Topic Question 1:
Low speed limits and traffic calming devices, such as speed bumps, plus animal under- or over-passes with viewing areas engineered not to disturb the wildlife.

Topic Question 4:
Wildlife deserve priority over visitors! And I say that as a frequent visitor to all the national parks.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Ie support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Park values are best protected under Alternative D, which recognizes that wildlife and park visitors can be thoughtfully managed together, the essence of National Park visitation. Under Alternative D, visitors experience this part of Grand Teton National Park in a way that is respectful of natural resources, informative, inspiring, and safe.

Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular public on a needed pathway.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitably see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway.

A separate Moose-Wilson pathway is a safety need, not a want, an imperative in any Alternative. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Decreasing the increased traffic volumes for the long term is the Park's objective and that is possible only with Alternative D, which uses thoughtful, safer ways to get people out of vehicles and into the outdoors.

Alternative D helps make meaningful traffic reductions and adaptations so that wildlife can thrive and visitors can have access to their national park.

Topic Question 3:

No.

Topic Question 4:

None.

Correspondence Text

Dear Superintendent Vela,

I write respectfully expressing my deep concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover and strong supporter of the national parks and the national park system, I place great value on the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development will disrupt and destroy these qualities we've tried so hard to protect. Whenever and where ever human footprint expands, the environment and nature always suffers. It is critical the park service maintain the low-speed, winding, gravel road to preserve natural habitats, its historic character, solitude for both wildlife and visitors, of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Respectfully,
Teresa Bessette

Topic Question 1:

First and foremost protect the unique solitude, wildlife habitat, and historic character of the Moose-Wilson road corridor. Nature and wildlife must come first in all cases. Do not do anything that would increase road traffic.

Topic Question 2:

Any ideas that put the needs of people first. Nature and wildlife must come first. Anything that increases road traffic will only make the problem worse.

Topic Question 3:

The only people who should be allowed to use the road are people visiting the park. Other commuter and commercial traffic should be prohibited. Permits should be issued for valid use.

Topic Question 1:

Alternative D would be the best. It would allow some, but reduced motor vehicle(MV) traffic, while improving the enjoyment of the region by people who are not in MVs. Thus, the unique values of the corridor will be preserved and area wildlife will benefit, and with fewer cars, and diverse access will be encouraged.

Topic Question 2:

Gates and closures, options B and C will disallow persons from enjoying the region in or out of MVs, and increase the overall environmental burden by forcing motorists to drive an extra 50 miles to get around the closures.

Topic Question 3:

Increase transit options, and in an environmentally sensitive manner add off road pathways in strategic regions for visitors enjoying the corridor by foot or bike

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose-Wilson Road Corridor within Grand Teton National Park (GTNP). I greatly admire and appreciate all of our national parks and have always been a strong supporter of the national park system. I greatly value the wildlife, scenery, and historic values of this road in GTNP and am concerned that unacceptable traffic impacts and unwarranted calls for additional needless development could destroy these qualities. I believe that it's critical for the park service to absolutely maintain and strictly enforce the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area, much like the 45 mile per hour speed limit is strictly enforced all along the Skyline Drive and Blueridge Parkway in northern Virginia.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of all reasonable traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along this road, as well as along all National Park roads. These goals, combined with consideration of reasonable alternatives, such as a one-way road option, or temporary or permanent road closures of all or part of the road, could allow for safe pedestrian and bicycling use within the existing road prism in GTNP. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to totally limit all winter disturbance of wildlife (when these animals are under the most stress to survive) and planning alternatives that protect wildlife security

and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be totally and forever avoided.

GTNP is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by the animals that live there, and by the people from across the United States, to all of whom just as much or more consideration is owed.

Thank you.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

I have been to Grand Teton National Park several times in the winter cross country skiing. It is a very special place. That's why I personally want it protected so those in the future can experience what I did and take the memory home with them.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

Kristine Hutchin

Topic Question 4:

I'm not qualified to answer these questions. The best I can do is voice my opinion/concern. National Parks are for everyone to enjoy. Congress set these lands aside to protect them, NOT to serve commercial interest. If commercial interest want a better/faster roadway to get from point A to point B, I recommend that they build it outside of the park boundaries.

Topic Question 1:

1. Realignment of roads to improve wildlife corridor and restore habitat: New Moose-Wilson realignment, with added parking areas for wildlife viewing , as in Alt D.
2. Reduce road intrusion of Death Canyon Rd. to White Grass Ranch junction, placing parking lot at that point as in Alt. B
3. Place either one or both 10/12 vehicle parking on Do not pave unpaved portion of Moose, Wilson, but require slow speed limit.
4. Relocate and replace Moose entrance station , create 4-way at Chapel Rd. junction to contiguous Moose-Wilson, abandon old and restore native vegetation to that section - Alt B
5. Terminate North Rd and South Road at the two separate parking lots, as in Alt B. This would reduce congestion and loss of wildlife viewing capacity and safety at mentioned peak periods.
6. Protecting and restoring as much riparian habitat is, as you present, highly important. Every portion of the road plan will, I hope reflect this priority.

What we want is to improve the wildlife corridor, as much as is possible, in order to facilitate large animal passage comfort. As you know, large mammals, from wolves to grizzlies need significant corridors without road and traffic in order to disperse, as the continuing development in the Rockies is cutting off or making difficult migratory passage for all large animals. While the issue is greater than those normally concerning National Parks, it would seem incumbent for NPS to provide what portions of the solution - wildlife corridor priority - it can.

THANK YOU for your continuing work and concern for America's wild nature in Grand Teton NP!

Topic Question 2:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Straightening roads, paving , and improving leads to higher traffic, and as you know, problems with Park rules enforcement.

I vehemently disagree with any choice to groom snow for xc skiing, mentioned as alternative in D. There are skis, boots, and bindings which allow for backcountry xc skiing, which are far more in tune with National Park objectives, and although not as heavily destructive to winter experience as are motorized activities, ski courses are inappropriate for actual experience fo the Natural experience of GT or every National Park.

I cannot at all agree with commercial facilitation, including that of commercial horse trips. In ALL NPs which I have visited, wilderness areas, and other public lands, these concessionaires damage trails severely, commonly build oversize camps inappropriately and unlawfully, and make considerably more noise than noncommercial users. For this reason, I would like to see all commercial use reduced in US National Parks.

Topic Question 3:

Again, I have been highly concerned for over 30 years with the damage done by horse packing on foot trails. Horse mule packing use on mountain trails is inappropriate . I strongly feel that horse use is tantamount to ORV use, and should be severely limited.

Comments: I am a twice-visitor in the last decade, and hope again to experience Grand Teton NP in the near future.

I appreciate your intent to preserve the primitive, quiet nature of the Snake/Teton riparian area, the Laurence Rockefeller Preserve, and hope you will design and plan to allow for destination visiting, rather than through vehicle traffic.

I understand the increased use, and hope that your plans will help Park visitors to truly change their perceptions by slowing, stopping, experiencing the small and larger beauties of GTNP outside their vehicles.

The USA and much of the world outside National Parks is increasingly polluted by noise, building, roading, permanent pavement, loss of natural habitat, habitat fragmentation. Since many parks were established before motor vehicles, it is clear that foot traffic can allow the least damaging, least intrusive experience in large NPs. Such a management priority would help the decreasing health evident in the US citizens.

The Teton area is an important part of North-South corridor for wildlife, and I hope you will work with an eye to helping reestablish the sorely needed wildlife connectivity.

Thank you!

Topic Question 1:

I support strategy D. I visited Grand Teton National Park in late June 2014 as part of a road trip across country and stayed in Teton Village. GTNP was the driving force to encourage us to extend our stay in Jackson to five nights, almost twice what we spent at any other place during our 5 week trip. Two days of our stay I biked the Jackson Hole pathway system, routing from Teton Village through Jackson and up into the park in order to avoid Moose-Wilson Road. I am a strong, competent cyclist who is unfazed biking through cities, winding country roads, and questionably surfaced roads. However, when I drove Moose-Wilson a previous day I made the decision that it would not be safe enough for me to enjoy. It has no shoulder with squirrely drivers who stop, speed up, and swerve for no apparent reason. When you add in a road with a surface that would be technical for a road bike, I did not feel comfortable to avoid road hazards among drivers. A separated path along this stretch is important for the safety of cyclists and pedestrians. Pedestrian and bicyclist use of this road should be strongly preferred over vehicular use because it does not impact the environment as much, is cheaper to construct and maintain, and provides consistency with the park service message: cyclists and pedestrians are experiencing nature in a more personal way than drivers behind windows and steel.

Topic Question 2:

I disagree with widening and repaving sections of the road to accommodate vehicular traffic. Even if the plan is supposed to decrease speeds (lower speed limit), a wider, smoother road will encourage higher speeds.

Topic Question 3:

Use of Moose-Wilson as a one-way road where half of the road is given to bicyclists and pedestrians

through the use of a curb or other barrier to provide a buffer area. This way the park service does not have to pave more land (road surface will have to be improved on pedestrian/bicycle side). Vehicular traffic along this section will be halved (force cars to do a loop) and pedestrian and bicycle traffic will be accommodated safely. Another option is to have the road be in-bound during a certain time and out-bound during another time.

Topic Question 4:

GTNP was the surprise favorite from our 2014 road trip. We also saw Arches, Grand Canyon, Sequoia, Yosemite, Redwoods, Crater Lake, Black Hills, Mt Rushmore, and Badlands. My traveling partners are already bugging for us to return to Jackson and spend an entire week biking and hiking.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Correspondence Text

Dear Superintendent Vela,

I wish to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. My family strongly supports the national park system. We greatly value the wildlife, the scenery, and historic values of this road and are concerned that unacceptable traffic impacts & increased development could destroy these qualities. It is crucial that the park service maintain the low speed, winding gravel road to preserve the historic character, peace, the scenery and the wildlife that inhabit this special area.

Once the Environmental Impact Study begins, please prioritize this road as a quiet park destination and wildlife viewing area; not as a busy traffic route. I hope you plan to use traffic management techniques that reduce the number of vehicles, maintain slow speeds & eliminates commercial & commuter traffic on this road. These goals, along with considering a one way road option, temporary or permanent road closures of all or part of the road would allow for safe pedestrian & cycling use within the existing road. Though the NPS alternatives mention the use of a future small shuttle system, I would hope that the NPS develops a more definitive plan that outlines how shuttles will be used to lessen traffic impacts.

I also support seasonal closures to limit winter disturbance of wildlife & plans that protect wildlife security & movement corridors from human disturbance. Of major importance is the avoidance of development in areas that have not been previously impacted.

Grand Teton National Park is not only a treasure for the residents of the local community, but also loved & enjoyed by citizens of the United States and foreign nations as well.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Thank you for your consideration.

Topic Question 1:

Maintaining a winding road, slow speeds, and possible use of shuttle buses in some areas to reduce traffic flow and jams could help preserve the outdoor experience for visitors and while also protecting wildlife.

Topic Question 2:

Too much development, while designed to facilitate people visiting and viewing wildlife, could become detrimental to those goals.

Topic Question 4:

Preserving the essential wild country experience, the beauty and quiet and solitude, along with wildlife protection, should be the first and foremost goals.

Comments: Dear Superintendent Vela,

I am from WA state and, with my family, enjoy visiting national parks. Grand Tetons and Yellowstone are two of our favorite destinations. That is why I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area. One of the most special attributes of Grand Teton is the quiet, and that should be maintained as much as possible while still allowing for people to visit this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

We must save all of our wildlife to preserve nature's balances. Must start with statistics of animals being killed by traffic and encroachments by humans.

Topic Question 2:

To beg developers won't stop their so-called progress. Man seems to be destroying everything on the planet out of arrogance and greed.

Topic Question 3:

This must be taken up with all environmental agencies. Humans need pristine, natural areas with natural wildlife for mental health. The so-called progress of things is making humans crazier and crazier.

Topic Question 4:

Let's save our planet, go back to living simply, develop electric vehicles, get gas guzzlers off the roads, stop the BLM from allowing the Cattle Industry to use all of the public lands which we tax payers support. Save the wild horses, the cattle industry wants the horses gone due to their greed. We humans are destroying our one and only planet. Walkways must be provided for wildlife under the roadways if we persist in allowing big vehicles on these roads in nature areas.

Comments: I'm shameful the way humans have allowed so much destruction to our planet. Now climate change, too many humans, too many vehicles, so much pollution, all must be reversed. Stop the greedy, stop the arrogant. Save our wildlife, all learn to live with less, to live healthy, simply, with great consciousness which included all of our animals. Stop factory farming, so many issues, save our horses,

our environments. Its all going in the wrong direction. Even the now digital age may very well be our end.

I have visited GTNP several times and have enjoyed the Moose-Wilson Road as it is. Making it more of a thruway would jeopardize what wildness in that corridor still exists. I would favor whatever alternatives there are to increasing traffic/development. Making it a bike/hike route solely, or making it one way, no thru or commercial traffic, etc. Northwest WY is truly a unique wild place and I do not favor any attempts to chip away at that. Please work hard to preserve GTNP's wildness.

Thank you, Bill Hill

Once-in-a-lifetime encounters with moose, grizzlies, elk, deer, and beavers often can be had just feet from the winding Moose-Wilson Road in the southwestern corner of Grand Teton National Park.

Now, the National Park Service must put together a plan that best protects park wildlife and its core habitat, visitor solitude, and the unique historic character of this corridor.

If NPS allows increased impacts on the Moose-Wilson Road corridor, it could irreparably harm park resources. Please protect the rare wildlife, unique cultural history, and quiet recreational opportunities along the Moose-Wilson corridor.

Park visitors hold dear the chance to experience serenity and quiet and an opportunity to experience a wide variety of wildlife that live nowhere else but the Greater Yellowstone region.

Superintendent Vela, first and foremost protect the unique solitude, wildlife habitat, and historic character of the Moose-Wilson road corridor.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Topic Question 1:

Wildlife impact needs to be minimized, while the nature of the land respected and protected. People appreciate a feeling of isolation in wild places. Traffic has already increased 60%.

Topic Question 4:

Human impact needs to be minimized as much as possible. And the ethics of wise land use to minimize pressure on wildlife.

Topic Question 4:

The primary goal of the Park Service should be to preserve the park and the natural resources that made it desirable to become a park. If necessary, the public needs to be limited to a number that permits the park to continue in as pristine a condition as possible. A suggestion for limiting would be a strict reservation system with an emphasis on limiting the locals to once or twice a year and giving priority to those coming the furthest to see the park.

Comments: Dear Superintendent Vela,

While I have not had the opportunity to review the prior drafts, please see my comments to Question 4 and the following. Thank you for your time and consideration of my input.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. Topic Question 1:

Rather than try to garner more commercial funds for National Parks, including the beautiful Tetons, the primary goal should be to protect the lands and animals for future generations. This is where a citizen can go to be closer to God, revive in the wild, beautiful scenery and be at peace. (Not to spend money)

Topic Question 2:

The road in a question is an animal passage and since it is in a National Park, should be respected since they are one of the main reasons to protect the park lands.

Topic Question 3:

The mission statement for any national park should include primarily the protection of beautiful lands and wildlife for current and future generations, not more commercial entities just because greed has entered into the equation.

Topic Question 4:

Protect the parks for the reasons they were originally intended!

Comments: I know that in this era of trying to find funds for various programs, etc, there are financial needs, however, giving up or trying to make commercial enterprises in National Parks should not be allowed. Funds to the parks are already cut and to preserve the few beautiful and wild places in this country should be primary.

Topic Question 4:
See below.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:
stress the need for quiet open space free of traffic and noise. do not get these animals accustomed to cars.

Topic Question 2:
eliminate daily and commercial traffic

Topic Question 3:
if we MUST have traffic make it 1 way only!

Topic Question 4:
it's only 7 miles !!! do we have to drive everywhere? this is a park, breeding space and home to wildlife.

Comments: Dear Superintendent Vela,

I love our national parks and am a strong supporter of the national park system, I GREATLY VALUE the wildlife, scenery, and historic values of this road.

I am extremely concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities.

It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

This road is a quiet park destination and wildlife-viewing area, not as a busy traffic route.

We need to eliminate commercial and commuter traffic along the road. Allow for temporary or permanent road closures of all or part of the road. This would enhance recreational use for safe pedestrian and bicycling use within the existing road prism.

Minimize ALL TRAFFIC. This is for the animals not us!! If you CAN'T then allow only ELECTRIC VIEWING SHUTTLES.

Topic Question 1:
Do an impact study and only allow changes that do not disturb the balance that exists presently.

Topic Question 2:
Allowing any changes/construction that increases traffic volume and speed. Also increased stress on the surrounding environment due to an increase in human traffic and business.

Topic Question 3:
Mass transit to alleviate traffic, noise, and pollution increases.

Topic Question 4:
With all the stresses that already exist (especially with global warming changing the entire planet) I hope the committee makes improvements that contribute to the sustainability of the park.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a visitor to the Park, a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities.

It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism.

Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning

alternatives that protect wildlife security and movement corridors from human disturbance. Road closures are used in Rocky Mountain National Park as a consequence of altitude, but this could be done by choice in Grand Teton as a deliberate choice. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:
Prefer Alternative D
BUT

Why are you asking for comment before Impact Data is reported and complied?
It seems that our comments may, in the end, be totally discarded and futile.

If the EIS shows detrimental impact on wildlife, then a modification of Alternative D should be implemented.

There's NO question that alternative transportation needs to be implemented on the Moose Wilson Corridor.

There's NO question that there is tooooooo much motorized traffic for the current road design - - and that it will only increase in the future if no alternatives are presented.

User friendly pathways for alternative sightseeing will get people out of their cars.

Walking, Riding horses, Biking, Skiing, Snowshoeing.

Right now, traveling on the road in a car is an undesirable experience, from every perspective. So why not change the mode and motivation? Currently only the brave of heart negotiate the road on bikes and fewer walk, myself included. I enjoy visiting the park and the Rockefeller Preserve on my bike. However, it's nothing short of dangerous because of the multitudes of cars swerving to miss potholes and or trying to pass on blind corners.

I'm also very happy that the road is closed from the south in winter.

I appreciate the Park's thoughtful consideration of solutions to this dilemma - the love it to death syndrome.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Topic Question 2:

Alternatives A, B, or C
do not address the issues fully.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Please consider the negative effect allowing developers on the Moose-Wilson Rd. in Grand Teton NP will have on wildlife. I ask you to strongly limit development on that road for the protection of wildlife and plant life. I have taken my grand-daughter to GTNP and sincerely hope it will continue to remain as undeveloped by commercial interests as possible.

