants are- rare plant for park.
11. Too complicated- other management strategies better to implement
12. Not a fan of daily closures- I foresee increased traffic in the town of Jackson and frustration on behalf of visitor whom are not aware of these policies.

13. I very much agree. Bummer!
14. Not hard to educate regarding [arrow pointing to the visitors whom are not aware of these policies]
15. Open to bikes two days is a good compromise and doable.
16. If a two day bikes only scenario is manageable, why not a 7-day bike/ped facility? It would seem to be simply an extension of the same scenario.
17. Yes! [referring to above comment]. Maybe allow public transit through and cars at certain times. Great idea!
18. 2 day closure to accommodate bicyclists is confusing. Also unnecessary- go elsewhere. They just want to go fast and through. No wildlife/nature experience. Paved bikeway not pedestrian friendly. Bikes fast and many walkers run past, and pavement path suburban.
19. Bad alternative- no need to close road.
20. Managing road closures would require huge human resource and very frustrated visitors.
21. Yes! [referring to c Managing road closures would require huge human resource and very frustrated visitors].
22. Absolutely no science to back 2 day closure makes very little sense.
23. Traffic entering Granite would have to go through TWO entrances? Crazy.
24. Close it. And close the airport. No people, no cars, no community!
25. Temporal closures not a good plan- very confusing. Keep road open 2-ways. Manage volume over 2000APT [hard to read- unsure what this last word says on flipchart.]
26. Limiting number of vehicles and closures 2 days per week would be confusing to park visitors-not park/user friendly.
27. Realignment of north section away from wetlands (beaver ponds) and chokecherries is critical given wildlife (including bear) utilization
28. Need to reduce traffic other than through adaptive [unreadable].
29. No through traffic
30. What about closing at night? Nobody other than commuters and taxis use it then!
31. Consider extending winter plowing to Death Canyon.
32. Unpaved section of road needs to be paved if it is going to be used by bicycles.
33. No interpretive signs.
34. This road is a jewel of a wilderness experience. Please respect it.
35. Yes! [referring to This road is a jewel of a wilderness experience. Please respect it.]
36. I agree, preserve the experience. [referring to This road is a jewel of a wilderness experience. Please respect it.]
37. Closing park road for 2 day is too confusing.
38. No commercial buses either, even to the airport. They can use the other toad. No taxis and delivery trucks.
39. Good! [referring to No commercial buses either, even to the airport. They can use the other toad. No taxis and delivery trucks.]
40. Yes for realignment around beaver ponds but no to closing two days- too confusing.
41. No to closing 2 days a week- too confusing and no to permitting only a designated number of vehicles- again, not user friendly.
42. Different uses on different days is too restricting to visitors.
43. Yes to current configuration and development level.
44. No additional paving- best conserves historic character, and preserves wildlife values.
45. Like keeping road alignment, no pavement.
46. Lower speed limit to 15 and enforce.
47. No bike trail good.
48. Like group size limits,
49. Preserve other North entrance with North section road away from wetlands- vital habitat.

50. If its not broke, dont fix it. No to closures. No to Alt C.
51. Closing certain days of week would only increase traffic and impact on days open. (if Im understanding this correctly). Traffic still needs to be reduced in general.
52. Discourage through traffic- reduce traffic.
53. Reduce traffic speed limit AND enforce it.
54. Yes! [referring to Reduce traffic speed limit AND enforce it.]
55. Yes. [referring to Reduce traffic speed limit AND enforce it.]
56. A nightmare to monitor.
57. If you couldnt get to LRP 2 days/week by car, then I disagree with this plan.
58. I second that! [referring to If you couldnt get to LRP 2 days/week by car, then I disagree with this plan]
59. Bad alternative- no need for unnecessary enforcement- timing idea is bad!
60. Disabled people put at a disadvantage in this option&
61. Bad idea!
62. Closure is a bad idea!
63. GOOD to consider this!
64. Support Death Canyon TH parking and improved trail system.
65. Moose-Wilson should open May 1, not mid-May.
66. Instead of closing to vehicles for two days a week, how about limiting vehicles to only a few hours each day? Like 3 hours?
67. How about one way traffic to LSR from North and South?
68. Should be open to visitors 7 days a week!
69. Add bicycle path.
70. Park service- this is a terrible idea. Why re-route traffic through town, increase pollution and congestion? Please do not restrict winter access for backcountry skiers- keep plowing to White Grass. Please provide a separate and SAFE pathway so cyclists, families, locals, and visitors can enjoy the park from outside their car. Please also realign the road to protect wildlife habitat.
71. This alternative seems very arbitrary and a monitoring nightmare. Drivers will not know when the road is closed and will be making trips back and forth on the Village road.
72. Bicyclists and hikers/walkers/baby joggers/wheelchairs need a separate and safe pathway.
73. Why 60 vehicles at Death Canyon? Do visitors to White Grass include people staying there? Seems like a lot of parking.
74. This leaves GTA open to ongoing nightmare of political and commercial pressures. BAD alternative. Need to plan for the future and meet the desired conditions, not try to accommodate all interests.
75. Ltd amount concession fee of wildlife viewing with interpretation on board is a good idea, but control the numbers, not like the numerous tours we see today.
76. Do not phase out horseback riding in the park.
77. Agree with this comment [referring to do not phase out horseback riding in the park]. Horses are our heritage. Please dont ban horses.
78. Agree with no phrase out of horses. Would like trailer parking at Death Canyon realign.
79. C/A Id like the road left as is with a 2-day motorized closure. Ill take those 2 days off from work to cycle through the park.

Moose-Wilson Preliminary Alternatives
Flip Chart Comments from Public Open House
August 28, 2014

Alternative D

1. Hate reservation system. Would like to see pathway as close to road as possible. Like the continuation of horse access. Would like horse trailer parking at Death Canyon. Best option!
2. Option D is the best plan. The wildlife viewing areas make sense. Bicycle on separate path is a strong way to serve the mission of the NPS. I would like to see the potholes remain. It is a strong natural limiting factor. The rough road to Death Canyon trail head is a good situation. Anything to enhance the primitive nature of the GTNP experience is favorable. Please no more curb and gutter. Thanks for keeping this process open to public input.
3. A separate pathway - This is the only alternative that provides necessary safe access. Yes to Alternative D.
4. This is a great option because it includes a separate pathway - this is ultimately the most environmentally friendly option since it encourages people to get out of their cars.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

5. This is the best alternative. I agree with the comments above. Thank you for the outreach! Support paving it too.
6. Yes to D. Pathways are for people, not just bikes!
7. No bikes.
8. I want to have my kids smell, hear and truly experience the park. It breaks my heart to envision them meeting the M-W Road through a windshield. Please envision a future for them that encourages them to visit this corridor on foot or bike. I want them to want to protect this resource as well.
9. Support Alt. D as it provides safe access for all users, not just motorists. The existing road has impacts to wildlife, habitat, and other resources, but it can be managed to achieve a balance between enjoyment of the park and preservation of park resources - much as a pathway or trail system can be managed. The experiences of the Moose-Wilson corridor should not be solely the domain of people in cars. All users should be provided the opportunity to safely experience this corridor or we should consider making it off limits altogether.
10. Support eliminating redundant roads to Death Canyon TH.
11. Alt. D seems to be the best!
12. Please do not restrict winter access for backcountry skiers. Alternative D will provide the same road plowing as what is currently happening - Alternative B and C dont. Let us ski Albright!!
13. Yes to Alternative D. To continue to educate and inform future generations about conserving and preserving our parks we need to provide safe access for them to explore, experience and (yes!) recreate safely in GTNP. Alt D allows a separate path where visitors can experience the park outside of a car. It encourages alternate transportation for visitors. It reroutes around prime wetlands and wildlife habitat and it continues to provide the road access for summer and winter visitors.
14. This alternative works well! Includes forward thinking tools for managing traffic, enhances wildlife habitat by re-aligning the road and includes a safe way to appreciate the Park from outside of the car.
15. No separate bikepath - habitat fragmentation. Wildlife should have priority. 60 vehicle parking at Death Canyon? Build it and then will come too much impact. Apply LSR concepts.
16. Honor the history of the valley.
17. Review usage (3%) bikes.
18. Best alternative but pave old road.
19. Add boardwalks to ponds.
20. Who doesnt smile when using the current Park pathways? For locals and visitors alike!
21. Pave road, add boardwalks, lots of turnouts. Nice bikepath.

22. Alternative D is by far the best option. The road needs to be realigned to protect the sensitive wildlife habitat at the beaver ponds and the sawmill ponds area. Visitors need to have a safe route for alternative transportation - why are we encouraging people to stay in their cars? Get out and enjoy the park! Think of the Axlerod family - how many more times does this have to happen before we listen and take action? We need a separate and safe pathway -its not a want.

23. There are plenty of bike paths paved. Leave alone some sections of park. More wilderness and many animals. This is worst plan.

24. By far the best option. Provides access to the park. Safer alternative because reduces road traffic for those that otherwise have to drive many miles around to get to the park. Needed to complete the bike loop - also a necessary safety issue for bikers.

25. Consider if bike path on wide shoulders w/ separating curb would be less impact than separated path. Agree!!

26. No pavement! How many bike paths do we need?

27. Remember the National Park mandate - protect the resource, honor the Rockefeller gift - this is not a National Recreation area.

28. GTNP can be a model for the future where recreation and preservation co-exist. Not have dinosaur (?) conflicts of the past ideas that keeping people in Winnebegos is the best. Get people out and in their parks.

29. M-W Road from Granite Canyon to LRP should be closed to all vehicular traffic year round. Existing roadway link can be used for all non-motorized travel and enjoyment.

30. This plan is disastrous to Park resources!

31. Alternative most beneficial to all users like the winter use (grooming) as it is being used already.

32. Bike path to LSR only - not north!

33. Keep Death Canyon primitive.

34. No - will not sufficiently reduce traffic and detrimental to corridor. No, No, No !!!

35. The best alternative. People can enjoy the park, outside of their car. Two way traffic good. Winter use is great.

36. This alternative is bad - A bike path will destroy critical, irreplaceable wildlife habitat! A disaster in the making!

37. This (above comment 36) isnt true. Closure is bad. Solve problems, wildlife preservation and a slow, narrow road work together.

38. No interpretive signs or material other than handout at entrances. I agree!

39. The country is attempting to fight obesity. Get people out of cars in federal / national parks to help with the fight.
40. The recreation aspect referred to in D should not be looked at differently than the visitor experience referred to in other options.
41. This option does not mention resource protection.
42. No commercial&
43. We dont need more bike paths! Too much asphalt. Vocal minority only 3% of current users.
44. This appears to be the least friendly option for wildlife and wildlife habitat. Separated paths further fragment habitat and would create new user growth in an area where we are trying to limit impact. This is my least preferred alternative.
45. No separated pathway - may further fragment important habitat and degrade historic resource (road).
46. No added areas of disturbance, e.g. turnouts (same reasons as above).
47. No winter grooming.
48. No separated bike path. No! Important wildlife habitat. Road-based tours? Guided bike tours? No!
49. Do not groom or expand MW winter use. This is important moose habitat!
50. No separate bikepath. No further fragmentation. No winter grooming.
51. This is a National Park. Wildlife habitat should be protected and maintained.
52. Too many parking lots and spaces& lots of asphalt instead of natural habitat!
53. No separate bike path - leave it alone - we have enjoyed existing road for years!
54. Continue this alternative with a complete pathway. Needed for safety and visitor experience. Provides spiritual connection, experience of the Park.
55. Winter grooming a good idea. Visitors need winter access. Winter is deep snow. Moose are not there in winter.
56. Continue 2-way road access, needed for park access, 83% of use are park visitors!
57. Road closures would impact N. 89 Park Road. Must model traffic and study that.
58. Pathways keep cyclists safe and take some traffic off the roads.
59. I agree with alternative D to give access to this part of the park and take pressure off the main roads.

60. PATHS. HELP ME.
61. Most disastrous plan option.
62. No new pavement / or bike path.
63. Bikes on existing road.
64. Public transport like Zion - Grand Canyon is needed.
65. Keep maximum current habitat.
66. Remember mission of national park.
67. Bike path north of LRP a hazard to wildlife and bikers.
68. Please manage with smart strategies instead of keeping people out.
69. If road realignment occurs, provide pathways to beaver ponds.
70. No winter grooming - critical moose winter range.
71. No through traffic.
72. No separated bike path.
73. I hope to ride my bike with my children on a safe and autonomous pathway.
74. Winter grooming is an outstanding idea -currently time and money is spent grooming an open area with no treed protection - blows in quickly.
75. Yes to two-way traffic flow.
76. Separate bike path - yes. Allows for ped. and bike experience, not auto.
77. No. No thru road reduces traffic and accommodates bikes without big impacts to corridor!
78. Offer non-motorized users safe access to the park. Ensures wildlife is protected by re-aligning road.
79. Staying open til Oct. 30 is good.
80. Bike path and pedestrian use incompatible.
81. Bikes too fast and many.
82. No bike path - too much loss of habitat: cutting of trees, regrading, invasives, and motion disturbance. Fragmentation of habitat.
83. Bikes go elsewhere!

84. A bike path is an excellent way to encourage slow speeds and reduce the need to drive.
85. Bike path needs to accommodate walkers safely.
86. Just say no to D.
87. No multiuse pathway - too much disturbance. Dont need guided tours for either x-country or bikes. I agree!
88. Please think with innovation. If too many vehicles, then inspire people to get out of their cars and walk or bike. Or use partners to pay for a smart transit system. Stage parking at Teton Village. Use small shuttles w/bike racks. Educate people along the way.
89. I support Alt. D. Its better to encourage people to walk and bicycle than sit in a car. Also transit is essential.
90. Offers a very safe way to enjoy a visitor experience.
91. I highly support a safe autonomous pedestrian / bike pathway that this option lays out.
92. Please create an alternative or many to offer opportunities to interact with nature.
93. Yes, a pathway. Yes, shuttles, taxis by permit. Yes, winter grooming.
94. No - Keep it for people to discover.
95. Reservation system drawn on VA experience&
96. Will this increase motorized vehicles - e.g., people drive cars to the road ends for their bike ride. To what extent is this happening at current bike path end points?
97. Best alternative of the choices. Separate pathways create safety.
98. No bike path!
99. Support multi use path for complete access to all - better non car alternatives for outdoor interaction and safety for all.
100. Pathway and better road will allow for interaction, understanding the resources and park knowledge.
101. Local recreation desires should be clearly distinct from visitor experience - not the same!
102. No separate bike path - too much pavement and disturbance.
103. This alt. is very dangerous for long and short term preservation of GTNP.
104. Locals trump visitors! Going both ways.

105. Concern about new path footprint and its impact on wildlife.

106. Please extend comment period.

107. Include trails to viewpoints. Increase / improve trails in corridor.

108. No to D. Bikes have much of the park already! No group gets everything! Save some for Nature.

109. Pavement is simply a way to get people out of their cars - its not always a bad thing! Please provide a safe and separate pathway. Keep the rural country road feel on MW, but give people an option to get out of their cars. Do we really want our future generations to enjoy the national parks from the backseat of a car with an iPad in their lap? Get outside America!

110. Although this is better than A or B for people, it is inferior to C for wildlife. Go with C, but take it further with 7 day a week closure to private vehicles (with a few exceptions). But saying there are too many bike paths in general is ridiculous. If youre trying to get from Wilson to GTNP on bike, it doesnt matter that theres a path south of town. For paths to be an alternative to driving, it must go where we need to go.

Correspondence Text

Question 1:

Which strategies in the preliminary alternatives do you think should be carried forward to best achieve the purpose and address the need for the plan? Why do you think they should be carried forward?

The Moose-Wilson Corridor Comprehensive Management plan should focus on long-term protection for wildlife and habitat in the Moose-Wilson corridor while making it easy and safe for people to visit this unique area on foot, bicycle, or public transit.

The Moose-Wilson corridor is not a transportation corridor for people trying to drive across the county. It is a special place to visit in Grand Teton National Park because of its rich wildlife habitat and abundant recreational opportunities.

Thorough analyses of the strategies proposed in the preliminary alternatives, as well as the strategies that will be considered in the draft EIS, will provide the facts and data necessary to make informed choices about how we provide appropriate opportunities for visitors to use, experience, and enjoy the corridor while protecting the park's nationally significant resources.

The EIS analyses should also consider the future impacts of climate change on the corridor and how the Comprehensive Corridor Management plan will ensure ecological integrity and resilience in the corridor

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

to withstand these predicted impacts in the long run.

Lacking these analyses, I am making my recommendations based on currently available preliminary information and what I believe will most effectively leave the wonders of the Moose-Wilson corridor (MWC) unimpaired for future generations.

Therefore, please carry forward these particular management strategies for further analyses:

The park should further research all strategies for traffic management in alternatives B, C and D including limiting through traffic, hourly limits on traffic, and a reservation system.

The park and almost all constituents agree that traffic is a critical management issue for the corridor. The park should aggressively investigate all methods to reduce traffic and ensure that all vehicular traffic entering the corridor has to pass through a fee station.

Recent research commissioned by the park has shown that about 2,000 cars use the corridor per day during peak periods. In addition, a significant fraction of these cars spend less than an hour in the corridor. These traffic patterns do not conform with the corridor being primarily used as a visitor destination. The park should seek traffic management strategies to reduce the total number of cars in the corridor while increasing the time that each vehicle/group of people spends in the corridor so they can fully experience and appreciate the natural wonders of the MWC.

The Strategy presented in Alternative B to make the Laurance S. Rockefeller Preserve (LSR) a destination and prevent through traffic is worthy of further consideration, despite the additional impacts of creating an additional road and parking facilities. Please evaluate if this is the least impactful way of managing traffic, while encouraging visits to the LSR Preserve.

Examine the short and long-term impacts of paving the southern section of the road. While a gravel road may discourage traffic, its impacts in terms of dust and dust-reducing chemicals may, in the long term, be no greater than paving a narrow section of the road in a manner that preserves the rustic character of the road.

The 2007 transportation plan included a decision to realign part of the northern section of the road away from sensitive wetland habitat. I assume that present conditions with respect to this decision still warrant realigning the road. Further, realigning the northern entrance of the road (near the Murie Ranch section) to be behind the park entrance station would move the road to less sensitive habitat and reduce the road obstruction for a critical wildlife movement corridor along the Snake River.

The recent report from Utah State University suggests one major impact from traffic is the large number of, and impacts from, visitor created parking along the Moose-Wilson Road. By creating a number of pullouts and strategically preventing visitor-created parking using design features in other places, the park can provide ample visitor opportunity to stop and watch wildlife while also reducing traffic impacts. All alternatives contain management options for creating pullouts. I urge a balanced number and location of pullouts that meet visitor expectations while limiting impacts to habitat along the road.

The park should consider strategies that make it safe and easy to visit the Moose-Wilson corridor by bicycle. In so doing, the park should evaluate the potential for harmful encounters between bicyclists and wildlife, especially in a densely forested area with limited sightlines. Appropriate strategies to manage these encounters must be developed to ensure the safety of visitors and park wildlife.

The park should consider all strategies to limit commercial use of the corridor by taxis and similar

transportation services as indicated in Alternative D. The Moose-Wilson Road is not a county transportation corridor. It is a park destination.

Commercial interpretive tours that focus on providing visitors with an experience of the wildlife and habitat in the corridor such as wildlife tours, horseback or bicycle tours, may be allowed to continue in a way that manages for impact, as with all other human activities in the corridor.

I encourage the park to strongly consider managing the Death Canyon trailhead using the strategy specified in Alternative B. This reduces impacts of visitors along the unpaved section of the road, while allowing ample visitor access to trails and hiking opportunities. Please use the data from the recent studies by Utah State and Penn State to justify and choose the smallest feasible size of the parking lot. Is a parking lot for 60 cars really necessary? This represents a peak number only met for a few hours each day during a brief two-week window, as suggested in the recent Utah State Study.

The ungroomed section of the road from Granite Canyon to Death Canyon provides excellent cross-county and back country skiing opportunities. I urge the park to continue evaluating strategies that retain this ungroomed section, regardless of whether the northern parking lot is moved to the Sawmill Ponds, Murie Ranch or the Death Canyon trailhead.

Preserve and maintain a great experience for visitors to enjoy and appreciate the natural beauty of the corridor. Maintain the rustic, rural and intimate character of the road. Limit any additional impact to the road and corridor from visitor traffic. The MWC is a prime destination well-known locally and nationally as a park destination. Management strategies should preserve the character - intimate wildlife viewing opportunities and a rustic, rural road - that make the MWC such a wonderful destination. I prefer strategies that minimize impacts and maintain the goal of self-discovery for visitors. Too many established vista points and visitor services along the corridor will impair the natural, intimate character of the road.

Question 2:

Which strategies in the preliminary alternatives do you think would not achieve the purpose and address the need for the plan? Why do you think they should not be carried forward?

The critical management issue confronting the corridor is the increasing human impact in the area, primarily from vehicle traffic. The park must minimize any additional human impacts on the corridor by maximizing the use of existing assets so that traffic is reduced while making it safe and easy for people to visit and enjoy the corridor on foot, bike, or transit.

Given that traffic management is the single biggest issue for the Moose-Wilson corridor and the biggest impact on both the park and visitor experience, please do NOT carry forward these particular management strategies:

No Action is not a feasible option, even though I recognize that it must be analyzed. Doing nothing does not alleviate the critical issue of the number of cars on the Moose-Wilson Road.

In addition, several of the alternatives call for adaptive traffic management plans, including closing the road at peak times or hourly limits. While attractive in theory, implementing these strategies may present significant management challenges; for example by creating traffic bottlenecks and putting park personnel in a position to refuse visitors entry that may result in visitor conflicts. These situations may result in negative and unintended impacts to traffic and visitor experience. The park should deeply examine which of these traffic management strategies are feasible and how they can be simplified for management and visitors. For example, the park may consider limiting through traffic for the entire duration of the peak

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

season, say from July 1st to August 15th, rather than attempting to manage traffic on a daily or hourly basis. Despite being more intrusive, simple decisions may be easier to communicate and manage than more complex strategies, making it easier to manage visitor experiences.

Alternatives A and C do not propose to realign the northern section of the road away from sensitive wetland habitats. I believe that factors calling for realigning the road as proposed in the 2007 plan still hold and the road should be realigned away from sensitive habitats. The old roadway should be restored to natural conditions.

Alternatives A and C allow taxis to use this corridor. The Moose-Wilson Road is not a transportation corridor; it is a park destination. I do not believe taxi transport is in line with park's objectives. Only commercial activities in line with using the Moose-Wilson corridor as a park destination, for instance, interpretive wildlife tours in vehicles, horseback tours or biking tours, should be considered within such a corridor.

Grooming the road during the winter is an unnecessary impact. Please do not continue this strategy. Opportunities to ski the road in its ungroomed state are adequate, and may even be more desirable and in line with the MWC as a wild destination.

The MWC is a prime destination for visitors locally, nationally and internationally. Strategies must be taken to provide visitors with adequate opportunity to enjoy and experience this corridor by foot, bike or transit.

The park's primary goal is, and must be, to protect the wildlife and habitat resources of the corridor. Strategies that entail any additional impacts on the corridor need to be adequately justified as bringing us closer to a long-term vision of protecting the natural resources of the corridor unimpaired for future generations.

Question 3:

Are there other strategies that should be included in the preliminary alternatives that are not already presented? If so, which strategies and why should they be considered?

As mentioned previously, traffic management is the single biggest issue for the Moose-Wilson corridor as vehicle traffic has the biggest impact on both park resources and the visitor experience.

Therefore, please consider the following additional strategies:

More aggressive strategies to reduce vehicle traffic flow through the corridor including:
The adaptive management strategies approved in the 2007 transportation plan - already studied and approved - should at a minimum be re-examined. For example, the park had proposed to study the effects of making the road one-way. This may allow accommodating traffic and bicyclists along the existing pavement. Why is this strategy not being further explored?

In addition, the park should consider options for redesigning and re-engineering the road in a manner that would physically limit vehicle speeds to under 15 mph, using speed bumps, dips and appropriate signage. This would discourage transportation-related trips through the corridor and further encourage

use of the corridor as a visitor destination. Park objectives should be to reduce the number of cars in the corridor while increasing the time spent within the corridor to experience and enjoy it. Closing the road at certain times of day, say from dusk to dawn, in order to minimize the impacts of vehicular and other human traffic on wildlife. Closing the road at night provides a clear message that the road is not a transportation corridor, but only a park destination.

The park should more explicitly consider strategies that encourage people to leave their cars and visit the corridor using human-power. The preliminary information from the Utah State Study shows that a majority of visitors to key destinations in the corridor did not ever leave their car. Providing incentives for people to leave their car and walk, hike, or bike in the corridor makes for a more intimate experience with wildlife and habitat, and fosters greater support of the park in the long-term.

The park should explore additional public transit opportunities, like using some type of interpretive tour / transit system that allows people to learn about and experience the corridor while not having to drive a vehicle.

Longer-term, I would encourage the park to develop a strategy to provide public transit throughout the entire park. In the future, one should be able to visit Grant Teton National Park without a car! Teton County, Teton Village Association and START would all be potential local government entities and corporations with whom the park may explore a partnership to provide transit services within the Moose-Wilson corridor and more widely across the park.

Question 4:

What other comments or suggestions do you have?

I want to reiterate the fundamental values of the Moose-Wilson corridor and an overarching theme that should guide any park management decision about the Moose-Wilson corridor.

The Moose-Wilson corridor is a unique part of the Greater Yellowstone Ecosystem and Grand Teton National Park that harbors a diversity of wildlife, habitats, streams, rivers, and scenic resources. It provides an unparalleled chance to experience some of Grand Teton's most spectacular wildlife, habitat and scenery. The National Park Service has an obligation to protect and preserve these resources for current and future generations and must focus their efforts on doing so.

The park must make it easy and safe for people to visit and enjoy the Moose-Wilson Corridor on foot, bike, or any other means. It should not be necessary to have a car to visit the corridor.

It is not the park's job to manage county transportation needs. The Moose-Wilson Road is not a county transportation corridor.

Overall, I recognize the challenges facing the park in meeting the demands of diverse interests. Ultimately, the park must manage the corridor to meet its stated and legal mandate: protect critical park resources while also making it easy and safe for people to visit and experience this unique corridor with minimal impacts to park resources.

Moose-Wilson Preliminary Alternatives
Flip Chart Comments from Public Open House
August 28, 2014

Other Comments

1. Look into rental cars and GPS companies to tell people to go through town to the airport. Right now they go from the airport (they are directed by iPhone) to village through M-W Road.
2. Need science for all alternatives and their impacts. Transit service, bike, ped. On existing road. No widening of road. Limit or remove autos.
3. DO NOTHING
4. Extend comment period!, please
5. No more pavement
6. Where is the wildlife/ecology alternative? All the existing alts focus on pleasing people to one extent or the other. What is best for the park, nature, and future?
7. Ditto! [Referring to comment above]
8. Respect national park mission by doing 2 things:
 - a. Reduce motor vehicle use and
 - b. Build a separated pathway.
9. Please extend comment deadline for alternatives.
10. Yes! [With three arrows pointing to the previous comment]

11. Extend comment period - provide more data
12. Yes! [Referring to comment above]
13. Need to model traffic impacts on N. 89 Rockefeller Parkway - South Boundary to Moose. Those are direct impacts of closure alts. Its also parkland, has wildlife issues now that more traffic impacts negatively.
14. Night-time closure!
15. Wildlife 1st! Bikes on road - no path!
16. No thru road
17. No winter grooming - critical winter moose range
18. No separated bike path - habitat fragmentation, 2000 trees removed and acres of pavement
19. Portable radar speed detection systems that rangers can take with them - signage telling people of citations and ticket costs at the entrance stations
20. Do people have to go to judge to pay a ticket? [With arrow to previous comment]
21. Protect park resources #1
22. Reduce volumes of vehicles
23. Directional traffic
24. Don't pave
25. Keep bikes on existing surface
26. Don't groom - leave natural
27. Add transit
28. Realign north away from wetlands
29. No commercial taxis
30. Permit limit commercial tours
31. Protect the park!
32. Demographic representation: Please note the age demographic that has attended this event. The pending holiday weekend approaching has kept many working families away who are in favor of PATHWAY.
33. Alt A with a pathway
34. Biking is a healthy use of GTNP - more pathways
35. More boardwalks for getting people out of cars. - More parking so they can get out of cars!
36. Alternative D is the best option for families, visitors, locals, wildlife, active folks and passive drivers. Everyone wins!

Thank you for taking comments on the transportation plan for the Moose Wilson corridor. I support Alternative D as it allows people to enjoy the park by walking or biking safely. We can walk on all of the dirt trails in the area, so why not when re-planning the fate of the Moose-Wilson road not allow for people to walk and bike safely along the corridors. When we have family and friends in town I can't imagine a better way to enjoy the Park than to ride our bikes from Wilson to the Rockefeller Center. Less traffic, better for the environment, and a healthy alternative.
Thank you,

Correspondence Text

1. What strategies do you like?

We support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Park values are best protected under Alternative D, which recognizes that wildlife and park visitors can be thoughtfully managed together, the essence of National Park visitation. Under Alternative D, visitors experience this part of Grand Teton National Park in a way that is respectful of natural resources, informative, inspiring, and safe.

Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular public on a needed pathway.

2. What strategies don't work?

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of

vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitably see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway.

3. What other suggestions do you have?

A separate Moose-Wilson pathway is a safety need, not a want, an imperative in any Alternative. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Decreasing the increased traffic volumes for the long term is the Park's objective and that is possible only with Alternative D, which uses thoughtful, safer ways to get people out of vehicles and into the outdoors.

Ask for Alternative D to help make meaningful traffic reductions and adaptations so that wildlife can thrive and visitors can have access to their national park.

September 15, 2014

Grand Teton National Park
Attn: Moose-Wilson Planning Team
PO Drawer 170
Moose, WY 83012

Dear GTNP,

I want to add my comments to those of many of my fellow Teton County residents on this important matter. While we all recognize that the future of the road is of national concern, the amount of local knowledge available on this question can be hugely helpful. We all feel passionate about it because we love that area so much.

Generally, I support the continuation of the road in the same slow, narrow, winding rural character we've known. However, I think the south end of the road should be narrowed and paved. As it is now, it gets continually wider, the trees and vegetation are covered with dust and I do not believe the use of the current dust control methods are good for cars, people or wildlife. Overall, I support Alternative D with some changes because I am in favor of the addition of a bike path for safety and access.

Current thinking seems to be focused on the phrase "adaptive management" and that is a wonderful way of thinking about changes in management based on solid facts and adapting to them as we go along. With that in mind, both cars and bicycles can be limited as to numbers, time of day and certain seasons as needed over the years to come.

I was privileged to see Bill Resor's letter on this matter and had the opportunity to talk with him about the changes he suggested to Alternative D. I doubt there are many who know that road better than he does and he had some very good ideas that deserve serious consideration. Chief among them (and also cited by others) is the traffic control station at the north end of the M-W road. It should be combined with the existing entrance station. Public transit should be a major consideration for the future and bikes and public transit should be allowed to pass through the traffic control station in a separate line from the regular traffic which would be subject to adaptive management constraints as needed. Private shuttles could also be included in the incentivized lane. The Granite Creek entrance station would also serve as a traffic control station that encourages shuttles and bikes and precludes excessive individual motor vehicle traffic.

The route of the bike path should be flexible and site specific and not always limited to 50 feet from the road. 18 suggestions by Resor are very detailed and helpful in determining the ideal route.

I know something needs to be done about the Death Canyon access and combination with White Grass Ranch, but I don't have strong feelings about the alternatives suggested.

Generally, I think the whole process on the draft alternatives has been very well done. The alternatives are clearly laid out and having the public meeting early in the process was a good idea. A lot of thought has obviously gone into the documents provided and the NPS deserves a lot of credit.

Sincerely,

Leslie Petersen

Topic Question 1:

I support Alternative D. I think this plan should be carried forward because it not only benefits wildlife but it also benefits bikers and hikers with an alternative route.

Topic Question 2:

Alternative B & C. This will increase the traffic through town and cause more wildlife impacts on the other road surrounding GTNP.

Topic Question 4:

As a local biker and hiker, I feel that it is imperative to have a separate pathway that allows bikers and hikers to a safe chance to view one of the best parks in the world.

RE: Comments on Preliminary Alternatives, Moose-Wilson Corridor, Grand Teton National Park

I. Overall Comments

Thank you for allowing time for public comment and reassessment of management alternatives for the Moose-Wilson corridor. As someone who has lived in the valley and has worked for both the Forest Service and the National Park Service here, I have an attachment to, and knowledge of, the Moose-Wilson road as well as an appreciation for the management obligations of the National Park Service.

The corridor is a particularly sensitive area of Grand Teton National Park; all the more so now that particular wildlife species are utilizing the habitat of the corridor. In addition, the road qualifies for listing on the National Register of Historic Places. Those two attributes in particular call for the National Park Service to take major steps to ensure the wildlife and historic resources are protected consistent with its mission.

One approach that may be considered is development of indicators and associated 'triggers' for management actions if conditions reach yet-to-be-defined unacceptable thresholds. If the present condition is considered the baseline, this is not appropriate. The 2014 public comment process is being conducted as conditions for multiple park resources in the Moose-Wilson corridor have already passed some undefined acceptable threshold.

The 2014 Utah State University study [1] notes that the corridor must absorb an average of 2,000 motorized vehicles a day in peak visitation months; and, further that the bulk of the traffic is passing

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

through without stopping and is traveling at a fairly significant rate of speed. This is not activity that enhances any of the goals the alternatives have presumably been developed to address.

It is not the park's obligation to provide a commuter corridor, especially where one did not previously exist and because private lands are 'exporting' development pressure to national park lands. It is also not the Service's obligation to accommodate narrow-interest recreational lifestyle demands as represented by many of the appeals for a separate pathway. Proportional use of the corridor for the lifestyle choice of bicycling only amounts to, at most, around three percent, according to the Utah State University study cited above. A separated pathway will do nothing to reduce continually escalating motorized vehicle traffic pressure on the corridor; however, it will have a negative effect on wildlife and habitat and will impair the historic character of the road.

The most critical management action to take to protect the corridor is to go beyond halting ever-escalating traffic pressure from motorized vehicle and alternative travel modes such as bicycling and reduce overall use. Two management actions in particular can go a long way toward reversing pressure on the corridor and making complicated management strategies such as issuing permits and policing usage levels moot: 1) making the roadway a dead-end from either direction, with a gate for emergency use, at the LSR Preserve, and 2) instituting the use of shuttles. Shuttles can accomplish two objectives at once. By eliminating or reducing the use of individual motorized vehicles, it radically reduces currently unacceptable pressure on resources. Through a dramatic reduction in motorized vehicle use, it can also make the roadway safe for bicycle use on the existing surface.

I strongly support the above strategies as an "Alternative E." Conversely, I specifically reject Alternative D. I strenuously object to a management strategy for "linking [the corridor] to the region's larger recreational network." This is a national park, not a national recreation area. The park has already amply provided for those who do not want to share roads with motor vehicles by the park being a partner in constructing a separated pathway from the north end of the Town of Jackson all the way to the Jenny Lake area. If a separated pathway around the Antelope Flats road is constructed, more than adequate linkage will have already been provided. As the Moose-Wilson corridor is highly sensitive wildlife habitat, constructing a separated pathway has a high likelihood of creating conditions of wildlife avoidance and concomitant habitat fragmentation. It is exceedingly inconsistent with the park's obligation to protect wildlife resources. There are abundant opportunities to meet objectives for access, education and appreciation of the unique natural environment of national parks throughout other areas of Grand Teton National Park. The park does not have to 'nor should it; nor does it 'accommodate every practicable activity for visitor experience everywhere. If anything, the Moose-Wilson corridor should be given special low-development status based on the high sensitivity of the area.

I do not support any of the alternatives that call for substantial alteration of the road such as additional paving, further roadway disturbance for parking, realignment on the north end or addition of a separated pathway as all of those actions will negatively affect the road's historic character. As the Moose-Wilson road qualifies for listing on the National Register of Historic Places, this is a significant issue. The only action I can support is whatever minimal modification is necessary to resolve issues associated with the road's location in wetlands utilized by wildlife.

I encourage the National Park Service to try to determine what level of use was present before intensifying corridor use warranted the current process and set that lower use level as a target for corridor conditions. This is not an innovative idea. It has been used as a policy and management goal for other issues in order to restore resources such as air quality and water quality. I urge the Service to use such an approach as a management strategy for the Moose-Wilson corridor in order to preserve a unique suite of resources the

National Park Service has the privilege, right and obligation to steward consistent with a mission that makes our national parks a model the world over.

II. Specific Comments

The following comments regarding the four current alternatives are made utilizing the Preliminary Alternatives Newsletter goal statements. I am not commenting on what I consider less important details such as relocation of the Death Canyon trail parking lot; rather, I am emphasizing potential effects of alternatives on the main road as that requires the most critical management decisions.

1. Scenery: Preserve the exceptional variety of scenery and wildlife viewing...

Alternative A: This alternative does nothing to meet the goal for scenery and wildlife viewing. It allows further congestion, disturbance of areas outside of the roadway, and general degradation of the overall experience by allowing what is already a serious problem to go unchecked. After all, the reason the current public comment process is now underway is because pressure on the corridor from several sources such as development on private lands south of the corridor and increased visitation generally has already seriously degraded desired conditions due to intermittent but severe congestion and motor vehicle traffic traveling at speeds inappropriate for the rustic nature of the road. To restore a higher level of resource protection and visitor experience, the park must find ways to roll back corridor use to a lower level.

Alternative B:

â€¢ Reducing speeds along the road is a positive step to restore former conditions and meet the goal of preserving scenic resources, but it is not sufficient to achieve the appropriate and necessary level of resource protection.

â€¢ Paving the unpaved portion of the road does not contribute to preservation of scenery and viewing experience and, in fact, may continue to degrade resources by further encouraging motorized vehicle use of an area already experiencing too much use for its resource-sensitive attributes.

â€¢ Installing a gate at the LSR Preserve to restrict two-way traffic is a good strategy as far as it goes, but it needs to go further. The Moose-Wilson road should be dead-ended from either direction at the LSR preserve with a gate to allow for emergency access. The road would no longer be useful as a potential commuter route or attractive for certain types of commercial enterprises. The LSR Preserve would be the destination, accessible from either direction. This would better ensure protection of visitor experience of the corridor's unique attributes. The overwhelming likelihood of traffic reduction as a result of eliminating drive-through traffic for commuting would also likely reduce speeds on the road.

â€¢ Assuming the Park Service were to adopt the strategy of closing the road from either direction at the LSR Preserve, there would still need to be limitation of commercial tour traffic to ensure protection of corridor resources and values. If a decision is made to continue allowing commercial use, numbers should be limited through use of contracts rather than special use permits.

Alternative C: This is an inferior choice for achieving the goal of viewing scenery and wildlife in the corridor. Limiting use of the roadway to non-motorized vehicles two days a week and implementing queuing is a convoluted management strategy. More than the other alternatives, Alternative C creates heightened uncertainty for once-in-a-lifetime park visitors who might want to experience the corridor. It could also lead to increased air and noise pollution in a national park setting. I have been in parking queues at the LSR Preserve. While the party I was with turned off the engine, multiple cars continued to idle while waiting for parking spaces, adding to air pollution and creating noise that took away from the opportunity to experience the natural sounds of the immediate area.

Alternative D: I do not support Alternative D for the reasons stated in my Section I Overall Comments at page 2. The 2014 Utah State University study, cited on page 1, determined that 74 percent of bicyclists did not stop in the corridor, suggesting that it is used for transportation or for exercise/training. It is doubtful a separated pathway would result in substantial additional use of the pathway as a means to observe wildlife and scenery.

2. Geologic Processes: Allow for natural geologic forces to continue...

It does not appeal' there will be any significant issues from any of the alternatives relative to this goal.

3. Ecological Communities and Wildlife: Protect and maintain the natural function, diversity, complexity and resiliency. ...and maintain the unique habitat characteristics...

Alternative A: This alternative does nothing to meet the goal for ecological communities and wildlife. It allows further congestion and disturbance of areas outside of the roadway, thereby further degrading ecological communities and potentially disrupting wildlife use of the corridor.

Alternative B: For the reasons stated in response to Goal 1, Alternative B as presented does not go far enough in protecting ecological communities and wildlife. Reaching most stated goals depends on implementing strategies that reduce corridor types and amount of use.

Alternative C: This alternative is an improvement over A and B in terms of potentially meeting the goal of protecting and maintaining corridor ecology and wildlife. The concern is closing traffic two days a week to all but bicycle and pedestrian traffic. This could, in fact, increase human-wildlife conflicts. Some of the wildlife now utilizing the corridor have aggressive tendencies. Whereas they may not be as likely to challenge motorized vehicles if agitated, bears and moose, in particular, may be more likely to charge cyclists and pedestrians. As stated elsewhere, the most effective strategy for achieving protection of ecological and wildlife needs is to take steps that will reduce corridor use below current levels. Those strategies include terminating through traffic from either direction at the LSR Preserve and implementing shuttle service within the corridor.

Alternative D: I do support Alternative D for the reasons stated in my Section 1 Overall Comments at page 2. Alternative D, in particular, runs contrary to protecting wildlife and historic resources while only providing vague direction and action to control motorized vehicle use, apparently using current conditions as the baseline, which is not appropriate.

In particular, I strongly object to the construction of a separated pathway that expands the road right-of-way, calling for permanent removal of vegetation important to wildlife for food and cover and further disturbing wildlife use of the area. The 2009 Revised Draft Moose'Wilson Corridor Adaptive Management Plan by the Western Transportation Institute (WTI) at Montana State University [2] states, at page 9, "The separated pathway...would require removal of 2,150 to 2,900 trees. There are concerns that the unpredictability of pathway users could make it more difficult for some wildlife to adjust to this new use, resulting in additional habitat displacement and fragmentation." Studies on wildlife interactions with recreational trails suggest this will be the case. [3] And, at page 27 of the WTI report, the pathway "would have an impact on the sensitive environment that the other strategies do not. Apart from other solutions, this approach would not address growth in motorized vehicle traffic volumes." Construction of the separated pathway should automatically be excluded based on its potential negative effects on corridor ecology and wildlife needs. Any suggested alteration of the road and right-of-way that

does not in any way address motorized vehicle traffic pressure, which is the fundamental and most critical issue driving this management plan process, should also be automatically disqualified.

4. Aquatic Resources: Protect and restore the natural hydrologic features...

Alternative A: This alternative does nothing to meet the aquatic resources goal as it allows further congestion and disturbance of areas outside of the roadway, thereby further affecting sensitive aquatic resources.

Alternative B: For the reasons stated in response to Goal 1, Alternative B as presented does not go far enough in protecting aquatic resources. Reaching most stated goals depends on implementing strategies that reduce corridor types and amount of use. Alternative C: While this alternative may not best achieve the goal of protecting aquatic resources, correcting drainage and road surface issues is the middle ground between doing nothing and impairing the historic character of the road through significant realignment of the segment that traverses the wetlands.

Alternative D. Alternative D does not appear to affect aquatic resources.

5. Cultural History and Resources: Protect and maintain cultural resources...

Alternative A: Although this alternative offers the least alteration to existing historic resources, it also does not go far enough in protecting the historic character of the road as it allows pressure for motor vehicle use to continue, and continue escalating, unchecked. The significant growth in use of the road over much of the past decade degrades the cultural character and possibly the physical structure of the road. Allowing this sort of impact to continue unabated does not meet the Service's obligation to protect the historic resource from impairment.

Alternative B: For the reasons stated in response to Goal 1, Alternative B as presented does not protect cultural history and resources. Reaching this goal depends on implementing strategies that reduce corridor types and amount of use.

There are additional problems with Alternative B relative to cultural history and resources protection. Realignment of the roadway at the north entrance and through the wetlands is inconsistent with protecting its historic configuration. Realignment at the north end becomes unnecessary if the LSR Preserve is the terminus from both directions, as this action will likely reduce overall traffic significantly.

While I support protection of wetlands along the corridor, protecting the road's historic character is also important; and it is a difficult trade-off. Under the circumstances, I do not support the realignment around the wetlands as presented. The currently unpaved portion of the road should not be paved as it will diminish the road's historic character and may further encourage use of an already-congested corridor.

Alternative C: While this alternative may not best achieve the goal of protecting aquatic resources, correcting drainage and road surface issues is the middle ground between doing nothing and impairing the historic character of the road through significant realignment of the segment that traverses the wetlands. I support this strategy over realignment, albeit reluctantly as I realize it does not do the optimal job of protecting aquatic resources.

Alternative D: The separated pathway suggested as a management alternative would clearly negatively

affect the historic character of the roadway and should therefore be rejected. As with Alternative B, realignment of the roadway at the north entrance and through the wetlands is inconsistent with protecting the road's historic configuration.

6. Natural Soundscapes and Acoustic Resources: Preserve and restore the natural soundscapes...

Alternative A: This alternative does nothing to meet the acoustic resources goal. It allows further congestion and disturbance of areas alongside of the roadway and the potential for introduction of pollutants associated with motorized vehicle use of the roadway, further damaging sensitive aquatic resources.

Alternative B: For the reasons stated in response to Goal 1, Alternative B as presented does not protect acoustic resources. As with the other goals, reaching the park's acoustic goal for the corridor depends on implementing strategies that reduce corridor types and amount of use.

Alternative C: Some of the traffic control methods suggested in Alternative C have the potential to slow increased incursions with respect to acoustic resources. Yet again, however, this alternative does not go far enough in that it does nothing to roll back conditions that already represent unacceptable effects on corridor resources.

Alternative D: This alternative does little to meet the goal of preserving acoustic resources. If anything, constructing a separated pathway may further diminish acoustic resources by further encouraging different uses than those already a part of the corridor. Greater numbers of walking parties carrying on conversations in areas of the corridor not previously available may interrupt enjoyment of the acoustic resources in ways that did not formerly exist.

7. Visitor Experience in an Outstanding Natural Environment: Provide meaningful opportunities to experience and enjoy the rustic character...

Alternative A: This alternative does nothing to meet the above goal as it allows further congestion, consequently diminishing rather than preserving or enhancing visitor experience of the corridor.

Alternative B: For the reasons stated in response to Goal 1, Alternative B as presented does not protect the potential for superior visitor experiences.

As with the other goals, reaching this one depends on implementing strategies that reduce corridor types and amount of use. If anything, this alternative diminishes the potential by allowing two-way through traffic to continue but makes the possibility of experiencing the unique environment of the corridor difficult to predict based on limiting access during certain ambiguously referenced, undefined peak periods. This in turn could result in frustrated expectations, thereby taking away from visitor experience potential. If two-way through traffic is prohibited, with LSR Preserve as the terminus, there will not be any unpredictability. Furthermore, the potential of traffic reduction as a result of not having through traffic may actually increase visitor enjoyment.

I support ungroomed winter access. Groomed trails are available elsewhere in the park. The corridor should be available for a more rustic winter recreation opportunity consistent with its general rustic character.

Alternative B appears to be the only alternative that includes the possibility of shuttle service; however, it also appears to be a lukewarm suggestion. The use of shuttles, combined with dead-ending the road from each direction and LSR Preserve, comprise the two strongest management actions to protect

the greatest number of resources associated with the Moose-Wilson corridor.

Alternative C: Similar to Alternative B, this alternative possibly diminishes the goal for visitor experience by making access difficult to predict based on complete motorized vehicle prohibition on certain days and queueing predicated on ambiguously referenced, undefined peak periods. Both actions could result in frustrated expectations, thereby taking away from visitor experience potential. If two-way traffic is prohibited, with LSR Preserve as the terminus, there will not be any unpredictability. Furthermore, the potential of traffic reduction as a result of not having through traffic may actually add to visitor enjoyment.

As stated elsewhere, this alternative does not go far enough toward achieving the park's visitor experience goal in that it does not roll back conditions that now represent unacceptable effects on corridor resources.

Alternative D: According to the 2014 Utah State University report referenced elsewhere, bicyclists only represent 2-3 percent of corridor users. Other than hiking on developed trails in the corridor backcountry, foot traffic is nearly non-existent along the road right-of-way. The construction of a separated pathway is so potentially destructive of wildlife and historic resource values that it cannot meet visitor experience goals. Further, a separate multi-use pathway may diminish existing opportunities for an exceptional experience by introducing an added human-made physical object 'the paved pathway' and by introducing further distractions from those using the pathway.

While additional guided tours might add to visitor education and enjoyment of the area, not taking action to reduce the already-present level of pressure would, overall, diminish the chance for the park to optimize visitors' experiences of the corridor.

Topic Question 1:

Plan D

Mostly because it includes a Pathway.

Increasing the parking spaces in Death Canyon is a great idea, I question not paving the road. the pot holes get so bad that drivers widen the road in an effort to get around the potholes.

adding a restroom at Granite Canyon Trailhead is a great idea. Could there be more parking spaces added there?

Topic Question 2:

Plan D is flawed by not paving the road , I feel that the current system of grading the road is inadequate for the current traffic. The pot holes do naturally slow traffic, but the drivers are so focused on dodging potholes they are all over the road causing danger to others. Paving the road is necessary!!).

I need more details to under stand the reservation system. I live Teton village and The Moose-Wilson Rd entrance is my main entrance to the park, How would the reservation system work? How often do you expect there to be delays ?

Topic Question 3:

Force the county into bridge across the Snake River.

Topic Question 4:

Have you considered lowering the speed limit to 20 miles per hour. adding Has the Park considered free shuttles? for the whole park including Moose Wilson. This could be paid for with a per vehicle surtax for both short term and seasonal visitors is speeding to be prevented on the road?

The Park might consider speed trap cameras. (This would be great on high way 89-191 too to help prevent the vehicle slaughter of wildlife

Topic Question 1:
Option A. Best way to protect habitat.

Topic Question 2:
All other options. Parking is a self limiting control as is the "rural condition of the road. If anything, the other alternatives under consideration will increase the chance of car / bicycle / wildlife interaction, creating any number of unintended consequences. Also, any of the proposals that require further habitat destruction are in direct conflict with the Park Service mandate of Protect and Preserve. The happy difference between the USFS and Park Service is that GTNP is not a "land of many uses."

Topic Question 4:
As a policy, the NPS should be more proactive in protecting all of the natural assets in the South Tetons. The lack of oversight when the JHMR tram was being constructed plus the virtually unsupervised visits of thousands of summer visitors has negatively impacted the habitat on the NPS / JHMR interface.

Comments: I would only re-state that the NPS is not obligated in anyway to provide increased recreational opportunities at the cost of increased stress on the habitat. The destruction of 3000 trees, for example, would significantly decrease bird nesting opportunities, small mammal habitat and significant food sources and hiding places for the mega-fauna.

Sometimes doing nothing while increasing oversight and communication is the best course.

Topic Question 1:

Most of the strategies outlined in Alternative D BEST address the seven goal statements.

I urge the NPS to look forward into the future and strive to engage visitors in their park experience in a way that will inspire and enrich their lives. The next generation of conservationists will not come from the backseat of vehicles. I think we need to create opportunities like a pathway to engage visitors in a deeper park appreciation.

Topic Question 2:

Strategies proposed in Alternative B and C achieve maybe five of the seven goals. Natural Soundscapes and Visitor Experience are not restored or enhanced.

The concepts of closures, gates and dead ends are problematic now and expanding on restrictions and closures should not be considered. These are not long term solutions. The park should not consider alternatives which damage surrounding ecosystems.

Topic Question 3:

Please consider the idea of a reservation system for just LSR visitation. This system would solve the HUGE problem of rangers and volunteers cueing idling vehicles into a restricted size parking lot. The reservation system could take into consideration if the visitors are hiking for the day or just visiting the center. Adaptive management could allow for future needs to expand the reservation system to the road ONLY if necessary.

As I study this issue over time, I become more and more convinced that a pathway is SO essential and key, that I hope to see more than TWO PRELIMINARY ALTERNATIVES which address pathway possibilities. A variety of alignments should be evaluated. Even the surface material of the pathway should be seriously analyzed.

All modes of transportation need to be considered individually. For example, taxis have a bad rap, thought to "short cut" to the airport. Someone who takes a taxi down the Moose Wilson Road is a visitor who decided not to rent their own individual car. One less car should not be penalized.

Permits for taxis, eco tours, transit can help manage sustainable solutions.

Information given at the Granite entrance station could include driving tips such as where to stop and park and when not to stop or park.

The merits of connecting the Park Headquarters to LSR in a non motorized way are HUGE and long lasting. For visitors and park personnel to only exclusively have the single drive option for this short distance is CRAZY.

As we go forward protecting our treasured places, I think the NPS should RECONSIDER the VALUE of CONNECTIVITY with their surrounding ecosystems and gateway communities as one of your GOALS AND DESIRED CONDITIONS. For example, forcing visitors to drive all the way around to a different entrance gate is not SUSTAINABLE. Global warming is a real threat to the parks so alternatives must make environmental sense.

Topic Question 4:

I fully support the comments submitted by the Teton County Commissioners. I also endorse the comment letter from Friends of Pathways so I have tried to not repeat those suggestions.

Please consider offering more than one Pathway Alternative for the next comment period !!!

Thank you for this opportunity to comment.

Maggie Gibson

John and I sent comments earlier against a bike path under any circumstances; we also are opposed to 2-way traffic on the road. We have considered a number of alternatives and believe the following would best comply with the NPS mandate to preserve resources above all else:

1. Realign road as shown in Alt. B;
2. Close the road to through traffic at Saw Mill Ponds overlook and Granite Canyon parking lot;
3. Provide regular shuttle service from Saw Mill Ponds and if demand requires it from Granite to the Rockefeller Preserve. Perhaps the Teton Science school, GRTE Foundation or other friends groups could work together to provide truly world-class interpretive tours. A great opportunity.

Mr. David Vela, Acting Superintendent
Grand Teton National Park
P.O. Box 170
Moose, WY 83012

Re: Moose-Wilson Corridor Comprehensive Management Plan Preliminary Alternatives

Dear Superintendent Vela,

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Thank you for inviting the National Parks Conservation Association (NPCA) to offer comments on the Moose-Wilson Corridor Comprehensive Management Plan. My comments are offered on behalf of the NPCAs 800,000 members and supporters nationwide. Grand Teton National Park (GRTE) is an iconic gem within the National Park Service (NPS), and draws millions of visitors each year to experience the majestic scenery and the diverse and abundant species of park wildlife. The NPCA Grand Teton Field Office, located in Jackson, Wyoming, is devoted to the many issues which affect the park.

We applaud the NPS for your ongoing efforts to plan for the future of the Moose-Wilson Road Corridor. This corridor and the 7.7 mile road within it provides essential habitat for many species of wildlife and could arguably be considered the best place to view wildlife in Grand Teton National Park. This destination road also provides the opportunity to find quiet and tranquility within an otherwise bustling summer season, hike on world-class hiking trails, cycle along the scenic gravel road, and provides the opportunity to visit the Laurance Rockefeller Preserve and Visitor Center; established to provide visitors with a contemplative experience of the parks natural environment.

The Preliminary Alternatives, released as part of the Moose-Wilson Road Comprehensive Management Planning process, will provide a foundation for a science-based analysis for future management of the historic Moose-Wilson Road Corridor. This road and its unparalleled biological treasures remain intact today, but modern day pressures require that the park exercise extreme caution to maintain and protect the values of this corridor. While the draft alternatives provide an important basis for discussing future management options, they do not include the science and policy-based impacts analysis that the draft Environmental Impact Statement (EIS) will provide in the coming months. As such, NPCA will not endorse a particular alternative at this point in the process. We will, however, thoroughly review the draft alternatives and continue to advocate for the visitor solitude and for the protection of the wildlife and wild places that this unique part of Grand Teton National Park is renowned for.

There are some interesting ideas presented within one or more of the alternatives that we feel have merit and should be carried forward and be further analyzed in the Draft Environmental Impact Statement. Our suggestions and comments focus on preserving the outstanding natural resource and wildlife values, unique solitude and historic character of the corridor. We also have identified deficiencies in the scope of the range of alternatives proposed, and strategies that have been left out that should be considered within any suite of draft Environmental Impact Statement alternatives.

GENERAL COMMENTS

Unique Values of the Moose Wilson Road Corridor:

Following are the values that NPCA has identified as most critical qualities of the MWR corridor that we ask NPS to prioritize and ensure non-impairment of these unique resources in action alternatives:

Quiet and Natural Park Experience:

The Moose Wilson Road corridor provides a rare experience for park visitors. This rambling country road winds through some of the most spectacular front-country scenery in the park. It offers the opportunity to experience the solitude and wonder of the area through the Laurance Rockefeller Preserve trail system and visitor center; a gift to the American people that embodies Laurences vision for the area as a source of renewal, reflection and opportunity to experience pristine nature.

Park Wildlife:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

The wildlife viewing in this area surpasses all other areas in the park. Within the 7.7-mile road corridor park visitors have a good chance of seeing black bears, beavers, Great gray owls, Trumpeter swans, moose, elk, and if they are lucky - Grizzly bears and Gray wolves.

The corridor provides key habitat for many species, and contains important wildlife movement corridors that traverse dense forests, sage meadows, and wetland riparian areas. Grizzly bears have also moved into the corridor over the past decade, and can frequently be viewed along the road. It is also not uncommon to see black bears hanging from the trees alongside the road harvesting the fall berry crop. Bear jams are a common occurrence, and traffic is frequently disrupted as visitors flock from their cars to view and photograph bears and other wildlife in their natural setting. These up-close experiences thrill park visitors, but frequently necessitate road closures several times a year, to protect wildlife and visitors and avoid wildlife/human conflicts. Over the past few years, wolves have also established dens in the area. Due to their sensitivity to human disturbance and intrusion it has been necessary for the park service to close areas around den sites.

The road is also closed to automobile traffic during the winter months to give wildlife a respite from the busy summer crowds and at a time when it is essential for their survival to conserve energy.

In short, these wildlife viewing experiences offered along the Moose-Wilson Corridor are unsurpassed in Grand Teton, and truly create a world-class experience for park visitors as a park destination - rather than a drive-through transportation route.

Scenery:

Among the most significant attributes of the Moose Wilson Road corridor are its scenic values. Park visitors are provided a tranquil journey along a meandering road that winds through deep wooded areas, and past riparian streams and ponds. From the road, visitors can access trailheads that follow canyons to high backcountry elevations. The area is well-used by artists, photographers, wildlife viewing companies, hikers, cyclists and equestrians. The slow speed limits, narrow gravel road bed and topography lend to a slow meander through the corridor.

Recreation:

Recreational opportunities abound within the corridor, attracting day hikers, climbers, backpackers, cyclists, and horseback riders. The road also provides access to designated park wilderness and provides a gateway into an extensive trail system in the Grand Teton backcountry.

Historic and Cultural:

This historic road provides a unique experience to allow visitors to escape the busy summer in Jackson Hole, and enjoy a slow and quiet drive along the winding gravel road past historic dude ranches, and the Laurance Rockefeller Preserve and Visitor Center. The preserve captures the rich history of the Rockefeller family's generous gift to the American people; first through the actions of John D. Rockefeller to purchase and transfer lands that would later become Grand Teton National Park, and now recently through the restoration and donation of the LSR Preserve.

SPECIFIC COMMENTS

Whats at Stake?

Traffic Impacts:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Please assure that the Moose-Wilson road corridor is maintained first and foremost as a national park system road throughout all action alternatives. As Teton County has grown into an international tourist destination; so have the demands on the park increased. Currently, the county is struggling with difficult transportation planning decisions, in response to both residential and commercial growth, and accompanying increases in residential and visitor traffic; particularly along the West Bank of the valley. These impacts are taking their toll on the Moose Wilson Road corridor, as residents and visitors increasingly use this corridor to bypass traffic in the Town of Jackson. Teton County transportation issues must be addressed through the current county transportation study, and should not depend on the use of this gravel park service road to address the county's transportation deficiencies.

A study was recently conducted by Utah State University for the National Park Service to assess changes in the Moose-Wilson Corridor road use. The study found that traffic volume on the road doubled between 1988 and 2003. Currently, an average of 2,000 vehicles use the corridor each day. The latest data released shows that trend continuing upward with a 30-60% increase since 2006 in late summer and fall use of the road. All indicators point to a continued, steady increase of traffic into the future.

Although, the road has always been managed by the NPS as a park destination where visitors can enjoy quiet, non-motorized recreation and view wildlife. This study clearly shows that it is increasingly being used as a commuter traffic corridor. This narrow gravel road was never meant to accommodate commercial and commuter traffic, and to address these current traffic levels. However, NPCA does acknowledge and support continued reasonable access to private inholdings along MWR. We applaud the Services efforts to try to address these impacts; focusing on vehicle, recreational and pedestrian traffic, while still seeking protecting the areas unique wildlife, biology and cultural history.

Any alternatives considered for inclusion in the DEIS must first and foremost protect the unique characteristics of the corridor, articulated above. In order to accomplish that goal, we believe it is imperative to significantly reduce commuter traffic, eliminate commercial traffic, and manage the road as a destination. This road is undeniably a park-owned and managed road, and has been adaptively managed through seasonal, and daily closures (when necessary to avert wildlife conflicts) for many years. There are new strategies presented within the parks proposal to increase management actions in the corridor to address traffic concerns. The majority seem weighted in favor of managing traffic. Proposals such as limiting the number of vehicles on a daily or hourly basis, utilizing a reservation system, and restricting commercial uses, and closing the road two days a week have merit, but are 'management heavy and may in the long run create more animosity towards the park service and more visitor frustration than a longer-term solution: Consider the impact of having cars waiting to enter the park, backed up from the southwest entrance to Teton Village as a worst possible scenario. Such proposals also create confusion for residents and visitors alike, require a high level of public information, and are subject to political and public pressure to increase the number of vehicles. A reservation system could be biased in favor of local residents and commercial businesses and hotels, who are savvy as to how to get into the cue for daily access.

Increased Surface Area Pavement:

While aspects of the proposals that focus on providing more road pullouts and larger parking areas may address peak visitor use, their construction and numbers need to be weighed against the environmental impacts of disturbing more habitat. Few people would like to see a parking lot the size of Jenny Lake built within the Moose-Wilson Corridor. It is questionable that a parking lot with 60 spaces is necessary or appropriate in the White Grass Ranch area.

The corridor may benefit from additional pull-outs and wildlife viewing areas, but even in the case of

these smaller disturbance areas, there should be limits on the number and size of these areas. If deemed necessary, these new pull-outs should not be paved, rather use the natural road surface. The NPS must use rigorous science to balance the impacts of more human use and disturbance along the road with their core mission of preserving and protecting both the natural environment. The scope and size, of any new pull-outs and parking areas should be minimized so as not to negate the over-riding goal of preserving the corridor and maintaining an enjoyable visitor experience.

Any alternatives or aspects of individual alternatives selected must utilize the existing road prism and ensure that the extraordinary natural and wildlife assets of the area are not impaired, and that the quiet and scenic experience of this historic roadway is maintained. Studies have shown that paving roads reliably increases the speeds, and that paved roads and wider roads provide greater obstacles to wildlife attempting to cross.

The NPS should also consider the impact on other natural and vegetative resources in the corridor and alternatives should avoid and minimize any significant destruction or removal of trees or disturbance of habitat.

Recreational Use:

Over the past nine years, the NPS has developed a system of bike and pedestrian paths in sections of Grand Teton National Park. These paths are enjoyed by park visitors and provide an extensive system of nearly 20 miles to enjoy the park safely by bicycle, particularly in areas adjacent to major highways.

However, there are many factors that must be considered by NPS as they develop a plan for this special area as it relates to new recreational access. Park studies have shown that the park pathways that have been constructed have had a varied impact on park wildlife. Research has examined how the pathways have affected the behavior of black bears, elk, pronghorn, mule deer, moose and songbirds in Grand Teton National Park. Although there are variations for different species, the presence of pathways and use by pedestrians and cyclists has influenced animal movements, patterns, and in some species, has led to avoidance of habitat adjacent to paths. Some species adjusted better than others; and variations were even seen along gender lines. Critical scientific analysis must be done within the DEIS to evaluate the impacts of any proposed development outside the road prism to ensure the protection of park wildlife and resources.

NPCA wants to make sure that any permitted recreational activities are made safe for park visitors, yet recognizing the fact that all recreational activities have some level of inherent risk. We request a thorough analysis of the safety benefits and tradeoffs associated with each action alternative as it relates to changes in recreational access. As part of the DEIS, we would appreciate an analysis of the factors that make cycling activity more or less safe-i.e. motor vehicle presence, vehicle speed, presence of wildlife and possible aggressive human/wildlife conflicts, etc. In this way, the public will best understand the mix of action alternatives and the environmental and visitor use tradeoffs associated with those alternatives. Recreational access within the corridor could best be accommodated by taking advantage of the fact that the Moose-Wilson Road is already managed as a slow-speed road and by adopting a variety of adaptive road management techniques for use within the existing road prism to allow for safe enjoyment of the area by horse, bike or on foot - without impairing natural resources, or impacting wildlife and habitat security and movement corridors. The NPS should also analyze the establishment of bike lanes within the existing road prism, and appropriate safety signage along the road to alert drivers to the presence of cyclists sharing the road.

The Draft EIS should also analyze potential conflicts between users. For instance, the high and historic

use of horseback recreation in the area could lead to serious safety problems when horses and bikes are sharing use areas. There are also serious safety concerns over potential confrontations between cyclists and grizzly or black bears. The NPS must analyze these safety issues, and have contingency plans for how to best manage and reduce the possibility of wildlife/recreationalist conflicts, as well as conflicts between different users groups whether they be pedestrians, cyclists or horseback riders.

Wildlife Impacts:

The use of the corridor by grizzly bears was not a significant factor when the original 2007 Transportation Plan was developed. Now that grizzly bears have expanded their use of habitat into this corridor, the NPS should study potential human/wildlife conflicts associated with expanded recreational access, habitat fragmentation, habitat avoidance, and disturbance within wildlife movement corridors in the DEIS as there is a significant body of science associated with human impacts on grizzly bears that will apply here. We believe that a rigorous scientific process will provide the best, most up to date information to guide the park in their management decisions to minimize the level of recreational disturbance and preserve wildlife security, habitat and critical movement corridors.

Preservation of Historic Values:

When selecting future alternatives, the park should consider how to best protect the gift of the Laurance Rockefeller Preserve, so that the unique qualities of this section of the road adjacent to and within the Preserve are not diminished by inappropriate traffic volume. Even aspects of the Preliminary Alternatives that propose new adjacent parking areas or significant expansion of the Granite parking area could impact the intent of the Preserve in their clear efforts to restrict parking, remove structures, and provide a quiet contemplative experience at the Visitor Center.

The road prism itself is an historic asset within the Moose-Wilson Road Corridor and should be preserved as a rustic, low-speed road, seasonal road. The Moose Wilson Road is eligible to be listed on the National Historic Register. Therefore, NPS has a responsibility under all alternatives that emerge from this planning process to assure that the unique historic character of this route is maintained. We do support the realignment of the north end of the MWR based on the environmental and habitat benefits inherent in doing so, as long as the existing roadbed is restored to its natural state.

The Advisory Council on Historic Preservation has established regulations for agencies to follow in complying with Section 106 of the National Historic Preservation Act. Under the Act, the NPS must evaluate the historical significance of the property using National Registry criteria, and determine whether a historic property will be affected by a proposed change or improvement and, if so, assess the possible adverse effects. The NPS must also consult with the Wyoming State Historic Preservation Office to develop a plan to mitigate any adverse effects.

Wilderness Values:

The Moose Wilson Road corridor plan must assure that no proposed activities impairs wilderness values on wilderness eligible lands. Lands that have been recommended for wilderness designation fall within the western and northern boundaries of the corridor. These lands should be identified and considered within the EIS process, and all potential alternatives should be evaluated as to its impacts on the natural and untrammeled wilderness qualities of those lands with outstanding wilderness qualities.

New Alternatives for Inclusion in the DEIS:

Although the Preliminary Alternatives provide an interesting and creative array of ideas for discussion,

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

they seem heavily weighted in favor of NPS management rather than working towards the goal of providing unambiguous, long-term solutions for the management of the road. These types of tools may temporarily address the problem, but are subject to change over time and public sentiment that might not favor ongoing limitations or restrictions. Many of the innovative strategies and reliance on transit we would like NPS to consider here are already used widely in the National Park System in parks such as Yosemite, Glacier, Bryce Canyon, Denali, Zion, Yellowstone and Acadia.

One-Way Road Access:

Within the DEIS alternatives, NPCA would like to see analysis of a one-way road alternative that would provide clarity for visitors and residents as to how and when to access the road. Although, there would be additional impacts from a uni-directional road, the Moose-Wilson Road is only open for a limited time during the year and has the positive benefit of discouraging commuter traffic, while still allowing for access. This scenario also allows for the road to be safely shared by cyclists and automobiles.

Temporary or Partial Road Closure:

Although closing the road for two days a week reduces some impacts to the road, it could actually exacerbate impacts on other days of the week, and likely lead to confusion and frustration among road and recreational users. That said, we do believe that closure of the road for periods of time throughout a week should be carried forward into at least one action alternative including an analysis of the potential drawbacks we identify here be addressed.

The permanent year-round closure of the road proposed in alternative B, should be studied, however, the paving of the road and addition of a new parking area could also have significant impacts, which should be analyzed in the DEIS. The proposal also calls for the alternative to be used only under peak use; which is subjective and the criteria for when the road would be gated, versus open should be presented within the DEIS as to estimated months of closure, number of days, etc.

The NPS should work to combine aspects of different scenarios. For example, the following scenario could meet the needs of nearly all the user groups and we request NPS to carry it forward through analysis as a component of an action alternative:

Two-way access could be allowed to White Grass Ranch from the north, allowing wildlife viewing at Sawmill Ponds, hiker access to Death Canyon and horse access to Poker Flats. From there the road would continue south as a one-way road (in favor of park visitor use and travel), allowing park visitors to access the Laurance Rockefeller Preserve and continue south in a grand loop to visit Teton Village and the Town of Jackson prior to heading back to the park. From the south, the road could be configured as a two-lane road from Teton Village to the LSR Preserve, where it would end, since access would be limited to one-way traffic from the north. This allows visitors from Teton Village to access the Preserve, hike Granite Canyon, and park horse trailers at Poker Flats.

This scenario eliminates the argument about access to the LSR, reduces traffic, keeps the road open, discourages commuters, allows for all recreational users, and enhances cycling safety along the road. Although residents from the West Bank would have to drive around to enter the park; they too would benefit by being able to take the road back home when heading south.

Trailhead and Road Reconfiguration:

Although disturbance in areas that have not been previously impacted should be generally avoided, there

may be merit in relocating the north segment of the road out of the riparian area to reduce impact on natural resources and wildlife. This would allow the old segment to be restored and enhance wildlife habitat in this important riparian area, and it would also provide for new construction but in an area that has already seen human impacts as a levy and as a utility corridor. However, this proposal should be weighed against the impacts of new road construction within the DEIS.

The option of moving the entrance of the north end of the road so that all visitors are required to enter the park through an entrance station should be considered and will be essential for any alternative that relies on monitoring and limiting the number of cars within the corridor. This also ensures that all visitors using the Moose-Wilson Road pay for entry and support park operations and maintenance. This could further be enhanced by the creation of a park-operated small shuttle system that also made the 'Grand Loop from Moose to Teton Village and back to the park; stopping along the way for interpretive opportunities, trailhead and LSR access stops and commercial centers at Teton Village and the Town of Jackson.

Shuttle System:

We support the idea of creation of a limited shuttle system. We request that the DEIS include analysis of the creation of a small shuttle system and provide a definitive plan within an alternative(s) that outlines how shuttle buses will be used to decrease traffic impacts and identifies funding and potential partners to make a shuttle system feasible.

Winter Use:

We request NPS maintain an un-groomed winter trail system to limit disturbance of wildlife and provide for winter respite during a season where wildlife must conserve energy for survival. The existing use is already high, and adding additional trail users will create conflicts between users and increase use of the area, and impacts on wildlife. This also provides a quieter winter experience for visitors snowshoeing and cross-country skiing through the corridor.

Bicycle Lanes and Signage:

The preliminary alternatives should include analysis of the identification of bike lanes within the current road prism as a potential solution to cycling safety concerns. Combined with appropriate signage, this alternative could provide safe bicycle travel through the corridor and also give notice to motorists that bicycles are sharing the road. This alternative could be particularly effective under a one-way road scenario or a mixed-use road option similar to that described above.

NPCA requests these specific points be considered in DEIS action alternatives:

"Prioritize the road as a quiet park destination and wildlife-viewing area; not as a commuter route - - by limiting vehicles and prioritizing visitors experiences.

"Eliminate commercial use of the road, especially taxi use.

"Require all wildlife-viewing companies to be contracted with the National Park Service, versus the current practice of simply requiring commercial use authorization. This would provide oversight on the number of expeditions and frequency of use of the road at any given time, and provide an opportunity to enhance interpretative opportunities.

"Establish daily or hourly limits on traffic within the road corridor; perhaps more feasible, consider seasonal limits that don't vary to reduce confusion. Wildlife-conflict closures should continue, and night-time closures should be considered.

"Maintain low speed limits and provide adequate enforcement

"Mandatory requirement to pass through a fee station

"Consider other traffic-calming strategies such as speed bumps to slow traffic and deter commuters
"Use park education and outreach efforts to encourage visitors to stop frequently, and enjoy their experience in the corridor, rather than rush through it. Encourage the use of interpretive apps, provide educational brochures, and ranger-led hikes and talks through the corridor.
Traffic management tools can greatly enhance bicycling opportunities and provide a pleasant bicycling experience along the road
"The NPS should research the use of non-toxic alternatives to reduce dust along the Moose-Wilson Road

NPS Management Policies

Please assure that all action alternatives fully comply with the NPS Management Policies, as amended.

CONCLUSION

There are many complex issues that should be evaluated in their totality to develop possible alternatives for future management and development of the Moose Wilson Road. Through this process, it will be important to weigh current and future visitor use, recreational use, and traffic impacts against possible negative impacts to the natural and wildlife resources of this important corridor.

NPCA encourages the NPS to explore solutions outside of the range of alternatives previously developed, to consider how transit, shuttle systems and other calming traffic measures could be applied to the road corridor to reduce traffic impacts.

NPCA also urges the NPS to utilize to the greatest extent possible, all peer reviewed literature pertaining to recreational impacts on wildlife and recommendations for minimizing human/ wildlife conflicts in relation to sensitive species and large carnivores.

We appreciate the opportunity to participate in this important planning process, and look forward to commenting on the draft EIS; once released.

Sincerely,

Sharon Mader

Topic Question 4:

I have read through the document submitted by the group called the Friends of the Moose-Wilson Rd. I support it as I find that it corresponds very well with my concerns for the preservation of wildlife habitat, and the character of the Moose-Wilson Rd corridor.

Comments: I appreciate the opportunity to comment on the preliminary alternatives the park has identified as options for the Moose-Wilson Rd.

The Moose-Wilson Rd corridor is an absolute gem in the national treasure that is Grand Teton National Park. What makes it such a gem are the natural habitats within the corridor that sustain the teeming and varied wildlife as well as the rustic character that visitors experience. That character should not be messed with! The road should continue to provide access to the historic properties and to trailheads along it however I believe it should absolutely NOT be converted to a more convenient thoroughway by paving the unpaved section, by straightening it or widening it to simply make easier access to the Teton Park road from 390 nor to accommodate commuters.

My parents purchased a haven 45 years ago not far from the Granite Canyon trailhead. I have driven the road countless times over the years. I love it. I do personally use the road to access trailheads along it, the Teton Park Rd, to go to Dornans, to go to and from the airport. After years of cringing at the idea of a north bridge from the airport to 390, I believe that now to be the most reasonable solution to help alleviate the pressure on the Moose-Wilson Rd. Leave the Moose Wilson Rd alone!
I would support it's conversion to a road that is NOT open for through travel as a way to alleviate some of

the increase in traffic.

I do not support Alternative A - the no action at all alternative. That will not ameliorate the major increase in traffic the road has seen over the years- It is being loved to death.

I do support within Alternative B the realignment in the two segments of the northern portion to the east of the beaver ponds thus easing the existing fragmentation of the wildlife corridor.

I think the park has done a magnificent and sufficient job accommodating bicycles within the park. I do not think the Moose Wilson Rd corridor should be further fragmented by creating a bicycle pathway along the length of it. Wildlife should be the primary concern here. Would it really be safe for bicyclists in a corridor heavy with bears?

Commercial traffic should not be allowed unless it is a park run wildlife tour. That may serve to give visitors access to the road with fewer individual cars.

I have read through the document submitted by the group called the Friends of the Moose-Wilson Rd. I support it as I find that it corresponds very well with my concerns for the preservation of wildlife habitat, and the character of the Moose-Wilson Rd corridor.