Topic Question 1:
Please see my brief comments below!

Comments: Aloha,
I have not been to the Tetons for about 30 years, but I do visit the Hawaii Nat'l Parks several times a yr. The ideal situation would to have NO commercial or commuter traffic in the park that is NOT ding business in the park. As the places park visitors come from become more and more crowded, the typical park visitor needs to get away to a quieter and slower environment. Ideally, this experience would not involve a car but it's doubtful if I make it back to the Tetons that I will be heading out on a backpack trip like I did last time.
Please do your best to give everyone a taste of wilderness and access to the joy of discovery!

Topic Question 1:
I like the closing when needed for animal protection as the most economical or the making it a bicycle and walking only zone.

Topic Question 2:
One way only seems to lessen the impact not fix it.

Topic Question 3:
I have seen green covered bridges built in Europe and the Netherlands to allow elk and such to travel over highways. Or put the cars up on an overpass build where the road is.

Topic Question 4:
These parks and animals are our heritage and need to be treated as irreplaceable; because they are.

Topic Question 1:

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Topic Question 2:

I am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. I think commercial and commuter traffic are counter to the function of National Parks.

Topic Question 3:

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning

alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of all our parks. However you have a special opportunity in Grand Teton.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts. I love shuttle service in other parks and strongly encourage its use in this special area.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by all Americans, and cherished and enjoyed by people from around the world.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Thank you.

Topic Question 1:
None. They don't solve the problem.

Topic Question 2:
All, because they don't solve the problem of chasing wildlife from the area.

Topic Question 3:
Yes. Make Moose Wilson Road a "dead-end" road. End the road before the Ranger Station at the South end of the Park. Access for Moose Wilson Road would only be from the north. Move the Entrance to Grand Teton NP south 1/2 mile so that it encompasses Moose Wilson Road. No Bicycles either. There are miles and miles of bicycle lanes without having to add Moose Wilson Road to them. This would keep the road strictly for Wildlife Viewing, and would significantly improve Moose and other wildlife sustainability in the area.

Topic Question 4:
If the answer to Question 3 is unacceptable than charge a fee each direction for each use. No daily, weekly, monthly, or annual passes. Fee only.

Comments: I am a Wildlife Photographer. Over the past ten years I have experienced the changes in Moose Wilson Road personally. When it was a dirt road I could always find Moose to photograph. It was perhaps the best place in the Western United States for finding Moose; moreso, than even Yellowstone National Park. This past summer I visited Grand Teton Park again specifically to look for and photograph Moose. I found none! I travelled Moose Wilson Road four times during my visit without luck. Cars were

back to back in both directions each time. Even if there was a Moose there would be no way to get off the road and take photos. But there were no moose. The reason for that seems evident - - invasion by humans, one after another. It is a shame that Moose Wilson Road has become a commuter road.

Topic Question 1:

The corridor must be kept as quiet as possible because of all the wildlife present in the area - the purpose of a national park is to preserve wildlife and nature in all its forms, not provide a playground for loud terrain vehicles.

Topic Question 2:

Only quiet vehicles and walkers should be permitted so as not to disturb the wildlife and nature in all forms - that's the purpose of the park, not to provide a playground for loud terrain vehicles.

Comments: The ultimate goal should be to preserve the integrity of the park for the wildlife and nature that live there, not provide a playground for users of loud vehicles.

Topic Question 1:

The plan should be to protect these lands for the wild animals and future generations. The plan should only do this.

Topic Question 2:

The strategy should be how best a plan can keep animals from entering lands that they will not be welcome in and to allow other native animals access to the area.

Topic Question 3:

Research what the best practices are from around the world in protecting land and animals in similar environments so they can be a part of this plan.

Comments: Keep/make it as natural environment as possible. We do not need to utilize this land for humans.

When changes like this are being considered, it's important to take into account the impact it will have on wildlife. This planet doesn't belong to humans. We just live on it and share it with many other lifeforms that should be equally considered as we develop things. The more we harm wildlife, then the more we harm the environment. The more we harm the environment and throw it out of balance, then the more we harm ourselves. Animals are part of the environment and help sustain it and we need the environment to sustain us or we would not survive.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Topic Question 1:

Limit snowmobiles and motorcycles. Protect wolves/ endangered species to keep a balanced ecosystem.
Limit private enterprise withn parks.

Topic Question 2:

If you kill off the wolves, there will be more deer, eating up the greens along the rivers.
If we had stores selling food, it would detract from the wilderness which is unioquely in the parks.

Topic Question 1:

First and foremost protect the unique solitude, wildlife habitat, and historic character of the Moose-Wilson road corridor. Do NOT increase access to these sensitive areas by even more development within the road corridor.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 4:

I do not have time to consider the preliminary alternatives and make a thoughtful reply. I can say one thing that has been at the forefront of my mind over the years concerning the park system, Yellowstone and the Tetons, actually. That is that I feel there is no reason to continually expand modern services for the humans that come to the parks. I do not like traffic jams but more roads will only encourage a more county fair atmosphere, more parking lots, more comfy places to sleep and eat, more places to have a beer is not what this special place is there for. We all must sacrifice for what we get. And what we are supposed to get is the most original geography left in its most pristine shape with the least impact by we humans.

Correspondence Text

Dear Superintendent Vela,

I wish to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. I am a strong supporter of the national park system, and I value the wildlife, scenery, and historic values of this road. I am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

I was very fortunate to have spent some time in Grand Teton National Park about 20 years ago. I would hate to see increased development destroy the wild beauty that I was able to experience. My hope is that the park can continue to be a refuge for wildlife and human into the far-distant future.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning

alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the local community; but it is also cherished by people from across the United States.

Thank you.

Topic Question 1:
I support option D. I am a road bicycle rider and would love to have ongoing safe access to Moose-Wilson Road.

Topic Question 2:
I believe that gating or closing the road would be short sighted and would remove a wonderful access that should be maintained, though with reduced traffic and a save access for bicyclists.

Topic Question 1:

I oppose completely any runaway development plans for the access routes through this area. However, should a hands-off policy be utterly unacceptable then I suggest that building natural wildlife crossings at strategic parts of the highway would go a long way to ensure the safety of wildlife and motorists alike.

Topic Question 2:

I greatly value the wildlife, scenery, and historic values of the Moose Wilson Road Corridor within Grand Teton National Park, and I am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Topic Question 3:

* a one-way road option, or temporary or permanent road closures of all or part of the road to allow for safe pedestrian and bicycling use within the existing road.

* the NPS alternatives mention the use of a future small shuttle system, I would like to see you develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

* Traffic management techniques that will reduce the number of vehicles, maintain slow speeds, and eliminate commercial and commuter traffic along the road.

Topic Question 4:

I support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

importantly, development in areas that have not been previously impacted should be avoided.

Comments:

Grand Teton is a landscape that is owned by, cherished, and enjoyed by people from across the United States. Please keep it as untouched as possible.

Topic Question 1:

I recommend that you prioritize the Moose-Wilson road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

Comments: I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

To keep the wildlife there and safe. I had one of my most treasured wildlife encounters there - a young male moose drinking from a stream very close to the road - and one of the best photos I have ever taken. It was so peaceful there and I think that is one of the reasons the moose was relaxed while I took photos. I wish there was no development around the Grand Tetons at all, one of the most beautiful places in all of America!

Dear Superintendent Vela,

I take this opportunity to my concerns about the future of the Moose-Wilson Road Corridor within Grand Teton National Park. I believe the NPS should maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area. This part destination and wildlife-viewing area should not be a busy traffic route. The use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance should all be given due consideration. And of cardinal importance development in areas not previously impacted should be avoided. Thank you for your time and consideration. AM

Topic Question 1:

Generally speaking, the strategies that reduce or eliminate use of the road as a commuter route should be carried forward. Heavy use of the road for through-travel underlies almost all the problems in the corridor and is the greatest threat to Park resources.

Relocating the road as in D and the associated strategies, especially the fee station, seems like the most reasonable way to restrict through traffic.

Topic Question 2:

I am very opposed to any of the strategies that reduce access to the Park, especially the backcountry. Whether these be relocating trailheads further away (as in B) or reducing access to the trailheads during certain days (as in C) or shortening the season by closing the road even earlier than now (as in C) or relocating winter trailheads further away (as in B and C), none address the real problem and all alienate those of us who use and love the Park the most.

The real problem with the Corridor is the amount of traffic on the road and most of that traffic is caused by those using it as a route for through-travel to other destinations. Those using the Park lands in the corridor, especially the backcountry, are not the problem and it is unnecessary and offensive to use road-related issues to restrict their activities.

Topic Question 3:

Consider making the road one-way.

Consider installing speed bumps and other methods to substantially reduce speeds on the road. I envision a speed of around 10 mph as the goal.

Either method would make the road safer for all, including bicyclists, with a minimum of disturbance. Either would make the road extremely inefficient as a commuting route and thereby greatly reduce traffic.

Topic Question 4:

Don't pander to the local and regional politicians, none of whom understand that the Park is national. Preservation of the Park and its resources is paramount.

Although I'm not entirely opposed to a bike path I am opposed to the heavy-handed tactics its proponents often employ. Please keep preservation of Park resources as the bottom line when evaluating any such path.

Educate yourselves on the use of taxis in the Park. A great deal of the use is by people who want to visit and utilize the Park without renting a car. The Park seems unaware that taxis provide a service to its visitors far beyond simply hauling commuters between the Village and the airport.

Alternative B has little value and should be abandoned.

Comments: The open house at the library was great; keep up the good work. And never forget that even though Jackson Hole locals are often characterized as selfishly wanting to exploit "their" Park at every decision point, the truth is a great many of us long-time residents are strong supporters of the NPS and its mandate.

Topic Question 1:

During peak visitation times, Moose-Wilson Road should be open ONLY to bicycles and pedestrians between Sawmill Ponds Overlook and the Granite Canyon trailhead AT LEAST two days a week OR MORE FREQUENTLY should the volume of traffic require such closures.

At times of high volume traffic, the National Park Service should limit the number of vehicles entering the corridor during certain peak periods. Hourly limits would be established to ensure that desired conditions were maintained and queuing areas would be established at either end of the road where vehicles could wait before entering the corridor.

Why is this advantageous? Visitors from countries around the globe come to the Tetons to experience the beauty of the natural scenery, the serenity of the outdoors, and the sight of wildlife that cannot be easily viewed elsewhere. Maintaining the rural quality of the Moose-Wilson road and preventing it from becoming just another high-volume, paved highway will continue to allow park visitors to enjoy this corridor as a natural area (rather than simply a thoroughfare to a more distant destination) and prevent the accelerated destruction of the corridor's natural beauty and the elimination of the wildlife that have lived there for decades (or longer).

Topic Question 2:

The Moose-Wilson Road should "be retained in its existing alignment and width" and should remain unpaved.

Paving the road will only increase the amount of traffic using this corridor; increase the speed of that

traffic; lead to further habitat destruction; cause increased wildlife fatalities; destroy the already weakened sense of wilderness; lead to even further calls for future development of the corridor for the sake of convenience of those commuting through the area.

Topic Question 3:

Many people use Moose-Wilson Road as an alternative to going through Jackson Hole. Has any consideration been given to how vehicular traffic through or around town could be modified or improved to make it a more palatable choice for those visiting the park?

Topic Question 4:

1. Reduce the speed limit on the Moose-Wilson Road and significantly increase the fines for speeding to encourage compliance with the reduced speed limit.
2. Make the Moose-Wilson Road a toll road to encourage visitors to go through Jackson Hole.

Comments: Dear Superintendent Vela,

I have been visiting Grand Teton National Park for more than 20 years and have been an enthusiastic supporter of the National Parks system for even longer. Because I visit multiple parks a year-in California, Montana, Wyoming, Arizona, Washington, and other states-I see firsthand the stress put on wildlife and roads by increased attendance and vehicular traffic.

I have seen frustrated drivers force animals off the road in Yellowstone as they speed down roadways far in excess of posted speed limits. I've seen elk calves and bison calves hemmed in by impatient drivers preventing them from crossing roads so that inhabitants can take photos. And I've seen many smaller animals and birds unnecessary killed by uncaring motorists indifferent to the fate of creatures who call the Natural Parks their homes.

Please do whatever you can to prevent the Moose-Wilson Road from suffering the fate of so many other roads in National Parks around the country-becoming simply another highway to speed tourist on the way to another destination.

When I first started visiting Grand Teton National Park, the Moose-Wilson Road was not nearly as popular as has become in recent years. Wildlife enthusiasts gravitated to the road because of the chance to see Moose, Beaver, Bear and other wildlife and for the sense of serenity-of aloneness-one could often experience. But over the last five years or so, the unique quality of this corridor has suffered as the number of people driving through it has increased.

I urge you to stem the tide of this increased vehicular traffic by limiting the number of cars allowed to access this corridor, especially during the peak tourist season; by eschewing paved roads in favor of the gravel roads that help preserve the historic quality of the area; and by reducing speed limits to protect wildlife and discourage motorists from traveling at unsafe and unsustainable speeds.

As the Environmental Impact Study begins, please make habitat protection and improvement an absolute priority.

Strongly consider the option of closing the road during peak visitation periods-or when the volume of traffic increases to the point where the safety of wildlife, pedestrians, or bicyclists is compromised.

Strongly consider the option of making Moose-Wilson Road one-way only when warranted.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

And please consider a shuttle system for Moose-Wilson Road as another means for reducing traffic to this sensitive area of the park.

Thank you for giving me the opportunity to participate.

Topic Question 1:

I think that you should find out what the carrying capacity of this area is and then allow only that number of visitors.

There is a thing called "loving a place to death" and we don't want that to happen here.

Without knowing how an area will withstand visitation, you should not move forward. This is crucial.

Topic Question 2:

This road should be deemed a scenic road and a quiet park destination. That is all it should ever be, so trying to make it into a thoroughfare to bring more people to the area, is a bad idea.

Topic Question 3:

The most important part of a wilderness experience is being able to get away from the normal hum and buzz of human activity. Being able to stop and listen to the birds and the wind is invaluable and cannot be had if you are trying to push through the throngs of humanity.

Topic Question 4:

Leave the place alone and stop fiddling with it. Stand your ground and protect and preserve the little quiet spots that are left.

Comments: Dear Superintendent Vela,

Topic Question 1:

I favor plan A or C or D

Plan C aims to focus more on the park's role as a heritage site, a cultural treasure, and makes some effort to limit traffic, which acknowledges the environmental damage of vehicular congestion. The planned maintenance is geared toward upkeep and not new interferences with the landscape, which I also support. Plan D may have the best idea, to institute a Reservation system, a more guaranteed way of keeping down the problems associated with congestion.

Topic Question 2:

I don't like plan B at all. Of course we want. To encourage visitors. To see the beauty of this spot, but plan B suggests a need to accommodate even more traffic and congestion, which will ultimately degrade the park.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 3:

We have been visiting The Tetons every summer for the last 26 years. I think the bicycle path along the Moose-Wilson road is a very bad idea. I have used the new paths located near Jenny Lake and enjoyed them very much this last summer but the M-W road is too narrow and congested. As a physician I see it as an open invitation for accidents and severe injuries. As I read the proposal it would require the removal of a significant amount of forest.

I also think that closing the Sawmill Ponds trail seems short sighted. The park is just beginning to restore the old White Grass ranch and part of that ranch experience was trail riding. Why take away an historic part of the history of the park at a place where it was actually practiced?

Comments: My family has enjoyed the Tetons for the last 26 years. Our kids looked forward to staying at a guest ranch every summer and now that they are adults they still return every summer. A big part of that attraction was the ability to ride horses in the park. I was sad when the Park Service tore down the big barn at the old White Grass ranch, but now am happy to see that they are beginning to restore the cabins. Future generations will now get a chance to see how the old Dude Ranch industry looked. I think they should also be able to ride the trails in the same manner.

Topic Question 1:

Alternative A (No action): The area continues to be enjoyed by visitors as it currently exists.

Alternative C: The area would maintain most of its characteristics, while also improving the visitor experience.

Topic Question 4:

I thoroughly enjoyed a visit to Grand Teton several years ago, and I hope to have an opportunity to enjoy the park again.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. Topic Question 1:

What ever strategies CNPR recommend, because I'm a retired ranger and well aware that on-the-ground experience is needed to make good decisions, and I've not worked the Tetons. CNPR was a little vague on the groomed xc trail issue, and I can appreciate that non skiers or alpine skiers may have trouble evaluating this one. Scott McGee however will hopefully weigh in on this, and I suspect he'll get it right.

Topic Question 2:

Any increase in commercial traffic, because windshield wildlife viewing opportunities are rare and extremely valuable.

Topic Question 3:

Groomed XC skiing is typically short changed around the NPS, and so I'm concerned that this introductory experience for quiet winter recreation be given an accurate analysis.

Topic Question 4:

I'd endorse opinions given by Jack Hughes and Janet Kailin at [REDACTED] who although also retired keep up on Jack's old haunts around Yellowstone, and also know xc skiing in the National Parks better than I do.

Comments: Be sure to contact Scott McGee, if he doesn't volunteer anyway.

Topic Question 1:

NPS is the voice for our wilderness, Parks and wildlife therein. We all see African Wildlife as the wonder of the world...and in danger of poaching as well as droughts like our own. We, as Americans, seem to take what we have in the way of wild places and wildlife for granted. Every rancher, corporation, and transportation provider wants more access to public lands and NPS needs to plan for the sustainability of our wildlife and the protection of our park lands and our wilderness areas.

Topic Question 2:

Any strategies compromising the above in Question 1.

Topic Question 4:

If we do not take action to protect our park lands and our wildlife therein, we, as a nation are the losers. Wolves are on the comeback list and ranchers in all the Western States want them GONE! Ranchers want more public lands opened up for grazing...they take advantage of grazing lands at the expense of the public (they pay a very low fee for every cow/calf pair...yet the price of beef and lamb keep rising and more of it is exported. Ranchers also feel entitled to graze their herds near waterways causing pollution of the streams and leave the clean-up to someone downstream. (If it can be cleaned up!...Farming also leaves many streams and waterways with high phosphate content along with other leaching from fertilizers. Gas and Petroleum entities are now demanding the right to FRACK in order to release oils and gasses from shales and other rock deposits. There are countless cases proving that fracking pollutes and ruins our water tables. When you can light the faucet in your kitchen as the natural gas released by fracking escapes into the wells and water resources serving homes and other structures, it is time to SAY NO TO FRACKING! The NPS must take a hard core stance against all these polluters and protect wildlife from

the long held belief that domestic herds are more valuable than wildlife.