Topic Question 1:
September 11, 2014

Grand Teton National Park
Attn: Moose-Wilson Planning Team
PO Drawer 170
Moose, WY 83012

Re: Moose-Wilson Corridor Preliminary Alternatives

Dear Moose-Wilson Planning Team:

Thank you for allowing the Jackson Hole Wildlife Foundation the opportunity to comment on Preliminary Alternatives for the Moose-Wilson Corridor Comprehensive Management Plan. The Jackson Hole Wildlife Foundation (JHWF) is a grassroots group working to promote ways for Teton County residents and visitors to live compatibly with wildlife. We accomplish our mission through focused, on-the-ground projects, providing opportunities for volunteers, collecting wildlife data and educating the public about wildlife.

JHWF applauds the National Park Service for initiating this planning process. The increased presence of grizzly bears in the Moose-Wilson Road Corridor makes a new National Environmental Policy Act analysis/management plan appropriate and necessary. National Park Service data show that grizzly bear

sightings increased from one or fewer sightings each year between 2000 and 2007 to 27 sightings in 2011 and 24 in 2012. The frequent spring and fall visits of grizzly bears to the Moose-Wilson corridor indicate that this is important habitat within the home range of breeding females. This increase of grizzly activity is a significant "changed condition" that will undoubtedly result in an increase in human-grizzly encounters. The increased chance for encounters is especially important considering that grizzly-human conflicts are a leading cause of grizzly mortality.

While any plan focusing on management of the Moose-Wilson Corridor must take into account numerous human safety, cultural, and historic concerns, JHWF is focused specifically on wildlife conservation. Therefore, the comments contained in this letter will be limited primarily to wildlife and wildlife habitat.

TOPIC QUESTIONS:

1. Which strategies in the preliminary alternatives do you think should be carried forward to best achieve the purpose and address the need for the plan? Why do you think they should be carried forward?

The Jackson Hole Wildlife Foundation supports the stated goals of protecting and maintaining (and hopefully improving) the "natural function, diversity, complexity and resiliency of the ecological systems and the natural communities of the Moose-Wilson corridor..." as stated in the Goals and Desired Conditions section of the Preliminary Alternatives. As such, we support many of the proposals outlined in Alternative B.

In particular, we believe realigning the northern 0.6 miles of Moose-Wilson Road out of riparian habitat would be a substantial benefit to many if not all of the animal species that currently use the corridor. The species that stand to benefit from the realignment include amphibians, reptiles and birds. Appropriate, low impact roadside parking should be developed and the current road surface reclaimed as part of this effort.

We also support the limitation and regulation of commercial traffic on the road as outlined in Alternative B. This includes the prohibition of taxis and other commercial traffic, unless those commercial operators are specifically permitted for access to the corridor. Restrictions on commercial traffic benefit wildlife, not only by reducing overall traffic levels, but also by reducing the number of vehicles using Moose-Wilson Road as a conveyance rather than a park destination. Park authorized shuttle service, especially with an interpretive guide, should be a key feature of any future management plan for the corridor. Such public transportation would help reduce traffic levels and therefore impacts to wildlife.

Relocating the Death Canyon trailhead to the end of the paved section of the access road is another feature of Alternative B that would clearly benefit wildlife by eliminating motor vehicle use and its associated impacts to the surrounding habitat along a 1-mile section of the corridor.

Maintaining the current level of winter maintenance in the Moose-Wilson corridor-i.e. not allowing groomed trails-is essential to maintaining habitat for wild animals during a time of year when they are most susceptible to impacts from human disturbance.

Topic Question 2:

National Park Service studies on traffic volumes, the increased presence of grizzly bears, and the overall biological importance of the Moose-Wilson corridor clearly demonstrate the need for a reduction in the

volume and speed of traffic on Moose-Wilson Road. Therefore, the Jackson Hole Wildlife Foundation cannot support the "no action" alternative, Alternative A.

As stated previously, a realignment of the Moose-Wilson Road out of riparian areas would benefit wildlife. Maintaining the current alignment, as stated in Alternative C, does not achieve these benefits and should not be implemented.

JHWF has a number of concerns about elements of Alternative D. First and foremost, we feel that creating a multi-use pathway parallel to the Moose-Wilson Road has unacceptable impacts to habitat and wildlife. These impacts include: direct loss of habitat resulting from the pathway itself, habitat fragmentation and indirect habitat loss around the pathway resulting from the displacement of mammals and birds due to human activity, and a substantial increase in the potential for human-wildlife conflicts. The increased chance of human-wildlife conflicts is especially acute with the Moose-Wilson corridor's grizzly population. Research on grizzly-cyclist interactions by Dr. Stephen Herrero strongly suggests that cyclists travelling quickly and silently through prime grizzly habitat will result in increased human-grizzly conflicts. Such conflicts often end in the relocation or death of bears, and have the potential for serious injuries and, in rare cases, death to humans.

Research looking at the impacts of various types of recreation on wildlife on the Starkey Experimental Forest and Range, in Mount Spokane State Park and elsewhere suggest that cyclists and other user groups on unpaved forest trails displace wildlife. While there are few applicable studies on the impacts of paved pathways, it is reasonable to assume a similar displacement effect. As stated in our previous comments, GTNP has funded four studies of the impacts of park pathways and non-motorized recreation on elk (Sawyer et al. 2011) ungulate responses (Hardy, A.R. and K.R. Crooks 2011) black bears (Costello et al. 2011) and avian species (Chalfoun, A. 2011). While these studies demonstrated the effects of pathways in sagebrush habitat, those results are not necessarily applicable to the varied and sensitive habitat types found in the Moose-Wilson Road Corridor. Further, those studies did not take into account the impacts of pathways and non-motorized recreation on the species of greatest management concern in the Moose-Wilson Road Corridor: grizzly bears. As part of any analysis of management alternatives on the corridor, JHWF respectfully requests that the National Park Service take into account the management effects of each alternative on grizzly bears as well as on moose, elk, bald eagles, wolves and black bears, Canada lynx, boreal toads, beaver and other species that inhabit that section of the park.

As stated above, JHWF would also oppose any plans to increase winter recreation on in the Moose-Wilson corridor via grooming the snow covered road or increasing the number of allowed activities. Promoting any increase of use during the winter months would have an unacceptable impact on wintering wildlife.

Topic Question 3:

Given the exceptionally high quality habitat available within the Moose-Wilson corridor, JHWF encourages the National Park Service to consider seasonal closures and restrictions at times of year when animals are most vulnerable to human disturbance. These closures and restrictions should apply to the Snake River bottom (in winter), other riparian habitat such as the Sawmill Ponds, and the road itself when appropriate. JHWF applauds Grand Teton officials for currently implementing these types of closures when bears are present on the roadway.

JHWF also encourages the National Park Service to develop a true conservation alternative for consideration in the draft plan/EIS. This alternative would focus on protecting and enhancing wildlife and

habitat and would serve as a useful baseline and source of ideas in the development of the plan's preferred alternative.

Topic Question 4:

In general, the board and staff of the Jackson Hole Wildlife Foundation feel the National Park Service should consider the Moose-Wilson corridor as neither a recreation center nor a byway to reach other destinations such as the Jackson Hole Airport and Teton Village. Instead, the Moose-Wilson corridor should be considered a destination for appreciating its unique and extraordinary wildlife and habitat resources.

JHWF supports non-motorized recreation, non-motorized transportation and pathways, but we feel the separated pathway and winter grooming scenarios outlined in the Alternative D would degrade habitat, wildlife and the visitor experience. While we provided no specific comments on the various traffic scenarios outlined in the Preliminary Alternatives for the Moose-Wilson Corridor Comprehensive Management Plan, we would support a dedicated multiuse pathway within the existing road corridor as long as that pathway did not result in a direct loss of habitat. The National Park Service could alleviate safety concerns about motor vehicle collisions with cyclists or pedestrians by creating a barrier between the road surface and the pathway.

The Jackson Hole Wildlife Foundation has four programs-Give Wildlife a Brake, Wildlife Friendly Fencing, Bear Wise Jackson Hole and Nature Mapping Jackson Hole- - that may be applicable to management of the Moose-Wilson Road Corridor. We appreciate the numerous opportunities we've had partner with GTNP on fence removal projects within the corridor, and we look forward to other partnership opportunities in the future.

In conclusion, thank you for the opportunity to provide comments for the Preliminary Alternatives for the Moose-Wilson Corridor Comprehensive Management Plan. Please don't hesitate to contact us with any questions.

Sincerely,

Cory Hatch
Executive Director

██████████ Jackson, WY 83002

Topic Question 1:

I am in favor of alternative D which allows for a separate pathway for bicycles. Regardless of whether or not a pathway is added, cyclists will continue to use the road, a practice which creates unsafe conditions for the cyclists and snarls traffic since motorists are not able to pass them safely on the narrow roads.

Topic Question 2:

All of the rest of them. The current situation is dangerous and needs to be addressed. Closing the road or converting it to a single direction is absurd - it will needlessly direct traffic in one direction through town, increasing congestion on our roads and wasting both fuel and time for drivers. Doing nothing does not address the current problems.

Topic Question 3:

Converting the existing road into a multi-user pathway for cyclists and pedestrians (no vehicular traffic permitted). A new roadway to the east of the existing road should be added, with multiple pullout areas to allow for photographs and wildlife viewing.

Topic Question 4:

If the "do nothing" alternative is selected, some pullout areas need to be created. People currently pull over on both sides of the road when wildlife is present, blocking traffic and creating a danger to pedestrians trying to cross the road for a better view. Not providing parking does NOT mean people will not park, it just makes conditions more dangerous for everyone using the road.

Topic Question 1:

We support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

Topic Question 4:

A separate Moose-Wilson pathway is a safety need, not a want, an imperative in any Alternative. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Comments: Rails-to-Trails Conservancy (RTC) is pleased to submit these comments of support concerning multi-use trail development in the Moose-Wilson Corridor. Of the preliminary alternatives presented for public comment, we believe that Alternative D is best suited to the needs of Grand Teton National Park visitors and nearby communities and is imperative for safe bicycle access by local residents and tourists.

RTC and our 150,000 members and supporters across the country are dedicated to creating a nationwide network of multi-use trails. RTC supports Alternative D because it:

- Allows for a continuous multi-use trail within the Moose-Wilson Corridor, creating and prioritizing safe nonmotorized, low-impact access to GTNP;
- closes the gap on an existing multi-use trail system that is fragmented, connecting the communities of Jackson, Wilson, Teton Village and the park headquarters in Moose;
- and allows for meaningful traffic reductions that will help wildlife thrive while maintaining good, connected visitor access to GTNP.

Alternative D is directly in line with the goals of Rails to Trails Conservancy and will be a benefit thousands of GTNP visitors and its neighboring communities. We appreciate the opportunity to present comments and support a plan that would prioritize multi-use trail development within one of the most visited and beloved National Parks in the U.S.

Topic Question 1:
D

A multi-use path would separate bikes and pedestrians from motor vehicles diminishing congestion and enhancing safety and enjoyment for all. The path further connects the corridor to the park as a whole, minimizing traffic in town while potentially increasing non-motor vehicle travel in the corridor. In addition, the path would negate the need to pave the entire road (unless there are other factors that play into paving the gravel portion).

There are portions of other plans that would be helpful. For example in B, the additional parking at the Laurence S. Rockefeller Preserve would be helpful during peak hours/season.

Topic Question 2:

Minimize media & interactive material. Produce this type of information for the visitor centers. For example, the Laurence S. Rockefeller Visitor Center would contain information related to the corridor. OR, create an APP of interpretive information.

Topic Question 3:

Peak season shuttle service to trailheads and viewpoints from Laurence S. Rockefeller Preserve or from main park visitor center (similar to Zion). No parking available at these sites during peak hours.

Thru traffic only pass during this period, perhaps even connected to a fee. Thru traffic should be allowed during peak.

Dear Moose - Wilson Planning Team:

I want to thank you for the opportunity to comment once again regarding the Vision for the Future of the Moose Wilson Corridor. In this process I did attend both public meetings of January 14, 2014 and August 28, 2014; and, previously submitted my comments after the first meeting.

In my 42 year of residency I have become quite familiar with the Moose-Wilson Corridor. I spent the winter of 1973-4 living at the White Grass Ranch; I worked for Bob Koedt in his office on the Murie Ranch from 1973-1 975; and, have lived on the southern end of The Village Road (Wyo 390) since 1976.

I need not tell you how significant this southern arm of Grand Teton National Park is in it's beauty, diversity and tranquility. I was fortunate enough to know Laurance Rockefeller; and, on more than one occasion we chatted about his family's stewardship of the JY Ranch and his vision for what has become the Laurance S. Rockefeller Preserve.

At the August 28th Public Meeting four alternatives were presented. Please understand that I was quite surprised that the most significant alternative was not presented at all. As a result I will outline it here.

After the Moose Wilson road is closed for hunting season and the winter in a month or so, there is no reason to re-open the "unpaved" section again in the springtime to motorized vehicular traffic EVER - save emergency vehicles or some future Park Service visitor shuttle service. This dirt road is within our National Park and is not a part of the Teton County Transportation I Roadway Plan - there isn't one; or, any State of Wyoming Highway Plan - it isn't one..... This is our National Park, not a highway right

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

of way. Shut the sucker down If done, there is little doubt that Teton County, WYDOT AND those with the MOST to gain WILL resolve the issue by creating a northern link from WYO 390 across to 89 I 191 in short order.... A win / win ! Access northward from Teton Village and development at the north end of the Village Road - YES. A shorter route from Teton Village to the town of Jackson, not to mention the airport, reducing vehicular travel on WYO 390 & 22 as well - YES, YES & YES. Nonmotorized travel on foot, bikes, horseback along the existing dirt road between the Granite Canyon parking lot to the Rockefeller Preserve - YES. The opportunity to make necessary improvements to Park infrastructure - YES. The opportunity to expand the Pathways System within GTNP - Yes. The starting point for a the development of a inner-Park transit system - YES.

Return of this special, environmentally diverse region of Grand Teton National Park back to a passive, wild and natural place, as it should be - YES The RIGHT course of action is crystal clear when the GREED motive is removed from the equation! Once realized, a Vision for the Future of the Moose Wilson Corridor can be contemplated.

Thank you for your efforts.

Regards -

Denny Emory

Topic Question 1:

I don't not believe any of the alternatives will achieve the purpose and need for the plan. See my comments in Section three.

Topic Question 2:

All of the alternatives, with the exception of no change, will increase the human footprint while not addressing the real problems along the corridor. See my comments in question three.

Topic Question 3:

Most roads in both Grand Teton and Yellowstone National Parks serving the tradition use and purpose as does the Moose - Wilson Rd. (i.e. Access primarily for scenic and recreational enjoyment) are one way or end in a dead end. The most obvious for our discussion is the Jenny Lake Rd. However in Yellowstone there are several examples; Blacktail Plateau Dr., Firehole Lake Dr., Firehole Canyon Dr., Fountain Flat Dr. Upper Terrace Dr. And others. These roads provide ample' peaceful access for scenic and recreational enjoyment, while not providing thruway/short cut access. Exactly what the Moose-Wilson Road needs!

The solution to many if not most concerns over the future of the Moose-Wilson Road may be to either make the road one way from Moose to a point north of the South Entrance or Granite Tail Head, or to dead end it there and allow traffic in both directions. The Park Service has ample examples attesting how very effective this means of control has been.

Topic Question 4:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

I do not believe any alternative which provides a separate bicycle path in this wildlife rich environment is appropriate. The National Park Service has gone overboard providing bike paths and this us the time, and most important the place, to say, NO!

Comments: The real purpose, historic use, and indeed the future value of the Moose -Wilson Road is to provide for visitor recreation and scenic enjoyment. It has not been, and never should be allowed to become a thru way or shortcut for fast, easy access to all points north..

With the substantial growth of the West Bank and Teton Village it simply cannot be both any longer. If visitors and residents of the West Bank need more rapid, point to point access to the Parks, the airport and points north then it is the burden and responsibility of Wyoming and Teton County to provide another bridge over the river, not the National Park Service! These political entities are hiding from their responsibility in hoping to force the National Park Service to build more bike paths and a high speed gateway to accommodate the greatly increasing commercial development on the West Bank and Teton Village. It is their responsibility, not the Park Services.

To coin a famous quote, GOD BLESS GRAND TETON NATIONAL PARK, AND KEEP OUR MOOSE-WILSON ROAD WILD...

Topic Question 1:

Keep this road as a quiet park destination and wildlife viewing area. Reduce the number of vehicles, keep slow speeds and eliminate commercial and commuter traffic along the road. Make the road safe for hikers and bicycles and wildlife viewing.

Topic Question 2:

Commercial and commuter traffic along the road.

Topic Question 3:

Making the road safe for hikers and bicycles and wildlife viewing.

Topic Question 4:

Reduce the number of vehicles, keep slow speeds and eliminate commercial and commuter traffic along the road.

Comments: I wish to express my concerns for the future of the Moose Wilson road corridor. As a member of the Grand Teton Association I love the Tetons and wish to see it protected. I value the wildlife scenery and historic value of this road. I ask you to keep this road as a quiet park destination and wildlife viewing area and not a busy road. It is a special place. It should be protected as it is not developed.

Correspondence Text

Topic Question 1:

Traffic management:

Do limit vehicular traffic during peak hours using monitoring and queuing; but, add alternative fuel mass transit to the LSR in both directions. This addresses the need to reduce local through traffic and increases the capacity of visitors who can enjoy LSR and the surrounding areas it provides access.

Physical characteristics/road realignment:

Maintain the rural, unpaved nature of the southern end of the road but make drainage improvements; realign the northern portions to better respect the areas around the ponds.

Turnouts and parking:

Improve parking/turnout facilities in current locations and seek options for others near known stopping/viewing areas. Apply design solutions to reduce resource impacts in other areas.

Bicycle use:

Continue to allow use in seasonal periods when road is closed to motor vehicles. Modify the multi-use pathway to areas where shared roadway use is deemed dangerous due to historical congestion. A pathway is more practical in areas where the road is realigned and it can be built more adjacent to the road and disturb less land.

Commercial activity:

The Park Service develops its commercial activities consistent with its best practices. Commercial traffic using Moose-Wilson Road as a through traffic to points north should be minimized. Allow recreational

uses that allow visitors to experience the park in modes they are accustomed to in other national parks.

Death Canyon:

Relocate trailhead to the best point the park deems necessary to reduce impacts to resources in that area.

Winter access and use:

Do what can enhance winter recreational opportunities consistent w/ the park's values. Northern winter parking at an improved parking area will help.

Visitor Use/Ed/Experience:

Do programs at key visitor gathering areas. Establish more viewing areas to concentrate use. Do provide short nature trails and interpretive materials. Additional winter bathrooms, yes.

Topic Question 2:

Do not restrict through traffic in either direction during peak periods as it is too unpredictable and will lead to a poor experience to those who wanted to connect to the broader park experience, but were turned around.

Do limit commercial traffic that's not contributing to the park experience.

In the winter, do not end winter maintenance at Sawmill Ponds Overlook. Provide backcountry winter access at existing locations for the benefit of winter access to the park.

Topic Question 3:

Do consider how more people can be moved through the park on alternative fueled mass transit.

Do consider how to incorporate a limited amount of multi-use pathway in areas where roadway needs to be realigned for sensitivity for wildlife, habitat connectivity and operational issues

Topic Question 4:

Thank you for opening up the process for public comment and opinions. I support the park's mission and look forward to its solutions in the best interest of the park - while balancing its relationship with the local infrastructure.

Topic Question 1:

I am in favor of Alternative A - no action on the Moose Wilson Road.

Topic Question 2:

I feel most of the strategies in Alternative Plans B, C & D will increase chaos along that corridor, further disrupt wildlife both during construction and after, make it more difficult for locals and tourists to figure out the schedules for access, increase lines and waiting times for auto traffic and thereby increase pollution from idling cars, increase traffic in town, and lastly cost money that would better be spent on personnel and maintaining general park infrastructure. I do not understand why bicyclists need access to all the park roads - especially the Moose Wilson Rd which does not connect to any bicycle trails.

Topic Question 1:

Paving the road is good. Poker Flats Trailer Parking good. Reroute road good. Improve death canyon good.

Topic Question 2:

Bike path is a great deal more of pavement, unsightly, and not interest of wildlife.

Topic Question 4:

I ride my horse once a week from Poker Flats, Sawmill Ponds, Taggart, or Jenny lake parking area. I really enjoy the loop from Poker Flats to North side of LSR up Wister Draw back along Phelps Lake on Valley Trail and back. I also enjoy ride out of Sawmill. Ponds to Whitegrass. I would hate to lose those rides. Us recreational riders are not included, however, we have spent the most in the valley on investment in our passion: horses, property, care. I/we have made a major investment in what we love, and in the local economy. Unlike the hikers, and bike riders, whom have made minimal investments. Keeping access open to the trails is very important. The wildlife does not seem like it is conerned with horses, unlike when they see two legged people on the ground. Animals seem to go about their business. Please don't prevent us from accessing the trail system... It is the reason I moved here over 20 years ago.

Comments: In addition to riding my horse once a week in the park, I also hike, use the park in winter, and enjoy leisurely looking for wildlife along the MW Road. As a scenic area, I think it should be used, never as a throughfare.

Topic Question 1:
There should be NO bike path. The wildlife should not be disturbed more than it is already. The construction of a bike path AND I AM A BIKE RIDER BUT THIS IS AN INAPPROPRIATE PLACE FOR A BIKE PATH would eliminate the food (i.e. huckleberry bushes), habitat and environment that protects the wildlife. Enough of the PARK space is being intruded upon by humans, please keep this to a low traffic area. Please protect the wildlife in the park for a change. It will improve your image and reputation to do so. Many thanks for considering this input.

Correspondence Text

Topic Question 1:

The most critical consideration is traffic volume. This can be addressed by one of the following: a. Ending traffic from each direction at LSR Preserve, creating no through traffic as a full-time restriction. b. Designating one-way traffic only either north or southbound. c. Closing the Moose-Wilson road between Granite Canyon Trailhead and LSR Preserve. These options would eliminate the through traffic and allow cyclists to use the road safely.

Topic Question 2:

Habitat destruction is the other critical component of this study and all efforts should be made to preserve existing habitat and decrease impacts on wildlife. To that end, the following should not be a part of the final plan: a. No action alternative
b. Reservation system
c. Vehicle limitation system
d. A multiuse pathway parallel to Moose-Wilson Road along any segment
e. Allowing taxis
f. Allowing through-traffic
g. Allowing grooming
h. Closing road to vehicles two days/week (or any other daily configuration)
i. Adding additional pull-outs with the exception of along the realigned northern segment
j. Adding extensive interpretive media/kiosks
k. Increasing disturbance
l. Fragmentation of habitat

m. Removal of large numbers of trees and vegetation

Some of these management suggestions would require so much administrative and enforcement time and money that they are not feasible, ie, reservation system and/or vehicle number cap.

In addition, a separated bike path, whether close to the road or separated by 50' or so, would severely impact habitat and wildlife use of some of the highest value habitat in the park.

Topic Question 3:

Using one of the three options in my answer to Q 1 would address the need to decrease traffic and to not impinge further on habitat. They would also allow bikes to use the road with either no or decreased traffic.

Topic Question 4:

Traffic Management along Moose-Wilson Road

• Moose-Wilson Road would be open to motor vehicles from early/mid-May through October 31.

• Reduce speed limits along Moose-Wilson Road.

1) Address increases in traffic and volume-related congestion by restricting through traffic in either direction beyond the LSR Preserve Center. This would be accomplished by reconfiguring access to and parking at the LSR Preserve and installing a gate to prevent through-traffic, thereby encouraging use of the road only as a means for visiting destinations within the corridor. Through-travel by bicycles would not be affected.

2) Address increases in traffic and volume-related congestion by closing the road between Granite Canyon Trailhead and LSR Preserve.

3) Address increases in traffic and volume-related congestion by designating Moose-Wilson Road one-way (northbound or southbound).

Physical Characteristics of Moose-Wilson Road

• No substantial changes to the alignment or width of Moose-Wilson Road, except for the realignment of two segments between Moose and the Death Canyon road junction. The unpaved section would remain unpaved, and routine maintenance and scheduled road projects would be undertaken as needed.

Moose-Wilson Road Realignment

• Two segments of the northern portion of Moose-Wilson Road would be realigned to address congestion associated with the presence of wildlife, wildlife habitat connectivity, and operational issues. The 0.6-mile section of roadway between Murie Ranch Road and the base of the hill near Sawmill Ponds would be abandoned and a new segment would be constructed to intersect with Teton Park Road at its junction with the Chapel of the Transfiguration Road. The segment between Sawmill Ponds Overlook and the Death Canyon Road junction would be realigned to the east of the beaver ponds to restore wetland functions and habitat connectivity. The old roadway would be removed and restored to natural conditions. Parking would be improved at Sawmill Pond Overlook.

• The new road segments would be constructed to emulate the slow-speed, narrow, winding character of the road corridor.

• Relocate and replace Moose entrance station.

Turnouts and Parking

• Establish an adequate number of strategically located turnouts to allow for visitor parking while reducing resource impacts. Minimize addition of turnouts.

• Apply design solutions to roadside parking that would reduce resource impacts from parking off-road.

1) Reconfigure the access and parking at LSR Preserve in order to prevent through-traffic.

- â€¢ Improve existing Poker Flats horse trailer parking.
- â€¢ Retain existing Granite Canyon trailhead and parking.

Bicycle Use

â€¢ Bicycles would continue to share the road with motor vehicles. The restriction on through-traffic or one-way traffic that would apply to motor vehicles would not apply to bicycles.

Commercial Activity

â€¢ A limited number of road-based commercial trips would be permitted within the corridor. This could include wildlife viewing, photography instruction, and painting workshops. Conservation-focused interpretation would be required, but could include a broad array of interpretive topics.

â€¢ Use of concession contracts rather than conditional use permits to regulate and monitor commercial use.

â€¢ Groups would be limited to current Moose-Wilson Road vehicle size restrictions.

â€¢ Commercial horseback riding in the Poker Flats area would continue with currently authorized trails and use levels; commercial horseback riding on the Sawmill Pond trails, would be phased out. Guided skiing and snowshoeing would continue under current use limits.

â€¢ All other commercial traffic, including taxis, would be prohibited.

â€¢ Park shuttle services could be authorized by park management.

Death Canyon

â€¢ Death Canyon trailhead would be relocated to the current end of pavement on the existing access road (i.e., the junction with White Grass Road). Parking would be provided for 60 vehicles. Include justification of the need for 60 vehicle parking spaces. The existing 1.0 -mile unpaved portion of the trailhead access road (no longer necessary for vehicular traffic) would be converted to a trail.

â€¢ The restroom would be relocated to the new trailhead location.

â€¢ White Grass Ranger Station would become a backcountry cabin (no vehicular access).

Winter Access and Use

â€¢ Winter maintenance of Moose-Wilson Road would end at the Sawmill Pond Overlook. The unplowed portion of Moose-Wilson Road, between Sawmill Pond Overlook and the Granite Canyon trailhead, would be available for cross-country skiing and snowshoeing, but would not be groomed.

Visitor Use and Experience/Education and Interpretation

â€¢ Minimal low-impact interpretive media would be provided. Very few interpretive signs and structures would be installed on the landscape. The focus would be on pre-visit information and electronic media to prepare visitors for self-discovery prior to entering the corridor.

â€¢ Trail densities and alignments would be managed to be compatible with the protection of natural resource values.

â€¢ Provide additional restrooms at Granite Canyon trailhead parking area and at the new "winter" parking area at Sawmill Pond Overlook to manage human waste during the winter.

Comments: Teton county has not responded to the issues on their road system adequately and should not now thrust that burden on the park to be solved. The Moose-Wilson Corridor deserves more than to be turned into a convenience for locals and visitors to move through that area without regard to the unique and fragile ecosystem of which it is part.

The Wyoming congressional delegation has been out-of-bounds in making assertions about the corridor and about the EIS that do not respect the park or the process. Or for that matter, the community that

abhors the idea of making this a political issue when it is most clearly one of NPS values.

I would suggest that the seven goals and desired conditions be looked at carefully when assessing each of the components of this study. That would eliminate many and substantiate the reasons why.

Topic Question 1:

Parts of Alt A and parts of Alt B. The parking lot idea at LSR center are a good idea to slow down the idea of just using M-W road as a commuting road.

Topic Question 2:

Alt C would not achieve the long term goals. It would be bad at the start by closing the road to a class(bicycles, automobiles)of use.

Constructing a new bike path does not seem to make a lot of sense. If the speed limits are enforced all can live happily together

Topic Question 3:

Please make Moose-Wilson a one way through road for use by all class of travel (bikes, pedestrians, cars). Move the north entrance booth east bound (but let the visitor center stay free, before the entrance booth) so that any traveling to the north or accessing Moose-Wilson have to enter the park.

Topic Question 1:

It makes sense to realign the road (as per Alt. B) to preserve habitat, provide pullouts to relieve congestion and allow visitors places to safely get out of the car. Definitely pave the southern end of the road which would make it safer and less costly overall to maintain. Keep speed limits low.

I fully support a separate multi-use pathway for a safe, enjoyable and alternative way to view and travel through the area.

Road based commercial use should be severely limited, possibly using a yearly lottery system for the companies. Other commercial uses should be limited as well, such as bicycle tours, guided ski and snow shoe and horse trips. From past experience commercial use turns areas into over-visited and abused habitat such as Inspiration Point and Hidden Falls.

The park should definitely consider shuttles within the corridor but look to providing park wide shuttles in the future, accommodating trips to other trail heads and Jenny Lake, where parking is already a problem.

I support the self discovery concept of low impact interpretive media.

Winter use should be supported by keeping access at and improving Granite and Death Canyon parking, provide restrooms. It would be great to find a partner to winter groom the road but this does change the "wilderness" character of the corridor.

Maintain the seasonal closure of October/May as this is truly some of the best time to explore and enjoy the corridor.

Using the White Grass road for all access makes the most sense, improved parking area and restroom could be moved .4 miles from current location as in Alt.C, to reclaim more area that is currently overused.

Topic Question 2:

Doing nothing ignores all the problems entirely and is not forward thinking. Habitat degradation and congestion would continue and the overall corridor experience would continue to decline.

I cannot support any increased commercial use as I believe it leads to overuse of habitat as well as adding to congestion.

Limiting traffic numbers using a reservation system does not seem to be a good solution as there would be a lot of administrative costs and be more of a frustration for visitors to the corridor.

Not paving the rest of the road seems negligent and in the end costly to maintain.

Common use of the road is inappropriate as cars need to be separated from pedestrians and bicyclists for safety and a better experience for both.

I cannot support moving winter access to the Sawmill area or Murie Center as this limits backcountry ski use in the Death Canyon area by adding extra mileage. Winter use has the lowest impact on habitat and shouldn't be limited.

Topic Question 3:

The park could consider closing the road several days a week at certain times (morning and evening) during which the park could lead vehicle based sightseeing trips, prohibiting these types of trips during the other days and times. This would reduce congestion from commercial vehicles.

Maybe experimenting with periodic road closures for pedestrian and bicycle use would be appropriate to see how well they are received by the public and could help guide the planning process.

Topic Question 4:

The elephant in the room is the construction of a north valley bridge. This is a county issue yes but it could lessen congestion in the corridor by eliminating "through" traffic.

It is important for the park to stay focused on its mission of managing the corridor as a scenic and rustic visitor oriented place. In keeping with the concept of self discovery, limiting commercial use within the corridor forces visitors to become true explorers.

Improvements should not be made to encourage corridor use as a highway, keeping in mind that many people traveling through the corridor are going to other places in the park which is where a park wide shuttle system could play an important role.

Comments: If I had to support one alternative unchanged it would be D because it's the only one with a

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

pathway which is at the top of my preferred strategies list, along with paving the south section of the road, but I don't agree with all that's included in it.

I prefer to look at all the alternatives like an a la carte menu, choosing the best strategies for the best outcome as I've outlined in my comments above.

My hope is that the most pressing issue will be dealt with first and in a timely manner with the south end of the road getting paved, followed by the construction of a multi use pathway with the rest implemented later.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:
alternative D seems to be the best approach. it allows for bicycle as well as motorized access to this scenic area.

Topic Question 2:
alternatives A, B, & C. A is not workable - - traffic is often a snarled mess. B emphasizes motorized traffic at a higher rate of speed - - dangerous to wildlife and non-motorized traffic. C requires visitors to preplan visits to this portion of the park. it penalizes visitors who happen to arrive on a "non-motorized" day and have only one day to visit the park.

Topic Question 3:
i believe alternative D addresses most multi-use issues while retaining the park environment.

Topic Question 4:

I don't know the details, but I know that we humans keep taking and pushing animals out of their natural God given homes. I am so tired of the abuse mankind has brought to the animal kingdom. It is time for us to back off and protect these beautiful creatures and their God given habitat. Anything less is in-human and possible even barbaric. Change now before it is too late, because we will be held accountable for our actions! Thank You.

Topic Question 1:

Out of the alternatives for the moose-Wilson Road I like alternative D. It allows for both motorized and unmotorized means of transportation. Although we don't use it often, we love it as an opportunity to view wildlife and for the serene and peaceful drive. We wish there were pull outs near the waterfall.

Topic Question 1:
Please see comment letter in Box #4

Topic Question 4:
Thank you for your preliminary alternatives for this new Environmental Impact Statement on management ideas for the Moose-Wilson Road. This is now the second EIS in the last 10 years on issues related to the Moose-Wilson Road and Grand Teton National Park transportation, so we have had an opportunity to consider various ideas quite thoroughly.

We strongly support Alternative D, with some modifications, as your preferred alternative to study because it maintains important 2-way public access to public lands, keeps the character of the Moose-Wilson Road slow and narrow without widening it, and enables non-motorized transportation to safely travel on a pathway without the need of a vehicle.

The modifications we request are that you partner with Teton Village, Teton County and other non-profit partners to provide comprehensive transit to help reduce vehicles on the road.

" We can help you achieve your reduced vehicle counts by using forward-looking transit systems that meet your own capacity limits for vehicles on the Moose-Wilson Road while still providing needed through public access and visitor experience enhancement.

" Also, let the private sector contribute toward the pathway construction and maintenance of the pathways overall so as not to stress the GTNP/NPS budgets, much like the Park did at Jenny Lake with those \$16 million of visitor improvements through private dollars.

The main point we hope you understand is this: As your adjacent, close neighboring community, and the greenest, most environmentally committed neighbors of any NPS unit, we are deeply and openly interested in partnering with you on positive solutions for the future management of the Moose-Wilson Road area.

First, before we review the 4 alternatives and share concise thoughts of elements that we hope you study as your preferred alternative, let us first establish a baseline of facts.

1) Teton Village is not a problematic subdivision at the southern end of GTNP, an area of alleged massive development that is responsible for 26% increases in traffic on the Moose-Wilson Road. The facts are Teton Village has seen about 20-30 new homes in the last 10 years since 2005 - surely not the cause of traffic increases.

2) The traffic increases occurred, as your data shows, because visitors want to experience their National Park, particularly the new Laurance Rockefeller Scenic Preserve or simply view the corridor. A visitor attractant was built along the Moose-Wilson Road - which is wonderful. That fact - both the construction and the operation of it - must be synced with your own explanation of traffic increases.

3) Furthermore, it is not transit to the airport. Teton Village discourages any hotel shuttles or taxis from using the Moose-Wilson Road. And the data the park collected and presented proves that.

Our comments are first focused on Alternative D, and then we discuss the elements of Alternatives A, B, C and the problems they present.

Alternative D - Modify with enhanced and comprehensive transit

The entire community has long pointed out that everyone supports GTNP. We all want the protection, preservation and conservation of the Moose-Wilson Road. We all want to support the National Park Service for long-term stewardship and visitor experiences in an environmentally friendly way. Teton Village itself operates on the ethic of practicing green, progressive, low impact, high quality business. We will help GTNP and the NPS stage comprehensive transit. We have a successful track record and practice of taking vehicles off of Highway 390. We would not only provide needed parking outside of GTNP to base vehicles that DON'T drive on the Moose-Wilson Road, but also we can dedicate space for an environmentally focused education center that operates small shuttles/transit and boards the visitors for park-directed messages.

We support two-way public access to public land. The existing public rights to the road are legal perimeters under which any Alternative must be developed. Along with the Enabling Act of GTNP that specifically mandates public access to and from GTNP and the private lands surrounding and within it, these public easements to use the road, especially on the southern section, must be met in the letter of the law. We encourage you to maintain public access to public lands, and not close or gate the Moose-Wilson Road.

Instead, set the number of the maximum vehicles daily that can be on the road at any given time - and then reach out to your neighbors at Teton Village to help you achieve that goal. We will work with you diligently in creating comprehensive transit, parking, and staging to keep the park values on the Moose-

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Wilson Road protected for the decades to come.

Environmentally Sensitive Pathway

Recreation and conservation do not have to conflict. Keeping the public in vehicles and not encouraging them to get out of their cars is an old, unsuccessful model of people management. The visiting public wants experiences that they can't get from behind a windshield. A pathway provides the ability to reduce vehicle use, get the public engaged in the outdoors, and provides vital safety.

Wildlife adapts as park studies have shown. And the pathway can be placed in an environmentally sensitive way over existing interior roads or on already disturbed land from when the park installed fiber optic cable lines on the corridor. Large numbers of trees do not have to be cut down. That is just a myth of the opponents to a pathway.

The private sector will donate to the GTNP Foundation to pay for the construction and the maintenance. Money should not be used as a reason for not providing this pathway.

The NPS says it wants partnerships - and the GTNP pathways were meant as a national model of pathway and non-vehicular transportation. That means to make the model a success, the gap needs to be closed and the corridor completed. The gap of 7-miles in a 30-mile loop that will exist within the next 2 years is incredibly dangerous to the average cyclist or pedestrian.

Wildlife

Who protects the grizzly bears and other wildlife? We all do. Knowing there has not been a bear fatality on the Moose-Wilson Road, we have to question what the problem really is. It seems to all that the increased pressure on faster park roads, like Highway 89, should be the real concern. Wildlife doesn't know the boundaries of the Moose-Wilson Corridor. We see wolves, bears, elk, moose - all species. They move east across the river and across 89, meaning that shifting more traffic to 390, 89, 22 because GTNP closes the Moose-Wilson Road or gates it, dials up the pressure on faster roads.

Grizzly bears are demonstrating in increased numbers that their recovery is factual. That is great news. It shows that there is no jeopardy from the access on the Moose-Wilson Road to the species. Nor would there be jeopardy to the species from a pathway.

Moreover we question that if the presence of a grizzly bear is the issue, why wouldn't more areas in the park be closed - or the park closed entirely? It appears that the Moose-Wilson Road is being treated differently than other public lands for a reason that isn't completely transparent to the public or supported by the species recovery numbers. The new road alignment will further alleviate any concerns.

One combined entrance station on the northern section

One combined entrance station on the northern section of the Moose-Wilson and Teton Park Road should be designed for simplicity, cost efficiency and better visitor service.

Alternative A

We do not support Alternative A. The Northern section of the road should be relocated in order to help reduce bear-vehicle-visitor conflicts along the hillside and ponds. Also this alternative does nothing to

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

reduce vehicle counts, which should be managed to achieve GTNP goals.

Alternative B

A gate in the middle of the Moose-Wilson Road during July and August is a terrible idea. You will cause more problems than are solved. Back-ups, poor air quality from idling vehicles and long, awkward turnarounds are not solutions. We strongly urge you to reject this alternative entirely.

Alternative C

Closures are blunt instruments to public management, and should be rejected. Instead, reduce traffic counts significantly by smart transit, smart partnerships and smart visitor management. Rather than shut the public out, manage when how and what visitors learn. Make the experience meaningful and a baseline to a new understanding or appreciation about nature. That's what Laurance Rockefeller would have wanted for the corridor he loved, and the public now loves as well.

Thank you for considering these thoughts. We expect as you develop a preferred alternative, you will be in conversations with your nearest neighbors on developing or maturing solutions. We look forward to those conversations as a Preferred Alternative is designed, and certainly before it is released.

Topic Question 1:
I favor Alternative D. I think it results in the best balance for wildlife, Park experience and transportation.

Topic Question 2:
I don't support Alternatives B and C. Everyone from the west bank will have to drive through town, adding to traffic problems. In addition, the strain on Spring Gulch Rd. would be severe.

Topic Question 3:
No, I think the choices are solid.

Topic Question 4:
We need a separate bike Pathway, no matter what Alternative is selected.

Topic Question 1:

I believe that of the 4 alternatives listed in the Moose-Wilson Corridor Comprehensive Management Plan - Preliminary Alternatives Newsletter the best choice will be Alternative A (No Action). That is the only alternative listed that comes close to meeting the Goal Statements listed in the aforementioned newsletter.

In reality, the ultimate BEST alternative is not listed in the newsletter, but is contained in my comments below.

Topic Question 2:

The paving of the currently unpaved section of the Moose-Wilson road will only increase vehicle traffic and will increase the speeds that vehicles are traveling. That would be counter-productive to ALL of the Goal Statements listed in the newsletter. Increasing parking lots (such as at the LSR preserve in Alternative B, or the new parking for the Death Canyon Trailhead in Alternative C and all the added parking plans in Alternative D) would also lead to increasing vehicle travel in the corridor and would therefore be going against ALL the Goal Statements. This is an area that should be primarily for the wildlife.

I am 100% aainst any pathway in this area. As there are already plenty of pathways in the Jackson Hole as well as Grand Teton National Park, this is NOT an area that a pathway is needed. PERIOD.

Topic Question 3:

See my comments to Question 4 (as well as the repeat of my comments in the comment section down

below)! The Perfect plan should be listed twice, after all!

Topic Question 4:

I honestly think that the BEST alternative for the Moose-Wilson Corridor is to remove and allow for vegetation rehabilitation the entire roadway from the Granite Canyon Trailhead parking lot to the Parking Lot at the Laurance S. Rockefeller Preserve.

The Granite Canyon Trailhead (and Poker Flats area) would continue to be accessed via WY Hwy 390 (and the existing Granite Canyon entrance station). The LSR Preserve (and the Death Canyon Trailhead) would continue to be accessed via Moose Village.

The area in between the Granite Canyon Trailhead and the LSR would be left for nature with NO road OR Pathway and NO wheeled vehicle access.

There should be a paved highway which goes from US Hwy 26/89/191 to WY Hwy 390 via the Gros Ventre Junction area directly across the Snake River (obviously with a new bridge). That would allow for the transportation needs of the valley that are currently using the existing Moose-Wilson road. (Possibly around the Zenith Road area?)

This alternative (let's call it Alternative E) would meet or exceed all of the Goal Statements listed in the Moose-Wilson Corridor Comprehensive Management Plan - Preliminary Alternative Newsletter with the possible exception of the Goal Statement listed under "Scenery" (as this alternative would reduce the wildlife viewing opportunities within the Moose-Wilson Corridor).

There should be NO further pathways in that part of the park. There are plenty of pathways for folks to use elsewhere.

Topic Question 1:
None

Topic Question 2:
All of them.

Topic Question 3:
The Moose-Wilson corridor provides a unique opportunity for motorists to experience, in an intimate manner, a portion of the park which differs in many ways from the rest of the park. It is a premier area for viewing wildlife and their natural activities. The preservation of this opportunity and the protection of the wildlife that utilize the area should be the primary focus of any plan.

Topic Question 4:
Features:

Retain Granite Canyon entrance and retain and expand the GC trailhead parking.

Improve the unpaved portion of M-W Road and improve the drainage and gravel surface.

Remove the paved surface of the road from the end of the gravel section to the entrance to the Rockefeller parking area and convert it to a gravel surface.

Improve the parking at the Death Canyon and M-W intersection. Improve Death Canyon Road and improve and expand the DC parking area.

Relocate the roadway and build a new entrance at the north end of the road as shown in Alt. D

Prohibit biking on the corridor. Do NOT install a bike pathway.

Enact an alternating one-way traffic system for motorists. Allow entry at the south entrance from an appropriate starting time until 12:00 noon and at the north entrance from 1:00pm until an appropriate closing time. This system would allow visitors staying on the West Bank to easily access the park in the morning and to return via town on WY22. Presumably, visitors staying in town would normally enter the park at Moose. With the one-way system, they could experience the M-W corridor and Teton Village on the way back. Each of these outcomes would expand visitors' knowledge of the valley and could disperse visitor spending across the entire community.

This one-way system would certainly reduce the traffic at any one time and would create less disturbance to wildlife and make the drive safer for motorists.

GTNP has and is providing substantial facilities for bikers to use the park. GTNP should not be required to provide biking access to every part of the park.

Additionally, in recent years there have been incidents that create questions about the safety of bikers in areas occupied by grizzlies. It has been surmised that the bikers are seen as fleeing prey by the grizzlies which provokes a predator response by the bears.

The business community, and therefore the politicians, would like the M-W corridor to be an essential part of the valley's transportation network and as a factor for increasing business activity and their own profits. As Mary Gibson Scott observed, it is not the NPS's mission to provide transportation solutions for the community. These community wishes would be a driver for the destruction of a unique environmental and visitor experience, which would be in direct conflict with the mission of the NPS.

Topic Question 1:

The unpaved portion of the Moose/Wilson Road should be paved as stated in Alternate B. The dust created by the present dirt road covers vegetation along the roadway which is unsightly and detrimental to the plants, not to mention the wear and tear on cars from the pot-holed road. Also, improvement of the Death Canyon portion of the road as presented in Alternate C is necessary. The current unpaved portions of the road requires regular grading and maintenance which would be unnecessary if the entire road was paved.

Topic Question 2:

The is ABSOLUTELY NO NEED for a bike path along the road. Teton County has an over abundance of bike paths paid for with tax dollars with the paths benefiting a small portion of the population. Construction of a bike path will greatly disturb wildlife, vegetation and natural water features due to its proposed location. Additionally, it is UNSAFE to ride a bicycle through this wooded area with such abundant wildlife. For example, what if a bear suddenly appears before a bicyclist?

Topic Question 3:

Yes, in the event it is decided to close the road on certain days, a provision should be made to allow Teton County residents and business owners, only, to travel through. We live north, near Moran, and travel to Teton Village a minimum of 3 times a week. Without this provision, we would have to drive all the way through town to get to the Village which would add at least 1/2 hour addition drive time each way thereby producing additional, unnecessary gas consumption and car emissions.

Topic Question 4:

We see no need to spend tax dollars on relocating the roadway to the east. There should be limited pull-overs/parking areas so that travelers do not stop in the middle of the road blocking traffic.

Topic Question 1:

I support Alternative D as the best way to handle the various uses of the Moose-Wilson corridor. A pathway separate from roadway is essential for increasing the safety of non-motorists. In addition, expansion of pathways elsewhere in both GNTP and in Teton County has had the very favorable and noticeable effect of encouraging non-motorized travel. These pathways are used not only by locals, but also by visitors to enjoy the beauty of the Park.

Topic Question 2:

Closing the corridor to certain traffic or to certain people does not seem to be a positive way to try to manage the corridor. Alternative B appears to ignore the very real fact that locals use this corridor, either for their own commuting needs (it cuts off a vast amount of mileage - forcing people to drive around results in a great deal more emissions, etc.) or to share with family and friends who are visiting. Alternative C very oddly seems to propose that people should only walk or bicycle on certain days of the week. What if the cycling day turns out to be rainy? Good luck next week! It also seems that this alternative would promote unnecessary friction between motorists and non-motorists. I think a lot of drivers (maybe most of them) would be livid to find the road open only to cyclists and pedestrians. Cyclists already experience enough road rage directed toward them; the Park does not need to exacerbate these feelings.

Topic Question 3:

I think the Park should investigate ways in which more mass transit could encourage fewer single car trips to the Park. For example, could the Park team with existing local wildlife tours to drive through the corridor on sight-seeing trips, with the finish being at one of the visitor centers or at Jenny Lake for a boat ride/hike. (Jenny Lake has way too many cars trying to use the parking lot; more often than not parking

happens along the highway in the middle of summer.) I know many visitors get directed toward the corridor as one of the more likely and easily accessible places to view wildlife. More turnouts for wildlife viewing also need to be incorporated into the corridor. Without a safe place to park while viewing wildlife, traffic through the corridor becomes that much more congested and dangerous. A separate pathway for cyclists and pedestrians is critical, both for the safety of those who already use the corridor to link the existing pathways and to encourage more people to view the Park outside the confines of their vehicles.

Topic Question 4:

A separate pathway for cyclists and pedestrians is critical, both for the safety of those who already use the corridor to link the existing pathways and to encourage more people to view the Park outside the confines of their vehicles. There is a pathway from Jackson to GTNP, and the pathway from Jackson to Teton Village will soon be complete. It makes all kinds of sense to also link Teton Village to GTNP, for a complete circuit. The current pathways providing safe access to the Park, as well as inside the Park, have encouraged many visitors to either bring their own or to rent bicycles to experience the park in a very different way than a car affords.

Topic Question 1:
See Question 4

Topic Question 4:

I support a modified version of Plan D. Basically, I support maintaining the road as it is with the realignment on the north end and a separated pathway. Two way traffic, narrow, windy, partially unpaved. Managing numbers of vehicles is fine and additional pull off areas to accommodate the overflow traffic into LSR. Perhaps some notification at each end of the road that there is no parking at LSR when it is backed up at that area. Thanks for the opportunity to comment.

Topic Question 1:

A separate pathway should be carried forward because it offers a safe option for those who wish to travel the corridor car-free. It also offers opportunities for those less mobile, such as wheelchair users, to experience the park in a safe way that is congruent with the values inherent to the national parks.

Topic Question 2:

Gates and closures would not achieve the desired outcomes.

Topic Question 3:

Public transportation should absolutely be included.

Bike and pedestrian needs should be prioritized.

Topic Question 4:

Please consider Alternative D.

Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular public on a needed pathway.

Last Wednesday's News and Guide printed an article about the complex process for public comment. The author, Mike Koshmrl, did a good job, but only scratched the surface. A fair reading of the NPS process makes it pretty clear they wanted no comments to get through. Perhaps our federal delegation was correct, the Park has already made up its mind.

Let's take a look at the first hurdle to anyone wishing to comment. Yes, it's on this page of the web site, just above, and asks, " Which strategies in the preliminary alternatives do you think should be carried forward to best achieve the purpose and address the need for the plan? Why do you think they should be carried forward?"

Hmmmm. Could this possibly be written by a bureaucrat? What strategies, where? What's a preliminary alternative? And what does "carried forward" mean? Not just a bureaucrat, but an environmental bureaucrat- - a NEPA Nerd.

Park spokeswoman Jackie Skaggs recognized the issue, saying, "It wasn't intuitive... some people were stumbling..." No kidin' Jackie. If you really wanted our comments, you should take them in our language, not yours.

Here are some comments:

- I remember when maps did not show a road connecting north of Teton Village. We did not have traffic problems then.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

- I have watched huge RV's pulling an SUV on a trailer negotiate the road and every vehicle travelling northbound had to pull entirely off the road to allow them through. Enforcement!
- No law enforcement ranger was around for the above infraction. In fact, never saw a law enforcement ranger on the road ever, except in winter when a ranger on snowshoes gave a \$50 ticket to some young skier with a dog off leash.
- The road is damaged more by speed and weight, than by volume. Any enforcement? Nope. O.K. never mind. The Park has never wanted to enforce any rules on the road, and when forced to by LSR, they only went through the motions.
- Enforce a 25 mph speed limit and have plenty of pull outs and the road will be fine.
- Any idiot who thinks it's faster to get to the airport via the dirt road, should not have a driver's license (Jorgenson?).
- What percentage of use is commercial wildlife viewing buses creeping along at 10 mph?
- Sadly, it is alternative E that may be the only viable choice- - we move to Montana.

Topic Question 1:

Definitely alternative D. It offers the most access while diminishing vehicular impact in an environmentally sensitive and active area. Closing down the corridor doesn't address the lack of safety for cyclists or walkers/runners. It would seem most logical and add a wonder dimension to the area to continue the complete pathway from Jackson to Teton Village and on to Moose. There are already parking incentives (low-emission vehicle parking spaces) at the Rockefeller Preserve. What could be more consistent with that philosophy than encouraging zero emission traffic (by foot and bike)?

Topic Question 2:

Any strategy that fails to address the reduction of gas vehicles AND the safe coexistence (separate) of foot and bike traffic.

Topic Question 3:

Additional bicycle racks at the Rockefeller Preserve in conjunction with alternative D.

Topic Question 1:

Of the proposed D is the best of the lot. It provides for a bike path, although in the wrong location south of the Rockefeller Preserve, and it addresses the issues around the Beaver Ponds.

Topic Question 2:

Alternative makes no changes to a bad situation that will only get worse. Alternative B has no bike path and paving the gravel section will only attract more vehicles. Alternative C has no bike path and does not address situation(s) around the Beaver Ponds. Not much better than doing nothing (A).

Topic Question 3:

Before discussing any of the alternative plans for the Moose-Wilson corridor, you should be asking is the current road in the right place if we were starting from scratch? I think the answer is definitely no. In its current location the road bisects a great deal of woodland habitat, floods around the beaver pond, is subject to moose jams in the summer and bear closures in the fall, has blind corners south of the Rockefeller Preserve and is dangerous for bikers. In short if you were starting from scratch, it would be in a different place and configured differently.

I would suggest that there is another alternative, call it E, which would be a better solution than any of the four currently proposed alternatives (A-D). Starting from the south, the road would be rerouted through the open meadows downhill and to the east of the current road. These meadows run northeast from where the pavement stops, just south of the Grand Canyon trailhead, past the Rockefeller Preserve. With the exception of a band of trees north of the Rockefeller preserve this is a relatively open corridor. The North end of this new alignment would then pretty much follow alternative D, although significant

savings could probably be realized by joining the Murie Center road, which has already been cut through the trees and graded. I'm assuming that the bike path would follow this same route as the road.

This new alternative (E) would solve once and for all most of the problems associated with the current route. Woodland habitat would no longer be bisected. The area flooded by the beaver ponds and subject to moose jams and bear closures would be avoided. The bike path would follow fairly flat and open terrain. Even if this alternative (E) is not chosen for the road, I strongly recommend it be followed for the bike path.

I'm not sure what is gained by replacing the current Moose entrance station as part of the Moose-Wilson management plan. If it is felt that an entrance station on the north end of the Moose-Wilson Road is a good idea, this could easily be accommodated on the Murie Center road. Obviously manning an additional entrance station adds to the park overhead as will the reservation schemes, proposed to limit traffic.

In summary, I have two recommendations: 1) don't let the current road dictate where the bike path is routed. Run it through the meadows, east of the current road, where it makes the most sense to be placed. 2) reroute the existing road through the meadows, where it should have been placed in the beginning.

Topic Question 4:

Topic Question 1:

I support alternative D and believe that there should be safe pedestrian access along the Moose-Wilson corridor.

Topic Question 2:

I do not believe that the road needs to be widened and am concerned that if the entire road is paved, that drivers will drive faster, leading to increased vehicle-wildlife collisions. If the road is paved and maintained to be safer with less potholes, I strongly believe that the speed limit needs to be no higher than 25mph and that there is an accompanying pedestrian/bike pathway. I am also opposed to making the road one-way due to the detrimental economic effects that may incur to Teton Village businesses.

Topic Question 4:

I support a safe pedestrian pathway along the corridor. I am also opposed to limiting the road to one-way traffic and widening it since that may increase vehicle-wildlife collisions.

Topic Question 1:
I believe maintaining the current

Comments: I would urge the park to avoid re-routing the Moose-Wilson road so that it would not negatively impact the known archeological sites in the area and it would still be able to stay on the National Historic register. The park maintains both the inner and outer park roads as larger highways and I believe the quaint nature of the current Moose Wilson road should be maintained.

Topic Question 1:

I think there should be a dedicated bike path, preferably separated from the road. My concern about just having a lane along the road is that drivers are very distracted on this road (looking for and at wildlife) and are not focused on staying within their lane.

Topic Question 2:

I think any of the alternatives that do not provide for a designated bike lane will be fraught with problems, hostility, and accidents. This is a beautiful road that should be used, but should be acknowledged to be a multi-use road.

Topic Question 1:
We need bike paths and non-motorized transportation.

Topic Question 2:
Closing the road creates more traffic elsewhere and therefore makes no sense ecologically. Also, there is plenty of wildlife elsewhere that suffers from too much traffic.

Topic Question 3:
A regular small shuttle from the Village to the Visitors Center could alleviate traffic.

Topic Question 4:
We need to recognize that growth is part of the future. So we can't wish our way back to 1950. The good news is that people like to bike and can become accustomed to shuttles stopping at trailheads. Certainly commercial traffic can be banned.

Topic Question 4:
Please see comments section

Comments: The Teton County Commission sincerely thanks all the folks at Grand Teton National Park and the Denver Regional Office for your thoughtful work on the draft alternatives for the Moose-Wilson Corridor Comprehensive Management Plan. You have captured and presented public comment in the context of the unique environmental, wildlife habitat and scenic resources of the road and larger study area. You have defined elements in the alternatives that serve as a menu of ideas, making it easy for the public to comment while providing the Park Service useful information to include in its analysis of the alternatives in your environmental review.

It is a shared goal among each member of this commission and, we believe, the entire community, to support Grand Teton National Park in your need to reduce traffic meaningfully. We understand and want to help GTNP adaptively manage future traffic on your roads within the Park, and partner with you on

real solutions as a community. We believe as a gateway community, our valley is one of the greenest, most supportive partners - be it government, the private sector and the residential community - that the National Park Service will find anywhere. The shared concept throughout each of the alternatives presented should be how to preserve the Moose-Wilson Road in the same slow, narrow, rural character. We do not support a wider, faster, or character change in the road. Instead, our overall request is that the National Park Service reach out to potential partners who will diligently work to help GTNP reduce traffic to meet a data-driven objective, enhance the visitor experience and help wildlife that moves in the Moose-Wilson corridor and throughout the valley.

We also appreciate that you have fully engaged the adaptive management recommendation in all of the action alternatives. Your approach to adaptive management based on factual data regarding both traffic levels and wildlife impacts will provide a management program that meets current issues and can adapt to future issues along the corridor. Adaptive management with defined triggers should help GTNP protect the resource now and in the future without over regulating use.

Generally, the county commission supports the elements in Alternative D, with some minor modification described in this letter, such as partnerships on small-vehicle transit to take more individual vehicles off of the road altogether, non-motorized transportation and the opportunity in these approaches for enhancing visitor stewardship education. What we generally like about Alternative D is it keeps the very slow, narrow, rural nature of the Moose-Wilson Road as it is, while addressing public safety and providing reasonable public access to the area. We have organized our comments around each action alternative and concluded with a short discussion of our recommended preferred alternative.

Alternative B

Traffic Management: The adaptive management concept of stopping traffic part way along the Moose-Wilson road seems worth analysis, although we are not clear how it will limit overall traffic, how it would be managed, and how GTNP would communicate to the public when the closure would be implemented. We also are concerned that it could cause increased idling, traffic backups and confusing bumper-to-bumper scenarios that could be bad for the air, harmful to wildlife, increase National Park Service costs of management and cause negative experiences for the visitor. The alternative assumes that much of the traffic on the Moose-Wilson Road is traveling through the corridor, rather than using the road for a park experience. In contrast, the traffic data presented to the community suggests that most of the traffic on the Moose-Wilson Road is park-related and that driving through the park is part of their experience. A gate mid-way could have the unintended consequence of adding more traffic, particularly on the northern portion of the road, with out-and-back traffic that would otherwise pass through the road one-way.

The commission supports all measures to realign the north end of the road, both around the beaver ponds and the connection to Teton Park Road west of the existing entrance station. The realignment, part of the 2007 FEIS ROD, was shown to be beneficial to wildlife and a measure we want to actively support. GTNP has long held this good idea, and we want to support the Park in its efforts to help wildlife, particularly bears and beavers that are constrained near the hillside by the existing road.

One advantage of the Alternative B adaptive management plan is the utilization of one entrance station on the north end of the road. The commission suggests that GTNP explore ways to use a single entrance station in all adaptive management alternatives. We expect that a single entrance station on the northern section at Moose for both the Teton Park Road and the Moose-Wilson Road would be efficient, less costly, less impactful during construction, and less confusing than two entrance points.

Commercial Activity: Commercial uses in this alternative include "shuttle services". This language

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

suggests private shuttles to the airport, lodging within the park, and other private transit solutions. It is unclear from this language if public transit is included in this concept. In order to distinguish public transportation from private shuttles, we suggest that NPS reserve the potential for public transportation (Transit) as a separate category in all Adaptive Management measures, rather than in the "Commercial Activity" category. Public transportation, either in partnership with another entity such as Teton County, Teton Village, Grand Teton National Park Foundation, or provided by the park, should be one of the adaptive tools NPS could use in the future to reduce congestion along Moose-Wilson Road and throughout the park. The commission expects that public transportation will help the park effectively measure the reduction of traffic volumes on the Moose-Wilson Road. Furthermore that public transportation is an opportunity for park-led education and environmental interpretation that can have lasting positive effects with deeper understanding of the corridor itself.

Death Canyon: National Park Service might consider combined trail access to Death Canyon and the White Grass cabins under this alternative with reclamation of the White Grass Road.

Winter Use: Please consider removal of the limited plowing measure. Winter access to Death Canyon provides historic and important recreational access to numerous mountains for backcountry skiing, including Albright, Buck, Mavericks and many other backcountry destinations. Eliminating the plowing would prioritize cross county skiing along the road over backcountry skiing and walking, where the current level of service supports both.

Education & Interpretation: All alternatives should include low-impact interpretive media. If there is a reason to included higher levels of interpretive media in the environmental review, the commission suggests that this measure from Alternative B should be included in a preferred alternative.

Alternative C

Traffic Management: The adaptive management strategy in Alternative C is creative. While the closure of the road to motor vehicles would create a much safer and quiet experience for cyclists and pedestrians, it would have other consequences that the commission does not support, such as limiting hiker and climber access to the back county during those days. And it does not address the safety issues for cyclists and pedestrians during days when all visitors would share the road. Furthermore, as a commission, we continue to support adaptive management strategies other than closure to limit overall use within the road corridor. We would like to see the National Park Service develop other active management measures to address traffic reduction while still enabling public access and safety. We encourage consistency with the Enabling Act for GTNP and subsequent publicly recorded easements on the Moose-Wilson Road to preserve historic public access as an important park value.

As stated in the discussion above, NPS should reserve the potential for public transportation as tool to help mitigate congestion.

MWR Realignment : As proposed in Alternative C., the road would not be realigned or paved. This is already analyzed in the Alternative A - the "no action" alternative. The commission suggests that NPS consider a more minimal realignment around the beaver ponds than considered in Alternative B and Alternative D. in order to expand the analysis of realignment options. We support the National Park Service's efforts to protect wildlife that are core to the realignment effort.

Also, Alternative C. does not consider paving the southern section of the road. But it prioritizes non motorized uses. NPS might consider creating partial pavement to support safer cycling and vehicle use, and reduce the overall chemical treatments on the road as currently practiced.

Death Canyon: In this alternative, the National Park Service might consider abandoning the White Grass access road and combining access to Death Canyon and the White Grass cabins along the southern road. The commission prefers the proposal to combine the access roads as described in Alternative D., but

suggests analyzing an alternative alignment in Alternative C.

Alternative D

Concept: The concept as it is currently written suggests an expansion of use and higher level of development throughout the corridor. In contrast, the commission suggests that the overall concept defined in Alternative D should be about balancing preservation of park resources with visitor experience by minimizing traffic and visitor impacts on wildlife resources along the road corridor and emphasizing visitor experiences outside of vehicles. The commission sees this concept as reducing noise, traffic and congestion and enhancing outdoor experiences. The overall level of development and expansion of turnouts and parking should be as small as possible to achieve these goals and should focus on self-discovery versus active programs and expanded interpretational sites. We believe one of the values the public wants is the feeling of less, while still having access to the public area. Similar to the spirit of the LSR, where signs are few and self-exploration is core, we hope that same approach of discovery is the overall ethic for signage, direction and directives of 'less is more' in this concept. We think the transit offers prime visitor education opportunities for this environmental approach to visitors.

Adaptive Management: The commission supports adaptive management of the pathway and road alternative so as to minimize adverse effects on wildlife and cultural resources from existing or future motorized traffic levels. Meaningfully reducing motorized traffic can be aided by non-motorized alternatives for the public. The pathway should include its own adaptive management such as time-of-day and seasonal use restrictions when wildlife use of the corridor could be impacted by these uses.

Bicycle Use: The commission supports the analysis of a pathway along the road. In the previous ROD, GTNP approved a separated pathway within the road corridor along the southern section from Granite Canyon trailhead to LSR. The environmental and wildlife effects of this were considered minimal at that time. The commission supported consideration of bicycle and pedestrian amenities from LSR to Moose to complete the pathway and make for safer conditions.

The pathway in Alternative D. should be studied in the context of the historical approvals and GTNP should consider tools and measures to mitigate environmental effects of construction and use. For construction, mitigation measures could include reclamation of damaged areas in the road corridor or park, planting of native shrubs, grasses and trees. Once constructed, the park should consider adaptive management measures such as time-of-day and seasonal use restriction to ensure minimal additional disturbance of wildlife.

The commission generally supports keeping the pathway close to the road. However, in order for the National Park Service to minimize resource impacts associated with site-specific features and resources, this language should allow park managers to design a pathway outside of the 50' limit if doing so would reduce resource damage during construction or if keeping it close to the existing road would have long-term adverse impacts on visual resources. In addition, the National Park Service should evaluate whether placing the pathway on already disturbed fiber optic line would be advantageous, as the construction of the pathway over the line may result in fewer trees being cut and less ground disturbance. We encourage the NPS to study the reality that the public will be using the corridor to connect with the celebrated GTNP pathways within the Park and connected to the valley, and that a pathway gap along the Moose-Wilson Road creates real safety issues. Two deaths in GTNP galvanized the approvals for the Jenny Lake to Moose and Highway 89 pathway sections within the park. Planning ahead and studying safety issues are important for this EIS.

Non-taxpayer funds and private-public partnerships: We encourage the NPS to plan that the additional tools to reduce traffic levels - transit, a multi-modal pathway and possibly maintenance of the entire pathway system in the park - be paid for with private dollars. Just as has been done at Jenny Lake for the

\$16 million in improvements, all privately raised, we too hope you will plan for private dollars so as not to burden the NPS and GTNP budgets. This is a new era of partnerships, and we will do all we can as a community to support your needs.

Commission's Recommended Preferred Alternative

The commission recommends the National Park Service adopt Alternative D with the following modifications as the preferred alternative:

Concept: Minimize overall traffic, noise and congestion of the corridor and emphasize outdoor experiences.

Adaptive Management: Include measures to manage pedestrian, bicycle and cars in a manner that minimizes impacts to wildlife at times of day and during certain seasons.

Traffic Management: Add public transportation to the adaptive strategy as a possible tool for managing and mitigation congestion.

Commercial Activity: Limit or disallow shuttle services that are not park-specific and other commercial traffic, including taxis.

Education & Interpretation: The commission supports the self-discovery, low-impact approach to interpretive resources as described in Alternative B.

Non-taxpayer funds and private-public partnerships: As done in the Jenny Lake Environmental Assessment, plan for private dollars to pay for identified transit partnerships or a pathway and maintenance.

In closing, the National Park Service should be commended for your work on this document.

Topic Question 1:
See comments below:

Topic Question 2:
See comments below:

Topic Question 3:
See comments below:

Topic Question 4:
Keep the comment period open until the end of the summer season.

Comments: The recent closures demonstrate how important the Moose-Wilson Road is as a thoroughfare to vehicle traffic between the West Bank and Moose, Wy. These closures resulted in increased traffic through the town of Jackson; delays, and in some cases, abandoned trips to Grand Teton Park, Yellowstone Park and other destinations north of Teton Village.

The current road does not need to be improved with additional paved sections. But, it does need to be open to vehicle traffic, in both direction, on a full time basis during the spring, summer and fall seasons.

The current configuration of the road and any proposed realignment ideas are not conducive to bicycle or pedestrian use. Bicycle and pedestrian activities should be accomplished in a way that is separate from the current roadway. If space or other issues do not permit a separate path, then those other uses should

be set aside until such time as they can be accomplished in a safe manner and consistent with proper wildlife management.

Regarding safety and comingling of people and wildlife, the park system already has standards and regulations on this subject. The recent closing of the Moose-Wilson Road simply demonstrates the lack of enforcement of rules already in place regarding safe viewing distances, approaching wildlife and parking on the park's roadways. Earlier during 2014 no-stop zones were enforced in the Willow Flats area when grizzly bear road crossings became frequent. Was this not an option on Moose-Wilson when the bear traffic recently increased?

Regarding the four options recently presented by the park, it would seem that Option B makes the most sense. The idea of moving the MW Road to join the inner park road after the Moose entrance station is a good idea. This feature would reduce congestion at the Moose entrance station. Those that entered the park via the Granite Station would not have to enter again at Moose. It would also alleviate the problem of over-sized vehicles entering the Moose-Wilson Road.

A feature of Option B limits through traffic during certain times. This is not a good idea. Again, the road should be open to vehicles in both directions during all hours of operation.

As noted during the park's recent presentation, the traffic on the Moose-Wilson Road has increased over the years and is expected to increase even more in the years to come. Placing restriction on the Moose-Wilson Road is not the solution. Rather, another road should be built from the Teton Village area to the Jackson Hole Airport. An idea that is not new to the valley. If such a road had been constructed years ago when it was contemplated, the current issues with the Moose-Wilson would likely have been avoided.

Thank you for the opportunity to comment on the Moose-Wilson Road.

Topic Question 1:

A separate pathway, keep cars and bikes/pedestrians separate.
Keep the road open always or same as it has been.

Topic Question 2:

Do not close the road to cars, defeats the purpose and isn't taking workers,etc into consideration.
Closing in winter also will make backcountry access very hard.

Topic Question 3:

Put a park entrance at the start of the moose-Wilson road.
Move the park entrance at Moose east if the Moose-village road- - so that you don't have to enter twice.

Topic Question 1:

I support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Park values are best protected under Alternative D, which recognizes that wildlife and park visitors can be thoughtfully managed together, the essence of National Park visitation. Under Alternative D, visitors experience this part of Grand Teton National Park in a way that is respectful of natural resources, informative, inspiring, and safe. Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular public on a needed pathway.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitably see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's

entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway.

Topic Question 3:

A separate Moose-Wilson pathway is a safety need, not a want, an imperative in any Alternative. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Decreasing the increased traffic volumes for the long term is the Park's objective and that is possible only with Alternative D, which uses thoughtful, safer ways to get people out of vehicles and into the outdoors.

Combination of Alternative B & D with additionsSee Comments

Topic Question 2:
Alternative A

Topic Question 3:
See comments below

Comments: Preliminary Alternatives Newsletter-Comments

We live in Moose and have frequently used Moose-Wilson Road in the past. I/we have used Moose-Wilson Road (MWR) for access to Death Canyon trailhead, the LSR, and to get to Teton Village and Wilson. After thinking about our use of MWR, I have changed my behavior, only using the road for specific destinations within the corridor (Death Canyon and the LSR). I have chosen to no longer use MWR as a means to get from Moose to Teton Village, removing myself from the vehicle congestion and the impact on wildlife in the corridor. Instead, I go thru town of use Spring Gulch Road. And I have found that the transit time is within 5 minutes independent of route taken, so it is not a significant inconvenience.

If the wellbeing of wildlife is important to us, then our behavior should reflect that attitude. I accept and believe that the MWR is a wildlife rich environment. If that is true, then eliminating pass-thru trips that do

not involve wildlife watching would make sense. The point is that if every local eliminated non-destination trips thru the corridor, we could significantly reduce the impact on the road, congestion, and wildlife.

The recently released Moose-Wilson Corridor Use Levels, Types, Patterns and Impacts in Grand Teton National Park is based on real data collected during the summer and fall of 2013.

According to the report, an average of 2000 vehicle trips per day were recorded for the MWR, with approximately 200 trips per day to the LSR and 200 trips per day to Death Canyon road. Assuming all LSR and Death Canyon trips were destination trips, a stop at any other location would be unlikely. Forty percent of vehicles on MWR (except for LSR and DCR), or 640 vehicles stop at Sawmill Ponds to look at/for wildlife. That means that ~1000 vehicle trips per day are either looking for wildlife but not stopping, or are simple pass-thru trips. For those of us like me who were not looking for wildlife as we drove on MWR, we were miss-using it. Certainly some portion of 1000 trips per day are pass-thru, they are done by us, and we could eliminate them.

The report also tracks bicycle trips on MWR. 90 bicycle trips were made in July on MWR, or an average of 3 per day. 84% of those were no-stop trips, so were unlikely to be for the purpose of wildlife viewing. For August there were 216 bicycle trips, or an average of 7 trips per day. 79% of those were no-stop trips. In September there were 85 bicycle trips, or less than 3 per day on average. The obvious question is, does this level of use justify the destruction of wildlife habitat to create a separate bike path in the MWR corridor?

Moose-Wilson Road should not be a transportation or exercise corridor. None of that is consistent with my understanding of a National Parks reason for existing.

No Alternative is suitable as presented. Specific suggestions are:

- One entrance station at Moose with realigned MWR to intersection with Chapel road per Alt B.
- Realign northern section MWR east of beaver ponds per Alt B.
- Death Canyon parking/access per Alt D. Hiking to Phelps Lake overlook is the only one (other than LSR) that can be made by elderly people without going up significant grades.
- Death Canyon Road winter access as current. This is the only approach to major backcountry skiing areas.
- LSR access/restriction per Alt B.
- Pave dirt section of MWR per Alt B.
- No bike path! See above comments re use.

Topic Question 1:

Option D is the best choice option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

As a Teton County resident, it seems the traffic and number of cars in Jackson is increasing. My assessment is based on my own observations(perhaps there is some objective measure to verify my observation?) however, as a community it is important to provide options to cars. Additionally, from a health benefit perspective, it makes sense to inspire and encourage people to get more physical activity. Pathways are a great way to make exercise accessible and safe to all and encourage additional activity.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

Bike and walking options are a benefit to the community and to society. However, additional public transportation is a need as well to reduce the number of cars. This summer I have personally witnessed a

car/motorcycle accident that resulted in a death. My personal assessment of the situation was that speed (not necessarily the speed of the person who died) and too many cars on a road with no shoulder were factors in the fatality.

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitably see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway.

Topic Question 3:

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future. This is an important long term solution to the traffic in our community. It appears that our limited roads are unable to handle the amount of traffic that comes through Jackson. Spend some time on the village road during ski season and it becomes clear that we need even more public transportation and creative ways to encourage people to use the bus. Some people are resistant and will continue to drive, however, if the public transportation is accessible, inexpensive and readily available people will ride the bus. Plus, it's too heartbreaking to read about the death of yet another moose on the village road. Less cars is really important for our ecosystem.

Topic Question 4:

The pathways in and around Jackson are an amazing benefit that I appreciate greatly. Prior to the pathways, I would not ride my bike to the park due to amount of cars, distracted drivers, and lack of a shoulder on the road. Now I use the pathways daily and feel they make sense in our community.

Please consider option D as the best choice for our community and visitors. It makes sense.

Topic Question 1:

there is clearly a need to accommodate bikers. It is only a matter of time before there is a tragedy on the road involving a biker. A path next to the road makes the most practical sense and the animals have not objected to the car traffic so a few more wheels should not make a difference. Bikers take the risk of encountering animals along the way - it is nothing new.

Topic Question 2:

Another expensive study will not solve anything. Make a decision.
The increased grisly activity is just an excuse to postpone doing anything.

Closing the road is a poor idea. Many of us depend on it for summer access to the parks. Town traffic is already a disaster; let's not add to it.

Moving the entire road closed to the river would disrupt animals beyond imagination...they know the road is there and they are used to it. I don't think there are that many animal deaths from collision....traffic goes by necessity quite slowly.

Topic Question 3:

What we really need is a new Snake River bridge that does not allow truck access. Any part you can play in that would be a big help to traffic on Moose Wilson Road. The argument that it would kill the town of Jackson does not hold up. Have you counted the tourists there lately? The town is a destination, those of us passing through look for alternative routes: Spring Creek Gulch and back roads through town. Not helpful on any front.

Comments: The drive through Moose Wilson is a landmark treat for many folks. Let's not corrupt the spirit of the Rockefeller contribution to all of us.

Also, a toll on the road is not fair to locals; it would be a regressive tax unless there is a season pass option for locals.

Topic Question 1:
Minimal changes to the existing road; change road only to enhance safety.

Topic Question 2:
I think all the options [A - D] are too complicated.

Topic Question 3:
I would simply make the road one way from Moose going south toward Teton Village. With only one lane of automobile traffic, there should be room for a bike path on the existing pavement or with minimal widening of the road in places. This would be similar to the road between String Lake and Jenny Lake, which seems to serve everyone well and seems to be generally accepted. Cyclists would have a "full circle" route from town although it would be only counterclockwise.