Topic Question 1:
Closing the road 2 days a week and limiting traffic would go a long way in reducing impact on the area.

Topic Question 2:
Realigning roads and increasing parking areas is disruptive and doesn't protect the natural dynamics of the area.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. Topic Question 1:

Keeping the road gravel and not allowing additional construction in currently natural areas will best serve wildlife and park visitors.

Topic Question 4:

I remember visiting the Grand Teton's as a kid and look forward to visiting with my children when they are a bit older. I hope that the NPS will preserve wildlife corridors and prioritize non-motorized recreation so that they will enjoy it as much as I did!

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

Topic Question 1:

Environmental assessment ASAP. Close mine to all activities until proven to be safe for drinking water; water containment & control of wasted natural resources.

Why carried forward? It is the only logical plan to halt hazardous fracking continuum. We are all mandated stewards of our natural resources.

Topic Question 2:

Environmental assessment ASAP. Close mine to all activities until proven to be safe for drinking water; water containment & control of wasted natural resources.

Why carried forward? It is the only logical plan to halt hazardous fracking continuum. We are all mandated stewards of our natural resources.

Comments: The above speaks for itself. We are mandated to save our precious natural resources. Fracking is solely driven by greed and disregard and disrespect of our ground and water resources.

Continuing of this dangerous activity can only lead to contamination and falling water quality. Do not let greed lead our world. What happens when our aquifers are polluted? This is already happening throughout the country.

Take hold of this disgusting activity known as fracking before it is any further out of hand.

I intend my comments--indeed, more of an editorial--to obviate the need to answer the specific questions because my jihadism is more broad-based, much like the way ecology and biodiversity are. It's no secret the natural world is under assault virtually everywhere by human activity and, sadly, indifference. Whether it's the unconscionable war on wildlife, the wanton destruction of habitat, the trashing of the planet or, most significantly, our malignant population growth, we are sawing off the very limb on which we're perched. Nature, while indifferent to human affairs, has certainly been badly wounded by human stupidity and hubris.

Harvard professor E.O. Wilson, a biologist, author and world expert on insects, has proposed "half for them, half for us" swaths of habitat across North America. These zones, he rightfully argues, are essential for maintaining the vitality of the biosphere. National Parks, a magnificent concept and, clearly, natural treasures, are understandably coveted by other than munificent interests. Wilson doesn't think they should be "island arks" but advocates for "corridor arcs". I go further and, regardless of how draconian it seems, espouse a simple but volatile policy: Whatever it takes.

Whatever the money, resources, political action, law enforcement, inconvenience it takes to preserve--indeed, expand--the park concept is valid and vital. Nothing matters more than good stewardship of the only home we'll ever know. Nothing. What. Ever. It. Takes.

I've been traveling the Moose/Wilson Road since 1985. At that time if I passed another vehicle on the road the entire trip it was a busy day. The last time I drove the road, last September, there was that much traffic on it that I had to sit and wait for vehicles to get out of the way. the wildlife on the road have no peace..... Personally, I think the road should be closed to all traffic unless you have a pass to go through it because you live in the area..... Just my thoughts.

Topic Question 1:

STOP LISTENING TO POWERFUL SPECIAL INTERESTS. They have and will continue to have only one thing they value: Their own self-indulgence and unsatisfied greed. Losing the Grand Teton Wildlife Corridor would be a tragedy for all of us but those whose wallets would swell with the development of this beautiful area. As for strategies, leave this area alone. Prohibit development and increased traffic and allow this area to remain as pristine as we are able. It's time to listen to the people not the bankers.

Topic Question 2:

Development in the area would be a tragedy. JUST LEAVE IT ALONE AND PROHIBIT ALL DEVELOPMENT.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

I have also visited Jackson Hole 9 times since 2002, and have, in fact, just returned from the area on September 6th, 2014. I am quite familiar with the greater area and with the Moose Wilson Road. The southern portion of it is paved (from the Wilson Junction to Teton Village) and the more northerly portion to Moose is where the more curving, unpaved portion exists. On the paved, straighter portion the maximum speed limit is 45 mph but on the curved portion it can often be wise to go no more than 20 mph.

As development has increased in Teton Village the pressures upon the southerly portion have greatly increased and have been reasonable well accommodated, but I was unaware that the northerly portion was also feeling such pressures. It is therefore absolutely imperative that the study team include individuals who are familiar with the route and knowledgeable regarding the varying aspects of its changing character from start to finish.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts. I also believe that a secondary road from Teton Village to Moose, to parallel the older unpaved portion but further eastward and straighter, could be a viable plan. That road could in turn be connected to the main highway to the east easily. There is a similar road that grants access to a development south of the airport where the golf course was built with surrounding homes, that runs perpendicular to the main highway where, incidentally the speed limit is 45-55 mph depending upon area, traffic pressure, weather, and wildlife. At times there are also large electronic signs alerting drivers to even slower limits, as are often the case to enable road repair and maintenance. Such difficulties ARE amenable to solution but it would be wise to develop a strong program of public education to assure visitors understand that they are entering a sensitive area and are expected to do so with caution and respect!

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States. It is also the home and natural habitat of some of our most interesting and valuable wildlife. Just because the area is beautiful and inviting does not mean that human beings should be allowed to inhabit or exploit it without restriction.

Thank you for considering my opinions.

Sincerely,
Patricia I. O'Reilly, La Mesa, California

It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 4:

Allowing for encroaching development is not the way to preserve our park; it threatens the very things people come to Grand Teton NP to see and experience. Follow the money, it only enriches the developers and robs the rest of us of the park we treasure.

Topic Question 1:
Please reduce traffic on Moose Wilson road even seasonally closing the road for a quieter park and an wildlife corridor.

Topic Question 2:
Allowing traffic to continue and increase on this road would harm the quality of the park and hinder wildlife ability to cross the road.

Topic Question 1:

I think reducing the number of vehicles, maintaining slow speeds, and definitely eliminating commercial and commuter traffic along the road would help. A one-way road option, or temporary or permanent road closures of all or part of the road that would allow for safe pedestrian and bicycling use would be good. I think the development of a shuttle bus system would be useful to decrease traffic impacts.

Preserving the natural values of the park area should be the guiding principle.

Topic Question 2:

Development in the area should be avoided. There are plenty of developed areas. But the Park System needs to maintain the wildness that is still there. Once developed there is no way to return to wildness and that would be a huge loss.

Topic Question 4:

I think we should keep these words from the 1916 Organic act in mind. "...to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

Comments:

As the Environmental Impact Study begins, please prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Topic Question 1:
Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

I like Alternative D best. I normally bring my bike wherever I travel these days, looking for opportunities to experience nature that way instead of driving everywhere. I think this option allows people to access the area with less impact to wildlife and will encourage less traffic. My family and others that I know are looking for more opportunities to view scenic areas by bike or on transit systems (like they have at Zion NP) that help cut down on the traffic impacts that degrade the national park experience.

Topic Question 2:

I don't think the gates and closures (Alternatives B and C) are a good idea. I like some of the intent behind it, but I don't think the diverted traffic is a good idea and I'd much rather see emphasis placed on transit options and encouragement/provision of a pathway for bicyclists.

Topic Question 3:

A pathway along the Moose-Wilson Road is really necessary for safety in my opinion. I support doing it in way that minimizes environmental impacts (like the paths near Jenny Lake inside the park), but I do think it's necessary. It would be good to have now but will be even more helpful once the path from Jackson to Teton Village is complete.

Topic Question 4:

Just that I absolutely love Grant Teton NP. I've been coming there since I was a kid in the early 80s and would have loved to have had non-motorized pathways back then. I'm completely supportive of the paths that have been installed already and really hope that the pathway/transit combo focus in Alternative D will be chosen as the preferred one.

Topic Question 1:
To hold development to its current levels.
Because the wildlife's survival depends on it.

Topic Question 2:
Increased development/urbanization.
Because it does not fit the character of the area.

Topic Question 4:
Every time we drive on Moose=Wilson Road, we see wildlife in one form or another. In addition, we see tourists who want to see wildlife. Don't kill the goose that laid the golden egg. People come to the area to see wildlife and nature.

Topic Question 1:

Grand Teton National Park (and all others) belong to the citizens of this country and were deemed natural areas to view nature and wildlife with little or no encroachment or disruption by humans. Any roads or infrastructure deemed absolutely necessary must have as little impact as possible on the natural landscape, environment and the wildlife who live there.

Topic Question 2:

Nothing that would compromise the aforementioned qualities of our parks should be allowed. Very specifically, there should be no hunting, fishing, trapping, mining, logging, drilling, fracking or any other activity should be allowed. There must not be any snowmobiles, ATVs, dirt bikes or any other recreational motorized vehicles allowed.

Topic Question 4:

Keep all national parks natural and pristine areas where wildlife can live free from the threat of harm and humans can enjoy nature and all its beauty. These lands must not be compromised for any reason and cannot be sold, leased or loaned at any cost.

We are especially concerned about the future of the Moose Wilson Road Corridor in Grand Teton National Park. We have visited Grand Teton twice and hope to be able to return. We greatly value the wildlife, scenery, and historic values of the Moose Wilson Road Corridor. Increased traffic impacts and increased development could destroy this legacy. The park service must maintain the low-speed, winding, less-intrusive character of this road to preserve the historic character, solitude, and scenic and wildlife values of this special area.

As the EIS begins, please prioritize maintaining this road as a quiet park destination and wildlife-viewing area; do not allow it to become a busy, high-speed traffic route. Please provide and enforce traffic management techniques to limit the number of vehicles, maintain slow speeds, and eliminate commercial and commuter traffic along the road.

Please also consider alternatives such as a one-way traffic at specified times, or temporary or permanent road closures of all or part of the road. This would allow safe pedestrian, wheelchair, and bicycling use of the road corridor. Please also consider and provide a definite plan for a shuttle system that could largely (or wholly) replace private automobile use in this corridor.

We also support the use of seasonal closures, efforts to limit winter disturbance of wildlife, and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided by every means possible.

Grand Teton belongs to all the people of our country, and is also cherished by people from around the

world.

Thank you for doing all that you can to protect Grand Teton's amazing and increasingly rare resources, including the above suggestions for managing the Moose Wilson Road Corridor.

Topic Question 1:

Alternative D. I biked across the U.S. in 2000 and went through the Tetons. Please create a safe pathway that encourages people to safely enjoy the corridor outside a car.

A separate Moose-Wilson pathway is a safety need, not a want, an imperative in any Alternative. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area-wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. That's crazy!

Topic Question 4:

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

The NPS alternative to use a future small shuttle system should be carried forward. Please develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

Also, the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance.

Last, do not allow development in areas that have not been previously impacted/developed.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the

road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Within the greater Yellowstone/Teton region gravel roads like one experiences in Denali National Park would be a good idea to protect the wildlife.

Topic Question 2:

Paved roads within Wildlife corridors lead to more animal stress and even death due to collisions. Winter closure allow wildlife to have a chance to forage where they need to.

Topic Question 1:

The early stages of the plan should cast a wide net so that visitors to the park and others who may not be aware of it can participate. The plan should not place emphasis on short-term economic ends when compared to long term conservation/preservation values.

Comments:

Dear Superintendent Vela,

My family's visit to the Grand Tetons and Yellowstone National Parks many years ago still remain a wonderful memory to me these many years later. Anyone who visits these truly unique places knows that they deserve to have special protections from the pressures of urban and commercial development.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area. Those who wish to see the area will be more than happy to slow down, take a deep breath and enjoy this special environment. Not every view must be readily available to all. Some places lose their special qualities specifically when they become too easy to reach.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic

management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States. It must be protected and preserved for the long term.

Thank you.

Dear Superintendent Vela,

Thank you for the opportunity to comment on the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a user of national parks and other federal and state lands to enjoy the wildlife, scenery, and historic values of this road and am concerned about traffic impacts and calls for increased development, which would be to the detriment of these assets. I urge the Service to maintain the low-speed, winding, gravel road in order to preserve the historic character, solitude, quiet, scenic and wildlife values of this area.

In the Environmental Impact Study please ensure that this road remains a quiet park destination and wildlife-viewing area rather than a busy traffic route. The Service should use traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. The alternatives should include items like a one-way road option, or temporary or permanent road closures of all or part of the road, allowing for safe pedestrian and bicycling use within the existing road prism. The NPS alternatives should include definite plans for future small shuttle system, which would go a long way toward reducing vehicle trips and impacts. Please also limit winter disturbance of wildlife and provide alternatives that protect wildlife security and movement corridors from human disturbance. Finally, please to not allow development in areas that have not already been developed. While the residents of the local community deserve opportunities, it should not be at the expense of outdoor resources that belong to the entire nation.

Thank you for consideration of these views.

Topic Question 1:

I oppose changes in the Moose-Wilson Road in the southwest corner of the Grand Teton National Park.

It provides a chance to see moose, grizzlies, elk, deer, and beavers often seen just feet from the winding Moose-Wilson Road in the southwestern corner of Grand Teton National Park.

Over the past ten years this sensitive and quiet area has been burdened with greatly increased levels of commuter and commercial traffic, creating high traffic volume along the corridor and increasing conflicts with wildlife.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of

alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 2:

Increased traffic, particularly during winter months.

Topic Question 3:

Please limit vehicle traffic. One way to do this would be to encourage non-car traffic to view the park.

Topic Question 4:

Please do not develop or open areas that have not been open to traffic. This areas should remain wildlife habitat.

Comments: I oppose more roads inside our National Park System.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Rick Whitman

Topic Question 1:
protect park wildlife and its core habitat, visitor solitude, and the unique historic character of this corridor.

Topic Question 2:
resist the powerful special-interest groups trying to force NPS to allow for increased impacts on the Moose-Wilson Road corridor, which could irreparably harm park resources

Topic Question 4:
let the Park managers, with the best interest of the park, develop a plan that will shape the future of this critical landscape without outside influence and lobbyists whose focus is on making money!

Topic Question 1:

I think the most important thing is to protect the unique solitude, wildlife habitat, and historic character of the Moose-Wilson road corridor. While it's nice to have people enjoy the area, it is more important to protect the wildlife in the area.

Topic Question 2:

There should not be any more development or roads added to the area. The saying "You build it, they will come" is certainly true and the area doesn't need more people or traffic.

Comments: Dear Superintendent Vela,

Dear Superintendent Vela,

I am writing to you asking you to please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

Please note, I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided. It is important to keep this area as pristine as possible.

Thank you for all you do to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

Victoria Grubbs

Topic Question 1:

The safety & welfare of all Wildlife and habitat should be the primary concern of any & all proposals made that have any impact, no matter how negligible it may be perceived.

Topic Question 2:

Opening the roads to further traffic & disturbance of the Wildlife & serenity of the environment is totally incompatible with the very reasons we visit our National Parks.

Topic Question 4:

Sometimes the only prudent solution is to NOT make any changes to the current situation. Doing so would only harm an already fragile environment.

Comments: Dear Superintendent Vela,

Comments: I am still learning about this situation. We have similar problems in Yosemite, CA. We want as many people as possible to see the wonders of these areas. But without a number limit, these wonders very possibly might not continue to exist. How do we find the healthy balance? There is the question! Make reservations, be patient.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

1. Re-route the road between Sawmill Ponds and turnoff to Death Canyon [Alts. B and D] in order to protect fragile habitat and busy animal corridor and feeding area.
2. Put just one road entrance to M-W road across from Chapel Road so it is inside the Park's fee area [Alt. B]. This will minimize expense of building and staffing an extra entrance station on current road, will avoid day-to-day schedule fluctuations which will be difficult and expensive to administer and extremely frustrating to Park visitors, will clean up the cluster of roads in the Moose/Murie Ranch area, and will cut down on use of M-W as a commuting route for locals who currently enter without impediment from the north end.
3. Make one Death Canyon/White Grass access road [Alt. D]. This will cut down on having two parallel roads in the small area, will reduce maintenance expense, and will integrate White Grass into public perception instead of leaving it out there as a secret alcove.
4. Add the multi-use pathway [Alt. D]. This will facilitate more foot and peddle enjoyment of the resource (and hopefully pull some motor vehicle pressure off the area), will solve a huge safety risk inherent in the current arrangement, will create a foot/peddle back entrance to LSRP, will provide a lighter/softer/quieter human impact on the M-W corridor. You will, however, need to provide vehicle parking at the north and south ends of M-W so people can load/unload for foot/peddle use, a la Windy Pointe and Moose Entrance with current bike path.
5. I hate to admit it, but pave the unpaved section of M-W [Alt. B]. This will cut down on dust, will avoid

the nasty potholes, will save on maintenance expense, and will help fix a bad mix of creeping and rowdy driving styles. The unpaved section is not preserving any aesthetic value.

5.

Topic Question 2:

1. Please don't double up on the north end entrances [Alts. C and D]. This is expensive to build and staff, and it just adds to the area's already complicated series of roads, parking and buildings. Simplify, don't multiply the facilities.

2. Please don't double up on the Death Canyon/White Grass access roads [Alt. C]. This is expensive, and doubles the vehicle impact on a quiet corner of the Park.

3. Please don't put in the half-way traffic break at LSRP [Alt. B]. This will make the LSRP a traffic center instead of a serene destination, it will create bad visitor management problems for the folks who inevitably miss the signs or who run out of daylight or trip time when they find themselves stuck at the end of a dead end road but with nothing more than a curb separating them from completing a through trip. Sorry, but this is just a bad idea.

4. Please don't impose separate car days and foot/peddle days. The travel culture of the M-W corridor was set a long time ago, and it will create confusion and frustration to have shifting schedules based on what will appear to many as simply administrative fiat. Don't set our Park personnel up to be the hall monitors on an awkward notion like this.

5. Please don't set up queuing lines and wait stations (or a reservation system) at the north and south ends of the M-W road. This will be a bottleneck, an eyesore and a source of frustration for Park visitors and Park staff alike. There will be excessive idling. There will need to be restrooms, trash receptacles, picnic tables, and pet relief areas. This idea makes images of Disneyland dance in my head.

6. Please don't let trailers, motorhomes, buses or commercial through traffic (cabs, etc.) run on the M-W road. That is not part of the established order, and it will just turn an idyllic back country lane into a thoroughfare.

Topic Question 3:

1. Have you considered turning the old road bed between Death Canyon turnout and the Sawmill Ponds into the designated foot/bike path, similar to a rails-to-trails conversion? This would save some money and cut down on the impact of establishing yet another new lane of travel parallel to the new road along that stretch.