Comments: Cyclists should be required to obtain FEE permits - or if not already required, to pay the same fees for park entry as automobiles. Funds from these fees should be used for any improvements necessary to accommodate cyclists. In parts of the park [I know this isn't a Moose Wilson road issue] cyclists who are on the main highway when a bike path is open next to the highway should be cited and fined.

Topic Question 1:

Mild Road Safety Improvements are OK, but nothing that might increase speeds.

Topic Question 2:

No Bicycle Path. As the area is being used more by wildlife and particularly grizzly bears, a new path separate from the road would lead to bear mortality due to human conflicts. The area should be primarily kept as pristine as possible for animal use and survival.

Topic Question 3:

Some preplanned road closures may be necessary with some days closed to road traffic or limited to visiting the Rockefeller preserve or the road that takes one to the trailhead for Phelps Lake Overlook

Topic Question 4:

Please keep the country road feel. This should not be a highway similar to the road from North Jenny Lake Junction to String and Jenny Lakes. Keep it very twisty and keep the hills that are there now.

Topic Question 1:

A slower speed limit with better parking and pullouts are good strategies. The public can be trained to drive slower even on straight stretches as proven by the Gros Ventre River area of Hwy 26/89/191. Safety of visitors, locals, and wildlife is an important part of this plan. I believe keeping part of the road unpaved also aids in slowing folks down.

I think keeping the current alignment near the wetlands is appropriate. There are a good number of visitors to the park that are not capable of walking (this nation is aging) it is nice to have a place where these folks can go and see wildlife fairly closely.

I think efforts to enhance winter use of the area with ski trail grooming on the unplowed road and better parking are both desirable and appropriate to the park service mission. This is the type of use we need to foster in this beautiful area.

Bikes can continue to use the rugged road and with slower speed limits and more enforcement it should be manageable. The idea of early and late periods for bike/pedestrian only use is good.

Topic Question 2:

I believe that any plan that includes realigning the northern portion of the Moose Wilson road through the rich archaeological site near the sawmill ponds is a violation of the public trust. That site despite once hosting a previous road alignment is one of the largest and most intact archaeological sites in the park and disturbing it for a road does not meet the park service mission of leaving resources unimpaired for future

generations.

Northern end road realignment also would not solve any wildlife use conflicts in the case of bears since the berry patches along the proposed stretch are as rich as those on the hillside and it is already the normal use pattern for bears to move between the river and the hillside.

All discussion of paving the unpaved section and adding an adjacent pathway should be dropped. This is delicate habitat and we do not need to introduce any more asphalt in the area. It is not the place to build a bigger corridor for any type of travel. The idea that a pathway would serve more than a small segment of the local public is highly unlikely. This park is set aside for all american citizens not just those living next to the park. There does not need to be a bike speedway developed so folks can make a great loop after work. The character of the area will not retain the slower paced observing nature focus if a pathway is added. Exercise bikers on an improved pathway would run into wildlife crossing the pathway as well as running slower (walkers/sightseers) off the pathway.

In the interest of reducing congestion, I think that road-based commercial activities should not be banned. Commercial activities taking folks away from the roadway using developed parking areas is fine.

Topic Question 3:

I think further discussion should be made about providing a shuttle service along the road during peak season- either to reduce traffic during peak season or with a closure to vehicular traffic.

Topic Question 4:

I know some have suggested making the road one-way. While this might help in some aspects in general I think it would encourage speeding since there would be no threat of meeting oncoming traffic. I have spent some years commuting along this road and know that that threat is all that keeps some folks from speeding worse than they do already.

I know that the choices for the Moose Wilson road are difficult and that is why we have seen plan after plan started and scrapped. I think that alone makes clear that the best alternative is to increase the physical presence of park rangers on the road (not in gatehouses) and enforce regulations. The cost of repeated planning is huge and instead of talking it to death we could see meaningful changes in managing the use as it stands.

Topic Question 3:
I believe the Moose-Wilson road should be closed entirely to private vehicles. A regularly timed GTNP shuttle could easily transport visitors from either end of the road to the various trailheads. The road could then safely be open to pedestrians and cyclists with no need for habitat disturbance.

Topic Question 4:
I appreciate the Park taking so much time and care into this plan.

Topic Question 1:

1 re-align the north end of Moose Wilson Rd so it is behind existing entrance gate

Topic Question 2:

Multi-use pathway is just asking for trouble with wildlife

Topic Question 3:

More pull outs and parking. Use curbs to prevent encroachment on vegetation

Comments: I favor alternative A as no other alternative provides the combination of satisfactory elements that I would prefer. I would advocate the following:

1. Lower the speed limit to 20 mph and ENFORCE IT.
2. Increase the number of turnouts and provide curbing so that they do not continually encroach on vegetation.
3. Do NOT create a multi-use pathway. There are plenty of paths in the valley and the nature values and wildlife along this stretch are not conducive to adding a multi-use pathway. Increased use as a result of including a pathway will lead to wildlife conflict or will annoy wildlife away from the road.
4. Ban commercial vehicles and taxis other than licensed tour operators.
5. Realign north end of road so it is behind entrance gate. It is silly and costly to add an additional entrance gate as proposed in one of the alternatives. This would also remove the dangerous blind spot on the northern most hill.
6. Dedicate one LE ranger to enforcing traffic and other regulations along the road.

7. Do NOT pave the gravel portion. The LSR agreement stipulates a "rural character".
8. Allow horseback riding on existing traditional trails..
9. Do not use a one-way strategy, ever
10. Do not use a reservation system ever
11. Consider running a bus tram line, would necessitate n and s parking areas.

Topic Question 1:

I believe that a realignment of the Moose-Wilson Road away from the sensitive wetland area, as proposed, would most benefit wildlife, and should be the primary consideration.

Topic Question 2:

Development of a multi-use pathway should NOT be carried out. Such a pathway would be very disruptive to wildlife. However, I also believe that not allowing through-way traffic would be a poor decision; at least, not until there is a north bridge and alternate route to Teton Village from Moose and other northern portions of GTNP. I do not support forcing motorists to drive through the town of Jackson in order to reach Wilson and Teton Village.

Topic Question 3:

A north bridge and alternate through route to Teton Village as mentioned under Question 2 is very much overdue and should be supported. This will permit through traffic and will greatly relieve the pressure on the Moose-Wilson Road.

Topic Question 4:

Please keep the interests of our wildlife foremost in this planning process. Do NOT permit construction of another "pathway". We have enough of those! But we do need to get from one end of the valley to the other without having to take a circuitous route through Jackson or Spring Gulch.

Comments: Moose Wilson Corridor Comments

I would like to preface my remarks envisioning the future of the Moose-Wilson Corridor with a description of my personal experience working and recreating within the corridor. I have worked at the Laurance S. Rockefeller Preserve since the opening and dedication of the Preserve in June of 2008. In addition, I worked four seasons as an interpretive ranger at Moose and Jenny Lake Visitor Centers. Prior to those experiences, I vacationed with my family in Grand Teton National Park every summer from 1995 to present. I have frequently watched wildlife along the road, ridden bicycles with my family from Moose to Teton Village, used the road to commute to work by car and bicycle and travelled it as a short cut to Teton Village and Wilson. I have seen the many faces of the corridor. Therefore I am well qualified to venture into this dialogue.

There is a varied spectrum of opinions about how we should manage this precious resource. Many competing perspectives are being raised. I have engaged in several convincing discussions resulting in modification of my ultimate selection of important points. At the heart of my analysis is the underlying premise that the National Park Service must embrace this opportunity to find common ground in the decision making process without compromising its stated mission to conserve and protect. Every action taken must first and foremost honor that mission.

Other worthwhile considerations must take second place. It is not the responsibility of the park to compromise this protection to help solve transportation issues arising from growth in Teton County and at Teton Village. Some would argue that there was no problem until the LSR Preserve was opened in 2008. Of course the Preserve has added traffic to the corridor, yet the data will show that the traffic increase is far greater than the number of cars arriving in the Preserve parking lot. The growth in Teton County, the west bank of the Snake River, Teton Village and Wilson in the last ten years is noteworthy.

The Moose-Wilson Corridor is entirely within the boundary of Grand Teton National Park. The north end of the corridor should be within the park entrance station, just as the south end is. Much like Yosemite, Zion and Arches National Parks, the corridor represents a park visitor destination and activity. At the same time, the wildlife within the corridor and its habitat are a primary consideration. Each park "provides for the public enjoyment" while "protecting the resource" by managing access. Realignment of the roadway, outside the prime wildlife habitat is crucial for many reasons. Climate change, public safety, cost of road maintenance are examples.

Public enjoyment of the corridor could be enhanced by improved parking at the Sawmill Ponds Overlook and addition of two other park and view lots, as is outlined in Alternative D. A family friendly pedestrian/bicycle pathway could be included beside the road to the Death Canyon junction or possibly to the Preserve.

If through traffic is shown to be significant and problematic, despite the seasonal availability of the through access, several other measures would be effective. First, whether or not the southern 1.5 miles is paved, the presence of taxis and excessive numbers of CUA holders with large wildlife viewing vans should be drastically limited. Speed control devices and other methods of speed reduction should be employed.

Neither bicycles nor horses need to have access to all places. At most there could be a pathway to the Death Canyon Junction or the Preserve to encourage people to leave cars behind. The public generally accepts and appreciates the separation of some uses. Both horses and mountain bikes significantly impact hiking trails. Visitors frequently comment to me that they very much appreciate the comfort of the trails at the Preserve, which are restricted to foot traffic and the numbers are controlled by the small parking lot. There are many good biking paths that are separate from the roadway within the park and the valley. There are short and long loops. The distance from Moose to Teton Village is too long for most family outings, and road bikes could share the road, especially if speed humps were installed and the speed limit lowered. Again, more bike paths are redundant and not necessary at the expense of prime wildlife habitat. (Data is emerging concerning the current pathway effects on wildlife.)

Improving and maintaining the Death Canyon road and parking lot as in Alt. C or D would encourage use of this relatively user-friendly trail to the Phelps Lake Overlook. This is a favorite for families and those who cannot take longer hikes because it is short, lacks significant elevation gain and has beautiful views.

Finally, as more equestrian users wish to enjoy the trails, there need to be adequate places to park horse trailers at the access points to the corridor. Poker Flats is a great spot, just too small. Both Taggart Lake and Death Canyon need improved trailer parking for equestrian use.

During a recent wildlife closure from the Murie Ranch road to Death Canyon, the LSR Preserve maintained a relatively normal level of visitation. The parking filled, and a waiting line was present as would be expected during exceptionally nice fall weather. The LSR Preserve is a destination for most visitors who have heard about it. The important piece for people planning to come there is that it be consistent, rather than subject to periodic closures. By moving the north section of road as described in Alt. B, the closures from the north would be eliminated. The road could be gated beyond the Preserve driveway and used for administrative access only. By gating it there, all other venues and private accesses would be available. Granite Canyon would be reached from the south, and the road gated at the trailhead. This potential option would protect the integrity of the wildlife corridor and allow access for public enjoyment of the LSR Preserve, Death Canyon and wildlife viewing opportunities consistent with the NPS mission. This is preferable in many respects to access to the LSR Preserve from the south. South access only makes administrative access and especially employee access more difficult. However, the existing roadway does act as a positive in this consideration.

No matter which combination of alternatives is chosen, the words of Robert Keiter in his recent book "To Conserve Unimpaired" resonate loudly. "The new image of the National Park Service calls for restraint on the periphery, a greater sensitivity to how development activities affect wildlife and other park resources, and recognition of just how far afield some of these threats are."

As the current stewards of these lands, we must be ever so careful, ever so diligent and ever so passionate in our protection.

Topic Question 1:
Alternative D.

Comments: I am in favor of Alternative D's following key elements:

1. Realign two segments of the northern portion of Moose-Wilson Road to address congestion associated with the presence of wildlife, wildlife habitat connectivity, and operational issues.
2. Construct a multiuse pathway parallel to Moose-Wilson Road between Moose and the Granite Canyon Entrance. The pathway would be generally within 50 feet of the existing or realigned segments of the road.

Correspondence Text

Topic Question 1:

Strategies that will best achieve the purpose and need for this plan include:

1. Reduced speed limits (as in Alt. B): to protect wildlife, natural soundscapes, and visitor experience
2. Realign two northern road segments (as in Alt. B): to protect wildlife, wildlife habitat, ecological communities, and visitor experience; and to provide wildlife viewing from a safe and non-disturbing distance
3. Retain the south end as unpaved (as in Alt. A, C, & D): to protect wildlife, scenic values, and visitor experience
4. Control traffic volume by prohibiting through traffic (as in Alt. B) but make it permanent at all times the road is open to motorized vehicles: to protect wildlife, ecological communities, scenic values, visitor experience. This can be accomplished by allowing two-way vehicle travel to LSR Preserve but no through traffic, or by closing the road between Granite Canyon Trailhead and the LSR Preserve.
5. Maintain existing turnouts, with no increase in paving, except as needed along the northern realignments, to provide wildlife viewing opportunities while minimizing impacts to wildlife habitat and scenic values
6. Allow bicycles to use existing roads (sharing the road with motorized vehicles, as in Alt. A & B), allow bicycles through access (as in Alt. B), do not allow bicycles on trails (as in Alt. A): to protect wildlife, wildlife habitat, and ecological values.
7. Prohibit commercial vehicles including taxis at all times, except for park-permitted commercial tours: to control traffic volume and protect wildlife, scenic values, and visitor experience
8. Relocate the Death Canyon trailhead (as in Alt. B): to protect wildlife habitat, reduce habitat fragmentation, protect soundscapes and visitor experience
9. Designate White Grass Ranger Station as a backcountry cabin with no vehicular access (as in Alt. B): to

protect wildlife habitat, reduce habitat fragmentation, protect soundscapes and visitor experience
10. Maintain current traditional non-motorized access in winter on unplowed road section, without mechanical grooming: to maintain winter solitude, protect winter wildlife habitat and wintering wildlife, and protect soundscapes and winter visitor experience

Topic Question 2:

Strategies that will now achieve the purpose and need for this plan include:

1. No traffic management (as in Alt. A): unsustainable growth of motorized vehicle traffic and unacceptable impacts to natural resources and visitor experience
2. Paving the unpaved section (as in Alt. B): unacceptable additional impacts to wildlife, wildlife habitat fragmentation and habitat loss, diminished visitor experience
3. Intermittent daily closures to vehicles (as in Alt. C): too complex and unmanageable, frustrating to visitors
4. Managing traffic volume by reservation (as in Alt. D): too complex and unmanageable, susceptible to manipulation and abuse by commercial or other special interests
5. Allowing through traffic (as in all alternatives except adaptive strategy Alt. B): unsustainable growth of motorized vehicle traffic and unacceptable impacts to natural resources and visitor experience
6. Improving Death Canyon Road and adding a new parking lot, or realigning the Death Canyon Road with the White Grass Road (as in Alt. C & D): unacceptable additional impacts to wildlife, wildlife habitat fragmentation and habitat loss
7. Adding new turnouts (as in Alt. D) except along realigned northern sections: unacceptable additional impacts to wildlife, wildlife habitat fragmentation and habitat loss, not needed if traffic volume is brought under control
8. Constructing a multiuse pathway (as in Alt. D): unacceptable impacts to natural resources and values, including wildlife and wildlife habitat; diminished wildlife viewing opportunities
9. Expanding interpretive displays (as in Alt. D): unacceptable and unneeded clutter and distraction from actual scenic values
10. Initiating winter grooming of unplowed road section (as in Alt. D): diminishment of winter solitude, unacceptable impacts to wintering wildlife
11. Allowing commercial use including taxis (as in Alt. C): incompatible with national park values and resources

Topic Question 3:

Other strategies that should be analyzed and included in the draft EIS include:

1. One-way motorized traffic, with half of existing road reserved for bicyclists
2. Park-managed public transit system
3. Closure to private motorized vehicles, replaced by park-managed public transit

Topic Question 4:

The Sierra Club's Wyoming Chapter and Greater Yellowstone Campaign appreciate the opportunity to submit the following comments on the preliminary alternatives for the proposed Moose-Wilson Corridor Comprehensive Management Plan. We submit these comments on behalf of more than 3,000 Sierra Club members and supporters in Wyoming, and 2.4 million Sierra Club members and supporters throughout the United States, who jointly own and care deeply about the management of Grand Teton National Park.

Early in this process, Grand Teton National Park officials stated that the purpose of this plan is "to

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

determine how best to provide appropriate opportunities for visitors to use, experience, and enjoy the area while protecting park resources", and "to ensure the protection of significant national park resources and values." We concur that the top priority for management of this road corridor within the national park must be to protect significant park resources and values. Designation as a national park confers responsibility to ensure the highest level of resource protection, and management actions must meet that responsibility.

As a minimally developed motorized route through premier wildlife habitat and scenery at the foot of the Tetons, the Moose-Wilson road is unique when compared to other motorized roads in other national parks throughout the country. In addition to providing direct access to the park's wilderness, the corridor also gives visitors the opportunity to safely and slowly experience distinctive scenery through varied landscapes with unparalleled wildlife viewing opportunities. These values must be preserved under future management.

Residential and commercial development near Grand Teton National Park is not an appropriate driver of park management decisions. It is the responsibility of the park to maintain access for park visitors who want to experience the Moose-Wilson corridor as a destination in and of itself. It is not the responsibility of the park to provide access to non-park destinations or to provide by-pass or commuter routes through the park.

The Moose-Wilson corridor must be maintained as a national park road. It is not, nor should it ever become, a county transportation corridor or a recreation-focused corridor for a single user group. Grand Teton National Park is a national park belonging to all Americans, not a county or state park.

Specifically, the comprehensive corridor management plan must ensure that:

- Private motorized vehicle traffic is brought under control, both volume and speed
- There is no increase in pavement
- There is no increase in habitat fragmentation or destruction
- Adaptive strategies suggested in Alt. B are explicitly defined during the EIS process: exactly what thresholds would trigger closure to through traffic, how would length of through traffic closures be determined, what peak hours would be implemented, etc.

Thank you for providing this opportunity to comment.

Sincerely,
Connie Wilbert
Sierra Club

Topic Question 1:

I believe that alternative A - no action-should be adopted at this time as I do not believe that any of the other strategies satisfactorily address both preservation and public use.

Topic Question 2:

Alternative B is undesirable as paving and straightening a road always leads to faster traffic, regardless of the posted speed limit, posing additional danger to pedestrians, bicyclists, and most importantly to the wildlife using this area.

Alternative C is more desirable in that it attempts to balance preservation and public use, however, this plan seems very bureaucratic as far as managing road closures 2 days a week.

Alternative D may have been desirable but the impact of construction of a bike path in a new corridor seems excessive. It seems unnecessary to take the pathway so far from the existing traffic corridor. As a cyclist who has used pathways around the valley extensively I have observed that wildlife is 'spooked' by bicyclists. I would prefer that any pathway remain closer to the existing road.

Topic Question 3:

I believe that the park service should look hard at the alternative of closing the road to through traffic and using a mixture of public shuttle style transport and human powered vehicles.

Alternatively if the existing road was to be one way only, to have in place a good public transport shuttle service and again the other lane such as it is, to be used as a bicycle lane.

The two parks I am personally familiar with using variations on these themes are Denali and Zion. No doubt there are others.

I encourage planners at GTNP to take no action at this time, and to review further actions that in the long

term are in the best interest of preservation of this treasure that we have, while still allowing for fair and open access by the general public.

Topic Question 1:

I prefer Alternative D, which provides for a separate bike pathway. I live in the Aspens and use this road 2-3 times per week in the summer. I would love to be able to cycle into the Park, but do not feel safe riding on this road with distracted drivers.

I personally do not have too much difficulty on this road for most of the summer, until the bears come out in the fall, at which point there is definitely a safety issue, between bears, photographers, through-traffic, etc.

I would not want to see the reservation system restrict traffic for those who are simply passing through, however I think that with thoughtfully placed parking areas, you can accommodate both groups: those who wish to use the area as a destination to see wildlife, and those who use the road as a means to reach the Park from the Westbank area.

My second preference would be that the area remain the same, with road closures in the fall as necessary to regulate safe bear/human interactions.

Topic Question 4:

I would like to see the corridor preserved for animal travel, however I am not convinced that our current use of the road is what is best, as opposed to simply what has been historically done. I believe that this matter can be solved in a manner that is best for animals as well as humans.

Topic Question 1:

I support Alternative C with minimal land and wildlife disturbance, yet make some needed improvements to the road.

Topic Question 2:

I believe that Alternatives B and D which create new alignments and a separate pathway do not preserve the natural landscapes and they also create additional wildlife disturbance.

Topic Question 1:
re-align the North end of Moose Wilson so it is behind existing entrance

Topic Question 2:
Do not consider Multi Use pathway Wildlife will be in conflict with people

Topic Question 3:
Add pull outs and parking. Prevent driving off pavement with curbs

Comments:

Comments: I favor alternative A as no other alternative provides the combination of satisfactory elements that I would prefer. I would advocate the following:

1. Lower the speed limit to 20 mph and ENFORCE IT.
2. Increase the number of turnouts and provide curbing so that they do not continually encroach on vegetation.
3. Do NOT create a multi-use pathway. There are plenty of paths in the valley and the nature values and wildlife along this stretch are not conducive to adding a multi-use pathway. Increased use as a result of including a pathway will lead to wildlife conflict or will annoy wildlife away from the road.
4. Ban commercial vehicles and taxis other than licensed tour operators.
5. Realign north end of road so it is behind entrance gate. It is silly and costly to add an additional entrance gate as proposed in one of the alternatives. This would also remove the dangerous blind spot on the northern most hill.
6. Dedicate one LE ranger to enforcing traffic and other regulations along the road.
7. Do NOT pave the gravel portion. The LSR agreement stipulates a "rural

character". 8. Allow horseback riding on existing traditional trails.. 9. Do not use a one-way strategy, ever
10. Do not use a reservation system ever 11. Consider running a bus tram line, would necessitate n and s
parking areas.

Topic Question 1:

Keep it simple. Do not add an additional bike path. Either leave things as they are, close the road to autos all year or 1/2 of the week in the summer. We live on the west bank and are used to not using the road for most of the year anyway.

Re-routing the northern section makes sense if necessary. Do not pave the southern section.

It's all about the wildlife in one of the last pristine parts of the valley, not about cyclists, tourists or locals going to the airport.

Topic Question 1:

In general, I like Alternatives B and D. I like the idea of paving the unpaved section of the road, as someone who has damaged my car there in the past, and who prefers not to drive 2 miles per hour. 20 or 25 mph is fine, but not safely

possible on the unpaved section in most conditions.

I also like improving the Death Canyon entry for the same reasons.

Having a pathway would be great, and maybe just have it closed at times of increased wildlife activity.

Restricting traffic during peak congestion makes sense, but one would want to know about this well in advance, so someone doesn't drive several miles to go on the road only to find it unavailable.

It seems reasonable to add some parking/pullouts as people make their own, anyway.

Topic Question 4:

Thank you for working on all of this. I hope some good solution is reached soon so improvements can move forward.

Topic Question 1:

Thank you for allowing comment on the Moose-Wilson road. Of the core values identified, wildlife and habitat are most important. None of the Alternatives A, B, C or D as proposed fixes the problem of too much traffic which must be addressed while maintaining public access, without consequences to this endangered iconic road.

General principles are: no further paving of the road; reduce speed limit to 10 or 15 mph (perhaps add speed bumps); realign road around the ponds and plan for maximum of 2 or 3 pullouts for wildlife viewing; road realignments must be made with minimum of habitat disturbance, few trees removed and vegetation protected; realign north road as proposed to Moose Entrance while maintaining existing road size, width and character. Reduced speed limits make it easier to maintain shared road w/bikes by implementing careful application of traffic controls which have been successful in other national parks. A pathway, if built and I'm do not support, should be adjacent to M-W road, with minimal expansion of width of road. The modest expansion of the Poker Flats trailer parking area for horseback riders is appreciated.

Topic Question 2:

Strategies which do not work: Alternative B: pave unpaved section; northbound traffic terminates at LSR Preserve parking and southbound traffic terminates at new parking at LSR Preserve. Alternative C: close road 2 days per week and dedicate to bike/pedestrian use only. Confusing, difficult to manage. Close to motorized traffic for bike/pedestrian use only after October 1, a season when highest percentage of visitors are seniors. Alternative D: A reservation system would be confusing, difficult and costly to implement, and potentially open to manipulation by special interests; a multiuse pathway parallel to any

segment of the road 50 feet from existing road. The construction of a pathway which skirts LSR Preserve extends into historic recreational horseback riding area onto the Cheney Highway in the JY area. This moves horseback riders out of the long meadow area north of the diversion dam and puts bike/hike traffic onto the main horse trail loop to Phelps and White Grass. Building an extensive pathway will result in major habitat impacts. Grooming road in winter changes the experience and not necessary. Additional educational kiosks detract of special nature of the road.

Topic Question 3:

Note: Horseback riding trails throughout Teton County have slowly been taken over by bike trails, creating potential dangerous conflicts. The history of horseback riding within the GTNP has been rich and should be considered an important part of the visitor experience. Horseback riding does not impact the environment and habitat of wildlife, and is a spectacular way to view wildlife. The Alternatives address only commercial riding, not recreational horseback riding. Don't reduce the lovely trails available for horses and hikers, and make mark crossings on Moose-Wilson Road.

Topic Question 4:

Pathways are certainly gaining popularity and use, and the park transportation plan addresses pathways along the highways within the park and I support that placement. However, pathways along the Moose-Wilson corridor/road is inconsistent with park values. In reading a variety of websites which discuss the alternatives, observations made by the Friends of the Moose Wilson Corridor are thoughtful, well researched and generally I support them.

Comments: Again, thank you considering our comments. Basically, we have not changed our minds about the importance of maintaining the special qualities of this corridor for wildlife habitat.

Sincerely,
Patty Ewing

PS. We have attended the public meetings, read newspaper articles, guest shots and letters to the editor, the NPS newsletter, and have accessed a variety of websites.

Topic Question 1:

I am not for any plan that would significantly increase traffic and pavement in the Park. Therefore I am not for any of the four strategies and think the Park should go back to the drawing board.

Topic Question 2:

Traffic must be contained and limited through the park. There needs to be road improvements outside of the park to offer alternative access to the Moose Wilson Rd.

Topic Question 4:

I urge you to value that Corridor as a National treasure, not a shortcut to the airport for locals, not a delivery zone for tourist buses, not a place we humans have a right to access with the speed and reliability we demand in so many other aspects of our lives. I urge you to address issues within the Corridor in a manner that conserves the rich biological diversity while making appropriate changes to lessen negative human impacts and never to increase them.

Topic Question 1:
I think the protection of Wildlife is the most important, particularly since Grizzly Bears are now inhabiting the road.

I have lived here since 1973 and I have seen a vast increase in traffic, people driving faster and faster, passing other cars, and that could endanger wildlife. Bear jams and moose jams with people WAY too close to the animals with no Park Service monitoring present.

Topic Question 2:
I think that there should NOT be a bike path, period.
There are great bike paths and more all of the time, keep the road dirt, do NOT pave it, The road is narrow and adding a paved bike path does not make sense. Plenty of other ways to bike in this valley and if Pathways has their way, it will continue to push for more paths. It does not necessarily take cars off the road.

If the road is closed all together it will force a North Bridge which will disrupt yet more habitat.

But I would try the one way option North in the morning, South in the afternoon as a trial period and see how it works in June but open it up both ways in July and Aug and try one way again in Sept. see what the impacts are and how it works. Then decide if it is a viable option.

Topic Question 3:

It is crazy to have an entrance station at Granite, then again at Moose, it may make the park more revenue, but most folks should only have to go thru one entrance station to get to GTNP.

If some folks are hiking up Granite or Death without paying so be it,

The LSR gets a lot of folks out into the park, you could charge for that, but Granite is a nightmare.

Topic Question 4:

Thank you for allowing the public to weigh in on this crucial issue. We all love the park and the animals and want them to be safe. The more the public interferes the more it looks like Disneyland.

Topic Question 1:
Alternative D.

This strategy takes into consideration and acts upon all of the fundamental issues at hand. It will reduce traffic by allowing safe and enjoyable alternative modes of travel.

Topic Question 2:

Gates and closures just move the problem to other areas. Alternative modes of travel need to be not only planned for but encouraged. Without a pathway visitors MUST rely on cars to safely experience that part of the park.

Topic Question 3:

A complete and separated pathway is fundamental to a positive long term change.

Topic Question 1:

I think there are good and negative aspects to each plan - so hard to suggest one over the other. I realize that no action isn't a possibility - unless I'm missing something, but a few thoughts on the positive. I can see some road realignment to get the road away from the wetlands.

Topic Question 2:

this is hard to say as a biker but i do not believe that a separate bike path in this corridor is a good idea. to me it is just too sensitive of an area and should be maintained in as primitive a state as prudent. I do not think the road gating it is a good idea and paving the southern portion would invite more vehicle / wildlife conflicts (as the owl and moose populations around flat creek road what happens when you widen and pave. 30MPH speed limit signs).

Topic Question 3:

I suggest a mix of the strategies, road alignment seems good and I would not be opposed to a seasonal one-way designation in peak season. possibly even south to north in the AM and reverse in the evenings to accomodate local workers. like it or not it has historically been a transportation corridor in addition to scenic uses.

Topic Question 4:

it's a hard job you face and we thank you for your efforts in balancing the needs with the growth here. I will say I really agreed with town councilman Jim Stanford on many accounts. note sure it's the right place at all for a pathway. Let's keep wyoming wild above all.

Topic Question 1:
Emphasize what's best for the wildlife

Realign the northern portion to reduce wildlife conflict

Leave southern portion unpave
Decrease speed
Bikes either share or have their own days
Close peak days or hours/limit # cars
Improve parking areas
Close to autos in southern portion

Topic Question 2:
Construct a separate bike path
Paving southern portion

Topic Question 3:
No bikes or motorized on the trails

Restore lost historic riding/hiking trails

Comments: 1) do not create a separate bike path

2) do not pave the gravel portion or cars will go too fast

3) either share the road like we do now, or designate different days in summer for bikes and others for autos.

4) limit # of cars if you want

5) don't ever allow bikes on any of the trails

Dear Moose - Wilson Planning Team:

I want to thank you for the opportunity to comment once again regarding the Vision for the Future of the Moose Wilson Corridor. In this process I did attend both public meetings of January 14, 2014 and August 28, 2014; and, previously submitted my comments after the first meeting.

In my 42 year of residency I have become quite familiar with the Moose-Wilson Corridor. I spent the winter of 1973-4 living at the White Grass Ranch; I worked for Bob Koedt in his office on the Murie Ranch from 1973-1 975; and, have lived on the southern end of The Village Road (Wyo 390) since 1976.

I need not tell you how significant this southern arm of Grand Teton National Park is in it's beauty, diversity and tranquility. I was fortunate enough to know Laurance Rockefeller; and, on more than one occasion we chatted about his family's stewardship of the JY Ranch and his vision for what has become the Laurance S. Rockefeller Preserve.

At the August 28th Public Meeting four alternatives were presented. Please understand that I was quite surprised that the most significant alternative was not presented at all. As a result I will outline it here.

After the Moose Wilson road is closed for hunting season and the winter in a month or so, there is no reason to re-open the "unpaved" section again in the springtime to motorized vehicular traffic EVER - save emergency vehicles or some future Park Service visitor shuttle service. This dirt road is within our National Park and is not a part of the Teton County Transportation I Roadway Plan - there isn't one; or, any State of Wyoming Highway Plan - it isn't one..... This is our National Park, not a highway right

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

of way. Shut the sucker down If done, there is little doubt that Teton County, WYDOT AND those with the MOST to gain WILL resolve the issue by creating a northern link from WYO 390 across to 89 I 191 in short order.... A win / win ! Access northward from Teton Village and development at the north end of the Village Road - YES. A shorter route from Teton Village to the town of Jackson, not to mention the airport, reducing vehicular travel on WYO 390 & 22 as well - YES, YES & YES. Nonmotorized travel on foot, bikes, horseback along the existing dirt road between the Granite Canyon parking lot to the Rockefeller Preserve - YES. The opportunity to make necessary improvements to Park infrastructure - YES. The opportunity to expand the Pathways System within GTNP - Yes. The starting point for a the development of a inner-Park transit system - YES.

Return of this special, environmentally diverse region of Grand Teton National Park back to a passive, wild and natural place, as it should be - YES The RIGHT course of action is crystal clear when the GREED motive is removed from the equation! Once realized, a Vision for the Future of the Moose Wilson Corridor can be contemplated.

Thank you for your efforts.

Regards -

Denny Emory

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

of way. Shut the sucker down If done, there is little doubt that Teton County, WYDOT AND those with the MOST to gain WILL resolve the issue by creating a northern link from WYO 390 across to 89 I 191 in short order.... A win / win ! Access northward from Teton Village and development at the north end of the Village Road - YES. A shorter route from Teton Village to the town of Jackson, not to mention the airport, reducing vehicular travel on WYO 390 & 22 as well - YES, YES & YES. Nonmotorized travel on foot, bikes, horseback along the existing dirt road between the Granite Canyon parking lot to the Rockefeller Preserve - YES. The opportunity to make necessary improvements to Park infrastructure - YES. The opportunity to expand the Pathways System within GTNP - Yes. The starting point for a the development of a inner-Park transit system - YES.

Return of this special, environmentally diverse region of Grand Teton National Park back to a passive, wild and natural place, as it should be - YES The RIGHT course of action is crystal clear when the GREED motive is removed from the equation! Once realized, a Vision for the Future of the Moose Wilson Corridor can be contemplated.

Thank you for your efforts.

Regards -

Denny Emory

Topic Question 1:

None of them. None of the proposed alternatives address the problem: cars are the problem. None of the alternatives reduce car traffic enough in this sensitive area. Other parks have limits and/or simply close the areas to cars. If people want to go there they need to use non-motorized ways travel. Not everywhere in the park is suitable for cars (and by extension people that do not get out of cars). There are other less sensitive areas for that and there are already plenty of areas available for that now.

Topic Question 3:

Yes. You should simply limit the access. Look at Yosemite. There are limits in sensitive places simple enough. NPS is there to protect and conserve these places NOT "balance" access. No such language appears in the organic act and it should not be a priority in this area.

Topic Question 3:
Please see comment section.

Topic Question 4:
Please see comment section.

Comments: The Teton County Commission and Jackson Town Council sincerely thanks all the folks at Grand Teton National Park and the Denver Regional Office for your thoughtful work on the draft alternatives for the Moose-Wilson Corridor Comprehensive Management Plan. You have captured and presented public comment in the context of the unique environmental, wildlife habitat and scenic resources of the road and larger study area. You have defined elements in the alternatives that serve as a menu of ideas, making it easy for the public to comment while providing the Park Service useful information to include in its analysis of the alternatives in your environmental review. It is a shared goal among each member of this commission and council and, we believe, the entire community, to support Grand Teton National Park in your need to reduce traffic meaningfully. We understand and want to help GTNP adaptively manage future traffic on your roads within the Park, and partner with you on real solutions as a community. We believe as a gateway community, our valley is one

of the greenest, most supportive partners - be it government, the private sector and the residential community - that the National Park Service will find anywhere. The shared concept throughout each of the alternatives presented should be how to preserve the Moose-Wilson Road in the same slow, narrow, rural character. We do not support a wider, faster, or character change in the road. Instead, our overall request is that the National Park Service reach out to potential partners who will diligently work to help GTNP reduce traffic to meet a data-driven objective, enhance the visitor experience and help wildlife that moves in the Moose-Wilson corridor and throughout the valley.

We also appreciate that you have fully engaged the adaptive management recommendation in all of the action alternatives. Your approach to adaptive management based on factual data regarding both traffic levels and wildlife impacts will provide a management program that meets current issues and can adapt to future issues along the corridor.

Adaptive management with defined triggers should help GTNP protect the resource now and in the future without over regulating use.

Generally, the county commission and town council supports the elements in Alternative D, with some minor modification described in this letter, such as partnerships on small-vehicle transit to take more individual vehicles off of the road altogether, non-motorized transportation and the opportunity in these approaches for enhancing visitor stewardship education. What we generally like about Alternative D is it keeps the very slow, narrow, rural nature of the Moose-Wilson Road as it is, while addressing public safety and providing reasonable public access to the area. We have organized our comments around each action alternative and concluded with a short discussion of our recommended preferred alternative.

Alternative B

Traffic Management: The adaptive management concept of stopping traffic part way along the Moose-Wilson road seems worth analysis, although we are not clear how it will limit overall traffic, how it would be managed, and how GTNP would communicate to the public when the closure would be implemented. We also are concerned that it could cause increased idling, traffic backups and confusing bumper-to-bumper scenarios that could be bad for the air, harmful to wildlife, increase National Park Service costs of management and cause negative experiences for the visitor. The alternative assumes that much of the traffic on the Moose-Wilson Road is traveling through the corridor, rather than using the road for a park experience. In contrast, the traffic data presented to the community suggests that most of the traffic on the Moose-Wilson Road is park-related and that driving through the park is part of their experience. A gate mid-way could have the unintended consequence of adding more traffic, particularly on the northern portion of the road, with out-and-back traffic that would otherwise pass through the road one-way.

The commission and council supports all measures to realign the north end of the road, both around the beaver ponds and the connection to Teton Park Road west of the existing entrance station. The realignment, part of the 2007 FEIS ROD, was shown to be beneficial to wildlife and a measure we want to actively support. GTNP has long held this good idea, and we want to support the Park in its efforts to help wildlife, particularly bears and beavers that are constrained near the hillside by the existing road.

One advantage of the Alternative B adaptive management plan is the utilization of one entrance station on the north end of the road. The commission suggests that GTNP explore ways to use a single entrance station in all adaptive management alternatives. We expect that a single entrance station on the northern section at Moose for both the Teton Park Road and the Moose-Wilson Road would be efficient, less costly, less impactful during construction, and less confusing than two entrance points.

Commercial Activity: Commercial uses in this alternative include "shuttle services". This language suggests private shuttles to the airport, lodging within the park, and other private transit solutions. It is unclear from this language if public transit is included in this concept. In order to distinguish public transportation from private shuttles, we suggest that NPS reserve the potential for public transportation (Transit) as a separate category in all Adaptive Management measures, rather than in the "Commercial Activity" category. Public transportation, either in partnership with another entity such as Teton County,

the Town of Jackson, Teton Village, Grand Teton National Park Foundation, or provided by the park, should be one of the adaptive tools NPS could use in the future to reduce congestion along Moose-Wilson Road and throughout the park. The commission expects that public transportation will help the park effectively measure the reduction of traffic volumes on the Moose-Wilson Road. Furthermore that public transportation is an opportunity for park-led education and environmental interpretation that can have lasting positive effects with deeper understanding of the corridor itself.

Death Canyon: National Park Service might consider combined trail access to Death Canyon and the White Grass cabins under this alternative with reclamation of the White Grass Road.

Winter Use: Please consider removal of the limited plowing measure. Winter access to Death Canyon provides historic and important recreational access to numerous mountains for backcountry skiing, including Albright, Buck, Mavericks and many other backcountry destinations. Eliminating the plowing would prioritize cross county skiing along the road over backcountry skiing and walking, where the current level of service supports both.

Education & Interpretation: All alternatives should include low-impact interpretive media. If there is a reason to included higher levels of interpretive media in the environmental review, the commission suggests that this measure from Alternative B should be included in a preferred alternative.

Alternative C

Traffic Management: The adaptive management strategy in Alternative C is creative. While the closure of the road to motor vehicles would create a much safer and quiet experience for cyclists and pedestrians, it would have other consequences that the commission does not support, such as limiting hiker and climber access to the back county during those days. And it does not address the safety issues for cyclists and pedestrians during days when all visitors would share the road. Furthermore, as a commission, we continue to support adaptive management strategies other than closure to limit overall use within the road corridor. We would like to see the National Park Service develop other active management measures to address traffic reduction while still enabling public access and safety. We encourage consistency with the Enabling Act for GTNP and subsequent publicly recorded easements on the Moose-Wilson Road to preserve historic public access as an important park value.

As stated in the discussion above, NPS should reserve the potential for public transportation as tool to help mitigate congestion.

MWR Realignment : As proposed in Alternative C., the road would not be realigned or paved. This is already analyzed in the Alternative A - the "no action" alternative. The commission suggests that NPS consider a more minimal realignment around the beaver ponds than considered in Alternative B and Alternative D. in order to expand the analysis of realignment options. We support the National Park Service's efforts to protect wildlife that are core to the realignment effort.

Also, Alternative C. does not consider paving the southern section of the road. But it prioritizes non motorized uses. NPS might consider creating partial pavement to support safer cycling and vehicle use, and reduce the overall chemical treatments on the road as currently practiced.

Death Canyon: In this alternative, the National Park Service might consider abandoning the White Grass access road and combining access to Death Canyon and the White Grass cabins along the southern road. The commission prefers the proposal to combine the access roads as described in Alternative D., but suggests analyzing an alternative alignment in Alternative C.

Alternative D

Concept: The concept as it is currently written suggests an expansion of use and higher level of development throughout the corridor. In contrast, the commission and council suggest that the overall concept defined in Alternative D should be about balancing preservation of park resources with visitor experience by minimizing traffic and visitor impacts on wildlife resources along the road corridor and emphasizing visitor experiences outside of vehicles. The commission and council see this concept as reducing noise, traffic and congestion and enhancing outdoor experiences. The overall level of development and expansion of turnouts and parking should be as small as possible to achieve these goals

and should focus on self-discovery versus active programs and expanded interpretational sites. We believe one of the values the public wants is the feeling of less, while still having access to the public area. Similar to the spirit of the LSR, where signs are few and self-exploration is core, we hope that same approach of discovery is the overall ethic for signage, direction and directives of 'less is more' in this concept. We think the transit offers prime visitor education opportunities for this environmental approach to visitors.

Adaptive Management: The commission and council supports adaptive management of the pathway and road alternative so as to minimize adverse effects on wildlife and cultural resources from existing or future motorized traffic levels. Meaningfully reducing motorized traffic can be aided by non-motorized alternatives for the public. The pathway should include its own adaptive management such as time-of-day and seasonal use restrictions when wildlife use of the corridor could be impacted by these uses.

Bicycle Use: The commission and council supports the analysis of a pathway along the road. In the previous ROD, GTNP approved a separated pathway within the road corridor along the southern section from Granite Canyon trailhead to LSR. The environmental and wildlife effects of this were considered minimal at that time. The commission and council supported consideration of bicycle and pedestrian amenities from LSR to Moose to complete the pathway and make for safer conditions.

The pathway in Alternative D. should be studied in the context of the historical approvals and GTNP should consider tools and measures to mitigate environmental effects of construction and use. For construction, mitigation measures could include reclamation of damaged areas in the road corridor or park, planting of native shrubs, grasses and trees. Once constructed, the park should consider adaptive management measures such as time-of-day and seasonal use restriction to ensure minimal additional disturbance of wildlife.

The commission and council generally support keeping the pathway close to the road. However, in order for the National Park Service to minimize resource impacts associated with site-specific features and resources, this language should allow park managers to design a pathway outside of the 50' limit if doing so would reduce resource damage during construction or if keeping it close to the existing road would have long-term adverse impacts on visual resources. In addition, the National Park Service should evaluate whether placing the pathway on already disturbed fiber optic line would be advantageous, as the construction of the pathway over the line may result in fewer trees being cut and less ground disturbance. We encourage the NPS to study the reality that the public will be using the corridor to connect with the celebrated GTNP pathways within the Park and connected to the valley, and that a pathway gap along the Moose-Wilson Road creates real safety issues. Two deaths in GTNP galvanized the approvals for the Jenny Lake to Moose and Highway 89 pathway sections within the park. Planning ahead and studying safety issues are important for this EIS.

Non-taxpayer funds and private-public partnerships: We encourage the NPS to plan that the additional tools to reduce traffic levels - transit, a multi-modal pathway and possibly maintenance of the entire pathway system in the park - be paid for with private dollars. Just as has been done at Jenny Lake for the \$16 million in improvements, all privately raised, we too hope you will plan for private dollars so as not to burden the NPS and GTNP budgets. This is a new era of partnerships, and we will do all we can as a community to support your needs.

Commission's and Council's Recommended Preferred Alternative

The commission and council recommend the National Park Service adopt Alternative D with the following modifications as the preferred alternative:

Concept: Minimize overall traffic, noise and congestion of the corridor and emphasize outdoor experiences.

Adaptive Management: Include measures to manage pedestrian, bicycle and cars in a manner that minimizes impacts to wildlife at times of day and during certain seasons.

Traffic Management: Add public transportation to the adaptive strategy as a possible tool for managing and mitigation congestions.

Commercial Activity: Limit or disallow shuttle services that are not park-specific and other commercial traffic, including taxis.

Education & Interpretation: The commission supports the self-discovery, low-impact approach to interpretive resources ad described in Alternative B.

Non-taxpayer funds and private-public partnerships: As done in the Jenny Lake Environmental Assessment, plan for private dollars to pay for identified transit partnerships or a pathway and maintenance.

In closing, the National Park Service should be commended for your work on this document.

Topic Question 1:

Practices such as limiting through traffic, hourly limits on traffic, and a reservation system are a good way to put the protection of wildlife and habitat FIRST, which I think the Mosse-Wilson Corridor Comprehensive Management Plan should focus on.

Topic Question 2:

The park's primary goal is, and must be, to protect the wildlife and habitat resources of the corridor. Strategies that entail any additional impacts on the corridor need to be adequately justified as bringing us closer to a long-term vision of protecting the natural resources of the corridor unimpaired for future generations.

Topic Question 3:

The critical management issue confronting the corridor is the increasing human impact in the area, primarily from vehicle traffic, therefore the park should:

- consider options for redesigning and re-engineering the road in a manner that would physically limit vehicle speeds to under 15 mph, using speed bumps, dips and appropriate signage. This would discourage transportation-related trips through the corridor and further encourage use of the corridor as a visitor destination. Park objectives should be to reduce the number of cars in the corridor while increasing the time spent within the corridor to experience and enjoy it, and

- closing the road at certain times of day, say from dusk to dawn, in order to minimize the impacts of vehicular and other human traffic on wildlife. Closing the road at night provides a clear message that the

road is not a transportation corridor, but only a park destination.

Topic Question 4:

The Moose-Wilson corridor is a unique part of the Greater Yellowstone Ecosystem and Grand Teton National Park that harbors a diversity of wildlife, habitats, streams, rivers, and scenic resources. It provides an unparalleled chance to experience some of Grand Teton's most spectacular wildlife, habitat and scenery. The National Park Service has an obligation to protect and preserve these resources for current and future generations and must focus their efforts on doing so.

I do NOT support building a pedestrian/bicycle pathway along this corridor. The National Park System is to "conserve the scenery and the natural and historic objects and the wild life therein" for future generations.

Topic Question 1:

Minimize changes to what currently exists, while reducing traffic and bear jams by making the road one-way. Add biking/pathway shoulder markings to current pavement. Don't pave what is currently dirt road to keep traffic and disruption minimal. After 5? years, evaluate to determine if further restrictions/changes are required.

Topic Question 2:

No additional paving or added pathway to current road. We do not need this wild area to have (another) pathway- -the wildlife/forest impact is not warranted, and increasing bear presence says it would be closed or risking spring and fall seasons.

Do not entirely close off the Moose-Wilson corridor to thru traffic. It is one of the best experiences for visitors and supports everyone's ability to use the access the parks. Not being able to use/enjoy this road at least one way is unduly prohibitive, at least at this time. Seems like over-reaction to close it off to through traffic both ways, and unnecessary at this time. Give it some time as one-way to see if it supports objectives.

Topic Question 4:

Please protect what is there, AND let it be enjoyed, with reduced traffic; don't build in this pristine area (ie no additional pathway, or paving).

Comments: Not having at least one-way through access

Topic Question 1:
Alternative D. I believe this will reduce traffic and create the best interface with wildlife protection and human use.

Topic Question 4:
I see the importance of maintaining this road as an alternative route in our community, both to save fuel for some and as an emergency bypass if needed.

Topic Question 1:

I think alt D contains the best balance of access by bicycle and foot and car and a reduction of intense auto traffic.

Topic Question 2:

I'm not convinced that closures would solve the problem, but

Topic Question 3:

More space, separation between autos and bicycles / foot traffic. A separate pathway would be ideal.

Topic Question 4:

Maintain the existing road as a bike /foot path and build a road in the sage brush flats out of riparian zone.

Correspondence Text

Topic Question 1:

- -The strategy to re-route the segment of road between Sawmill Ponds overlook and Death Canyon road is necessary to meet the Goal/Desired Conditions for ecological communities and aquatic resources. The existing roadway should be restored to natural conditions. It should not be groomed for winter use.

- Do not increase pavement or the existing human footprint; far better to reduce it! Retain the south end of Moose Wilson as unpaved and narrow, rather than paving it (if the road corridor between Moose and Teton Village is continued).

- Do not allow any increase in habitat fragmentation and human disturbance. This should include consideration and analysis Park facility maintenance activities, especially those using motorized heavy equipment.

- Avoid removing trees or modifying natural vegetation.

- It is appropriate to emphasize destination visitors over local recreationists and County drivers in all the alternatives. The County must figure out how to handle the traffic issues it has generated by permitting so much growth in the Wilson-Teton Village corridor; this should not be the Park's problem. Park accommodation of County traffic flow issues will only grow more problematic in the future, given the County's continual growth.

- Alternative D should be more accurately described as promoting the 'local recreational network', rather than 'regional'.

-Restrict through traffic and apply well thought-out traffic management plans. However, Alternative B is problematic and confusing with its vague reference to 'certain peak periods', and I think it would result in many management problems for your staff. I will mention techniques to consider later in these comments.

-Reduce speed limits for vehicles. Enforce speed limits strictly.

Topic Question 2:

-I oppose a bicycle or multi-use pathway, either adjacent or separated from the road. The impacts from construction, maintenance, and use conflict with the ecological and scenery Goals and Desired Conditions. Cyclists have many other outstanding areas inside and outside the Park to exercise on their bikes, and this activity does not typically involve appreciation of the wildlife and habitat quality (e.g., very few cyclists even carry binoculars or cameras). The claim that this area constitutes a 'gap' in the pathways shows the extent to which local people have grown to expect special service from the National park.

-The safety issues have been much overblown in letters to the editor, etc. All Park users should practice their activities where they feel safe and take responsibility for their choices. Recently increased bike use in unsafe areas does not justify pathways any more than handrails should be installed in the mountains, or snags removed from the Snake River. I am particularly alarmed by parents who think they should take kids cycling in this area...will they next be asking that the bears and moose be removed to keep the kids safe?

-If the road is left open to through traffic, taxis should not be allowed, nor should commercial traffic (e.g., delivery trucks and vans). Limit vehicle size, do not allow large RV's, especially those towing cars or boats.

-Stop emphasizing wildlife viewing in the Moose-Teton Village zone! The Park has many magnificent places to watch wildlife, and is justly renowned for this. You appear to be promoting the need for more pull-outs, parking zones, and congestion by this emphasis on wildlife viewing. Park staff and publications should not specifically emphasize this area for wildlife viewing. The LSR and the trailheads are already a huge attraction. Most people touring the area probably don't see anything they consider significant in terms of animals....I have seen many disappointed people at Sawmill Ponds overlook, making a quick stop and driving on because there were no moose. Expectations are too high...please consider the source of these expectations; is it coming mostly from the Park?

The high number of wildlife deaths on the roads inside and just outside the Park indicates the curious (and avoidable) perception that wildlife are only to be expected and valued in certain areas, not including the state highway and county roads. What can you do about this?

(My profound thanks for lowering the nighttime speed limit on the highway!).

Topic Question 3:

Please seriously consider and evaluate these alternatives:

- - One-way road similar to current width, that accommodates vehicles and bikes, with seasonal suitable spring, fall, and winter closures. (Similar to the Jenny Lake road, with bikes allowed both directions). This would accommodate destination visitors and local recreationists without adding more pavement and without increasing habitat fragmentation.

-Two-way road from the north that ends at LSR, and a two-way road from the south that ends at Granite Canyon. I support closing the road between Granite Canyon trailhead and the LSR to motorized traffic.

This would eliminate the conflict of Park values with local motorized commuters, and be a much better fit for Park conservation.

-My favorite strategy would be to close the existing road to all motorized vehicles other than small shuttle vans to take people to LSR and trailheads. Allow bike use during a constricted season and daylight hours, preferably on an unpaved surface to minimize speeds and purely athletic use. A rougher surface would encourage cyclists to slow down and be more conscious of the scenery, etc. Also, evaluate Jack Stark's recent suggestion to put in an open-air tram.

-All strategies should aim to remove the road from the beaver-wetlands between Sawmill Ponds overlook and Death Canyon road. Ecological processes cannot remain unimpeded with the road in its current location.

-If you retain a motorized road, please close it to private motorized vehicles and bicycles in spring and fall when bears and other large mammals are likely to be present, and also in the early morning, evening, and night-time (as well as winter closure). The probability for wildlife-bicycle conflicts seems high in this area and deserves careful analysis. Cyclists have an abundance of areas to ride in the Park where visibility is better for the riders and the animals.

- Reduce the number of vehicles, however you can. Current use of 2,000 cars per day during peak periods is far too high. There is no 'safe' and clean way to keep increasing the numbers of vehicles.

Topic Question 4:

There is much work needed by the EIS to define conditions (current and potential) and protections needed for ecological communities & wildlife, and aquatic resources. I do not have confidence that the preliminary alternatives presented here actually considered the habitat needs of wildlife; e.g., movement and foraging zones for mammals, migration/dispersal zones for amphibians, wetlands existing and potential (with continued or increased beaver presence), avian nesting and foraging, and critical seasonality for various kinds of wildlife. The expanded parking and overlooks, pathways, road reconstruction, etc. in the alternatives may have serious consequences for various kinds of wildlife. Without specific information and knowledge of habitat use and movement patterns, you cannot actually meet the Goals and Desired Conditions no matter how good they sound in the abstract. Biological analysis needs to consider buffer zones for sensitive areas such as amphibian-inhabited ponds, raptor nesting areas, ungulate movements, and stands that contain key seasonal bear foods.

-All plans should respect potential expansion of beavers in the area. Keep roads, pathways, parking areas and pullouts away from areas that may be flooded. Recent years have provided strong evidence of how dynamic the area is. The quick colonization by all 4 species of amphibians of the newly extended beaver sites was amazing to see and of scientific interest; we don't have such striking examples of such a large wetland-amphibian expansion elsewhere in the GRTE or Yellowstone.

On-the-ground and technical evaluation by beaver experts and fine-scale topographic surveys would be very helpful and necessary for a successful project if development must expand in the corridor. Where could wetlands expand in the future, due to beaver damming? Placement of road, pathway, pullouts, etc. could be a set-up to years of costly challenges if this information is not available or not used. Recent aerial imagery is quickly out of date. Of course, the beavers could also diminish or disappear for some years, but if so one might safely assume that they will return in the future. [Surveying the area in our catchment

2006-2011, I certainly did not predict would happen, but maybe the experts could have.]

- Amphibians and other small-bodied animals have fine-scale movement patterns that may be difficult for planners to consider, which means that habitat fragmentation from development is easy to overlook. Please do not confine your thinking about wildlife to moose and bears. While populations can often endure a temporary disturbance, years take their eventual toll and species will be lost in the area if fragmentation occurs. A pathway may seem small and nonthreatening compared to a road, but construction and frequent required maintenance by heavy machinery are threats, on top of changes in drainage patterns, pollution, and animals getting crushed under wheels (including bikes).

- Employ state-of-the-art culverts and road designs to help protect small animals. There has been considerable study and application of this topic, especially in Europe and some urban areas in the US. Avoiding wetlands and adjacent areas, especially where there are springs and small streams, is the safest approach. Some of the features used by even large numbers of amphibians (e.g., for overwintering) are very small and unrecognizable unless you are there at just the right time (or have radios on individuals, which is very difficult to do and impossible for some species and sizes).

- For each alternative, please disclose acres of wetland destruction and disturbance (current and potential wetlands using detailed survey methodology rather than outdated aerial imagery), and acres of vegetation and vegetation species that would be disturbed or removed. This should be clearly depicted for each alternative in the EIS.

- This document should be an EIS (not an EA); it is significant and controversial.

- Information from traffic studies should be fully used in the EIS. You should also project future human use, visitation, and local growth patterns. Disclose the time-frame for the action alternatives; how long do you expect the management plan in your preferred alternative to be operational, feasible or desirable given visitor and regional population projections?

- I am worried about the Park's ability to manage and enforce management schemes such as reservation systems. Please depict the costs and requirements for various alternatives, and the feasibility of support. Under current management, it seems obvious that portions of the Park are already being neglected; e.g., law enforcement on the road between Lizard Creek and South Entrance Yellowstone. I fear that things will get even worse if you divert much or most of your too-scant law enforcement and interpretive resources into the southwest corner of the Park.

- Need to assess the impacts of the projected numbers of human users under the various alternatives. Avoid the assumption that the area can absorb ever larger numbers of people without degradation. One example is human waste...there seem to be copious and ever increasing amounts of human waste and toilet paper in popular areas of the Park, especially near pull-outs, picnic areas, trails and pathways.

- Need serious, scientific analysis of the common assumption that more people on bikes means less cars on the road. Has this been shown by the current set of new bike paths in the Park? My impression is that many people drive to either or both ends of the pathways segments (staging a car for the end of the bike ride), thus increasing vehicles.

- Please evaluate any alternatives for the 'fuels management' projects they may engender. This must be disclosed by the EIS. There are biological, ecological, scenic, and human behavioral impacts (e.g, more human litter and illegal parking in disturbed areas) from fuels management projects. Elsewhere, the Park has not done a good job in assessing, disclosing, and mitigating impacts from fuels projects. The likelihood

of any particular area burning in the next 20 years is very small, but the fuels management projects have real impacts on the environment, at a cost to habitat and scenery.

Comments: Thank you for providing preliminary alternatives, and for accepting public comment at this critical time.

I was disappointed to see that there is not an alternative striving for maximum conservation and long-term protection for this special place. There needs to be a clearly stated 'environmentally preferred' alternative, which can at least be used to measure the number and extent of the contradictions that would result from the other alternatives tailored to service visitors, traffic flow, and local recreation demands. I found it difficult to see how most of the excellent Goal statements would be fulfilled by the preliminary alternatives you presented.

I don't think you have adequately stated the purpose and need of the plan, with the view of meeting the NPS mission to preserve the Park "unimpaired" for future generations, considering this area's outstanding and distinctive natural qualities, and the already developed or compromised nature of much of the zone between the Snake River and the mountain slopes in southern GRTE and adjacent non-Park lands. Your word choices for the purpose and need, and the content of the preliminary alternatives, convey strongly the idea of 'humans first / nature second'. Please re-think this!

-I am ashamed that Teton County and Congressional leaders promote the desires and convenience of Jackson Hole residents over the long-term good of the Park. Please stand up to them. Teton County needs to solve its traffic flow problems without depending on the Moose-Teton Village road. Bicyclists and their advocacy groups are vocal and well-financed but still a tiny minority of Park visitors now and in the future.

I also was disappointed to see that the one-way road alternative (and other ideas?) developed in the 2007 transportation plan were apparently not included. Your specialists must have had good reasons for those plans in the past, so the unfortunate appearance now is that the Park was unduly intimidated by U.S. Congressional and local political pressures, although I hope that is not the case.

Please know that you have very strong support for actions that vigorously protect the future of this sensitive and distinctive area within this treasured national park of international renown. As I noted in my Scoping comments, the term "Moose-Wilson Corridor" speaks of a strong pre-existing bias to facilitate moving people from the town of Wilson to NPS facilities in Moose. It is vital to see the area for what it is naturally and what may become of it in the future, rather than primarily as a zone managed for human transit and current recreational desires.

Topic Question 1:

The strict limitations on commercial vehicles (Plan B), the total prohibition of taxis on the road, the increased and improved parking at Poker Flats for horse trailer parking, the improved parking at Sawmill ponds and Granite Canyon, movement of the road away from the beaver dams, the retention of the unpaved road (with improved drainage features) and the retention of the Granite Canyon entrance Station. All of these features will improve the visitor experience while minimizing the impact on the wildlife and scenery, keep the unique nature of this road intact as much as possible, help protect fragile areas from the stress of visitor impact (such as the beaver dam area), help with traffic flow and management of the area.

Topic Question 2:

The bike path is not appropriate for this road. The vast majority of users of this road access this area of the park by vehicle. Every year this area of the park is seeing more and more bear activity. For the last three days alone the road has been closed to all traffic due to grizzly activity. Adding a separate pathway to this unique area of the park is not only dangerous but it also will disrupt flora, wildlife activity, scenery and is unnecessarily intrusive. There are miles of pathways in the greater JH and Park area now that are much more appropriate for hiking and biking activities.

Topic Question 3:

Other strategies that should be included are signs posted at the Granite Canyon Entrance Station, the Moose Entrance Station and the Village Highway Light. These signs are posted today and are flashing messages about road closures due to grizzly activity. The signs could be used to inform the public about traffic back-ups on the road during peak periods, parking lot waits at LSR preserve and other information.

Many visitors would choose to find another alternative if given this traffic information in advance and plan accordingly prior to entering the area and the Park could avoid having to build costly turn-around areas.

If it is determined that biking the loop is necessary to the enjoyment of the Park for enough users, the Park could close the road for vehicle traffic for one to two pre-determined days early in the summer when bear activity seems to be low in the area. Biking would also be allowed as it is now when the road is cleared of snow but closed during the seasonal closures if there is no bear activity.

Topic Question 1:

Keep the road open when conditions allow for driving traffic.

I think a one way road from the village side to Moose and a pathway on the road is the best option. Or keep it how it is.

Topic Question 2:

Closing the road!

Topic Question 3:

A pathway would be nice but I think it could be closed or restricted as well if conditions require it. i.e. grizzly traffic, etc. Maybe have the pathway closed during animal activity hours, early in the morning and late in the afternoon?

Topic Question 4:

Keep the National parks, National! For our Nation and all alike that would like to visit them. Most everyone follows the rules that are in place, there is no reason why they wouldn't be followed if new ones were put into place for this road.

Topic Question 1:

Alternative A: Moose Wilson Road would not be groomed for winter recreation activities.

Alternative B: Realign two segments of the northern portion of the road. Restrict through traffic - NO through traffic. Have it one way between Wilson end and LSR. One way in the other direction between LSR and Moose.

Alternative C: Nothing to recommend to be carried forward.

Alternative D: Only element to move forward is realignment of the two northern segments.

Topic Question 2:

Alternative A should not be carried forward, as is. Clearly the Moose Wilson Road is being "loved to death." We need to have a good comprehensive plan.

Alternative B: I do not think that the unpaved portion of south of the LSR Preserve should be paved.

Alternative C: Limiting numbers of visitors and have certain days is too complicated.

Alternative D: The construction of a multi use bike path will severely impact the wildlife of that corridor, as well as compromise the overall sense that one has that he/she is in a National Park. Limiting the number of vehicles is too complicated.

Topic Question 3:

Thoroughly investigating the possibility that the Moose-Wilson Rd. would be listed on the National Historic Register. When thinking about this entire process, I think the Park Service should always keep paramount it's mission to protect and preserve the wild lands and wild creatures that call Grand Teton home. It is, in my opinion, not the responsibility of the Park to make sure that biking enthusiasts may bike where/when ever they desire. Our National Parks are the crown jewels of our land. They deserve better

than to become extensions of special interest groups.

Topic Question 4:

The September 11th edition of the Jackson Hole Daily features a picture of a grizzly photographed on the Moose-Wilson Rd on September 10th. The article lead is: Hungry grizzlies close Moose-Wilson Road. As they say, "A picture is worth a thousand words." No bike path. No through traffic. This is not Disney Land.

Topic Question 1:

Manage traffic volumes on Moose-Wilson Road by establishing a reservation system. Visitors without reservations would be accommodated on a space available, first-come, first served basis.

The existing, unpaved section of the Moose-Wilson Road would be paved, but would remain in its current alignment. Width of this segment would be consistent with other portions of the road.

Apply design solutions to roadside parking that would reduce resource impacts from parking off-road.

Two segments of the northern portion of the Moose Wilson Road would be realigned to address congestion associated with the presence of wildlife, wildlife habitat connectivity, and operational issues. The 0.6 mile section of the roadway between Murie Ranch Road and the base of the hill near Sawmill Ponds would be abandoned and a new segment constructed to intersect with Teton Park Road at the junction with the Chapel of Transfiguration Road. The Sawmill Ponds Overlook and the Death Canyon Road junction would be realigned to the east of the beaver ponds to restore wetland functions and habitat connectivity. The old roadway would be removed and restored to natural conditions.

No substantial changes to the width of Moose-Wilson Road.

Improve parking/turnout facilities and add additional parking or turnouts in strategic areas.

Enhance existing and add additional parking at either end of the road for both summer and winter use.

During the winter, bicycles would only be permitted to use the pathway when it is free of snow and ice.

All other commercial traffic, including taxis, would be prohibited

Shuttle services could (I would say SHOULD) be authorized by park management

Northern winter parking would occur at an improved parking area north of the Death Canyon Road Junction.

Provide additional restroom at Granite Canyon trailhead parking area and at the new "winter" parking area north of the Death Canyon Road junction.

Provide additional restrooms at Granite Canyon trailhead parking area and at the new "winter" parking area north of the Death Canyon Road junction to manage human waste during the winter.

The new northern alignment road segments would be constructed to emulate the slow-speed, narrow, winding character of the road corridor.

Backcountry patrols would continue to monitor hiker and backpacker compliance with regulations and visitor use.

During seasonal periods when the road is closed to motor vehicles, bicycles would (I would change to COULD) continue to be permitted to use the road when it is free of snow and ice.

Commercial horseback riding in the Poker Flats area would continue with currently authorized trails and use levels; commercial horseback riding on the Sawmill Pond trails would be phased out. Guided skiing and snowshoeing would continue under current use limits.

A sense of arrival experience that cues the visitors that they are entering a natural setting that is unique and protected would be created.

Road-based tours would be permitted through a limited number of operators: these trips would have an allocation should a reservation system be implemented. Interpretation would be required, but could include a broad array of interpretive topics.

Groups would remain small in size (10 visitors plus a guide).

Additional activity or learning-focused commercial services would be permitted, but limited in numbers. These might include photography or painting workshops. These commercial trips would not have priority access in a system designed to manage traffic flows.

The Death Canyon trailhead parking area would be reconfigured and expanded in its current location to accommodate 60 vehicles. The 0.4-mile segment of the Death Canyon Road between the trailhead and White Grass Ranch would be improved. A new road segment between Death Canyon Road and White Grass Road would be constructed. White Grass Road would be improved to allow for one-way traffic with staggered pullouts. The remaining portion of Death Canyon Road would be removed and the area restored to natural conditions.

In winter, the unplowed section of Moose-Wilson Road would extend from the Death Canyon Road

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

junction to Granite Canyon trailhead.

Enhance winter recreational opportunities (i.e., cross country skiing) by improving parking and seeking a partner to groom the unplowed section of Moose-Wilson Road.

In keeping with the goal of creating a welcoming environment with enhanced understanding and enjoyment of the corridor, interpretive media and programs would be made available at key visitor gathering areas in the corridor.

Establish viewing areas to allow visitor gathering areas in the corridor.

Establish viewing areas to allow visitors to appreciate vista points. Use viewing areas to concentrate use. Provide short nature trails and interpretive materials to enhance experience. These interpretive materials could be designed as a free app downloadable onto smart phones or computers to eliminate the use of printed materials.

These strategies would best carry forward the mission of the Park which is to allow visitor access and enjoyment of the Moose Wilson Corridor while at the same time preserving and protecting the wildlife, the habitat, and the scenic values the visitor associates with GTNP, thereby leaving the resources unimpaired for future generations of visitors. The purposes of this planning should not be to reduce traffic by preventing visitors from visiting the area, but by educating the visitors well in advance of their visits what their options are and how to go about getting the most out of their time in the Park. More use of social media, free apps for download on Smart phones or tablets, notebooks, and laptop computers should be utilized for preplanning any trip to our National Parks. We should not want to prevent visitors from accessing any portion of GTNP, but rather make their visit more meaningful and rewarding by preparing them in advance of how to plan for visiting the areas of the Park they most want to experience. See additional comments below.

Topic Question 2:

Visitors would continue to be allowed to park in user-created parking areas along the unpaved (or paved) portion of the road.

Roads, parking areas, turnouts, trailheads, trails, campsites, picnic areas, entrance stations, restrooms, and other visitor facilities would remain in essentially their current configuration and condition. Any changes from existing conditions would be made on a case-by-case basis.

Bicycles would continue to share the road with motor vehicles.

Manage traffic volumes on Moose-Wilson Road by limiting the number of vehicles entering the corridor at any one time during peak use through timed sequencing techniques. Provide queuing lanes on the north and south ends of the corridor as needed.

Moose-Wilson Road would be closed to motor vehicle use two days per week, but open to bicycles and pedestrians during those times. At all other times bicycles would share the road with motor vehicles.

Construct a multi use pathway parallel to Moose-Wilson Road between Moose and the Granite Canyon Entrance. The pathway would generally be sited within 50 feet of the existing or realigned segments of the road.

Address increases in traffic, and volume-related congestion by restricting through-traffic in either direction beyond the LSR Preserve Center during certain peak periods.

Reconfigure the access and parking at LSR Preserve in order to prevent through-traffic at certain peak periods when necessary to alleviate congestion.

The unpaved section of the Moose-Wilson Road would remain unpaved.

All of the above strategies are complicated and far more restrictive than the average visitor will appreciate. Providing a safe and enjoyable experience for visitors as well as an informed and least restrictive way to manage traffic flows throughout the length of the Moose-Wilson Corridor should be the number one objective of any plan for lessening the impacts to the resources; wildlife movement, habitat sustainability, ecosystem integrity, cultural or historic preservation. Management options must be considered that leave them unimpaired for future generations. These goals can be achieved by putting emphasis on visitor preplanning and educating themselves regarding the challenges of managing for preservation, while at the same time providing safe and enjoyable experiences for visitors and their families. All of the strategies in Alternative D, with the exception of two, I feel are appropriate for solving the problems of too many people, too much traffic, and too much damage to resources currently being experienced that have caused the need for these studies and alternatives to be explored. (Please see my further comments below)

Another pathway for bicycles does not seem to be needed in this more primitive and sensitive part of GTNP. From the studies, it appears most cyclists who are currently using the road are simply riding straight through for recreational purposes rather than as a transportation alternative to experience the unique and special aspects of the Moose-Wilson Corridor. Providing for a separate multi-use pathway parallel to the current road would require the removal of large numbers of trees and other vegetation through prime wildlife habitat that is now occupied by Grizzly bears and black bears. If, indeed a separate pathway is justified, it should be located in areas that are not heavily forested, but are open where riders or walkers can be easily seen by wildlife and wildlife by riders and walkers well in advance of finding themselves face to face with wildlife. There are alternative routes away from the Moose-Wilson Road that could be considered to meet the need for avoiding these kinds of wildlife encounters, if, indeed, it can be proven that people will bike or walk into the area with specific destinations within the corridor in mind to visit. Regardless, if such a pathway is built, it should be closed during the early morning hours and at dusk to allow wildlife to make their way to and from the areas as they otherwise would do were there no pathway.

Leaving the portion of the Moose-Wilson Road that is unpaved as it is rather than paving it is subjective depending on an analysis of the cost differences. For the safety of visitors and their personal vehicles, dust, large rocks and boulders, potholes, and washboard conditions may inhibit speed, but they do not contribute to enjoyment, or enhance wildlife viewing or viewing scenery. It would seem to me that by installing speed bumps or dips and paving the road would not detract from the visitors experience of a narrow, winding road, like those many of us remember from an earlier time in our history or the history of the Park. There are other unpaved narrow roads still located in less heavily travelled parts of the Park. We can limit the numbers of vehicles, but we cannot limit the popularity of this highly sensitive and highly prized jewel which I often refer to as the "over the river and through the woods" road experience.

Topic Question 3:

My preferred strategy is not included other than in a vague and unspecified way. Other Parks have gone to mass transit methods of cutting down on the number of fossil fuel burning vehicles within heavily visited portions of their units. Yosemite, Zion, and Bryce Canyon all provide various forms of "shuttle" systems that allow visitors to explore, enjoy, photograph, and learn about the various features within their Parks. Visitors can get on or off at designated stops after parking their cars in a designated location where the shuttles stop on a regularly scheduled basis. The Moose-Wilson Corridor could be tied to such a system that would operate between Teton Village Parking Lot facilities and the GTNP Visitor Center. If electric or some other type of renewable power sources could be used to pull open air or enclosed seating with large windows that could be completely moved all the way up or down, everyone could enjoy the commentary of an official Park Service Interpreter and an Interpreter at various stops along the way could assist visitors with getting the most out of their visit by answering questions and directing visitors as to how best to select and enjoy the kinds of experiences individual visitors are looking for.

It would seem to me that this kind of investment for the long term future of leaving the Parks unimpaired while allowing visitors to enjoy the Park in a more informed and inviting way would enhance their experience and allow for more rather than less visitation and negate the necessity of have a reservation system in place. Simply by eliminating use by cars, other than those of folks who would be going on permitted backpacking adventures out of the provided parking lot at Whitegrass Ranch, much of the traffic issues being discussed here would be eliminated and bicycles would still be able to ride on the road along with the shuttles.

In this Alternative, lets call it E, the need for pullouts, parking lots, etc. would all be unnecessary, but there would still be the need for realignment of the sections of road between Sawmill Pond and the Death Canyon Road. Restrooms could also be placed in appropriate locations at certain stops along the way that could be used in summer or winter. A shuttle bus could be used in winter to shuttle people from Teton Village to the Granite Canyon Trailhead for skiing or snowshoeing and a shuttle bus from the Visitor Center to the Death Canyon Road drop off, or Sawmill Pond drop off, could eliminate the need for plowing the road beyond whatever place along the road that the Park determined was appropriate for winter access to skiing and other winter experiences.

I personally feel this would be a much wiser management plan for this wonderful and significant corridor of the Park and would provide exactly what it is the Park Service Mission requires. It could also serve as a precursor to a similar system being expanded to include the Inner Park Road from Moose to Jackson Lake Lodge, or Colter Bay Village if found to be successful in achieving the goals it was designed to achieve.

Topic Question 4:

Through advances in technology available to visitors in today's high tech society, GTNP Park has an exceptional tool that can be utilized to help visitors with planning for their visit here well in advance of their arrival, and given the pressures of increased visitation and development of destination vacations by the gateway communities that surround the Parks and are financially invested in visitor satisfaction with their experience in both their communities and within the Parks, it is incumbent on both the gateway

communities and the Parks to cooperate in how to make visitation an exceptional experience, not a complex and easily confusing and seemingly restrictive experience. By cooperating and collaborating, these communities and the Parks they surround could create an experience that most visitors would look back upon as one of the most enjoyable they have ever had. The added benefit to Park Managers would be that they would be able to design and promote an informative campaign that encourages the early planning of visitors to our National Parks to learn about and plan their visits to get the most out of the time they have to spend here in GTNP and take away with them an understanding of what National Parks have as their mission and how they strive to achieve that mission using all available means of technology, research, and development of systems that work efficiently and with the visitor's safety and enjoyment as well as the resources they are attempting to preserve and protect first and foremost in their minds as they plan for future generations arrival in a place that will continue to be an inspiration and a place of inestimable value to all of us who understand and study the ever evolving complex natural systems that exist all around us and that we depend on for our very existence as a species.

It was not my intent in answering Question 3 to give a detailed set of requirements to a new Alternative, just the general scope of what I believe such an alternative could provide. The details, it would seem to me could be worked out in the review process of how to make such a system work to benefit and enhance the Mission and those who support it!

Comments: As a long time resident of Jackson Hole who worked as a Seasonal Park Ranger Naturalist during the 1970's-80's for seven seasons in Grand Teton National Park in the South District headquartered in Moose, I have a deep love and appreciation for GTNP and feel honored to be able to submit my comments on the various preliminary Alternatives the Park Service presented to the Public at the open house event that took place at the Jackson Library in late August.

Having been an educator 12 years, a freelance tour director 10 years traveling all across America and throughout many parts of the world and also having been a landscape photographer professionally and a private tour guide in both Yellowstone and Grand Teton 10 years, I am now happily retired while continuing to live in Jackson Hole. All of these experiences have led me to have, perhaps, a slightly different perspective on choosing what I would feel is the best of the suggested alternatives presented by the Park with the couple of suggested changes to Alternative D that I outlined in my comments above.

My personal preference as a local citizen conservationist, would be to close the unpaved section of the Moose Wilson Road to all vehicular travel and allow that segment of the Moose-Wilson Corridor be accessed only on foot for the benefit of the wildlife that resides and uses this portion of the Park to move unimpeded between the riparian areas along the Snake River and the wooded Lodgepole forest that covers the glacial moraines at the base of the Teton Mountains. This certainly would comply with the part of the Park Service Mission to preserve and protect in its natural condition the biological, ecological, and geological resources within that section of the Moose-Wilson Corridor. However, that having been said, I also realize that the portion of the Park Service Mission that provides for visitors to have access to enjoy and experience the Park in such a way as to leave the natural systems unimpaired, although of secondary importance to preserving and protecting those resources, must be considered in making wise choices that will lead to better understanding, appreciation for, and partnering with Park Service staff to give the Park visitor an experience that they will always remember and that will increase their support of the mission of the National Parks.

Therefore, after careful consideration of all the Alternatives presented I have come to the conclusion that none of the choices presented are what I feel would be the best way to accomplish the mission or a plan for reducing the amount of traffic that is currently using this corridor in such a way that it would not

confuse, or otherwise interfere with the American peoples right to visit and see the entire Park they may have travelled many miles to visit. Other Parks in the system have chosen different methods of managing traffic and congestion in the more popular areas of their units, and have done so, I am certain, using much of the same criteria as is being used here in GTNP. Decisions must be based on data collected, interviews of visitors to the area conducted, traffic analyses, and other research and documentation of how all of these are impacting the resources or the experiences of visitors negatively. With those facts, figures, and testimonies as a basis for establishing where the problems lie, only then can one proceed to suggest ways to reduce to a minimum those impacts that are proving problematic and damaging to the overall objectives of reducing the volume of people, vehicles, and other detrimental aspects of the current situation as it now exist on the ground.

Today, the Park Service has a unique opportunity to use the hi tech advances of our modern society to its advantage in informing future visitors regarding how best to plan for a visit to GTNP well in advance of arriving here. The surrounding gate- way communities also have the advantage of these same technologies to collaborate with their adjacent National Parks to make visitor experiences within and outside the Parks ones they will treasure for a lifetime. Through cooperation and collaboration, the Park can achieve its mission while the community will benefit financially by reinforcing and extending a hand in preparing their visitors and patrons for a positive and meaningful experience both before and after they enter the Park.

If the Parks invested in development of free applications that could be downloaded onto Smart phones, tablets, laptop computers or GPS devices, Visitors could be prepared well in advance as well as instantly while traveling to get the latest information on road conditions, weather conditions, traffic conditions in various parts of the Park and where and how to arrange to visit various parts of the Park safely and efficiently. In my opinion, we are at a point in our country's history when we can no longer ignore the growing problem of too many people, too many vehicles, too many complicated systems that are confusing and in some cases difficult to understand by the general public who is now accustomed to having access to information and social media sites where they get most of their ideas from. If the Parks hope to help solve their problems, they are going to need to prepare a campaign that educates future visitors to what they will need to know BEFORE they arrive at the gates of a National Park they want to experience. If a reservations system, for example, as described in Alternative D, were to be chosen as the best alternative, the public would need to be informed and educated well in advance the reasons for such a system and how the visitor should engage the system in order to plan for their visit well in advance of their departure. The American people are going to have to adjust to understanding that no longer are they going to be able to just drive 100's or 1000's of miles to get to the Parks, expecting they will be able to do everything they wish on their own time schedule, that to have the best experience possible, they may have to reserve in advance some of their time they wish to spend in particular areas of Parks that are extremely popular and can no longer survive in their unimpaired state with unlimited numbers of visitors impacting them on a daily basis. Once the Public is informed and understands the mission of the Parks, they are most likely going to be happy to conform to whatever system is needed to protect and preserve these national treasures.

Once we have an informed and understanding public behind the Park Service mission, we can really begin to address what the best way to do the least harm to the Parks for the greatest number of people. This would apply particularly in the case of the Moose-Wilson Corridor! Putting in a Shuttle System, whether it be first using privately contracted services of a concession operator, or a Park Service operated system like the one in Yosemite, the objective would be to get people out of their automobiles and into some kind of clean energy transportation vehicles that would not pollute the air, would be quiet operating vehicles that would be equipped with either a canned commentary or a Park Service Interpreter who could provide

information on the various stops along the way, or having Naturalist available at specific stops to answer questions and provide information visitors might want as they head out on a short walk, a trail hike, or a wildlife rich wetland like the one along where the current road exist today. To me, all visitors should have access to real human being whenever possible to add to their enjoyment and experience of THEIR Park. Being able to get on and off at various points of interest, including the LSR Preserve, would be so much more enjoyable for families if the person driving their own car could also relax and enjoy the experience without the added responsibility of have to "watch the road". Having experienced these kinds of transportation systems in other Parks I know of what I speak and it can be a very enjoyable experience in which many people from across the country can intermingle and share their own experiences while they are in the Park. Others who don't wish this type of experience can hike the trails into the backcountry to experience the wilder side of GTNP....There should be a wide diversity of experiences to meet individual expectations without having everyone experience everything whether they want to or not!

If the goal is to reduce traffic to a manageable and acceptable level, certainly a shuttle transportation component would be well worth the investment and could serve as a trial for future development into other heavily travelled portions of the Park along the Inner Park Road between Moose and Colter Bay! We should be encouraging locals and others who only wish to drive straight through the Park to use the Outside highway rather than add to the already congested areas of the Park.

I thank you in advance for considering my comments in your exploration of how best to deal with the difficult issue of managing traffic in the Moose-Wilson Corridor. Having lived in the Valley since before the development of Teton Village and the LSR, I am acutely aware of the increased traffic through this important corridor both have created and I am grateful for the opportunity to be a part of the solution rather than a part of the problem.

Sincerely,
Vance Carruth

Topic Question 1:

First and foremost: protect the unique solitude, wildlife habitat, and historic character of the Moose-Wilson road corridor.

Comments: Dear Superintendent Vela,

I am greatly concerned that unacceptable traffic, and calls for increased development, on the Moose Wilson Road could destroy the wildlife, scenery, and historic values of the road. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area of Grand Tetons National Park.

Please ensure that as the EIS begins, you preserve this road as a quiet park destination and wildlife-viewing area; NOT a busy traffic route.

Thank you for considering my comments.

Topic Question 1:
none

Topic Question 2:
all

Topic Question 3:
Close the unpaved portion of the Moose-Wilson Rd to motorized traffic, EXCEPT emergency and official Park vehicles, plus construct pathways parallel (mostly) to existing paved part of the road, and east of beaver ponds. Granite Canyon TH could be reached for motorized users from the South, Death Canyon TH and LRP could be reached from the North. Voila, no more motorized THROUGH traffic and little or no maintenance on the unpaved section needed!

Topic Question 1:

The reason we have NP are for the preservation of the land and the animals that were there before man. There is too huge of a demand on this small area from Humans to expand their accessibility.

1. Access for people in cars to Laurence Rockefeller from the north, so 2 way traffic. Road would be closed southward.

This is a permanent solution, not a temporary.

2. Pave road until Granite parking lot. This would be 2 way, and one way north only.

3. Make road one way north.

3. Build a connection between the airport and the village across the Snake. so ALL the commuters year around have easy access to the Village and the airport. Cuts way back on fuel and car use.

Topic Question 2:

No new bike paths! as it would bring visitors too close to the bears, Moose, etc.

all road expansions will affect the wildlife who are finally re-populating in this area. We should decrease the number of cars and bikes by one way only.

No need to expand roads at all.

Pave the roads.

Make the road one way south to north.

Road two way from Laurance Rockefeller to Moose.

The buses, lottery reservations, close on some days is stupid, hard to administer, frustrating to visitors.

Topic Question 3:

The population is only growing in the Tetons. The visitors will only increase in numbers in the next 20-50 years. GTNP should NEVER be a cut through to the Village, ever. An alternative MUST be implemented. It is a bridge over the Snake close to the airport to divert ALL the traffic from Moose, Moran or Dubois that wants to go to Idaho.. and do NOT need to go thru the already congested town of Jackson!! All the trucks that go thru town to use the pass.

Think of preservation and the wildlife...they do NOT want or need any more traffic, roads, congestion in that small and fragile area in the park.

Topic Question 4:

There is so much access for bikes in the Greater Jackson area. they do NOT need to use the Moose/Wilson road.

The bicycle road from town to the park should be open ALL the time. Why did you build it if you can't use it 7 months out of the year?

So bikers ride on the road and get injured or killed??

Comments: Wake up NP service. Your job is PRESERVATION OF THE LANDS FOR THE FUTURE. Which means keeping them as natural as possible.. have great habitat for the animals.

No new roads or bike paths for the Moose/Wilson road are necessary.

Traffic must be lessened.. by one way traffic ONLY.

A bridge from the airport to the Village avoiding the Moose/Wilson Road for the airport traffic, visitors and residents wanting to get on hwy 89

think of how much fuel and congestion you would reduce by diverting the traffic and dumping it on hwy 89.

Do not be short sighted.

Plan for the way future not the near future.

do not succumb to the pressure of small interest groups, like the Pathways...

You need to plan for a huge increase in numbers in your park.

Do not destroy the pristine beauty in this small section of the park .

Topic Question 1:

I have lived in Jackson Hole for close to 30 years, having moved here primarily because of the wildlife found in this remarkable place. Please find my comments on the preliminary alternatives presented below:

Do not pave the southern end of the road. Its primitive nature is perhaps the one thing that has kept the volume of visitors from exploding over the past decades. Traffic is far worse than it use to be due to commerce at Teton Village, the increase in population, especially during the summer months along the West Bank, and those looking for a quick route to Moose/Dornans and/or the airport. Don't use Park resources and commit the Park to maintenance of a road that has worked just fine for decades.

The volume of traffic no doubt has effects on the wildlife that use the rich habitat of the Moose-Wilson corridor, especially in areas that are rich in foraging opportunities for bears, moose, elk, beaver, numerous species of songbirds and forest raptors. The northern portions of the road should be realigned (but kept at its current width and rural character) in order to move traffic away from such important habitat. The old road, of course, should be removed and rehabilitated.

Vehicular traffic clearly needs to be reduced. Other parks have had success with alternatives to through traffic, either using systems like Denali which I have used and had no issues using as I still was able to have an extraordinary experience. Or one-way travel past the Rockefeller Preserve, allowing two-way traffic up to that point. Access to the LSR, Death Canyon, and the Granite Canyon trailhead could still be accommodated.

No winter grooming. Keep it as is- primitive.

If the north end road realignments occur, then the northern parking area should be located at Sawmill Ponds parking lot and/or at the new entrance station location, rather than at locations near the Murie Center.

No additional turn-outs should be added, nor should any existing turn-outs be paved. The only exception to this is that if the northern segments of the road are realigned to move them away from important wildlife habitat, a turn-out should be added to allow for wildlife viewing opportunities.

The idea of moving the Death Canyon trailhead is a good one but the existing road would then need to be rehabilitated back to a trail so that there would not be continued use as a road.

Park visitor transportation with interpretation (like in Denali and others) would be fantastic. A system like this could provide access to trailheads. Using concession contracts instead of conditional use permits would be best to properly manage and regulate the numbers of commercial tours within the corridor. Restrict and manage by permit or contract the number of commercial tour operators. Park-permitted transit should be explored in the DEIS as a full alternative. This should not include commercial transportation or county- operated shuttles, rather it should solely managed by the NPS, and be based on visitor use levels ties to indicators and thresholds to be established through this NEPA process.

Topic Question 2:

The No action alternative is not a viable option. The increasing number of vehicles and their associated impacts should not continue into the future.

I see closing the road two days a week as a management nightmare, and particularly problematic to those who are specifically travelling from other parts of the country (or world) to visit Grand Teton and most likely Yellowstone. This is a terrible idea!

Alternative D with a multiuse pathway parallel to Moose-Wilson Road along any segment would result in the removal of an unacceptable number of trees, sagebrush and other associated plants, fragmentation of habitat, an increase in pavement, and an increase in invasive and noxious weeds. If there is a pathway in the future, it absolutely should not be separate.

No taxis should be allowed.

Other national parks (Zion, Mount Rainer, Acadia,Denali)have successfully incorporated one way traffic. Can't Grand Teton use these models to consider no more through traffic.

Do not allow winter grooming on the Moose-Wilson road. This requires the unnecessary use of Park resources. The groomed trails north of the Moose entrance station are sufficient for the visitors who opt to experience the Park in the winter. The park should provide a variety of experiences, and Moose Wilson lends itself to a visitor experience that is more primitive.

There is little need to increase pull-outs and more interpretive media/kiosks. Keep the corridor primitive.

Topic Question 1:

Alternative D. Alternatives A, B, C are not viable and fail to balance both the interests of the local community and long-term objectives of the park.

We support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

My views align exactly with thus: "Park values are best protected under Alternative D, which recognizes that wildlife and park visitors can be thoughtfully managed together, the essence of National Park visitation. Under Alternative D, visitors experience this part of Grand Teton National Park in a way that is respectful of natural resources, informative, inspiring, and safe.

Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular public on a needed pathway."

Topic Question 2:

Alternative A does nothing to mitigate the issues facing residents of Teton County and the park.

My views for B and C are as follows: Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitably see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway."

Topic Question 3:

No

Topic Question 1:

Alternative d makes the most sense to me. It encourages alternative modes of transportation and provides us a safe way to enjoy the park in a more natural method.

Topic Question 2:

Any strategy that seeks to limit our access to our parks will simply not achieve the strategies. The current problems are due to inadequate infrastructure, not too much interest and use. There are environmentally sound strategies available to provide safe and enjoyable coexistence with nature.

Topic Question 3:

Alternative d is adequate and appropriate because it recognizes and accommodates natural methods of access and safe transportation.

Topic Question 4:

Please create year-round access to people who seek to enjoy the park in an environmentally responsible manner. The impact of the "footprint" is not the only issue at hand, and to simply continue to follow the park service's short-sighted and arbitrary mandate is in direct conflict with the very purpose for which the park system was established.

Topic Question 1:

None of the strategies in the preliminary alternatives strike me as "perfect." But I do think the roadway needs to be moved away from the wetlands and toward the river.

Topic Question 2:

I am very much opposed to strategy D, particularly the idea of creating a separate pathway for bicyclists. There are more than sufficient pathways available to bicyclists in Teton County and Grand Teton National Park already.....there are many places where families can recreate and enjoy the outdoors together without damaging the sensitive Moose-Wilson corridor with another bike path.

Topic Question 3:

Making the Moose-Wilson a one way road only - all the time - - would go a long way to reducing congestion. It has been done on other roads in many national parks and on the Jenny Lake Road in GTNP. Keeping that roadway open, it seems to me, is politically essential. But also keeping it its current width and its current gravel section in tact while maintaining one way traffic only seems like the best way to "balance" human automobile use with the needs of the "resources." I personally would not mind a shuttle system for the roadway but that would be very difficult to get through the local and state "electeds."

Topic Question 4:

I know GTNP is under immense pressure from Pathways, Teton Village and other west side businesses, and their political allies but please protect the Moose-Wilson corridor from further development. It is a very special place and the NPS does have tremendous support both locally and nationally to see that it

remains undeveloped. THANK YOU.

Topic Question 1:
All comments are provided in block 4 in a letter format to Director Vela. A hard copy of this same letter has been sent via US Mail on this date.

Topic Question 2:
See answer in block 4

Topic Question 3:
See answer in block 4

Topic Question 4:
September 15, 2014

David Vela, Superintendent
Grand Teton National Park
PO Box 170
Moose, WY 83012-0170

Dear Superintendent Vela,
Thank you for the opportunity to comment on the preliminary alternatives for the Moose-Wilson Corridor Comprehensive Management Plan (CMP). The Moose-Wilson Road in Grand Teton National Park (GTNP) provides public access to the Park by both residents and visitors.

Cooperating agencies, including local and state governments, provide valuable input into land management planning. As stated in previous comment letters, I encourage GTNP to work with local communities and the State of Wyoming to address management of the Moose-Wilson Corridor. This includes meaningful engagement in the development and analysis of alternatives and preferred alternative discussions. To date, this engagement has not occurred at the level anticipated.

If GTNP does not have a cooperating agency meeting to discuss alternatives, I ask you to analyze Alternative D as the preferred alternative. This alternative allows for diverse uses and two-way vehicle access while maintaining the existing nature of the Moose-Wilson Road and protecting park resources. Understanding the final decision in the CMP lies with the National Park Service, Alternative D provides a starting point for discussions on future management of the Moose-Wilson Road.

Thank you again and please contact me if you have additional questions.

Sincerely,

Matthew H. Mead
Governor

MHM:mdm

Topic Question 1:

I support Alternative D. I have always agreed with the philosophy that nature and preserves need to provide friendly access to ensure that generations of users will have an appreciation for the natural world. I appreciate efforts taken by wildlife preserves to limit certain access to certain areas, and to take measures that promote low impact means that afford ways for individuals in these areas to experience a sensory experience in nature. The Moose-Wilson Road currently affords several different ways to do so. The Rockefeller Preserve has been a great addition to the traditional hiker friendly areas in this section of the Park. I would like to encourage more people out of their vehicles (and the commercial "safari" vehicles) that I constantly see on the Moose-Wilson Road. I bike commute from my home to my law firm in Jackson Wyoming by bicycle. On the way home, I often ride pathways up to Moose and down through the Moose-Wilson Road. I do this 2-3 times a week in the summer. As a frequent cyclist on the Moose-Wilson Road, I have the opportunity to witness many wonderful natural moments. However, I often feel crowded on the road. The use of Moose-Wilson is increasing due to its growing popularity. I would encourage adoption of Alternative D to manage the masses that come for the sensory experience of being in a special part of the Park. If we encourage people out of their cars with the use of an alternative and safe corridor, we stand a better chance to preserve the values in nature for generations. As a society, we need to adapt to survive. Adaption with safety and wildlife concerns is our best alternative and is best addressed via Alternative D.

Topic Question 2:

I do not approve of Alternatives B and C. These seems to be band-aid approaches to GTNPs corridor issue. The roadway should remain narrow and slow - - and patrolled better by Rangers who can help alleviate the excessive speed of those tempted to speed through a short cut. I suspect that those staying on

either side of the closure will still travel to their destinations on the other side (Moose-Teton Village; Teton Village-Moose). Closing the roads will merely increase the carbon footprint of this valley as people travel a more circuitous route to achieve their end goal. I also am concerned that gates and closures will put more traffic on WY 390 and cause the moose fatalities on that road to rise. As a resident on the 390 route, I see an increasing amount of moose fatalities and "moose jams" that snarl traffic on dangerous roads with higher speeds than that of Moose-Wilson Road. I really would hope that a more planned and progressive plan could be implemented that would redirect the Moose-Wilson Road from sensitive areas (beaver ponds, and low wetlands) and focus the solution on how heuristics play into negative wildlife impacts rather than how a gate/closure can limit days.

Additionally, something must be done to address the increased usage on this corridor. Therefore Alternative A is irresponsible and ill fated.

Topic Question 3:

I would like to see passive speed control devices implemented. I would like to see better staffing of Rangers on the Moose-Wilson Road to slow traffic. I would like to see a limit of passengers in vehicles to limit the use of "safari" vehicles that border on the width and weight restrictions that used to only apply to RVs and larger trucks. I believe that these types of measures would help to reduce traffic and protect wildlife corridors.

Topic Question 4:

As a constant bicycle commuter on the Moose-Wilson Road, I would like to see more safety measures taken for non-motorized users of the road. Pedestrians and cyclists face a grave danger when vehicles travel too fast, take turns too wide, swerve to avoid potholes, or suddenly pull into/out of traffic without looking for smaller users of the road.

Correspondence Text

Topic Question 1:

Closing the road to vehicular traffic two days a week should be extended to seven days a week with shuttle service providing the only access to this area.

Topic Question 2:

Paving any new parts of the current moose-wilson road would not protect and maintain any of the seven fundamental resources identified in the plan. Building an adjacent pathway would also not protect or maintain 6 of the 7 fundamentals, the one fundamental it would help is visitor experience.

Topic Question 3:

One strategy not included is the complete closure of the road to all vehicles including commercial and private. To really protect and maintain all seven fundamentals listed, closing the road year round to traffic is the best option. One option to protect and maintain the visitor experience is to provide access via shuttle, either bus or train. An efficient and well-timed shuttle service can provide low-impact service to all trailheads, cultural sites and wildlife viewing pullouts.

Topic Question 4:

In considering all options for the best way forward with the moose-wilson corridor, it is imperative that the park considers what is best for itself, its natural resources, and its visitors (in that order) and NOT what is best for teton county, jackson hole mountain resort or anybody who views the road as just a way to get from point A to point B. I truly hope the park service can put together a plan that maintains the natural integrity of this corridor.

Topic Question 1:

Option D is the only truly safe and equitable way to include bicycle traffic in the plan. All other options only give lip service to bikes and do not address safety issues that result from cars and bikes sharing the same road.

This strategy will also encourage bicycle use in the park and reduce the volume of traffic on the road even further.

Topic Question 2:

Because they do not take into account the solution to the problem. Bicycles. Slower, safer, more efficient. People will choose to ride if they feel safe doing it.

Topic Question 3:

Buses buses buses. Make everybody park their cars in one spot and take buses throughout the park. Other national parks have successfully utilized this option and it makes for a far better experience overall. With ever increasing number s of visitors I believe this is inevitable. Unless the caldera blows.

Topic Question 4:

Believe in bikes . They are the solution, the future.. Less pollution, noise, parking and less impact on the wildlife.

People don't need to drive in their cars everywhere they go it's time to embrace a part of the solution and not let old school anti bike sentiment get in the way.

Oh yeah and buses.

Comments: It's time to reconsider mountain biking in the national parks. Horses are allowed why not bikes? A bicycle has less impact than a horse on trail sustainability. Or ban the horses. That would be fair and I would shut up. Why should they be able to go out there, hammer the trails and crap on everything and a biker can't go ride trails in peace on public land with minimal impact. Just because that what has always been done I guess. And that's not a good reason.

Topic Question 1:

Alternative D provides the best chance of honoring the National Park Service's mission of protecting the resource and providing for visitor enjoyment.

Topic Question 2:

Alternative A is the worst choice because it leaves untouched a problems that most people acknowledge exists.

Topic Question 3:

The National Park Service did a commendable job in identifying alternatives that respect a range of opinions on this issue.

Comments: Wallace Stegner said "National Parks are the best idea we (Americans) ever had."

Ken Burns added texture to that statement thru his PBS series titled "National Parks: America's Best Idea" - a 6-episode celebration of the first 100 years of this inspiring vision.

But when the Service celebrates its second hundred years in 2116, will that sentiment still ring true to a tech savvy multi-tasking citizenry? Hints to that answer may very well be found in how officials elect to manage the MW corridor.

Alternatives A and B seem to lack imagination and reflect a type of retro management that is not going to attract new constituents to the park.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Alternative D embraces the most forward looking and creative set of choices. It recognizes that there are many ways to enjoy our national parks including front country travel by bicycles and wheel chairs. It seeks to protect park values using real time information instead of arbitrary openings and/or closings. It opens the possibility that friends groups, such as Grand Teton National Park Foundation, are capable of raising funds for visitor centers, trails, and 'yes', maybe a bike path. It gives weight to technology in helping manage congestion. Finally, it asks the community to help instead of stigmatizing them as the source of the problem.

In other words, it's a solution that sets an optimistic vision for the next 100 years.

Thank you.

Topic Question 1:

D - - Comes the closest to balancing wildlife habitat and human enjoyment of the Park. Safety for cyclists is also a high priority for me.

Topic Question 2:

B & C Do not address the rights of visitor's enjoyment of the Park and their safety.

Topic Question 3:

YES. Improve and pave the whole road, do not ration usage, plus build a bike path.

Topic Question 4:

The Park errors in not considering the human species on the same level as wildlife species. The Park is to be preserved for human enjoyment, and reasonable, safe access for humans to the Park.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

The best strategy is embodied in Alternative A. Maintaining historical use best protects the visitor experience for this and future generations.

Topic Question 2:

Reconfiguring Death Canyon trailhead would be detrimental to the visitor experience.

Any strategy that in anyway reduces motor vehicle traffic is detrimental to the visitor experience should not be carried forward.

Topic Question 3:

Yes, as I stated in my scoping comments, there should be a strategy that evaluates working with Teton County to develop a paved road along the south boundary of the park and over the Snake River to provide for a connection to Highway 89 near the Jackson Hole airport. Its is irresponsible to not include such an alternative, as this will have an immense impact on how the Moose-Wilson Road is utilized, and frankly is the only way to conduct a meaningful analysis of whether any change in the current management of Moose-Wilson Road is warranted.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Comments: To: Grand Teton National Park
Attn: Moose-Wilson Planning Team
Date: September 15, 2014

Subject: Comments on the Moose-Wilson Corridor Preliminary Alternatives

Dear Moose-Wilson Planning Team,

Please accept the following comments on the preliminary alternatives for the Moose-Wilson (MW) corridor in Grand Teton National Park. I do not support any of the three "action" alternatives because each one has elements that are not in keeping with the goals and desired conditions so eloquently

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

expressed in your NEPA brochure. None of the alternatives are an improvement. I conclude that the best alternative among the four presented is the "no action" alternative. I request that the NPS go back to the drawing board to develop new preliminary alternatives more in keeping with the goals and desired conditions. This corridor is too critical for wildlife and park values to ruin it by charging ahead with the dreadful "action" alternatives proposed.

NPS has done an excellent job compiling a list of goals and desired conditions that are spot on. However, many of the aspects of preliminary alternatives B, C, and D are incompatible with these goals. The Moose-Wilson corridor is a place for unhurried opportunities for wildlife viewing and a rustic park experience that is like no other place in GTNP. It is not an appropriate place for a thoroughfare from Teton Village to the airport, a separated bike path, paving additional sections of the road, or making them wider. The Moose-Wilson corridor is a unique experience the way it is. It is precisely what makes it different from the Jenny Lake area that makes it so special. GTNP should preserve its rustic character and charm and not turn it into another Jenny Lake mess with park service "improvements".

I recognize that there are problems with the no action alternative, but at this point, this is the only preliminary alternative that I can support. A new alternative should be crafted to minimize construction and habitat destruction that inevitably occurs during any construction project, which invariably involves heavy equipment. The elements of a new alternative that I think will accomplish these goals are:

1. One-way road - Include a new alternative that makes Moose-Wilson a one-way road. This will reduce traffic on the road. It is extremely disappointing that the planners have bent to pressure from local special interest groups, developers along the Teton Village Road, and local elected officials (Teton County Commissioners and the Wyoming Congressional delegation) and not even put forward this alternative for the public to comment on. This is a National Park and you should do what is in the best interest of the entire nation, not the local special interests. If vocal locals with special interests had their way in the past, GTNP would never have become a national park.
2. No additional paving - Do not increase the amount of pavement on the road. Keep the gravel sections unpaved including the road to the Death Canyon trailhead. A simple solution is to grade the road to the Death Canyon trailhead. Maintaining dirt sections unpaved discourages folks trying to drive through as fast as possible to get somewhere else and encourages a slower pace that is more compatible with wildlife and wildlife viewing. Encourage use of the road for reaching destinations within the MW corridor and don't cater to others who desire to speed through.
3. Consider 'unpaving' the paved section of road - Instead of proposing to pave unpaved sections of the road, why not let the paved section of the road deteriorate, which would discourage through traffic and encourage use by those needing to use it to reach destinations along the road.
4. No additional road width - Do not increase the width of the road. Slow down traffic and encourage visitors to take in the irreplaceable, unique wildlife-rich, MW corridor experience.
5. Striping to accommodate cyclists - Stripe the paved portions of the road with one lane for cars and one for cyclists. Place a sign at the entrance to the unpaved road to alert cars that cyclists are sharing the road.
6. Limited road realignment and no entrance station relocation - Use the current roadbed with the exception of the portion of the road past the beaver ponds and wetlands. The current situation with bears frequenting the area is easily managed by GTNP closing the road until the bears move a safer distance away. The situation with the beavers is less manageable. Realign just the northern portion of the road that goes past the beaver ponds and the hawthorn bushes. It is incompatible with the goals and desired conditions to turn this road into a fast thoroughfare between the Teton Village road and the airport. Do not realign the northern most section of the road. Although a reason for doing this and moving the entrance station was not provided, I can only surmise that it is to collect additional fees. The habitat destruction and disturbance is not justifiable. Visitors entering the MW road from the south will already

pay fees. Do not realign the section that goes past the Murie Center access road. I can see no benefit to moving the entrance station and realigning that section of the road.

7. Don't restore to natural conditions the old segment of road around the beaver ponds if the road is realigned. - Minimize construction activities. Just pull up the asphalt but don't plant anything. Let the beavers flood it. They will reclaim it on their own. The old road can be a walking path to visit the edge of a pond to watch beavers at work.

8. Build no pathway -I do not believe this is an appropriate place for a separate bike path. There are already many miles in Teton County of separated paved bike paths that provide cyclists like myself with scenic and safe options that are better suited for cycling. Moose-Wilson corridor is important bear habitat and it is not in keeping with park values to encourage more habitat destruction for pathway building. The Rockefeller family donated so many acres to GTNP (there would not be a GTNP without the generous gift and vision of the Rockefeller family) that it is unconscionable for the park service to propose construction of a pathway around the southeastern boundary of the preserve when the Rockefellers were very precise that these uses were strictly forbidden within the preserve. Section 3.8 of the Jackson Hole Preserve Inc. (JHPI) specifically prohibits bicycles in the list of allowed non-motorized uses, except in an emergency (Section 4.8). Section 4.7 (conservation easement across the Laurance S. Rockefeller Preserve) prohibits building a bike path or road. GTNP should honor their vision, not totally ignore it by building a pathway within the Moose-Wilson corridor. The goals and desired conditions are better served by encouraging folks to get out of their cars and hike and watch wildlife, not speed through in a car or bike on their way to get somewhere else.

9. Reduce speed limits along the road and add speed bumps - Encourage visitors to slow down and enjoy the journey not as a means to get somewhere else.

10. Prohibit commercial traffic including taxis - Taxis passing through are not compatible with the goal of encouraging visiting destinations within the corridor. The corridor is popular enough without encouraging commercial for-profit uses.

11. Do not move the Death Canyon trailhead or Death Canyon access road.

12. Shorten the season that the road is open to vehicles.

13. Keep current vehicle size restrictions.

14. No reservation system or hourly quotas - These proposals are too bureaucratic, difficult to manage, and should be scratched. Funds for the park are already short. Do we really want users to be that frustrated? Other proposals listed above will reduce the traffic and achieve the same goals without the need for a reservation/quota system.

15. Shuttle service - If the road remains 2-way, offer regularly scheduled small vehicle shuttles with stops at the LRP and trailheads, similar to shuttle services offered in many other national parks.

16. Do not allow winter grooming of the Moose-Wilson road - Although I am an avid cross-country skier, I do not support winter grooming on the MW road. I regularly skate (or try to but it is often not groomed) on the inside highway between Taggart Bradley parking lot and Signal Mountain. GTNP does not have the funds to groom this road and already relies on private donations and the County to groom it. Why allow for another use that the park cannot maintain? There are already many places to ski along groomed trails in the area. Let's leave the MW road for quiet, slow exploration uninterrupted by the disturbance of grooming machines.

I also have a few questions that should be better explained or rethought when the alternatives are revised:

1. It is not clear what is meant in Alternative B under Visitor use/Interpretation by "a sense of arrival experience". More details are necessary to comment on this and decide if this is a good thing or not.

2. In Alternative D, how does realigning two segments of road mean "no substantial changes to the alignment"?

Moose-Wilson corridor should not be a route for the quickest, shortest transportation to and from somewhere else. Increasing speed and ease of vehicular travel through additional paving and widening will not obtain the Park's goal of natural soundscapes and acoustic resources and visitor experience in an outstanding natural environment. This important issue will affect future generations and their ability to enjoy this rustic resource in the special way I have for many decades. Do the right thing and rework the alternatives to preserve fundamental park values unimpaired for future generations. Thank you for considering these comments.

Topic Question 1:

I like the re-routing of wetlands area and the improvements of the Death Canyon trailhead in Alternative D. Thanks for including a MUCH needed restroom at Granite Canyon.

Topic Question 2:

I hate the idea of "limits" or "reservations" - -if people are willing to sit in congestion, let them. I also hate the idea of closing the road to vehicles on certain days. Please don't limit access- -this is not what a National Park should be doing. The Moose-Wilson Road is a jewel much like the Jenny Lake area. It is so special. Please don't ever pave it all the way through. That will just invite MORE commuter traffic. Commuters have a "right" to pass, but let's keep it scenic and wild, ok? The alternative use pathway is great IF there is money for it. I would personally love it, but hey-it's the taxpayers paying for my playground.

Topic Question 3:

Parking at Granite could be increased and improved.

Topic Question 4:

Please don't pave Paradise!

Topic Question 1:

Question 1: Alt A: Bicycles continue to be allowed on road only. No new pathways due to wildlife and habitat impacts. Alt B; reduce speed limits for safety and to minimize wildlife disruption.. Realignment of northern portion of road to allow for sensitive wetlands and wildlife areas to be undisturbed..
Alt C: unpaved remain unpaved to minimize vehicular speed and maintain a more pristine environment.
Alt D:realignment of northern portion of road to stay away from sensitive wetland and wildlife habitat

Topic Question 2:

Question 2:

Alt A: Existing road configuration is not acceptable due o impacts on wetlands and wildlife near the ponds ,etc. Need to realign northern sections of road. Commercial activities should be limited and managed by GTNP. Alternative A is not acceptable as is in terms of management, negative impacts on wildlife and wetlands, traffic congestion.
Alt B: no new paving. need new aiignment for norther section. bicycles should have use of road only when open to other vehicles. no commercial activity.
Alt C: difficult to manage or monitor closing road 2 days per week. need a better way to manage traffic volume and flow. Road need realignment on norther section. Bicycle use should match vehicular use.Commercial use should be very limited and subject to GTNP control.

Alt D: need to realign norther section of road to protect wildlife and wetlands. NO multiuse PATHWAY.due to substantial disruption of habitat, wildlife and risk of human interaction, impacts of tree removal and paved surface area.

Topic Question 3:

conclusion:

Hopefully we can find a way to: limit traffic volume and flow; realign the norther section of the road; not add to impact and pavement with a pathway system; focus on the unique qualities of this special area by minimizing impacts to wildlife and habitat.

The closure of the M W Road this week due to hungry grizzly bears says it all. The picture in Jackson Hole Daily on 9/11/14 on the road depicts the wild nature of this important habitat, the need to protect the critters as well as potential human encounters.

Topic Question 4:

see Question 3 above.

Thank you for the opportunity to participate in this process.

I realize my previous comment about one way traffic is un-clear. I prefer the road be one way from LSR to Moose ponds Overlook. The road from South to North. When I stated no pedestrian access this includes no additional bike path. No bike path at all. If this alternative is not viable then close the road at LSR from village completely. No road to Moose Ponds. db

Topic Question 1:

Preliminary plan D is the only plan with a bike path, and is the only plan I support.

Topic Question 2:

There is too much traffic on that road. It needs to be straightened and paved. Or better yet, move the road so that it goes directly to the Snake River bridge, and leave the existing road as a slow, wildlife viewing road.

Topic Question 3:

A bike path away from the road would be great. I don't understand why you put the existing Jenny lake bike path next to the road. All you hear are the sounds of cars, and all you smell is the exhaust of cars. Would you ever build a hiking trail next to a road? No. Why? because the hiking trail would suck. You built a terrible bike path next to the road. Make a good one here. This is your opportunity.

Topic Question 4:

It's time to acknowledge that the Moose to Teton Village road is overcrowded. The valley now has too many people, and it's only going to get worse. Make the road more appropriate for the crowds. Make it faster and straighter. As it is now, it's annoying when you want to pass a car, and it's annoying when you are the car being passed. It basically is awful for everybody. It's an ancient road that is obsolete. You can do better.

Topic Question 1:

Promote shuttle system to encourage visitors to arrive without a car, and maximize wildlife corridors and use topography to reduce speed & traffic.

Topic Question 3:

None.

Comments: Dear Superintendent Vela,

As someone who has visited and bicycled through the Tetons, I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife of this road and am concerned that unacceptable traffic impacts and calls for increased development could irrevocably impact wildlife. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

There is enough commercial traffic plying its way through the Tetons already. Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future

small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Correspondence Text

Topic Question 1:

I appreciate the opportunity to share my comments, ideas, thoughts and feelings during the planning phase of the Moose-Wilson Corridor (MWC) Comprehensive Management Plan. Thank you for this opportunity

While I have lived in Teton County, Wyoming for over 40 years, have much enjoyed the MWC over the years for different reasons, have seen much development and many changes, I rarely submit statements or give prepared comments at public meetings, but at this time I feel compelled to do so.

I feel strongly that the following should be carried forward:

-Retain the south end of Moose Wilson as unpaved.

-Realign the two segments of road on the north end, and move them out of critical wildlife habitat. It is key to maintain wildlife habitat. The old segments of roadway should be removed and restored to natural conditions, this would, in fact improve the wildlife habitat.

-Establish traffic management techniques - while still accommodating access to the LSR, Death Canyon, and the Granite Canyon trailhead. This would reduce vehicle traffic while affirming access to the corridor's major destinations and have the benefit of supporting bicycle use on the existing road surface.

-For winter use, maintain the current traditional non-motorized access, e.g. snowshoeing, skiing, and walking, without grooming. This would maintain the solitude within the corridor, and provide a more

primitive visitor experience than elsewhere within the park, e.g. Teton Park Road. It would also be more compatible with improving the significant moose habitat within the corridor. If the north end road realignments occur, then the northern parking area should be located at Sawmill Ponds parking lot and/or at the new entrance station location, rather than at locations near the Murie Center. (Once you have realigned the road out of that heavily covered portion of the old road, it would be best not to encourage winter use in the restored area).

-Regarding formalized/paved turnouts, I would like no additional turnouts to be hardened, with the exception of adjacent to the north end realignment so as to provide improved wildlife viewing opportunities but minimizing impacts to wildlife in the southern portion of the corridor. The park should apply design solutions to roadside parking that would reduce resource impacts from parking off-road.

-Moving the Death Canyon trailhead is a positive action as long as the existing road is rehabilitated (back down to a trail width rather than road width) beyond the new trailhead, and that there is no net gain of total parking associated with that trailhead.

Topic Question 2:

- Increasing disturbance.

- Fragmentation of habitat.

- The no action alternative. The continued growth of vehicle traffic and its impacts can not be tolerated further, and should be reduced through future management actions by the NPS.

- Reservation system/vehicles per hour system, and/or closing the road to vehicles two days/week. These are complex and challenging techniques to manage, are unpredictable, provide no certainty to the general park visitor as to what they may be able to experience during their visit, and could lend themselves to being manipulated by special interests and/or commercial entities.

- A multiuse pathway parallel to Moose-Wilson Road along any segment. This would have unacceptable impacts to park resources and values. Further, a separated pathway more than 50 feet from the existing road would result in even more direct habitat loss than if the pathway were immediately adjacent to the road. Shared use of the road by bicycles and transit/reduced vehicle traffic would negate the need for any separate/parallel corridor.

- Allowing taxis. This is a commercial use that is not dependent on park resources.

- Allowing winter grooming. The park should provide a variety of experiences, and Moose Wilson lends itself to a visitor experience that is more primitive.

- Adding additional pull-outs with the exception of along the realigned northern segment.

- Adding extensive interpretive media/kiosks.

- Removal of large numbers of trees and vegetation.

Comments: I am very concerned with the loud, strident, vocal push by locals, individuals and groups, to add a bike path within the corridor. I do not believe that GTNP is able to nor mandated to provide

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

recreational opportunities for all visitors at all places at all times. I am concerned that the addition of a bike path within the MWC would extend that now small footprint and jeopardize critical habitat

While I would hope that GTNP would be able to work in concert with Teton County and Town of Jackson on this issue, I feel very strongly that decisions concerning MWC should be based on the primary purpose of the Park: Preservation and Protection of the Resource as clearly stated in both your document and in the 1916 act of Congress that established the National Park Service:

"The Service thus established shall promote and regulate the use of Federal areas known as parks, monuments, and reservations hereinafter specified by such means as measures as conform to the fundamental purpose of the said parks, monuments and reservations, which purpose is to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

As stated, the purpose of National Parks in general and specifically GTNP closely parallels the #1 priority of Teton County: Protection of the Resource, the land and habitat for Wildlife habitat. I understand that Wildlife and Wildlife Habitat consistently ranks as #1 priority of importance to Teton County residents.

I feel quite strongly that GTNP decisions on the MWC should here, in this time, reflect what is best for wildlife. The various myriad species: furred, feathered, slimmed, or scaled have no real voice in the decisions that seriously affect their habitat. GTNP needs to make decisions for the good of this important and valuable resource. Preserve and Protect the Resources...â€leaving them unimpaired for the enjoyment of future generations.

I feel quite strongly that individuals and the special interest groups they comprise should be willing, here and now, to give up their own personal desires for the common good, that is, for the good of wildlife habitat. The MWC is and needs to be considered as habitat critical to the preservation of the wildlife resource. The Corridor offers a contiguous area for movement of wildlife between the Teton Range, the Snake River, the Valley floor and the National Elk Refuge. There is, with the meander of the Snake River, a 'natural constriction' of habitat along the MWC and while I agree that moving portions of the Road to the East is necessary to enhance and thereby protect habitat, the widening of the road to accommodate the addition of a bike path would create more disturbance within this 'naturally constricted' portion of the corridor. Preserve and Protect the Resourcesâ€leaving them unimpaired for the enjoyment of future generations.

I feel quite strongly that the individual and special interest groups urging inclusion of a bike pathway do so for their own personal justification and gratification. By and large, bicyclists, as a group, are primarily intent on their own personal private fitness program. They do not generally stop to view scenery, flowers, birds or wildlife. Their purpose in pushing for the inclusion of a bike pathway does not parallel the stated purpose of GTNP or the National Park system. Preserve and Protect the Resourcesâ€leaving them unimpaired for the enjoyment of future generations.

I feel quiet strongly that the number of comments during this Planning Period should not be construed as "votes" for one type of plan, additions or subtractions to that plan. GTNP decisions should be determined by the stated purposes of the National Park System and the order of priority of those purposes. Preserve and Protect the Resourcesâ€leaving them unimpaired for the enjoyment of future generations.

I feel quite strongly that at this planning point, GTNP should again 'continue the notable conservation

story'; 'continue to inspire for future generations'. That said, I fear that we are again seeing a struggle between private (personal) interests and a serious concern to conserve the habitat ie. the Teton Range, the Valley floor, the Snake River corridor and the existing, historical, minimal impact of the MWC. This is an opportunity for GTNP to set a baseline of action and preservation for the future, for GTNP to control the situation pursuant to the stated Purpose. Preserve and Protect the Resourcesâ€¦leaving them unimpaired for the enjoyment of future generations.

I feel quite strongly that the addition of a bike pathway to the Moose-Wilson Corridor would impair the enjoyment of this section of the Park for current visitors and for generations to come.

I feel quite strongly that every compromise in the environmental arena is a loss. A loss for Preservation. A loss for Protection. A loss for habitat. A loss for the environment. The addition of this bike pathway would be this type of compromise.

I am proud to live in a community as diverse as Jackson and I understand the many challenges for the community that this diversity creates when building a Comprehensive Plan, for a corridor or for an entire county. Perhaps that was the rational when the Jackson/Teton County Comprehensive Plan was written as it states: it "is not the goal of the community to overextend our resources or jurisdiction into adjacent communities or State and Federally managed lands." (Policy 3.5.b: Strive not to export impacts to other jurisdictions in the region). I feel quite strongly that it is not incumbent upon GTNP to provide recreational pathways and opportunities for all visitors to the Park be they locals or out-of-towners.

The opportunity is available to minimize impact on the environment. Preserve and Protect the Resourcesâ€¦leaving them unimpaired for the enjoyment of future generations.

The answers to this planning sequence lie in GTNP's own stated Purpose: Preserve and Protect the Resourcesâ€¦leaving them unimpaired for the enjoyment of future generations.

Please, keep the corridor a minimum width in order to preserve habitat. The less development, the less disruption of habitat.

Again, thank you for the opportunity to comment.

Topic Question 1:

Do nothing from Alternative A is the only proposed strategy that I fully agree with. All the other alternatives envision major changes that will deter wildlife and increase traffic, particularly bicycle and pedestrian traffic which will scare off the animals and negatively impact their use of the corridor habitat.

Topic Question 2:

The worse strategy is the addition of a bike pathway, for the reason stated above. Bicyclists are a vocal and well-funded advocacy group in Teton County, but there are numerous (expensive) pathways all over the area, whereas there are very few relatively undisturbed wildlife habitats. Realigning the road & paving the graveled area should not be done for the same reasons - - will increase traffic & negatively impact wildlife.

Topic Question 3:

Reduce speed limit - - enforce it and/or add speed bumps to slow down traffic.

Add and/or widen pullouts so that vehicles stopped to watch or wait for wildlife can do so.

Topic Question 4:

The corridor is a precious one for wildlife and preserving that aspect should be the NPS' top priority. Improving through traffic from Teton Village to Moose and the airport is not a valid objective for the Park. Nor is providing more opportunity for bicycling and hiking, which is already amply provided in the Park & elsewhere in Jackson Hole.

Comments: Grand Teton National Park is a national resource, and not just an amenity for local Jackson

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

area residents. The great majority of people who visit are really interested in viewing wildlife in its natural habitat, and there aren't many places in the country where they can do that. Expanding Moose-Wilson Road, and making it more of a transportation and recreational corridor, would severely limit the opportunity for tourists and residents to see wildlife there, and would make it harder for wildlife to use the natural habitat safely.

Topic Question 1:

1. Continue monitoring all traffic uses annually to have basis for management decisions going forward.
2. Close the road to through motorized vehicle traffic at LSR Preserve Parking Lot. Two way access from both Moose and Teton Village (Granite Canyon). May consider park administered shuttle when needed. Objective is to eliminate through traffic using this as a part of local road system. It is up to Teton County, Wyoming Department of Transportation, and Town of Jackson to improve capacities of their public roads to accommodate the traffic impacts of developments on private lands. Accommodating those impacts is not a responsibility of Grand Teton National Park. Other agencies could follow Wyoming Department of Transportation recommendations to widen State Hwy. 390, State Hwy. 22, construct Tribal Trails Connector, pave and improve Spring Gulch Road, and follow up on Wyoming Highway Department 1972 planning study for a road crossing from Gros Ventre Junction to Teton Village. These efforts should be initiated prior to insisting on through traffic on the Moose-Wilson Corridor in Grand Teton National Park.
3. Relocate road north of LSR Preserve per Alternative B. Use cross-section: two 8 ft. vehicle lanes, one 6 ft. bike lane.
4. Bicycle use per Alternative B. Do not permit gonzo fat snow tires with chains - send them to National Forest.
5. No commercial traffic, except GTNP regulated shuttles as per Denali, Zion, Yosemite, others.
6. Relocate Death Canyon trailhead per Alternate B.
7. When Barker life estate ends, stop plowing at Moose Ponds Overlook. No trail grooming. Let the area rest.
8. Improve parking at Moose Ponds Overlook, Granite Canyon, Horse Trailer parking.
9. Do not pave remaining gravel section.

Topic Question 2:

1. Continued two-way travel between Moose and Granite Canyon will lead to increasing traffic numbers (most of it through traffic), pressure to pave and improve road to accommodate the traffic impacts of future development at Teton Village and subdivisions on West Bank.
2. No boating, rafting, paddleboarding on Phelps Lake - it will become Coney Island like - see String Lake on a weekend - mostly locals.
3. No separate pathway. With elimination of through vehicular traffic bikes and cars can share the road.

Comments: This portion of Grand Teton National Park has never had a real Management Plan and increasing visitation trends are identifying issues which must be addressed. The two major impacts of increasing visitation are on wildlife and the LSR Preserve.

For wildlife this is a portion of the park adjacent to lands to the west where wildlife is routinely hunted, sometimes legally, sometimes, in the case of protected species, not legally. Grand Teton National Park lands are among the few adjacent refuges for these species.

The LSR Preserve was established in 2009 to commemorate and put a face on land conservation, as evidenced by the numerous Rockefeller gifts responsible for much of the park itself. The values for which the park was established include natural sounds which are diminished by sounds of visitation. As Grand Teton National Park has expanded eastward, many of the uses once permitted have been ended: Jenny Lake store and gas station; Wyoming State Highway moved from Moose-Jenny Lake-Moran to east side of Snake River; and cattle grazing. The Moose-Wilson Corridor has a more restrictive noise limitation from aircraft by virtue of location. This area deserves special protective consideration.

The most effective alternative to protect these two values, wildlife and solitude within which to contemplate, is to eliminate the opportunity for through motorized vehicles who are not using the roadway to access any park destinations along the corridor.

Various suggestions have been made in several alternatives for consideration of: one way traffic, alternating one way traffic, a reservation system, real-time notice of open parking spaces at LSR Preserve. All I have heard of are poorly understood by their proponents, would create unnecessary ambiguity on the part of visitors, would deny to once in a lifetime visitors to Grand Teton National Park an opportunity to experience the LSR Preserve, and would be an administrative challenge to enforce.

A closure gate at the LSR Preserve prohibiting through traffic, except for administrative and emergency use, is the most effective, most inexpensive, readily placed of any proposed strategies.

As to the legitimate users of this road for accessing Granite Canyon and LSR Preserve from the south, and for accessing LSR Preserve, Death Canyon Trailhead, White Grass whatever, and Moose Overlook Ponds from the north, they would all have access and be able to return the way they came in.

As visitation counts to LSR Preserve continue to increase over time, it might be desirable to provide park Concessionaire shuttle service from Teton Village and Moose Visitor Center to the LSR Preserve with stops at other attractions along the route. This is common practice in many National Parks; Denali; Zion; Yosemite; Acadia; Glacier.

One of the often unacknowledged factors in this issue is the strong political and economic desire for full time through traffic on this corridor. The basis for this is the fact that the distance from Teton Village to

the Jackson Hole Airport via this corridor and Moose is 11 miles compared to a distance of 22 miles through the Town of Jackson and its' traffic delays. Both the Jackson Hole Ski Corporation and private residential developers around Teton Village will be lobbying strongly for the kind of "creeping incrementalism" which Interior Secretary Jim Watt brought to the Jackson Hole Airport when he authorized the 50 year lease extension agreement for the airport in the 1980's. They will all profess to want the existing crooked road, but they know that increasing traffic inevitable leads to accidents, upgraded roads and higher speeds - the very threats to the values in this portion of Grand Teton National Park.

This political and economic lobbying will continue regardless of the outcome of this study and for that reason it is important for the NPS to continue the factual monitoring of usage on the roadway. In this instance the proper action is to not establish a subjective "trigger point" where traffic is too much, but rather to acknowledge that the first step is to eliminate through traffic, perhaps then follow up with shuttles from either end. Why not start with a true Grand Teton National Park/LSR Preserve Alternative from the beginning? It would be the balance to the No Action Alternative. Perhaps call it Alternative E (END GAME). If that Alternative E was selected and contested, defend it in court now rather than drag it out over 20 years as we have done with snowmachines and wolves in Yellowstone.

Local elected officials: County Commissioners, City Councils; State Legislators; Governors; and Congressional delegations too often come down on the side of loud or influential commercial interests rather than collaborating in a responsible way with federal land managers. They often talk sustainability but usually are referring to their economic bottom line, not acknowledging that the values on the federal lands are responsible for their healthy economy.

Topic Question 1:

Wyoming Pathways supports the basic concepts and key elements included in Alternative D in the preliminary alternatives newsletter. We recommend several modifications and additions to Alternative D be considered, to provide the public an "Enhanced Alternative D" as the "Preferred Alternative" in the upcoming Draft EIS phase of the planning process. The additions and changes recommended for Enhanced Alternative D are noted in our response to Questions 1&3 in this comment letter.

We support an Enhanced Alternative D because it continues and better manages two-way road access, adds alternative modes, reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values. An Enhanced Alternative D benefits area wildlife with better managing motor vehicles, and encourages diverse park visitor access for safely enjoying the corridor outside of the car. Enhanced Alternative D would best achieve a sustainable balance of excellent resource protection for this and future generations along with a providing very high quality visitor experience.

Well implemented, Enhanced Alternative D will inspire and enable a shift of 10-30 percent of visitors to use bikes, walking or transit. Enhanced Alt D will be the most sustainable of the options. It will best engage the significant resources of the gateway community of Teton County, Town of Jackson, Teton Village, and other local partners, to assist in the success of Moose-Wilson park section and the connected public and private lands.

Park values are best protected under an Enhanced Alternative D, which recognizes that wildlife and park visitors can be thoughtfully managed together, the essence of National Park mission under the Organic

Act. Under Enhanced Alternative D, visitors will experience the Moose-Wilson corridor of Grand Teton National Park in a way that is respectful of natural resources, informative, inspiring, and safe.

Enhanced Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular park visitor on a needed pathway.

Topic Question 2:

Gates and closures (such as Alternatives B and C) are bad solutions to traffic management. Gates and closures shift, and most likely increase, the number of motor vehicle trips area wide, including on already congested Grand Teton National park roads and highways. They also fail to work for nonmotorized park visitors.

The National Park section of Highway US 26/89/191, from the south entry of Grand Teton National Park north past the Airport to Moose, has existing safety problems that far exceed those on Moose-Wilson. From a safety side, these include both a history of motor vehicle crashes and a documented hot spot for wildlife-vehicle collisions. Diverting additional traffic from Moose-Wilson directly onto the Park's main highway would add to these existing problems, potentially at greater impact overall to park wildlife and park traffic safety.

From a transportation standpoint, the Grand Teton National Park section of US 26/89/191 currently borders on capacity for a two-lane highway. Traffic counts at the park boundary can exceed 20,000 vehicles per day in summer months. Speeding, accidents, and wildlife collisions are significant problems now. Gates and closures on the Moose-Wilson road would exacerbate the very real problems that exist on Grand Teton National Park's main highway.

For national park visitors and locals alike, under Alternatives B or C, to get from the WY-390 corridor (Wilson, Aspens, Teton Village), where many park visitors base from, to Moose and back will be a 50-mile round-trip instead of seven direct miles that could be experienced on foot, bike, transit or vehicle. The added carbon footprint of B or C, noise and air impacts, and added vehicle miles traveled (including in the park) would be significant and need to be studied.

The NPS Moose-Wilson planning process has failed so far to include these direct impacts of what happens if the gates and closures are implemented. Unfortunately the Preliminary Alternatives continues with that missing, yet critical, component.

There is a major distinction between the Moose-Wilson Road in Grand Teton National Park and situations such as Zion National Park. There the Zion Canyon Scenic Drive is a dead-end canyon with access to a unique park destination. By comparison, as the GRTE and local traffic studies show, Moose-Wilson road is intrinsically tied to the larger National Park and Jackson Hole regional transportation and recreation systems. Changes to Moose-Wilson have impacts both on the Moose-Wilson corridor, and have direct impacts to the connected transportation corridors of Wyoming highways WY-390, WY-22, West Broadway, and US-26/89/189/191, which is part of the Rockefeller Parkway.

We don't think the alternatives B and C have merit, but should they continue in the Draft EIS, it will be critical that the NPS EIS study all the impacts, including those that are simply redirected to other park and local highways, with potentially greater impacts to park resources. The impacts to the adjacent

community of Jackson Hole and the adjacent National Elk Refuge would need to be studied. Both park and local impacts need to be studied more specifically in any alternatives like B and C that may move forward; that is, the EIS must do more than a simple glance in the cumulative impact analysis section. Those are significant direct impacts and need to be accounted for and fully developed, with traffic models on all the impacted highways, in any B/C type alternative that moves forward.

The negative impact of shifted and increased traffic would be bad for the environment and bad for park wildlife that live outside the corridor, especially along area highways, including the main National Park route, which will inevitably see more traffic and wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose.

The Alternative A, no action, is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies, and it fails to address park visitor needs and the benefits of a pathway along the corridor.

Instead of closures, park visitors and the gateway community of Jackson Hole can help the National Park Service by innovating real solutions that are better for the environment - like multi-modal transportation with managed motor vehicles, pathway, smart transit, TDM, education and encouragement.

Topic Question 3:

The following additional strategies should be included in what we have termed Enhanced Alternative D, which includes a complete pathway in the corridor. These include the following:

TRANSIT. Enhance and propose stronger Community Partnership on Transit.

There is only a weak reference to transit in the newsletter, with a vague shuttle services could be authorized. That's not good enough. The preferred alternative should include a more robust forward thinking transit component. Please add public transit, with small energy efficient vehicles serving Moose-Wilson, and commit the National Park Service to building a community partnership as a way to reduce traffic congestion even more in the future.

The Jackson Hole community has developed impressive capacity to partner with the National Park Service on transit for Moose-Wilson. The START bus is the largest transit provider in the State of Wyoming, and is now completing a \$30 million bus facility with help from a USDOT TIGER grant. The Town of Jackson/Teton County Comprehensive Plan clearly outlines strong local policy to support transit and help minimize transportation impacts. Teton Village brings additional capacity with access for bus users, parking, bus storage and maintenance, and willingness to partner with Grand Teton National Park. Working together, the National Park and community could create a win-win-win for park, park visitors, and community.

TDM. Enhance the TDM program.

There is significant opportunity to reduce demand for motor vehicle trips through a smart trips type of Transportation Demand Management program that could be included into the future. Teton County and Teton Village have shown that reducing trips is possible on the WY-390 corridor south of the park boundary. The preferred alternative should spell this out in the goals and the adaptive management strategies. The National Park should partner with the local governments on TDM goals, some of which should target park-generated trips that are redundant or wasteful. Reduced demand through ride-share options to Moose-Wilson trailheads, and reduced NPS park staff generated trips, should be combined

with the public transit options recommended.

SAFETY. Improving safety should be added as a strategy along with reduce traffic congestion. Moose-Wilson should have a vision zero goal for crashes of all types.

PATHWAY LOCATION. The location of the pathway should be more flexible than 50, and the design guidelines would be better described as generally within 150 of the existing or realigned road (except the LSR section). This is needed provide more design opportunity to follow the contours and minimize cuts and fills and vegetation impacts, while enhancing the visitor experience.

The difference of the two design approaches is easily seen comparing the section of GRTE Pathway along the highway by the Airport, and the more curvilinear pathway from Moose to Jenny Lake. The Airport example is straight for long distances and sits on placed fill up to 5 high and 25 wide. By comparison, the Jenny pathway is low to the ground, follows the land contours, and is more enjoyable for visitors, while being lower impact on the park. For example, the native plant revegetation is nearly 100% successful along the Jenny pathway, and much less successful along the Airport section where steep elevated pathway side slopes have not taken seed nearly as well.

The active use of the pathway, much like a walk on a park trail, is essentially how visitors experience the park; the journey in fact is a part of the visitor experience. This experience needs to be designed into the pathway, as the best National Park designers have done since 1916, whether for an iconic trail or unique park road. Careful attention to the design and layout of the pathway is critical to provide the best experience and minimize impacts to resources.

MOOSE-WILSON ROAD CHANGES:

Wyoming Pathways supports the relocation of the section of road along the wetland on the north half. Shifting the road east, and adding a pathway, would be a net benefit to wildlife.

Wyoming Pathways is less clear on the solutions being proposed on the north end. In general, we support the need to have a gate on the north end, which would facilitate the peak season reservation system proposed in Alternative D. The map for Alt. D, which states, Relocate and replace the Moose Entry station is not well explained in the preliminary alternatives.

We were not able to find or view more detailed drawings that the NPS showed at the Open House, despite NPS statements that the drawings were available online. It would be helpful to see those.

ROAD STANDARDS.

It is critical in any new work that the NPS build to the historic Moose-Wilson standards; this should be no more than 20 wide, which will help slow traffic. No centerline paint or edge stripes should be used, because that would tend to increase speeds.

EXISTING PAVEMENT MINOR CHANGES.

On the south end, around 1990 when former Superintendent Jack Stark directed the paving of the southern 1-mile of Moose-Wilson Road from the Granite Entry to the large ditch before Granite Trailhead, it was paved wide at about 24, which is wider than the historic road sections. Future road surface work strategies could restore that to a narrower 20-22 foot width to save pavement and help keep speeds slow.

Also on the south end, the NPS should consider a strategy of extending the paving the short distance from

the large Lake Creek ditch where it ends now up to the Granite Trailhead winter gate. While it is not critical to the public use and function of the road, its worth considering from a maintenance and common sense standpoint. Its a short section that sees constant wear and is very difficult to keep graded. As in the above comment, if this strategy was used, the pavement should only be a 20 wide cross section, with a safety edge type construction as noted in the Road Safety Audit.

WILDLIFE VIEWING OPPORTUNITIES.

The Moose-Wilson Road Realignment strategies should include adding visitor viewing opportunities of the moose pond that will no longer be visible from the new realigned road. Some type of wildlife viewing trail should be provided to allow that special experience that the road currently provides so many visitors each year.

TURNOUTS AND PARKING.

Wyoming Pathways recommends that motor vehicle parking in the preferred alternative be minimized along the entire corridor.

BICYCLE USE.

This term is not fully inclusive of nonmotorized park visitors. The Draft EIS alternatives must develop this strategy into a more inclusive term for bicycle, pedestrian and nonmotorized use in all seasons. The proposed pathway strategy in D, a complete pathway from Granite to Moose, is a good start and highly supported.

To further improve Alt D, in the winter seasons, allowed use should include pedestrians, skiers, people on fat bikes and snowshoes these all need to be considered as part of nonmotorized human powered access that needs to be provided to GRTE. Wyoming Pathways specifically requests that a strategy of Fat Bike access be included on groomed roads and the Moose-Wilson pathway in winter.

COMMERCIAL ACTIVITY.

The strategy of guided bicycle tours should be expanded to also include guided Fat Bike tours as an option.

From an equity standpoint, not every visitor can afford to pay for a commercial guided tour of the Moose-Wilson. Consideration of the pathway as a way to encourage all visitors to be able to experience Grand Teton should be part of the decision to add the pathway. Access by foot, bike, and public transit is important so that Moose-Wilson serves all park visitors, not just the wealthy that can afford a guided tour in a motor vehicle.

WINTER ACCESS AND USE.

To further improve Alt D, in the winter seasons, allowed use should include fat bikes along with pedestrians, skiers, snowshoes; all these low impact healthy park access modes should be considered as part of nonmotorized human powered access. Wyoming Pathways requests that Fat Bike access be allowed on groomed roads and pathway in winter. A fat bike is defined as a bike with wide low-pressure tires at least 3.7 wide that are designed to go over groomed snow covered roads or pathways. Fat Bikes are a quiet, slow, safe and fun way to experience the park in winter. This is a sustainable low impact park visit access choice that should be embraced, as visitors could ride to the park from Teton Village and not need a motor vehicle at all.

WINTER CLOSURE.

The Moose-Wilson Road has historically been opened on May 1st. One problem with the Preliminary

Alternatives is that it claims the opening was changed to early/mid-May through October 31. All the Alternatives in the DEIS need to be corrected to open the road from May 1 through October 31.

INHOLDINGS.

It is a surprising omission that none of the alternatives show or describe any inholdings as an issue. Development of inholdings could be the greatest threat to the Moose-Wilson. The EIS should add a discussion on acquiring the remaining inholdings. That is a significant protection element missing in the strategies.

While its great that two of the Stanley Resor properties on the south end have been acquired in the past decade or so, there are several more parcels that still need to be purchased. The acquisition of the Hartgrave place was good to see finally accomplished, but took far too many years to complete. Other parcels remain to be acquired. By identifying the need to secure the remaining inholdings in the EIS, it will help toward progress on completing the park.

Topic Question 4:

While it does not seem like its happened so far in this process, we hope that the Draft EIS and the preferred alternative takes into consideration the significant protection that has taken place in recent decades, and which the Jackson Hole community leaders are further prepared to assist the National Park with. In fact, looking at the list of accomplishments, its hard not to conclude that the Moose-Wilson is in fact better protected than 10 or 20 years ago. Consider the land swap that protected the first section of LSR, Laurance Rockefellers donation of the balance of LSR lands and creation of the new visitors center, and the purchase of additional inholdings like Hartgrave, White Grass Ranch, and other parcels, often facilitated by local community members that care deeply for Grand Teton National Park.

In addition, it is worth note that the community is not requesting that the road be widened, nor asking for year-round use, and comfortable continuing with restrictions on large vehicles and keeping the road curvilinear and speeds slow. Despite some critics claims, the community supports the managed sustainable access to the corridor, no road expansion, shift the road from sensitive areas, and keep it slow and narrow. The community, and many park visitors, simply ask to add a pathway for safety and visitor experience, and manage the traffic with smart solutions and collaboration with capable local partners.

It seems wildlife is thriving, and begs the question, what is the problem? We are told grizzly bears, an indicator species, are moving through. Elk herds are thriving; in fact there has been no discussion of actual wildlife problems in the Moose-Wilson discussion. Is there a problem if wildlife is thriving? The National Park seems to be spending significant resources because there could be a problem.

In the Road Safety Audit that the NPS conducted, 90% o the 42 crashes that occurred from 2002-2012 were property damage only, and of the 10% wth injuries, 3/4 were vehicle-bicycle crashes, was pedestrian involved. It would appear that only three wildlife-vehicle crashes were found in a decade of park records. That is remarkable; in fact that makes Moose-Wilson the lowest problem for wildlife-vehicle crashes of all park roads.

Since 2000, the number of animals killed on all other park roads has steadily increased. According to park news releases, a 31% rse in wildlife-vehicle collisions occurred between 2008 and 2010. While an average of 104 animals are killed annually on park roads, 162 vehicle-caused deaths were tallied in 2010 alone. Included in the 2010 data were 48 elk, 41 deer, 17 bison, 6 pronghorn, 5 moose, 5 bears, and 2 wolves.

Records of wildlife-vehicle collisions indicate certain trends and patterns. Statistics show that most of the accidents occurred between dawn and dusk along Highway 26/89/191 where the speed limit is posted as 55 mph.

However, the Moose-Wilson Road has the lowest levels of wildlife/vehicle fatalities of any park road because it is wonderfully slow, narrow and rural - and should be kept that way with an alternative like D, with fewer cars, smart visitor transit and a pathway.

The Road Safety Audit report does show that nonmotorized park visitors are the vulnerable ones. While it states the motor vehicle visitor is relatively safe, it also states, The perceived risk for bicycles and pedestrians in (Moose-Wilson) corridor is moderate-low to moderate-high.

A separate Moose-Wilson pathway is a safety need, not a want, especially for families with children, people with disabilities, and cyclists in general. It is imperative therefore for the Preferred Alternative to include a complete pathway. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap. This will be even more apparent when the new \$15 million pathway and Snake River bridge from Jackson to Wilson is completed, thereby connecting pathways fully from Jackson to Teton Village by 2015, and with the existing pathway connecting from Jackson to Moose and Jenny Lake.

Decreasing the increased traffic volumes for the long term is the Parks objective and that is possible only with Enhanced Alternative D, which uses thoughtful, safer ways to get people out of vehicles and into the outdoors. Alternative D will help make meaningful traffic reductions and adaptations so that wildlife can thrive and visitors can have access to their national park.

Comments:

The current 1976 the NPS Master Plan for Grand Teton provides solid support for a pathway along the Moose-Wilson Road. The Master Plan states specifically "Visitor facilities permitted within these [class III] lands include bicycle trails..." (GRTE Master Plan page 15). It also states "When visitors enter [the valley] zone, they gain opportunities to interact more intimately with the resource - to get out and get involved." And further "Some form of supplemental interpretive and transportation system must be devised for this [valley] zone, leading toward the eventual elimination of visitor dependence upon private motor vehicles for access to and enjoyment of these areas" (Page 20).

More recently, Visitor Use studies that have been completed by the NPS as part of a one million dollar investment in pathway research and supportive and should be considered in the Moose-Wilson EIS. These social science studies show extremely high visitor satisfaction with the new park pathways. Visitors have universally embraced the new mode of access, and companion pathway/wildlife studies show negligible impacts on wildlife, despite some park service unsubstantiated claims to the contrary.

These visitor studies should be recognized in the Moose-Wilson Corridor plan, supporting the need for pathway facilities in the Moose-Wilson corridor. It is quite encouraging that those studies showed such strong support for pathways.

However, it is disappointing that these Social Science studies that were paid with public funds are not available anywhere on the NPS website.

Wyoming Pathways would like to specifically note the following two studies, which we wish to attached by this reference as part of this comment: 1. Evaluation of Non-Motorized Use in Grand Teton National

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Park Phase II: Post-Pathway Construction by McGowen, Gleason, and 2. Hansen; and Analysis of Nonmotorized Use in Grand Teton National Park, 2010 by Eric Hansen.

Significant findings in the studies include:

• Non-motorized use increased nearly ten-fold after the pathway was constructed.

• With the pathway, non-motorized travelers felt safer and were more satisfied with nonmotorized travel options in the park.

• The type of non-motorized travelers in the park changed with the construction of the pathway. Proportionally, there were more older travelers, more children, more females, larger groups and more non-locals.

To quote the Hansen study conclusion,

"the one major suggestion given by almost everyone riding the pathway; Extend the shared use pathway. People love the pathway and want it to go farther. People want to get out of the car. People want to feel Grand Teton National Park. On a bicycle it blows in your face, it can be smelled, it is seen unobstructed, and the slower pace allows time for it all to soak in."

Correspondence Text

Topic Question 1:
Proposal D

The Moose-Wilson Road should remain open in both directions, with a separate pathway for pedestrians and cyclists. The road needs to be improved from Teton Village.

I support a separate pathway - to insure SAFETY and enjoyment for runners, walkers and cyclists. I can't see that a pathway will significantly disturb wildlife; wildlife has large areas in the park where there are few people.

Topic Question 2:
I do not agree with doing nothing. Proposal A

Proposals B and C Many logistic (and resources) would be involved in closing the road certain days to motorists. This would frustrate and disappoint locals, tourists and hikers/climbers trying to access trail heads. Our Parks are for humans to enjoy.

Topic Question 3:
At the least, improve the road (fill potholes), and even better pave the entire road. Do not ration usage. Use the resources it would take to limit #s, to strictly enforce the speed limit. Word will spread quickly, if speed limits are enforced with strict fines.

Topic Question 1:
Maximum protection of the ecosystem

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

I think the best strategy is to leave the Moose Wilson area as undisturbed as possible. I would maintain the road near the Lawrence Rockefeller Preserve and possible straighten part of the roads but no way do I think that area needs to be expanded for cyclists and campers. We comet the JH area every year because of the parks and the more natural the better. So plan A in philosophy and maybe correct road configuration to some degree. Traveler alerts for closed roads and full parking sooner that the park entrance would be helpful.

Topic Question 2:

An expanded parking for 60 cars near Death Canyonno way. Closing the road 2 days a week means to me that that many more people will attempt to drive through on the open days making for more traffic.

Topic Question 3:

Not let campers through the Moose Wilson entrance to the park. They shouldn't be going through, but I've seen many go through. Possibly restrict traffic thru that entrance as needed.

Topic Question 4:

Enforce the no campers going thru the park.....enforce the speed....and fix the road. Mostly enforce the

rules in place and allow the park to remain pristine .

Topic Question 1:

I support alternative D. I believe it will lead to less traffic, and a safer experience for a more diverse group of visitors. Additionally, I believe it will encourage reduced auto traffic due to encouraging alternative transportation, while maintaining the least impact on the natural environment.

Topic Question 2:

Alternatives B and C would not achieve the goals of this plan. Given that a recorded 90% of vehicular traffic on this road is non-resident these alternatives will negatively impact the park's visitors' experience.

Topic Question 3:

I strongly believe a separate pathway is a safety need for all users of the Moose-Wilson route, it will significantly protect bicyclists and automobile drivers from endangering each other, while also encouraging a slower speed of transportation.

Topic Question 4:

Alternative D is the only practical solution for the park's visitors to encourage a slower, safer and more environmentally friendly corridor.

Comments: Please select Alternative D

Topic Question 1:

Leave the existing road where it is but with improvements to turn outs. Leave the winding, narrow road to prevent wildlife deaths and to preserve the land as it is now. Limit car traffic, increase Park vans to transport people to trailheads and for sightseeing.

Ban taxis traveling to and from the airport.

No snowplowing is a good idea and make this a wonderful place to ski into in the winter.

Topic Question 2:

I like the idea of closing the road to car traffic a couple of times a week, but it may be confusing to visitors, and may mess up their travel plans.

Plans to move the northern section of the road east will destroy land and upset present wildlife daily migration, and cause wildlife deaths. The existing road is in the best spot it just needs to have turn off improvements. The unpaved section helps to keep speed down.

Topic Question 3:

Consider separating the bike path from the road, if surveys show that the bike path would have high usage and is really worth it. Place the bike path east of the road and keep the existing road where it is but with improvements to turn outs.

Topic Question 4:

Please see below.

Comments: It is important to save wildlife in this area for the Moose-Wilson Road to remain narrow and winding. As a part-time resident of the northern section, I see each day during the summer months, a huge amount of wildlife. There is an elk herd of about 100 who migrate daily from the western bench (west side of the present road) crossing the road and dropping down to the east to the Snake River. In the evening the herd reverses this. About a dozen moose travel from the moose ponds east across the flats and down to the Snake and back again daily. Presently the moose do not cross the road at all. Deer, black bear and grizzly bear are roaming this area. Many smaller mammals, such as the beaver also inhabit the ponds.

**In order to save the wildlife, I would like to see the road stay exactly where it is, but with improvements to the road and turnoffs. I do not think the visitors should be further to the east, let them enjoy the views they now have of the ponds but make it safer for them with appropriate turn offs. Let us not destruct any of the present beauty and wildlife with a new road and bike path.

Reducing the number of cars driving both ways at any given time would be helpful. I like the idea of monitoring this with gates and holding areas, though closures could be confusing to visitors. Transportation via vans to trailheads or for sightseeing, instead of cars is a terrific idea, perhaps this sort of transportation would negate the need for any cars at all driving the Moose-Wilson Road.

I think taxis should not be allowed to take this road to and from the airport, and maybe Teton County can re-visit the "North Bridge" over the Snake that has been on the master plan for so many years.

I like bike paths but how many people will really use it? Is it worth it? Can it be separated from the existing road and constructed east of the ponds. Is it safe to have hikers and bikers crossing the flats with grizzlies in the area? (I suppose it is not different than hiking the trails in the Park)

Topic Question 1:
I believe that Alternative D is the best solution.

Alternative D is by far the best solution because it recognizes that wildlife and park visitors can be thoughtfully managed together. It is respectful of natural resources, informative, inspiring, and safe.

Topic Question 2:
Gates and closures do not work(Alternatives B&C)
I believe gates and closures are not a good solution to manage traffic. This instead, I believe will cause further problems with an increase of vehicle trips area wide.

Topic Question 3:
A separate Moose-Wilson pathway.
More public transportation.
No action(Alternative A) does nothing to help wildlife by reducing traffic and is not the right solution.

Topic Question 1:

Strategy B seems to be the best for wildlife. I think the first thing we should be considering is wildlife and the lowest impact we can make on the wildlife.

I guess that would mean to close the road to cars and only have shuttles available. The drawbacks to that are that it would add to the congestion in town. Would we consider upgrading the Spring Gulch Road as an alternative to closing this one?

There is also part of me that says Do Nothing. The bad road encourages you to drive slow.

Topic Question 2:

I do not want to see any habitat lost with this project. No bikepaths. No expansion of the road, no widening.

Topic Question 3:

I do not want to see the road become a bigger travel corridor (to get from Point A to Point B) however, if you live in Wilson or are coming over Teton Pass and want to go to the Park, having the Moose Wilson option is a better alternative than driving through the town of Jackson and contributing to that congestion problem. Thus it is hard to say No cars at all. If we continue to allow cars, everyone needs to drive slow and know the road is a slow zone. The problem comes when it is deemed a shortcut or people are in a hurry.

Topic Question 4:

If you are to leave it open to cars, then perhaps making areas "one lane" - like the Hanna Highway in Hawaii to avoid too close collisions..this gets people slowing down to where they have to stop... Speed bumps slow people down. I'd vote to repair the potholes as sometimes you feel like you may collide with someone while you are trying to avoid a big pothole. If that section is to be paved, it should include speed bumps.

I do not support a paved bike path that would further destruct habitat. We have alot of bike paths. This area is sensative. I'd almost say close it to cars but there are drawbacks to that too. The shuttle is a good idea but what if you are just using the road to pass through to the other trailheads?

As per the wetlands re-design, if it helps the habitat in the long run, then I am for it. Although it does seem like we are developing a new area and thus impacting a whole other area...Is that wetland area so impacted the road needs to be moved?

Topic Question 1:

Alternative D is the most appealing to me, however there are good part of each proposal. I am very much in favor of a bike path, however, I would like to see as little land disturbed as possible. The path could be next to the road to help with building and maintaing both. I would also like to see the road extend to the Death Canyon trailhead for both summer & winter access.

Topic Question 2:

Alternative A does not provide enough changes. The road is over stressed now & definitely needs improvements.

Topic Question 3:

Most of the strategies suggest pullouts, which I highly recommend. Commercial tours and tourists wishing to go slowly should be Required to use these pullouts to let through traffic pass.