2. Have you considered establishing some type of visitor center or service at White Grass Ranch? It is historically interesting, it is a beautiful restoration demonstration project, and it would be a neat new place of interest for seasoned GTNP visitors.

Topic Question 4:

1. M-W is too established in local and visitor patterns to allow ratcheting back to minimal use and low impact without a huge outcry. Restoration of the LSRP area was possible because the historical use was surrendered to a new paradigm. M-W doesn't have this essential element; and a forced conversion will

cost more in resentment, disappointment, political capital and enforcement problems than any conceivable benefit.

2. It is essential to separate foot/bike traffic from the cars on M-W. Death is knocking at the door every day on that stretch.

3. Bikes are here to stay in the Natl. Parks. They add a unique means of experiencing a Park, they are quiet and low impact, they are family and fitness friendly, and they generate their own culture and aesthetic.

Dear Superintendent Vela,

I am writing as a biologist to express my concerns about the future of the Moose Wilson Road Corridor within the Grand Teton National Park.

Knowing the importance of national parks, I am a strong supporter of the national park system. The current road possesses wildlife, scenery, and historic values and I am concerned that unacceptable traffic impacts and increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road as is to preserve the historic character, solitude, scenic and wildlife values of this special area.

Therefore it is vital that you ensure that, as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States and, indeed, from other parts of the world.

Thank you.

Topic Question 2:
After visiting the R lazy S ranch in august,I found out just how special the horseback riding trails are. They give you the opportunity to see just how beautiful and unspoiled those areas really are. Do not allow bike riders to spoil the beauty of these woods by tearing up the trails. There are plenty of bike paths along the roads. To me this was the most memorable vacation I have ever had. I plan to come back every year to repeat the experience. Please do not let anyone spoil this beautiful country. thank you. H.T.Lavett

Topic Question 1:

It is always good to have a plan for the future. It is especially true for a national park, since traffic seems always to get worse everywhere. We want to keep as close to the current situation with the presence of as much wildlife as possible.

Topic Question 2:

Further development of traffic and noise in the area would will cause the wildlife to retreat and, hence be unseen by park visitors.

Topic Question 3:

I dont know, but the continuing increase of traffic on the road is a continuing threat to the enjoyment of seeing all the wildlife in the surrounding area.

Topic Question 4:

Please do not make it easier for traffic to increase on that road. It would destroy the present excitement of seeing the great variety if wildlife in such a natural setting.

Topic Question 1:

I think that wilderness is best left untouched. Animals can mostly take care of themselves and when they need help we should help them. If the issue is traffic then we should study where most of the wildlife is spotted and avoid roads through these areas. Avoid development in areas where the water may become polluted so that people and animals can use the water. Its best to create a big area of nature preserve instead of little spots here and there that have developments on and off. If you have to build roads and access ways then please build them in no more than 25% o the park area and mostly in one location or in the circumference of the park.

Topic Question 2:

Not achieving the purpose is to over develop our wilderness and sell parts of it off to fracking, and logging and developments. Further, not achieving the goal would be to make it so that our children and their children enjoy less of it than we have enjoyed, that is a failure.

Topic Question 3:

Please consult the wildlife scientists, veterinarians, geologists, botanists, plant experts, other wildlife experts, hunters, poi lets, and possibly military and fire when developing lands that consist of great open spaces of wilderness and their developments or wanting to develop them.

Topic Question 4:

Less is more and essentials necessary as possible.

Comments: Thank you.

Topic Question 1:

greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Topic Question 2:

Anything which makes the habitat area more busy noisy or otherwise less wild.

Topic Question 3:
Wildlife only, exclude people.

Topic Question 4:
None.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. Topic Question 1:

As the Environmental Impact Study begins, please prioritize the Moose-Wilson Road Corridor as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. In addition, it is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism.

Topic Question 2:

Increased development and paving the road would create unacceptable traffic impacts; moreover, calls for increased development would destroy the wildlife, scenery, and historic values of this road.

Topic Question 3:

Seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance need to be implemented. Most importantly, development in areas that have not been previously impacted should be avoided.

Topic Question 4:

If a shuttle system is being considered, such a system needs to be carefully planned, in detail, and with an

eye toward the environmental impacts of such a system. Many small buses emit far more pollutants than automobiles; could these buses either be electric vehicles or less desirable but better, fueled by natural gas? How would these shuttle buses be used to decrease traffic impacts?

Comments: As a frequent visitor to both Grand Teton and Yellowstone National Parks, I am concerned about the future of the Moose-Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. NPS must not let this happen.

Topic Question 1:

I would like to see rangers in the area at all times. Some visitors do not consider what is in the best interests of the wildlife. In their excitement seeing the animals, they crowd the animals which alters their routine. This creates much stress for the wildlife.
I think the area should be closed at times to the public.

Topic Question 2:

I don't think making it a one way road will decrease the number of people in this area.

Topic Question 3:

Having ranger-led hikes in the area

Comments:

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. I have been privileged to visit GTNP twice within the past 3yrs and to travel on Moose Wilson Road. I have been awed by the sight of moose, elk, bear and beaver. I would hate to have this opportunity lost or diminished. However, I agree something must be done. I was witness to a crowd of tourist who were much too close to a black bear as it was trying to cool down in the ponds. The bear was panting due to the anxiety of being followed by the curious crowd. It was a hot day and the bear paced back and forth across the road and was never able to find peace and comfort in the water of the

ponds. My husband and I left the area and drove to the Moose Wilson Visitor Center to report what was occurring. We knew that something tragic, either for the bear or the people who were much too close to him, could happen at any moment. A park ranger went to the area and instructed the tourists to move on. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

Correspondence Text

Dear Superintendent Vela,

I am truly concerned about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am sure that unacceptable traffic impacts and calls for increased development could destroy these qualities. Please allow and help the park service to maintain the low-speed, winding, gravel roads to preserve the historic character, solitude, scenic and wildlife values of this special area.

As the Environmental Impact Study states, you need to prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road network. Although the NPS alternatives mention the use of a future small shuttle system, the park service needs to develop a definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is a natural gift to the residents of the local community; but it is also landscape that is owned

by, cherished, and enjoyed by people from across the United States.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your careful actions will set an example for how the park will manage critical road corridors in the future. We must give Nature priority in our plans.

Thank you.

Sincerely,
Kristina Moazed

Correspondence Text

A peaceful future for the Moose Wilson Road Corridor within Grand Teton National Park is hanging in the balance. I love our national parks and am a huge supporter of the national park system. Please keep this road from being overused by too many vehicles or developed as that will destroy the wildlife, scenery, and historic values of this road. The park service needs to maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

As the Environmental Impact Study begins, please prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. Our parks were not put here to be developed and destroyed by companies only looking to profit off the parks many treasures. They are supposed to be places for peace and quiet and a refuge for the animals. Turning the Moose Wilson Road Corridor into a super highway will destroy this peaceful area forever. You have the power to make sure it remains the scenic, low speed road that has served this area perfectly for years and years.

Alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States. could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Correspondence Text

The following comment is copied and pasted from the NPA, but it expresses my concern for the preservation of the quality of the area under consideration.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:
making room for wildlife in economic growth

Topic Question 2:
nature needs space, I understand the need for growth, but without costing the loss of all animals. I suggest working together to prevent extinction and loss of tourism

Topic Question 3:
non lethal strategies, let existing organizations move animals to safe havens, then develop. Over hunting will cause a great extinction where not even cattle will exist. Must save species to save development then everyone wins.

Topic Question 4:
work with nonlethal organizations to keep the peace and prevent unnecessary violence

Comments: Logistics is working together even with nonlethal wildlife management.

Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

sharon_mader_90b.jpg

Sharon Mader
Grand Teton Program Manager

Hi my name is Sara. I love the outdoors and really hate watching the world as it takes over all the wonderful wild places that we still have. I think it is important to continue to preserve these places like the Grand Teton Park. Please don't destroy one of the few natural areas we have left.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

Suzanne M. Milewski

Topic Question 1:

To limit the traffic through the corridor as not to disturb the animals habitat. The animals need to have their habitat protected and they cannot speak for themselves. Do not allow traffic during the winter months for the health and well being of the animals.

Topic Question 2:

Increasing the traffic and/or using a shuttle. It's bad for the stress level of the animals in their natural habitat. They are being intruded upon and they were there first. We have a habit of pushing ourselves into areas where animals are living and then complain that they are harming our pets, eating our shrubs, etc...

Topic Question 3:

Find a different route.

Topic Question 4:

Protect and preserve the animal habitats now for future generations to enjoy.

Topic Question 1:
Bike path and full public access. Open all year round.

Topic Question 2:
Limiting public access to our national park roadways. More parking should be created to eliminate moose jams. Bike paths with amenities, such as rest stops, drinking fountains and scenic viewing areas are the answer to this problem.

Topic Question 3:
Cross country multi use hiking and biking trails that present the glory and beauty of this area. Why confine everyone to one route? I could build and design a trail that would expose everyone to the profound greatness of this national treasure.

Topic Question 4:
It will be a tragic crime if public access to this area is limited. Humans will respect nature more if they are allowed to experience it and isn't that one of the major goals of our national parks?

Comments: Bike paths are a great way for people to experience the park, no gas fumes and you see and feel more of nature. How could you not envision this as the green path to the future? Winter too.

Topic Question 1:

I think the road should be left as is, no trees and bushes cut down, the fences taken out and no new separate bike path added. I have visited the Tetons every year for the past 6 years and lived in Moose for one of those years. I am very familiar with the Moose Wilson road. I have driven it, biked and hiked and cross country skied on it. It is great just the way it is, pot holes and all. Every time I drive on it there is significant wildlife sightings. And currently people drive way too fast on the paved sections scaring the wildlife. I have seen deer run for cover, elk hit with headlights in their eyes and stunned into confusion, grouse stop displaying due to stress of autos, and bears and moose and fox confused by the cars and tourists. The current level of traffic and the speed at which it goes through is already having a huge negative impact on a highly critical wildlife habitat.

Topic Question 2:

NO separate bike path. That is so unnecessary and I say this as an avid biker. What a waste of money, space and time.
NO paved road. The pot holes are horrible to drive over but this is a park in wildlife habitat. Most parks in the world do not pave their roads to perfection. Again a waste of money.

Topic Question 3:

I think the Park should consider having a shuttle only access road for Moose Wilson. The fees would be good for the Park. It would eliminate fast driving traffic, traffic jams, stress on the animals, and bikes could be allowed at the same time.

Topic Question 4:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Mentioned in #3.

I am in shock that a separate bike path is being considered on this road. What a horribly wasteful use of precious wild life habitat, old trees and bushes. For what? A path that will be used a couple of months out of the year by a handful of people. The hundreds of times I have biked the path from Moose to Jenny Lake, there are rarely been more than one or two bikers that I have passed, Quite an expensive, although wonderful, for a select through. Let the bikers use that route and don't provide any more. Bikers can easily go on the Moose Wilson Road as it is currently.

These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

Topic Question 1:

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. I am concerned that unacceptable traffic impacts and calls for increased development. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Topic Question 2:

I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Specific plans are required for shuttle services.

Topic Question 3:

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Topic Question 2:
[REDACTED]

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

Topic Question 1:

I believe that a slow, curving road to the park helps the visitor to make the transition to this special place. Please make shuttle bus service a high priority to help minimize the reliance on cars and the pollution, traffic, and noise they create.

Topic Question 2:

Increased car traffic will not benefit the park, animal, or park visitors. Increased commercial activity does not belong at the gateway to this park.

Topic Question 3:

Seasonal closures to give the wildlife and the park opportunity to recover from so many visitors. Restrict development to areas that already have development

Topic Question 4:

Please prioritize this road as a quiet wildlife-viewing area; not as a busy traffic route. I encourage you to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road.

Consider a one-way road option, permanent road closures could allow for safe walking and bicycling. I encourage planning for a shuttle system.

Grand Teton is owned by, cherished, and enjoyed by people from across the United States. It doesn't exist to increase the wealth of those who happen to live nearby.

Comments: Dear Superintendent,

I am concerned about the Moose Wilson Road Corridor in Grand Teton Park. I am a supporter of the national park system and I value this road as it is - - an appropriate approach to the beautiful park. Designing a road that would increase traffic is unacceptable traffic impacts, as is an increase in development. Both have high potential for permanently gaming this historic road. I urge you to keep the low-speed, winding, gravel road to preserve the character, scenic and wildlife.

As the Environmental Impact Study begins, please make the road a place to quietly view wildlife. It should not be a busy traffic route. Please reduce the number of vehicles, keep speeds slow, and reduce or ideally eliminate commercial traffic.

A one-way road option would be my first choice. Please create a plan for shuttle buses to decrease car traffic. Pedestrian safety and safety for bicyclists would also be high on my list of priorities.

I support seasonal closures to limit winter disturbance. I encourage alternatives that increase protection for wildlife and the corridors they use and to keep people and wildlife separate.

It is particularly important to confine development to areas where there already is development. Please avoid undeveloped areas at all costs.

Grand Teton is owned and cherished by the people of the United States and I am one of them. It was not created to foster the financial well being of people who live nearby. It must be managed carefully and the number of visitors must be restricted so that it will be a place of beauty and respite for many years to come.

Thank you.

These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:
Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Topic Question 1:
We need to protect the wildlife

Topic Question 2:
I think there's already too much traffic going thru that area

Topic Question 3:
The area should be preserved for all future generations to come. I understand progress also.

Comments: I strongly urge You to find a way to protect the wildlife and the land first and then see what can be done about the Road. Your first priority should be protecting the animals. they count on us to do that. Roads can go in a different direction. These animals have been there for decades. Why should they be denied the land that is their home. they've roamed these acres forever. I don't think it's fair to them to give in to modern progress just to make it more convenient for a few people. I know that You understand preserving this land for future generations. Most of the time You have come up with an reasonable solution for all concerned. I'm counting on You to do just that now, Please?

Topic Question 1:

This sensitive and quiet area has been burdened with greatly increased levels of commuter and commercial traffic, creating high traffic volume along the corridor and increasing conflicts with wildlife.

Topic Question 2:

I support the protection of the rare wildlife, unique cultural history, and quiet recreational opportunities along the Moose-Wilson corridor

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the

road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,
Michele Nihipali

Topic Question 1:

- prioritize this road as a quiet park destination and wildlife-viewing area
- use of traffic management techniques to reduce the number of vehicles, maintain slow speeds
- eliminate commercial and commuter traffic along the road
- one-way road option or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism.
- support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance

Topic Question 2:

- a busy traffic route will endanger wildlife and create poor air quality and noise pollution to an area designated as QUIET
- unacceptable traffic impacts and calls for increased development could destroy wildlife, scenery, and historic values of this road
- develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.
- development in areas that have not been previously impacted should be avoided

Topic Question 3:

- development in areas that have not been previously impacted should be avoided

Comments: Dear Superintendent Vela,

It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

I am extremely concerned about proposed development on the Moose-Wilson Road Corridor in the Grand Teton area.

We have enough freeways and high-traffic thoroughfares in this country. Small roads in isolated areas offer citizens a rare and fast disappearing experience into the few remaining wild areas we have left.

Are we really willing to trade rare and exquisite areas for the mediocrity of the commonplace? What next, wi-fi towers so visiting kids can play with their Ipods?

Are we really ready to trade pieces of gold for crumpled greenbacks?

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

Nicholas M. Williams

Topic Question 1:

We prefer Alternative D. This new proposed route will make it safer for bicyclists while also reducing traffic.

Topic Question 2:

Alternatives B and C. This would increase the number of motor vehicle trips.

Topic Question 3:

My wife and I have our annual vacation in Grand Teton National Park. We use bicycles as an alternate form of transportation and really enjoy riding bikes in the Grand Tetons. A separate Moose-Wilson pathway would be greatly appreciated.

Topic Question 4:

We have really enjoyed the new bike paths that have been constructed and would appreciate the 7 mile bike path to be built.

Topic Question 1:
Priority should be given to wildlife, the preservation of the landscape, and the spiritual element of the Park. The road should not be considered a thoroughfare. On this basis, I would support the following elements of B, C, and D: re-alignment of the road; limits on access; 2 day/week closure to cars; and paving of the gravel road (on the assumption that does not involve any incremental destruction of landscape and would facilitate road biking). Adjustments to enable better use of the interior destinations make sense as well, as these seem modest tradeoffs of landscape for substantially improved visitor experience without overwhelming any of the destinations off the road.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Thank you.

Sincerely,

PEPC Project ID: 48252, DocumentID: 60898 Correspondence: 1304

Topic Question 1:

I think we should maintain seasonal closures to allow animals to hibernate and lessen human disturbance. Also, eliminating commuter traffic along the road would lessen human disturbance.

Topic Question 2:

Development in areas that have not previously been impacted should be avoided. Human disturbance to the Grand Teton ecosystem should be as little as possible.

Topic Question 3:

There needs to be a more definitive plan with the shuttle system, as well as how it will positively impact traffic in that area.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. Topic Question 1:

I support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Park values are best protected under Alternative D, which recognizes that wildlife and park visitors can be thoughtfully managed together, the essence of National Park visitation. Under Alternative D, visitors experience this part of Grand Teton National Park in a way that is respectful of natural resources, informative, inspiring, and safe.

Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular public on a needed pathway.

Topic Question 2:

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitable see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway.

Topic Question 4:

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

Topic Question 1:

Please consider plan D as the preferred option to allow public accessibility while balancing impacts on nature. Keep open as a mixed use path option, no cars. Reduces GHG and death to wildlife while allowing public access to scenic and precious corridor.

Topic Question 2:

Plan A-C is not good option as it does not address access issues for public and closes off precious potential use area.

Topic Question 3:

If reduction of total paved surface is needed, propose option "x" as in removal of road pavement but open the area as natural trail area. Use to include horse riding, biking, hiking, and cross country skiing. Convert a portion to an unpaved parking area for trail use.

Topic Question 1:

The park should have quiet winding roads to limit speed of vehicles and keep the pristine areas that way. No future development should be done in the quieter areas of the park.

Topic Question 2:

Do not allow snowmobiles, ATVs or other loud motor vehicles to disturb the quiet nature of the park. Wildlife can be very negatively impacted by excessive intrusive noise!

Topic Question 3:

Keep noisy vehicles out of the park. They are greatly upsetting to the wildlife and diminish the other visitors quiet experience.

Topic Question 4:

Keep the parks quiet and clean for the survival of wildlife and the enjoyment of the visitors who expect it to be that way.

Comments: Dear Superintendent Vela,

Topic Question 1:
Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Topic Question 2:

Anything which increases traffic or speed.

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Please continue to maintain the majesty of the park - my grandparents used to visit frequently and my family has not been able to visit yet.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic

I believe that nature and animals should be given priority over the pleasures and recreation of humans. People have ease of movement, vehicles, all the necessary equipment to enjoy their lives. Nature and animals do not have any devices except their native ability. They are outnumbered, outclassed and outGUNNED. The area under consideration should be kept as near to pristine as possible; in other words, as close to the original habitat for nature and animals as possible.

Topic Question 1:

Of the 4 alternatives presented, A and D seem the most acceptable. However, winter grooming and completed paving should be implemented in any solution.

Topic Question 2:

Alternatives B and C do not meet the need for the plan. And in general, the idea of closing off the road for "bicycle only days" is ridiculous. I'm totally in favor of the trail in alternative D, but it is inappropriate and counter to the NPS mission to close off a substantial portion of the park to the vast majority of people to meet the needs of a small but demanding subset.

Topic Question 3:

Alternative D completed paving winter grooming.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Maintaining slow road conditions and keeping the roads open to a set number of vehicles. Opening up to more vehicles or allowing them to drive faster endangers wildlife and scares them away.

Topic Question 2:

Not allow commercial or commuter traffic on the roads. This is not, and should not, become a regular traffic route. It is a scenic route through a national park and not meant for more regular traffic and people who want to rush through, honk their horns, pass other vehicles, and cause traffic problems.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States. Please do the right thing.

Thank you.

Topic Question 1:
Walking and biking paths are crucial. These allow for less pollution in the park and let citizens enjoy the beauty of the park in a more relaxed and healthy setting.

Topic Question 2:
Do NOT increase vehicular access.

Topic Question 3:
Provide parking for buses and cars at starting points for the bike trails. Do all that you can to make it easier for walkers and bicyclists. A reduced park entrance fee for citizens not taking a vehicle past a certain point makes sense.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. First and foremost you must protect the unique solitude, wildlife habitat, and historic character of the Moose-Wilson road corridor. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. Topic Question 1:

I think the parks should emphasize limiting the traffic, and encouraging bikes and destination park visitors. I like preliminary plan D for more opportunities to be out of your car, and a secondary multi purpose route. But I like the gate from plan B because alternate routes will be found by random road users when it gets out that busy times are closed. Like the idea of reservation to drive through.

Topic Question 2:

I like every idea that has concrete ways to limit the road use to only destination visitors.

Topic Question 3:

I don't know if there would be enough interest, but in the same way there is bike rental through many cities now, perhaps some kind of bike rental or bike buggy rental so visitors can always access the area, even if they forgot to make a reservation, or the road is closed due to excessive traffic.

Topic Question 4:

I'm so glad an effort is being made to reduce the congestion, and pressure on wildlife areas. There are not enough wild areas remaining.

Topic Question 4:

I have visited Grand Teton National Park in the past and plan to do so again this winter. Over time, we have come to realize that the needs of wildlife must be paramount to preserve the unique qualities for which the national parks were created. Increased urbanization does not achieve this end.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.
Cenie Cafarelli

Topic Question 2:
None of the four options protect wildlife and the area.

Topic Question 3:
The Park should make the road a one way road. None of the options listed protect the environment or the wildlife that resides there. The current proposals all suggest that we encroach upon this corridor further to accommodate both cars and bicycles.

Making the road a one way road with a strip like the one on the Jenny Lake loop would do several things. It would limit traffic, make the road safer, have a separate lane for bicycles all without having to destroy habitat to increase the size of the road and create a separate lane for bikes. Have it go from Teton Village to Moose that way you already have a gate where you can collect fees.

Not all uses can be served in all places. Protect this beautiful area first.

Topic Question 4:
Make it a one way road! No additional construction would be needed.

Topic Question 1:

Protecting wildlife habitat by limiting traffic. Keeping the goals of Park preservation intact for future generations by recognizing the need to put the environment first.

Topic Question 2:

Road improvement and or enhancement will increase traffic to the detriment of wildlife and natural environment.

People come to Jackson Hole to experience it's natural beauty as well as to recreate. We need to understand that to preserve that experience it is necessary to maintain an environmental infrastructure that may not be readily available to increasing human traffic encroachment. The wildlife need space to flourish.

Topic Question 3:

The Moose - Wilson Road should be turned into a one way road with access from Teton Village to Moose. There is already a Ranger Station in place to collect fees. The existing road can be maintained the way it currently is. By making the road one -way, it will be wide enough to accommodate both cars and bikes.

I think that if they do what has already been done at Jenny Lake, it will be a simple and economical way to address the problem.

Topic Question 4:

We share this beautiful valley with other species. If the animals had a vote, they would probably want the

road closed. I think that limiting access to the road by making it a one way "path", we are reaching a reasonable compromise that is economical and that provides a safe corridor for both car and bike traffic. Hopefully, it will also lessen and give the animals safe habitat.

Correspondence Text

Dear Mr. Vela,

My husband, Alan, and I volunteered for Grand Teton National Park for the whole summer of 2012. We were on the Wildlife Brigade and also at LSR Preserve.

While on the brigade, we encountered many dangerous situations on Moose Wilson Rd. Cars would stop at the sight of a moose, beaver, owl, or in one case a bear, sometimes parking in the middle of their lane and stopping traffic sometimes on both sides of the road. They would then abandon their car and run towards the wildlife with cameras, unaware of the danger of approaching an animal in that way. We did our best to calm people down, educate them, and encourage them to move along when no parking was available.

I suggested at least a stripe down the middle of the road, to remind people how narrow the lanes are. Park management was not interested in this simple measure, because it would change the character of the area. Changes are indeed needed. I am not familiar with the particular strategies now being considered, but I understood in 2012 that a new road was to be built further away from the wetlands. This measure in conjunction with restoration of the banks of the river now covered by pavement, parking pullouts on the new road and foot paths to the wetlands for wildlife viewing would, I think, be a good strategy. It would benefit both wildlife and people. I don't think it is particularly appropriate in this case to expect that people can view wildlife from their cars. I think people should get out of their cars as much as possible while visiting the parks.

Sincerely, Victoria Adams

PS, I think I am already on your email list.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

Topic Question 1:

Since this is a National Park area, it needs to be protected for the people of the USA and the animals of the area. If it's not necessary, don't do it!

Topic Question 2:

Wildlife corridors! Nothing noisy to ruin the natural sounds of the park.

Topic Question 3:

Must be visually pleasing and blend into the natural beauty of the park area.

Topic Question 4:

Wiegh all the options and remember this Park belongs to the whole country and the animals who live in it, not to any special interest groups who are out for a profit.

Comments: Please consider the interests of the visitors and most of all the living creatures of the Park and the beautiful mountains and vistas that should be protected, which is the reason it is designated a national park!

Topic Question 1:

I support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a good for the environment - like multi-modal transportation and smart transit.

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitable see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway.

Topic Question 1:

I am not an expert but I know that the pressure for development of our Parks and wilderness areas is exerted by those with interests for profits above all else. Development is all too often at the expense of our National Parks, places for wildlife and areas where people can visit to enjoy the natural world.

Once these places are gone, we will not be able to get them back. It is extremely short-sighted to add any more development to an already compromised place. We do not need more traffic on the Moose-Wilson Road in Grand Teton National Park.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. Topic Question 1:

The only strategy should be to protect the area from development and leave it as a wild area. There are plenty of developed areas for people to enjoy but fewer and fewer non developed areas due to developers pressure and unlimited funds for their agenda.

Topic Question 2:

Developing the area should not be part of the plan. The area should be left alone.

Topic Question 4:

Please resist the pressure that developers with a lot of money continue to put on the NPS to ruin pristine areas for their profit. The wildlife and the habitat have no voice and I hope you will listen to the voice of those people who continue to care about our wild places and wildlife.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

As a wildlife photographer, I enjoyed my opportunities to get some awesome shots there! That is just one thing the National Parks were set aside for!! Increase in traffic and construction would destroy these incredible, vanishing memories and opportunities!! Please don't let this happen!

Topic Question 1:

We love national parks...we strongly support all environmental protections for wilderness & wildlife above all else. Reducing the amount of vehicle traffic is a must.

Topic Question 2:

Seasonal closures are a must to protect wilderness & wildlife!

Topic Question 3:

Low speed travel & FEWER VEHICLES are a must do to protect the environment & wildlife. No commercial vehicles at all, but a shuttle system is desirable to cut down on traffic, pollution & animal injuries.

Topic Question 4:

Seasonal closures, fewer traffic, shuttle system. Little human interference with wildlife is a must. No future development at all. Let the environment be wilderness & wildlife friendly...forever.

Topic Question 1:
My personal preference would be for a one-way road option, or, best of all, temporary or permanent road closures of all or part of the road which would allow for safe pedestrian and bicycling use within the existing road prism while protecting wildlife from traffic collisions.

Topic Question 2:
Maintaining current road system or expanding it to accommodate increased development, which should be banned as inconsistent with the National Park mission.

Topic Question 3:
Increasing impacts of climate change on native flora and fauna necessitate protecting not just actual but also potential habitat as species will need room to migrate in response. No development or infrastructure construction should impede the access or options for native flora/fauna.

Topic Question 4:
The mission of national parks is to protect, conserve and restore the natural and cultural history of the United States. The public's right to visit them must be balanced by the needs of those resources. Climate change poses new and extensive threats to every aspect of life on this planet and our public lands represent the best option for the survival of native species in the face of these increasing threats. Helping them survive and adapt must be the highest priority in planning for the future of these parks.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, ecosystem services, scenery, and historic values of this route and am concerned that unacceptable traffic impacts and calls for increased development would destroy these qualities. I believe it is critical and therefore essential that the Park Service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife safety of this special area.

I urge you to ensure that, as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area, not as a busy traffic route. Use traffic management techniques to reduce the number of vehicles, maintain slow speeds, and eliminate commercial and commuter traffic along the road. My personal preference would be for a one-way road option, or, best of all, temporary or permanent road closures of all or part of the road which would allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I urge the park service to more fully develop a plan that outlines how shuttle buses would be used to decrease traffic impacts.

Seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance would be most in keeping with the history and adaptive needs of this national park as climate change tightens its grip. Most important of all, keep development out of areas that have not been previously impacted.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

Topic Question 1:

One thing I'd like to see, whether it has any possibility, I doubt, but it would be great if we were to get beyond the population count of various species to determine whether a species is endangered. I suggest that the indicator should be an agreed upon mutual lifestyle "treaty" with the species. So, for instance, lifting the protections for wolves should be related, not to how many remain on the Earth, but on whether we have configured a mutually agreeable approach to sharing the Earth - - e.g. wildlife-friendly farming. Instead of battling it out species by species and park by park, is there a way we can extend park protections to continental lands by adopting a plan "treaty" that serves wildlife on and off park lands? Thank you for your consideration. Tena Meadows O'Rear

Topic Question 2:

Shared park lands is not working as a strategy. Park visiting should be limited to specific areas, and we should maintain wilderness for native plant and four-footed animal species only. Other park Commercial use of park lands for drilling, grazing, etc. should not be permitted at all for any reason.

re: grand Teton wildlife corridor

I am disabled, can't hike or bike, and can only be driven through this, our most beautiful place in the country. slow roads are the best here and the area should not be open to commercial traffic. this should be kept for the wildlife. I could not ride a bus either, so cars should be allowed - - but slowly. viewing areas where people can just stay in their cars and enjoy watching the wildlife - - not getting out and pestering them, just watch. bathrooms once and while would be nice too, but don't allow people out of the "visiting area" (parking lot and bathroom).

keep it simple, slow and clean.

thanks!

mary

Topic Question 1:

I think the north end entrance station question is best answered by alternative A or B. A would require no additional construction or ground disturbance. B would centralize the entrance station, but I see no reason to move the entrance station. It would work better to leave the station where it is to give more space for people to sort out which lane they need to be in as they travel north. If turning left onto the realigned MW Road, you don't want to be in the right lane at the entrance station as shown under Alt B. The 4-way intersection seems to work here, and closing the existing roadway through the trees would help improve mule deer habitat, but there would be a need for new ground disturbance across the sagebrush flat.

Moving the road between Sawmill Ponds and Death Canyon to a more sustainable location is far preferable to leaving the road where it is. Wetlands are never a good place for a road. Unlike the conceptual drawings provided, I suggest using the existing old road (gravel trace of which remains obvious) between the south end of Sawmill parking area and the existing reconnection where housing driveways meet the MW Road. Advantages: this would allow restoration of the existing paved road and allow natural processes to function, and would provide a route with better views of the mountains and opportunities for decent pullouts and short nature trails to overlook spring creek ponds below the terrace. Road maintenance would be simpler and less costly, and the old road trace is already disturbed. Bringing the road back to the MW Road at the housing driveways rather than as shown on the conceptual map is preferable to creating a four-way intersection at Death Canyon road. Not only would less wetland and aspen be disturbed, but concerns about visitors being uncertain of which road to take would be alleviated.

Restoring the current road to a natural condition is a good idea. It would allow for the natural processes of landslides, springs, beaver ponds and elk trails to become undisturbed, would eliminate problems with congestion and wildlife disturbance, and would eliminate a part of the road that is subject to buckling and frost heaves. It is hard to know why the road was put here to begin with.

Providing access to the existing Death Canyon trailhead via the Whitegrass road would be a much better location for the road, and would serve recreation better than the existing road that is hard to negotiate with frequent deep puddles, etc. Using Whitegrass road would also improve opportunities for interpreting the historic structures there and giving access to the Valley Trail. I prefer to leave the Death Canyon parking area where it is rather than disturb more ground for a new spot. Having people around could protect the isolated patrol station from potential vandalism. Overflow parking along the roadway just below the trailhead could be established along the realigned road and a small place to park to view the Whitegrass cabins or access the Valley Trail could be placed at the junction between the new Death Canyon access road and the road to the cabins.

Creating a short road link from the Whitegrass Road upper end to the existing Death Canyon Trailhead would disturb less ground than creating a new parking area. The current one, with several bays separated by trees, makes the whole parking area seem smaller than if one large spot was built for 60 cars. I assume it has been determined that a 60-car capacity is needed. It sounds like more than necessary.

Keeping part of the MW Road unpaved lends to the rustic nature of the roadway and helps keep traffic slow. The road would need considerable work to be better drained, and is currently becoming wider with each attempt at grading. Filling the worst potholes, providing better drainage on parts of the existing road, and maintaining the existing turnouts would help improve visitor experience and safety.

Improving the horse parking at Poker Flats would serve a segment of the public that has not been well served in either the national park or forest due to all the other competing uses on trails. Keeping the trail system as it is between this parking area and the LSR would assure continued opportunities for equestrians.

Some kind of shuttle service seems to have merit if it can be shown to reduce congestion and the amount of traffic on the roadway instead of just adding to it. A shuttle serving the LSR may be most practical since parking is limited there, but the limited parking is there for a reason so adding more people to the LSR and its trails may be counter to the objectives for the preserve. In any case, shuttles or other commercial services should have a strong natural history interpretive dimension.

Topic Question 2:

I see no need for 2 entrance stations at the north end of the MW Road. It makes more sense to use one centralized entrance to serve both roadways.

I don't think the 10-12 car parking areas along the proposed realigned section of roadway are needed to enhance visitor experience, since there is already a good parking area at Sawmill Pond. Pullouts for short photography or wildlife viewing stops would be fine, but it seems best to keep people moving through the corridor rather than creating multiple places to serve as mini-destinations. I would favor pullouts and parking areas along the road to be non-paved.

I don't care for the option in Alt. B to close the MW Road to winter traffic. Keeping the access from the north to Death Canyon would allow skiers to continue using Maverick and nearby destinations without having to ski an additional 6 miles round trip.

The idea of placing a toilet at the lower junction between Death Canyon Road and MW Road does not seem necessary. It would serve mostly winter users, and the toilets that are accessible from the outside of the visitor center in Moose would do the same, even if the VIC isn't open in winter.

I'm not sure the proposed pathway is needed or desirable, especially a pathway that diverges significantly in places from the roadway. For most of the length of the road there isn't a lot of room to install one next to the road either, due to topography or dense vegetation, and it would only disturb more ground, which is counter to the stated goals of the project. It doesn't make sense to have a paved pathway along the currently unpaved part of the MW Road as shown in Alternative D. The pathway as shown around the LSR Preserve would displace existing equestrian use and create another potential conflict with wildlife, since it follows an edge between sagebrush and cottonwood/hawthorn woodland, used by ungulates, bears, and other wildlife. The whole concept seems counter to the stated goals and objectives of the project and the LSR management.

Many of the concepts listed in "adaptive management" require on-site management and would create unnecessary complication. For example, the idea of closing MW road 2 days/week to accommodate bicycles and pedestrians. This would seem hard to manage, plus it would fail to serve those who by necessity travel this road - those who live there, those using trailheads, or park employees who live on the west side of the valley and would have to drive the long way to work.

Topic Question 3:

I'd like to see an alternative that greatly emphasizes the rustic and quiet nature of this area, distinct from other park destinations, encouraging appreciation for nature and protecting wildlife habitat to the degree possible. Features of this part of the park include reasonably clear access between the mountain front and the river for wildlife, with no major high-speed road to cross; an extensive system of low-angle trails that most people can use without having to be mountaineers; and items of historic interest including Whitegrass and the LSR Preserve, as well as the Murie Center, though that would be disconnected from the rest of the area if the north end access road were realigned. It is a fine place to see fall colors, listen to elk bugling, and enjoy pursuits such as photography, birding, and art. There could be an opportunity to arrest the current deterioration of the Sky Ranch buildings and perhaps use them for educational/artist-in-residence purposes. Consider the following aspects of such a theme:

Keep it simple with minimum infrastructure and ground disturbance. Use thoughtful design to achieve goals, not a bunch of complex permits and active visitor management.

Use the road alignment concept shown in Alternative D for Sawmill Pond to Death Canyon, but keep the road on the existing old roadway and leave it unpaved to give a more rustic feel and to slow traffic. Re-establishing this road, with the potential for short nature trails and overlooks between pullouts, would also give an opportunity to work on the weeds that seem to be taking over there.

Bury the power line. It is the primary reason people can't get a decent photograph of the fall colors and mountains.