Topic Question 4:

The addition of a bike path will be appreciated by so many tourists and locals. This is a perfect way to access GYNP and the pathway to Jenny Lake.

Topic Question 1:

I support alternative D and if funding is an issue then alternative A is acceptable.

Topic Question 2:

I do not support alternatives B and C. They are both impractical and do not improve public access to our national parks.

Comments: GNTP is one of our country's greatest treasures. It is meant to be enjoyed by all citizens and visitors alike. Their access should not be limited. Furthermore, a bike path will only enhance the experience of all. I find the concept of restricting vehicle access to a sign-up sheet and/or specific days and times to be absurd. I can easily envision a secondary market for time slot access to the park developing with mark-ups and premia going to admittedly creative entrepreneurs. I don't think this is the intent or the mission of the National Park Service. Moreover, much like the Griswold family from the classic movie "Vacation", I can only imagine the disappointment of a visitor who was unaware of these mundane restrictions.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

Topic Question 1:

Wildlife and the resource must be FIRST. Reducing traffic, especially through traffic such as commuters, airport shortcuts, taxis must be addressed as a detriment to the mission of the Park but also because their perceived importance undermines the ability of the Park to preserve and protect the resource. North end rerouting to leave the berry corridor and the beavers and moose in peace. Controlled traffic patterns. NO SEPARATE PATHWAY

Topic Question 2:

Alternative D places the wrong priorities on how a national park should be managed. Parks must never compromise their mandate by feeling pressure from local and special interests.

Topic Question 3:

The ability of GTNP to make a decision without the inappropriate and self serving political pressure from local state and federal interference.

Topic Question 4:

Reroute northern end
finish paving southern end
allow bicycles on roadway and control traffic patterns.

Comments: Please do not compromise the animals and the natural resources of the MW corridor. There

are a couple of issues that provide the foundation for the debate.

Entitlement to use a precious area as a commuter corridor, adding unnecessary traffic for purely selfish human reasons.

The expectation of a well financed and politically influential private interest group to 'bully' the park into completing a 'grand loop'. Nowhere is there evidence that this is anything more than a 'want', not a need. The expectation that a national park situated in close proximity to a town must be forced to become no more than a city park with a view. It does not matter that GTNP is close to the wealthy and vocal Jackson, it must still be allowed to function as a national park-resource first, people of the entire nation and not just the locale second.

Please do not give in to political pressure. If you will make the right decision to stick to park principals of preservation, you will be eagerly supported.

Topic Question 1:

I believe the best preliminary plan is Alternative D, specifically the element to include a multi-use pathway parallel to Moose-Wilson Road between Moose and the Granite Canyon Entrance. As a wheelchair user and hand cyclist, I want to experience the Park as an active participant and not a passive observer. In order to do this in a safe way, I need an accessible pathway where I am not distracted by looking over my shoulder for oncoming motorists. Alternative D would provide a park experience like no other, for able-bodied and disabled alike, and the chance to enjoy the ENTIRE experience with a completed pathway.

Topic Question 2:

Strategies like no action, or lack of safe, unpaved access are not needed. Areas that do not allow for space and protection for pedestrians and cyclists are not needed.

Topic Question 3:

Not at this time.

Topic Question 4:

I was thrilled to experience the accessible pathways from Jackson in to GTNP for the first time in August. What a life-changing weekend! As a wheelchair user, I am used to being relegated to the sidelines due to lack of safe access- forced to observe rather than participate. This pathway was a game-changer; and it was all inclusive! Folks of all abilities and "walks" of life were able to actively participate and enjoy God's amazing creation in a safe and accessible way. This gift should be available to everyone throughout the park as a completed pathway.

Comments: As an organization dedicated to the protection of mountain lions and other large predators, we urge you to make preservation and protection of the wildlife and the habitat of Moose Wilson Road your priority.

There is no other state or public land outside of a national park that has the potential to protect animals as you do.

Please do not compromise. State lands are managed for the consumptive user, USFS lands are managed for multiple use, refuges are also often managed for consumption but parklands can proudly prioritize their commitment to the resource above all else.

Thank you for taking your responsibility to uphold the park service mission seriously.

Topic Question 1:

To achieve the majority of the goals as outlined by the "Goals and Desired Condition" statements in the "Moose-Wilson Corridor Comprehensive Management Plan - Preliminary Alternatives" it is necessary to limit the plan to the fewest changes in the Corridor. A few changes could even reduce the amount of disturbed land within the pathway. For example, relocating the Death Canyon trailhead as proposed in Alternative B would allow for the rehabilitation of the road and reduce it to a more narrow trail would achieve this goal. Formalizing pull-out and viewing areas would also help to reduce the amount of disturbance and degradation of vegetation along the Moose-Wilson Road as we see currently and if nothing is done to prevent the user created pull-out from expanding. The unpaved portion of the Moose-Wilson Road is already disturbed. This portion should be paved, but not widened. Paving the road would reduce the amount of sediment and dust abatement chemicals from entering the streams and Snake River that run through the Corridor. Most of the proposed changes outlined in Alternative B would achieve the goal of the least amount of disturbance. Although the road realignment outlined in Alternative B would result in some disturbance of land, if the alignment follows closely the existing gravel road (as outlined in Alternative B) little new land would be disturbed. The benefit of doing this would be to remove the road away from the hillside which is so important to bears feeding on berries, beaver in the spring fed ponds, and other wildlife. The realignment of the road to create a four-way intersection at the Chapel Road with the rehabilitation of the existing road would result in the end with less pavement once this has been accomplished. It makes no sense to add two entrance stations at Moose as is seen in Alternative C and D. This would only increase the amount of disturbance and reduce the visitor experience because visitors would be confused by the two entrance stations.

Topic Question 2:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Adding a pathway (as outlined in Alternative D), which would require an increase in the disturbed footprint of the pathway is counter to the goals as outlined by the "Goals and Desired Condition" statements in the "Moose-Wilson Corridor Comprehensive Management Plan - Preliminary Alternatives". Although bicycling in the park is an enjoyable activity, it is an activity that negatively impact wildlife. As the number of bears, particularly grizzly bears, increase in the Moose-Wilson Corridor the negative impacts of bicycles in the mix can only negatively impact the bears. This is also true for other wildlife including moose. Reducing vehicle traffic in all forms (bicycles, cars, and commercial vehicles) would have the greatest benefit to wildlife and also improve other aspects of the "Goals and Desired Conditions" such as the Scenery, Aquatic Resources and Natural Soundscapes and Acoustic Resources.

Topic Question 3:

One of the things that has lead to the degradation of the Corridor in recent years has been the increase increase in vehicle traffic. Alternative B attempts to reduce the amount of vehicle traffic by preventing through traffic at peak periods by putting a gate and two access roads and parking lots for the LSR Preserve. Another way of doing this with less land disturbance would be to close the road between the LSRP and the White Grass Road Junction during peak period. Alternative B proposes to improve the parking lot at this junction. People wanting to visit the LSRP could park here and walk or bicycle to the LSRP or a shuttle could be operated between this parking lot and the LSRP.

Topic Question 4:

Grand Teton National Park is at an important crossroads in regard to the Moose-Wilson Corridor. As parts of the park are developed there is a degradation of the park for wildlife, ecological communities and in the end the visitor experience of those who come to the park. Once an area is developed by adding something that does not currently exist, such as a separated paved pathway through the corridor it will be almost impossible to remove it, even if we see enormous negative impacts to wildlife in the future. Although recreation, such as bicycling is one of the reasons that people come to the park and enjoy the park, most would not choose bicycling over wildlife. I think that this is the choice here and once we make the choice there is no going back. The National Park Service has an obligation to protect its wildlife. This obligation, by law and policy, is ranked higher than allowing any recreational use in the park. There is conflict here and by trying to achieve both resource protection and recreation, resources in the Corridor will be impaired.

Comments: Increasing traffic in the form of more cars, more bicycles, more commercial vehicles, more horses, and even more people in the Moose-Wilson Corridor will continue to degrade the Corridor and the "Goals and Desired Conditions" of the Corridor. The Corridor has seen an increase in traffic and use in the last couple of decades and this use will only increase as more the area around Teton Village becomes more populated, as more and larger planes come into the valley. The pressures on the resources associated with the Moose-Wilson Corridor will continue, and unless we do what we can to reduce the threats we will lose the resources that people cherish in the Corridor.

Topic Question 1:

Option D. I feel that this would be the most advantageous for both humans and wildlife. Part of the point of National Parks is to let people interact with nature and wildlife in a truly authentic setting. A pathway rather than a closure seems to solve this issue.

Topic Question 2:

Closure of the gates would be a mistake. It would severely change the experience at GTNP for the worse.

Topic Question 1:

The strategy of openness is one that the NPS should carry forward. You have done a terrific job of opening the opportunity to comment publicly and helping people to understand early the alternatives and the importance of the public to know the need for balance. Nationally, regionally, statewide or locally, people know more because of the preliminary alternatives. And for that, you have done a great service in helping to educate people and engage them in thinking about a better future for the corridor.

I also very much appreciate that you have alternatives that are based in compromise. It is an important strategy. While we can and should do the best we can for planning the best future, it will be compromise that is important to any strategy or alternative. For me, it is Alternative D with key changes (transit, a visitor center on lands outside the park) that is the best strategy overall because it is founded on a compromise of an admission of a limit, a dynamic capacity cap, on the Moose-Wilson Road. What is interesting about that is it would be dynamic - - seasonally and annually adaptable to the changing needs of the NPS and the corridor values and resources. We all have to agree that there can only be so many vehicles on the road, and then live with that. And people will. If you engage people meaningfully, they will do the best to share in good outcomes. If you educate people, they will go beyond best to reach out and help you even more. Alternative D is inherently positive. And optimistic. And those are what we know to be the heart and soul of the park service spirit. People aren't the problem. Chaotic management of people is the problem. Old school models of vehicle management are the problem. Instead, help people understand that getting out of the cars will be great - - get them into transit or on their own feet. Either way they can be educated to better help the NPS. Another point of excellence in Alternative D is the NPS engaging in technology as a great tool for management. Twenty years in the future, you will be seen as the smartest NPS unit for the forward looking effort of using technology well. Closures and gates are the

blunt instruments of the past. And for an aging support base, the NPS needs younger, technologically interested visitors. Please study the elements of Alternative D that are positive engagement with people, rather than shutting generations of potential park supporters out.

Topic Question 2:

Closures, gates or traffic jams don't make national parks more relevant to future generations. And relevancy is part of what the NPS needs going forward. Your support base is aging and America's best idea is threatened by being America's forgotten idea to Americans who don't have the chance to visit - - and won't if it's harder to access. Enhance NPS relevancy to the public so that people support the NPS for the serious financial needs of the future. Relevancy happens from experiencing public access to public lands. Not theoretical. But actual. Access managed well so that resources are protected. The big picture is important in the example of the Moose-Wilson Road. Grizzly Bears as a species will not be jeopardized by a reduced number of vehicles on the Moose-Wilson Road or by a well designed pathway placed sensitively. Manage adaptively - - control it. But don't close it.

And don't make it one-way. You will be placing wildlife in harms way with a one-way road. People drive faster on one-way roads. And if there is cyclist access two way on a shoulder of a one-way road - - that is a hotbed of accidents and tragedy waiting to happen. Please don't study ideas that are harmful to both wildlife and people alike with one-way roads.

Topic Question 3:

Comprehensive transit is an excellent tool that can help you achieve very real traffic reduction. As can the pathway, adaptively managed and paid for only with private dollars for management as well as construction. Imagine what you need most and best and then ask this gateway community to help you pay for it and deploy it. Be hopeful. You can get there. Be bold - - why? Because your best ideas can happen. But closures and gates are not your best, forward-looking ideas.

Topic Question 4:

We can't believe that the Rockefeller family would give their beloved JY - - or the ranches that comprised the establishment of GTNP in 1950 - - only to see access to it closed and diminished. The corridor can be managed - - with data, controls, flexibility and adaptivity. And done well, resources will be protected.

Very grateful to you for asking for people's thoughts. Wonderful of you. Thank you very much - - you have done this very well.

Topic Question 1:

I support Alternative D because it reduces vehicle traffic which benefits wildlife yet it encourages safe enjoyment of GTNP.

It would be an incredible gem for this country if we connected the bike path through GTNP into a loop. I think we should be visionary about how incredibly valuable this would be for protecting GTNP while enhancing the visitor experience.

Topic Question 2:

Gate closures do not work - Alternative B & C.

Topic Question 3:

A separate Moose-Wilson bike path is a safety need and not a want and should be included in any alternative. We must, as a country, get over the addiction to automobile/fossil fuel intensive transportation and encourage other modes of transit.

Topic Question 4:

Who benefits from Alternative D? Wildlife, the environment (reduction in carbon emissions), visitors (think Europeans who enjoy 200 km bike paths along the Danube and Rhine rivers in the Black Forest), residents (who could commute between Wilson and Moose by bike, visitors in cars who might find sharing the road with cyclists to be stressful, cyclists who might find themselves a motor vehicle/bike accident statistic. Alternative D is visionary and, GTNP/NPS would be lauded for making a smart choice.

Topic Question 1:
Leave the road as is and lower the speed limit and paint a white dividing line.

Topic Question 2:
Bad idea to add a pedestrian/ bike path due to animals. Slow down the road speed and make southbound entry from Moose PAID!

Topic Question 3:
Lower the speed limit and add more speed limit enforcement.

Topic Question 4:
Keep the road and access as is(except charge for southbound traffic). Lower the speed limit. Paint a middle white line.

For folks who are too young or too infim, the MW road is a fabulous window into the park's wildlife. The Death Canyon trailhead was one of the best when our kids were 4 and 7. To have to use a shuttle would have been awful..please keep the MW road the same, with a lower speed limit and a charge for going SB from Moose.

Topic Question 1:

1. the gravel portion should be paved
2. it should remain two way
3. there should be no realignment of the road anywhere, UNLESS it will mean that it will ALWAYS STAY OPEN regardless of the presence of bears etc (like what you do up by Jackson Lake Dam, willow flats where there are OFTEN bears present in spring and fall). closing the road for this reason is not done in other parks... why here?
4. do things to keep the traffic moving, such as providing turn outs in places so people who want to stop, enjoy the scenery etc can do so (instead of stopping in the middle of the road! thereby causing traffic jams and stopping all traffic in both directions.
5. when there is wildlife present and a perceived danger to people or the animal, then just put a NO STOPPING rule in effect. keep the traffic moving and people will have to stay in their cars, not be in danger. and the wildlife will deal with it as it does in all other parts of the park!!
6. retain similar physical characteristics
7. put in a bike path ALONG THE ROAD, as close as possible to minimize the # of trees that have to be chopped down. any separate path that does not follow close to the road would be a disaster for the wildlife that retreat to these areas to stay away from people. you don't have to go far off the road to find these areas... so keep the people away from them (the animals are smart and know where to go!).
8. keep the road open YEAR ROUND.
9. guided horseback riding in the corridor should be continued as is. the dude ranches nearby are one of the BEST stewards of this sensitive area as there is. Do not close commercial horseback riding on the Sawmill Pond Trails. It is one of the most unique areas of the park that allows this activity without causing any conflicts with other park's goals. It has also been an activity that has been historically used in this area

for over 90 years with minimal conflicts and requiring minimal park management. Why is the park attempting to eliminate historical horseback trails that have been previously approved for commercial use?? This area offers access to unique and safe horseback riding trails unavailable in other parts of the park. These trails are used to access the historical Whitegrass Ranch area, along with Sky Ranch and Trail Ranch. By taking interpretive rides through these historical ranches, we help reach a park's goal to "Protect and maintain cultural resources as important links to the human history of the Moose- Wilson corridor, including historical and archeological sites, cultural landscapes, and ethnographic resources."

10. repair the road to the Death Canyon trailhead. this is one of the main routes into the Tetons, and the road is an embarrassing disaster!! WHY??

Topic Question 2:

1. making it one way
2. closing it for any period of time
3. doing nothing to address the condition of the dirt portion

Topic Question 3:

1. keep it open year round
2. in order to protect wildlife at times when they come very close to the road (like the bears are now, causing it to be closed for extended periods of time), put in a temporary NO STOPPING RULE as needed, to keep traffic moving and avoid having to close it off (which is not necessary, as proven in other parts of the park where the public and the wildlife exist side by side very successfully! look at the fame of Grizzly 610 and 399! people come from all over the country to see them for days on end, with no harm

Topic Question 4:

Listen carefully to those who know the park well, such as the year round neighbors immediately adjacent to the park AND who live IN the park! people who live in places such as Poker Flats, Moose, the R Lazy S, Yodler Subdivision, etc). We use the park daily and see what's actually taking place. Unlike other people who may visit only once and have no idea what's really happening.

thank you for your time and opportunity to comment

Topic Question 1:

Realignment of the northernmost section of the road to avoid the ponds/hawthorn bushes to allow people to watch wildlife safely from a distance. This would most likely avoid the road closures for bears and maintain normal access to the LSR even during berry season. However, the realigned road MUST be kept in character and not made wider/straighter and with all the attendant backslopes, foreslopes and ditches that road engineers love to design into road plans.

Topic Question 2:

Alternative D with the separate pathway: construction would be too damaging to the corridor vegetation, habitat would be further fragmented, safety issues related to encounters with wildlife, especially bears and moose.

Bikes are an appropriate use on the existing road and would be easily accommodated there if traffic is seriously curtailed and thru traffic eliminated. ("share the road" as already implemented in many other parts of the county and especially in the town of Jackson)

Grand Teton should not be forced to bear the burden of Teton County development and the inability of local officials to solve county traffic problems outside of the National Park.

Alt A no action: will not protect park resources from the ever increasing traffic. It will meet none of the goals and desired conditions.

Alt C appear to mostly focus on traffic management. The proposals would be confusing and time consuming to manage operationally.

Topic Question 3:

Where is the alternative that proposes the best possible scenario to achieve the goals and desired outcomes and which gives genuine priority to wildlife and giving the highest possible protection to the amazing and varied resources of the corridor? Please include such an option in the draft EIS. For those of us who wish to be a voice for the highest level of protection of the M-W corridor, there is not yet a satisfactory alternative proposed.

Topic Question 4:

Winter use: regardless of which alternative is ultimately decided upon please ensure that the road closed seasonally as it is now. The opportunity to walk/ski/bike there during the off season is the only time one can truly experience the tranquility of the corridor. It should be available for walking,ski-ing/snowshoeing but remain ungroomed as it is now. I am also concerned about the increasing use of snow bikes on valley trails. They are not compatible with the tracks that are broken in by cross-country skiers. The "wobbly" or somewhat uncontrolled/unstable nature of riding these bikes in deeper snow inevitably means that they stray onto the ski tracks...or even ride in the intentionally! Now would be the time to look at this topic and decide if bikes must be able to ride there in winter. I submit that winter use should be closed to all forms of wheeled transportation The Rockefeller vision of a place for "spiritual tranquility" can be achieved in M-W corridor, in the winter, with the permitted uses being walking,ski-ing/snowshoeing. Commercial trips should not be permitted. Trips guided by a park naturalist could be worth considering.

Comments: As a seasonal resident of Teton Village for the past 25 plus years, I have enjoyed driving on the Moose Wilson Road as well as cross country skiing in the winter but with the increased development of the Village, it is not a pleasant drive anymore on this road and I am constantly aware of the disturbance of its wildlife. I understand it to be a very valuable and important wildlife resource, one of the most important in the Park. I am in favor of closing it to vehicle traffic as a thru way and I DO NOT want to see a separate bike path. Such a path would fragment the habitat even further and the construction would cause too much environmental damage. With the increased bear activity in the corridor, having fast moving cyclists riding along a separate pathway would be potentially dangerous to both bears and cyclists. None of the alternatives gives priority to wildlife and genuine protection of the rich resources of the corridor. Please add an alternative that prioritizes wildlife and the natural resources of the corridor. The Rockefeller Preserve was established with the specific intent of providing a "special opportunity to connect with nature in an environment designed to reduce congestion and provide an opportunity for solitude and reflection". The Preserve lies at the very heart of the corridor and to quote Rockefeller : " In too many places in the national parks, overcrowding and overuse are progressively destroying the very values people seek in coming to our parks" Grand Teton should honor the spirit and intent of the Rockefeller's gifts to the nation. The alternatives developed thus far keep the door open for the progressive destruction of the very values the park should be seeking to preserve. Close the road to thru traffic (bikes could use the existing road and access maintained by providing a shuttle as has been done in other parks) and "restore tranquility" to the corridor! Honor the efforts and legacy of those who struggled to establish and to protect Grand Teton National Park for the enjoyment of future generations.

Topic Question 1:

We support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

Topic Question 3:

A separate Moose-Wilson pathway is a safety need, not a want, an imperative in any Alternative. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Topic Question 1:
Alternative D is my preference. Maintain public access to the road AND build a separate pathway connecting Moose to the South Entrance. I feel strongly that access for the public should be the highest priority for Park lands.

Topic Question 2:
Partial or complete closure of the road will lead to more cars driving more miles around the valley. I don't support closure of the road in any way, but Alternative D is my choice since it includes a pathway.

Topic Question 3:
Is it completely impossible to put a pathway from near the South Entrance up along the current levee and river bank to connect to the pathway at the main Moose Visitor Center?

Topic Question 4:
PLEASE put in a pathway.

Topic Question 1:

Alternative D is the best strategy. It allows a control on the car traffic that can negatively impact the area, but still allows access by encouraging alternative forms of transportation into the area.

Topic Question 2:

Alternative b and c don't work. It would be a shame to shut down the access, as that would eliminate the potential for incredible human/nature connection in a very special area of the park. These alternatives would be bad for the environment as they would shift traffic to other areas, and force people to commint 50 miles around instead of along the 7 mile direct route from the park gate to moose.

Topic Question 3:

It is imperative that a pathway be considered. As we have seen in ther parts of the park, pathways encourage alternative meat huds of transportation and encourage park goer stove plow the park on feet and bikes instead of behind the wheel of their car.

Topic Question 1:
Wildlife protection is the paramount goal. Alternative A "do nothing" approach is the only one I agree with.

Topic Question 2:
Paving the road and/or building a bicycle path would be extremely detrimental. I totally agree with the eminent wildlife writer Bert Raynes who in his weekly column in the Jackson Hole News and Guide newspaper (Sept 3, 2014 edition, page 2B) wrote: "To pave it or build a parallel path along the Moose-Wilson Road is to take the first step to losing it."

Topic Question 3:
Again, the purpose of the National Park is to protect Wildlife and their habitat. There are plenty of other pathways and roads for the bikers; the Moose-Wilson corridor does not need bikers, and should not be a transportation corridor.

Topic Question 4:
The Moose-Wilson corridor is a very fragile wildlife ecosystem. The Park Service needs to resist the well-organized pathway advocates and the local politicians, and protect this ecosystem and the wildlife depending on it. Alternative A is the best strategy for doing this.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Alternative D. Alternative D will best complete one of the most unique and productive pathways I've seen anywhere. I had the pleasure of bringing a few of my athletes over a month ago to roller-ski on the existing pathway. The surface was well engineered and porous enough for our carbide tips to grip yet smooth enough to have very little vibration on our roller-skis and feet. The grade was gradual enough to be safe but taxing and challenging enough to get a great workout and keep it interesting. To top it off it's obviously got one of the most spectacular views anywhere in the world.

Most importantly it gets runners, walkers, cyclist, roller-skiers, able-bodied and adaptive athletes off the dangerous roads where there is huge potential for deadly accidents. I personally know 3 athletes in my sport of nordic skiing that have been hit and killed by motorists. These pathways greatly reduce this potential loss of life. They also serve to facilitate and encourage healthier modes of transport for our citizens building a healthier community with a greater appreciation for preserving our environment we are so fortunate to have in it's current state. Supporting this Alternative D will take a big step in the direction to maintain this amazing area and set an example for other communities to do the same.

Topic Question 2:

Alternatives B & C would not work due to the fact they would add gates. Simply a hinderance and potentially unsafe if they are opened and shut at different times. Pathway users can become accustomed to open gates and then come across a closed gate for some unexpected reason running into it. Also, for adaptive and challenged athletes and citizens this presents a greater challenge potentially causing them to turn around if they can't manage to open the gate on their wheelchair or alternative cycle or sitski.

The other positive is the likelihood of a great reduction of travel through an already overly congested downtown area. Having a loop to recreate on versus and out in back is simply much more enjoyable. Citizens are more likely to go out and do a loop as it's a more enticing and motivating goal than an out and back where you can turn back sooner than you might otherwise.

Topic Question 3:

None

Topic Question 4:

None other than encouraging you to support this project to it's completion as soon as possible. Not only will the Jackson community benefit from this but the visitors will most likely come from surrounding communities to enjoy the pathways which will bring more business to the area. Also, they will bring this back to their community and encourage similar healthy projects that fit their community. Lead the way!

Comments: I'm very hopeful to see this loop completed as my club and Paralympic Team will be using this path for years to come.

Thanks you for the opportunity to share our thoughts and feelings.

VR,

Rob Rosser

Topic Question 1:

Although alternative D is attractive from a selfish perspective, the no action option, perhaps with pavement and traffic sobered enforcement could save significant costs, maintain the nature of the corridor and support all users.

Topic Question 3:

As I mentioned the no action alternative with paving and traffic control, passive or active is the strategy that should be considered.

Topic Question 4:

I have personally provided input several times to the recent survey. I have no feedback nor assurance that my comments have been received muck less heard! This is frustrating and supports allegations that this process is one of answer shopping. You should avoid this perception and listen to the answers, that in my case are here for your utilization.

Topic Question 1:

I think the only action that should be carried forward is rerouting the north end of the Moose-Wilson Road to be inside the current entrance station. The road should use the same entrance station as the Teton Park Road. The corridor is an important part of the park and visitors should pay the NPS fee to visit the area. Also, having a single entrance station will make the fee process and traffic control easier for park staff to maintain.

Topic Question 2:

The road should not be rerouted. This reroute will damage cultural resources, a vital aspect of the corridor. A second parking lot should not be created at LSR because it will impact the natural landscape of the area by adding more of a built environment and it will possibly damage cultural resources. The White Grass Road should not be used for access to Death Canyon because this will negatively impact the ranch's cultural landscape and this dirt road will eventually see the same degradation as the current Death Canyon dirt road. Also, a parking lot should not be built within the viewshed of White Grass because this will negatively impact the historic character of the ranch. The Moose-Wilson Road should not be completely paved because the currently unpaved section of the road is the only part which has never been paved in the history of the road. This section has an incredible history and feeling, and that should not be changed. A pathway should not be built anywhere within the corridor because this will degrade both natural and cultural resources which are the backbone of the corridor.

Topic Question 3:

A method to avoid degrading both natural and cultural resources needs to be consider in the Sawmill Ponds area. This may include a causeway over the resources (including wildlife habitat, natural springs,

and archaeological sites) or another method to completely avoid the destruction of either resource.

Topic Question 4:

The public must know about any possible adverse effects to cultural resources within the corridor by these alternatives. Specific locations are not needed to explain that certain alternatives include the destruction of archeological sites. Because the park is currently facing an adverse effect to cultural resources at Jenny Lake, the park should greatly consider the implications of adversely affecting another cultural resource through this project. A national park has an obligation to protect and preserve both natural and cultural resources and adversely affecting cultural resources during two projects in two years does not follow the park service mission.

Topic Question 1:
Alternative b,the road needs to be paved.it is a hazard to our drivers and wildlife because of the soft edges.

Topic Question 2:
Anything that does not pave the road. It really needs to be paved for navigation purposes. Especially in slower times/ shoulder season. It is hard to avoid wildlife with the state of the road.

Comments: Here is the thing, I would rather speed bumps and the current curve of the road paved than status quo.

RE: Moose-Wilson Corridor Plan Preliminary Alternatives

Thank you for your continuing work in developing four preliminary alternatives for the Moose-Wilson Corridor Comprehensive Management Plan, and for the outreach you are doing to the local community as well as regional stakeholders and national supporters of the incredible place that is Grand Teton National Park. The four alternatives look at many ways in which to insure continued access and

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

enjoyment of the park while remaining committed to the principles of the National Park Service and providing for the continued protection of the area's abundant natural resources.

As you know, our community takes great pride in joining with NPS and others in stewarding our valley's natural environment and wildlife, particularly the many incredible public lands managed by Federal and State agencies. We are a community of conservationists who understand that continuing to pass along an ethic of conservation and stewardship to our next generations takes great commitment and dedication to long-term efforts. That is why I am sure that our community can help the NPS find a way to preserve what is so important to all of us - the continued ability to safely visit, experience, and enjoy the Moose-Wilson area while managing the impacts that are associated with such visitation, just as is done across the whole National Park System.

I support the Teton County Commissioners in representing the interests of our gateway community as they also work to support those of the NPS. These shared interests can be in fact integrated, and with partnership and collaboration if and when the respective interests of each come into conflict, an ongoing dialog will serve us all well in working toward resolution. The Commission, as a cooperating agency, has offered a collaborative approach to this process with suggestions on each of the draft alternatives. I point you to the narrative from their comment under Concept for Alternative D:

"(The) commission suggests that the overall concept defined in Alt D should be about balancing preservation of park resources with visitor experience by minimizing traffic and visitor impacts on wildlife resources along the road corridor and emphasizing visitor experiences outside of vehicles."

I believe the sentiment captured in this statement meets what those who love GTNP - no matter the individual viewpoints on so many proposal and alternatives - can come together to support. In other words, the Moose-Wilson Corridor is an incredible place to be, and the managers of Grand Teton National Park are to be commended for providing for, and encouraging visitation to, the many destinations within it - Granite Canyon, Death Canyon, White Grass Ranch, Laurance S Rockefeller Preserve, etc. It is a place to be visited, enjoyed, and appreciated, as are so many incredible and unique places within the NPS system. That enjoyment and access need not come with too great a price, when thoughtful management policies are adopted with adaptive management techniques based on factual data, ongoing study, and clearly defined triggers before any new action.

I hope that the results of this process of proposal and review of draft alternatives will result in NPS having insight into what the best aspects of each alternative are and that a Preferred Alternative will emerge that will provide for the continued enjoyment, access, and protection of the Moose-Wilson corridor as well as mitigation of the regional impacts of the attractions within the corridor. Enjoyment, access, and protection need not be presented as inherently in conflict - in fact, NPS and so many other agencies and organizations work to provide for the accommodation of all of these ideas every day - our communities will be better served when we can all work together toward that goal. Again, I am supportive of what our County Commissioners have asked be included in the resulting Preferred Alternative including these objectives:

• No directional closure of the Moose-Wilson Road

• Commercial activity be limited to that which is clearly essential (transit, educational, interpretive, etc.) and serves the park interests for the corridor

• Explore comprehensive public transit throughout GTNP in order to reduce single-occupancy vehicle trips including a route along the Moose-Wilson Road in order to reduce vehicle trips through and within the corridor

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

• Expand the previously proposed and approved separated pathway along the southern portion of the road to include the entire length of the road with context-sensitive design and construction, and approach management of the pathway with same adaptive management strategies proposed for the road

• Move forward with the much-needed realignment of the northern portion of the road as long desired by GTNP out of sensitive habitat, while keeping the 'slow, rural, country road feel' of the existing road

I applaud the thoughtfulness that has been put into the effort of drafting these alternatives, and thank you for the balance that you have tried to achieve in Draft Alternative D, particularly. I believe that after a review of comment on the draft alternatives, several good ideas from Alternatives B & C might be combined with those of Alternative D for the creation of a new Preferred Alternative - for so many who love GTNP to support and embrace.

Thank you,

Mike Welch

I am 99 years old and for many years I lived on the Murie Ranch as a friend and neighbor to Olaus and Mardy.

I know from personal experience about the wildlife that lives in the Moose Wilson Corridor: from porcupines to bears , moose, deer, pine martens, great gray owls...such a variety of creatures that were our friends and neighbors too and we lived with them each day.

It has concerned me for a long time that so many more people are using this part of the park and often not to enjoy and experience it but just to pass thorough on their way to other places or to and from the airport. I know that this is not what Laurence Rockefeller would want for the land he cared so much about.

I would like to see the Park stop traffic from using the road as just a shortcut and I think that the only way to do that and protect it is to make it so people cannot drive all the way through. If that means I cannot have the convenience of driving from Moose to Teton Village, then so be it. Protecting the place for the future is far more important than my personal convenience or saving a few miles of travel.

I also do not understand why people who ride bikes want to cut down trees and impact the animals so much by having a separate path. This is not protecting the things we say we value so much.

I would like people who come here 50 years from now to be able to see and enjoy the things that I experienced in my many years of living on the Murie Ranch.

Topic Question 1:

First, I spent some time trying to find the "purpose and need" a standard part of the NEPA process. It would be great if it was clearly and simply stated. Please note the follow NPS direction:
http://www.nature.nps.gov/protectingrestoring/do12site/02_Ovrvu/022_purp_need.htm.

Given the description of the purpose, I believe that Alternative D best balances the needs of park resources and visitors, by fixing needed portions of the road and constructing a pathway. There is a current perception that the only people that want this pathway are a bunch of rabid cycle enthusiasts. While a high percentage of the current Moose-Wilson bikers today are often locals and fairly experienced bike riders, the reason is simple: Use of the Moose-Wilson road for novice and intermediate bikers is not safe! Construction of a safe pathway would encourage many novice and intermediate bikers to explore the park in a safe, enjoyable and reduce the one auto trip.

Topic Question 2:

Resource issues and the needs of walkers and bikers are not addressed in Alternative A. Alternative B and C and the use of gate and road closures would be difficult to implement and would burden the visitor who perhaps is only in the area for a day or so. These alternatives are really band aids that would not last. They would also increase traffic on highway 390 and highway 89/26/191.

Topic Question 4:

While no one wants to talk about it, we are talking about how the Moose-Wilson road fits into a logical regionally transportation plan. The cumulative effects of the dramatic increase in summer use at Teton Village and the rest of Highway 390 are required to be addressed as part of this NEPA analysis. See NPS direction: http://www.nature.nps.gov/protectingrestoring/do12site/02_Ovrvu/024_connected.htm Visitation at Grand Teton continues to increase each year; the Park has to accept that with increased park visitation comes increased transportation needs. This should not be a problem that the Park gives to someone else (the County), it needs to be a shared solution.

The NEPA document also must address the possible cumulative effects of the County constructing a "north bridge". In many ways construction of a north bridge would solve many of the current problems with commuters using the Moose Wilson Road. Most everyone that has been involved in transportation planning in the valley knows that construction of this bridge is not if, but when. Both the county and the Park need to understand that this elephant is in the room, and must be addressed to arrive at a logical solution for the Moose Wilson analysis.

Comments: This summer I rode my bike in the park several times. Each time I was amazed at the variety of visitors riding the bike path. They were smiling, and casually riding enjoying the scenery. They were interacting with the Park the way the original park leaders envisioned. They were not speeding around in their car so that they could get to the next pull-out. Construction of a Moose-Wilson pathway would allow more visitors to enjoy this experience. One would envision renting a bike at Teton Village and then a nice ride up to the Park!

One additional comment regarding some of the speculation on wildlife impacts. We need good science here, not one Park biologist speculating on what he thinks needs to be done. Reading some of the discussions lately, you would think that the Moose Wilson road is the only place with increased grizzly bears and is some sort of special grizzly bear haven. The impacts of the expanding grizzly bear population are affecting the entire GYA, and we are dealing with these challenges everywhere. As the population expands we are all learning to live with the bears.

Thanks .. I would keep writing, but time is running out.

Cheers
Andy Norman

Topic Question 1:

If I had to choose one of the existing alternative it would be D. Traffic needs to be limited on the road some how and the road is not safe for any transportation other than automobile.

Topic Question 2:

A In taking no action things will become worse. The Moose-Wilson road has become an important travelway which is contrary to the goals.

Topic Question 3:

Teton County and GTNP should get together and over come the environmental, legal and right-of-way problems to create a new roadway over the Snake River between highway wy390 and us89 approximately between Teton Village and the airport. Leave the Moose Wilson road as-it-is now, but plan to close it completely at LJRP eventually. Traffic could reach the LJRP from both directions but not pass through. (except emergency vehicles and non-motorized traffic)

Another possibility to reduce traffic is to post the speed limit as 15 or 20 MPH with many speed monitoring traffic cameras (some moveable) along the way. Photos of violators would be sent to the entrance stations where violators would need to pay fine\$ before they could leave.

Correspondence Text

Topic Question 1:

In general, I am in support of the presented strategies unless commented on below.

- I strongly support the adaptive strategies of alternative B of restricting through traffic! This is particularly true given the recent data suggesting a very significant number of users are not stopping to experience the corridor but using the road as a transportation link, which it is not. Establishing the appropriate metric and triggering volumes should be part of the next phase of these planning efforts.
- The strategies surrounding the Death Canyon access in alternative B should be moved forward.
- The notion of added pull outs and/or hardened shoulders to provided opportunities should be maintained.
- Relocation of the two sections of roadway in the northern sections should be retained in the planning documents.

Topic Question 2:

- While I support the goals of the adaptive strategies of reservations or traffic volume limits in alternatives C and D, they seem to be overly complex and would require a large amount of resources that are in conflict with the stated purposes. These resource impacts include organizational in staffing and managing as well as significant physical footprint on the landscape for entrance stations and queuing lanes.
- The detached multi-use paths would significantly increase the physical human footprint that is in conflict with protecting the natural elements of this corridor. Bicycles and pedestrians should be able to share the roadway corridor as long as traffic is limited and controlled.
- The fully detached multi-use path of alternate D creates a fully redundant human corridor that is unnecessary. This is particularly risky when given the potential for wildlife impacts with moose and bears.
- Any paving of the unpaved section should only be done if other strong traffic management measures are

in place. The condition of this section is currently the main limit on numbers of vehicles.

- Alternative A should not be carried forward as it is clearly not achieving any reasonable measure of protection of a number of the desired resources.
- Unmanaged commercial efforts should not be permitted. This is particularly true with taxis. Should focus on commercial efforts which contain interpretive components.
- Grooming of winter trails should not be moved forward.

Comments: I feel strongly that GTNP's goals and visions must be the driving force behind any review of the planning efforts. It should be noted that of the seven resources referenced under goals and desired conditions all but one are larger than ourselves. The final goal of recreation is the goal that we as community members have the most direct impact on, the other six goals contain at risk factors and conditions that we may not fully understand. As such, we must be more conservative in managing human interaction in order to ensure that we do not create unintended consequence. In many cases, these unintended consequences may not be evident until it is too late to reverse course.

As residents of the gateway communities, we care an additional stewardship responsibility to remind ourselves that our local National Parks are National, not county or state parks! The values enshrined in GTNP and YNP are far larger than ourshelves.

I am writing because I adamantly oppose ANY development , specifically, a bike path through the fragile M-W corridor for all the obvious reasons: first & foremost,for the protection of our wildlife & their habitat. As we all know, our exploding grizzly population, along w/ the black bears, have discovered the abundant fall berries at the edge of this windy, narrow road. It would be a disaster waiting to happen if a bike path was to be added, not to mention, the destruction of precious wildlife habitat in the process of carving a bike path. The M-W corridor is extremely unique & should remain that way. It should be protected. The wildlife & habitat should be #1, our priority, NOT biking or a quick commuter road to the airport. This is a National Park, NOT a recreation playground. HOLD STRONG Teton Park, don't budge! Hard to believe a National Park doesn't have the power to control & protect their most precious jewel. Don't develop M-W corridor! Please, let's STOP PAVING PARADISE !!!! We have ample bike paths. I like the proposed compromise to lesson traffic ... 2 way traffic from Moose to the Preserve, one way from Village to Preserve. Alternate A would be my other choice. I would rather see the corridor closed permanently, than to pave a bike path thru this precious zone for a few months out of the yr. for a few self serving, hedonistic bikers. DON'T LET THIS HAPPEN !

Topic Question 1:

The north end of the road should be realigned and end inside the moose entrance station, The Death Canyon parking lot should be moved to White grass.

Safety better control less cars in the backcountry

Topic Question 2:

The unpaved section should not be paved nor should there be a pathway much less a paved pathway.

The road is overcrowded now and once you put in pavement it will never go back to dirt. The pathway if constructed it will become a racetrack of out of control cyclists not a slow moving walkway for pedestrians and disabled. Usage will zoom and so will confrontations.

Topic Question 3:

Make the whole road dirt. no commercial traffic at all, no taxis no airport runs reduce the usage 30% AAP

Topic Question 4:

We need to plan for the long term health of the park, increasing the pavement will only increase the speeds and the usage and the cries for a year round road. There is no reason to rush into this the pathway people have already gotten a huge amount of pathways. The Park needs to be protected not overrun. This is an amazing corridor and paving it and paving a pathway would ruin everything the Park stands for.

Topic Question 1:

I support Alternative D because it is the best way to protect and enhance the visitor's experience while protecting wildlife, and the local's long-time connection between Moose and Wilson. Jackson and Teton Park have experienced a huge success in their development of pathways. Many people use them recreationally but more and more people use them as commuter trails, helping to reduce traffic and pollution. I hope the National Park embraces and supports this kind of use. Improving the parking at Death Canyon trailhead is needed whether it's relocated or stays put and it will fill up so I like the traffic/parking informational signs. And more pullouts

Topic Question 2:

I disagree with road closures and/or any straightening that would increase speed.

Topic Question 4:

Is there any way that alternating direction of flow during the day would work with the people who live out there? Say traffic flows South to North from 8am-2pm as most people are heading into the Park. North to South 2p.m. -8p.m. as people are heading back to lodging? Or would that be a nightmare to control?!

Comments: I grew up in Jackson and rode the loop from Jackson to TV to Moose and back to Jackson every summer! It is such a lovely way to see that country and I'm so impressed with all the pathways I see there now. And, how many people are using them! The more you can encourage people to get out of their cars the better.

Topic Question 1:
alternative D. it addresses most issues. leaves unpaved section unpaved.

Topic Question 2:
a,b,c

Topic Question 3:
In addition to alternative D changes instead of making a reservation system(which would be confusing and unfair) the easier way would be to make road one way going north(into the park)in the morning and at noon the road would be one way going south (out of the park) as this how most of the heavy traffic flows.

Topic Question 4:

Topic Question 1:

Both the realignment of the road around the wet lands and cliff area as well as the new separate pathway adds to the aquatic restoration, protects the wildlife/ecological systems and enhances the visitor and resident park experience.

Topic Question 2:

The "A" alternative definitely does not address the expanding use of the road and it's natural wonders outlined in the Parks "Goal Statements". Alternatives A,B & C may result in reduced access to the Park without the separate pathway as well as restricted use days.

Topic Question 3:

Allowance for safari/shuttle use with designated parking areas.

Topic Question 4:

As part of the new road alignment in Alternative D the Park plan shows two new roadside parking areas. These areas should include designated parking for safari/shuttles. Connected to these parking areas a raised wooden walkway should lead to an observation deck overlooking the wetlands and beaver lodge area allowing for spectacular viewing experiences. As has been observed wildlife can live and thrive near humans best when a separation is obvious. We see this cohabitation with the horse drawn sleighs at the elk refuge as well as the numerous bird nests on power poles near roads and homes. These raised wooden walkways will accomplish that separation while allowing for exceptional viewing!

Comments: Alternatives B,C & D demonstrate a willingness by the Park Service to manage the Moose-

Wilson corridor for users and visitors along with wildlife and aquatic resources. Some previous Park Service personnel seemed bent on denying access to this corridor decreasing visitor opportunities here as well as other Park areas.

Topic Question 1:

Alternative D mostly has it correct, wwith a few exceptions:

- There does need to be a paved bicycle/pedestrian pathway
- The road should be paved from end to end
- Taxis should not be allowed
- Permitted, standard vehicle commercial tours should be allowed. Tour buses or oversized vehicles should not be allowed, with the exception of park-run shuttles.
- The entrance gate on the north side needs to be behind a staffed gate. This will cut down on the number of cars using it as a shortcut or access without a park pass or in an unintended manner, such as taxis.
- Shuttles should be considered, but should not completely replace personal vehicles

Topic Question 2:

Limiting the number of vehicles or requiring passes adds too much complexity, cost, and intervention by the park service. Make the changes suggested in Alternative D and then determine if human or electronic control is needed to control access to the road. Closing the road a few days a week would add to futher confusion and bad experiences for visitors.

Topic Question 3:

Possibly making all traffic northbound from 8 AM-2 PM, and southbound from 2 PM-10 P during the busiest months. Traffic would be 2-way the rest of the time.

Topic Question 4:

Even if nothing else is done, moving the road to behind the north side entrance station or even creating another station should cut down on a fair amount of unintended traffic.

A north bridge from the airport to Teton Village would eliminate a lot of traffic from the Moose-Wilson road, as well as highways 22 and 390.

Topic Question 1:

I would pursue a combination of Alternatives B and D. Block the road at the LSR but build a bike lane, not a separate path, along the realigned road. The bike lane would be much more cost effective and less disruptive to wildlife while still achieving the goal of increasing bike and pedestrian safety. Besides the cost of laying another separate roadbed for the path, a spooked moose on a separate bike path could easily run into traffic. I would also leave the Death Canyon trailhead a mile in off the road. I see no reason to add a mile walk to people wanting to access the canyon or Phelps Lake from the north.

I would just support the straight alternative D except for the reservation system. Long queues just seems like an invitation to road rage. You might as well block the road if you are committed to restricting access (a concept that I question the need for). I already see quite a bit of anger directed at the rangers in the LSR lot when it is full why add to that stress?

Topic Question 2:

Alternative A solves no problems and makes no one happy and option C is worse, the inconsistent opening and closing would inevitably lead to visitor frustration.

Topic Question 3:

See question one

Topic Question 4:

Do you really have to restrict the traffic numbers to protect the resource if you move the road to the east? I suspect most of the wildlife conflict would be resolved and increased traffic volumes could be supported

without undue impact. If you have data that says otherwise I would love to see it. I have spent a fair amount of time on foot and skis east of the road and I rarely see wildlife while west of the road I almost always see it.

If it can be done safely I do believe that one of the Park's goals should be accessibility. The general public is not interested in protecting wilderness they can't experience.

Topic Question 1:

I support the following strategies to achieve the goals to

- 1) Protect and maintain the natural function, diversity, complexity, and resiliency of the ecological systems and natural communities of the Moose-Wilson corridor; and maintain the unique habitat characteristics and conditions that result from the distinctive proximity of the Snake River riparian habitat to the Teton Range.
- 2) Protect and restore the natural hydrologic features, processes, and functions within the Moose-Wilson corridor project area, including wetlands, beaver ponds, seeps, springs, floodplains, the Snake River and its many tributaries, and Phelps Lake.

The following strategies should be carried forward.

1. Realign the north end of the Moose-Wilson road away from the wetlands
2. Relocate the Death Canyon trail head and parking area
3. Winter access: do not groom or plow the road between Granite Creek trail head the Murie Ranch but allow for cross country skiers and snow snows
4. Keep signage and trail density to a minimum
5. Close the road to traffic from Oct 1 to early May but allow bicycles once snow is gone
6. Leave the unpaved section as it is; keep the road as configured except for the north end realignment

Topic Question 2:

The following strategies should not be carried forward as they will seriously compromise the goal to preserve natural diversity, restore and preserve wetland habitat, preserve and restore the natural

soundscapes and acoustic resources within the Moose-Wilson corridor project area and allow for meaningful opportunities to enjoy and experience the diverse habitats in this area of the park.

1. Commercial activities: none should be allowed especially tour buses and ecotour vehicles. This area of the park should be left for visitors to experience the area on their own. The huge increase in the number of eco-touring companies creates more crowding and detracts from the natural feel of this area. Guided snowshoeing, skiing or biking trips should also not be allowed as large groups detract from the natural feel and create more disturbance compared to small private groups. The park already provides ample opportunity for these commercial activities.

2. Multiuse pathway- -this should not be constructed as proposed. Such a pathway would result in too much habitat loss and fragmentation especially for the reclusive forest associated wildlife species. I use and like the existing pathway to Jenny Lake, but I do not think such a separate pathway is appropriate in the Moose-Wilson corridor. It would create too much additional use purely for recreational bikers rather than for visitors. This would create a loop ride from town that would be used very extensively, greatly increasing the number of trips along the Moose-Wilson Road while not decreasing vehicular traffic at all. It is a lose-lose strategy for wildlife.

Topic Question 3:

I propose that another alternative be developed that would focus entirely on foot, bike or public transit only between the Rockefeller Center and the Death Canyon trailhead between early May and October 1. The main goal would be to reduce the number of vehicles in the area which would increase wildlife security and the quality of visitor experience.

The current traffic levels which have increased dramatically since the 1990s exceed what is sustainable for this unique part of Grand Teton NP. Other National Parks have taken bold moves to reduce auto traffic and the impact of vehicles on the natural ecosystems that parks were created to protect. These are difficult steps to take but once implemented have been very popular with visitors once established. The same would hold true for the Moose-Wilson road corridor. This would also help to fulfill Rockefeller's vision for maintaining the natural beauty and ecosystem for the area he donated to the park for public use. One of the worst experiences I have had in GTNP was when I found a badly injured pine marten that had been run over very early one morning along the Moose-Wilson Road.

Since that time I have become even more convinced that this road should be managed to reduce traffic as much as possible. The park should provide small shuttle buses to carry visitors between the Rockefeller Nature Center and the main Visitor Center and also from a parking area at new Death Canyon Trail head. The roadway should be open only to these buses and to bikes and hikers. The popularity of this type of management is clearly demonstrated by the high volume of visitor use on the inner Park road when it is closed in October and April to vehicle traffic. I think if the park adapted this strategy for the central portion of the Moose-Wilson Road this would become one of the most enjoyable experiences the park could offer tourists and area residents alike. This would also be cheaper in the long run than trying to regulate traffic at different times and also maintain a separate bike path. Ecologically it makes the most sense. The biking lobby should certainly support such a strategy.

If this is considered too restrictive, then the idea of having one way traffic at different times during the day should be reconsidered with bike traffic allowed as on the Jenny Lake Loop Road. I think this is a very valid alternative also.

Topic Question 4:

I have been disturbed by the political pressure to develop a pathway along the Moose-Wilson road. In conversations with proponents I have also been amazed at the lack of understanding many seem to have

in regard to the impacts of maintaining both a road and a bike path in this narrow corridor. I think the park needs to emphasize in its study the value and importance of lower elevation habitats along a major river and the ecotone along the forest and sage/grassland communities in addition to the wetland habitats. This really is a very unique and incredibly ecologically rich area of the park. Similar habitat has been developed south of the park and no longer provides for many wildlife species that occur regularly in the Moose-Wilson Road corridor.

I encourage the park to carry forward a bold, new and ecologically sound plan.

Topic Question 1:
Alternative D, modified, but retaining a safe and separate pathway. See, e.g. comments of Teton County, Wyoming County Commissioners, local resident Bill Resor, and local non-governmental organization Friends of Pathways.

Topic Question 2:
Alternative A is already a failure. B and C are good tries at offering a range of alternate choices, but neither works. Combine the best from those two and see if there's something workable there. No sense retaining two non-starters for further analysis.

Topic Question 3:
See comment note at bottom of form.

Topic Question 4:
Thank you very much for soliciting August - September 2014 public input on this matter during the advanced scoping period / early dEIS development phase of your work. I hope the public input will be helpful. The Park Service's open outreach on this topic has won widespread praise and admiration, deservedly so.

Attn: Ms. Sue Masica, Regional Director
Denver, CO

RE: Moose-Wilson corridor NEPA study - comments of Len Carlman, offered September 15, 2014 during the NPS 30-day August-September 2014 comment period

Request:

I would be grateful to get some fall or early winter 2014 field time with the NPS Intermountain Regions landscape architect on this project, Mr. Chris Church (I believe that's his name). I met him at an open house on this project in early winter 2014. He presented the kind of open, wholesome, professional engagement with this NEPA process and its underlying practical project that it warrants. I would be grateful for field time with local GTNP staff too. From having lived on the Moose-Wilson Road in my teens in the late 1970s to having participated in recent years as a citizen-panelist on local educational discussions about plans and options for this part of GTNP to having tapped my avalanche probe pole against 1,353 tree trunks in a foreseeable 20 pathway alignment corridor (by ski and snowshoe on deep consolidated snow, March 2014) to having been a regular member of the 2% to 3% of bicycle riders who already regularly use the roadway to visit with nature in Grand Teton National Park, (most recently September 14, 2014), I believe I have something useful to offer to Mr. Church or others who will wrestle with plans and options for particular places and practical concerns. (And FYI, contrary to some assertions, there are not 3,000 trees in this corridor that would be removed to make room for a pathway - that number is an incorrect estimate; my number is not perfect, but it's a lot better than that estimate. If minimizing human-induced tree mortality is a significant NPS objective, there are design and alignment choices that would bring the tree count to a number much lower than 1,353).

Endorsements:

Please count me as an endorser of three sets of comments that you have already received on this matter during the August 15-September 15, 2014 comment period:

1. Comments dated September 15, 2015 from the Teton County, Wyoming, Board of County Commissioners. This body of elected officials, in their capacities both as formal cooperators with GTNP on this project and as public representatives, has done an exceptional, humble, and thorough job of identifying the public interests at stake and advocating for them in both general and detailed terms. The local commissioners have done this in ways that are appropriately respectful of their colleagues in public resource governance at the National Park Service. I'm grateful to be their constituent on this matter and I hope you will give their remarks due consideration.
2. Comments dated September 14, 2014 by private citizen William Bill Resor. You may be hard-pressed to find another set of comments as well-rounded and grounded as Bills. His notes have practical insights about this project. At the same time, his comments reach the national perspective appropriate to the role of national parks in our country. I hope your planning team finds his comments helpful.
3. Comments dated September 14, 2014 signed on behalf of non-profit entity Friends of Pathways by its Executive Director Katherine Dowson. For all the rhetoric that has bounced around on this issue, and as much as Friends of Pathways has placed itself in a leadership position in support of safe and exceptional

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

non-motorized pathway-supported movement in GTNP, it is impressive that this entity has kept its head on straight, avoided hyperbole, taken a long and careful view, and offered thoughtful comments. I hope you will find them helpful.

Range of alternatives:

Will you be adding in the draft Environmental Impact Statement a section on alternatives considered but not examined in detail? I hope so. A section like that would help show the breadth of your consideration.

Alternatives A, B, C and D, as currently presented:

The comments I endorsed at the outset of this note do a good job of tackling the benefits and detriments in the current set of preliminary alternatives.

Alternatives A, B, C and D, as they may be presented in the draft Environmental Impact Statement:

Putting in a separate pathway for non-motorized movement is its own serious and important design challenge. It's not just a mini-road. It warrants smarter design than a simple engineering formula of keep it within 50 of the road. Please present more than one pathway alignment alternative in the draft EIS. A pathway is a serious proposition, a terrific innovation in the national park toolkit, and, in this setting, there are several interesting ways to engage it, not just one.

The draft EIS probably needs to keep its range of alternatives to a manageable number - 4. If that's the case, and if one alternative must, by law, be the no action choice, then there are only three options for addressing the problems and challenges that make the status quo unacceptable, (which it is). Please create a new alternative B that combines the best of the current preliminary alternatives B and C, and uses other clever ideas that do not include a separate pathway. I probably won't like this one, but enough people are interested in this that it warrants your best shot.

Then please offer two alternatives, C and D, that each have different takes on corridor management issues and, particularly, on different prospective pathway alignments. You are already likely under some pressure to limit the pathway alignment to the least imaginative design criteria - keep it within 50 of the road, period, with variances only for serious obstacles. That's ok. It may even be ideal. You could label this one the new alternative C. But this solution is hardly the only reasonable response to the public demand for a safe and resource-sensitive separated pathway. I hope the National Park Service can do better than that.

Alternate pathway alignment options:

Here are some design elements for a new alternative D, that would take a dEIS alternative away from the 50 design constraint and possibly allow the NPS and our nation to own a world-class pathway that reflects excellent resource management and unparalleled visitor experience. Segments of this alternate route, some of which might be desirable, others of which might not be desirable, are presented in a south-to-north format, ignoring, for the sake of descriptive convenience, the fact that the roads orientation is not perfectly south-to-north.

1. The southernmost section, from the Granite entrance station to the Lake Creek Ditch: In this 0.9 mile open sage area, keeping the pathway pretty close to the road is fine.
2. The section from Lake Creek Ditch to the existing road gate that seasonally bars traffic, on the north side of the Granite Canyon trailhead parking area, approximately 0.2 miles: put a fork in the motor vehicular road: (1) run a dead end cul-de-sac to an expanded (current one is routinely overwhelmed) Granite Canyon parking lot. The only vehicular traffic on this little western stub would be to and from this trailhead; no through traffic; and (2) relocate the motor vehicle route to the east, between Lake Creek Ditch on its east side and the old riparian bench on its west side. Design choices here could result in

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

sightlines for motorists that would still be short enough to foster the slow, safe, windy, country road driving experience. Here, the pathway could again stay close to the newly aligned road, on its eastern side. But pathway curves need not mimic roadway curves - different user experiences, safety issues and resource needs should yield at least the open prospect of non-matching design solutions.

3. Return the motor vehicle road north westerly to re-join the existing alignment along what is now dirt, leaving enough space between the new Granite Canyon cul-de-sac and the road to block the parking area from southbound motorists views (the small hill terrain here lends itself to this); continue the separated pathway tight to the western edge of this linear meadow, up against the thin line of lodgepole pine forest, picking a careful route through the trees on the northern end of this run, (still south of Cheney road), until the pathway intersects the actual existing Cheney (levee maintenance access) road. This is a distance of about 0.7 miles.

4. Follow the Cheney road with the new pathway until it veers toward the river; run the pathway to the LSR Visitors Center, where a supply of well-designed bike racks would accommodate LSR visitors who need to put their bikes somewhere. Leave the paved road where it is, traversing Lake Creek and passing through its beautiful small hills and sharp turns until it descends to the LSR access road.

5. Keep the existing paved road where it is, through the deep forest, at the base of the seasonally bear and berry-laden ridge up to and past the T intersection with the Whitegrass / Death Canyon Trailhead until it reaches the old Hartgrave place. Locate the new pathway proximate to the new fiber optic line, in the row for the existing overhead power line, on the bench above the river. Two bridges will be needed in here, one for Kaufman Creek and the other for the creek that runs out of Stewart Draw. This is a distance of about 1.5 miles; placing the pathway here results in the sparing of, by my count, 589 trees. The pathway experience, including its scenic beauty, will be, in many parts of this reach, stunning.

6. From the old Hartgrave place to Sawmill ponds overlook, follow the tremendous consensus favorite re-alignment choice, as long-favored by GTNP, out of the beaver/moose ponds to the east, into the sage meadow, with such traffic calming and speed slowing design techniques as may be needed to prevent motorists from going too fast through here. Put the pathway closer to the east side of the ponds, but not on their east flanks, and put the pathway closer to the bench above the river bottom, following the old 2-track that still is evident there. This is a distance of about 1.55 miles.

7. From Sawmill Ponds parking lot leave the paved road where it is, including its brief, sharp descent to the sage flats below (same altitude, more or less, as Craig Thomas Discovery Center and GTNP HQ). Move the pathway to the east to take advantage of the slightly gentler descending (& ascending when going south . . .) gradient of the old wagon road. I dont have a note on this distance; it might be 0.75 miles.

8. From the bottom of the hill, send both the paved road and the pathway north to a re-located Moose entrance station. Grind up the old road and seed it for long-term restoration. The Murie Center should be the only destination reachable by turning south at what is now the intersection of the GTNP inside road and the existing Moose-Wilson Road.

Many thanks and best wishes,

/s/

Len Carlman

Correspondence Text

Topic Question 1:

Traffic Management - Reduce speed limits along Moose-Wilson Road. Absolutely essential.

Physical Characteristics - Alt. D - No substantial changes to the alignment or width of Moose-Wilson Road, except for the realignment of two segments between Moose and the Death Canyon Road junction. The unpaved section would remain unpaved, and routine maintenance and scheduled road projects would be undertaken as needed. Yes, a very good idea

Moose-Wilson Road Realignment - Alt. B - Two segments of the northern portion of Moose-Wilson Road would be realigned. The old roadway would be removed and restored to natural conditions. The new road segments would be constructed to emulate the slow-speed, narrow, winding character of the road corridor. This is absolutely essential to protect wildlife and habitat, to establish access control and improve enforcement measures.

Turnouts and Parking - Alt. B - Establish an adequate number of strategically located turnouts to allow for visitor parking while reducing resource impacts. Apply design solutions to roadside parking that would reduce resource impacts from parking off-road. Yes.

Bicycle Use - Bicycles would continue to be allowed on roads and parking areas and not allowed on trails. Bicycles would continue to share the road with motor vehicles. Yes.

Commercial Activity - Current commercial activities within the corridor would continue to be permitted. Commercial horseback riding in the Poker Flats area would continue with currently authorized trails and

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

use levels; commercial horseback riding on the Sawmill Pond trails would be phased out. Guided skiing and snowshoeing would continue under current use limits.

All other commercial traffic, including taxis, would be prohibited. Essential!!!

Groups would remain small in size (10 visitors plus a guide). Groups would be limited to current Moose-Wilson Road vehicle size restrictions.

Shuttle services could be authorized by park management. It's very important that this be established now as a prelude to future possibility of restricting or eliminating private motor vehicles.

Death Canyon - Alt. D - The Death Canyon trailhead parking area would be reconfigured and expanded in its current location. The road segment between the trailhead and White Grass Ranch would be improved. A new road segment between Death Canyon Road and White Grass Road would be constructed. White Grass Road would be improved to allow for one-way traffic with staggered pullouts. The remaining portion of Death Canyon Road would be removed and the area restored to natural conditions. Basically good ideas but 60 parking spaces is too many and the road should not be paved..

Winter Access and Use - Moose-Wilson Road would not be groomed for winter recreation activities. Absolutely no grooming of this road!

Alt. B - Winter maintenance of Moose-Wilson Road would end at the Murie Ranch access road junction. The unplowed portion of Moose-Wilson Road, between the Murie Ranch access road junction and the Granite Canyon trailhead, would be available for cross-country skiing and snowshoeing, but would not be groomed. Yes - long past due.

Visitor Use and Experience / Education and Interpretation -

Alt. A - Visitor services such as staffed interpretation at the LSR Preserve, interpretive waysides, interpretive publications, ranger programs, and education programs would continue to be provided. Park staff would continue to actively manage visitor use and congestion associated with the presence of wildlife. A variety of backcountry-oriented activities would continue to be available in the corridor, including camping, hiking, climbing, swimming, boating, rafting, floating, cross-country skiing, backcountry skiing, snowshoeing, horseback riding, and fishing. Backcountry patrols would continue to monitor hiker and backpacker compliance with regulations and visitor use counters would monitor use at trailheads. Trail densities and alignments would be managed to be compatible with the protection of natural resource values. All of this is absolutely necessary to educate the public and prevent wildlife conflicts and degradation of the resources.

A sense of arrival experience that cues the visitor that they are entering a natural setting that is unique and protected would be created. Setting the stage for a nature experience, rather than a recreational one, is important!

Topic Question 2:

Which strategies in the preliminary alternatives do you think would not achieve the purpose and address the need for the plan? Why do you think they should not be carried forward?

Traffic Management - Provide traveler alerts before entrances to inform visitors of traffic congestion, full

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

parking lots, and potential wait times, and give them the opportunity to choose an alternate route before entering the corridor. No - this increases conflict, visitor frustration and management activity. It also creates the opportunity for commuters to zip along the road, knowing they will not encounter much traffic.

ALL the Adaptive Strategies outlined in Alt. B, C, D (restricting peak period through-traffic in either direction beyond LSR; limiting number of vehicles through timed sequencing; provide queuing lanes; establishing a reservation system; closing MWR two days per week) are completely unworkable, subject to political manipulation, and create a management nightmare. They are frustrating to visitors and residents alike in creating uncertainty.

Physical Characteristics - Alt. B - The existing, unpaved section of Moose-Wilson Road would be paved. Terrible idea - increases speed

Moose-Wilson Road Realignment - Alt. A - There would be no realignment of Moose-Wilson Road. It's essential to realign the road as envisioned to protect habitat and wildlife

Turnouts and Parking - Reconfigure the access and parking at LSR Preserve in order to prevent through-traffic at certain peak periods when necessary to alleviate congestion. Enhance existing and add additional parking at either end of the road for both summer and winter use.

Bicycle Use - Alt. B - During seasonal periods when the road is closed to motor vehicles, bicycles would be permitted to use the road when it is free of snow and ice. Alt. C - During seasonal periods when the road is closed to motor vehicles, bicycles would be permitted to use the road when it is free of snow and ice. The earlier road closure in this alternative would allow more time for bicycle-only use before winter conditions necessitate bicycle restrictions. Moose-Wilson Road would be closed to motor vehicle use two days per week, but open to bicycles and pedestrians during those times.

NO - All of these establish a preferential use for a small minority of users. They also create management problems.

Alt. D - Construct a multiuse pathway parallel to Moose-Wilson Road between Moose and the Granite Canyon Entrance. The pathway would generally be sited within 50 feet of the existing or realigned segments of the road. This is unquestionably the worst idea proposed in the PEPC. It will destroy massive amounts of habitat, disturb wildlife of all sorts and dramatically increase the potential for conflict with bears and ungulates. ABSOLUTELY NOT!

Commercial Activity - The Moose-Wilson Road is not a county transportation corridor. It is a park destination. Commercial traffic should be completely prohibited, except for Park permittees conducting educational and nature-related activities.

Death Canyon - is there really a need for a 60-car parking lot?

Winter Access and Use - Alt. D - Enhance winter recreational opportunities (i.e., cross-country skiing) by improving parking and seeking a partner to groom the unplowed section of Moose-Wilson Road. Northern winter parking would occur at an improved parking area north of the Death Canyon Road junction. . NO - to these and any other proposals that increase wildlife disturbance during the critical winter months.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Visitor Use and Experience / Education and Interpretation -

Alt. D - In keeping with the goal of creating a welcoming environment with enhanced understanding and enjoyment of the corridor, interpretive media and programs would be made available at key visitor gathering areas in the corridor. Establish viewing areas to allow visitors to appreciate vista points. Use viewing areas to concentrate use. Provide short nature trails and interpretive materials to enhance experience. Provide additional restrooms at Granite Canyon trailhead parking area and at the new "winter" parking area north of the Death Canyon Road junction to manage human waste during the winter. NO - all of these proposals are "attractive nuisances" - increasing and intensifying visitor use without allowing for the increase in habitat degradation, wildlife disturbance and the need for increased management activity.

Topic Question 3:

Night closure - I'm surprised that GTNP did not include a strategy of a sunset to sunrise night closure. This would be one of the best strategies GTNP could adopt for reducing wildlife disturbance and conflict without affecting visitor experience. This night-time closure would provide the wildlife with a recuperative time from steady vehicular traffic and human visitation. The result will be a higher quality wildlife viewing experience to Park visitors. Night closures also simplify law enforcement and emergency response efforts and costs.

Benefits to wildlife. It's well-established in the scientific literature that artificial lighting, including and especially headlights, create numerous negative impacts of almost all nocturnal wildlife. These range from the familiar "deer-in-the-headlights" behavior of ungulates that causes them to freeze in a roadway in approaching headlights to disorientation and degradation of night vision that can take up to several hours for recovery. These may interrupt natural behaviors, expose individuals to higher predation levels, or disrupt navigational abilities. "For nocturnal species which only use rod cells in their eyes to see, such a sudden change in illumination, saturates their retinas rendering the animal instantly blind. Literally, they can not see where to go to avoid getting hit by a car, so they stand frozen in the way, uncertain of what to do and then unfortunately get hit. Although many nocturnal mammals do have a rudimentary cone system and can switch over to it, the switching time can take a few seconds to do so, during which they are temporarily blind. In that time, a car could have hit them. Once they do switch to the cone system, the dark areas outside the light now become so black, so they will be unable to see into them, and the animal may become lost or disoriented. They may even be unwilling to return to the new shadowy regions from where it came. Once they do venture into the dark areas, it will take them 10 to 40 minutes before their rod cells can function as effectively as before and their night vision fully returns." From *Ecological Consequences of Artificial Night Lighting*. Catherine Rich & Travis Longcore (eds). 2006. Island Press. Covelo, California. Pages 15-42.

Precedents in other National Parks. Newton B. Drury Parkway in California's Redwood National Park is closed each day at sunset and reopened at sunrise. This closure was enacted to control wood poaching occurring along the parkway. For 33 years, portions of the Skyline Drive, the famed mountain road through Shenandoah National Park, have been closed at night during hunting season to control illegal hunting activity within the park during hunting season outside the park. In addition, almost all of the 561 National Wildlife Refuges close their gates after dark to protect wildlife and reduce the necessity and cost of enforcement activities.

This would allow (indeed require) GTNP to install one-way tire spike and automatic gates at both the north and south entrances to MWR. Users of inholdings would be allowed access through the gates and

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

special use permits could also be established for activities such as wildlife photography.

Physical Characteristics - Do not pave the new road. Maintain it as a narrow, graded, dust-treated dirt road to make clear this is a different area of the park with a more rustic, wildlife experience, with reduce speed. While a gravel road may discourage traffic, its impacts in terms of dust and dust-reducing chemicals may, in the long term, be no greater than paving a narrow section of the road in a manner that preserves the rustic character of the road.

Moose-Wilson Road Realignment - realignment South of Saw Mill Ponds must be designed to protect wildlife and natural vegetation. However, route it along the existing old road bed and portions of old landing strip to minimize disturbance of natural habitat. Change alignment plan to avoid vernal pool and wet meadow north of current Sawmill Ponds Overlook, as well as, a large stand of trees with hawthorns. Instead, continue along top of river bench, following old track. Have a few pull outs and even connect the pull outs with narrow foot path near the bench summit for people to peer down into wetlands.

Topic Question 4:

There is no other National Park that offers the unique wildlife and recreational opportunities of Grand Teton. In considering the balance of its twin mandates to protect natural resources and enhance visitor experience, protecting the resources, in the case of GTNP especially its wildlife, MUST come first. We must always err on the side of protection. The plan must focus on long-term protection for wildlife and habitat in the corridor while making it easy and safe for people to visit this unique area on foot, bicycle, or public transit.

This is not a county transportation corridor. It is a special place to visit in Grand Teton National Park because of its rich wildlife habitat and opportunities to encounter nature.

The park and almost all constituents agree that traffic is a critical management issue for the corridor. The park should aggressively investigate all methods to reduce traffic and ensure that all vehicular traffic entering the corridor has to pass through a fee station.

Bicycle Use: Do not build a bike path or grant special privileges to cyclists - they are only 2-3% of total vehicles and less than 1% of all visitors. A paved bike path will significantly degrade natural resources and negatively impact wildlife. Cycling is recreation, and inimical to the nature-based, contemplative, discovery activity appropriate to this part of the Park. The cost of the pathway to both construct and maintain deprives other visitors, indeed other parts of the park, of much needed staff and financial resources. this is a terrible, terrible idea.

Comments: Do not be swayed by the politicians and special-interest groups. Grand Teton National Park superintendents have a long proud history of protecting the park's resources in the teeth of corrupt politicians and commercial interests.

Topic Question 1:

I support Alternative D as a preferred option because it reduces overall traffic in a way that allows cars and bicycles to coexist on the road peacefully while making as little an environmental impact as possible. Gates and periodic closures sound like logistical and management nightmares. Alternative D is an ecologically responsible option that encourages alternative transportation by providing a much-needed pathway.

I also believe that paving and slightly rerouting the Death Canyon trailhead is imperative. Death Canyon is a popular tourist destination and the hike to Phelps Lake overlook or the lake itself is a nice grade for tourists who aren't in great shape. But the poor, degraded condition of the road precludes those with low-clearance vehicles from accessing the trail. This Park is a world-renowned tourist destination. We should be encouraging as much access as possible. The treatment of the Death Canyon trailhead in Alternative D hews closest to this goal.

Topic Question 2:

The gates and closures proposed under alternatives B and C should not move forward. They are inefficient and shift or increase the number of vehicle trips area wide because they will transform a 7-mile trip from the West Bank to Moose into a 25-mile trip. And without a pathway, those miles will be travelled by vehicle, as opposed to more environmentally responsible methods such as bicycles or on foot. The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitably see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and

rural - and should be kept that way with fewer cars, smart visitor transit and a pathway.

Topic Question 3:

I believe the unpaved section of the Moose-Wilson road should be paved. I understand that folks think this would encourage speeding, but the road isn't well maintained and it is hard on low-clearance vehicles to drive on the road. Paving the road but keeping the speed limit low and frequently posting it should mitigate the incentive to speed through.

Additionally, no matter what alternative is pursued, a separate Moose-Wilson pathway is a safety need. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

Decreasing the increased traffic volumes for the long term is the Park's objective and that is possible only with Alternative D, which uses thoughtful, safer ways to get people out of vehicles and into the outdoors.

Topic Question 1:

I do not want to we the road adjusted or changed from the existing roadbed. Wildlife watching is an important component of the road and realigning the road away from wildlife habitat ruins what makes the road so special. I do not believe Wildlife are being negatively impacted by use of the road over my 30 year lifespan I have not seen any reduction in wildlife or habitat because of the road, keep it the way it is! Keep it special, don't realign it! Alternative A is the best solution.

Topic Question 2:

Any sort of quing for the road or closing it on certain days is just idiotic, too many people want to use the road already, so you want to make it available to less people? How is that even a solution, the park needs to serve the needs of the public, the public needs to use the road. Why not make it one way northbound from midnight to noon and southbound one way from noon to midnight, then the road is safer, fewer people use it but people can still get through. Please don't make people wait in line to go into a notional park, this is not Disney world.

Do not limit commercial wildlife viewing on he road, those people are educating the public about the wildlife and habitats, why would you reduce that?

Topic Question 3:

Make the road one way northbound from midnight to noon and southbound from noon to midnight that is the predominant direction of travel during those times.

Ban taxis, trailers and rv's if you pave the road. Do not reduce commercial wildlife viewing.

Don't close the road for bears, have a ranger on site when they are around. That makes sure folks are not

stupid who visit the road in the fall.

Topic Question 4:

Please don't ruin the best road in the park, leave it open for everyone to enjoy, don't limit who uses it when, dont realign it, just leave it alone! Tell the county to build a bridge across the snake river at teton village and most of the traffic would leave the road, don't change the road, stick to alternative A!

Topic Question 1:

I prefer Option A to just leave the situation alone. Not making any 'improvements' selects more for those who are motivated to experience the area, and weeds out those who would drive the road simply because it's 'improved' and could really care less. Making it easy to pack more people in there lessens the experience for those who truly appreciate it. There needs to be some places in the park that have windy dirt roads - it enhances the concept of getting away from civilization. The more effort required to get somewhere, the more one values the trip.

Topic Question 2:

I don't like the idea of limiting use of the road with timed closures. Travel alerts will simply not reach most visitors ahead of them driving all the way to an entrance, only to turn around and go back through town. Locals don't want to have to keep track of extra schedules either. How would that work with people getting permits for multi-day backcountry trips who may not come out on the day/time planned? It adds another complicating difficulty to anyone's plans. Also, any widening and paving of the road encourages more people to drive it and to go faster. Knowing that it's a tight and narrow road with an unpaved section eliminates some traffic from the start. The Death Canyon experience would be wrecked by a large paved parking lot encouraging those who will only hike to the moraine overlook and turn around. Keep those hordes at Cascade Canyon and let those looking for a backcountry experience get one.

Topic Question 3:

If the goal of the LR Preserve is to enhance quiet self discovery, they should prohibit kids from jumping off that rock in Phelps Lake. You can hear them screaming from across the lake and it was a total beach scene this summer complete with someone flying a drone to record all the action. It's not the experience

for which I expected or wanted at the Preserve.

Topic Question 4:

Adding a bike path off the road would be fine in sections where it'd be feasible without disturbing existing water features.

Comments: Sadly, our national parks often become 'national sacrificial zones' just because they draw attention to places the general public wouldn't think to visit if it wasn't designated a park in the first place. 'Improving' roads and flows and parking lots adds to the increase in volume, which is ultimately what ruins the experience of the place and creates the need for even more management. The Moose-Wilson corridor has kept its profile lower than other roads of the park precisely because it's known to be a small, windy, partially dirt, slow road to drive without easy parking. This, by itself, helps limit the volume and thus increase the enjoyment of those who really value what the corridor has to offer. Please don't sacrifice this area by making it easier for the hordes to access. Spend the money on more rangers to better educate those visitors who do come to the park.

Topic Question 1:

The Moose-Wilson Corridor is a unique part of the Greater Yellowstone Ecosystem that provides a diversity of wildlife habitat. One only needs to consider the number of days that the road has been closed in recent years due to bear activity. The "somewhere else" that wildlife are supposed to go, is the Moose-Wilson Corridor. The selected alternative must also consider the future impacts of climate change on the corridor and ensure ecological integrity and resilience in the corridor to withstand these predicted impacts.