By improved drainage so the roadbed is sustainable, the current unpaved section of the MW Road can be made into two 10-foot lanes with room in the roadside disturbance area to provide additional pull-offs for slower vehicles. This would also allow for overflow winter parking at Granite trailhead without disturbing the aspen stands in the area.

Topic Question 4:

No new ground disturbance should be considered before conducting a floristic survey to be sure there are no sensitive plants that would be affected. Use already disturbed areas wherever possible.

Wildlife presence, numbers and use patterns should be well documented and used to determine where infrastructure should go and whether seasonal closures are needed.

Beyond the scope of this document but a point: if natural soundscapes are to be preserved, the noise from the airport seems to outweigh any noise coming from use along the corridor itself. Could it be abated somehow?

What is most important is to develop and select an alternative that meets the NPS legislated mission to "conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. I have driven this road many times personally with my family and consider it one of the most beautiful places to be seen in the Lower 48 states.

As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

We support Alternative D as a preferred, positive option because it reduces overall traffic in a way that is essential to preserving the Moose-Wilson corridor's unique values, benefits area wildlife with fewer cars, and encourages diverse access for safely enjoying the corridor outside of the car.

Gates and closures are bad solutions to traffic management. Instead, inspire and enable more 10-30 percent of visitors to use bikes, feet or transit.

Park values are best protected under Alternative D, which recognizes that wildlife and park visitors can be thoughtfully managed together, the essence of National Park visitation. Under Alternative D, visitors experience this part of Grand Teton National Park in a way that is respectful of natural resources, informative, inspiring, and safe.

Alternative D enhances the visitor experience in an environmentally responsible way - providing public access with reduced traffic impacts to wildlife, smart public transit and greater safety for the non-vehicular public on a needed pathway.

Topic Question 2:

Gates and closures (Alternatives B and C) don't work. Gates and closures shift or increase the number of vehicle trips area wide. For visitors and locals alike under Alternatives B or C to get from the Westbank to Moose and back will be a 50-mile round-trip instead of 7 direct miles that could be experienced on foot, bike, transit or vehicle. Instead, we can help the National Park Service by innovating real solutions that a

good for the environment - like multi-modal transportation and smart transit.

The negative impact of shifted or increased traffic is bad for the environment and bad for wildlife that lives outside the corridor, especially along area roads like 390, 22 and 89, which will inevitably see more traffic and potential wildlife collisions from cars re-routing from road closures to get to the Park's entrance in Moose. The Moose-Wilson Road has no wildlife fatalities because it is wonderfully slow, narrow and rural - and should be kept that way with fewer cars, smart visitor transit and a pathway.

Topic Question 3:

A separate Moose-Wilson pathway is a safety need, not a want, an imperative in any Alternative. It can be placed in an environmentally sensitive way to minimize impacts and close a dangerous gap, which will be even more apparent when the pathway from Jackson to Teton Village is complete by 2015.

Please add more public transit and partnerships as a way to reduce traffic congestion even more in the future.

No action (Alternative A) is not the right solution because it does nothing to help wildlife by reducing traffic levels or manage traffic flow with adaptive strategies.

Decreasing the increased traffic volumes for the long term is the Park's objective and that is possible only with Alternative D, which uses thoughtful, safer ways to get people out of vehicles and into the outdoors.

Ask for Alternative D to help make meaningful traffic reductions and adaptations so that wildlife can thrive and visitors can have access to their national park.

Topic Question 4:

Making the area more accessible for cyclists is good for locals, tourists and the wild life.
cars = bad; bikes = good

Topic Question 1:

D. I think visitors and locals should be allowed to travel through the Moose Wilson road to access the park as it provides the recreational experience in line with NPS goal to provide for enjoyment of all. It's convenient to go to the park from my job in Teton Village and I do use this road to travel to the park for recreation.

Also, I like the road now because it does promote a slow drive through the park which I think benefits the wildlife as well.

Finally, I would like to enjoy the park on my bike, and currently I feel that it is pretty unsafe given the narrow road and all the cars.

Topic Question 2:

I feel the options with out a bike path are not as favorable for the guests to enjoy this portion of the park. When my friends come into town we have often considered the taking them biking from the village to the Lawrence Rockefeller Preserve but then we don't end up going because it is too dangerous.

Topic Question 3:

no

Topic Question 4:

I strongly promote two way traffic on the Moose Wilson road because in addition to the reasons stated above, I believe a closure would negatively impact our local economy by inconveniencing our summer

visitors.

Grand Teton Moose

[Click Here to Send Your Comments!](#)

(This link will take you to the National Park Service's Planning, Environment, & Public Commenting website.)

Take Action

Dear Kathy,

Park visitors may not always remember the name of the road, but they certainly remember their once-in-a-lifetime encounters with moose, grizzlies, elk, deer, and beavers often seen just feet from the winding Moose-Wilson Road in the southwestern corner of Grand Teton National Park.

Over the past ten years, however, this sensitive and quiet area has been burdened with greatly increased levels of commuter and commercial traffic, creating high traffic volume along the corridor and increasing conflicts with wildlife. Now, the National Park Service (NPS) is facing demands for even more development within the road corridor. NPS must put together a plan that best protects park wildlife and its core habitat, visitor solitude, and the unique historic character of this corridor.

Park managers are developing a plan that will shape the future of this critical landscape, but powerful

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

special-interest groups are trying to force NPS to allow for increased impacts on the Moose-Wilson Road corridor, which could irreparably harm park resources. Please lend your voice to support the protection of the rare wildlife, unique cultural history, and quiet recreational opportunities along the Moose-Wilson corridor.

As part of a two-year process to develop the 'Moose-Wilson Road Comprehensive Management Plan', preliminary alternative scenarios were proposed for addressing vehicle, recreational, and pedestrian traffic while still protecting the area's unique wildlife, biology, and cultural history. Your comments will be used to develop their Environmental Impact Study in 2015. Some ideas within the park's proposal will lead to increased protection for park resources, while others will contribute to a decline of the very values park visitors hold dear: the chance to experience serenity and quiet and an opportunity to experience a wide variety of wildlife that live nowhere else but the Greater Yellowstone region.

Take Action: Tell Grand Teton National Park Superintendent David Vela to first and foremost protect the unique solitude, wildlife habitat, and historic character of the Moose-Wilson road corridor.

Here's how to submit your comments to Superintendent Vela.

Step 1: Go to <http://parkplanning.nps.gov/commentForm.cfm?documentID=60898> and carefully follow the form instructions.

Step 2: Please submit your comments by copying and pasting the sample message below into the 'Comments' field of the web form, adding any personal observations or stories that support your comments. Note: Four questions precede the 'Comments' field; those are optional.

Step 3: Once you have completed all of the required fields on the form, click the gray "submit" button at the bottom of the page.

Sample message/comments

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

My interest as a private citizen is to see the Grand Teton National Park retained in its natural state to the greatest degree possible, consistent with the original intent of the legislation establishing the Park System, to allow controlled public use and access.

Consequently, I favor Alternative C. It emphasizes entry to the Park, and the Corridor, by groups of individuals rather than by private vehicles. It also reduces by a month public use of the Corridor. (Please see my comments below.)

Comments: I do not feel qualified to make very specific comments on the alternatives since it has been a very long time since I was there and do not remember if I have been on the Corridor.

However, relying on the Park Management's judgment, I would ask that you do all you can to limit use of the Corridor, and the Park backcountry, including skiing slopes, by individuals travelling separately, while encouraging group use.

I feel sure this action would lessen impact on wildlife, provide better control of behavior within the Park, and lessen the need for development of public facilities.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

I have not personally been to the Yellow Stone area yet, but in touring National Parks and Monuments in New Mexico and Utah, encountering wildlife, from song birds exotic to a Vermonter to a Golden Eagle, pronghorns and more was the the greatest part of the experience.

Thank you.

Wendell Coleman

Topic Question 1:
Any expansion of roads, traffic and off-road vehicles!

Topic Question 2:
Ditto: the area should be for enjoyment of wildlife - all of which we should LEAVE ALONE to live their lives.

WHO NEEDS MORE ROADS, TRAFFIC, VEHICLES - PEOPLE - INVADING THE PARKS AND DISTURBING (OR KILLING) WILDLIFE?

Topic Question 3:
ALL STRATEGIES SHOULD AIM TO PROTECT PARK AREA - FROM US!

ALL STRATEGIES SHOULD BE DESIGNED TO PREVENT FURTHER INTRUSION OF ANY KIND, BY HUMAN BEINGS. WE CAN ENJOY ALL OUR PARKS AS IS - MORE OF OUR TRAFFIC AND GARBAGE IS CERTAINLY NOT TO THE BENEFIT OF THE PARKS OR THEIR WILDLIFE.

Comments: I STRONGLY SUPPORT ANY AND ALL DECISIONS THAT PRESERVE WHAT'S LEFT OF OUR NATIONAL PARKS - ALL OF THEM - AND THE MAGNIFICENT WILDLIFE WHO CALL THEM HOME.

THIS DOES NOT INCLUDE MORE ROADS, TRAFFIC AND VEHICLES.

Correspondence Text

Dear Superintendent Vela,

In July, I just visited Grand Teton National Park, my favorite national park out of the many, many parks I have visited. As such, I am writing to express my concerns about the future of the Moose Wilson Road Corridor within GTNP. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. This road is a unique area within the park, allowing visitors to access less crowded areas of the park that allow visitors to experience the wilderness and serenity that makes GTNP my favorite park. When I visited in July, the road was already extremely crowded with traffic. All the human traffic led to some people approaching wildlife closer than the set guidelines- -I saw some visitors park cars and walk to within 5 meters of a resting bull moose. Further, other visitors were anxious to get places and drove dangerously fast and close to other cars. I would hate to see what would happen to this area if the road were made even easier to traverse. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a

more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

I am in favor of option 1 which is as I understand it, is to do nothing. We need to be stewards of our national parks, wildlands, wetlands and wildlife, and paving, or widening or creating another pathway will alter the environment, interfere with migratory patterns, and stress the wildlife. Please preserve and protect this special area.

Topic Question 2:

Strategies 2, 3, and 4 all create too much impact on the environment and confusion as to when the road is open, not to mention, the need for more staff to manage the timing of the road opening, volume of traffic and more. Keep it as it is.

Topic Question 3:

Yes, make the road one way heading north to reduce the traffic, and have folks go around if they have to drive south. It is not that far out of the way, and necessary to preserve and protect, and limit the amount of traffic on the road now.

Topic Question 4:

The pathways exist on the outer road to the Park and are perfectly fine and usable. We do not need another pathway to Moose, especially since the damage that will be done in creating this pathway is irreversible. Please, preserve and protect this incredible natural environment that we have.

Comments: As steward of our natural resources, parks and wildlife, please do not succumb to the pressures of the Friends of Pathways, commerce and greed. Preserve and Protect as you are charged to

do.
Thank you for offering public comment.

Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will

be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

This area, which is home to wildlife, should be kept as natural as possible with roads used only for quietly viewing the wildlife as they normally live. People in vehicles impose themselves on the animals' living area. Heavy vehicle traffic would disturb and disrupt, defeating the purpose of the National Park concept.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Alternative D is my preferred alternative because it is:

â—¼Best for the environment

â—¼Best for enhancing visitor experience

â—¼Best for keeping the road SLOW & NARROW

â—¼Best for reducing traffic by encouraging active transportation and traffic flow technology

â—¼Best for safely enjoying the Park on foot or bike

Topic Question 2:

Alternatives A, B and C. These alternatives are less desirable because:

â—¼Road closures cause an imbalance of traffic flow, idling lines and erratic visitor experiences with negative impacts to the environment and the public

â—¼Without a separate pathway, the Moose-Wilson road cannot be enjoyed safely outside of a car

Topic Question 4:

Connecting the pathway corridors and having a pathway on the Moose-Wilson Road should be priorities. The Park should encourage as much non-motorized transportation as possible.

Comments: Thank you for recognizing the positive value of active transportation. I think it's so important to experience the Park outside of the car and have fully utilized and enjoyed all current pathways in the

parks. My nine year old son loves them, too, and I am so grateful to have a safe way for my son to enjoy the park on his bike. It is so fabulous to see so many visitors getting out of their cars and enjoying the pathways.

Topic Question 1:
Alternative D

This is the people's park. Safe, accessible modes of travel (vehicular, bike, pedestrian) can be achieved without further impact to environment / wildlife.

Topic Question 2:
Closing the road would be the worst possible outcome. If you are required to keep the road operating between Moose and the Rockefeller Center, keeping the road open to Teton Village for all visitors and locals is simply common sense.

Topic Question 4:
Thank you for the opportunity to comment - and your willingness to have an open, transparent process.

Topic Question 1:

The Moose-Wilson corridor is one of the special areas of GTNP with an abundance of critical wildlife.

Topic Question 2:

The single most important issue affecting the Moose-Wilson corridor is the existence of the active through roadway itself. In my 35 years out here, my friends and I have utilized this roadway in the summers as a matter of convenience. This roadway is inconsistent with Park values. The road, currently closed to vehicular traffic for up to seven months every years should be closed to non-emergency vehicular traffic and bicycles permanently, at all points north of the LSR Center. I am in favor of a non-vehicular/non-bicycle pathway for walkers, horses, skiers connecting from 390 to Moose.

Topic Question 3:

This corridor is a special place with critical scenic and wildlife habitat. It should be treated and preserved as such.

Topic Question 4:

Close this road to motorized vehicular traffic (except emergency vehicles) and bicycles permanently at all points north of the LRS Center. Pedestrians, horse and skier traffic only.

Comments: The Moose-Wilson Road should be closed to all through route motorized vehicular traffic and bicycles year round permanently. Prior to the development of the Jackson Hole Ski Resort this entire roadway was an unpaved rural ranch road. See enclosed letter to David Vela and GTNP.

Topic Question 1:

Roads in the National Park must not be high traffic corridors but rather be geared to shuttle busses, pedestrian paths and biking trails, for the enjoyment of tourists without impact on the wildlife in the Park. More development and paving of roads must not occur, and seasonal closures are necessary for the animals to be undisturbed when winter comes. Keep the parks accessible without any further disturbance to the wild animals that live there, and to maximize the natural ecology of their habitat.

Topic Question 2:

More paving for traffic is a bad idea for the land and the animals that live in the Park. The road should remain a one lane gravel low speed road. Plans for shuttles and for bike trails and walking paths are needed.

Topic Question 3:

Commercial trucks and large carriers do not belong in the Park.

Topic Question 1:

Protect and Preserve are key words in the goals with which I would hope everyone can agree. Alternative B addresses safety and Park access issues (Moose Wilson Road access only after entering the Park) which are important and logical. Moving the north entrance may reduce some unnecessary traffic. I believe the Rockefellers' wanted the Park including the Moose Wilson Road to remain as natural as possible. We should honor that request. We should also do everything we can to make the area available for wildlife to traverse, habitat and be safe.

Topic Question 2:

Extensive changes and modifications. Constructing a bike path would be very disruptive to the area and ultimately create potentially dangerous conditions for bike riders. We know that numerous wildlife species including bears inhabit that area and having bike riders (potentially children) in the woods seems dangerous. We certainly would not want human injury. We also would not want a bear or elk destroyed because they had an encounter with someone walking or riding along a bike path. I think that bikers should follow the same road access rules as for automobile travelers.

Topic Question 3:

Reinforce the priority to protect, preserve and keep as natural as possible.

Topic Question 4:

Please do not make this road a highway, keep it as natural as possible. I am not an advocate of paving the current unpaved section as I believe that will just increase commuter traffic. Sometimes it gets quite rough

which should be addressed but paving is not necessary and may be counter productive to the goal of control and safety...paving will increase speeds.

Topic Question 4:

The National Park Service is in Stewardship of these lands, and as such should do all that is within its powers to maintain quiet, peaceful, serene and safe environments, particularly and specifically for the wildlife, flora, and the overall natural habitat. It is not intended as an amusement park. It should not be commercialized for profit. When these lands are gone, destroyed, it is forever a loss and a shame upon humanity.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Correspondence Text

Topic Question 1:

Realignment of road between Sawmill Ponds and Death Canyon
Abandon section of road between Murie Ranch Road and the Hill near Sawmill Pond and relocate to intersection with Teton Park Road to eliminate need to enter the park twice.
Rework White Grass Death Canyon access road
Pave existing part of unpaved road
Effect some limitation of vehicular traffic
Provide bikers with a safe pathway
Restroom at Granite Canyon trailhead

Topic Question 2:

Except for a one-way road (perhaps even north only in the morning and south only in the evening)all of the discussed alternatives to limiting vehicular traffic are impractical, expensive or grossly inconvenient - necessitating, at the least, effective alerts before anyone even entered Hwy 22 from Hwy 390.

Much as I would love it, an off road bike path is too costly and damaging to the Park environment and would invite more bear/human conflicts.

Topic Question 3:

Recognize the road is now little more than a short-cut into the Park and to the Airport for those living and visiting Teton Village, Highway 22 and Wilson. THERE IS A BETTER ALTERNATIVE!!

A safe bike path is very desirable but it needs to be all or a portion of the existing roadway (fully paved) or a widened area immediately adjacent to the existing road [as reconstructed in its northerly reaches]

Topic Question 4:

Decades ago Lawrence Rockefeller urged the Park/County to construct a "North Bridge" from The Teton Village area to Hwy 89 between the Golf & Tennis Club and the Airport. I understand he offered one million dollars toward such project. That project should be pursued now. The road would commence on the Moose Wilson Road just South of the current entrance station, continue eastward along the southernmost edge of the Park then across BLM land on the western bank of the Snake, then, after bridging the River, across one or two private parcels located to the East of the Snake, thence connecting with the end of West Zenith Road and utilizing that existing road and East Zenith Road to the intersection with Spring Gulch Road. From there you have a choice of turning South and using that road to its intersection with Golf Course Road and eastward to Hwy 89, or you can proceed straight eastward to Hwy 89. If this was done, you can eliminate the Moose/Wilson park entrance station, convert all of the southern end of the existing roadway in the Park to bike path (ideally pave a pathway across the currently unimproved section) until it reaches the Rockefeller Reserve road. From there on the path would be constructed immediately adjacent to or as a widening of the paved road as reconstructed in its northern reaches. If the alternative was elimination of the southern end of the existing Moose/Wilson Road, all of the merchants and lodging companies as well as all f the residents of Teton Village and residents along Hwy 22 and Wilson, as well as Teton County and the State would find a method of funding the expense of the new Bridge [which is badly needed when you consider there is only one narrow bridge across the Snake near Wilson. If it was blocked or damaged, the only way from Jackson the West is across the bridge in the Park thence South down Moose/Wilson Road] and, if the Park Service contributes to the costs of the roadway it will not be significantly more than the costs of construction of some of the other alternatives, including ongoing maintenance and operation of the superfluous entrance station and administration and policing of the various alternatives for limiting traffic that have been proposed. THIS IS THE SHORT-CUT TO THE PARK AND AIRPORT THAT SHOULD HAVE BEEN IMPLEMENTED YEARS AGO WHEN TETON VILLAGE WAS DEVELOPED. LAWRENCE ROCKEFELLER HIMSELF RECOGNIZED THAT. Teton county is now in the midst of construction of a six million dollar bicycle bridge across the Snake River - so much for the costs and environmental effects they might complain when they consider a North Bridge!