Topic Question 2:

NO MORE PAVED PATHWAYS!!!

Topic Question 3:

Alternatives A and C do not propose to realign the northern section of the road away from sensitive wetland habitats. The road must be realigned away from sensitive habitats, and the old roadway restored to natural conditions.

Topic Question 4:

Close the road at certain times of day (dusk to dawn) in order to minimize the impacts of vehicular and other human traffic on wildlife. Closing the road at night provides a clear message that the road is not a transportation corridor. It is not the park's job to manage county transportation needs. The Moose-Wilson Road is not a county transportation corridor.

Comments: Even if you cage all of the wildlife and pave every square inch of habitat, the selfish people will still want more. Please stick with your mandate to protect the wildlife and habitat resources of the corridor. Strategies must ensure a long-term vision of protecting the natural resources of the corridor unimpaired for future generations (of wildlife).

Thank you for the opportunity to comment on the Moose-Wilson Corridor Comprehensive Management Plan.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

PEPC Project ID: 48252, DocumentID: 60898 Correspondence: 2172

Topic Question 1:

The problem being addressed is too much traffic/pressure/stress in a sensitive and uniquely special wild environment within a national park. The strategies within the alternatives which specifically address this problem are those that should be carried forward. These include: limiting vehicle traffic meaningfully/significantly by restricting flows, restricting/eliminating commercial/taxi use of the road, creating a better Death Canyon trailhead/entry experience, and completing the two roadway adjustments on the northern section to bypass the sensitive and critical beaver pond/wetland habitat and straighten the northernmost section to align with the park gate. Maintain and enforce very low speed limits. It is a not a through-highway.

With the above strategies, the park will have shown the foresight to protect a key wildlife area while holding its preservation as its paramount concern.

Topic Question 2:

The various traffic restrictions by peak hours, queue lots and twice-week closures seem to invite a management mess and a PR/visitor experience problem. Simplicity, regularity and ease of communication should be guiding factors to traffic calming. The separated pathway, while undoubtedly a nice amenity for a great means of recreation, seems an unnecessary addition to that area of the park, particularly when considering the physical disruption to to the immediate environment, the expansion of the total roadway berth to infringe upon a migratory barrier, and the potential human-grizzly conflict that could arise. A family and young kids rising their bicycles through a fairly dense bear zone is a safety concern for the good of the people involved, and a huge management issue for the park. The road is already frequently closed due to grizzly presence. I'd have to imagine that those closures would increase if the volume of

casual family bike traffic increased.

Topic Question 3:

Additionally, I believe that the best traffic reduction plan will include making the road a one-way for the 6 months that it is open. If possible to manage for a shift in direction based on daily usage patterns, that would be the ideal scenario. However, if that is impossible or impracticable, a one-way in the direction of the greatest summer traffic (likely south to north) should be established. I don't think it is possible to reduce the traffic to the degree needed (significantly or meaningfully) by any of the other proposed "calming" methods, which also seem to create additional management burdens and unsavory visitor experiences (waiting in holding lots, etc., advance reservations, etc.). Public transportation shuttles could be used to move people through the corridor and perhaps the one-way strategy is a precursor to a second phase of shuttle-only through the corridor. Any traffic issues related to the increase in Teton Village success/stress must be dealt with independently. Moose-Wilson Road cannot provide a solution to growing demand at the resort. When the road is a one-way, it should be striped to provide a safe bike lane just as the Jenny Lake Scenic Loop enjoys. In this way, it also allows for people to bike it safely, but likely also does so in such a way that doesn't overburden the area as it might if it were promoted as an "official" pathway connector.

Topic Question 4:

In any scenario, I don't think paving the remaining stretch has a deleterious effect on the overall goals unless existing science shows otherwise. If the road becomes a one-way with a striped biking option like Jenny Lake Scenic Loop, it would seem advantageous to pave the remainder without adding any additional "footprint."

Comments: If you don't know where you are going, any road will take you there. But we do know. In many moments of prescient thought, this community has reaffirmed what it believes is right while placing wildlife and wilderness first. For the future of Moose-Wilson, our predecessors have left a great map. We would do well to follow their lead.

From his cabin in Moose, Olaus Murie served as president of The Wilderness Society beginning in 1950. In the decade prior, Murie and other engaged citizens had successfully campaigned for the expansion of Grand Teton National Park to include the valley floor of Jackson Hole, without which the preservation of our magnificent array of wildlife likely would have been impossible.

Throughout the 1950's, Murie and other Wilderness Society members and friends from around the valley - and world - discussed how they could more effectively protect the wild places and wildlife they loved. Wilderness Society co-founder and Murie friend Aldo Leopold had once said that a land ethic "evolves in the minds of a thinking community." The product of the thinking community whose heart and soul was in Moose throughout that decade was the 1964 Wilderness Act. Such a movement was especially impressive since the National Park Service was engaged in an era of rapid infrastructural improvement to enhance the visitor experience during that same period. The Park Service's Mission 66 program aimed to increase access wherever possible: more roads, more amenities, and more convenient interactions with wildlife to please and thrill tourists. Mission 66 was a product of its time, but it represented a way of thinking that the Muries and contemporaries rightfully challenged.

Mission 66 sparked an especially vigorous debate in Mount McKinley (now Denali) National Park. Brothers Adolph and Olaus Murie fiercely opposed Mission 66 efforts there, which would have resulted in an expanded, paved highway leading to Wonder Lake - and additional visitor comforts along the way. Adolph pleaded for "some planning along idealistic lines." Olaus warned against the "prevailing

enthusiasm for what the bulldozer can do."

Thanks in large part to the efforts of the Murie brothers and assembled friends, Denali National Park eventually adopted a new guiding theme that would place the "maintenance of wilderness integrity" above all other considerations. With that guide in place, the Park Service terminated construction of the road even as it had already begun - a sustained illustration of the power of impassioned and principled voices to change the course of history. Visitors to Denali today, fifty years later, can appreciate that foresight as they view the vast, wild landscape and wildlife from a shuttle bus on a still-dirt road. It is an unmistakably wild experience.

So now we consider what to do with our road - and America's road - that runs through a landscape that we share with grizzly bears and sandhill cranes. This reflection is valuable and necessary. Many wild lands and wildlife have relied on our voices to ensure their survival, grizzly bears and sandhill cranes among them. Those of seven generations hence can't raise their voices yet, but I hope that one of our foremost considerations is how we can ensure that they will see bears and cranes in that part of the park.

I am grateful for the land and wildlife we have inherited in Jackson Hole, and recognize the privilege we have to reside humbly in this extraordinary place. By passionately protecting the wildlife-rich and magically enchanting Moose-Wilson area, we'll demonstrate that we are a thinking community, sharing an ethic worthy of our valley's past, and necessary for its future. Leopold once said, "A thing is right when it tends to preserve the integrity, stability and beauty of the biotic community. It is wrong when it tends otherwise." I think it is clear that a park visitor in 2100 will know that the right decisions for Moose-Wilson always protected the wildness first. We might simply ask: based on everything we know, what is the best thing we could do to further and strengthen that habitat for bears, cranes, beavers, elk and all the rest? That will be the right answer.

Topic Question 1:

The strategy should be to reduce traffic by encouraging use of the road only as a means for visiting destinations within the corridor, and to do it with as little disruption of the corridor (and cost) as possible. Try simple steps first:

- - Keep traffic slow, to eliminate the incentive to use the road as a shortcut. Best initial low cost steps are to leave the road as it is, employing speed bumps between Sawmill Ponds & LSR Preserve Center, and lowering speed limits - - no new construction costs and no need for new enforcement personnel.

- - Ban RVs, trucks, buses, tour guide vehicles over ten pasengers.

- - Ban bicycles (I write as a former avid road biker, recently reduced to a wheelchair). The issue here is safety - - for wildlife, bikers and drivers. An option would be to allow bicycles only for the first and last 2-3 weeks the road is open.

- - Don't do more paving, parking lot expansions, facilities/adaptations for the handicapped (I'm in a wheelchair and enjoy the corridor just fine), or anything else to make it less wild. That destroys the reason for having this unique space.

- - Don't plow or groom any segments not now plowed. Those who want groomed trails have plenty of other options(written by a former avid cross country skier on groomed and ungroomed - - including Moose Wilson - - trails).

Topic Question 1:

I think the strategies that need to be carried forward should be directly related to " decrease in visitor volume " i.e :control # s of vehicles by using limited "public transport", with off sight parking (like Zion , Denali & Yosemite NP 's). Changing Dates of access according to Peak wildlife activity i.e: closed during grizzly feeding times & spring calving). Bathroom at Granite Cyn . Limit Death cyn visitors like the LSR.

Topic Question 2:

PLEASE DO NOT PUT A BIKE PATH ON MW ROAD !!!!! Why would we EVEN THINK ABOUT major construction for years & years....resulting in destruction of important wildlife habitat, geology, waterways, ecosystems being disrupted and wildlife being disturbed...this all seems to defeat the ultimate purpose of preservation !!!! NO road realignments, NO changed trailheads, NO more development & NO bike path !!! Leave well enough alone and close the road if we must !

Topic Question 3:

I am totally appalled at ALL " The FOR - PROFIT " commercial vehicles that have taken over the MWC and the rest of the valley i.e.: wildlife safaris This has become a huge problem and should not be allowed on the MWC.

Comments: I am a 38 year GTNP enthusiastit would break my heart to see the MWC developed like the rest of this valley. This Valley has been " Loved To Death "like So many other beautiful places on earth ! People are the problem, and it is only going to get worse, I really don't know if there is truly a " Solution " !

Topic Question 1:

The identified need for a comprehensive plan for the Moose-Wilson corridor is a) increased motor vehicle and bicycle traffic, which complicates the management of wildlife (including, e.g., grizzly bears). Given this identified need, the appropriate strategies are those that will significantly reduce current and future traffic levels, to protect both the wildlife and the safe wildlife-viewing experience of visitors. The strategies that would best meet the need and achieve the goals of the plan would therefore be:

- - to reduce the volume of traffic by a) encouraging the use of the road by motor vehicles only as a means for visiting destinations within the corridor, and b) disincentivizing, and to some extent restricting, other uses. These goals can be achieved by (i) reducing speed levels on the Moose-Wilson Road (including through serious speed bumps, see Q4 below); (ii) eliminating use of the corridor by commercial vehicles other than those necessary to NPS maintenance and wildlife-viewing/ski-touring vehicles as now permitted (no taxis should be permitted as the only purpose is to commute to the airport); and (iii) limiting vehicle size to exclude buses, large RVs, etc.

Topic Question 2:

Regarding the paving of the south end of the road: I would advocate leaving it unpaved, which necessarily slows and diminishes traffic; but if it is more economical to pave the southern stretch, I would not oppose that strategy if speed bumps were closely placed on the road (See Q3 below). Other strategies laid out in alternatives B and C to address traffic volume may be aimed at the primary identified need for a plan, but the mechanisms are far too elaborate, costly, complex, and unnecessary to accomplish the plan goals; they

therefore should not be considered unless and until simpler, cheaper, and more straightforward means of dealing with the need have been tried and have demonstrably failed (See Q3 below). The movement of roads, development of parking areas, and closures of winter access north of Death Canyon trailhead seem to serve no identified need and would, to the contrary, diminish the kind of visitor experience the plan is intended to enhance.

The strategies in Alternative D appear to be wholly contrary to almost all of the goals set out for the plan, and are completely unnecessary to meet the identified need. They would destroy the qualities of the Moose-Wilson corridor that make it a special place in GTNP, would diminish if not destroy the visitor experience, and would be irreversible. It is nothing but a grand development scheme that is contrary to the stated goals of the plan and certainly not justified by the identified need for a plan.

Topic Question 3:

Yes. Reduce and slow traffic by the installation of serious speed bumps at close intervals over the entire course of the Moose-Wilson road (whether paved or not). The speed bumps would sharply discourage using the road as a commuter shortcut from Teton Village or the rest of hwy 390 to the airport, and commercial and other traffic from north of town to Teton Village or Wilson (or Teton Pass).

The speed bumps could be permanent or the temporary kind that could be placed when the road is opened each Spring. They would permit passage of bicycles (though see bicycle comments below).

Topic Question 4:

Like doctors' Hippocratic Oath, the NPS charge should be to First, Do No Harm. The Moose-Wilson road is a special place in GTNP and its unique qualities should be preserved for future generations.

Consequently, in principle, I believe the road should be left alone, but protected from current and future misuse. Steps clearly need to be taken to reduce traffic, and I have outlined above a speed bump proposal that I think would largely, if not entirely, meet the need identified for the plan and would do so cheaply and without harm to all the values that those of us who love the Moose-Wilson road want to protect.

Regarding bicycle use: Every road does not need a bike path, and this is the road that should not have one. The Park (like Teton Co) has (and is expanding) wonderful bike paths that connect to the entrance at Moose, but where these would threaten wildlife or diminish the intimate wildlife viewing experience of visitors - - i.e., the Moose-Wilson Road - - they should not be built. And to protect wildlife, bicycles should probably be banned on the Moose-Wilson Road. Although it seems impractical to me, if the NPS were to conclude that it was safe, I would have no objection to, for example, a two-week period in the Spring and Fall when the road would reserved for bikes.

Comments: First, please don't pave paradise. I am a cyclist who likes pathways, but not this one. I am married to a committed road-biker who has always opposed pathways, including this one, that would destroy the whole point of being there. And now he is in a wheelchair, and neither he nor I thinks that the Moose-Wilson Road is a place where special arrangements should be made for the disabled. Some things have to be left alone.

Second, Please extend the comment period, and further publicize the issue and opportunity to comment. In recent weeks and days of raising this subject with friends and acquaintances, it has become clear to me that a lot of people who care about the issue and have useful thoughts on it were not aware of the comment deadline. Mostly, I think the young people who will either benefit or suffer from the choices made have been unaware of the opportunity to be heard.

Thanks for the opportunity to comment, and please, do no harm.

Topic Question 1:

Option D. A bike path would reduce traffic and create a safe corridor for bikers. Tourists on that road are not looking out for anything but wildlife and it is a hazard to ride there!

Topic Question 2:

I oppose the options that don't include a bike path. One way and alternate days would pose an undue burden on the people that use the Moose-Wilson road to get from the village to the park.

Topic Question 3:

I like the idea of moving the road to a location where it would be less disturbing to wildlife, so grizzlies could eat berries in peace without the road needing to be closed. Also, keeping the road open in winter would provide great access to the park.

Topic Question 4:

Thank you for accepting public comment on this issue!

Topic Question 1:
D is the only alternative to consider. The road as it is needs to stay open for obvious reasons of unique guest experience, better traffic flow throughout the valley, getting visitors to have interpretive opportunities in the park etc etc.. The addition of a pathway is overdue and should be a priority of the park. Pathways are important to both residents and visitors. Allowing access to the park to non motorized visitors and residents is better for the environment, provides better connective opportunities the natural splendor of the park, and is a far safer. Autos and bikers or walkers on the road as is is very dangerous.

Topic Question 2:
B and C are a joke and I won't further comment as the reasons. They are obvious.

Topic Question 3:
No suggestions.

Topic Question 4:
A pathway is essential and handles all of the items listed as goals. Particularly it allows folks to enjoy values of the park.

1. scenery
2. geologic processes
3. ecological communities and wildlife
4. aquatic resources
5. cultural history and resources

6. natural soundscapes and acoustic resources
7. visitor experience in an outstanding natural environment

Comments: D is it.

Topic Question 1:
Plan D has a bike path, and thus it's the best. Any plan without a bike path would not be acceptable.

Topic Question 2:
I think the road should be moved to the flats, so that tourists landing at the airport could have easy access to Teton Village. The existing road is slow and not very fun. If you're looking for wildlife, it's too crowded. If you're just trying to get to Teton Village, it's too slow. Nobody is happy. How about making a fast road to Teton Village, and leaving the slow road as a one-way wildlife viewing road. Everybody is happy that way. Then build a bike path next to the slow road, and you'll have something special.

Topic Question 3:
Simply put, the existing road is bad for everybody. Make two roads: one for people who want to get from Teton Village to the Park, and another wildlife viewing road for people who aren't in any hurry. A bike path is essential.

Topic Question 4:
The bike path to Jenny Lake is right next to the road. Why? Why would you ever build a path next to a busy road? Would you ever hike next to a busy road? You have all this land, build a bike path that would be a model for every other national park. Make it wild and scenic. Leave a legacy that generations will enjoy.

Topic Question 1:
alternative D= preferred positive option b/c there'd be fewer cars by encouraging diverse access thus preserving corridor's unique values, i.e. wildlife. alt D would enhance the visitor experience simultaneously preserving the wildlife by reducing motorized visitation.

Topic Question 2:
a, b & c
a= do nothing solves zero problems
b & c= gates & closures merely reroute traffic and bottleneck it in time/days

Topic Question 3:
free smart transit like buses in yosemite, grand canyon & zion canyon would be great for grand teton park & yellowstone.

Topic Question 4:
a separate pathway is a safety NEED.

Comments: thanks for asking for public comment. my parents, andrea & andy, and my four cycling siblings in JH appreciate it.

Correspondence Text

Following are brief comments regarding the Moose-Wilson Corridor Comprehensive Management Plan. After reviewing the management goals and desired conditions for the Moose-Wilson Corridor outlined in the published NPS newsletter, it is apparent that the inclusion of a separated pathway would not be compatible with the long-term vision of this unique corridor.

A key element of Alternative D, the construction of a separated multi-use pathway, should not be a preferred strategy carried forward in this planning effort. The impacts associated with the construction, use and maintenance of a pathway carry far too many risks to the natural and cultural resources this planning effort intends to protect.

Irreplaceable areas such as the Moose Wilson Corridor, where the American public can experience a wilderness setting, with abundant wildlife, are too few. For this reason, preferred management strategies should be based on a principle of minimal ecological disturbance. Constructing a separated pathway up to 50 feet away from the existing road is just the opposite.

If you do evaluate a pathway as a potential strategy, it is essential that the functions of the pathway, in terms of alternative transportation versus recreational amenity, be clearly distinguished. Potential increased visitor volume at the Rockefeller Preserve should be addressed. Safety issues related to potential human-wildlife encounters on the pathway should also be addressed.

The general concept of a pathway in many areas is fine. The benefits often outweigh the costs. However, in the Moose Wilson Corridor, a separated pathway is not appropriate. All management actions possible should be taken to prioritize wildlife habitat protection in the Moose Wilson Corridor. If not here, a place

of such ecological abundance and a conservation legacy that is home to the Murie Ranch and Rockefeller Preserve, then where?

Topic Question 1:

A plan to combine the park entrances to that traffic from the north would be subject to all restrictions (size and weight) that exist now, but are NOT enforced. This also allows the park to collect fees.

I think that the road to the Death Canyon Trail head trailhead should be improved to a single lane with periodic pullouts for passing. This leaves the distance of all hikes the same as it is now.

The Granite parking area should be improved with restrooms. And the road paved as well.

Topic Question 2:

Under no circumstances should a 2-day period for bicycles be allowed. This would restrict cars that need to go to work. and further exacerbate the demand for the trails.

To allow any commercial vehicles would be in direct violation of the road to be a small vehicle experience.

Topic Question 3:

I don't believe you have specified restrictions about size and weight of vehicles, whether commercial or privately driven.

Correspondence Text

Topic Question 1:

With few minor changes, I feel that the best alternative is to leave the Moose Wilson roadie its current state. The addition of a fee/information station @ the north end, and status signs that can continually be updated at each end of the road (but prior to approaching the entrance station) would help park visitors to make alternative decisions in regards to dealing with crowds in this corridor. The use of satellite parking areas at each end of the road, and free shuttle vehicles would help eliminate the traffic from vehicles that do not want to continue through. This service could also shuttle cyclists through this section of the park(with bike racks provided on the shuttle vehicles.

Topic Question 2:

No new pavement! No paved bike path! The destruction of park habitat and resources for such a purpose would be horrible. The road is already a fabulous bike ride in the "off season" when it is closed to cars. Why not keep it a seasonal special activity rather than destroy acres of land and thousands of trees for a paved human experience, that will only be available for a short time each season. Not every geographic area is suited to be paved for the pleasure of humans. The dirt portion of the road should be kept as seasonally maintained dirt...it helps to keep the traffic flow moving, but slow.

Topic Question 3:

The commercial use of the road is very high. Traffic problems could be cut down if through traffic by taxis was banned(through commercial traffic is banned on other park roads unless it is the only way through to a destination, I believe). "Road based"(i.e.motor touring)wildlife tourism is very thick, and should be curtailed,if not eliminated through the area.

Topic Question 4:

The Granite Canyon trailhead is the only major trailhead in the park without so much as a vault toilet. It could use a little upgrade, and hygiene.

Comments: If increased visitor use is a problem, don't make things bigger and nicer, it only brings more people. "If you build it, they will come." The Park has been part of the problem with increased use, by adding the entrance station @Granite canyon, and the LSR, people have been drawn to this part of the park. If more development is added, more people will be drawn to the development. Don't pave the road, and don't add a paved path.

Topic Question 1:

After reviewing ALL 4 alternativ, I find that no single Alternative fulfills the purposes/need of a plan. 1. Any plan MUST include an entrance gate at the North end of the Moose/Wilson (M/W) road. Vehicle size and weight must be controlled if the purpose of this road is to remain narrow and winding (mentioned in all Alternatives. Managing traffic flow during peak periods I believe would best work by queuing timed sequencing techniques, bearing in mind not all cars in either direction plan to simply drive from Moose to Wilson. I favor a small bicycle path, not a multi-use path, closely following the M/W road as the best alternative for bicycles. Users must be informed that bears like to chase running objects, They do not discriminate between a small child or a small animal food source. I foresee a serious increase in human-bear conflict with the creation of a multi-use path. Please maintain the Death Canyon trailhead parking area in its CURRENT location. The plans described in Alternative D for the access road to the Current Death Canyon trailhead I feel is the very best plan which meets your goals and serves the public.

Topic Question 2:

There are many preliminary alternative which I feel would be detrimental to positive visitor experiences. Requiring reservations to go on the Moose/Wilson road I see as non-workable. Reservations don't even work when people are paying for a reservation. A vast majority of visitors will not be pre-informed. This creates an immediate negative experience. Closing this road 2 days a week for bicycles will not work either. Both bicyclists and motorists will be unhappy because the days will never meet the desired needs of either faction. A separate bicycle path is a much better idea. Only peak flow days should require traffic management. If the road is closed for wildlife. bicycles should not be given special entrance. Bicycles should follow the same rules as motorists when the road is open. Please do not allow any more commercial traffic on the road than currently exists.. This road should be

always narrow and winding and SLOW.

Topic Question 3:

If you have not already done so, please prohibit oversize vehicles, both private and commercial from entering the road. These over-size, overweight vehicles block traffic, take up unreasonable parking space, block views of other cars. i suggest speed-bumps because they control traffic better than dozens of patrol cars could. Pleasdo not create an outside "sense of discorvery". Any attempt to do this will prevent people from their own self-discovery

Correspondence Text

Topic Question 1:

I believe Alt. B would be the better strategy, because it protects wetlands and gives the greatest protection to animals and plants, as well as the protection of wetlands.

Topic Question 2:

I am not sure a gate at LSR will achieve lower density of vehicles, as all vehicles would have to turn around and return on the road, essentially doubling traffic and potentially causing traffic jams and crowding. My question would be, would it really cut traffic down that much if the road does not go through to Teton Village or the Park? Possibly, or possibly not. It sounds like a tangling mess.

Topic Question 3:

Shuttles to and from LSR/N and S entrances with drop-offs for Death Canyon trailhead. Also controlled amount of Tour vans, and little to no private automobiles. Other parks have used public transportation /shuttles to move people through sensitive areas of the park. GTNP should also look into this more thoroughly.

Topic Question 4:

I believe the Park should do what is needed to provide lasting preservation of a place that could literally be loved to death. Un-regulated travel, travel through as a commuter road, adding more concrete/blacktop barriers to moving wildlife, and changing vegetation and micro-habitats, all contribute to erosion over the years to something more sterile, less alive - not what any of us want over the long term. I think there are many self interest groups and individuals that are myopic about the long range outcome of the MW Corridor, and GTNP needs to see beyond the desires of interest groups and individuals

focused only on the immediate results that would benefit themselves in the relative short run. The Park should absolutely do what is right for the wildlife and plant life, and for sensitive areas, with a look at the long term survival of of habitat, animal, plant, and scenic values.

Dear Superintendent Vela:

Thank you for the opportunity to weigh in on the Moose-Wilson road corridor. In 1960, my parents, purchased 10 acres from the Huyler family, at the southern end of the Grand Teton National Park (aka Granite Canyon/Poker Flats). For decades my family and I have been the eyes and the ears of the park as well as ardent stewards. The Moose-Wilson road dissects our property and the Moose-Wilson corridor is our front yard. I have spent my entire life hiking, running, fishing, skiing and thoroughly exploring this precious corridor. I have had the great fortune to know every inch of this part of the park intimately.

Curiously, the biggest change to the M-W corridor in my lifetime occurred when Laurance Rockefeller generously turned over the J-Y Ranch to GTNP and created the LSR preserve. All of a sudden, his heirs were cut out of the will and we, the public, were the beneficiaries. While Laurance had a clear vision and thoughtful plan to preserve this part of the park, the greater Phelps Lake area is, without a doubt, being loved to death. That being said, I am conflicted about what to do to save this precious resource. I appreciate all the options and thought put into alternatives A-D.

My ideal solution involves no bike path, an unpaved, rustic and pot holey southern section and a realigned northern section to distance the vehicles from the berries, beavers and bears. I realize that vision will likely not fly into the future, so below is my cheese plate of strategies from all four alternatives.

- â€¢ Please do not close the road, make it one-way or limit the number of private vehicles, yet.
- â€¢ Please do not develop a pathway.
- â€¢ Drop the speed limit to 25.
- â€¢ Prohibit commercial vehicles except permitted wildlife viewing concessions.
- â€¢ Realign the northern section of the M-W road away from the beaver ponds and berry bushes. Create

pullouts and parking areas for wildlife viewing. (Yellowstone National Park just reported 2.7 million recreational visitors for the first eight months of 2014 and I do not know of road closures due to chronic animal jams.)

â€¢ Improve the southern end of the road, keeping the narrow, windy character.

â€¢ Add outhouses and improve the parking areas at Granite Canyon and at Death Canyon (across from the Barker's driveway.)

â€¢ Improve the horse parking at Poker Flats and Death Canyon.

â€¢ Combine the one-lane White Grass and Death Canyon trailhead roads. This takes stress off of the LSR parking. Improve the parking at Death Canyon.

Thank you!

Topic Question 1:

realigning north part of road around ponds to move traffic away from wildlife activity and prevent bear related closures Winter use: seasonal closures and no grooming, no commercial activity maintain tranquility. Amazing part of the park so easily accessible during winter just don't commercialize it. Traffic must be: ideally through closure and use of transit managed. at the very least directional flow techniques but ideally use of transit and shared roads for bikes. Many other parks have successfully done this

Topic Question 2:

Alternative D should not go forward. It proposes strategies that have serious and frankly unacceptable impacts on the values the Park is tasked to protect : a separated pathway would further fragment habitat; construction through heavy vegetation results in significant impact on the vegetation ;it increases the potential for animal human conflicts and humans on bikes are a very threatening proposition for wildlife being unpredictable and often almost completely silent in their approach. Sharing the road is a strategy that the Town of Jackson and Teton County have both found acceptable in many places.; it should be acceptable in the M-W corridor. Biking is an optional activity and mostly for recreation not as a transportation alternative so cycling in the corridor is a choice people make.

One of the principal issues facing the corridor is the increase in human related impacts, mainly through the ever increasing use by vehicles .Alt D does not address this problem adequately: a reservation system is difficult to manage and would no doubt leave some visitors quite disappointed. Better to initiate a transit system as in Zion or other parks and prohibit thru traffic on the road. Transit, bikes via share the road or walking would offer visitors daily access to the corridor. but without the environmental impacts of continued road traffic. Transit from Moose to LSR and from Teton Village and M-W entrance to LSR.

Could allow some vehicle traffic from Moose to LSR but this would be constrained by Rockefeller parking and use conditions.

Alt D fails to meet the goal statements and desired conditions, rather it seems to be encouraging development of a recreation destination. and not "meaningful opportunities to experience the rustic character and diverse ecosystems".

Where is the language used by Mr Rockefeller in his dedication of the LSR: "harmony with nature. Spiritual renewal" "avoidance of progressive overuse which is destroying the very values people seek in coming to our parks"

Alt D would, I submit lead to the very overcrowding and progressive destruction that Mr R is appealing for us to guard against..

Alt A solves nothing and will lead also continue the corridor on the path to progressive destruction.

Alt B restriction of traffic during peak periods does not address issue of people speeding thru when possible en route to somewhere else i.e., the bypass/airport shortcut problem

ANY alternative proposing one way traffic only should have that flow going south, otherwise , if the flow is northward, the road will become the expressway (absent a bear jam, of course,) to the airport or elsewhere. Two way traffic from Moose as far as LSR should be maintained for visitor access to the VC there unless transit is provided.

Winter use should NOT include grooming of the trail, use by snow bikes or commercial guided trips by ski or snowshoe. The plan here is managing for the long term future. Commercial pressures from Teton Village in particular and elsewhere will only increase over the years. The pressure for increase use will be significant. Witness the amazing proliferation of wildlife viewing tours in the last few years. Wonderful that visitors can see wildlife but what about the quality of the experience and the level of educational interpretation and the volume of traffic associated with it.

No taxis and commercial traffic

Topic Question 3:

There should be an ALternative that addresses the absolute highest quality protection the park can offer to h=this amazing resource. There are creative ways to control numbers yet maintain access. Other parks limit numbers and maintain the quality of the experience. Rockefeller wanted the place to be protected and offer tranquility and a place to experience spiritual renewal. This alternative should capture the spirit and intent of the LSR Preserve gift and extend it to the entire corridor.

Stopping thru traffic at the LSR VC and perhaps from the south at Granite would go a long way to maintaining the tranquility. You cannot have heavy traffic, even in a somewhat controlled manner and maintain the quality of the experience. They are simply incompatible .

Comments: I totally agree with the sentiments in this column by Todd Wilkinson who is far more articulate than I am

http://www.jhnewsandguide.com/opinion/columnists/the_new_west_todd_wilkinson/increased-protection-doesn-t-harm-parks/article_7be4b836-5e63-5457-aba6-1d0f7f0286ce.html

The New West / By Todd Wilkinson | 1 comment

In his new page-turning book, "Peaks, Politics & Passion: Grand Teton National Park Comes of Age," historian and seasonal Moose resident Robert W. Righter reminds us that Grand Teton is a national park. It's a fact some local politicians, self-interested land developers, state legislators in Cheyenne and all three members of Wyoming's congressional delegation are loathe to grasp or accept.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Sothebys/Huff - In Story Quarter #1 - 50k

Unfortunately, antagonism has always been this way in the valley, since the very beginning of the park's creation.

How often people forget the awakening that occurred inside the late Wyoming governor and U.S. Sen. Clifford Hansen, a lifelong local rancher and Teton County commissioner who rode defiantly on horseback across the sagebrush in protest, a young man hellbent on defying federal expansion of the park boundaries.

Ironically, the park made Hansen's own land astronomically more valuable for nothing he did. Hansen spent the last decades of his life publicly admitting his efforts to undermine park preservation were a mistake - that Grand Teton was the best thing that ever happened to Jackson Hole.

In Hansen's defense, even conservationists with the largest environmental groups in the country were myopic in fully appreciating the enduring value of protected landscapes.

Righter's "Peaks, Politics & Passion" couldn't arrive at a better moment, just as this community is becoming embroiled in yet another battle royal; this one involving proposals to radically alter the rustic character of the Teton Village-Moose Road.

ANd this piece by Bob Righter

By Robert Righter and Sherry L. Smith | 7 comments

Many years ago Olaus Murie reflected on the fierce discord created by the fight to create Grand Teton National Park: "It would seem the sheer beauty of the place ... has actually been the cause of discord.

Neighbor against neighbor, group against group, the feelings have smoldered, leaping out in open conflict from time to time, the bone of contention being: what to do with this beautiful place?"

Once again battle lines are forming about what to do with this beautiful place as Grand Teton National Park issues its "Preliminary Alternatives" for the Moose-Wilson corridor plan and invites the public to comment. This park inevitably generates conflicts between peoples' interests and those of the wildlife that cannot speak for itself or write letters to the newspaper. That is the essence of this current controversy. Advocates of expanding human access are at odds with those who want to preserve the area from further development. Which way should we go? Promoters of the new bicycle path and road improvement, for instance, believe it is possible to have it all, doubting their presence will disturb wildlife.

JHREA - In Story Quarter - 50k

The problem is too many people demand too much from this small corner of a relatively small national park. So, who will protect it against the deluge? Certainly not the Wyoming congressional delegation or some local representatives, political figures who respond to constituents' demands, especially those from well-organized and well-funded special interests. An exchange between President Theodore Roosevelt and "nature's advocate" John Muir demonstrates the problem. In 1909 Muir was desperately trying to save Yosemite National Park's Hetch Hetchy Valley from a dam that would provide water for San Francisco. Roosevelt pointed to the voters in that city and then asked Muir, "Do your constituents [meaning the non-humans of the threatened valley] vote?" San Francisco dammed the Tuolumne River and flooded Hetch Hetchy. Interestingly, there was no National Park Service to help Muir protect Yosemite. That agency emerged out of the controversy to represent the voiceless and keep such degradation from happening again.

Today it is up to the National Park Service, aided by environmental groups and sympathetic citizens, to speak on behalf of the flora and fauna of the Moose-Wilson corridor. Of course, the National Park Service must also provide access to the public. It is a challenging balancing act. Bicyclists currently have more than 20 miles of pathways, constructed over the last five years, to enjoy on National Elk Refuge and national park lands. This autumn a 1.2-mile strip, costing \$3.2 million, will connect the current pathway at Moose Junction with Antelope Flats Road, making a wonderful loop to the east for those who want a circular route. Another loop, carved into the Moose-Wilson corridor, is neither necessary nor

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

appropriate.

We are in danger of destroying what we all love. It often begins with an innocent activity and an inability, or unwillingness, to consider long-term consequences. In 1939 a handful of recreational pilots cleared a sagebrush strip north of town where they could fly their biplanes. Seventy-five years later that rustic runway has become the busiest airport in Wyoming and one that has seriously compromised the park. It is a case of "creeping incrementalism." Activities that start out harmlessly can take on a life of their own, damaging the park forever.

Who does not like bicycles? Who does not advocate safe pathways? But do they belong everywhere? This is a moment and Moose-Wilson is a place where people need to honor the park's responsibility to protect, defend and look to the future so that 75 years from now people will continue to enjoy the sanctity and natural wonders of that precious patch of land.

Earlier in his career, Righter, a research professor in American history, penned what many consider a classic must-read for anyone who loves Jackson Hole: "Crucible for Conservation: The Struggle for Grand Teton National Park."

The clarion message of that book was this: Had it not been for a brave coterie of citizens speaking out for the national interest and refusing to let Grand Teton become captive to narrow-mindedness on the part of Wyoming politicians and resource developers, park views and wildlife habitat as they exist today would have been destroyed, covered with scattershot development.

In "Peaks, Politics & Passion," Righter picks up where "Crucible" left off, carrying readers forward from 1950 to the present.

He delves into controversies, actually names names and reminds readers that the human melodrama playing out in Grand Teton can be as heart palpitating as any ascent up the mountain.

Righter explores the never-ending pressure from individuals and commercial interests to exploit the park for their own economic ambitions and conveniences.

He wades into the ethical and moral dilemmas involved with search and rescue using real-life examples.

He dives into the contentious issues and bullying tactics of the federal government surrounding park inholdings that still rankle people to this day.

He recounts the history of livestock grazing and controversial big game hunting in the park while discussing management of grizzly bears, wolves and the adjacent National Elk Refuge.

Righter's text stops just short of getting into the Teton Village-Moose Road debate, though he notes that the National Park Service Organic Act, the courts, and the American public have consistently sided with management decisions favoring preservation over development.

An ardent rafter, Righter notes that he would relish having the park change certain rules to fit his own whims, including lifting prohibitions on camping in undeveloped sites and allowing boaters to take pets into the backcountry.

"I see no reason that my perfectly behaved dog cannot accompany us," he writes. "He does not bark and has no interest in chasing wildlife. However, I realize that our personal behavior can, when multiplied many times over, dilute an unspoiled semi-wilderness experience. The river and its protective regulations must remain as they are. The greater good for the river must trump my self interests."

Imagine that: Espousing a "greater good," accepting limitations on personal self interest and not always putting personal profit, pleasure or self convenience ahead of the long-term well-being of a crown jewel national park with 300 million stakeholders.

To those, including Wyoming's congressional delegation (which almost certainly would oppose Grand Teton's creation were it put to vote today) and to Teton County commissioners willing to "improve" Teton Village-Moose Road at the expense of harming park character, are you really paying attention? Read Righter's book. You might learn something important and spare yourself from coming down on the wrong side of history.

Dear Superintendent Vela,

Thank you for the opportunity to comment on the preliminary alternatives for the future of the Moose-Wilson Corridor. As you are no doubt aware, this area is one of the most endangered portions of critical habitat within the GYE, and the preliminary alternatives will directly impact the future of the most sensitive and endangered areas of this national park.

The National Park Service management goals and desired conditions for the fundamental resources and values accurately outline the critical resources at risk. As stated in the park's newsletter, a visitor use management framework will be part of this plan, which will include indicators and thresholds that will establish minimally acceptable conditions as well as defining the kinds and amounts of visitor use that the corridor can accommodate. The park needs to define these indicators and standards within the Draft EIS, since many of the adaptive management strategies and/or action alternatives that may be considered rely on establishing some sort of capacity and related desired visitor experience, and maintaining/enforcing them.

The following overriding principles are recommended for inclusion in any alternative that may be considered as the preferred: maintain and/or decrease the vehicle speed; permit no removal of, nor impact to, intact habitat; allow no net increase of pavement within the corridor; and allow no increase in overall habitat disturbance/fragmentation. An overarching principle should also be to not allow the county to export their development impacts onto national park land.

The following compilation of management actions were developed after reviewing the three action

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

alternatives outlined by the park, and I believe best support the fundamental resources and values as outlined. The group of actions detailed below would also best meet the plan's purpose to establish a long-term vision for the future management of this remarkable corridor within Grand Teton National Park.

These actions include:

An action that is not addressed in the preliminary alternatives is that of the corridor's important cultural history, specifically the National Register eligibility of the road, and the significance of the corridor to a number of Native American tribes. The number of cultural elements within the corridor - evidence of significant seasonal occupancy of the corridor by a number of Native American tribes, the Murie Ranch NHL, the National Register-listed Whitegrass Dude Ranch, and the potential for future recognition of Laurance Rockefeller's historic gift of the LSR Preserve (the most significant private donation ever given to the NPS) - strongly suggest that further consideration should be given to an alternative that focuses on protecting the integrity of the significant cultural resources concentrated within this corridor. This should be included as a possible management action in the alternatives.

The two segments of road on the north end should be realigned, and the new road should duplicate the road's historic width, character, and slow speed. This would move the road out of critical wildlife habitat, and provide for wildlife viewing from a safe distance, which is not currently the case. The old roadway would be restored to natural conditions.

Two commonly used NPS vehicle traffic management techniques - specifically park-concession operated transit (which would replace individual motor vehicles), and/or a use of a one-way road by private motorized vehicles, are not included in the preliminary alternatives. This represents a significant oversight as to the range of possible and feasible management actions being considered. Transit capacity and frequency should be designed based on resource carrying capacity and visitor experience levels that are determined through this NEPA process for the corridor, be connected to other estinations within the park, and should not further impact Moose Wilson corridor trailheads or backcountry areas of the park. Both techniques would reduce motorized vehicle traffic, reduce the increasing number of user-created turnouts alongside the road, accommodate access to park estinations, support bicycle use on the existing road surface without adding pavement and thereby negate the perceived need by some for a separated pathway, and all be done without any loss of or further fragmentation of critical wildlife habitat.

Per NPS Management Policy 9.2 "Traditional practices of building wider roads and larger parking areas to accommodate more motor vehicles are not necessarily the answer. The Service must find transportation solutions that will preserve the natural and cultural resources in its care while providing a high-quality visitor experience." Further, in Policy 9.2.1.1., "Before roads are chronically at or near capacity, the use of alternative destination points or transportation systems or limitations on use will be considered as alternatives to road expansion."

Transit and other traffic management techniques are used throughout the National Park System. A few examples include Zion, Denali, Zion, Rock Creek, Acadia, Bryce Canyon, Yosemite, Grand Canyon North Rim and Yellowstone, among many, many others. To not include transit and one-way as full alternatives could lead to the NEPA process being found inadequate, since these actions are wholly viable and feasible in addressing the park's stated goals. For this process, transit should not include commercial transportation or county-operated shuttles, since those methods could have undue local influence on use levels within the corridor. Instead, such transit should solely be managed by the NPS, and be based on visitor use levels tied to indicators and thresholds to be established through this NEPA process.

With regard to commercial uses, taxis should be prohibited. With regard to non-transit alternatives, the

park should use concession contracts rather than conditional use authorizations to properly manage and regulate the total number of commercial tours within the corridor. Current commercial use has received limited regulation or use management. The park should continue traditional non-motorized winter access without grooming. This would maintain the corridor's winter solitude, provide a more primitive visitor experience than elsewhere (Teton Park Road), and would better protect critical winter moose habitat. If the north end road realignments occur, then the northern winter parking area should be located at Sawmill Ponds parking lot and/or at the new entrance station location, rather than at locations near the Murie Center as described on the preliminary alternatives document.

Moving the Death Canyon trailhead is a positive action as long as the existing road is rehabilitated to trail width and condition, and that there is no net gain of total parking associated with that trailhead.

Strategies that should not be carried forward include the reservation system/vehicles per hour system, and/or closing the road to vehicles two days/week. These are complex and challenging techniques to manage and provide no certainty to the general park visitor as to what they may be able to experience during their visit. They also carry the possibility of being terminated or eliminated without public comment. Such systems could also lend themselves to being manipulated by special interests and/or commercial entities.

Thank you for the opportunity to comment on the preliminary alternatives.

Sincerely

Mary Scott

Grand Teton National Park
ATTN: Moose-Wilson Planning Team
P.O Drawer 170
Moose, Wyoming 83012-0170

RE: Grand Teton National Park - -Moose-Wilson Corridor Comprehensive Management Plan

Dear David:

The Moose-Wilson corridor is a special area of GTNP with an abundance of critical wildlife and wilderness habitat.

The single most important issue affecting the Moose-Wilson corridor is the existence of the active through route roadway. In my 35 years out here, my family, friends and I have utilized this roadway in the summers as a matter of convenience. Yet, this through route roadway is inconsistent with Park values. The road, currently closed to vehicular traffic for about seven months every year, should be closed to

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

vehicular traffic and bicycles permanently, at all points north of the LSR Center. It should be open year round to non-vehicular/non-bicycle pathway for pedestrians, horses and skiers. This corridor is a special place. This critical Park habitat should be treated and preserved as such.

Some commercial and real estate interests have lobbied hard, with aggressive paid lobbyists, to improve this road as a direct year round access from Teton Village to the airport and points north. That would be totally inconsistent with Park values and very bad for Town businesses. But they will keep pushing. It is time to shut down this road as a through route NOW.

The Park should close this road to motorized vehicular traffic and bicycles permanently at all points north of the LRS Center.

Prior to the development of the Jackson Hole Ski Resort this entire roadway was an unpaved rural ranch road.

The following correspondence is attached and incorporated herein by reference:

â€¢ August 6, 2014 Editorial by former Rep. Pete Jorgensen.

â€¢ My February 6, 2014 letter to GTNP, with Jack Turner's enclosed February 5 letter.

Kevin Schneider,

Acting Superintendent

Grand Teton National Park

Jackson Hole, Wyoming

RE: Moose-Wilson Road

Dear Kevin:

I concur with Jack Turner's letter (enclosed). If the Moose-Wilson road stays a through route it should NOT be paved or expanded, as a roadway or pathway. As a matter of foresight given development pressures noted below, it probably should be closed to through traffic- -both vehicles and bikes.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Some Village area developers have looked at this small road as a potential future expanded route with high traffic volume from Teton Village to the Airport and points North, bypassing Town. Not so long ago, there was a Washington, D.C. lobbying effort with a professional lobbyist hired by Village area developers- -arguing that we already have a "North Bridge" in Moose, so we just need to pave and vastly expand the Moose-Wilson road. To many of us, that would be a travesty. It probably would not help Town businesses either!

It should be closed to through traffic, and any path should be unpaved. We do not need bikes roaring through on pavement. Their paved bilcing playground is plenty big enough already, and will get bigger with the pending Jackson-Teton Village bike connection. We do not need to pave a through route for them.

Sincerely,

Peter F. Moyer

To Whom It May Concern:

I mostly agree with alternative A. I think a bike path would be a huge mistake. Paving the south portion might make sense from a maintenance position, but if done the speed limit should be kept low & enforced. I also think both realignments on the northern section make sense.

Good luck

Correspondence Text

Attention: Moose-Wilson Planning Team:

As long time residents of Jackson Hole, which includes 30 years of living and working in Grand Teton National Park, we feel qualified to comment on the Moose-Wilson Corridor. I have also driven that road several hundred times in my position as Project Manager of the LSR Preserve.

We do not feel that any of the 4 alternatives satisfy the needs of that area. This is such a pristine part of Grand Teton National Park that an expansion of this road and area is not appropriate. This is a National Park road that should be controlled by the National Park Service and should not be considered a local or state government road.

The four current alternatives appear to be written to appease the elected officials and the bicycle lobby. We oppose Alternative A because improvements are needed to this corridor. We oppose Alternative D because we do not believe bicycles or bicycle paths are appropriate in this area of the park nor should the area be groomed for the winter. It is already available for cross country skiing and snowshoeing. There are two other alternatives that should be considered.

1. Close the Moose Wilson road entirely from the Granite Canyon trailhead to the entrance to the LSR Preserve. Perhaps a shuttle service could be developed over this portion of the roadway. Shuttles could be equipped to carry bicycles from Teton Village to Moose parking areas.

2. A combination of Alternative B and Alternative C: The unpaved portion of the road should remain unpaved with safety upgrades and some turnouts.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

The northern portion of the road should be realigned as presently planned. We feel that parking areas, turnouts and hiking trails should be established for guests to hike up to view the present beaver pond areas

Taxis, trailers, R.V.'s, buses and large trucks should be prohibited at all times and enforced by Park Rangers.

The road should remain open 7 days a week during the summer season on a two way basis. However, a maximum number of vehicles per hour should be allowed. This would include travel alerts by radio and signage as well as volunteers similar to the LSR volunteers advising visitors of wait times.

We do not feel bicycles should be allowed at any time. There is adequate access to the park for bicycles on Highway 89. Not all areas of the Park need to be accessible by bike. Bikers are a very small percentage of the population here in the valley and we do not feel additional bike trails in the park are appropriate when there are other trails available outside the park for them to use.

No additional visitation to the LSR Preserve should be allowed and the parking lot should remain as is. The present visitation numbers are manageable and have accomplished the goals that were established at the opening of the LSR Preserve.

The Moose-Wilson road study indicates that the busiest time in the parking lot at the LSR Preserve is from 4 to 6 pm. This is flawed information and needs to be corrected. In the busiest months, the parking lot fills at approximately 10 am daily.

Adding an additional Moose entrance station within 3000 feet of the existing entrance station is poor planning and a waste of taxpayer dollars. We like the Alternative B plan for the Moose entrance station. We thank you for this opportunity to comment on this very special area of Grand Teton National Park. It should remain as unspoiled as possible.

September 3, 2014

Grand Teton National Park
ATTN: Moose-Wilson Planning Team
PO Drawer 170
Moose, WY 83012

Dear Sir or Madam:

I attended the open house on August 28, 2014 for the Moose-Wilson road. After a few preliminary remarks and a personal introduction, I will provide detailed comments on a range of issues.

The status quo is unacceptable, and I do not like any of the four presented options. Something needs to be done to preserve the wildlife and wildlife habitat in this area of the park and to enhance the visitor experience. The road serves a growing number of people with different desires, and it seems to be satisfying no one. People who view the road as a quick way to Moose and beyond are increasingly finding road conditions to be challenging. People who wish to view wildlife in a relaxed, unobtrusive way are no doubt frustrated by increasing traffic counts. People who bicycle the road no doubt find the experience challenging and not as enjoyable as it could be. People who journey to trailheads often find too many people and cars. To find an acceptable solution that balances all of the interests will be quite difficult. I certainly don't know at this point what the best answer would be, but I can certainly tell you what I think

is, and will be problematic.

I reside in a subdivision along the Moose-Wilson road. I have been using the Moose-Wilson road since 1995. Wildlife are important to me. I enjoy photographing them behaving naturally, and I enjoy being in relaxing, peaceful scenery that should be a major part of any national park experience. I enjoy bicycling on a road bike, and I have done a lot of it in my lifetime in a variety of settings. I commuted to work in a major metropolitan area for decades; I have bicycled in a number of national parks and scenic areas, and I have bicycled our west coast highway from Seattle to San Luis Obispo. I have worked to establish trails, including bicycle trails in, of all places, Las Vegas, Nevada. Preserving our natural heritage for present and future generations has been a career goal and personal interest of mine.

Grand Teton National Park is noted for world-class scenery and wildlife. The Moose-Wilson road is notable for its wildlife. Over the years I have observed and photographed black bear, moose, elk, deer, fox, coyote, beaver, great grey owls and a variety of other birds. Documentary films have featured beavers and their ponds along the Moose-Wilson road. Anything that adversely affects wildlife and their habitat in this national park should be seriously considered since this national park and its iconic scenery would not be the same without its large numbers and varied wildlife.

It is easy to first say what I don't like.

I don't like proposals to pave the unpaved portion of the present road. Paving the road, straightening the road, and other road improvement measures by themselves will only encourage more people to use the road and to drive at higher speeds. This is bad for wildlife and poses problems for those who wish to travel at a slow pace and enjoy the scenery and relative backcountry byway experience.

Realignment of the present road will likely disturb additional wildlife habitat and also lead to increased traffic and speeds. Some wildlife habitat may be enhanced at the same time that other habitat is lost. The present footprint of the road is significant. Why increase it further?

I absolutely do not like the suggestion that we place a separate bicycle path in this corridor. There are already a number, a growing number, of places where bicyclists can bicycle in the valley. Most of the dedicated pathways are in areas with good visibility and long sight lines. Placing a bicycle pathway in the Moose-Wilson corridor only serves to impact wildlife even more with the loss of habitat and increase in human-wildlife close encounters.

There are no limits to the volume of traffic on the road and not enough limits on the type of vehicles. One could say that a natural limit would be grid lock or bumper-to-bumper traffic on the road. This year, during July and August I would say that there have been times when the road was getting to that point. At times, the backup at the Granite ranger station has gotten pretty bad. I have seen a growing number of taxis on the road, and I can only imagine that they are using it as a short cut from the West Bank to the airport. I have seen large pickups with campers, and I have to wonder what it is like when they round a blind curve or encounter another car on an especially narrow section of the road.

More people are pulling off to the side of the road when it is either not permitted, or there are inadequate pull offs.

The sign at Teton Village indicating that Grand Teton National Park is dead ahead is inappropriate. It suggests that anyone, with any vehicle, at any time can conveniently enter the park a short distance ahead.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

It is not until later that one reads signs indicating that the road ahead is not suitable for large vehicles, RV's, and trailers. Even then, it is unclear that the road ahead could be very rough and slow going. This summer I observed at the Granite entrance station a large RV pulling a car behind it had made it all the way to the entrance station where it was turned around after delaying all those who were behind it. Better signage may have prevented the driver of the RV from making it that far.

Since there is no entrance station on the north entrance and few signs indicating the situation for the road ahead, those who take the Moose-Wilson road may not know exactly what lies ahead. On the other hand, more signage on the north end of the road might entice more people to take the Moose-Wilson road all the way to Teton Village and beyond - thus exacerbating present day problems.

Here are some of the things I like about our present Moose-Wilson corridor and some of the proposed alternatives.

I thank the Rockefeller's often for their contributions to Grand Teton National Park. I was told years ago that the unpaved portion of the road was that way because the Rockefeller's wanted to limit traffic past their JY Ranch. I understand that documents conveying the road and ranch to the Park Service specify certain conditions on the road that would preserve its rural character. This would be in line with what I have observed at the Lawrence S. Rockefeller Preserve - an effort to limit numbers to preserve a quality experience for those who seek it. (I am referring to the unpaved parking lot, of limited size, which requires people to sometimes wait to park their vehicles.) This vision and desire by the Rockefeller family is one reason I praise them for their efforts to preserve Grand Teton National Park for present and future generations. I like the "Goals and Desired Conditions" listed in the handout for the August 28 open house.

I like Alternative A in theory, but in practice Alternative A is failing with the increasing traffic every year. The unpaved portion of the road deters some traffic along with the unpaved road that develops potholes with increasing traffic and with rain. I like the road's rural character, but the increased traffic sometimes leads me to look more at the cars ahead than the scenery and wildlife along the way. I like the fact that the road closes in late fall and opens in early spring. For those who desire access to the northern portion of the road, it is open all year. For those who desire a quiet time on the road, the seasonal closure provides that. A major problem with Alternative A is that there are no limits to traffic.

Alternative C provides an adaptive management strategy for limiting traffic during peak periods. I like that in theory, but I am not sure how it would work in practice. How many vehicles would be appropriate at any one time, and how would that benchmark be determined? Since vehicles passing an entrance station could be going to park at the Rockefeller Preserve, a trailhead, a roadside pulloff, or to observe wildlife, how would the number of vehicles on the road be determined? A control point, e.g. entrance station would probably have to be built at the northern entrance to the road. I like the suggestion of better signage at both entrances that would somehow indicate traffic conditions ahead and regulate traffic numbers, but I would have to see further details before I could fully support this suggestion.

There are examples of where traffic on roads can be limited. The road through the tunnels in Zion National Park is restricted to alternating flows of one-way traffic. Often, construction on stretches of road are limited to alternating flows of one-way traffic through the use of automated, synchronized temporary traffic lights or flagmen. While I do not believe long periods of one way traffic on the Moose-Wilson road in the park would be supported by many, consideration of alternating, one-way traffic flows, as I have outlined, may serve to limit traffic and enhance the experience of drivers who would not have to contend with oncoming traffic on a narrow, winding road. Drivers could be forewarned that one-way traffic flows

would alternate on, for example, every hour. Those who wish to stay in the corridor would know when to leave to catch a desired flow of traffic. In an emergency, a driver could travel against the flow of traffic. A downside would be longer lines at the entrance stations, or control points, while traffic waits to enter the restricted roadway.

Alternative C suggests closing the road for two days a week. This presumably would provide those seeking solitude on the road and non-motorized travel an opportunity. Again, it sounds good in theory, but how would it work? Which days of the week would be selected? What about those people who come here for a vacation and wish to see the Moose-Wilson corridor only to find that they picked the wrong days? Will everyone who wishes to drive the corridor shift their times to those days right before and after the road closure, in which case traffic demand will be even worse for those days? What if the numbers using the road on those "closed" days were embarrassingly small?

I like the present seasonal closure dates for the road. I've gotten used to them as I am sure many people have. Why change them? What is the criteria for changing them? I could understand changing them to further protect wildlife during certain periods, for example, when bears were on the road in the fall eating berries, but those dates could not be set in stone. What about those people who wish to view the wildlife?

Wildlife viewing along the road at certain times of the year can be problematic, especially with increasing traffic volumes. I have wanted to pause for wildlife only to find people behind me anxious to get by. On the other hand, I have encountered wildlife jams and wanted to avoid the mess altogether only to find that I could not move. Sometimes the Wildlife Brigade is there and sometimes not. There seems to be no easy answer to this problem; however, increasing traffic levels and speeds on the road can only exacerbate the problem.

Alternative C provides for some modifications by providing better pulloffs. I like that.

Alternative D proposes realignment of portions of the road. I would question the value of habitat being lost to realignment of the road, particularly east of the beaver ponds. I have seen elk and moose in that general area. The great grey owl may range in that area as well. A realignment of the road may increase speeds of the vehicles because the road surface would be in better shape and straighter. That may adversely affect wildlife. During construction of the new road alignment and possible rehabilitation of old roadway, wildlife could be severely impacted by the construction machinery and activity. I would like to see more data on wildlife and wildlife habitat in the Moose-Wilson corridor before I could weigh better the pros and cons of realigning the road.

The Alternatives with a realignment of the road state: ". . . new road segments would be constructed to emulate the slow-speed narrow, winding character of the road corridor." There are times when I feel the present speeds on the existing narrow, winding corridor are too high. The posted speed limit for much of the road is 25 mph, but I feel this is too high when one looks for wildlife, or when one rounds a curve with oncoming traffic. Again, any road improvements that might increase speeds and encourage increased traffic on the road should not be adopted.

Alternatives B, C, and D propose expanding the Death Canyon trailhead to 60 vehicles. I have used the present parking areas at the Granite Creek and Death Canyon trailheads over the years, and I have seen, on occasions, that they are crowded. I question, though, the proposal to expand parking to 60 vehicles. That number of people on the trail may detract from the backcountry experience that people may seek on these trails. Using the Rockefeller Preserve parking lot model, it may be better to limit the parking at these areas than to try to accommodate demands at any one time. Perhaps parking permits could be issued at

the entrance stations for these trailheads to limit the parking? If we just look at the parking situation at Jenny Lake where it would seem there should be ample parking, in practice, in the summer, that large amount of parking is not enough.

Over the years I have observed an increasing amount of commercial activity on the Moose-Wilson road. This year, in particular, I have observed an increased number of taxis. I commend the Park Service for drawing attention to this activity, and I would support limiting this type of activity in the Moose-Wilson corridor, in particular taxis. I have to believe that most of the taxis are using the Moose-Wilson road as a shortcut where speed is important.

I have used the Moose-Wilson road in the winter. I do not believe grooming the road is necessary and worth the expense.

I do not have all of the answers to the many issues posed by the Moose-Wilson Corridor Comprehensive Management Plan. I don't think anyone does, and I support the Park's efforts to study the various issues and solicit comments. Whatever course of action is developed will take time to implement. Additional resources will be required to implement a variety of measures. I would expect the final recommendation to be based upon a phased approach. Some things may be implemented quickly and may not require further study. Other measures may require further evaluation after their implementation.

I am aware of the Park Service's limited financial resources. There are many demands for the money the Park Service receives from Congress and from entrance fees. The increased money required to implement recommended measures for the Moose-Wilson corridor will have to come from somewhere. I would like to suggest a few things that are not in any of the presented alternatives and that go towards the goals of protecting wildlife and wildlife habitat and enhancing the visitor experience

Part of the problem with the Moose-Wilson road is perception. People have different perceptions of the present day road. For those people who perceive the road as a shortcut into the main part of the park and beyond, they will likely advocate for more pavement and improvements to the road. Traffic volumes and speeds will only increase as more people accept this perception of the road. I propose that the Moose-Wilson road in the park be labeled in maps and on signs as a "Backcountry Byway." This will indicate to people that the road is not a thoroughfare to be traversed quickly and that it is a road to be driven slowly - with the expectation that there will be something to see, e.g. wildlife. When I see a Bureau of Land Management's "Backcountry Byway" I know that this is a journey that will be leisurely and reveal sights that are seldom seen by those in a hurry on more traveled routes. Isn't this what we want for the Moose-Wilson corridor?

The costs in maintaining the existing road corridor (Alternative A) are relatively small when compared to major changes to the existing road. Dust suppressant chemicals and grading of the unpaved portion of the road occurs three times a year, and the costs can add up. It may be tempting to reduce these costs by using gravel or pavement on this section of road, but that could lead to unintended consequences. Traffic volumes and speeds would likely increase. In the case of gravel, broken windshields and periodic grading may result. Gravel would also make it difficult for thin-tired road bikes to use the road. If traffic increases on the Moose-Wilson road, maintenance expenses can be expected to increase.

Increased costs for implementing the proposed additions to the Moose-Wilson corridor will have to be paid out of an increasingly taxed park budget. One suggestion to pay for increased costs for increased services for the Moose-Wilson Backcountry Byway would be to charge a small user fee for this area of the park. This fee might deter some people from using the route as a frequent, shortcut through

the area, but it would also fund in a more timely fashion some of the improvements to the area that most people could agree upon. If it could be made clear that the nominal user fee (similar to fees charged for backcountry use) were expressly devoted to the Moose-Wilson corridor, e.g. dust suppressant and road grading, then people would more likely support such a fee. Without additional funding to mitigate the increasing impacts in the area from increased traffic, the present situation for the Moose-Wilson corridor will only get worse.

I hope this lengthy letter will be useful in your deliberations. If I can be of further assistance, let me know. Otherwise, I look forward to the next stages of your planning process and hopefully an improvement of the Moose-Wilson experience.

Sincerely,

Jeff van Ee

Moose-Wilson Rd.

We support alternative A - but as an additive important idea; we also would include adding more & bigger turnouts for the many people that stop & stay in the middle of the road looking for wildlife etc.

I do not feel it is safe to add a bike lane - with all the bear & moose near the road. And the bicycles have many other roads - the road to Teton Village & Hiway 89 (town to Moose & into the parks - taxis from the airport do not need to use this road at all!

Changing the day s and/or hours of having the road open would be very confusing to tourists!

Turnouts could be put by the old R Lazy S Ranch location & by the old ranch roads.

No big R'V's allowed on the road - please!

Dear Sir or Madam:

On behalf of the National Trust for Historic Preservation, I am providing comments on the preliminary-alternatives for the NPS Moose-Wilson Corridor Comprehensive Management Plan.

The National Trust is a private, non-profit corporation that helps people protect, enhance, and enjoy the places that matter to them. Chartered by Congress in 1949, the National Trust protects and defends America's historic resources, furthers the historic preservation policy of the United States, and facilitates public participation in the preservation of our nation's diverse heritage. 16 U.S.C. § 468. We have had long-term involvement with the National Park Service and its stewardship of historic properties, particularly at Grant Teton National Park.

Over the past 10 years, the National Trust has been deeply engaged in preservation of the 1913 White Grass Ranch, a National Register Historic District located along the Moose-Wilson Road. We have raised nearly \$1 million to help the Park secure the future of this property by rehabilitating 13 buildings on the thirty-acre ranch, and ensuring its continued use by the NPS as the Western Center for Historic Preservation. Because of its historic significance and the National Trust's broad organizational investment of time and funds, we named it as one of our National Treasures in 2011.

We have reviewed the preliminary alternatives and have several significant concerns about fundamental changes to the area proposed in all but the No Action Alternative. When concerns about the Moose-Wilson Road were raised in the 2007 transportation plan, we were unaware that any solutions could

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

potentially impact the White Grass property and learned about this issue just last week while attending meetings at the Park.

First, we are very- concerned that Alternatives B, C and D all contain the addition of a "new parking lot for 60 cars" to be located either at the current Death Canyon trailhead immediately to the west of White Grass or at the junction of the White Grass Road and the Death Canyon Road just to the southeast of the property. While the alternatives document does not explain the number of spaces currently available for parking, our first hand knowledge of the area leads us to believe that there are far less than 60 spaces, and that most of that is disbursed. We are very uncomfortable with the notion of adding a large, formalized lot holding 60 cars which we believe has the potential to impact the setting of the White Grass National Register District. While we understand concerns about congestion and parking in the Moose-Wilson Corridor, we feel that more disbursed parking, rather than parking concentration, is preferable to retain the setting and feeling of the area.

Similarly, our second concern is regarding the proposed alterations to the Death Canyon Road and the White Grass Road. When the environmental review was being undertaken for the rehabilitation of the White Grass property, we heard quite clearly from the public that they DID NOT believe that additional traffic was beneficial nor welcome on the Death Canyon Road and were concerned that White Grass not be viewed as an additional "attraction" which would bring more traffic and visitors. We are not sure what has changed that would now lead NPS to direct even more visitors to the area via road improvements and alterations in this area.

Additionally, we were horrified to see that Alternative D proposes to abandon Death Canyon Road and moves all traffic going to the trailhead onto the White Grass Road. The reopening of the White Grass Road was undertaken as part of the rehabilitation of the property to reestablish historic access and the historic landscape and to provide limited administrative access. This historic route was not built to accommodate the volume of traffic that will correspond to the planned parking area, and at most, current traffic counts are not more than a few cars a day.

We strenuously object to this part of Alternative D, because if adopted in conjunction with the parking recommendation, it would mean that all trailhead-bound traffic will intrusively cross through the Historic District, altering its setting, feeling and association and changing the character by the introduction of numerous vehicles and associated noise, dust, etc.

Without addressing these concerns by making appropriate revisions to the alternatives, the Plan's "Desired Conditions" for Cultural History and Resources - such as safeguarding cultural resources to "preserve significant attributes. . . that contribute to historic significance, that cultural resources are "managed in a sensitive manner" and that "management actions. . . do not degrade their historic integrity or significance" - cannot be successfully realized.

Finally, it does not appear that we were contacted by the Park regarding its planned compliance with Section 106 of the National Historic Preservation Act. We are interested to learn how the Park intends to meet that requirement and would like to be a Section 106 Consulting Party for this undertaking. Thank you for considering our comments and please include us in future correspondence about this project.

Sincerely,

Barbara Pahl

Correspondence Text

September 10, 2014

Dear Moose-Wilson Rd. Planning Team,

Thank you for the opportunity to comment on the preliminary alternatives for the Moose Wilson Road Corridor. I've traveled/commuted on this road regularly for more than 30 years and I hope future generations will experience similar extraordinary experiences. The National Park Service must protect this sensitive unique wildlife area for all United States citizens, not for special interest groups in our one small Jackson Hole community.

I've reviewed all four alternatives in detail and though excellent ideas exist, there are some major flaws in all the alternatives which would prevent us from achieving the seven goals outlined by the Park in the preliminary newsletter. Rather than pick each alternative apart in detail, I will express my major concerns and suggestions.

Alternative A

Unfortunately the road cannot sustain the current traffic levels. Im part of the 38% who commute and that number will only grow if this alternative is chosen. The roadside side is suffering resource impacts, riparian lands are being compromised and commercial use is mushrooming, i.e. both taxis and wildlife tours. Fortunately the road width and speed deter some commuter traffic. I would hate to see nothing done but it would be better than Alternative D.

Alternative B

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

I support many elements of this alternative but dont see how the goals can be achieved with a two -way road. I strongly encourage a one way road such as done in other Parks and right here in Grand Teton National Park by Jenny Lake.

Alternative C

This alternative would be a management nightmare.

Alternative D

I oppose this alternative for many reasons: caters to special interests, fails to meet the Park Service Organic Act and the Laurance Rockefeller Conservation Easement, ies unsafe for people to be mingling with grizzly bears, puts recreation first and Park values last, destroys and segments habitat, caves to local County short sighted government.

Lets honor the Organic Act and either make the road one way, shuttle people or close the road from Teton Village to the LSR.

Please:

Maintain and/or decrease the vehicle speed

Allow no net increase of pavement within the corridor

Permit no increase in habitat disturbance/fragmentation

Permit no removal of large numbers or trees and vegetation

The National Park Service was created in the Organic Act of 1916. The new agencys mission as managers of national parks and monuments was clearly stated.to conseive the sceneiy and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will l leave them unimpaired for the enjoyment of future generations."

Sincerely,

Kim Springer

Comments on the Moose-Wilson Corridor Comprehensive Management Plan - Preliminary Alternatives Submitted by Beverly Boynton, Kelly WY September 9, 2014

Thank you for the opportunity to offer some thoughts on the Moose-Wilson (MW) road. The 4 alternatives each have ideas with which I agree or disagree, and some that I do not have strong feelings or sufficient information to voice an opinion. For that reason, I will discuss my thoughts independent of which alternative they are associated with.

The MW corridor as road: The road should not primarily be thought of as a through corridor. Rather, it offers access to various areas of the park for a variety of park users, in addition to itself being a way for visitors and locals to experience a peaceful, winding road in amazing habitat. Your study shows through drivers are a majority of road-users; measures can be taken to discourage fast-transit driving. A continuation of some current practices, and the addition of a few simple measures are sufficient. To that end:

- â— Keep the unpaved portions of the road unpaved, winding and narrow. This slows speed.
- â— Lower the speed limit- -25 mph? Entrance stations can have signs and information that notify people that MW is for slow-moving traffic, as opposed to being a quick shortcut to points south. Patrol to ensure compliance. Perhaps volunteers could be used to flag fast drivers down (similar to road construction flaggers).
- â— Increase education at entrance stations, informing drivers of speeds, the purpose of the road (i.e. slow, tranquil enjoyment, access to park use, and only secondarily as a through route), and when peak times are.

- â— Continue to ban taxis, restrict RVs, trailers, and other thru-traffic commercial vehicles.
 - â— Explore road engineering to keep speeds slow, such as speed bumps.
 - â— Explore further public transit and commercial wildlife vehicles. Park and Moose workers could be encouraged/mandated to use a shuttle service to work (similar to JHMR workers). Such public transit vehicles should have the ability to carry bicycles (as do buses in Seattle).
 - â— Increase small turnouts at specific places (so traffic can continue to slowly flow through)
 - â— The road should remain 2-way, and should be open end to end. The habitats change from one end of the road to the other, making a more interesting, informative drive. If it were a 1-way road, I think people would have a tendency to drive faster on the return trip.
 - â— Keep the road open at night. The MW road is a very special place in the twilights and in the dark, a place of mystery and tranquility- -even more so than during sunny daylight hours. In fact, we seem to have forgotten the beauty of nighttime! I have not heard valid reasons to close the road' are there wildlife collisions (I haven't heard of any), and is this lighter traffic load affecting wildlife? There are also late-returning hikers and climbers that need to drive out. The signs along the main highway within the Park that remind drivers that night speed is lower seem to be working. Try this before cuffing off access to this remarkable time of night.
 - â— Travelers who choose to use the road to get from Moose to the Village and beyond must be prepared to drive slowly and to experience some degree of congestion. I don't use the MW road a lot, but when I do, I am prepared to go with the slow flow. Patrolling so cars do not stop in the middle of both lanes would help.
 - â— Generally, the simple ideas should be implemented, the result on traffic congestion evaluated, then if necessary more severe restrictions could be added later if needed.
- The alternatives that include reservations, queues, and 60-car parking lots are over the top, and involve more land disruption, and destruction of a natural-seeming landscape. They don't get one in the mood or a tranquil period of nature discovery!

The MW corridor as wildlife habitat: Realignment of the road out of the wetlands is an interesting idea. I would like to know more about the effect construction and realignment would have on wildlife and on removal of vegetation that serves as both cover and food sources. Of course wildlife includes more than bears; what is the effect on birds, smaller creatures, insects, the whole ball of wax. What do Park biologists think about this? I support closing the road when there are potential conflicts with wildlife, such as when the bears are feeding heavily in the fall, and the use of the volunteer Wildlife Brigade to help manage wildlife viewing congestion. I wonder how the Murie Center and White Grass Ranch fit into the overall plan for this area?

Bicycles: obviously a separate bike path would be safe, get heavy use, be a wonderful activity, and I would use the path. But does a separate pathway overly fragment habitat? Does it remove too much undisturbed land? Have inventories of plants, animals, birds, insects, soils, etc. been done? Again, what do the biologists say about such an impact? I understand there is an archeology site in one of the proposed realignment areas- -what do your archeologists say about this?

User groups: I remind the Park that bicyclists are just one of many user groups. I am firmly opposed to the idea of closing the road to motor vehicles two days per week, or allowing only non-motorized access as early as October 1st. This would negatively impact climbers, hikers, walkers on the Valley Trail, those that choose to or are only able to experience this area by car, and other user groups. These are traditional uses that not only are enjoyable to the user, but also result in an appreciation of the importance of our wildlands and wildlife. Climbers and hikers often need access quite early and late in the day in order to safely and successfully complete their projects.

Non-winter trailhead access: parking should be dispersed, lots small in size, and should remain rustic (i.e. dirt, log barriers). To that end, a combination of parking at White Grass Ranch, with continued parking on the road to Death Canyon Trailhead and at the Trailhead is appropriate. An occasional grading of the road from White Grass to the Trailhead would help. What are the plans for visitors at White Grass?

Winter Access is a big issue if winter plowing stops other than at current places. Death canyon is an important and popular backcountry ski location (Teton traverses, the south end of Maverick, Aibright, Banana Couloir, Olive Oyl). To add a roundtrip of 6 miles more would make this historic and important activity more than most could handle. A resulting impact would be a shifting of skier use to the Taggart parking area, which already sees heavy use (both in the parking lot, and on the ski terrain accessed from here, such as the north end of Maverick, 25 short, and other places). Other winter uses such as iceskating on Phelps Lake and ice climbing on Prospectors would become quite difficult, if 3 miles each way were to be added. Please do not effectively end these traditional winter uses of the Death Canyon area. I support the gentler activities closer to the road that a place like the LRP caters to, but please be aware that many of us are able to go far deeper into the mountains, and we are experiencing the Tetons in a magnificent way. Be careful not to constrain this type of user.

Winter grooming of the road for Nordic (for both skate and classic, which require a groomed track, as opposed to touring which does not need a groomed track). Keep the section of Moose-Wilson Road from the Death Canyon Road junction to Granite Canyon trailhead (we are used to it!). Grooming would have a lot of benefit without much impact. The county seems eager to assist in grooming, the park has a groomer, and Jackson Hole Nordic (jhnordic.com) is busily promoting the idea of the area being a destination for Nordic skiing. Unlike backcountry skiing, congestion on Nordic trails is not a problem. I support this idea.

North MW Entrance station: rather than have 2 stations, or realigning the entrance roads here, just move the entrance station to the east.

Sincerely,

Beverly Boynton

██████████

Kelly, Wyoming 83011

Last minute additional idea: eliminate parking at LRP [Laurance S. Rockefeller Preserve]. Use a shuttle bus (small, from each end) to transport people to & fro the LRP. This would decrease many cars. Ideally, such a shuttle would include nature info stop if good wildlife. If the shuttle went as far as JHMR [Jackson Hole Mountain Resort], some could go Moose - -> LSR - -> JHMR - -> LRP - -> Moose.

To: Grand Teton Park
Re: Moose Wilson Road

Thank you for seeking input into this issue but making everyone happy is very minor.

Please step up and protect your park from the County Commissioners who pressure you to solve their transportation problems from their expanding tourism.

This section of your park is a natural rare wonder and must be saved from destruction.

1. No bike path. No need for a recreational loop and landscape being paved for it. A great U that allows access and fun for people already.
2. Look into the GPS and hotel sites that direct visitors to Teton Village from the airport by this road. This is why the study (Utah) showed nobody got out of their cars!
3. Explore closing the road 2 days a week for bikes in summer. Make the times & days regular.
4. Prohibit taxis and big buses. (Only in the last couple years has this commercial use been happening.)
5. Make this road a destination not a transportation arm.
6. Don't pave the South part. Rockefeller knew what he was doing when he did not pave it.
7. Don't groom the road in winter for skiing.

Please don't destroy this treasure & fold under business/commercial pressure. Once gone it will be gone forever. (There is no room for "woops we made a mistake.")

Jean Ferguson

September 12, 2014

Superintendent David Vela
Grand Teton National Park
PO Drawer 170
Moose, WY 83012-0170

Dear Superintendent Vela:

On behalf of the Jackson Hole Chamber of Commerce I would like to thank the National Park Service for your process to ensure a thorough and comprehensive public engagement so that the future of the Moose-Wilson Corridor reaches the best outcome for our community and our nation's treasure. We again reiterate our shared goal of preserving and protecting the Moose-Wilson Corridor and our national parks. We appreciate the difficulty of developing a management plan that balances the requirements from the language of the Organic Act that created the NPS nearly 100 years ago: "...purpose is to conserve the scenery.... and...provide for the enjoyment...and... leave them unimpaired for the enjoyment of future generations." We understand that the management plan for the Moose Wilson Corridor will be ultimately designed and selected by Grand Teton National Park. We appreciate being invited to add our input so that our voice can be considered during that process.

Respecting the power of place is core to the Jackson Hole Chamber of Commerce's brand. It is our position that our economy, community and environment make this place special and additionally that they're completely interrelated. The Chamber is aware that studies exist and continue to be conducted on

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

this issue and we will take these into account post publication for future comment.

It is through this lens that we make our public comment. The Chamber continues to support a sustainable Moose-Wilson Road open to two-way traffic every day. A significant cross-section of our membership and Teton Village on the West Bank will be affected by limited access of any nature. Some of our membership is concerned that partial or full closure of the corridor would reduce business levels and in turn harm their ability to provide jobs and sustain their businesses. The corridor provides access largely for tourists and to a lesser extent locals to unique scenery within the national park that is both a core value of the park, and a reason that many visit the park. Additionally, the corridor open in two directions would allow some motorists wanting to get from Teton Village to or from Moose to shorten the trip by nearly 30 miles. This reduction would decrease deadly high-speed wildlife-vehicle collisions that would occur by going around on the highway, and reduce greenhouse gas emissions caused by the extra miles driven inside the park.

The Chamber also continues to support the pathway, preferably separated, along the entire section of roadway under review to the extent allowed or supported by current regulations and forthcoming environmental studies. Cycle tourism is a growing industry and that segment would complete a valley loop already established in the park- -further securing Jackson as a world-class cycling destination, attracting more park visitors using non-motorized means, and strengthening our community's tourism economy. A separated pathway would provide a safer experience by keeping motorized vehicles away from hikers and bikers which in addition to potentially saving lives is also a foundational need for growing cycle tourism and promoting non-motorized use. More non-motorized use in lieu of motorized use means protection of natural soundscapes and a reduction of greenhouse emissions, both of which would help contribute to the experience our visitors seek.

Thanks again for engaging in this public dialogue. We truly believe that the solution for managing the Moose-Wilson Road and Corridor can reflect the mission of our most valued resource, our national park, while aligning with the community and the mission and vision of the Chamber. Please find our responses to the public comment questions on the following page.

Thank you,

Anna Olson
Chair - Jackson Hole Chamber of Commerce

Jeff Golightly
CEO / President - Jackson Hole Chamber of Commerce

cc: Moose-Wilson Planning Team
Teton County Board of County Commissioners
Jackson Town Council

Question 1: Which strategies in the preliminary alternatives do you think should be carried forward to best achieve the purpose and address the need for the plan? Why do you think they should be carried forward?

Please see the letter above. Additionally, the adaptive management strategy identified in alternative "C" (limiting the number of vehicles entering the corridor at any one time during peak use through timed

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

sequencing techniques) seems to be more visitor / customer centric than some of the other adaptive management strategies. The reservation system in alternative "D" would seem to be difficult to administer for reasons not limited to: cell coverage and outage issues, lack of smartphones among some users if using an online or app system, and missing reservation times because of travel delays. These and other issues related to a reservation system could cause a great deal of operational headaches for users, Park employees, and community members trying to explain the system to visitors. The Chamber understands some sort of adaptive management may be needed and look forward to more detail on the science behind why and how it might be managed before making further comment.

Question 2: Which strategies in the preliminary alternatives do you think would not achieve the purpose and address the need for the plan? Why do you think they should not be carried forward?

Please see the letter and answer to question 1 above. Additionally, the closures on some days to vehicle traffic (as proposed in Alternative "C") could be very confusing and frustrating to visitors. We imagine that many people would arrive at the road thinking they could pass through the corridor only to find out that the road was closed that day. A management system that is consistent on a day-to-day basis is easier for visitors to understand and would reduce potential frustration.

Question 3: Are there other strategies that should be included in the preliminary alternatives that are not already presented? If so, which strategies and why should they be considered?

Please see letter above. Additionally, if a separated pathway option is not supported by the park's environmental impact study that is still forthcoming, please consider a connected pathway or lane for non-motorized use. This could still encourage non-motorized use and remove more cars from the corridor as well as provide a safer experience for all users.

September 10, 2014

Grand Teton National Park
ATTN: Moose-Wilson Planning Team
PO Drawer 170
Moose, WY 83012-0170

Dear Planning Team,

I have been drawn to the Moose-Wilson road debate that is now taking place in Jackson. I find the debate centering around three basic components of the discussion which I see as money and development interests, bikers, and transportation issues, all confined to the local population. I have read where all of these issues have been truly discussed at all levels on both sides. Yet there is one group not represented in this discussion and they are the owners of the park, the people, me.

This park is a jewel, for those that come to see nature in its own environment. I have spent many days on this road watching moose, elk, deer, and an occasional black bear. I realize what will happen if this road is improved. First the animal sightings will become less, second more car kills, third, more air pollution, fourth, more environmental degradation, and last, an evermore urbanization of the park.

If the visiting population desires urban living, they do not need to find it in an area set aside for nature. There are numerous parts of the country, in local and state parks for this type of recreation. I have observed in this park what bike paths and better roads have done, which has contributed to less sightings

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

and higher volumes of traffic, We don't need all places in this park for everyone to take all means of transportation to all parts of the park at higher speeds. Please keep it the way it is.

Personally I would love to see the south end of the road equal to the road to the Bar BC to slow down traffic. If this road comes to pass the north end should run through the park gate not down past the Murrie center road and old post office. Those going into the park from the south should have a park fee sticker booth staffed, 24/7. The numbers of times I have gone through there without being checked are to numerous to count. What is the positive impact on the park for doing this? Is the impact long term, or for the next thirty years when someone wants to put in a four lane road from Yellowstone to Jackson.

My family has enjoyed this park for many years; I hope my grandkids will see it as I have with few changes.

Sincerely

David Dobkoski,
Park Owner, CEO of The Teacher Restoration Corp Inc.

Comments Moose-Wilson Road 9.13.14- submitted Frances Clark, Wilson, WY

The following comments are based on reviewing M-W Rd Preliminary Alternatives Newsletter and Corridor Use Report - 2013 Data as well as walking several of the proposed routes outlined in the Alternatives. The points are organized first with my overall preferences /concerns, and then taken point by point by Alternative. No one alternative supports the goals; however, a mix of ideas from each can be beneficial.

Overall Comments:

Goals and Desired Conditions: Excellent: Well expressed and detailed. Totally agree. Thank you!

Realign north end of Moose Wilson Road to Death Canyon Road: This restores the wetland values and ecotone vital to a variety of wildlife. Have one north entrance station, not two. Move it to the north as indicated to provide for better wildlife (mule deer) corridor to the south and more control over traffic/use along the M-W Rd and into the rest of the park.

Reduce use of M-W Road as a through-use road: This road should be designed as a park road for viewing and appreciating nature and should not be considered a through county road.

" Do not pave the re-aligned road to the north nor the M-W road section to the south. Paving enables faster traffic and encourages more road use. Both are disturbing and dangerous to wildlife movement

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

from elk to squirrels.

" Stop widening the road, indeed narrow it back to earlier condition: While improvements to grading/drainage and dust abatement of the existing road are appropriate and needed, the road should not be incrementally widened as is being done now-in fact it should be reduced back to earlier conditions of 10 years ago. Narrow, winding, dirt, and some pot holes are all natural traffic calmers and deterrents to pass-through use.

" Reduce speed limit to 15-25 mph and enforce it. This protects the surrounding resources and provides for enhanced park visitor experience.

Bicycle Use: Do not build a bike path or grant special privileges: The bike path degrades natural resources. It broadens and adds significantly to the length of the human corridor, thereby, directly and permanently reducing the size and quality of plant and wildlife communities and the connectivity between these vital areas:

" Construction will permanently remove vegetation, destroy natural soils and topography, alter wetlands and streams, add miles of impervious, man-made surfaces, and introduce invasive exotics. Not only is wildlife disturbed directly along the bike way, but also for IOOs of yards beyond into adjacent habitat, due to noise and motion. Natural wildlife movements both locally and throughout the area are disrupted.

" In addition, potential for direct conflicts of people with animals: e.g. bear, elk, moose, even small mammal is increased.

" Bicyclists should not be given preferential use as shown in Alt. c. and Alt d. They are only 2-3% of total vehicles (and 1% of users) and the great majority are pass-through users-not slowing or stopping to enjoy a natural experience. Bicycling is fundamentally a recreational use, not a nature-based, contemplative, discovery activity appropriate to this section of the Grand Teton National Park. The cost of the pathway to both construct and maintain deprives other visitors, indeed other parts of the park, of much needed staff and financial resources.

" Bicyclists have miles of new bike paths already in the park and throughout the valley. They have biking alternatives in other cities and parks throughout the country. This section of the park provides a unique set of biologically diverse natural communities and wildlife corridor, found nowhere else within GTNP or the rest of the country. It should be preserved as such. **Visitor Use/Experience:** Prioritize options that minimize vehicle traffic while providing park visitors with a range of compatible, intimate, nature-based experiences:

" Maintain a scenic, narrow, unpaved, rustic road with low speed limit of 15-25 mph. 35 mph is fast for the winding roads and for nature observation. Close at night. This closure would further protect the wildlife during their critical night-time movements.

" Prohibit unrelated pass-through commercial traffic e.g. taxis, vendors, service vehicles, etc. Permit/provide nature/historic/art tours of less in small vans/buses. Provide access for photographers through a strict training and permit process.

" Offer a shuttle service between the south entrance to Craig Thomas Visitor Center during peak season (June 15 - Sept 15). If it is connected to a park-wide shuttle system, this can accommodate those who go straight through or who get off at the destination points along the way. It could also provide transportation for commuting park workers.

" Close road between Granite Canyon and LSR. When possible, allow through visitor traffic in quiet season. Bicycles can share the road with cars, but should not be given special closures.

" Have well-placed turnouts and parking lots that are naturalistic in design and reduce noise and visual pollution while providing trail access and scenic and wildlife viewing. This could reduce wear along edges of M-W Rd.

" Minimize disturbance of natural areas: For any construction, including restoration, of roads, parking areas, and pull outs reuse already disturbed areas-old roads, intersections, heavily grazed agricultural

lands.

" Preserve the relaxed, unhurried discovery on trails into natural plant communities with limited parking/visitor use. Too many people reduces the opportunity to see wildlife, enjoy tranquility, and maintain civility. Support non-intrusive, individualized interpretation/educational opportunities, as well as professionally guided tours: both private and NPS.

" Adaptive management subjects park staff to continual political pressure and ongoing complications. Any Framework has to be detailed, reviewed, and approved as part of the M-W Plan.

" Research needed to inform decisions:

- o Botanical inventories along all proposed travel routes, expanded parking areas, and turnouts, as well as restoration areas: throughout growing season, based on community types, and relative abundance of species. Sensitive or unusual species locally, park-wide and valley wide should be noted. Wildlife value of forage and cover should also be included, such as hawthorn stands and other berry sources for bears, birds, small mammals. Assess current status and potential colonization of exotic species.

- o Surveys on habitat availability, use, and value for common species- -Mammals: elk, moose, mule deer, black and grizzly bears, beaver, weasels, fox, as well as, small rodents: red squirrels, pocket gophers, least chipmunks. Birds: nesting raptors, great grey owls, osprey; sage habitat sparrows and towhees; night hawks and ruffed grouse; flickers and sapsuckers in aspen. Amphibians: chorus frogs, etc. All these species are present along this corridor and directly adjacent habitats.

- o Determine appropriate wildlife observation sites: where small groups of people gather to see common wildlife (see above list) with minimum disturbance to the species e.g. such as view over Sawmill Ponds. Also, observation points! trails through good examples of key habitats including wetland mosaic, streams, sagebrush shrubland, aspen groves, spruce fir /lodgepole pine forests.

- o Gather information/studies on wildlife reaction to various types and levels of human bicycling, hiking, vehicles, and tour/informal visitor groups in various habitat situations.

- o Determine visitor-use levels that maintain an enjoyable and safe visitor experience along roads, observation points, and trails with the goal to maintain civility, even friendliness, of visitors to encourage sharing of experiences. This creates a community which together enjoys the natural wonders of the park
- o Models for controlling traffic in other national parks or heavily visited public lands: controlled access, permit/reservation system, shuttle buses, etc.

- o Added details of traffic study: Where are the pass-through vehicles coming from and going to? The bimodal pattern: peaks at 8 a.m. northbound and 5 p.m. southbound should be researched more thoroughly: are they commuters to the park or just commuters/users to non-park destinations. Definition of Local may be too limited as summer residents and workers from Idaho are local in their habits. This will help with both county planning and park shuttle bus planning.

Alternate A: Wish we could keep the lower level of traffic, then Alt A. would be fine, with minor adjustments. But such is not currently the situation.

Alternative B: Many of the elements are good.

1. Traffic management: Agree with the need to reduce traffic and speed along M-W corridor to protect wildlife and to promote a nature-based visitor experience.

- a. Lower speed limits, but also enforce them I 35 mph is too fast, especially as people go faster than the speed limit. 15-25 mph makes the trip long for those wanting a quick pass-through trip. And it makes it safer for bicyclists.

- b. Do not pave the newly aligned road in N section. Except for the steep grade up the river bench in the N, the topography is relatively level. A well constructed, well graded road can be easily maintained and provide a rural sense to the area.

- c. Limiting pass-through traffic during peak periods (July-August) is a good idea, but question how to do

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

this without visitor confusion and administrative hassle. A shuttle service between S entrance and Craig Thomas Visitor Center which is also connected to other parts of the park is the best solution combined with a closure between LSR and Granite Canyon parking areas.

2. Two parking lots at LSR doesn't meet common sense criteria. Also this option doubles visitation to LSR which I understand is deliberately limited to current parking lot size. There are several areas around the lake etc. that are receiving heavy use already.

3. Realignment of N. end portion of the road restores and enhances wildlife:

a. Restores wetlands and vital ecotone with upland.

b. Allows for better wildlife (mule deer) corridor connectivity to the south east of N entrance.

c. Maintains popular overlook at Sawmill Ponds for visitor viewing (both cars and bicyclists stop here) with minimal wildlife disturbance. This is an ideal viewing situation with both people and wildlife safe.

Carefully design a route through sage-shrub habitat with a few pull offs (not major parking areas) and some short trails (note current informal trails) to add to visitor viewing of both wildlife and scenery.

Follow current old road to driveway approx. 1/2 mile north of Death Canyon, not to Jct w. Death Canyon, to reduce habitat disturbance.

d. Agree with new placement of N entrance station as it helps control traffic down M-W Rd and into rest of park. No need for new entrance station and restroom as proposed in Alt C. This would be a very large foot print.

e. Do not pave the new road. Maintain it as a narrow, graded, dust-treated dirt road to make clear this is a different area of the park with a more rustic, wildlife experience, with reduce speed.

Concern a: Conduct a botanical inventory of the new road and restoration of old road area (and any areas to be disturbed). There are some unusual plants for the park along the current section (*Perideridia bolanderi* (a yampah) and *Tritelia grandiflora* (wild hyacinth) at overlook and *P. bolanderi* south side of road towards Murie center. Also the corner at base of river bench has one of few places of Turkey Peas (*Orogenics lanceolata*) that I have seen in this part of park.

Concern b. Conduct a thorough wildlife survey for elk, mule deer, moose, bear and nesting birds. Elk often stand above on the higher bench to west on verge of trees in evening and migrate/move through this entire area. Also, I have heard many hawks in stand of trees next to Saw Mill Ponds parking lot. But overall road realignment appears beneficial.

4. Design of realignment S of Saw Mill Ponds to protect wildlife and natural vegetation, while providing wildlife and scenic viewing. General realignment of route is an improvement as it protects the wetland/montane ecotone to west. However, route it along the existing old road bed and portions of old landing strip to minimize disturbance of natural habitat. (see notes on map)

a. Do not go in where indicated on current plan. There is a vernal pool and wet meadow with chorus frogs just to the north of the current Sawmill Ponds Overlook area, as well as, a large stand of trees interspersed with many hawthorns.

b. Instead, continue along top of river bench, following old track. Have a few pull outs and even connect the pull outs with narrow foot path near the bench summit for people to peer down into wetlands.

c. If needed, add a small parking area where there is an old homestead: Large Norway Spruce and other non-natives.

d. Then angle W-SW through sage habitat along scenic old road to join current road south of wetlands and 3/4 mile north of Death Canyon ict. This area is already disturbed and could provide parking for winter. Alignment as a cross-road by Death Canyon not necessary.

e. Exact locations for pull-outs and small nature paths need to be determined to minimize disturbance to wildlife while enhancing wildlife viewing. The informal trails along the top of the river bench south of Sawmill Pond Overlook is a good indication of interest.

f. Place electrical wires underground to enhance view.

g. Need study for elk, moose, bear, mule deer movement/feeding, as well as sage-shrub habitat birds throughout this area, especially during their most active times.

5. Turnouts and Parking areas: Essentially agree. White Grass: Agree, as will restore habitat, including wetlands and accommodate heavy parking for both this natural and cultural resource.
 - a. It keeps popular trail to Phelps Lake Overlook as a short hike for casual hikes and still provides access to Death Canyon for back-country backpackers.
 - b. If expansion is necessary near jct of M-W and Death Canyon Rds, add instead to disturbed ranch areas to N.
 - c. Design parking areas to be natural in feel, not big paved areas.
 - d. Accommodate elk bugling audience in fall near White Grass Ranch.
6. Bicycles: Agree that bikes can use same road as other vehicles at same time (unless being used by bears-peak bear jams in August and Sept!) Do not provide special privilege to bicycles to ride when road is closed. Fall is a time when other visitors enjoy driving through to see wildlife. Furthermore, bicyclists are more vulnerable to dangerous encounters with bears and moose than people in cars! (Information on wildlife movements would give better sense of timing.) Always close if bears pose danger or potential major road jams.
7. Commercial activity: Agree to all: focuses visitor experience on value of nature while minimizing conflicts with wildlife. Consider permitting photographers after training and signing of contract within certain times. Emphasize shuttle as way for people to access destination points without using vehicles. With cell phones etc. it may be easier to schedule pick-ups and drop offs to make it economically feasible.
8. Death Canyon. Good. Restores habitat, reduces road surface, and concentrates parking at this popular destination point.
9. Winter Access and Use: Unless it has an impact to winter wildlife, allow access down to approx. Death Canyon Road Jct. This is an important access point for X-country and backcountry skiers. Adding 4 miles to the round-trip from North entrance is a lot. Do not groom trails as it is unnecessary. Also, this is one of the few park roads that winter visitors in cars can travel. Use is typically very low. At least plow down to Saw Mill Ponds overlook.
10. Visitor use: Like the goal of cuing and supporting visitors entering a natural setting that is unique and protected.

Alternative C: Focus on bicyclists for two days is inappropriate as gives preference a very small recreational user group.

1. Traffic management:

Designating 2 days for bicyclists (which comprise only 2-3% of vehicles with 79-84% going straight through July-Mid August) unfairly excludes other park visitors. Access to trail heads for hiking will, practically speaking, be only for bicyclists who in fact just bike through. Visitors could not reach LSR visitor center. Hikers would have to walk a long way down the road to trail heads. Backcountry hikers would also be limited to in and out days. Furthermore, the two-day closure is very confusing for out-of-town visitors.

This option encourages a wildlife incompatible use: bicyclists are more exposed, noisy when they are talking/yelling, and startling in motion than vehicles. They will either scare away wildlife or create surprise conflicts. Furthermore, the survey indicates that bicyclists are purely pass-through visitors, traveling close to the speed limit-they are not observing nature.

Closing the road as of Sept. 30 is a bit early if keeping it open is not impacting wildlife. Currently Oct. is a low use time. Always close it for nearby/unsupervised bear activity, and close road in early evening to past dawn in the fall to benefit wildlife. Close road at night. Provide shuttle service to trail heads. Accommodate dusk and dawn elk bugling opportunities through NPS or permitted wildlife tours.

Bicyclists can use road when other vehicles can, unless bear difficulties.

2. Adaptive Strategy: Traffic sequencing

" Concerned about how this would work administratively-need details.

3. Physical Characteristics:

Location and extent of M-W Rd N entrance-fee station with queuing lanes, turnaround, interpretation and restroom is poor option:

" The location of the station is in a vulnerable spot for plants and wildlife (see Alt B. Concern a above).

" Having two entrance stations so close together is an inefficient use of staff. Put together so there is staffing flexibility during the quieter season.

" Requires north-bound, left-turning traffic to go through 2 entrance station.

" Requires extensive pavement for queuing lanes. Gives urban parking lot/toll booth experience. Is unsightly from afar in this open habitat and inappropriate for the upcoming rustic/natural experience.

" Additional restroom is unnecessary as these facilities are already available at nearby Visitor Center and Chapel Road.

While minimal alteration of the road is preferred, alt C. does not offer the Alternative B option of restoring the wetlands and providing unfragmented wildlife habitat. It will be difficult to improve the northern section of road along wetlands for drainage without significant engineering and expense.

4. Turnouts and parking areas: Agreed, but do not disturb aspen communities along the south end by constructing extra pull outs.

5. Commercial Activity: Special treatment for bicyclists/groups is inappropriate; also taxis should not have preference. Shuttle service, as well as wildlife tours, all days of week should be emphasized.

6. Death Canyon: Prefer Alt. B, as reduces impact at the trail head and controls the number of trail users. This trail head is already busy. Provide for overnight slots for those with back-country permits or encourage/require/facilitate shuttle use.

7. Winter Access Use: If there is no evidence of harm to wildlife, ok, but prefer allowing vehicle use up to approx. Death Canyon Rd. ict. for winter access. Review effects of back-country skiing on bighorn sheep (Courtemanch study) and possibly moose.

8. Visitor use experience: This alternative drops the highly relevant language of Alt B: Trail densities and alignments would be managed to be compatible with the protection Natural resource values, which is a mandated goal.

Alternative D: Pathway gives undue preference to bicyclists to the detriment of wildlife and other users.

1. Traffic Control: Needs research: A reservation system should be a last resort after all other efforts to minimize traffic. People like their independence, especially while on vacation, and a reservation system may be hard to manage. Peoples time is unpredictable (many restaurants in Jackson dont take reservations for this reason): bison jams, changing childrens demands, weather, etc. Also a reservation sets up an expectation of something particularly unusual. While it is a unique are, the expectation of seeing bears, elk, and moose in any given tour is unlikely to be met-creating disappointment. A shuttle service is

preferable.

2. Physical Characteristics: Prefer Alt B with road realignment at north end as discussed above. No paving of south end and also no paving of realignment. Keep road narrow!

3. Turnouts and Parking: At Granite Canyon Trail head, do not disturb the aspen habitat as it is rich in wildlife and scenic resource values. Many song birds nest and use this area, along with deer, least weasel, and fox. The view looking E coming back from the canyon is gorgeous. Currently, even when close to the trail head, you do not see the parked cars or road. If there is a need more for parking:

" Add some wider parts of road near existing parking lot to provide a slight expansion.

" Create overflow parking area further south in an already disturbed area e.g. just south east of irrigation ditch. Add path through aspens to join existing one.

" If need restroom, add near South Entrance or in overflow parking area.

4. Bicycle use: No pathway as it diminishes the key resources and promotes incompatible recreational use over other visitor experiences.

" Wildlife/plant community impacts: A bike path diminishes this vital wildlife habitat and movement corridor by broadening the human corridor:

o Significant cutting and removal of vegetation (1000s of mature pine trees, aspens, rabbitbrush, sagebrush, wildflowers, grasses, etc.); alteration of soils by re-grading, degradation/fragmentation of wetlands with culverts, bridges etc.; and introduction of invasive exotics.

o Added disturbance and conflicts with wildlife by people (bicyclists) exposed on fast moving machines coming around corners startling animals, and possibly increasing incidences of collisions. Also, additional disturbance by noise of some bicyclists yelling-talking as they ride. Wildlife is likely to flee.

o The bike trail skirting LSR adds a whole new human corridor, significantly increasing fragmentation of wildlife habitat e.g. where elk often gather, sage birds set up territory, feed, nest, etc.

" This stretch is a key connection between Death Canyon and the Snake River-two major natural resources; and it is the only corridor between the Tetons and the Snake without a major road in the entire park.

" While the bike path would be along an existing maintenance road and, therefore, not directly affect the plant community, paving would require significant work/disturbance to grade and cover the cobbles. It could also add potential for invasive exotics whose seeds spin along wheels.

" It also runs along a significant ecotone of sage brush and mature cottonwoods with a dense understory of hawthorns-unique to the park. It runs near wetlands with sheltered terrain for elk. While a study is essential, it appears that elk use this area heavily. Bears likely feed on the hawthorns.

" Bicycling would startle and move these animals.

" Alternatively, aligning the bike path along the current road through LSR is not feasible due to the habitat destruction required to accommodate grades, sight lines, and pavement.

" Visitor impacts: Alters experience of other visitors by increasing built environment by 25-50 along roadside, reducing the intimacy of the surrounding natural landscape, including wildflowers, shrubs, aspen right next to the road, adding visual commotion of bicyclists peddling along the route, and scaring away wildlife. Creates a suburban, not rustic or natural feel, to the route. Also, bike paths are not readily shared with other users because bikers go fast, are startling, and often ride abreast. This is the case in bike paths in more suburban areas where use is heavy. This bike path would undoubtedly become heavily used as commercial enterprises and bike groups would promote it. This is an inappropriate, escalating use for this section of this national park.

" The extra route around LSR, away from the current road, is used by horses and some walkers, who

would likely be displaced. Also the view from the trail from the LSR parking lot to visitor center would be impacted with the fast, shiny movement of the bicyclists, as well as possible noise. This is counter to the intent of LSR. In addition, the S end of the trail comes out near a sharp corner of M-W Rd, making it potentially unsafe. This road should not be paved.

" With a shuttle service and other methods for reducing car traffic along the existing road, bicyclists could share the road more safely. They can also choose not to use it because they think it is unsafe and instead ride the many miles of bike paths elsewhere.

5. Winter Access and Use: Wildlife impacts need to be studied. While cross-country skiing is a contemplative, exploratory, and scenic use of the park, it will not be if the trails are too heavily used. To manage the level of use, do not significantly expand parking, do not groom unplowed section of Moose-Wilson Road. Do not promote additional ski tours. However, please continue to provide groomed access from Bradley Taggart parking area up to Jenny Lake.

6. Visitor Use and Experience: Designing vista points to enhance wildlife viewing without disturbing wildlife is an appropriate use of the park. However, conduct a full assessment of wildlife use and visibility to be sure such pull outs are appealing and appropriate. A few short walks to view points such as overlooking wetlands at the north end of road would be good, as again it would encourages visitor appreciation of the parks key resources. Winter outhouse at Death Canyon Road for sanitation purposes ok, but not year round.

Finally, all this planning needs to consider the larger context of the park:

- o Uniqueness of this corner of the park vs. other different (and still wonderful) places in Grand Teton National Park.

- o Energy-efficient transportation plan throughout the park.

- o Administrative and financial feasibilities.

- o Growth throughout Jackson Hole and appropriate tourist promotion. What is the carrying capacity of the Park and Jackson in sustaining wildlife and its habitat, the scenery, and the special visitor experience unique to the world?

Thank you for the consideration of these comments.

Sincerely,

Frances H. Clark

Grand Teton National Park
Attn: Moose-Wilson Planning Team
PO Drawer 170
Moose, WY 83012

Subject: Moose-Wilson Comprehensive Management Plan ' Preliminary Alternatives

Dear Superintendent Vela

Please accept this input on behalf of The Wilderness Society in response to Grand Teton National Park's solicitation of input for the preliminary alternatives proposed for a new comprehensive plan for management for the Park's Moose-Wilson corridor.

The Wilderness Society ("TWS") is a national non-profit organization established En 1935 to "protect wilderness and inspire Americans to care for our wild places." With over 500,000 members and supporters today, TWS prides itself as being the nation's preeminent organization focused on the protection of wild lands and stewardship of the national wilderness system. Our Northern Rockies regional efforts include a Greater Yellowstone Ecosystem program and we recently expanded our Wyoming program which includes opening a new office in Jackson.

The Wilderness Society is concerned that this process and plan has the potential to both degrade and further fragment existing wildlife habitat and jeopardize areas that have wilderness characteristics due to increased access and transportation priorities. The area in question is a concentrated wildlife corridor

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

that is used by numerous species including elk, moose, deer, and both species of bears. Additionally, the corridor contains a documented wolf den. We encourage the Park to focus on a solution that reduces vehicle traffic, enhances public experience but minimizes impacts to wildlife and wildlife habitat.

We also would like to remind the Park that this corridor contains potential wilderness and is adjacent to recommended wilderness on the northern and western boundaries of the corridor. Consequently, we ask that the formal alternatives and the preferred alternative provide information on how each would affect the wilderness character qualities that exist here. This includes whether each alternative would diminish or effectively maintain the existing natural, untrammeled, undeveloped qualities as well as the opportunities for solitude or primitive and unconfined recreation.

Considering our comments above and carefully reviewing the preliminary alternatives as presented, TWS could support either Alternative A or B. Alternative A, which is the no action alternative, obviously does not address the issues of improved vehicle control and public experience but would retain the existing characteristics. In our opinion, however, Alternative B provides the best compromise of maintaining existing characteristics while offering both improvements in the corridor and an enhanced visitor experience. The proposed realignments help decrease congestion and the proposed realignment of the road to the east of the beaver ponds increases protection for wildlife, removes habitat fragmentation and improves connectivity to habitat on the north and east which contains wilderness characteristics. The improvements to the Death Canyon/White Grass trailhead should assist in reducing congestion, improving public access and while reducing public impacts. This Alternative will also improve the biking experience without any further impacts to the corridor that a separate multiuse pathway would incur.

The issue of transportation, resource protection, and recreation values that exist in Teton County centered on the Moose-Wilson corridor has high public interest, both locally and nationally. TWS expects the Park Service to select an alternative that provides a full range of options for management, some of which include reductions in vehicle usage and congestion while maintaining wildlife habitat, wilderness characteristics and visitor experience. We would expect that any alternative selected would also minimize additional surface disturbance and commercial use of the corridor (taxis, shuttle buses, etc.).

We appreciate this opportunity to comment on the preliminary alternatives and look forward to reviewing formal alternatives when available.

Sincerely,

Dan Smitherman
Wyoming Representative

September 12, 2014

To the Moose-Wilson Corridor Planning Team

Personal Reaction to the Four Alternatives Presented

1. You have the important issues coming/ed with the lesser:

Parking areas; pave or not; straighten north end or not; Death Canyon TH are side bars

Wildlife Impact; Natural lands impact; Traffic control/rationalization; Scenic byway vs functional through route; Added User Group paths /trade-offs are the core issues.

2. In terms of GTNP's managing the current practice, unfortunately you have not made a strong case for change, particularly with respect to growing traffic volume

Besides potential delays, what is the specific problem with Increased congestion? No case has been yet made on incremental wildlife impact or on the need for improved safety. No case has yet been made that particular commercial vehicles are key culprits. Even the case for eliminating unnecessary shortcutting to the airport or northbound US89 has not been made

A case can be made for the growing damage to the road shoulders, but added turnouts will be insufficient to handle the high car count congestion of the bear/moose jams

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Thus it becomes loggerhead arguments of individual principles without a shared base of facts or expert opinions.

3. Your traffic control options are administratively difficult and probably expensive, and they also have a high likelihood of generating ill-will across the lesser-informed visitor population

4. You avoid the option of effectively lowering road speeds and purposefully increasing transit times to take the time-saving incentive away from those people using the road to connect to US89 going south or north.

5. You completely ignore recreational horse usage and priorities, except as related to the longplanned Poker Flats parking area upgrade.

6. As now cast, the added cyclist pathway option is an unprecedented new encroachment into natural park areas, serving as a new benefit for the cyclist group with no discussion of current cyclist safety issues or the constraints that must be satisfied were the cyclists continued to be channeled through the M-W segment through the LSR Preserve.

Given the above, I would prefer Option A for the major issues, coupled with generally lowered speeds throughout, but particularly through the LSR Preserve. I do not want to see any additional path added that is not adjacent to M-W Rd. I leave the lesser issues to the long-term priorities and discretion of the GTNP staff.

Question 1

I guess Alt. D is the best option. Safer

Question 2

Making the road faster seems to be a bad idea

Question 3

Make the whole road slow dirt w/ separate pathway

Question 4

I like to ride my bicycle on the road alot esp. the dirt.

Thank you
Good luck

Joel

Grand Teton National Park
Attn: Moose Wilson Planning Team
Moose, WY 83012-0170

Dear Planning Team,

It is my hope that the park can maintain the Moose-Wilson road more or less as it is - - preserving the rustic nature of the road for wildlife viewing and protection thereof. It should not be improved and realigned so that more cars and commuters can pass through.

Paving the portion of the road which is gravel now may reduce maintenance of that section by obviating grading and dust reduction chemicals.

I do not believe that a bike pathway should be constructed. The park does not owe cyclists paved pathways over every inch of the park. If the speed on the road were kept to a minimum, cyclists could continue to use it as they now do more safely. Attempts to reduce any commercial or commuter use would be smart, whether by using shuttles or making the road one-way. But visitors should not be denied enjoyment of the Moose-Wilson road by gating or closure.

Sincerely,

Karen W. Hobbins

September 12, 2014

To: Moose-Wilson Corridor Planning Team, GTNP

Second Input from a Recreational Equestrian Trail Riding Group, the Teton Back Country Horsemen (a chapter of the national Back Country Horsemen of America)

Background

On February 3, 2014, we submitted to you a lengthy commentary on how recreational horse riders use the Moose-Wilson Road corridor, including a map of the major north-end horse trails and our priorities for the future. These comments still stand. This letter addresses our reaction to your four possible alternatives, and to the individual elements relevant to us

Overall Reaction

We were quite surprised and disappointed that the recreational riders existence and interests were not mentioned at all beyond the planned Poker Flats trailer area upgrade.

As we discussed in our Feb 3 letter, while we do not use the M-W Rd for transit, we are quite interested in maintaining safety at our several road crossing points, maintaining our horse trailer parking options, and protecting our existing trail network and associated experience.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

We recreational equestrians gain little beyond the improved Poker Flats trailer parking in Plans B and C. Plan D, with its middle segment looping around the LSRP onto our horse trails, presents a major problem for us.

Issue #1 Improved M-W Rd Crossing Safety

Our issue is the 5% of the autos that drive too fast. This is a particular challenge on our crossing to the Wister Draw trail access near the north side of the LSRP driveway, where there are blind corners in both direction.

We would advocate lower speeds, particularly in the LSRP section for example: 25 mph at the two M-W Rd ends, then down to 20mph and then down to 10mph through the LSRP. This greatly improves safety where most needed, and it also permits safer mixed use on the existing M-W roadbed specs through the LSRP.

Issue #2 Maintain Horse Trailer Parking

Poker Flats PA

While improved trailer parking at Poker Flats would be a nice added amenity for us, the current trailer parking area, which was widened 1-2 years ago and graveled and re-graded last month, is basically very satisfactory.

This area is used by experienced, repeating locals. Your last summer's trailer and horse count census seems to undercount weekends but probably seems an adequate order-of-magnitude estimate.

Six trailers can park there now.. two along each outside area and two in the center row which leave two lanes for the rear trailers to exit. Backing the trailers into the lot is not usually a problem.

Our key desires would be 1) to re-gravel it every couple of years to keep the large middle area mud hole from returning, 2) to add some signage to instruct trailers on the parking sequence and to preclude tourist autos, and 3) to use the saved funds to maintain the three trail bridges over the diversion ditch.

Our worry about the planned improvement is that it will attract tourist and cyclist auto parking, regardless of signage. and cars can really foul up the parking accessibility.

White Grass Turn-off Junction PA

This is our primary north-side parking area. We access White Grass to the west, the old JY and Wister Draw to the south, and lower Poker Flats to the east. Any parking area improvement should allow for 2-3 horse trailers on occasion.

Our 'wish list would also include a new trail segment on the east side of the M-W Rd paralleling the Barker driveway that would connect into the 'telephone line trail which goes south into the old RLazyS. That would keep us from trespassing on the in-holdings driveway.

Sawmill Ponds PA

We do park trailers in the large Sawmill Ponds parking area, and then ride west into White Grass or north into Skyline and beyond. Upgrades to this parking area should allow for continued occasional horse

trailer parking.

The change alternatives call for eliminating guided horse rides in this area. We would object to this as well as the elimination of any of the horse trails accessed from Sawmill Ponds.

Issue #3 Added Path for Biking/Hiking

As we stated on February 3, we do not object to an added path adjacent to the M-W Rd if it is the only option to achieve a required level of multi-user safety. However we do object strongly to routing the new path onto our existing horse trails and through the naturally scenic middle meadows that we currently enjoy.

We recognize that the added bike/hike path would be a valued added amenity for the cyclist community, particularly for those riders desiring to make the long loop ride from town. We anticipate that the biker census will climb from last years 18 to 21 bikers per day to something in the area of the current GTNP pathway. However we do not think that this goal of the cyclist community can be satisfied without excessive cost to the natural resources and also to the compromised experience of the hikers and horsemen using these trails now.

It would appear that your constraint is that a new side-path can not be added through the LSRP. This forces you into expanded precedents of bad and worse added path options to the east. Two major problems with Alternative D:

" Last fall you eliminated the primary horse trail through the meadow connecting the new diversion ditch bridge to the LSRP, and you re-routed the horse traffic onto the Cheney Highway. Now you are putting the bikers on this same stretch of the Cheney. And this is essentially your only option beyond using the existing M-W Rd for this stretch.

" Secondly, with the LSRP topography and the marsh on its east end, the only way to go from Poker Flats to Wister Draw or White Grass is the horse trail east of LSRP and then linking to the horse trail coming out of the old RLazyS going to M-W RD near the LSRP driveway. This sole horse trail exit is where you are overlaying the bike trail in Alternative D.

Thus separating the horse riders from the bikers will require several new trail segments, and the major bridge on the Cheney Highway will probably have to be shared. Specifically: a regular horse trail from the highway bridge to the previously eliminated horse trail will be required; the previously removed horse trail will have to be re-instated; a second loop around the LSRP will have to be established; and safe conduct for the horse to cross over the bike path and the LSRP driveway to cross the M-W Rd to Wister Draw will have to be created. This is an exceptional amount of natural habitat to be converted into new trails.

We think that keeping the cyclists on the M-W Rd though the LSRP eliminates the above problems for us. And we think, with study, such a solution should be within reach.

In summary, considering the elements of your four alternatives which impact the recreational horse riders, we would favor 'no action as opposed to Alternative B, Alternative C and, particularly, Alternative D. Respectfully submitted,

Jim Wolf, President

Alternative "A" (No action alternative)

Unacceptable resource & visitor experience degradations already occurring - ever increasing traffic, speeding, dust, noise, wildlife harassment @ critter jams, radius of disturbance increases @ sensitive sites (hawthorns, choke cherries, beaver dams, moose ponds, nesting areas etc) soil compaction & user created parking, "wildcatted" social & bridal trails, increasing taxi - wildlife tour- shortcutter trips...

In essence a qualitative "death via a thousand cuts." None of the goals & desired conditions can ever be substantially achieved without implementation of traffic reducing restrictions.

Alternatives B, C, and D

* Ideas & concepts to carry forward *

- Northern realignment is an ecological upgrade

- Please redefine scope & scale of "certain peak periods"

- Lower speed limit great - if more enforcement is available

- Some combination of roadway reclamation & colocation in the Death Canyon / Whitegrass area I.E. one parking area - one road. Great idea - more trail, less road, less maintenance, less development footprint.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

- Consider June 1 opening - Sept 30 closing. This leaves a "greener" foot, stroller, bike, wheelchair - quiet, contemplative, human powered access season (Sept. 30 closing better for hyperphagic bears also).

- Any realignments should replicate winding rusticity of old roadway to promote slower speeds.

- Focus on previsit info not "turn left at the log, right at the rock" signage = visual degradation & loss of sense of discovery.

- Turnouts on northern alignment are probably a problematic necessity - helps prevent user created parking. Site to minimize wildlife disturbances.

- Cost-benefit analysis graphic would be very helpful. What would each alternative cost?

- Please expand on pros & cons of new 6 hour trailer parking expansion @ Poker Flats.

- Sadly, Granite Canyon could probably already use a restroom. Human waste problems in area - in past.

- Please observe the "reduce, reuse, recycle, repurpose & rethink" mantra. *How can we do the most good, with the least disturbance, in a reduce footprint, for the lowest cost, for the longest time.

- Please consider the tragic bear removals & relocations have already occurred in other areas of the park due to careless food security lapses.

- Please reexamine one way option - WTI/MSU rated it the best option (of many considered) for a reason.

- The Day of Week closure option is scalable to additional closure days in the future. This is true adaptive management. Add a day if we continue "loving it to death." Subtract a day if Teton County takes care of some of its own traffic problems.

- Consider burying the overhead power line along the northern realignment - bird collisions, visuals, fire sparking potential.

- Consider a phasing plan that is segment specific & prioritized - hold to ensuring that "development is the minimum necessary."

* The simplest solution is sometimes the best or the easiest to implement - move the Death Canyon gate to one foot south of LSR entrance & call it good - put a bike lane on the northern realignment (widened shoulder) to create a reduced development footprint in that segment & the entire southern section of road is now defacto human powered access only (or transit) subject to complete, seasonal, one way, time of day, nighttime or day of week closures.

- Please consider that paving the southern section would according to data - at the current speed limit - increase avg speeds 3 to 4 mph - significant in road kill & collision science.

* Ideas and concepts not to carry forward *

- Traffic alerts en masse - confusion, need to update, added personnel, distracted driving, eyes off road etc.

- Paving of southern section increased speed, runoff problems.
- Queuing lanes - more pavement, more personnel, signs, more confusion, more idling of vehicles, en masse travel through, speeding, passing etc etc.
- Reservation system - not management or visitor friendly other parks (Mesa Verde etc) that have reservation system are generally singular destination parks w/ lower visitation on a larger "Great Circle" tour route in one day use.
- Any plans for separated pathway - tree removal, radius of wildlife disturbance increases, increase in development footprint, canopy discontinuity (squirrels, marten & other arboreal species), maintenance issues with falling beetle killed trees, impermeable surface & associated runoff induced "green up" along pathway margins (creates attractive nuisance in area of greatest human activity), overwhelming of Granite trailhead facilities due to people parking then bike riding out & back, maintenance costs ongoing, expectation of reciprocity from "private" funding sources, perception of undue influence from local interests in a national park from local funding sources, paved pathway surface would melt off sooner than surrounding area - creating a linear path of least resistance that possibly would increase human/wildlife conflicts in this confined space, lateral damage beyond actual pathway width from heavy equipment, potential for overwhelming of LSR. Bathrooms & water fountains from bike tours, lots of research suggests the human form, the human voice & the human presence have a similar disturbance range to vehicles - the levee road bike route would expand into previously undisturbed areas thus expanding the human footprint of the park etc etc etc.
- Winter grooming of entire corridor (road or potential pathway) should not be considered. Under some alternative it would be the "Gateway Drug" for cries to keep it open year round. Especially from Village/Airport/Chamber/Elected Officials & other who view this as more as an "Economic" corridor than as an "Ecologic" treasure.

General Comments

Please keep your "eyes on the prize" as stewards of this outstanding natural area. Resource protection, visitor experience & "preserving unimpaired for future generations" should reign supreme. National "needs" trump local "wants." Please do not be bullied & browbeat by the Village/Airport/Pathways/Chamber/local & state elected officials or any others who promote economic or organizational self-interest over long term resource protection.

Sincerely, Gregory Griffith

Mr. David Vela,
Superintendent,
Grand Teton National Park
P.O. Drawer 170
Moose, WY 83012-0170

9th September 2014

Dear Superintendent Vela,

Submission regarding the Moose-Wilson Corridor Comprehensive Management Plan

I would like to provide input to the proposals for the Moose-Wilson Road. Before I do, I would like to explain why I feel so passionate about this issue.

In the winter of 1990 I was reading the London Times at my home in Andover, England and came across an article on Dude Ranching. The author talked of the history of dude ranching, the ability to experience the western way of life and the beauty of seeing spectacular landscapes from horseback. I realised this was something I wanted to experience for myself. I set about learning of the faraway lands of Western USA. In the days before the internet I relied on the post, and received brochures from many state tourism boards. The one that captured my imagination came from the State of Wyoming, showing the Teton Mountains in that stunning pink hue.

I spent that winter learning to ride and looking for a dude ranch in the valley. I was fortunate to speak to Claire McConaughy at the RLazyS and managed to secure a week at the ranch in late September of 1991.

As a twenty something year old Brit, I landed at Jackson Hole some 15 hours after leaving London. I was picked up at the airport and driven to the ranch.

My first taste of the Grand Teton Park wasn't the Snake River Overlook, Jenny Lake or any of the other beautiful places I have since discovered ' it was the Moose-Wilson Road. I watched in awe as we drove past moose standing in the ponds, stopped to let an elk cross the road and then winded our way through a pristine forest that seemed a universe away from my world in southern England. I had never seen these animals other than in an encyclopaedia.

My week at the ranch was transformational for me. I saw elk bugling & sparring, bald eagles on the Snake River and visited places which are part of the history of ranching in the park including Whitegrass, Skyline, Trail Ranch and of course the original RLazyS. I was able to experience these things first hand because of the intimate knowledge of the owners and crew at the ranch. I wasn't on an hourly trail ride, I was with people who cared about the park, who were educating me in its natural history and wanted to share its beauty and wildlife with someone whose world was 5,000 miles away.

Fast forward to 2014. I am now living just outside Atlanta, GA. Many things have changed in my life, but the one constant has been GTNP and the RLazyS.

In a week's time I will be making my t2h4 trip to Jackson Hole. In those intervening years I have brought my elderly parents and sister from England to see the beauty of GTNP. All of them have gone back to England and are ambassadors for the beauty and history of GTNP.

I have been fortunate to meet three generations of owners of the RLazyS. Each of them has been dedicated to the education of their guests and to ensuring that the use of horses in the park is undertaken without conflict. Kelly and Nancy Stirn are continuing the great tradition of dude ranching in the valley and I believe are doing everything to protect and respect the GTNP. If I didn't believe this, I would not have returned 23 more times to the ranch.

Over the last 23 years I have seen many changes in the park. The biggest of course, being the changes at the JY and the Preserve. We all understand that times change, but they should be done carefully and with great deliberation. Changes can never be reversed and can often set in motion other unintended consequences.

The prospect of a cycle path running through such a pristine place is totally beyond me. From what I understand, several thousand trees will be destroyed to make way for the path and countless animals will be disturbed - not only by the path but also the construction traffic. Indeed, reviewing the Plan D information, it appears that the path will bisect the Moose-Wilson Road and the Snake River in the area of the Preserve. In the 23 years I have been visiting the park and riding through it, I have seen maybe two dozen people in that area. Bringing bicycle and foot traffic into that area is bound to result in a significant change to wildlife, their habitat and migration in the southernmost part of the park.

If this cycle path is added, what comes next? An extension of the cycle path to the Snake River - allowing cyclists or tour groups to picnic by the river? After all it would "only" be a small addition at that point. Once that addition has been built, why not extend the cycleway from the Preserve to Jenny Lake and connect to the Death Canyon trailhead to make more of the park accessible? I know it's a large elevation

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

change, but so what ' it will allow more adventurous cyclists to experience the back woods feel of the park. It's easy for me to foresee how one change can lead to so many more incremental changes that simply cannot be stopped.

My views of this proposed cycle path can best be summarized by borrowing a phrase from the Prince of Wales ' this change will result in a monstrous carbuncle on the face of a much-loved and elegant friend.

I am also concerned at the prospect of the loss of commercial horse access to the Whitegrass area from Sawmill Ponds. The history of dude ranching and horse use in that area stretches back to before the establishment of GTNP. I have ridden to Whitegrass countless times over the last 23 years. Each time I learn more of the history from our wranglers and fellow guests ' several of whom worked at those.

With the exception of the period when the buildings were being removed, I could count on two hands the number of people I have met walking the trails in that area. There is clearly little conflict between horse and hikers in the area. I therefore fail to see what benefit would arise from the prohibition of commercial horse rides in that area.

Again this incremental change in horse access has me deeply concerned about the long term future of riding in the park. I want to spend September riding in GTNP for the next 23 years as a guest of a dude ranch.

I am not fortunate enough to live in Jackson, but I care deeply about GTNP. I urge you to re-consider the plans to add a cycle path and to remove commercial horseback use from an area of the park that is steeped in dude ranching history. Traffic management shouldn't result in such a structural change to the park or its use.

Finally, I would request that you withhold my personally identifiable information from public review.

Sincerely,

Mr Stephen Golton

Re: Moose-Wilson Corridor

The #1 job of the national park is to protect its resources. It is not up to the park to service a single interest group. The national park is just that - a national park. It is not up to this community to decide its future.

A separate pathway makes no sense. It is not greener. It does not get people out of cars. The cost to use ratio is totally out of proportion. The money spent elsewhere would yield far greater results. People like the idea of a pathway but only a small percentage actually use them. There is actually a silent majority who do have pathway fatigue. It's the vocal people who want it but don't need it that you hear from. This is such an ecologically rich area and now there is a bear issue. As I write this the road is partially closed due to the presence of bears. The 1st time there is an accident due to the bike/walker/bear interaction (and it will eventually happen) - you, the park will be accused of not protecting its users.

Paving, pathway, etc. will disturb the wildlife and have unforeseen radical impacts.

This is such a unique area - truly one of a kind. It needs to be treated as it deserves to be treated.

Specifics -

A reservation system will not work - too difficult & unwieldy. There will be public outcry like you have never heard before. It is not a viable option.

A one way (incorporating the existing levee road) with no need for a separated pathway would seem to be

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

the easiest solution and satisfy the most.

Realistically if the number of cars needs to be cut down, then do as you do in the winter - a gate at Granite and a gate near the Death Canyon Road. It is a shame that overbuilding at the Village has caused much of the problem.

The Moose-Wilson Corridor is not meant to be a shortcut to the airport.

You need to put out the costs of each alternative - that could help people see the actual price involved.

The best option is a[n] amalgam of the alternatives - you have to choose the best parts of each - there are so many considerations that would be better than the 4 presented - I know that is what you are trying to do here. Thank you for involving the public - again follow the park mandate and not groups with a specific agenda.

It needs to be managed solely for its own intrinsic value. Whatever that takes - whoever is upset. You will never please everyone anyway. It is up to you to decide what the legacy of the Moose-Wilson Corridor will be - choose carefully.

Brooke Bullinger

Comments on the Moose-Wilson Corridor Management Plan

My name is Jack Turner. I've been visiting Grand Teton National Park (GTNP) since 1960, and I've lived in the Park since 1978 at Moose, Jenny Lake, and for the last nine years near the south entrance inside the Moose-Wilson Corridor. During that time I worked as a mountain guide, both for Jackson Hole Mountain Guides and for Exum Mountain Guides. I spent several years as the president of Exum. I've also written two books on the area: Teewinot: Year in the Teton Range and Travels in the Greater Yellowstone.

By way of introduction...

Most of the problems facing the Moose-Wilson Corridor are caused by forces outside the Park. The primary cause is massive real estate development on both sides of the Snake River, particularly at Teton Village and, now, at the Shooting Star development. Then too, we have more visitors due to Jackson's and Teton County's efforts to bring in more tourists, especially on the spring and fall "shoulder" seasons' various "festivals," bike races, instructional courses, etc. These factors have created a transportation problem, one that has been known and studied for decades. And last, we have seen skyrocketing recreational hobbies, mainly, for the purposes of this document, riding a bicycle. These various forces now impinge upon a small, fragile, critical segment of a much beloved national park.

My fear is that the Park's management plan for the Corridor whatever that turns out to be will address the symptoms of that impingement, not the causes. The Wyoming Department of Transportation has already decided to build four-lane highways from Hoback Junction to Jackson, from Jackson to Wilson, and from

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

the junction of Route 22 north to Teton Village' though local politicians are very much opposed to these plans and will no doubt fight them, perhaps legally. Those plans leave one significant issue unaddressed, the elephant in the room: How do you move all that traffic north to GTNP and beyond? There are four options. Through Jackson, a town that already has up to nearly two-mile-long waits for drivers wanting to turn left at the junction of Route 22 and Route 89. A road and bridge linking Teton Village and Route 89 north to the Jackson airport. Or, up Spring Creek. Or, yep, a modern Moose-Wilson Road giving rapid access to GTNP and a shorter trip to the airport.

Jackson is already a traffic bottleneck, and it will get worse. A direct road from Teton Village to the airport? The owners of the ranches and mansions on both sides of the Snake River are not keen to have a modern road and bridge running through their expensive properties. A four-lane bypass up Spring Creek? Spring Creek is the bastion of Wyoming's royalty' governors, senators, multi-million dollar ranchettes, and a golf course plus country club. All these folks may wear cowboy hats and cowboy boots and love John Wayne, and they bear a heavy responsibility for the real estate boom that created the transportation problems, but when push comes to shove they are not going to cowboy up and solve their self-made transportation problems. No, they will dump their self-made transportation problems on the National Park Service and the American people.

Thus we see efforts by private interests to improve the Moose-Wilson Road. Eventually, they will apply intense financial and political pressure in an attempt to coerce GTNP to build a modern road through the Corridor. This pressure must be firmly resisted. I believe that changes to the Moose-Wilson road should be modest because coming changes in the county's transportation plans' including a north bridge over the Snake River with a road from Teton Village to the airport and a four-lane bypass up Spring Creek, both of which I support' will radically diminish pressure on Moose-Wilson, both the Road and the Corridor.

What is at stake now with this NEPA is the value and integrity, the idea even, of a national park. The coming battle over the Moose-Wilson Corridor is another iteration of every battle in the history of modern conservation: a public good, in this case a national park, versus entrenched local, vested interests with deep pockets. Please persevere in your defense of GTNP.

Now for the alternatives...

The statement of management goals and desired conditions is excellent. However, I found the preliminary alternatives very, very disappointing. Indeed, they seem in some instances inconsistent with the stated goals and desired conditions, perhaps even with the Organic Act.

Alternative A. A no-brainer. The current situation is unacceptable to everyone. It can be argued that the road, with its heavy traffic and moose/bear/beaver jams, affords the worst visitor experience of any national park, Yosemite Valley being the only competition. Most important, the current situation is detrimental for the moose, elk, deer, bear, beaver and other critters living there. Doing nothing is not an alternative.

Alternatives B and C. My objections to both these alternatives are:

- 1) They virtually assure a bad visitor experience. Visiting the Corridor would become a crapshoot' too complicated and unpredictable. People do not pay attention to warnings or signs or alerts, whether on the highway or on their computer or smart phone' witness the numbers of people with trucks, trailers, motor homes that every day !! are turned back at the south entrance station. Adding complexity (restrictions during peak periods, etc.) would create traffic jams' and there are already traffic jams at the

entrance station, plus lots of anger directed at rangers. It would generate anger toward bikers, who, face it, are a small minority of visitors to the park. These alternatives are a prescription for a mess.

2) Parts of the alternatives do not always address the core problem: too many people in the Corridor. The Park's own recent traffic studies show increased use of the road, roughly doubling every ten to fifteen years. Having a one-way road will not reduce traffic in the long term.

3) What works elsewhere will not necessarily work here. Denali and Zion and Yosemite do have one-way roads, but they also lead to natural dead ends. Moose-Wilson is not a dead end. A one-way road will make most visitors very angry. Drive up to Jenny Lake from your room in Teton Village and you are forced to return by a long route through the bottleneck of Jackson. Drive for your camp at Jenny Lake to the LSR Preserve and you face a really, really long drive back through the bottleneck of Jackson. That means unhappy visitor experiences.

4) I believe all commercial use should be prohibited'taxis, sightseeing wildlife tours, and shuttles. The emphasis should be on a reduced human presence in the Corridor; not no human presence, but reduced presence. The critters need more room to live their lives without constant human presence and interruption. The point here is conservation, not kowtowing to human desires or commerce.

5) Improvement of the Death Canyon road'trailhead should be minimal with no increase in parking spaces'they just mean more asphalt.

6) No new paved turnouts'more asphalt. No increased parking at LSR Preserve.

7) Paving or graveling the unpaved section of the road is a horrible idea. If you improve the road, people will only drive faster. Speeds of 35-40 mph are now common. Why do something that increases the chances of wildlife collisions? That section of the road would be best served by a policy of benign neglect. The more potholes the better; the deeper they are the better. (Show visitors a little bit of old Wyoming!) A rough road will help restrict traffic to those who are not in a hurry and intend to use the resources of the Corridor, not use it as a means to someplace else. I also support slower speeds around prime wildlife habitat, with speed bumps if necessary.

8) On the other hand, I very much support your proposed changes to the northern section of the road. The changes will restore damaged habitat, provide wildlife with more protection from vehicles, and even improve some scenic views'wildlife with a mountain backdrop.

Alternative D

A truly terrible alternative for many of the same reasons mentioned above, but also:

1) Any reservation system would be a bureaucratic anvil around the Park's neck; it would waste money; and, yet again, make for a poor visitor experience. People do not pay attention to traveler alerts; consider your present experience with traveler alerts at the south entrance: a mess.

2) Any reservation system would require massive holding areas with multiple lanes or parking lots to hold those waiting because they arrived early, they arrived late and are waiting for a first-served opening, or they are just waiting for a first-served opening. More asphalt. It would back up traffic down Route 390 and traffic is already backed up there. It would require multiple park service employees to operate, thus costing the Park more funding at a time when dollars are scarce.

3) A multiuse pathway is the worst aspect of your preliminary alternatives. The Organic Act privileges conservation over development and recreation. By your own admission, the Corridor is "distinctly different from those [areas] found elsewhere in the park." Hence, conservation efforts must be distinctly different; in particular they must give absolute priority to wildlife, and to be more specific: grizzlies. According to your recent study by biologists from the University of Alberta, grizzlies are present in increasing numbers in the Corridor. Your overarching concern should be averting human/bear conflicts. A pathway will put more people in this wildlife intense area; a pathway will be dangerous. Anyone who knows anything about bears knows they do not like being surprised by humans moving at high speeds. And they are likely to chase people leaving them at high speeds. A pathway will be an accident waiting to happen, and when it does happen (not if, but when) it will be a PR disaster for GTNP. A pathway is not fair to visitors, and, more important, it is not fair to our bears.

4) You say your goals are scenic values and wildlife viewing. Visitors do not want to see multicolored minions streaking past at 20 mph. Electric lime green is not a natural color in our ecosystem. A pathway will destroy vast numbers of trees, destroy other habitat, require more asphalt, bridges, signage'all human intrusions in what is supposed to be, per your stated goals, a natural scenic environment with great views of wildlife. No electric lime green Lycra, please. A pathway will be an aesthetic disaster for viewing a natural environment.

5) A multiuse pathway will further fragment already fragmented prime habitat and inhibit the free movement of wildlife. We have a long multipath through GTNP; we don't need another one'something even some local bikers admit, albeit privately. Friends of Pathways has no sunset clause; ten years from now they will still want more pathways; but by then the issue will be pathways up Cascade Canyon and around Leigh Lake. I have nothing against bikes or pathways; this is about limits. Let's put a limit on pathways'NOW. Worried about safety for bikers? You recreate at your own risk, whether it is riding a bike or climbing the Grand Teton. Reread Mountains Without Handrails.

6) Don't groom anything in the winter. Let visitors experience a bit of natural terrain, break trail, and get lost! There is already a groomed ski trail in the park.

To reiterate the important points:

No commercial use of the Moose-Wilson Road.

Decrease vehicle speed around dense wildlife habitat, with speed bumps along the entire road if necessary to reduce use. Make visitors show down.

Do not pave or otherwise improve the southern section of the road.

Do not introduce complexity or complication into the visitor experience.

Forget the one-way road.

Do alter the location of the northern section of the road, keeping its current width and character'which means no shoulders.

Absolutely no multiuse pathway.

And if you really want to demonstrate the courage of your convictions about the importance of wildlife in GTNP, then eliminate the road between Granite Canyon and the LSR Preserve. In one fell swoop that would solve most of your problems, save money, and make our wild critters very happy.

Thank you for the opportunity to comment.

Jack Turner

Via Hand Delivery

Mr. David Vela
Superintendent
Grand Teton National Park

Re: Moose-Wilson Corridor Alternatives

Dear David,

Thank you for the opportunity to comment on the preliminary alternatives for the Moose-Wilson Corridor. Jackson Hole Mountain Resort (JHMR) with Teton Village Association and residents have seen active in this important decision making process for over eight years. We have done so from the perspective of environmental sustainability supported by our ISO 14,001 certification which is shared by only one other ski resort in the U.S. On the ground these policies, including windpower and transportation demand strategies, have made a difference in our community.

First, let me say we appreciate the way in which the alternatives are presented. Further, and potentially, the Adaptive Management Strategies create an opportunity for partnership to develop together mitigation to achieve the desired goals. Please consider JHMR along with Teton Village as an active and willing partner in achieving reasonable goals that embrace a shared vision.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

While Alternative D comes closest to achieving our goals of continued access and safety, I want to couple that with qualifiers. Contrary to recent rhetoric about Teton Village experiencing "out of control growth" an accurate account of history will show a reduction in mountain capacity and a downzoning from early Teton Village plans. As a result of substantially upgraded mountain and Village infrastructure recent success has put Teton Village in a better position financially to be an active participant in traffic management and other strategies.

Road

We support retaining the slow, narrow, rural, two-way character of the existing road.

- The unpaved portions of the road should be considered for paving but only if desired from a maintenance perspective.

- The northern section of the road should be realigned as in Alternatives B and D.

- Combine the Moose entrance stations as in Alternative B.

- Pullouts should be constructed and maintained.

- Death Canyon and White Grass cabins' access should be combined similar to Alternative D.

- Road opening in the Spring and closing in the Fall should remain similar to current policy.

- Given the winter utilization by Nordic skiers and snow shoe users consider grooming strategies

Bicycle Pathway

We strongly support non-motorized utilization of the corridor. From a completion of the Park pathway to a safety emphasis, the benefits are indisputable.

- We support a separated pathway along the entire road alignment from the South Entrance Stations up to a connection with the existing pathway at Moose.

- The Park should not be constrained in siting the pathway within 50 feet of the road. Tree removal should be considered along with existing open areas, particularly south of LSR.

- Adaptive Strategies specific to bicyclists should be developed and implemented specifically toward resource and wildlife interaction.

- We stand ready to participate with the National Park Foundation and other private sector individuals to address capital and operations funding for the pathway.

Adaptive Strategy

- We share the advocacy of limiting the capacity of the road during peak periods through smart traffic strategies that allow for future technological improvements.

- We concur that elimination of most commercial traffic is desired.

- We support utilizing small appropriately sized vans to encourage transit along and through the corridor. Vehicles should be equipped with bike racks.

- We support and encourage a park and ride or park and bike location near the north and south end of the corridor.

- We would support working with the Park on the creation of a Park/Ride/Bike that could include an interpretive element at Teton Village.

In closing, JHMR supports Alternative D as modified. We look forward and accept the challenge to assist in the development of effective adaptive management strategies perhaps with a Visitor/Eco-Education and Interpretive Center in cooperation with Grand Teton National Park.

Sincerely,

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Re: Comments for Moose-Wilson Corridor Comprehensive Management Plan Preliminary Alternatives

Dear Mr. Noon:

The U.S. Environmental Protection Agency Region 8 has reviewed the Grand Teton National Park (Park), National Park Service's (NPS's) Preliminary Alternatives Newsletter for the Moose-Wilson Corridor Comprehensive Management Plan. The newsletter was helpful in providing an update on project progress, and we appreciate the opportunity to comment on the preliminary alternatives early in the process as you prepare an Environmental Impact Statement (EIS). We plan on providing comments on the Draft EIS in accordance with our responsibilities under Section 102(2)(C) of the National Environmental Policy Act (NEPA), and Section 309 of the Clean Air Act.

Project Description and General Recommendations

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

The EPA understands that changes in ecological conditions, development patterns and visitor use within the Moose-Wilson corridor have prompted the need to establish a comprehensive management plan; most notably due to the increase in both motor vehicle traffic and potentially dangerous wildlife such as grizzly bears, moose and black bears in the area. Additionally, the EPA recognizes that visitor safety issues and potential impacts to wildlife and ecological communities have complicated the management of this corridor.

In developing the preliminary alternatives, the NPS considered management goals and desired conditions for seven fundamental resources and values identified within the corridor: 1) scenery; 2) geologic processes; 3) ecological communities; 4) aquatic resources; 5) cultural history and resources; 6) natural soundscapes and acoustic resources; and 7) visitor experience in an outstanding natural environment. We understand that the NPS plans on establishing indicators and standards for maintaining these desired conditions. The EPA will be interested to learn more about these components in the Draft EIS, especially as the NPS develops threshold triggers for management actions to ensure the protection of these nationally significant resources. Based on the information included in the newsletter regarding the alternatives and project area, the EPA's preliminary comments will focus on aquatic resources as well as mitigation and control measures. Because the NPS and EPA have a shared interest in protecting park resources, the recommendations offered below have likely been considered by the Moose-Wilson Planning Team. Please let us know if there are any specific areas that we may further assist you with as you proceed through the NEPA process.

Protection of Aquatic Resources

Depending on the alternative, potential elements of the proposed project include realignment of the road and the paving of unpaved road sections. The EPA will be interested in learning more about best management practices (BMPs) applicable for construction, operation and reclamation activities, which could include silt fences, detention ponds and other stormwater control measures. We will also be interested in any planned mitigation for road stream crossings which can cause, among other things, sedimentation loading and possible pollutant delivery. Potential impacts to water quality from runoff associated with surface disturbance include the potential introduction of sediment, salts, selenium and other pollutants into surface waters. Based on information included in the NPS newsletter, it is clear that the Park intends to protect and restore the natural hydrologic features, processes, and functions within the corridor project area; including wetlands, beaver ponds, seeps, springs, floodplains, the Snake River and its many tributaries, and Phelps Lake, as well as the aquatic communities that rely on these hydrologic features. We agree that the protection, improvement, and restoration of wetlands and riparian areas are a high priority because they increase landscape and species diversity, support many species of western wildlife, and are critical to the protection of water quality and designated beneficial water uses. Therefore we suggest that the NPS analyze potential impacts from the project for the following:

- Stream structure and channel stability;
- Streambed substrate, including seasonal and spawning habitats;
- Stream bank vegetation, riparian habitats, and aquatic biota; and,
- The cumulative effects of increased levels of erosion and sedimentation.

The EPA also offers general recommendations applicable to road construction activities under the proposed alternatives, which include the following:

1. Locate roads away from streams and riparian areas as much as possible;
2. Locate roads away from steep slopes or erosive soils;
3. Minimize road stream crossings;
4. Stabilize cut and fill slopes;

5. Provide adequate road/trail drainage and control surface erosion with adequate waterbars, crowns, rolling dips and ditch relief culverts to promote drainage off roads or along roads;
6. Consider road effects on stream structure and seasonal spawning habitats when determining alignment; and
7. Allow for adequate large woody debris recruitment to streams and riparian buffers near streams.

The EPA encourages the NPS to include as much information as possible on any watershed restoration actions in the Draft EIS that will be included in the project to help mitigate for project-related impacts. Wherever possible, the EPA recommends the NPS take action to reduce the likelihood of an adverse stream listing or further exacerbate a current condition, especially potential impacts to impaired waterbodies within or downstream of the project area, including waterbodies listed on the Clean Water Act (CWA) § 303(d) list and waterbodies with completed Total Maximum Daily Loads (TMDLs). In addition to listing any impaired or threatened waterbody segments, we also recommend that inventories and maps of existing wetlands, perennial seeps, springs and waters of the U.S. within the project area be included in the Draft EIS, including wetlands that are regulated under Section 404 of the CWA and wetlands that are determined to be non-jurisdictional and protected under Executive Order 11990 'Protection of Wetlands (May 24, 1977). Where project impacts are likely, we recommend including acreages and channel lengths, habitat types, values, and functions of these waters.

As mentioned earlier, another component of the proposed alternatives is to potentially pave existing dirt roads, and also to construct additional pullouts, overlooks and parking. Although unpaved roads can be a dominant source of sediment for adjacent streams or where there are stream crossings (as well as present a potential fugitive dust issue for air resources), there may be drainage challenges that can result from paving a road or from constructing additional wildlife/scenic viewing areas and parking. For example, curbs and gutters can concentrate flows and decrease infiltration. If there are areas where concentrated flows cannot be avoided, it may be beneficial to construct a few sediment ponds for storm water events. Therefore, for areas that will be converted from unpaved to paved roads and for any new layout/parking areas, we recommend that design features be considered in the planning process to avoid/mitigate concentrated flows when possible.

The newsletter also discusses the adaptive management strategy of restricting through traffic during certain peak periods either through denying access to motor vehicles on certain days of the week or through limiting access of motor vehicles during peak use times. The EPA will be interested in learning more details regarding these and other adaptive management strategies, including any additional information on a monitoring program to determine the relationship between road use and associated negative impacts on nearby water resources, as well as the criteria used to evaluate the effects.

Closing

Thank you for the opportunity to provide comments during this phase of the project as you prepare a Draft EIS. I look forward to working with you in my role as lead reviewer as the project progresses. Please feel free to contact me at [REDACTED] or by email at wasco.melanieepa.gov if you have any questions about these comments.

Sincerely,

Melanie Wasco

Comments Re: Preliminary Alternatives and Related Issues/Concerns For the Moose-Wilson Road Corridor within Grand Teton National Park

I. General Comments and Overview

With appreciation for the opportunity, I offer the following personal comments in regard to the four (4) preliminary alternatives put forth for public feedback in regard to their ability to address desired conditions of seven identified fundamental resources and values for this area of Grand Teton National Park (GTNP). These views are based on experience, which I will note later on, and upon studying the information provided in a newsletter entitled Envision the Future of the Moose-Wilson Corridor, published by the National Park Service.

Summary of my key points and issues, include:

1. Alternatives A,B,C and D do not achieve the desired goals or conditions as described. Detail in the following section.
2. I support GTNP protecting and restoring Park resources as a first priority. Local government or commercial transportation challenges should be a separate issue, although collaborative problem solving and strategizing should not be precluded if Park goals are respected.
3. I suggest that an eighth goal of maintaining Class I air quality standards, as required under the Clean Air Act for National Parks over 6,000 acres, be included. Engine idling in congested areas is not conducive to clean air.
4. The current four alternatives fail to relieve congestion, whether within the corridor or at other Park

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

locations such as entrance stations, offices or visitor desks. Safety concerns and wildlife disturbance would remain or escalate.

5. Financial impacts and GTNPs ability to implement and maintain new construction or various alternatives is an essential consideration-especially in the past 20 year climate of reduction of federal funding for public lands and personnel. I see no mention of this critical factor.

6. Alternatives B thru D open the door to abuse of reservation and traffic management systems by those able/willing to pay, or to constantly monitor Park traffic, creating inequality of access.

7. There are other reasonable, if innovative, options to better achieve protection of Park resources and values. It is my belief that they would be compatible with the vision and subsequent actions of the originators of GTNP (L. S. Rockefeller and family) and available to understand and witness in the Rockefeller Preserve. I will suggest a model in the third section.

8. The values embodied in the Moose-Wilson corridor would benefit from traffic calming techniques. The North Jenny Lake loop has already seen benefit of such actions, despite great outcry at the time. In fact, the Park experience was not ruined as some predicted.

Finally, in the general overview category, it is almost easier to define what I do NOT support, as a starting point for finding a good management scenario:

1. The adaptive strategy of traffic management that facilitates the inherently contradictory situation of allowing both private, motorized single occupancy vehicle (SOV) two-way travel while restricting it. Such an option would seem to be an attempt to accommodate 'convenience -which I did not see as an identified priority. To the contrary, I can envision confusion, increased stress and frequent disappointment for visitors from around the globe.

It has also been brought to my attention that much through traffic is generated by GPS directions (phone or computer sites) that have little to do with Park values and, during a 6 month winter season, may actually create great inconvenience, if not a dangerous situation for those unfamiliar with GTNP. Surely, our National Parks need not be held hostage by a situation that could be corrected.

2. A new, separate bike/walking path. Multiple studies, including those done by public land agencies have identified human travel corridors as detrimental to wildlife habitat, territory and movement, whether major highways or forest two-tracks.

I believe those who perceive otherwise, may be thinking in the context of only their passage-not passage of the thousands that follow or the construction impacts in a rich, dense forest with many riparian areas. (I must note here, that I was the first elected local official to run on a platform of public pathways. A sound lesson about being careful of what you wish for. Specific conditions must always be considered.)

Forest trail access should remain for those on foot.

II. Comments More Specific to Alternatives A-D and the Ability of Each to Achieve Stated Goals and Desired Conditions.

Alternative A (no action)

While supporting the seasonal closures and no grooming- as outlined and in support of rustic character, peaceful soundscapes and minimal wildlife disturbance along with backcountry monitoring, this alternative essentially does little to address the conditions that likely prompted the current NEPA process. Unrestricted, two-way motorized travel would increase congestion and stress-negatively affecting visitor experience, wildlife well-being, soundscapes, aquatic resources, and rustic historic

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

character. Although not specifically mentioned, I believe human safety would also be compromised with bike travel sharing the road under such circumstances.

Alternative B

The term traveler alerts and subsequent adaptive traffic management strategies are in direct contradiction to the desired goal to enjoy the scenic and rustic character of the corridor through experiences that are unhurried, relaxed, uncongested, and intimate. An adaptive strategy likely assumes the possession of certain technologies which are not rustic and may not be available to all. To use a metaphor, the adaptive strategy seems like pricking holes in a full tube of toothpaste and then squeezing it. The pressure will simply manifest elsewhere, diminishing visitor experience.

Soundscapes will not be enhanced with two-way motorized travel. Nor will ecological communities, historic character, or biker safety (except for short, hard to track periods of time).

Elements of this alternative which I support include:

- * Potential realignment of the northern portion of the road with special care for both the new construction and removal of the old portion in order to minimize impacts, though temporary, to riparian and habitat areas. I also support the described slow speed and intended character of the new road.
- * Suggestions regarding commercial activity, and for the White Grass area.
- * Relocation of the Death Canyon restroom, but not the large parking area.

Alternative C

Concerns about adaptive traffic management and two-way motorized private and commercial traffic remain, as previously discussed, and do not support the goals or desired conditions identified.

In addition, bike travel would be all but precluded, with minor exception.

Alternative D

Concerns about adaptive traffic management and two-way motorized private and commercial traffic remain, as previously discussed, and do not support the goals or desired conditions identified.

I cannot support a separated multiuse pathway due to its incompatibility with the identified goals and desired future conditions. While accommodating a very popular form of recreating, it is a relatively new recreational activity, not compatible with rustic character. It is unlikely to significantly alleviate traffic congestion. Most importantly, it would dramatically expand the corridor of human use, sound and activity-negatively affecting ecological systems and wildlife with further fragmentation of, and intrusion into, territory and habitat.

III. Alternative Proposal

Effectual consideration of the proposal below requires a desire to achieve a long-term solution that meets the goals and desired conditions identified, an openmindedness to innovation that has already been initiated or implemented in the National Parks, and a willingness to check assumptions.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Implementation of the proposal below would be best served through true collaboration between GTNP, county-town-Teton Village interests and the general public, including the biking community.

While not yet having many details (where the devil resides), I propose the following as being more compatible with the identified goals and desired future conditions and one that, with cooperative spirit, can be reasonably achieved:

1. Eliminate two-way private and commercial motorized travel. Permit one-way bike travel (likely from the south), in the current or newly re-aligned road corridor. Bikers may continue riding or return to town via existing bike loop(s), once they reach Moose. They may also take advantage of the key element of this proposal, next.
2. Implement an electrically powered, newly designed shuttle system, utilizing smaller vehicles, that operates in the existing seasonal time frame. Ample, easily accessible storage for bikes and backcountry gear is envisioned. Soundscapes would be improved from current conditions. Visitors could experience a more relaxed, and potentially informative, experience via interpretive driver/guides and in-vehicle displays/media, providing equal access not dependent on technology capability or investment. Users could get off and on upon request. Accommodation for commercial tours via shuttle could be made by advance reservation or permit, similar to river use in some areas.

The above, simple version, deserves more description which I will attempt to provide, but is acknowledged to be incomplete.

GTNP already has some of the cooperating partners needed, including the Yellowstone Teton Clean Energy Coalition (YTCEC). YTCEC has a 12 year (via MOU) or more history of working together to provide cleaner, more sustainable transportation in GTNP, as well as Yellowstone. It is affiliated with the U.S. Dept. of Energy and has received grant funding for various Park transportation improvements through the national Clean Cities program which has a demonstrated interest in transportation improvements in National Parks.

Our community, in the form of cooperating private and public participation, was also the originating catalyst for the development of cleaner, quieter snowmobiles. This was achieved with the help of the Society of Automotive Engineers who assisted with promoting The Clean Snowmobile Challenge throughout universities in North America. The challenge was held in Jackson Hole for 3 years running. The results were astounding with more than 90% reduction in both emissions and sound. While naysayers said users would never use 4-stroke machines, exactly that has happened and is written into regulations. It could be, and was, done with a common goal, perseverance and cooperation. I suggest we could achieve similar success with regard to shuttle design and characteristics that fit both the roadway use and setting.

Other opportunities for meaningful collaboration in a corridor important to the community include planning for the north and south terminus for the shuttles. In particular, it seems that it would serve both Teton Village and the Park to have the southern terminus originate in the Village. Of course, this solution does nothing for facilitating through traffic to/from the airport, but that is a separate issue and is generally detrimental to the corridor and its visitors, not to mention a safety hazard when speed is desired.