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 2:
Do not alter road...see below.

No pathway needed...we could make it a one way road?

Topic Question 4:

I am very concerned that the alternatives proposing realigning the road and creating a new pathway have the potential to disturb known archaeological sites in GRTE and make the National Register listed (historic) Moose-Wilson Road not eligible. This is a very scenic road that I always bring visitors to see. To alter it, alters a significant historic place in Jackson.

I am in favor of an alternative that will not destroy known archaeological sites and will not adversely affect the historic road, such as making Moose Wilson Road a one way road.

Comments: I am very concerned that the alternatives proposing realigning the road and creating a new pathway have the potential to disturb known archaeological sites in GRTE and make the National Register listed (historic) Moose-Wilson Road not eligible. Dear Superintendent Vela, As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of the Moose Wilson Road Corridor within Grand Teton National Park.

It is a crucial concern that unacceptable traffic impacts and calls for increased development could destroy these qualities of natural beauty.

The park service must maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area. and not as a busy traffic route.

The use of traffic management techniques to reduce the number of vehicles, slower driving speeds, and to eliminate commercial and commuter traffic along the road would help preserve it's character.

These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road system.

Although the National Park Service alternatives mention the use of a future small shuttle system, it should develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts and lessen human impact. Bio-fuel shuttles could run on waste oil from park concessions and local restaurants, making it a low cost and non-polluting alternative.

It is also crucial to support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance.

Most importantly, any new development in areas that have not been previously impacted should be prohibited.

The vast landscape of the Grand Teton range are owned by, cherished, and enjoyed by people from across

the United States, who would want the utmost protection to ensure they are enjoyed in their wild beauty for generations to come.

Park protection is crucial to support around this country. Grand Teton National Park is a splendid place of unparalleled wonder.

Your actions will really make a difference in how the park will manage a critical road corridor in the future.

Please protect the wildness of this magnificent place.

Thank you.

Sincerely,
Cynthia Piper

Topic Question 1:

The shuttle service proposal can be a good alternative if it respects the natural rhythms of the entire ecosystem.

Topic Question 2:

Do not pave over any of the current gravel roads.

Topic Question 4:

The most important goal shall be for this plan to preserve the current natural state of this corridor. Please include total closures for as long as needed to ensure this region stays pristine. Human's activities shall never negatively impact the wildlife. Humans that want their comforts, and gas guzzling toys, need not come to this place.

Topic Question 1:

I believe alternative A is the best choice. This choice still allows access to the area without the disruptions and flow control called for in the other options. Many of the current problems could be solved with my proposal in question 3.

Topic Question 2:

Options B, C, D are only stop gap at best with the continuing growth of human pressure on the corridor. Until permanent relief, see 3, can be achieved I believe option A is best.

Topic Question 3:

Yes. The increasing human pressure on the corridor can only be reduced by providing an alternative route between Teton Village and Moose. I don't see a plan for a totally new route. Looking at this as a traffic problem for all of Teton County and not just the park one can see the need for a new road and bridge across the Snake river. If you do that between Teton Village and the airport I think you would substantially reduce the corridor traffic. I understand that the majority of that route is not in Teton Park but the Park could bring pressure on the county to do what has been needed for many years and solve two problems with one bridge.

Topic Question 1:
KEEP FEES AT PRESENT LEVELS - - DON'T PRIVATIZE.

Topic Question 4:
SEE THE COMMENTS BELOW.

Comments: Since I don't know what the propose preliminary alternatives are, I cannot be specific, but I can make a good guess what they are. My comments are numbered below.

1. Keep entry fees as they are. Face the rising costs of maintenance and provision of extra facilities to serve the increasing number of visitors by eliminating the tax breaks that oil and coal companies now receive, and using the extra taxes that they now must pay to fund these requirements. An easy solution that has the additional secondary benefit of raising the cost of polluting energy and encouraging non-polluting wind and solar, so that the very air over the parks is better and less polluted.
2. Provide a fleet of rental electric vehicles at the boundary of the park, so that visitors may quietly observe the animals that they came to see, and produce no air pollution in the process.
3. Above all, DON'T PRIVATIZE [PROFITIZE] the national park operations. This makes the rich even richer, and it makes it more costly for those that are able to visit, and prevents others from visiting who have helped to pay for these parks with their taxes, but are too poor to travel to visit them.

Topic Question 1:
KEEP THE ROAD THE SAME AND CERTAINLY DO NOT MAKE IT A BIKE PATH. WE HAVE ENOUGH ANIMALS AND DO NOT NEED ANY BEAR ATTACKS

Topic Question [REDACTED]
[REDACTED]

[REDACTED]
WE NEED TO KEEP THE ROAD IN GOOD REPAIR AND NOT SPEND MORE MONEY OR CUT ANY MORE TREES

Topic Question 3:
NO

Topic Question 4:
JUST KEEP THE ROAD THE WAY IT IS!!!

Comments: WE ARE 12 SOULS OF THE MAGNUSON TRUCCO FAMILY AND HAVE LIVED HERE SINCE 1966. CHANGE FOR SOME THINGS ARE GOOD BUT THINKING OF MAKING A BIKE PATH NEXT TO THIS HISTORICAL ROAD IS A TRAVESTY. WE HAVE ENOUGH BIKE PATHS AND NOT THAT MANY BIKERS. WHY RUIN A GOOD THING AND SPEND MORE OF OUR COUNTY'S MONEY AND OUR MONEY. PLEASE LISTEN AND DO NOT CHANGE THIS

WONDERFUL SCENIC ROAD.

Grand Teton Moose

[Click Here to Send Your Comments!](#)

(This link will take you to the National Park Service's Planning, Environment, & Public Commenting website.)

Take Action

Dear Robert,

Park visitors may not always remember the name of the road, but they certainly remember their once-in-a-lifetime encounters with moose, grizzlies, elk, deer, and beavers often seen just feet from the winding Moose-Wilson Road in the southwestern corner of Grand Teton National Park.

Over the past ten years, however, this sensitive and quiet area has been burdened with greatly increased levels of commuter and commercial traffic, creating high traffic volume along the corridor and increasing conflicts with wildlife. Now, the National Park Service (NPS) is facing demands for even more development within the road corridor. NPS must put together a plan that best protects park wildlife and its core habitat, visitor solitude, and the unique historic character of this corridor.

Park managers are developing a plan that will shape the future of this critical landscape, but powerful

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

special-interest groups are trying to force NPS to allow for increased impacts on the Moose-Wilson Road corridor, which could irreparably harm park resources. Please lend your voice to support the protection of the rare wildlife, unique cultural history, and quiet recreational opportunities along the Moose-Wilson corridor.

As part of a two-year process to develop the 'Moose-Wilson Road Comprehensive Management Plan', preliminary alternative scenarios were proposed for addressing vehicle, recreational, and pedestrian traffic while still protecting the area's unique wildlife, biology, and cultural history. Your comments will be used to develop their Environmental Impact Study in 2015. Some ideas within the park's proposal will lead to increased protection for park resources, while others will contribute to a decline of the very values park visitors hold dear: the chance to experience serenity and quiet and an opportunity to experience a wide variety of wildlife that live nowhere else but the Greater Yellowstone region.

Take Action: Tell Grand Teton National Park Superintendent David Vela to first and foremost protect the unique solitude, wildlife habitat, and historic character of the Moose-Wilson road corridor.

Here's how to submit your comments to Superintendent Vela.

Step 1: Go to <http://parkplanning.nps.gov/commentForm.cfm?documentID=60898> and carefully follow the form instructions.

Step 2: Please submit your comments by copying and pasting the sample message below into the 'Comments' field of the web form, adding any personal observations or stories that support your comments. Note: Four questions precede the 'Comments' field; those are optional.

Step 3: Once you have completed all of the required fields on the form, click the gray "submit" button at the bottom of the page.

Sample message/comments

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you. Robert Cobb

Topic Question 1:
Plan D is the best alternative

Topic Question 2:
Closing the road on certain days during the week, or making the road one way are alternatives that will not accomplish anything but confusion and frustration.
It will also force people to waste fuel by circumnavigating the valley, adding additional traffic to the downtown area.

Comments: Human beings, as part of the natural food chain need to be included in planning and maintaining the national parks. By taking people out of the equation, you create an unrealistic view of our environment.
Hopefully, we'll all be able to enjoy this amazing place for many many years to come. But we have to do it with a true grasp of reality and not fantasy.

Topic Question 1:

The strategies I am in support of are mostly in alternative B. The relocation of the Moose entrance station so that you only have to go through one, regardless of which way you come in. Rehabilitation of the north road section that will then be abandoned with new road realignment away from the Sawmill Ponds. Modification proposed for the Death Canyon trailhead, although it would be nice to see less than spaces for 60 vehicles. Maybe half that. Keep the LSR lot as is and also the Granite Canyon trailhead parking. Improve the gravel section of the road, but not pave it - just a higher quality grading and gravel.

Topic Question 2:

I oppose any separate/additional pathways. This is not a state, county or city park. This is a National Park that has been set in place to first and foremost protect the land and the wildlife for future generations. We need to be better stewards of our national treasures and not succumb to individuals who want to push their personal agendas. There are plenty of pathways to be found outside of the Park for those who want to recreate. This area is also highly used by wildlife, and adding extra pathways for people to bike and walk on will increase wildlife/human encounters and incidents which generally means that the wildlife gets destroyed (as in put to death). This must be avoided at all costs.
Also, there is no need to pave any more road. Leave the gravel road as gravel.
I also oppose limiting traffic during peak hours. Who will be counting cars, opening and closing gates and watching the times. This seems a needless waste of park dollars to me. There are better alternatives. (To be addressed in Question 3)
I also don't think there is a need for so many pull-outs to be added. I will address my reasons for this in Question 3 also.

Topic Question 3:

Yes, yes, yes. I would like to see a push for a Shuttle Bus system for the Moose-Wilson corridor. These are very efficient while freeing up the riders to enjoy and view the area as someone else drives. They reduce the impact of individual cars and have a smaller carbon footprint. These systems are already in use in other parks. I have used them and have found them (to my surprise and pleasure) to be convenient and easy. This would of course necessitate parking areas at both ends of the M-W corridor, but in the big picture it would reduce the need for adding asphalt in many other places. The north end can integrate into the existing Craig Thomas Discovery Center (probably enlarged), and the south end can terminate at the south entrance. The shuttle service can operate 7 days a week between 8am to 7 or 8 pm. When they are not running, cars should be able to use the road and the assorted trailhead parking in existence. The road should still close down for winter. There are many ways to make this alternative work and it is looking to the future when there may be heavier use of all roads and then you would just be looking at expanding the system and not starting from scratch.

I still see this alternative as using a realigned road that will avoid the Sawmill Pond area.

Topic Question 4:

I just want to reiterate that we should be looking at a Shuttle Bus system. Everything in our society is skewed towards growth and bringing in more and more visitors to the area. In the Big Picture, I think this alternative addresses all the issues the best while preparing for a future expansion into the rest of the Park. We need to be forward thinking, remembering the mission of these unique Parks and what they stand for and how best to preserve the land, the wildlife and the wilderness experience while giving everyone the ability to access these areas. Adding roads, pathways and asphalt is not the way. That kind of expansion can only go so far.

Comments: I can only add that I sincerely hope you will give my above comments your consideration. And please... please do NOT bend to local pressure to develop any more pathways. This Park does not belong to just the local users, who I think forget what the mission of our National Parks is all about. This is not a county park or a city park that is devoted to human recreation. We are looking at the future of our earth. This Park is only so big. It is not fair to take any more away from the natural world just so someone can ride their bike on their own road. This Park belongs to the bears, coyotes, moose, wolves, martens, owls, etc. Us humans are only passing through and should endeavor to do the least amount of harm.

Topic Question 1:

I don't have access to a copy of your actual alternatives. I am generally aware that you are considering a variety of options for the Moose Wilson Corridor, some of which would result in more traffic and human and vehicular activity on that corridor, some less. I am concerned that the corridor not experience any additional impacts from traffic and that the road through the corridor remain a gravel road and not be "upgraded" to allow for faster speeds or for commercial or commuter traffic.

Topic Question 2:

Do nothing that would increase either the speed or the capacity at which the existing road can be driven. I also support partial and temporary closures of the road, particularly in winter months to help protect wildlife.

Topic Question 3:

I support any strategies that would reduce access by vehicle. I am opposed to any additional development in the area.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As someone who cares deeply about preserving the natural environment and protecting wildlife, I see those things as the greatest value and main purpose of national parks. I am extremely concerned unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve

the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 2:
[REDACTED]

Comments: Park visitors may not always remember the name of the road, but they certainly remember their once-in-a-lifetime encounters with moose, grizzlies, elk, deer, and beavers often seen just feet from the winding Moose-Wilson Road in the southwestern corner of Grand Teton National Park.

Over the past ten years, however, this sensitive and quiet area has been burdened with greatly increased levels of commuter and commercial traffic, creating high traffic volume along the corridor and increasing conflicts with wildlife. Now, the National Park Service (NPS) is facing demands for even more development within the road corridor. NPS must put together a plan that best protects park wildlife and its core habitat, visitor solitude, and the unique historic character of this corridor.

Topic Question 1:
Important to protect wildlife in this area and find some way for people and animals to exist:
- keep traffic record
- find alternative routes for PEOPLE!

Topic Question 4:
This is a unique area (I have been there) - suggest NO traffic during high season, only small buses (like other parks).
Find an alternative route for public use!

Dear Superintendent Vela,

I have been visiting the Grand Teton National park for nearly 60 years. I first visited as a 2 year old on my way to visit family in Wyoming. I have visited almost yearly for many years and am appalled with the development around the area. Please keep this area as undeveloped and quiet as it was 60 years ago and resist special interests calls for increased development. NO development and a quiet wildlife habitat is the only way to go.

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. Topic Question 1:

Alternatives B & C should be carried forward. Both alternatives would limit traffic as needed to prevent overcrowding. They would also improve the overall movement of people through the corridor.

Topic Question 2:

Alternative A should be abandoned. Something must be done. This alternative could do nothing to limit traffic through the corridor.

Alternative D should also be abandoned. A reservation system would be difficult to administer and would be a hardship for visitors coming into the area for a limited stay. Widening the corridor to provide pathways would have a diverse effect on wildlife.

Topic Question 3:

None to suggest.

Topic Question 4:

None.

Comments: We have a condo in the Aspens and spend a month here each year. We have been doing this for 20 years and have owned property here and visited periodically for more than 30 years.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development would destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road, because allowing such traffic will only increase pressure to straighten and pave the road and increase speed limits to the detriment of wildlife and those who wish to enjoy peace and solitude. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

I don't think any strategies should be carried forward. The Moose-Wilson Road corridor needs to be left as it is so that it will continue to fit the purpose of a national park.

Topic Question 2:

All of the development strategies should be halted, and the road should be kept as a gravel road. National Parks were never intended to be developed any more than the limited amount necessary to accommodate visitors and campers.

Topic Question 3:

The only strategy in my opinion should be to maintain the gravel road as is and to let the park continue to be a natural area as much as possible.

Topic Question 4:

Please try to resist all the commercial development pressure and to maintain Teddy Roosevelt's philosophy of National Parks being places to get away from development.

Topic Question 1:

As we consider alternatives to the existing M/W corridor, we should look at the successes we have achieved in the park already. #1 is a connective pathway system for bicycles and pedestrians. The new pathway within the park has been an amazing addition and an extension of that pathway along M/W makes complete sense. #2 Re-alignment of the road and entrance stations at the Chapel would provide efficiency as long as more stations were added to prevent congestion, such as a "QUICK LANE" for season pass holders ! #3 It also makes sense to pave the unpaved section of the road while we are doing this improvement. #4 improve entrance to Death Canyon Road and Trailhead for the benefit of all is long overdue. #5 Restroom at Granite Trailhead would be a great improvement to hikers/bikers/cross country skiers.

Topic Question 2:

While I hesitate to agree with a reservation system to limit car traffic, it could have potential for the best alternative to traffic control. I am adamantly against Plan B to stop traffic at LSR preserve. I do not think it would be a good decision either to only allow bikes and pedestrians two days per week. I think this is too limiting for tourist visitors, and make the other 5 days very congested. A compromise could be to use Plan D reservation system on heavy traffic volume days (perhaps weekends) and see how that would work before implementing a complete reservation system each day.

Topic Question 3:

My suggestions are to make sure if we re-align the M/W entrance stations to the Chapel, we have a "QUICK PASS" lane for all those that have a season pass. This will avoid congestion and frustration at the gate for all.

Compromise on the reservation system idea for vehicle entrance, and perhaps use the reservations on heavy volume days to begin, such as weekends, to see how this works. I have really never experienced a heavy enough volume of cars that I still didn't enjoy my experience on the corridor.

Topic Question 4:

I do feel we could use overall improvement on this corridor. Overall, I would vote for Plan D, with minor adjustments.

I look forward to a beautiful pathway and enhanced trailheads in the future !!

Thank you !

Topic Question 4:

I think the main objective should be to build a multi-purpose pathway separate from the road for pedestrians and cyclists. I do not support closing the road to vehicles or limiting the number of vehicles - with a decent pathway it wouldn't be necessary. Park and ride mass transit is impractical unless the roadway is widened and unless there is a lot of new parking at both ends of the road. I also believe that the time has come to pave the last few miles of the road to Teton Village - it has not been a "rural" thoroughfare for many years so let's concede that and move on.

Topic Question 1:

I am for Alternative B and Alternative D. I don't see why we cant have access to the road and have a separate path for cyclists, etc. If I had to choose one, it would be Alternative B (however, as a cyclist, this option is unfortunate as well). The Moose Wilson corridor is an important road to keep open to drivers. As someone who used to work in Moose and travel to the West Bank often, this road cut my time tremendously.