Last, but not least, for this submittal, is addressing funding opportunities. Again, with mutual recreating

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

and Park visitation facilitation interest, for locals and visitors, it seems reasonable to have cooperative conversations with local elected and appointed boards regarding potential financial support through several local funding sources, including the Lodging Tax, the Special Purpose Excise Tax, the Teton Conservation District and, perhaps, several nonprofits with keen interest in preserving the values of the corridor.

[As promised, my background and experience for the above perspectives and suggestions include 3 terms as a Teton County Commissioner-initiating both the pathway system and collaborative communication with land use agencies including GTNP, five years as Exec. Coordinator of YTCEC, 12 years as a seasonal BLM volunteer river ranger monitoring permitted use in southern Utah, Safe Wildlife Crossings Co-convener, current Chair of the Teton Conservation District, participant or facilitator for multiple governmental facilitations/strategic planning efforts and 43 years as a county resident user of the Moose-Wilson corridor and backcountry.]

Thank you for seriously considering these comments.

Respectfully Submitted,

Sandy Shuptrine

To Whom It May Concern,

I am writing to you about the possible construction and widening of the Moose-Wilson Road. My family has been coming to the Tetons on vacation for close to 40 years. My parents took me almost every year of my childhood, and now my husband and I take our children. One of our favorite parts of the trip is traveling on the Moose-Wilson Road. We love being able to drive slow and see the vast variety of wildlife of beaver, elk, deer, moose, bear, and so much more.

I am greatly concerned about you widening the Moose-Wilson Road to allow RV's and campers. It seems to me that the reason we have National Parks is to protect wildlife and wonders of nature like the Grand Tetons and its surrounding habitats. It is not to make more convenient for tourists and residents. I propose that at the most you pave it and have strict slow speed limits on the road, so that bikers, hikers,

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

and animals are all protected. It would be a huge disappointment to see the road become just another highway to travel rather than keep it the gem it already is.

Sincerely,

Jenny Ellsworth

September 14, 2014

Grand Teton National Park
ATTN: Moose-Wilson Planning Team
PC Drawer 170
Moose, WY 83012-0170

Dear Moose-Wilson Planning Team:

Thank you for the opportunity to comment on the proposal to change the Moose-Wilson Road. We are residents who live north of town and are avid outdoor enthusiasts who appreciate the wildlife and wilderness of our special surroundings.

We attended the open house at the library in August and have talked with many people about the proposed changes. After reviewing the alternatives and giving much thought to the situation, we advocate the following:

1. Do not allow a net increase of pavement within the corridor.
 - a. Increasing the pavement will only serve to increase vehicle usage and speed as the road will be perceived as faster and 'safer'. No change should affect the road's National Register eligibility nor the corridor's historic significance.
2. Permit no increase in habitat disturbance/fragmentation.
 - a. This is important, and should be a primary consideration ' this is their habitat ' lets not make life harder

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

for them by making it easier for us.

3. Do not allow the removal of large numbers of trees and vegetation.

a. Again this is critical for the main inhabitants of this area ' the wildlife.

4. Do not allow any commercial traffic (including taxis) on the road.

a. This should not be used as a thoroughfare, the motivation for taxi's and Westbank residents and visitors to use this route as a shorter and faster way to get north of town and to the airport is not the purpose of this road. No consideration should be given to such interests!

5. Do not add a bike path!

a. With the increase in grizzly activity in this area ' we would believe that a bike path would not be safe.

Suppose a grizzly attacked a biker - would there be a push to kill or remove the grizzlies to make the area safer for bikers and walkers using the path? We believe the Park is overreaching by considering

adding a bike path ' it is a wildlife corridor ' not a bike path corridor' there are alternate bike paths

available but no alternative habitat for bears and wildlife. How far is the Park willing to push and pressure wildlife and habitat to accommodate bike traffic? We strongly urge you NOT to include a bike path!

6. Continue winter road closure, no grooming or motorized usage.

a. This area has been and should continue to be a quiet wintertime refuge.

7. Do not implement one-way traffic or a reservation system.

a. This creates unacceptable difficulty reaching LSR and trailheads. A one-way traffic loop requires visitors on the Westbank and in Teton Park areas to drive thru Jackson to complete the 30-odd mile "loop."

8. Do consider two-way traffic to LSR with no through traffic.

a. This would reduce congestion, increase safety for visitors and wildlife, and solve many other "road" and usage issues.

9. Do maintain or decrease the vehicle speed limit.

We understand that the pressure to pave the road, etc. for the Westbank and add a bike path is considerable ' however we need to remember to speak for the wildlife and protect their interests. In the words of Edward Abbey ' 'Wilderness doesn't need more defense ' it needs more defenders'.

We feel that the preceding recommendations will help defend this important wildlife corridor and fulfill the mission of Grand Teton National Park and the Park Service " . . . to promote and regulate the use of the...national parks...which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.

Sincerely,

Randall & Mary Kaufmann

██████████

Moose, WY 83012

P.S.

Adding a bike path & pavement adds additional maintenance cost to an already tight Park budget. The on-going cost of a bike path could be better spent on things like employee housing!

Correspondence Text

August 14, 2014

Grand Teton National Park
Attn: Moose-Wilson Planning Team
PO Drawer 170
Moose, Wyoming 83012-0170

Greetings, MW Planning Team

As conservationists and environmental advocates residing in Teton County for over 35 years, we have actively participated in numerous NEPA processes. We are keenly aware that allowing the public to weigh in before the DEIS is released is unusual, and extend our sincere thanks for this opportunity.

We have read through the preliminary alternatives, 2009 Western Transportation/MSU study and the recently released University of Utah Moose Wilson Corridor (MWC) traffic data. As a broad overview, two things are apparent:

1) The DEIS must include defensible indicators and baselines for whatever alternative is selected. At what point are resources/wildlife unacceptably damaged? Have we already surpassed it (i.e. what is the baseline for motorized/nonmotorized visitation in the corridor?) Without solid data, the park will be in for very rough sledding from those with business, county transportation and recreation interests that conflict with park values.

2) None of the alternatives is sufficiently forward thinking to manage ever-increasing traffic for more than a short window of time.

Comments on specific alternatives, from the least desirable to more preferable.

Alternative A

With a projected doubling of traffic every 15 years, there is broad-based agreement that business as usual cannot continue.

Alternative D

Road re-alignment is needed, and supported for all alternatives.

A reservation system on a two-way road would be exceedingly difficult to manage, leading to visitor dissatisfaction. There would also be an unintended consequence for nonmotorized users of the corridor. As park visitation continues to grow, a larger percentage of people will be unable to secure a reservation. Those who may have photographed or hiked along trails to Granite, Death Canyon and LSR will likely choose to recreate in the already heavily-impacted Jenny Lake area.

Enhanced winter recreational opportunities are not appropriate. The corridor is critical moose habitat. Its use should be further restricted rather than expanded. The Snake River bottomlands through the corridor should be closed, and grooming and/or guiding should not be employed to draw more people. Those seeking a groomed experience in the park have the inner park road. A wilder experience should remain in the corridor.

Given the critical needs of wildlife, increasing any type of usage in the corridor, including cycling along a separated pathway, strikes us as a step backwards. The corridor is among the most heavily-treed passageways in the park. The vibrant forestlands fringe an eco-tone, a transition zone to a different type of biologic community. In this case, the forest transitions to a riparian area, then open sage meadows that border the Snake River. This rich environment provides both food and cover to a wide variety of wildlife species, including struggling moose and, recently, black and grizzly bears.

A separated pathway along its 7.1-mile length would virtually double the human disturbance zone-permanently impacting 14-acres of intact habitat-and require paving almost 9 acres of land and removal of as many as 7,500 trees. The potential effect on wildlife is so significant that the updated 2009 Western Transportation Institute study of the corridor recommended that a separate pathway be the last adaptive management strategy adopted of the seven management options it analyzed.

The park has historically regulated recreation to protect resources. Backpacking sites are limited; jet skis and pack rafts are prohibited; and skiers and snowshoers may not travel along segments of the Snake River corridor. Bicycle pathways should not be the exception. Visitors already have a wealth of non-motorized options to explore the park, including the pathway from town to Jenny Lake and a well developed trail system.

Recognize that pathways are not a panacea for safety. Everyone is aware of the oft-repeated, tragic death of Gabrielle Axelrod on a park road near Jenny Lake. Sekiom mentioned is the 2005 death of Ed Henry on the separated pathway at the south end of the Moose Wilson Road. Ed, rollerblading, was struck by a fast-moving cyclist. Pathways, and cycling in general, are not without risk. Moreover, grizzly bear biologists

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

indicate that a separated pathway would increase surprise bear-human [and moose-human encounters, with potential for injury and possibly death for both humans and bears. This should be a compelling concern for both wildlife and separate pathway users.

Alternative C

Closing roadways to all other use two days a week is not optimal, and would be unpredictable to wildlife. Further, it would have the unintended consequence of concentrating and increasing vehicular demand on the days the road is open. As overall park visitation continues to grow, daily peak use would expand, fueling visitor frustration and overwhelming queuing lane capacity, as "alternative routes" are limited. It also creates undesirable pavement at both end of the corridor.

Taxis should be prohibited. MWC should not be treated as a shortcut to the airport.

Alternative B

We view this as the best of the presented alternatives as it curtails through traffic during predictable peak time periods. University of Utah data indicates as much as 80% of the traffic spends only 27 minutes in the corridor; a very high percentage of visitation is through traffic that does not stop. In the short-term, gating should reduce traffic to a level that affords adequate resource protection and could safely accommodate bicyclists without increasing the width of the road. Flashing signs reminding drivers to watch for cyclists as they enter the road would heighten awareness that the roadway is shared. Given that traffic from Teton Village Road is projected to double every 15 years, however, this solution has a relatively short shelf life.

Suggested adaptive management techniques for MWC without getting into the weeds with details, we hope you consider more stringent management options, including:

1. A one-way, reverse flow road the length of the corridor. Allow one-way traffic from both ends to LSR until the LSR center opens. Close the road at night. This would allow earlier access for trail users, while significantly reducing use during critical dawn and dusk wildlife activity periods. Cyclists must also follow one-way restrictions.
2. Dead-end at LSR from both directions. Road should be closed at night.
3. Restrict motorized traffic to park shuttles in the Moose Wilson Corridor AND the Inner park road to South Jenny Lake parking area. Signal, Jenny and Jackson Lake Lodges would still have private vehicle access via the outer park road and north end of the Inner road. The Town of Jackson, Teton Village and private lodges could provide feeder shuttles, as is done in Zion, to Moose and Granite parking areas, limiting the need for parking lot expansion in the park. Small shuttles could be utilized in the corridor, full size buses on the Inner park road.
4. For all alternatives, contact GPS mapping services and have them remove the Moose Wilson Road as the shortest route from the airport. This effectively rerouted large truck traffic over Teton Pass.

Finally, the park should be aware that one of the largest landowners along Teton Village Road has placed conservation easements on their property except for an obvious access point to the Snake River. They are aware that a north bridge may be necessary, particularly if they perceive their business interests would be impacted if the park exercises its clear authority to manage park roads in line with the mandates of the 1916 Organic Act.

This is a high stakes poker game. Dont forget who holds the aces.

Again, thank you for the opportunity to comment.

September 15, 2014

Grand Teton National Park
ATTN. Moose-Wilson Planning Team
PO Drawer 170
Moose, WY 83012-0170

Re: Moose-Wilson Corridor Comprehensive Management Plan - Preliminary Alternatives

Please accept these comments on behalf of the Greater Yellowstone Coalition (GYC). GYC has over 40,000 supporters and constituents who support our mission of protecting the lands, waters and wildlife of the Greater Yellowstone Ecosystem (GYE), now and for future generations. The GYC was founded in 1983 on a simple premise: An ecosystem will remain healthy and wild only if it is kept whole and we advocate for the idea that ecosystem level sustainability and science should guide the management of the regions public and private lands.

This vast ecosystem includes 20 million acres of wild country that includes Yellowstone and Grand Teton National Parks, parts of six national forests, five national wildlife refuges, and state and private lands in Wyoming, Idaho, and Montana. The Moose-Wilson Corridor represents many of the conflicts and threats to the ecosystem that play out on a much larger scale and cumulatively erode ecosystem function, even though it remains a 7.7 mile road system opened seasonally. Many of the conflicts between stakeholders in this corridor are a harbinger of future issues that this ecosystem faces.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

The Greater Yellowstone Coalition works to ensure that a thoughtful and holistic approach is taken to managing the national and wildlife resources in harmony with people and modern development. We work to shape a future where wildlife populations maintain their full diversity and vitality, where ecological processes function on public lands with minimal intervention, where exceptional recreational opportunities abound for visitors and residents alike, and where communities can enjoy a healthy and diversified economy.

Principals behind GYCs comments

The following comments are motivated by three guiding themes: 1) Moose-Wilson Corridor should be managed as a destination in-itself because of its outstanding natural communities, cultural and wilderness resources, and opportunities for visitor enjoyment. 2) Moose-Wilson Corridor is a Grand Teton National Park (GTNP) resource that is autonomous from Teton County's transportation planning and the Park Service has the authority and expertise to wisely develop a plan for transportation in this corridor. 3) GTNP is responsible for maintaining the ecological character of this corridor to preserve unimpaired the natural and cultural resources and values of the national park system for the enjoyment, education, and inspiration of this and future generations.

Protection of the Laurance S. Rockefeller (LSR) Preserve

We urge the Park Service to comply with the intent and requirements accompanying the donation of the LSR Preserve that fulfills the expectations that these lands and values are conserved for future generations. The Reserved Conservation Easement for the Laurance S. Rockefeller Preserve directs the [Moose-Wilson] road to be maintained in its current width and with its current horizontal and vertical alignment as reflected in the inventory, within the easement (Sect. 3.3). Further, using motor vehicles and bicycles on approved and existing roads, driveways, and parking lots provided that no snowmobile, motorcycle, ATV, or any similar device, whether motorized or not, shall be operated on the Property, except as specified in Sect. 3.5. This expectation that Moose-Wilson Corridor not be developed for additional uses such as a winter groomed trail (similar device as a snowmobile or ATV) would appear to limit the use of snow grooming equipment within the LSR. Similarly, road improvements and the construction of a separated pathway would be limited. We ask GTNP to provide the public with explanation of how the proposed alternatives adequately address the spirit and intent of the easements that opened the LSR preserve to public use.

Reducing Conflicts with Grizzly Bears

While grizzly bears may be a recent arrival to the Moose-Wilson Corridor, their presence has significantly changed the character of this roadway and necessity for considerations of impacts to this iconic species of the Greater Yellowstone Ecosystem. The Park Service should consult with the U.S. Fish and Wildlife Service (USFWS) on the impacts of road realignment, traffic volumes, increased recreational use on grizzly bears as well as Canada Lynx in developing an Draft Environmental Impact Statement (EIS). This analysis should also include cumulative impacts associated with Grand Teton National Parks 2007 Transportation Plan Final EIS. A central subject for Moose-Wilson Corridor Draft EIS should include minimizing conflicts with grizzly bears and grizzly-human safety analysis. During previous planning processes the USFWS has cited concerns with adding multi-use pathways and the probability of human grizzly bear encounters and associated human injuries. Habitat fragmentation is very real for grizzly bears. Studies have shown that there are predictive thresholds of traffic volumes that prevent grizzly bear crossings of roads. One study from northwest Montana predicts that the threshold occurs at approximately 100 vehicles/hr (Waller 2005). Habitats along roadways have shown to be beneficial for use

by grizzly bears in Yellowstone National Park, however requiring managed visitor behavior at bear jams which results in predictable human behaviors for bears (Haroidson et al. 2013). Road densities are also closely associated with predicted grizzly bear survival and as road densities increase, survival of grizzly bears decreases (Schwartz et al. 2012). Results from studies in Yellowstone suggest that human presence can reduce grizzly use of areas with unrestricted use and that management closures to human use are a benefit to grizzly bears (Coleman et al. 2013).

Grand Teton National Park has a long history of proactive management solutions to reduce conflicts with grizzly bears that have proven effective including but not limited to; management closures on Willow Flats, requiring bear-spray to be carried by hunters during the Elk Reduction Program, managed bear jams through the Wildlife Brigade program, limiting road vehicle use in the John D. Rockefeller Parkway, and road closures during the fall on the Moose-Wilson Corridor. The Park Service should provide an analysis of the adaptive strategies that will be used in the Moose-Wilson Corridor Management Plan Draft EIS as well as analysis of impacts to grizzly bears directly and indirectly by habitat modification. This analysis should include the components of each of the proposed alternatives including modifications of the road itself, increased visitor and bicycle use, and winter access use.

Consideration of Proposed Alternatives

At this stage in the National Environmental Policy Act (NEPA) process, we are not supporting, nor opposing in these comments any of the proposed alternatives as described in the newsletter. All aspects of the proposed alternatives will require thorough analysis for their potential impacts to resources and visitor experience, as well as data analysis of the current and proposed conditions. This community deserves a full disclosure of the costs and benefits of modifications in this important ecological corridor. Consistently, residents of Teton County list wildlife and scenery as the highest values of the communities character and those values also translate to visitor experience when they visit GTNP. The four draft alternatives all have impacts that may benefit or harm GTNP resources and a factual analysis of these impacts will provide the community and Park Service with the opportunity to make an informed decision, rather than a pre-determined hypothesis of our personal desires for the corridor.

Maintain Physical Character

The slow speed and winding character is part of the local cultural value of the Moose-Wilson Corridor. Additionally, seasonal closures of the road should remain. The rustic corridor contains cultural and resource values that are unique in GTNP and currently attract visitors for these reasons. We also think the current limitations to trailer and oversized vehicles have added to the values for this corridor. We realize that the park must also consider strategies that make it safe to travel the Moose-Wilson corridor regardless of mode of transportation. In so doing, the park should evaluate the potential increased conflicts between bicyclists and wildlife, which may be direct, or indirect because of loss of habitat and increased human use. The Park Service must use caution and care to ensure that any modifications of this character are compatible and prevent the impairment of natural and historical values.

Components of the new Alternatives that should be carried forward

Acknowledging the additional need for analysis there are elements of each of the proposed alternatives that deserve further development and consideration within the final draft alternatives.

Road Realignment- The proposed road realignment between the Death Canyon road and Sawmill Ponds deserves further consideration within the purpose and need of this plan. Relocating this section of road

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

will remove direct impacts to riparian and wetland habitats. Wetlands and riparian areas make about 2% of the land in Wyoming, making them unique within the region. Approximately 90% of the wildlife species in Wyoming use wetlands and riparian habitats daily or seasonally during their life cycle, and about 70% of Wyoming bird species are wetland or riparian obligates (Nicholoff et al., 2003). Wetlands are also intricate in maintaining water quality. The area is known for its high use by moose and beavers. Moose on a local scale have been in decline for the past two decades. Conflicts with beavers at this site have resulted in NPS actions to modify beaver dams when impounded water threatened roads. Finally, the abundant choke cherry and hawthorne shrubs in this stretch of road have resulted in NPS actions to close the road during the recent years to preemptively avoid conflicts with grizzly bears. The proposed realignment appears, at face value to mitigate some of the above conflicts and serve as a net gain for wildlife. The Park Service should provide a thorough analysis of habitat impacts in the sagebrush community where the road would be relocated to.

Similarly, there appears to be great value in considering realignment away from the cottonwood complex at the north entrance to the Moose-Wilson Corridor. This realignment may have beneficial impacts of reducing traffic volume because of requiring entry fees as it occurs beyond the entrance station. The Park should analyze this potential reduction of volume and increase of user fees because of this proposed realignment. It is critical that the Park Service fully rehabilitate any removed road sections back to natural conditions and that the slow-speed and narrow winding character of the road remain consistent in the realigned segments of road.

Increased Turnouts

Providing safe pullouts and parking for park visitors enjoying the scenic and wildlife watching opportunities should be analyzed fully for impacts, however these added pullouts seem compatible with adding enjoyment, education, and inspiration for park visitors and the purpose of the corridor as visitor destination.

Traffic Calming

All of the proposed alternatives contain thoughtful proposals to better manage traffic along the Moose-Wilson Road that deserve additional consideration and analysis. Wider roads, higher traffic volume, and higher vehicle speeds lead to increased impact on wildlife, including their habitat and movements across the landscape (Gunther et al. 2000). Some of the proposed strategy for reducing vehicle speed, reducing congestion by managing entry rates, restricting through-traffic during peak periods, increasing public transportation options, managing commercial activity through limits to resource-based interpretive use, and a reservation based system should be considered through this process. The draft EIS should also consider maximum thresholds that would trigger defined actions to clearly outline future agency actions rather than rely upon multiple adaptive strategies.

Public Transit Options

There is mention of creating shuttle services in all of the proposed alternatives. We ask the Park Service to outline the details of a shuttle service and explore options to partner with Teton County, the Town of Jackson, or private entities to provide shuttle access through the Moose-Wilson Corridor, to the LSR Preserve Visitor Center, to popular hiking trailheads, to the Craig Thomas Discovery Center, and perhaps beyond to the Jackson Hole Airport. Non-permitted commercial use should not be considered in the final alternatives and should be addressed currently with increased enforcement. Analysis and projections of use and its impact to the number of vehicle use days and reduction of traffic volume should be included in

the draft EIS and include analysis of increased safety to cyclists and pedestrians.

Death Canyon Trailhead

Minimizing additional paving while maintaining reasonable access should be the goal for this portion of project area. The current access that is unmaintained and causing resource damage should be corrected with both restoration of existing road to natural conditions and allowing for safe parking opportunities. We feel its outside of the scope of the Moose-Wilson Corridor travel planning to seek increased visitor use at the White Grass Ranch or to manage administrative access in this effort. A thorough analysis of paving, parking, and restroom facility options should be included for impacts to vegetation, visitor experience, and wildlife.

Options Within Proposed Alternatives Requiring More Analysis

We could foresee the park developing a matrix of options within the proposed alternatives for additional analysis of impacts under the categories of bicycle use and in treatment of the physical character in terms of the unpaved section of the Moose-Wilson Corridor.

Rather than an independent alternative that contains a separated pathway, we ask the Park Service to analyze and disclose the impacts of a suite of options for providing safe bicycle use that would include many of the components that we've listed above that have clear resource benefits. Safe bicycling use may be achieved by three options including continued shared roadways with reduced traffic speed and volume, an expanded shoulder along the existing and proposed roadway modifications, or the separated pathway option as discussed within Alternative D. These three options should be analyzed for their impacts on visitor experience, resource considerations including vegetation modifications, and impacts to wildlife and habitat.

Similarly, paving the currently unpaved segment of the road requires further analysis. What are the impacts to the surface and ground water with a net increase of asphalt in the Moose-Wilson Corridor? What are the current impacts of dust abatement and resource damage from user created pullouts? These options should be considered in a matrix with the other components of the proposed alternatives and not simply a paved or no paved option, or separate-pathway or no pathway option. Explicitly providing the public with the impacts of all the above options will give valuable insight in supporting or opposing the alternatives that will be disclosed in the draft EIS.

Conclusions

I appreciate the opportunity to submit these comments on behalf of Greater Yellowstone Coalition on the Moose-Wilson Corridor Comprehensive Management Plan - Preliminary Alternatives. As stated above, we are not supporting nor opposing any of the preliminary alternatives until further analysis of the associated impacts of the components of each alternative have been closely examined and disclosed to the public. We have participated in the previous public processes on transportation planning in GTNP including February 5, 2014 comments on the Moose-Wilson Corridor Comprehensive Management Plan scoping and August 24, 2005 comments on the GTNP Transportation Plan Draft EIS, and those comments remain relevant on overall planning for this important corridor. The Moose-Wilson Corridor has renowned values as a rural and historic road that travels through excellent habitats for moose, birds, beavers and grizzly bears. Many of the components within the three proposed alternatives would have direct benefits to these species. Because of these benefits, the no action alternative should not be considered as a viable option. Each of these proposed changes will have costs and benefits economically

and ecologically and the public should have an honest discussion on these impacts through the public process. We encourage an open dialogue that discloses the environmental impacts to these resources and includes the best available science, prevents impairment of Park resources and allows visitors and wildlife alike to enjoy this spectacular corner of Grand Teton National Park safely.

Thank you for your consideration of these comments,

Sincerely,

Chris Colligan
Wildlife Program Manager, Greater Yellowstone Coalition

Grand Teton National Park
ATTN: Moose-Wilson Planning Team
PO Drawer 170
Moose, Wyoming 83012-0170

Dear Friends,

Thank you for offering us the opportunity to comment on the future of the Moose-Wilson Corridor and for providing such a clear presentation of preliminary alternatives to shape comment. You really have done a nice job with this.

I should like to begin by acknowledging that neither I nor most (possibly any) of us who are commenting are in full possession of relevant facts and arguments. I respect those of you required to assess all those as fairly and dispassionately as possible. As I age, I'm more and more put off by people who have firm and strong opinions about things they actually know little about, and I don't want to fall into that trap.

Nonetheless, I have very strong feelings about the Moose-Wilson corridor and Road and about "improvements" in our Park and our Valley. With your indulgence, I'd like to start with the latter.

"Improvements"

What's special about our Park, about the greater Yellowstone system generally, and derivatively about Jackson Hole is the opportunity it affords for direct experience of the wild'of wilderness and the wildlife

that inhabit it. In my view there's a subtle threat to all of them'one which, unlike other threats, we here have some capacity to ward off. That threat stems from the urge to "improve".

The urge to improve seems deep in the human psyche. We seem always about some kind of improvement to the things we own or have charge of. For those of you responsible for the Park that inclination must be as strong as for the any of us, reinforced by the natural wish to leave your mark.

Moreover, that impulse must be aided and abetted by those of us who live here. We came here, most of us, because we love the wildness that surrounds, with the beauty and the recreational opportunities it affords. Yet once here we too suffer from the urge to improve. We also suffer from what I call "the Jackson-Hole paradox". Because many of us have to make a living here, and because our political officeholders need tax revenue to pay for public services, we're naturally motivated to grow our economy and so to "improve" conditions for businesses, visitors, and residents. That too leads to ever more invasions into the natural world. As we keep adding bigger, better roads, bridges, visitors centers, facilities, pathways, traffic signs and signals, and so on and on, we erode the wildness and the direct experience of that wildness that attracted us here in the first place. As we keep improving things, we make them worse.

In short, and because I won't know all the considerations you need to take into account, the strongest consideration I want to urge is that you resist the urge to "improve" (including even with seemingly minor things like turnouts and interpretive or traffic signs) unless the considerations that require improvements are well-nigh overwhelming.

I therefore tend to a strong preference for Alternative A, or something like it with minor adjustments.

Moose-Wilson as a national and local treasure

Our forty years around and in Grand Teton National Park literally began on the Moose-Wilson Road'we drove straight from the airport to it and stayed along it for ten years. We've driven along it (and stopped along it) innumerable times then and since. We have the strongest possible affection for it just the way it is, and would much rather see it remain just the way it is.

The road has been and remains one of the most interesting and rewarding ways of seeing the Park, and in a different way than is afforded by any of the other Park roads. Realigning part of it away from the wetlands and out onto the sage flats, in particular, would cost us and thousands of others a big part of that wonderful experience. That the Road is one of the best places in the Park for wildlife sightings is surely in itself a plus'just what we want visitors to thrill to, as they do, and just what, probably more than anything, motivates them to come.

Effects on wildlife

The flip side, of course, is the potential that traffic and wildlife watching along the Road will endanger and disturb that wildlife. However, our long experience on the Road suggests that this potential may not be serious. In forty years on that Road I, at least, have not once seen a killed or injured animal. Indeed, the almost invariant reaction when people see wildlife (which they are almost invariably looking out for) is that they slow down or stop to watch. That should reduce any danger to the wildlife from cars. Moreover, my invariant experience is that animals and birds seem to find people in cars far less disturbing than people on foot'one of the reasons the Moose-Wilson corridor is among the best places in the Park to see wildlife.

By and large, moreover, I've not noticed that oglers who get out of their cars'let alone those who just roll down their windows to watch or take a picture'do much to disturb, let alone to endanger, the animals or birds. People must be stopping daily during the summer, for example, to watch the beaver and the moose in the wetlands. It's not obvious, at least to a casual observer, that most of the time the animals even take much notice.

If I were you guys, I'd want to see some solid and significant contrary evidence before adopting any major change to the Road that would do serious damage to the visitor experience, as relocating a big chunk of it almost certainly would.

Grizzly bears

It's not obvious to me why the increased presence of grizzly bears in the Moose-Wilson corridor'positive evidence of their successful reintroduction'should be regarded as a particular problem. We've grizzlies everywhere in the Park now. People in cars don't seem in much danger from them. Instead that seems the safest way for people to observe a grizzly'and observing a grizzly is invariably a highlight for any visitor.

People on foot (or bikes) who use the Park anywhere are certainly on notice, undertake the risk, and should be expected to exercise personal responsibility and common sense in being prepared for bear encounters. It's not obvious, at least to me, that there's anything special about the Moose-Wilson corridor in this respect.

Traffic

It's certainly true that there's more traffic on the Moose-Wilson road now, as on all the roads in the Park and in the Valley generally.

But I'm disquieted generally with the idea that the way to deal with heavy traffic is to build more, bigger, or straighter roads. Those too are "improvements" with big cumulative downsides. Moreover, I'm getting on in years now and have watched that dynamic, here, elsewhere in Wyoming, and in major metropolitan areas. To a significant extent, it seems just to invite yet more traffic and more congestion. If instead we leave things alone, congestion is at least partly self-limiting. People find alternatives.

That's especially true in the Moose-Wilson corridor. Traffic on the Moose-Wilson Road is slow at best, slower during peak tourist season, and slower still when people stop in the road to watch animals. In my view, expressed above, that's a prime value of the road. As long as visitors don't tie up both lanes so that traffic is halted entirely, stopping to watch wildlife should be regarded as the right of visitors and a key purpose of the Park. Those of us who may be trying to get somewhere over the Road should acknowledge that priority and adjust'if necessary by taking an alternate route. In other words, "congestion associated with the presence of wildlife" is a price we should be glad to pay. If you can't take some time on route to watch wildlife'and our guests from elsewhere in the country watching and enjoying the wildlife'you're on the wrong road.

I'd go a step further. I'd urge that as far as possible you deal with traffic and congestion on the road by using the slowness of the road, whether from congestion, curves, or potholes, in a natural way to inhibit overuse. For example, the idea of paving the currently unpaved part of the road seems attractive, but would likely encourage traffic, particularly of the kind that's in a hurry.

Through traffic

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

I saw a newspaper story on the recent report which says that most drivers on the road are not stopping at the trailheads, LSR, or other destinations along the Road, but instead are passing through on the way to some other destination. This hardly seems news. Why should it be regarded as bad or wrong? Many of us and many visitors use the Road when we can, often in preference to faster and less bumpy alternatives, because of the natural beauty we travel through and the wildlife sightings possible. Closing the Road to through traffic would deprive thousands of us of these pleasures and experiences. In doing so it would defeat key purposes of our National Park system.

Moreover, if anyone objects to people using the Road for getting from here to there, the last solution they should embrace is any that enables faster and less impeded traffic on it.

Bikes

With some discomfort, because I'm a biker myself and because many of my neighbors and friends would like a bike path in the Corridor, I'm quite strongly opposed to that idea. "Pathways" certainly have positive values, but they too are "improvements" that get in the way of directly experiencing our natural surroundings. Pushed by an extremely well-organized lobby, it seems to me and many others, "pathways" have become something of a sacred cow here. To now interpose yet another pathway between us and the natural world in the Moose-Wilson Corridor seems particularly inappropriate. Moreover, there the danger of bear encounters to bikers and the likelihood of their adversely affecting wildlife seems quite significant. We have plenty of other pathways now where we bikers and skaters and such can recreate. Please not along the Corridor.

Death Canyon

I'm inclined to oppose shortening the road out to the Death Canyon trailhead, certainly by a whole mile. For highly fit young people that would be trivial. For us oldsters and for less fit visitors it would make trekking into Death Canyon, or even to the Snake River Overlook, significantly more daunting.

Thanks again for the opportunity to comment.

Sincerely,

Charles H. Herz

Correspondence Text

15 September 2014

To: "Moose-Wilson Planning Team"
P. O. Drawer 170
Moose, Wyoming 83012-0170

Dear "Moose-Wilson Planning Team":

Comments on "Preliminary Alternatives Newsletter" released 15 August 2014 by Grand Teton National Park pursuant to Notice of intent to Prepare a Comprehensive Management Plan for the Moose-Wilson Corridor, and EIS, 78 Federal Register 78559-60, December 6, 2013:

Assistant Public Affairs Officer Andrew C. White of the Grand Teton National Park staff assured me on 7 September 2014 that written submissions regarding the "Preliminary Alternatives" for the Comprehensive Management Plan and EIS being prepared pursuant to the Federal Register notice cited above would be accepted as timely if transmitted by U.S. Mail postmarked on or before September 15, 2014. This is.

I submitted formal comments on the "Scoping" stage of this Management Plan preparation, hand-delivered to Park Headquarters at Moose on 6 February 2014. Please incorporate all remarks offered in those Scoping Comments into this submission.

Study of Impacts; Changes to the "Affected Environment"

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

The nature of the Moose-Wilson Corridor has changed greatly since it was included in the Grand Teton National Monument on 15 March 1943, and later included in the enlarged Grand Teton National Park by the expansion act of September 14, 1950.

Some of those changes have increased human presence, but many have tended in the opposite direction. As the report, "Options and Opportunities for Protecting Inholdings in Grand Teton National Park," prepared by ConServCo for the National Park Foundation in February, 2004, demonstrated, in 1950 almost all the land along the Moose-Wilson Corridor was in private ownership. Now, virtually all is in federal ownership. Some private residences in that corridor are still occupied pursuant to life estates, but those are nearing their termination and those lands will soon revert to natural condition.

Dude ranches lined the Moose-Wilson Road ' the J-Y Ranch, the White Grass Ranch, the Circle-H (later owned by Harry and Margaret Barker), The R-Lazy-S, and others. Each of these businesses kept strings of riding and pack horses. The total horse count in the Corridor probably exceeded two hundred, possibly considerably more. The presence of these horses, and their owners' defense of them from predators, was probably a significant impact on wildlife use in the area.

That impact from dude ranching and associated livestock is now virtually gone. Wildlife have freer use of the habitat along the Corridor than in almost a century. The report in the Jackson Hole Daily for Thursday, September ii, 2014 that the Moose-Wilson Road had been closed due to grizzly bear activity is just one example of increased wildlife use of the Corridor. It seems likely that the bear presence is only one indicator of the general improvement in habitat availability due to the reduction in human and domestic livestock use. The Corridor Management Plan environmental study should address this possibility, and consider its long-term consequences.

It is probable that there will be a significant increase in the variety and intensity of wildlife use in the Moose-Wilson Corridor over time. The Management Plan and EIS should consider how to manage human activity so that conflicts are avoided - not just with current wildlife use levels, but with increased wildlife use in the future.

Discussion ' Straw "Preliminary Alternatives" as a NEPA method:

The Comprehensive Management Plan for the Moose-Wilson Corridor will decide a variety of actions. Grouping these together in four "Alternatives" is an artificial way to invite public discussion. Many of these decisions can be made one way or another in isolation. The decisions are not inevitably linked in one "Alternative" or another.

Some of these actions to be decided are physical ' to pave more of the road, to remove existing pavement, to build a separated bicycle pathway. The effects of those decisions will last many years. Once pavement is placed in the Park, it is not likely to be removed. Furthermore, as I discussed in my Scoping comments, the history of Grand Teton National Park demonstrates that each step by the Park Service to make local use and traffic easier leads to pressure for the next step. "Cumulative impacts" must be studied in the NEPA process ' not merely the cumulative impacts of actions being considered in the proposed action, but the added cumulative impacts of future actions that will be made more probable by choices in this Management Plan.

My comments are organized by specific management strategy, not by the "Alternatives" lumped together in the NPS handout. I have divided them into issues that involve physical alterations to the Park, and those that are administrative and interpretive.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Physical Changes ' Proposed Actions

1- Road Alignment Should Not Change; Reduce Paving

The Moose-Wilson Road within Grand Teton National Park should be kept within its existing alignment. It should not be widened. The length of the road that is currently not paved should stay unpaved. The paving that has been installed by the Park Service in recent decades, from the White Grass Ranch turnoff south, should be removed and that section of the road restored to gravel, as it was. The extent of the Moose-Wilson road that is NOT paved should be increased, not reduced.

The proposal to build new road to the east of the existing alignment from the Sawmill Ponds Overlook to the Death Canyon road junction should NOT be carried out. The wetlands benefits claimed can be achieved with careful engineering techniques within the existing road line. This relocation will unfairly disrupt the right to quiet enjoyment of the remaining term of occupants of property in the route of the proposed realignment. The proposed new road location may impinge on private property at T43N, RI 16W S.34, Lot 5, Tax Parcels 22-43-16-34-4-00-006 and -007. Further, winter recreation use will follow the new road alignment. Moving that recreation use into the location of the proposed realigned road is not desirable.

Once the Park Service starts relocating and rebuilding the Moose-Wilson Road, the NPS will not be able to stop until the entire road is upgraded to a much higher, more destructive, standard. The claim in the NPS brochure that "The new road segments would be constructed to emulate the slow-speed, narrow winding character of the road corridor" [Alternative B text] is not believable. The proposed new road line will be across open sagebrush flats with no willows, no water, no sidehill, and no topographic constraints. The NPS cannot "emulate" the existing road character in those conditions.

The north termination of the Moose-Wilson Road should be within the Entrance Station control area. A visitor should have to pass through Park Entrance control before entering the Moose-Wilson road. This could be accomplished by relocating the existing Moose Entrance Station, rather than by constructing new roadway. However, relocating the road from north of the foot of the sidehill grade up to Sawmill Ponds Overlook, if necessary to establish Entrance Station control, is acceptable.

2- Bicycle Pathway Construction

There should not be any construction of separated pathways, whether paved or unpaved, for bicycle use through the Corridor. Bicycles should be allowed to use the existing road space. All bicycles using the Moose-Wilson Corridor should be required to have warning bells, safety lights and reflectors, and bear spray.

The description of proposed pathway construction in the Park brochure, Alternative "D," is deceptive. The statement in the NPS brochure text that "the pathway would generally be sited within 50 feet of the existing or realigned segments of the road" IS NOT TRUE, according to the Alternative D map. The map shows about 1.6 MILES of new bicycle path way around the LSR Preserve, on a line that is totally separated from the Moose-Wilson road.

Why does the Park Service text falsely describe this proposed bicycle pathway as "generally sited within 50 feet" of the road, when the map makes clear that a major length of the path will cover Park landscape totally separate from the Moose-Wilson road? What is the Park Service plan for this proposed bicycle

path around the LSR? Will the path follow the existing service roadway SW of the Preserve center? If so, how will a "serpentine alignment" be achieved? Or, will a new twisty bicycle path be constructed alongside the existing service road? If not, the speedier cyclists will ride on the service road instead of the path? How will this separated pathway avoid creating increased conflicts between cyclists and wildlife?

Conflicts between cyclists and motorists on the single, existing, Moose-Wilson Road should be managed and all possible measures taken to improve safety for all. Creating a separated bicycle pathway is not necessary for visitor safety. Creating a separated bicycle pathway will lead to an acceleration of other impacts on Park values in the Corridor.

3- Death Canyon / White Grass Ranch Access

Closing the Death Canyon trailhead road and rehabilitating that ground, Eastward to the White Grass Ranch service road junction, is a reasonable step. I recommend studying ways to reduce wildlife impacts of activities at the White Grass Ranch site. I would prefer that the White Grass Ranch property be restored to its natural condition; there are better places to play with log cabin construction.

Administrative and Management Steps ' Proposed Actions

1 - Motor Vehicle Traffic Management

The Park should work with the State of Wyoming to have the speed limit on Wyoming Highway 390 reduced to 45 miles per hour maximum outside of the Park. At present the WY390 speed limit is 45-day / 35-night in the moose-crossing area several miles north of WY22, but it then rises to 55 MPH at the northern end of WY390. This creates an inconsistency in driver behavior and expectation that could be easily improved.

The 25MPH speed limit throughout the Moose-Wilson road within the Park should be strictly enforced. In addition to patrols, speed cameras should be installed and enforced.

When a motor vehicle enters the Corridor at one end, its license and time should be automatically recorded and transmitted to the other end station. If that vehicle arrives at the opposite end in less time than is required to drive the road at the posted speed limit, the vehicle should be detained in a holding area until the proper minimum time has elapsed. This is not technically difficult. Very few drivers will be detained more than once.

Vehicle size limits and the prohibition on trailers should be vigorously enforced by Park staff at the admission stations; this is not being done now, even at the South entrance.

2- Corridor Entrances Management and Interpretation

As noted under physical steps above, any user of the Moose-Wilson road should have to pass through a Park Entrance Station. The South Entrance station should be manned at all times. If the station cannot be staffed, the Moose-Wilson road should be closed to all users, both motor vehicle and bicycle.

A visitor to the Moose-Wilson Corridor should be clearly informed that he/she is about to use a slow, narrow, partially-unpaved roadway where experiencing the special values of Grand Teton National Park is the goal, not through-transportation. The existing road sign at the Moose end of the road is totally inadequate. Staff at the Entrance Stations should have special training in instructions to be given to users

of the Corridor.

3- Winter Access and Use

The Moose-Wilson road should continue to be closed seasonally as is done now. No snowmobile use should be permitted. The road should not be groomed for winter recreationists; the Park already offers lots of opportunity for that experience.

If it is practical to close the road at the Murie Cabin road junction at the north, I would support that. However, I believe there are maintenance needs at the LSR Preserve and the White Grass Ranch buildings that may require winter access. Is it the Park's intention to allow access via the Snake River dike road for winter maintenance at the LSR and White Grass Ranch? How will the major headgate on the Snake River dike, east of the LSR, be operated? How will occupants of the remaining private residences reach their homes?

4- Assure and Retain Full NPS Management Authority over the Road

The Corridor Management Study must include an assessment of the NPS's current authority to control activities on and alongside the Road, and a commitment to maintain, and if necessary expand, NPS authority to manage the corridor forever to prevent damage to Park values. See the discussion in my February comments on Scoping. None of the Alternatives addresses this crucial management need at all. Solving it is essential.

The Corridor Comprehensive Management Plan should include a commitment to bind future Park managers to preserve all existing NPS management authority. The Plan should commit the NPS to expand its authority if necessary. No future NPS decisions or agreements should be permitted that in any way reduce the NPS' power to control uses and impacts on the Road and its vicinity. No construction or maintenance of facilities along the Corridor by private funds should be permitted.

Beyond the "Alternatives" ' NEPA Compliance Requirements

it is deceptive to present the public with this quartet of contrived "Alternatives," when the scientific data-gathering, assessment of impacts, and evaluation of foreseeable cumulative impacts extending into the future, has not been completed. Please see my Scoping comments submitted 06Feb14 for discussion of these issues. It is dismaying that these crucial topics are not even laid out as concerns by the Park Service in this photogenic "Alternatives" brochure.

Conclusion:

Thank you for your attention to these concerns. Please keep me informed as the Study and NEPA process advance.

Sincerely,

Philip M. Hocker

The number of signatures on the unmodified form letter #1 is 479. In addition, 38 people modified the form letter and their individual comments that differed from the master letter are have been typed below the master text. Public comment on the preliminary alternatives was sought to gain a sense of what the public thought about the potential alternatives and their concerns. Not all correspondences are substantive in a technical sense.

The dates on the letters received on September 11, 2014 ranged from September 4 - 11, 2014.

Correspondence Text

Subject: Protect our Wildlife in Grand Teton National Park

Dear Grand Teton National Park Superintendant David Vela,

Thank you for the opportunity to comment on how the Moose-Wilson road should be managed, and what kind of additional development, if any, should be permitted along the road corridor.

I ask you, first and foremost, to protect Grand Teton National Park as a national treasure, and to protect its wildlife and wildlife habitat. This world-renowned national park must be managed to protect the natural resources and values for which it was established, for the benefit of all Americans who own it.

The Moose-Wilson road passes through an area known for its diversity and abundance of wildlife, and the Park Service must give top priority to protecting wildlife and the outstanding wildlife habitat along the road corridor. The best way to do this is to reduce traffic volume and keep the road the way it is now: small, narrow, winding, and slow-speed.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Neither the road nor its corridor should be widened or improved, and the unpaved section should remain unpaved. Road realignments on the northern end will protect wildlife and should be pursued. Curtailing through traffic at the Laurance S. Rockefeller Preserve and disallowing commercial traffic would control traffic volume and should be pursued. A paved bike pathway would increase impacts to wildlife and should not be allowed. By controlling traffic volume, bicycles will be able to safely share the existing roadway while protecting natural resources and values. The Park Service should fully evaluate the feasibility of a park-managed public transit system.

I believe we must keep this part of Grand Teton National Park as beautiful, peaceful, and scenic as it has always been. Thank you for considering my comments.

Sincerely,

The following text was excerpted from modified correspondences that were based on the master form letter #1.

- "Even beyond traffic volume control, paving brings toxic oils into soil and water sources, it invites damage and disturbance to an area by heavy machinery, and requires regular maintenance that is equally harmful."

- "Neither the road nor its corridor should be widened or improved. If people want to drive fast they have the whole rest of this country for speeding. If one does not want to experience the wildness don't go. If you must speed, an area that provides habitat to endangered species is not place for you."

- "In Alaska moose and highways don't mix. Over 200 moose are killed annually in collisions with vehicles on that state's limited highway system- -like between Kenai and Homer. There are limited numbers of animals up against unlimited numbers of vehicles and inattentive drivers. We cannot afford to loose our wildlife anymore than we can afford to loose humans in such collisions. the loss"

- "LEAVE THE MOOSE-WILSON ROAD AS IS. I HAVE BEEN VISITING TETON AND YELLOWSTONE SINCE MID-1980s, and MOVED TO BOZEMAN MT TO HAVE NEARBY ACCESS TO THE PARKS. HARDLY ANY OF THE CHANGES SINCE MY FIRST VISIT IN MID-80s HAS MADE SENSE. DON'T COMPOUND THAT BY DEVELOPING MOOSE-WILSON RD INTO HIGH SPEED THOROUGHFARE FOR SPEED-OBSSESSED GAWKERS (THE SAME ONES THAT NOW MAKE AUTO TRAVEL ON THE GALLATIN CANYON HIGHWAY AN ACT TAKING YOUR LIFE IN YOUR HANDS.) IT WASN'T LIKE THIS WHEN I FIRST VISITED IN MID-1980S.

TETON AND YELLOWSTONE SHOULD BE MANAGED FOR A CONTEMPLATIVE AND NATURE-BASED EXPERIENCE. THAT MEANS KEEPING EVERYTHING ON THE SLOW-LANE AND AVOIDING 'FAST-LANE' MODERNIZING DEVELOPMENT INITIATIVES WHICH MAINLY DO NOTHING BUT DISTURB THE PEACE OF A TETON/YELLOWSTONE EXPERIENCE. YELLOWSTONE FACILITIES PRE-1990 SHOULD BE THE MODEL STRIVED FOR, WHICH WOULD INCLUDE AND BE BASED ON A SMALL SCALE VILLAGE-BASED SCALE THAT JOHN MUIR WOULD APPROVE. ALTHOUGH IT IS NOW 2014, AND WE CAN'T GO BACK IN TIME, WE SHOULD NEVERTHELESS ADOPT A SLOW-PACED AND LOW-TECH CONCEPTUAL MODEL FOR PROJECT INITIATIVES IN TETON AND YELLOWSTONE."

- "My family and I have for many years appreciated the Moose-Wilson road as a take-off point for

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

hikes and skis in a part of Grand Teton that doesn't get over-used. We hope the Park Service will preserve the low-traffic ambience of this area, not just for the pleasure of users, but for the protection of wildlife.

Like Yellowstone, there are parts of the park available to auto-oriented, densely-populated recreation. There is no need to expand this kind of use to the Moose-Wilson road area, which, thanks to the Rockefeller donation, now can disperse users with less impact. If anything, you might consider limiting the pass-through traffic of folks using this road as a short cut to Teton Village.

Even as an avid bicyclist, I agree with the following list of recommendations from the Sierra Club:

Neither the road nor its corridor should be widened..."

- "To pave a parking lot to contain 60 vehicles will do more to destroy the environment for wildlife. PLEASE don't let this happen.

I believe creating some turnouts for vehicles for wildlife viewing will vastly improve the safety and ease of passage for both man and wildlife."

- "Earlier this summer, I had the opportunity to spend time along the Moose-Wilson road and believe it should remain undeveloped and unimproved. Part of the beauty of this region is the lack of highways and four-lane roads in our National Parks. I like the slow speed limit and the fact that this road remains CLOSED during critical seasonal wildlife migration and the winter months."

- "Over development of wild habitat does nothing to enhance the enjoyment of the earth. Isn't that why we are here? Populating every place up to the brim with humanity will not provide a quality life for our children and grandchildren. Barreling along wildlife areas is a recipe for disaster for the animals that live there."

- "I agree completely with the statements below. I have enjoyed driving very slowly on the Moose-Wilson Road for many years. It is a treasure for wildlife viewing and makes the moose, the beavers and the bears available for viewing by small children and those seniors who can not hike any more. Those wetlands are rich with life and to be able to explore in peace and quiet is wonderful. Please preserve this for us."

- "The purpose of the road is to take people to areas that most likely would not be accessible otherwise, but it is not to allow more people beyond its capacity to these quiet places. It is not to speed-up the experience and to crowd the resource."

- "First I would like to say that I have over the last 41 years driven this road on occasion, and would like to keep it as it has been with few if any "improvements"."

- "A paved bike pathway would increase impacts to wildlife and should not be allowed. Indeed, this may ultimately cause conflicts with wild animals via bear attacks, etc. By controlling traffic volume, bicycles will be able to safely share the existing roadway while protecting natural resources and values. The Park Service should fully evaluate the feasibility of a park-managed public transit system, such as the one in Denali Park."

- "Moose Wilson is an important road in the Teton area. It's a beautiful peaceful drive and home to many

wildlife species. I love visiting this area and think the road is appropriate the way it is now."

- "It is your duty to protect Grand Teton National Park as a national treasure, and to protect its wildlife and wildlife habitat not to increase traffic."

- "This small stretch of road is a very important aspect of the wild life corridor through what is now an incredibly busy stretch of road. The only thing that will come of 'improving or widening" this stretch of road is an increase in vehicle traffic and the loss of a corridor that is at this point in time is a stretch where the wildlife has the ability to pass through without thousands of vehicles and people encroaching on the landscape."

- "We travel this road regularly for its current natural qualities. Please don't "improve" this road. We are happy with its backway character."

- "I have visited Grand Teton National Park almost every year over the past dozen years and am concerned about the possibility of further developing the Moose-Wilson Road."

- "Why fix what ain't broken! Please reconsider any new developments to this area. Keep the road and area as is. I am sure there are many other areas of the Park infrastructure that needs work/updating/improvements. This seems like a frivolous use of money as well as having negative impacts on the wildlife. Thank you for your consideration."

- "As a Glacier backcountry volunteer, this issue is extremely important to me."

- "This is important to our Montana family!"

- "In the last 14 years I have spent many days hiking through Teton Park and have climbed several of its tallest peaks, including the Grand and Middle Teton. But not every visitor is capable of getting into the heart of the park. The Moose-Wilson Road gives visitors a chance to see, from the safety of their cars, some of the largest and greatest of Teton Park's residents doing simple things like quietly feeding along the roadway. Please ensure that this very special small area of the park stays the same for all future visitors to enjoy."

- "Why is it that people who supposedly 'love' the wild places, always, eventually, want to pave the roads and construct buildings? This will only damage the wild place we GTNP and its inhabitants."

- "I have been visiting GTNP since 1971 and have lived in Jackson, WY, since 2001. I am against any further development of Moose-Wilson Road."

- "I believe we must keep this part of Grand Teton National Park as beautiful, peaceful, and scenic as it has always been. Thank you for considering my comments. That whole area is already over developed! The traffic is horrible! This is supposed to be a place for wild life!"

- "One question. "Do you not think that the GREEDY element of the United States have destroyed enough NATURE?"

- "I've spent time in Grand Teton National Park since moving to Idaho five years ago. I've grown to love and appreciate the pristine untouched beauty of the area."

- "The first place we take visitors is a ride on this road. It gives a good intro to the back country and we always see wild life. Do not destroy this great experience."

- "Please, no more road 'improvements'. 'Improvement' here means degradation."

- "Living in neighboring Idaho, I have utilized this road several times. It provides a nonintrusive gateway to a magnificent natural panorama. To change the road from its present state to a more developed version would pose unacceptable risk of damage to a pristine area."

- "Please protect this wonderful park and the wildlife and nature within and around it! We can't lose this amazing place. It must be protected!"

- "I have lived in Teton County since 1991, and have greatly enjoyed our marvelous resources. I believe that this beautiful road should remain as it is today. My entire family is very active outdoors, (skiing, biking road/mnt, hiking, kayaking, etc...) we recognize and value the unique nature of this corridor. It is a jewel as is and should not be expanded."

- "The Moose-Wilson road passes through an area known for its diversity and abundance of wildlife, and the Park Service must give top priority to protecting wildlife and the outstanding wildlife habitat along the road corridor. The best way to do this is a challenge to figure out.

We drove on the road last week. It is unsafe for cars or bikes in its current condition. I like the idea of a bike path because that would help complete the grand loop. Folks are going to ride their bikes, so safety is important and it is definitely not safe the way it is now.

The plan for some days cars, some days bike, is a new model. I don't know how that would work, but definitely one to consider.

Mass transit for the entire park, a shuttle system, is also an excellent idea."

- "As residents of Teton County, we only too well understand the significance of this wildlife corridor. Grand Teton already suffers from an AJRPORT within it's small boundaries. Please do not allow the further degradation of this National Treasure."

- "Achieving long term resilience from connectivity of habitats, thus allowing genetic transference must be a key component to longterm management of regimes for America's wild places."

- "IF YOU DON'T PROTECT THIS AREA IT WILL BE RUINED FOREVER BY DE'/ELPMENT!!!!!!!!!!!!!! I!!!!!!!!!!!!!!II!!!!!!!!!!!!!!III!!!!!!!!!!!!!!II!!!!!!!!!!!!!!II!"

- "We would like to still be able to see the bears and wolves, but I don't believe making them easier to photograph by being closer is a good idea. With every death related to the bears in our national parks, it just isn't worth taking a chance by getting closer to the animals and being mauled or killed."

- "And please know that I do visit the park and I do not like traffic in Jackson, but I still wouldn't change how I feel about this subject. Thank you."

- "Protecting wildlife and wildlife habitat is the number one priority"

Correspondence Text

Subject: Protect our Wildlife in Grand Teton National Park

Dear Grand Teton National Park Superintendant David Vela,

Thank you for the opportunity to comment on how the Moose-Wilson road should be managed, and what kind of additional development, if any, should be permitted along the road corridor.

I urge you to protect Grand Teton National Park as a national treasure, and to give the very highest priority to protecting the natural resources and values for which it was established. The best way to protect wildlife and other natural resources along the Moose-Wilson road is to reduce traffic volume, reduce vehicle speeds, allow no net increase of pavement within the corridor, and permit no increase in habitat disturbance or fragmentation.

Specific strategies I support include:

- Keep the unpaved section unpaved
- Reduce speed limits
- Reduce traffic volume by stopping through motorized traffic while maintaining access to LSR Preserve, Death Canyon, and Granite Canyon trailhead
- Prohibit non-permitted commercial traffic, including taxis
- Realign two northern road segments, maintaining historic width and character, to protect critical

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

wildlife habitat

- Maintain traditional non-motorized winter access, without mechanical grooming
- Provide park-managed public transit

Specific strategies I oppose, and why:

- No action - severe impacts to wildlife and natural resources
- Separated multi-use or bike pathway - severe impacts to wildlife and natural resources
- Reducing traffic volume by reservation system, vehicle numbers & timing restrictions - too complicated and confusing to visitors

Road realignments on the northern end will protect wildlife and should be pursued. Curtailing through traffic at the Laurance S. Rockefeller Preserve and disallowing commercial traffic would control traffic volume and should be pursued. A paved bike pathway would increase impacts to wildlife and should not be allowed. By controlling traffic volume, bicycles will be able to safely share the existing roadway while protecting natural resources and values. The Park Service should fully evaluate the feasibility of a park-managed public transit system.

I believe we must keep this part of Grand Teton National Park as beautiful, peaceful, and scenic as it has always been. Thank you for considering my comments.

Sincerely,

Below are the modifications 16 individual commenters made to master form #2.

- "I live 90 miles from the north end of Yellowstone Park along highway 89 - speeds up to 70 mph. Many deaths of wildlife and vehicle accidents occur just after leaving Gardiner, MT. The MT Dept. of Transportation is looking into why these accidents are so frequent. Some of us are of the opinion that state highways and all roads leading into and exiting our National Parks should have reduced speed limits to protect wildlife who don't respect boundaries and making it so vacationers are safer. It should be apparent that the Moose-Wilson Rd. should also fit the category of Slow Down for wildlife. Thank you for considering my comments."

- " - Provide park-managed public transit. This is absolutely necessary if private motorized traffic is not allowed.

Specific strategies I oppose, and why:

- No action - severe impacts to wildlife and natural resources
- Separated multi-use or bike pathway - severe impacts to wildlife and natural resources. In addition, bike riding on a separate path would increase the chances of injurious encounters with wildlife, both for riders and for the wildlife, especially if children ride through this area, as many advocates are suggesting. There are plenty of bike paths, and more to come, elsewhere in the valley.

I believe this is an area of the Park where preservation should supersede other activities."

- "Keep life simple and special; don't commoditize our natural God given gift!"

- "I realize that economics drives the issue of upgrading the road and the addition of the bike path, nothing could be farther from protecting what our visitors come to experience. There is no long range benefit to the upgrade and in my personal opinion the funds required for these up grades to the road would be much better spent on the park's cultural resources and interpretation programs not to mention employee housing. This is a case of how does the visitor and staff better benefit.

I am not a biologist by any stretch but the impact on the wild populations would be detrimental not to mention the opportunity for catastrophic encounters with wildlife present on the road. You know me and you are well aware of my passion for the National Park Service and our mission, key being to do no harm and to preserve for our future generations. As mentioned above, this jewel has so many wonderful cultural resources and programs that would provide so much more to our visitor experience, I can not imagine one more intrusion upon that experience.

We are friends and you are a good man but I am just one voice in a crowd of many, please redirect the funding for something that will provide a positive legacy to an already stellar career. If the funding is strictly based on this road upgrade, drop it. This park has never been about the few it is about and for all of us, those who wear the green and gray and those that do not."

- "Please hear our voices to protect our beloved wildlife."

- "I have watched the development of the Jackson Hole area for all my life, of nearly 60 years, and I am deeply worried that any further development will severely disrupt the fragile ecosystem we cherish. Please choose wisely when considering such proposals, as future generations depend on wise decisions made today."

- "Please let WILDLIFE PROTECTION, PRESERVATION AND KEEPING THE PRISTINE CONDITIONS OF THE PARK BE OUR FIRST PRIORITIES."

- "Grand Teton National Park provides ample opportunity for a vast array of recreational activities.. It also serves the driving public, giving millions of visitors a once in lifetime chance to see our unique wildlife and natural beauty not found anywhere else in the world. The Moose Wilson road needs to be kept as special and unique as it was in 1971 when I a young girl, visiting for the first time. Please consider the fact you now have the opportunity to keep this little slice of wildness preserved for generations of young visitors to come."

- "You need look no further for an example than Glacier National Park and the Pollbridge area. People love that backwoods feel in this modern time."

- "I do not support bicycle traffic on this road at all. I do support biking as a recreational activity in scenic areas. I believe that bicyclists should be encouraged to co recreate on pathways that would be and are in areas that are not within critical habitats."

- "I have traveled this road and enjoyed its special character because of the lack of development. We saw moose and other wildlife - - any vehicles who drive this road need to do so slowly so as not to adversely impact any animals. Paving it would be disastrous, as would be the addition of a bike path."

- "As a former serious cyclist, I am aghast at how ignorant so many cyclists are now about rules of the road and courtesies. If that's prevalent even on bike paths in town, imagine what may happen in wildlife habitat. Don't do this!"

- "It is critical to protect true wilderness and all the wildlife in our country."
- "Grand Teton National Park should be left [sic] natural with less development as possible."
- "THE MOOSE/WILSON ROAD IS FINE AS IT IS."
- "I lived for many years in Jackson, WY (now live, not too far away, in Idaho). I have traveled Moose-Wilson road many times. Only thing to do is to make necessary safety repairs and lower the speed limits. It's a very scenic and educational drive at a proper, slow, speed

End or severely limit snowmobiles. If snowmobiles are allowed on designated trails ONLY with park supervision. Heavy fines and confiscation of property for unauthorized travel."

Correspondence Text

I have personally driven the Moose-Wilson road many times and have enjoyed the slow, back country experience of this trip. Wildlife is abundant. This road is a treasure and should not be upgraded. A paved bicycle path should not be added. This is a road to be slowly savored, with time taken to enjoy the variety of vegetation, ponds, and critters. This is not a place for those who think they need to get from here to there as quickly as possible. This road offers a unique, accessible, view into the wilderness for people who may not have the ability to hike into the back country.

Thank you for this opportunity to comment.

Thank you for the opportunity to comment on how the Moose-Wilson road should be managed, and what kind of additional development should be permitted along the road corridor.

I ask you, first and foremost, to open the Grand Teton National Park as a national treasure. This world-renowned national park must be accessible to everyone, including our disabled citizens.

The Moose-Wilson road passes through an area known for its diversity and abundance of wildlife, and the Park Service must give top priority to opening access to ALL citizens along the road corridor. The best way to do this is to enlarge, widen, provide vehicle turnouts and wheelchair access.

Both the road and its corridor should be widened and improved, and the unpaved section should be paved. A paved bike pathway would be an excellent resource and encouraged.

I believe we must keep this part of Grand Teton National Park as accessible to ALL citizens as possible. It is a shame to prevent some from enjoying this beautiful, peaceful, and scenic treasure. Thank you for considering my comments.

Correspondence Text

Dear Grand Teton National Park Superintendent David Vela,

Thank you for the opportunity to comment on the Moose-Wilson road.

One of the beauties about this road - THE thing that makes it special - is that it exactly like it was 40 years ago, the first time I drove it. Please don't change that. Let future generations experience something that hasn't changed, that hasn't been "improved," that hasn't been modernized.

I visited the Tetons this past summer and traveled the Moose-Wilson Road for the first time in 8 years. There is no doubt that it had a very high volume of traffic and that volume and the resulting dust did distract from the experience a bit, but I think widening and paving and adding bike lanes would distract from the experience far, far more and destroy the character of the corridor.

There really is nothing man could do to improve this corridor. Leave it as it is. We don't have to pave everything! Really, we don't. The very notion that the Park Service would widen or change the corridor and call it an "improvement" really needs to be examined, because destroying part of the environment in the corridor will not improve it.

While I enjoy being able to drive my own personal vehicle down the road at the time I chose, I could agree that a system of small, roomy shuttle busses could provide pretty much the same experience. Shuttles and bikes would be the only vehicles allowed on the unpaved road. The shuttles would be free and would

leave the parking lots at each end every 15 minutes and stay spaced at least 5 minutes away from one another. Shuttles would be allowed to stop for wildlife viewing however.

Grand Teton National Park is a national treasure and I know the Park Service is dedicated to protecting the natural resources and its values for the benefit of all Americans. Protecting the natural resources along the Moose-Wilson road corridor as well as the road itself is as important as protecting any other part of the park. You would not consider putting a coat of paint on the Cunningham Cabin in order to brighten the place up a bit. Treat the road the same - preserve its history.

Thank you for considering my comments.

Dear Grand Teton National Park Superintendant David Vela,

Please do NOT put a bike path along the current road which has been closed the past few days due to grizzlies feeding. The bikers have a path all the way in the Park now., protect the scenic values and wildlife!!!

Correspondence Text

Dear Grand Teton National Park Superintendant David Vela,

I visit my grandchildren in Jackson and Victor often. I take the local weekly Jackson newspaper. The myriad problems with the whole of the Jackson WY area are disturbing and astounding. The very thing that made this area attractive to humans is the wildlife and scenic beauty. Today, the thing that makes it unattractive is the exploitation by people who put financial gain first.

The premier wildlife habitat along the Moose-Jackson road must not be violated. ESPECIALLY by those who advocate broadly widening the road so the occupants of Teton village can get to the Jackson airport without taking the slightly longer route. This is abominable meritocracy.

Please do not even think of taking away this great wildlife corridor that allows all people to experience the safety and viewing opportunities in seeing the only Jackson area as it once was and should remain. Just read the newspaper there to see how overrun development has ruined the city and its suburbs.

There is no - - absolutely no - reason to ruin more of that lovely area than people already have. Please do not develop. Thank you

Sincerely,

Correspondence Text

Dear Grand Teton National Park Superintendant David Vela,

Pave it please. My fellow Sierra Clubs are correct that the beauty, serenity, the wildlife should all be protected, but having a hell hole of a road fails at that. Who can enjoy any of those values when everyone is fully concentrating on dodging monster potholes and swerving vehicles? Then if you get a chance to look up, through the miasma of dust you get to see dust covered trees and brush. As a dirt road it is very unsafe for pedestrians and bike riders and is not an inviting habitat for wildlife as they are well aware of the vehicle traffic and do not relish dust covered vegetation for food. With proper design, enforced low speed limits and traffic calming features, a paved road should not be more of a danger to wildlife.

I too believe we must keep this part of Grand Teton National Park as beautiful, peaceful, and scenic as it has always been. A well executed paved road will do just that. Thank you for considering my comments.

Sincerely,

Correspondence Text

Dear Grand Teton National Park Superintendent David Vela,

Thank you for the opportunity to comment on the Moose-Wilson road.

I urge you to leave the road and the road corridor as it is. Please do not widen or pave it and please, please do not add bike lanes.

If the road has become too congested, and my own recent experiences there suggest that perhaps it has become too busy, I suggest the Park Service consider possibilities other than widening and paving.

1) Consider making the road one-way. At least during the peak visitation months. I know this would cause inconvenience for some, but because the road has become so busy, it is would probably cause no more inconvenience than is experienced now. The one-way road would probably receive less traffic than it does now and it would have a better flow and less dust.

2) Consider not allowing any commercial traffic whatsoever.

3) Consider creating a free public transit system to carry folks through the corridor. Use small buses that are easy to get into and out of that don't crowd people. Perhaps look at the small busses they use in Glacier National Park. Have these busses operate from a parking lot at each end of the road. The busses could travel the road in both directions at a slow enough speed to look for wildlife and to enjoy the scenery. The busses ideally would maintain some sort of separation so that one doesn't have the feeling

of being on a dusty train. The busses would leave the parking lots every 15 or 20 minutes during the busy times of the day. No cars would be allowed on the road.

A public transit system like this for the Moose-Wilson road might also help in situations like when the Park Service needs to close the road because bears are using the corridor. Depending on where the bears are, it might be possible to keep the road open if people were traveling by bus. They would have the opportunity to view the bears which they don't have with road closures, and the bears would be protected and undisturbed because the people would not be out of their vehicles or approaching the bears too closely.

As always, I appreciate all that you do to preserve and protect Grand Teton National Park. It truly is a national treasure. In addition to the incredible, breath-taking scenery and the wildlife, Grand Teton National Park has done an outstanding job of preserving history. Like many of the historical buildings in the park and surrounding area, the Moose-Wilson Road has its own historical character. I urge the Park Service to not change that historical character. Please do not widen or pave or add bike lanes to the road. Please keep it as a small, partially unpaved, narrow, winding road that takes us through a beautiful place and reminds us of our past.

Thank you for considering my comments.

Correspondence Text

Dear Grand Teton National Park Superintendent David Vela,

Do not think that I just sign things without having some knowledge. In Fact, I was married to a forester for the Forest Service in Oregon. In those days the Forest Service built dirt logging roads all over the forest trying to meet Richard Nixon's demands for an enormous timber but. You could walk up a hill, not a mountain and walk across 4 dirt roads. Those roads allowed everyone into way too much of the forest. That frightened the wildlife with a lot of noise from 4 wheel drive trucks and dirt bikes. It became my husband passion at the time to close as many of those roads as possible. It was a little easier because they were still dirt.

Don't built a road into a pristine area. The wildlife will be horribly harmed as it was in the forest my husband worked in. Put a road into an area with precious bears and there will be conflict between people and bears. An outrage wanted bad bears shot will come because we love our guns so much in this country. We must keep as much pristine wild area in this country as we possibly can. This park is a public trust. All of the public owns it and that included poor city people who can not even get there yet.

Your job is tough! Don't give in! Keep to the mission!

Sincerely,

Correspondence Text

Dear Grand Teton National Park Superintendant David Vela,

Please protect nearby Grand Teton National Park wildlife and wildlife habitat.

Give top priority to protecting wildlife and wildlife habitat along the Moose=Wilson road corridor by reducing traffic volume and keeping the road as it is now: small, narrow, winding, and slow-speed.

Please keep this part of Grand Teton National Park as beautiful, peaceful, and scenic as it has always been.

Sincerely,

Correspondence Text

I doubt that I can state this any better than the message that was already written by the Sierra Club, but I felt that it was important to put it in my own words.

I live in Montana, north of Yellowstone National Park. I visit the Tetons at least once or twice a year, so I am very familiar with the Moose Wilson Road. It is a very special place, both to visitors and to a variety of wildlife. There are few places, if any, in the Yellowstone Ecosystem that can even begin to rival it I am aware of the traffic difficulties that this road can have at certain times of the year, but destroying the unique character of the road by widening it, creating bike lanes etc. cannot, and should not, be the answer. I would much rather see other forms of traffic control, such as making it one way during the busy time of the year. Please, please, please, think long and hard before altering what is a very special place for visitors, and an extremely important place for wildlife. It is so rare to find such a place in the lower forty eight. It is worth protecting. Thank you for taking the time to read my comment.

Sincerely,
Alan Sachanowski

Correspondence Text

Thank you for the opportunity to comment on how the Moose-Wilson road should be managed, and what kind of additional development, if any, should be permitted along the road corridor.

Please don't Over develop I think the bikepath is not a good idea, As this road is a great place to mountain bike just the way it is. I think maybe a few more pullouts to deliver a scenic view available be okay. I ask you, first and foremost, to protect Grand Teton National Park as a national treasure, and to protect its wildlife and wildlife habitat. This world-renowned national park must be managed to protect the natural resources and values for which it was established, for the benefit of all Americans who own it.

The Moose-Wilson road passes through an area known for its diversity and abundance of wildlife, and the Park Service must give top priority to protecting wildlife and the outstanding wildlife habitat along the road corridor. The best way to do this is to reduce traffic volume and keep the road the way it is now: small, narrow, winding, and slow-speed.

Neither the road nor its corridor should be widened or improved, and the unpaved section should remain unpaved. Road realignments on the northern end will protect wildlife and should be pursued. Curtailing through traffic at the Laurance S. Rockefeller Preserve and disallowing commercial traffic would control traffic volume and should be pursued. A paved bike pathway would increase impacts to wildlife and should not be allowed. By controlling traffic volume, bicycles will be able to safely share the existing roadway while protecting natural resources and values. The Park Service should fully evaluate the feasibility of a park-managed public transit system.

I believe we must keep this part of Grand Teton National Park as beautiful, peaceful, and scenic as it has always been. Thank you for considering my comments.

Sincerely,
James H. Emerson

Correspondence Text

Thank you for the opportunity to comment on how the Moose-Wilson road should be managed, and what kind of additional development, if any, should be permitted along the road corridor.

I'm a Montana resident and spend weekends with family in Grand Teton National Park. I have for 40 years. Please leave the Moose-Wilson road as is. We have never minded taking it slow viewing the scenery and animals. This road has a charm that will be lost if it is paved. I want my grandchildren to enjoy the habitat as it is, without change.

I was most sad to see the construction taking place on the road near Norris in Yellowstone National Park when I drove through on Labor Day weekend. The widening and grading will permanently alter the habitat there. Rather than building bigger highways, I think it would be better to focus on encouraging different transit opportunities in the park.

I urge you to protect Grand Teton National Park as a national treasure, and to give the very highest priority to protecting the natural resources and values for which it was established. The best way to protect wildlife and other natural resources along the Moose-Wilson road is to reduce traffic volume, reduce vehicle speeds, allow no net increase of pavement within the corridor, and permit no increase in habitat disturbance or fragmentation.

Specific strategies I support include:
- Keep the unpaved section unpaved

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

- Reduce speed limits
- Reduce traffic volume by stopping through motorized traffic while maintaining access to LSR Preserve, Death Canyon, and Granite Canyon trailhead
- Prohibit non-permitted commercial traffic, including taxis
- Realign two northern road segments, maintaining historic width and character, to protect critical wildlife habitat
- Maintain traditional non-motorized winter access, without mechanical grooming
- Provide park-managed public transit

Specific strategies I oppose, and why:

- No action - severe impacts to wildlife and natural resources
- Separated multi-use or bike pathway - severe impacts to wildlife and natural resources
- Reducing traffic volume by reservation system, vehicle numbers & timing restrictions - too complicated and confusing to visitors

Road realignments on the northern end will protect wildlife and should be pursued. Curtailing through traffic at the Laurance S. Rockefeller Preserve and disallowing commercial traffic would control traffic volume and should be pursued. A paved bike pathway would increase impacts to wildlife and should not be allowed. By controlling traffic volume, bicycles will be able to safely share the existing roadway while protecting natural resources and values. The Park Service should fully evaluate the feasibility of a park-managed public transit system.

I believe we must keep this part of Grand Teton National Park as beautiful, peaceful, and scenic as it has always been. Thank you for considering my comments.

Sincerely,
Linda Healow

Please don't pave anymore surfaces., or permit a separate bike path. Leave the road alone don't reconstruct it as it will destroy the habit.
No commercial vehicles... One way for am and other for pm...
Don't connect it to the main part of the park... leave the road alone.
No buses either. Thanks

Sincerely,
Beatrice van Roijen

Correspondence Text

Protect the magic of the Moose-Wilson Road! Do not give in to demands to increase through-traffic on this incredible scenic thoroughfare. It will infringe on valuable habitat and reduce the visitor experience in this premier area of the Park.

You have an amazing opportunity to protect and preserve the wildlife, scenic, cultural, and backcountry values of this treasure of Grand Teton National Park for generations to come.

Please protect Grand Teton National Park and to give the very highest priority to protecting the natural resources and values for which it was established. This includes protecting the Moose-Wilson Road. The best way to protect wildlife and other natural resources along the Moose-Wilson road is to reduce traffic volume, reduce vehicle speeds, allow no net increase of pavement within the corridor, and permit no increase in habitat disturbance or fragmentation.

Please keep this part of Grand Teton National Park as beautiful, peaceful, and scenic as it has always been so that those who come after us will be able to experience this National Park in the peace and beauty of its original inception.

Thank you for your consideration.

Sincerely,

Please keep the Moose-Wilson road similar to it is. We have many high-speed roads in the Park. I always make a point to travel M-W road whenever I an near Jackson. It is an important part of the Park's environment.

Sincerely,
Jay And Kathy Puckett

Thank you for the opportunity to comment on how the Moose-Wilson road should be managed, and what kind of additional development, if any, should be permitted along the road corridor.

My husband and I drove this road last Sunday. Most of it is delightful, except that about 2 miles is in terrible shape and needs to be paved.

I'd also like to see the bike path continued north through this territory as bikes have less detrimental effect on wildlife and have beneficial impacts on human health. This narrow road would be treacherous to bike. Separate bikeways are a great idea.

Beyond that, I think additional development in that corridor should not be allowed.

Sincerely,
Barbara Geller

Correspondence Text

As someone who frequented grand Teton since year 1979 and finally took residence in town of Jackson I strongly urge officials of grand Teton to shut down MOOSE WILSON RD to private vehicles and bring in SHUTTLE service .something like DENALI Alaska .when moose Wilson was closed first time I suggested shuttle thenshuttle is way to go

Not only park will benefit from fee but animals will have freedom and peace
I have no words to write a book here but rather to say to the point
...

It is for BENEFIT of WILDLIFE
Thank you for listening
I am all for wildlife

Sincerely,
Bianca Thomas

Thank you for the opportunity to comment on how the Moose-Wilson road should be managed, and what kind of additional development, if any, should be permitted along the road corridor.

I live near this amazing wild corridor, and believe that we should remove the pavement, and RESTORE this area to its natural dirt roads. Our community wants to develop this treasure for its own benefit,, without considering that this is the last remaining wild areas of this tiny GTNP. Please consider protecting this area for all things wild, and for the humans who crave it! Thank you!

Specific strategies I oppose, and why:

- No action - severe impacts to wildlife and natural resources
- Separated multi-use or bike pathway - severe impacts to wildlife and natural resources
- Reducing traffic volume by reservation system, vehicle numbers & timing restrictions - too complicated and confusing to visitors

Road realignments on the northern end will protect wildlife and should be pursued. Curtailing through traffic at the Laurance S.