Topic Question 2:

C and A don't make sense to me. There is a need for improvement of some kind to the Moose Wilson corridor and only opening the road to cyclists on certain days is silly because of peoples work schedule conflicts, etc.

Topic Question 3:

I personally think that the Moose Wilson road should be widened and a separate path for cyclists, etc should be put in. Wildlife is extremely important in this area but we are also keeping ourselves from enjoying it as well when we put SO many restrictions on our environment.

My wife and I traveled on the Moose Wilson Road Corridor during our most recent visit to Grand Teton National Park two years ago. We urge you to do everything to minimize development along the Corridor and maintain the 'wilderness' nature of the roadway as much as possible.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Topic Question 3:

In the southwestern corner of Grand Teton National Park, there is too much commercial and commuter traffic on the Moose-Wilson Road corridor, which interferes with the wildlife and the peaceful setting of the environment. This should be re-routed further away from the Grand Teton National Park, especially the commercial traffic to avoid conflicts with nature.

Comments: RE: the Moose Wilson Road Corridor within Grand Teton National Park

Dear Superintendent Vela,

I'm concerned that increased traffic and development could destroy the peace and quiet of the park. The park service must please maintain the low-speed, gravel road to preserve the park's historic character, solitude, scenic and wildlife.

Please prioritize this road as a quiet park destination and wildlife-viewing area and not as a busy traffic route. Please reduce the number of vehicles, maintain slow speeds, and eliminate commercial and commuter traffic along the road.

Please consider one-way road option, or temporary or permanent road closures of all or part of the road to allow for safe pedestrian and bicycling use within the existing road system.

Please develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

impacts.

Please implement seasonal closures, efforts to limit winter disturbance of wildlife, and planning alternatives to protect wildlife security, and movement corridors, from human disturbance.

Most importantly, please avoid development in areas that have not been previously impacted at all cost.

Thank you.

Topic Question 1:
Maintain and/or decrease vehicle speed.
Allow no net increase of pavement within the corridor.
Permit no increase in habitat disturbance/fragmentation.
Permit no removal of large numbers of trees and vegetation.

The world needs more bear, elk, wolf, coyote and deer population and untrammled habitat to support them and the human spirit.

Topic Question 2:
Multi-use parallel pathway, taxis, winter grooming, more pull outs, interpretive kiosks, more disturbance.

The world needs to adapt to nature more commercial interests less.

I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Topic Question 2:

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Topic Question 1:
Keeping corridor intact is vital.

Topic Question 2:
Those ideas not supporting protection for perpetuity are not keeping with the protection set up for the national park and buffer zones. Private industry gain over citizen benefit should not be supported. You cannot rebuild a corridor if broken, it is irreparable.

Topic Question 3:
Please consider WHY the corridor was set up initially, going back to square one is my idea. Scientists and conservationists advocating for wildlife have very real, sound and valid reasons for protections to be in place.

Topic Question 4:
This isn't just about short term gain for a few business owners, this is about protecting our national heritage for future generations.
Disturbing this remaining corridor is not a good idea for many reasons, survival of wildlife and biodiversity is one very good reason that creates long term benefit for the majority versus a few.

Comments: Please do not break up the wildlife corridor, it is not a profitable idea for citizens who value their natural heritage.

Correspondence Text

Topic Question 1:

Continue "as is" - two-way travel between Moose and the Granite Canyon Entrance in the same manner as the existing conditions, under the same calendar schedule. The road would be retained in its existing alignment and width and would remain unpaved. There would be no realignment of Moose-Wilson Road. Parking lots and turnouts would generally remain their current size and the same locations. Bicycles would continue to be allowed on roads and parking areas and not allowed on trails. Current commercial activities within the corridor such as park-authorized wildlife viewing trips, guided snowshoeing and ski touring would continue to be permitted. Guided horseback riding in the Moose-Wilson corridor would continue on currently authorized trails and at current use levels.

Topic Question 2:

No bicycle pathway on the Moose-Wilson Road. It would destroy over 3,000 trees in a very pristine historical wooded area and increase the potential for wildlife and horseback rider conflicts. With only 3% of park users currently using the bicycle paths, I just don't see the benefit of such a large and disturbing project.

Do not close commercial horseback riding on the Sawmill Pond Trails. It is one of the most unique areas of the park that allows this activity without causing any conflicts with other parks goals. It has also been an activity that has been historically used in this area for over 90 years with minimal conflicts and requiring minimal park management. This area offers access to unique and safe horseback riding trails unavailable in other parts of the park. These trails are used to access the historical White Grass Ranch area, along with Sky Ranch and Trail Ranch. By taking interpretive rides through these historical ranches, you can reach the parks goal to Protect and maintain cultural resources as important links to the human history of the

Moose- Wilson corridor, including historical and archeological sites, cultural landscapes, and ethnographic resources.

Topic Question 4:

After studying the plans, I am concerned about two goals in the Alternatives since they may alter our enjoyment and experiences on the trails that makes ranch life so special. Specifically, creating bicycle pathways along the Moose-Wilson Road and phasing out commercial horseback riding on the Sawmill Pond trails.

As much as I love bicycle paths, I don't feel this corridor is an appropriate location to have one. Commercial horseback riding provided by the dude ranches in the area provide a very important and historical function with few side effects over the decades they have been in operation.

Comments: I appreciate your continued dedication to retaining and respecting the culture and history of the park which includes dude ranching activities, an activity that should be protected and celebrated.

Topic Question 1:

I support Alternative D, particularly the separate pathway and re-alignment around Moose Ponds. Alternative C could be acceptable if adopted entirely, closing road to all vehicles all the time. The plan must include a separated pathway for hikers and cyclists. Please stop ignoring the risks to safety of cyclists and pedestrians. As an 18 year Teton County resident, 12 year worker in GTNP, and long time professional advocate for conservation, I would say without hesitation that GTNP ignores or dismisses the safety of pedestrians-cyclists. GTNP and its biologists trivialize safety and use it to deny access or limit access to all but motor vehicles; for example, purporting to protect cyclists-hikers from encounters with grizzlies, which are almost unheard of, by forcing them to risks cars crashes, which are real and common-place. I am sure that hikers/cyclists will gladly take their chances with grizzlies rather than cars. The Park and its senior wildlife biologist have no credibility on this issue. Do you really think that the public believes that the reason you have resisted separate pathways, while seeing no problems building and enhancing roads (Jenny Lake Loop Road) or forcing bikes to compete against cars, RVs, and trucks, is that you are concerned about the safety of hikers/cyclists?

Topic Question 2:

I am opposed to Alternatives A and B. Neither addresses the two critical issues of preservation of Moose Ponds and creating a safe, appropriate experience for visitors. On many summer afternoons the moose ponds become a parking lot. Cars stopped ON THE ROADWAY in both directions, usually with the engine running, while passengers abandon their vehicle and run out to take pictures. A PARKING LOT OF VEHICLES WITH ENGINES RUNNING IS NOT A RURAL

ROAD. This behavior has been tolerated by GTNP for the 18 years that I've been living on the Moose-Wilson Road, and the dozen years that I drove the road reach the park most summer days to work as a guide.

Alternative A and B do not provide reasonable public access TO ALL MEMBERS OF THE PUBLIC, NOT SOLELY TO AUTOMOBILES AND RVs. No one in right mind would ride a bike or hike along road. I would love to be able to ride and walk along a separated pathway.

Topic Question 3:

An alternative that also merits consideration is simply to close the Moose-Wilson road to ALL motorized travel all the time from the Granite Canyon parking area to the Rockefeller Preserve, and leave it open the pedestrian and bicycle travel only. In effect, adopt the concept underlying Alternative C, closing road to motor vehicles, but doing so whole-heartedly, 7 days a week, rather than only 30 percent of the week (2 of 7 days). The latter alternative saves money, closing the unnecessary roadblock (entry station) on the south side and does not require a separated pathway - thus none of the "development" or "improvements" railed against by the environmental purists. The road becomes the pathway for pedestrians, hikers, bird-watchers, and cyclists.

Topic Question 4:

GTNP has a credibility issue which you continue to ignore. The entire Wyoming Congressional Delegation and most of the local elected officials don't believe that this is a fair process and that it hasn't been set up solely to reverse the decision reached in 2006. Even though the environmental purists may not like their policies, these are not bad people. There is a reason that they don't trust or believe GTNP. Comments from GTNP, especially Steve Cain, indicate that this issue has already been decided against hikers/cyclists and a separated pathway. If this were a court of law, no one who has expressed publicly the views of Mr. Steve Cain would be allowed to participate in the process. Any future drafts or plans should state that only unbiased, unprejudiced evaluators will participate in the decision-making. Let Mr. Cain file his comments publicly like the rest of us.

Topic Question 1:

None of the preliminary alternatives meet the objective of putting wildlife first.

Topic Question 2:

I think any cars or bicycles on the road thwart the purpose of putting wildlife first - so I think the road should be closed to all traffic to allow the wildlife to reclaim their preferred habitat.

Topic Question 3:

Full closure of the road to all traffic should be the preferred alternative.

Topic Question 4:

Driving the road this week and seeing how badly humans behave in the presence of wildlife reminded me that sharing and giving animals space is not a human priority. The only real solution is to remove humans from that critical habitat.

Topic Question 1:

Restrictions on traffic, like the bicycle days in plan C, and phasing out the horseback riding might be an improvement to existing management.

Topic Question 2:

I don't really understand the alternatives B, C, and D in terms of how they will restrict traffic and help preserve the park and the wildlife. They all appear to be aimed at increasing traffic (except for the aspect of plan C where the road would be closed to traffic except bicycles 2 days per week). Anything that increases traffic or makes it easier to drive through park doesn't seem desirable.

Topic Question 3:

Straight-up limits on traffic would be helpful. Closure to all commercial traffic seems like a no brainer. Parks are for preserving our natural heritage and having access to nature in its unaltered state - you don't need a jeep tour to appreciate the splendor of Grand Teton.

Comments: Grand Teton is a precious gem in the treasure trove of American parkland. As such, this magnificent wilderness belongs to all American people, including our children, and their children. Please ensure that whatever plan is chosen maintains the wild character of the park, preserves the peace and quietude essential to a natural oasis, and re-establishes the connectedness of a thriving ancient ecosystem.

I am writing to express my concerns that future enhancements to the Moose Wilson Road Corridor within the Grand Teton National Park may degrade the visitor experience to such a natural and historical treasure. While efficient access is important, the overall design of the corridor should reflect the tranquility and natural beauty that visitors expect from our national parks. Furthermore, the corridor should be kept in such a way to minimize disruptions to wildlife and provide safe passage for pedestrians and bicyclists.

With these goals in mind, this project should be maintained as a quiet, scenic park destination that avoids heavy or quick moving traffic. Commercial and commuter use of the corridor should be avoided and seasonal closures should be used to protect wildlife movement. Development along the corridor should be limited to areas that have already been impacted. Where possible, the use of shuttle buses or other forms of mass transit should be used to reduce the overall traffic on the road. To discourage high speed travel and to preserve the current route's scenic qualities, the corridor should preserve the road's gravel surface and its meandering, winding route.

Thank you for taking the time to consider my comments.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Limit the number of vehicle trips per day on the road. Preservation of the habitat should be the first priority.

Topic Question 2:

Widening the road to accomodate a bike path or any other strategy that encourages more use.

Topic Question 3:

Could there be a bike path elsewhere in the corridor? Could visitor travel to view wildlife be in small buses or limited hours?

Topic Question 4:

Keep habitat protection to encourage wildlife as the highest priority for this very special place. The County needs to find another crossing of the Snake closer to the Village.

Topic Question 1:

The Moose-Wilson Corridor should first and foremost be managed as a part of Grand Teton National Park. The challenge is to balance the unique opportunity for visitors to experience the exquisite scenery, wildlife, and historic values that the corridor offers, while still maintaining and preserving those same qualities that make it so valuable and appealing to us. In other words, we are in danger of shaping and remodeling a natural setting simply to suit our own needs. (History always repeats itself!)

I am sad to say that No Action is no longer a solution. I have always personally enjoyed driving, walking, skiing, and showshoeing the corridor as it is. To me rerouting the road is probably tantamount to the replacement of Menor's Ferry by a steel bridge back in the 1920s; but a change is definitely necessary. Happily, visitation to GTNP has increased. It's important for people to have the opportunity to connect to this natural setting, and for many visitors that connection only occurs from their cars. Therefore, I support the realignment of the Moose-Wilson Road from the north - specifically, the plan set forth in Plan B - with strategically placed pullouts that allow visitors to get out and look down over the wetlands on the east side of the road. Frankly, I walked the old two-track road from the Sawmill Ponds parking lot and found myself wondering why the Moose-Wilson Road wasn't constructed there right from the beginning! I also support paving the road from the south - also suggested in Plan B. The unpaved portion currently requires frequent regrading and dust abatement, which I feel certain has to be stressful to the wildlife that resides within that portion of the corridor. (When referring to paving, I envision chip-seal as opposed to asphalt.)

I also support reducing the speed limit on the Moose-Wilson Road, restricting traffic during peak periods as proposed in Plans B and D, and restricting taxi service through the corridor to encourage use of the

road as a part of the national park experience, and discouraging the corridor simply as a form of transportation just because the county has failed to adequately plan for increased visitation to Jackson Hole.

I also support relocating the Death Canyon trailhead to the current end of pavement on the existing access road.

Topic Question 2:

Although I agree with many of the strategies in Alternative B, I do not feel that reconfiguring the access and parking at the LSR Preserve in order to prevent through-traffic is a good solution. I think this would cause a lot of frustration for visitors and create a lot more work for park personnel.

I also feel that closing the road to vehicles to allow for bike traffic only two days per week as proposed in Alternative C would limit visitation to the LSR Preserve and Death Canyon for many people. These are popular destinations, and this alternative would also be frustrating to visitors who have only allocated one or two days to this area - especially if biking is not an option for them physically.

The reroute of the northern part of the road, as proposed in Alternative D sounds like a logistic nightmare. During peak visitation when the line is backed up at the Moose Entrance station, it would be very difficult for visitors trying to make a left turn onto the Park Road from the Moose Wilson Road.

Of all the alternatives, I am most opposed to the proposal for a separate bike path through the corridor as set forth in Alternative D. Biking along the Moose-Wilson Corridor is a wonderful experience and should not be denied, but that opportunity should not come at the expense of the unique natural setting and wildlife habitat that deserves preservation as part of a national park. In addition to the exorbitant cost and destruction to the habitat necessary to construct a bike path, one has to also consider the safety of visitors biking or walking through corridor. By reducing speeds and limiting the number of cars that are passing through the corridor, visitors should be able to safely bike the road. Sharing the road with cars would also offer a small amount of safety to bikers in the event of a dangerous wildlife encounter.

Topic Question 3:

Other strategies that should be considered include strategically placed speed bumps or dips to help slow people down and help enforce a 20 mph speed limit. Also, if the Moose-Wilson realignment is adopted as suggested in Alternative B, additional kiosks should be considered at the Moose Entrance Station to accommodate for a higher traffic volume.

Topic Question 4:

I feel it is lamentable that we are in danger of losing one of our greatest treasures within Grand Teton National Park because of increased traffic due to expanding commercial development and a sense of opportunistic entitlements felt by many businesses and individuals around the valley. What drives our decision on what's to be done with the Moose-Wilson Corridor should be based on its value as a national park and all that entails. This is one of those times when it is important for us, as humans, to practice self-restraint, to stand our ground and admit that there are natural spaces that are truly worth preserving and protecting from overuse and commercial exploitation.

The Moose-Wilson Road should be accessible to visitors looking to experience its rustic character and diverse ecosystems. As nature struggles to reclaim the road where it narrowly winds its way between ridge and wetlands from the north, changes do need to be made to safely accommodate the many visitors traveling through the corridor. When it comes to accommodating travelers simply going from Point A to Point B, however, we need to look outside the national park for those solutions.

Topic Question 1:

These lands and life on these lands were designated for protection. Ask Theodore Roosevelt. Note the size of unprotected and developed lands in our country vs. the size of national parks and state parks. Where are these animals and geographical / historical sites to go? If they are not protected as first intended, then the answer is that their fate is extinction. My suggestion is to follow the ideals behind the creation of these designated lands, and all else is secondary. Snow mobiles vs. elk? Is this really a question? Seriously? Haven't we enough polluting (atmospheric, land, noise, etc.) already?

Topic Question 2:

Educate, educate, educate. Protect the lands and life in them, and spend the money that would be used to expand trails, roads, services, to educate the public.

Topic Question 3:

EDUCATE!

Topic Question 1:

None exclusively but parts of each. The biggest problem creating high traffic through the park is the lack of a northern bridge across the Snake River from just south of the park gate to the vicinity of the airport on the other side. All your proposed solutions push more traffic on a long detour with more pollution, moose deaths, fuel waste and congestion on the village road, through Jackson and points north to the airport and park. All the while these plans (except A) would also limit the use of the park for hikers and back country campers like me and my wife. Instead of living 10 minutes from my favorite Trailhead, Death Canyon, we'd be dealing with the governments scheduling bureaucrats to get into the park...maybe...sometime. I'd vote for A, with all roads paved, north end rerouted behind the main park gate, and a bike path. But nothing will relive traffic except a north bridge. Restricting the Moose Road will just push it to the longer even more congested routes.

Topic Question 1:

Traffic reduction plans that reduce impact on the park and environs. Particularly a energy efficient transit system.

Parks are places people look to for environmental stewardship over entertainment which is readily available in a myriad of venues. Given the growing demand placed on our parks system, the US needs to make a priority of environmental stewardship. When we lead on this, the public will follow.

Topic Question 2:

Increasing private vehicle access of any kind does not further the goals that are at the foundation of US parks in the 21st century

Topic Question 3:

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Comments: I wish you well in balancing the demands placed upon you by the nation and hope you keep foremost in the plan the stewardship of these parks for future wildlife and people.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

this is a Natl park so maximizing animal and plant life and minimizing hard surface roads, noise, and other pollutants.

Topic Question 2:

Hi volume roads through the park and excess pavements and increased development will destroy the park and reduce its meaning to visitors and the future.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS

alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

Topic Question 1:

Designate the road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles and maintain slow speeds. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of part of the road could allow for safe pedestrian and bicycling use within the existing road prism. See "Comments" section below.

Topic Question 2:

Increased development and paving and upgrading road to facilitate more commercial and commuter traffic along the road should not take place. See "Comments" section.

Topic Question 3:

Perhaps a more definitive plan on future use of shuttle buses to decrease traffic impacts.

Topic Question 4:

See "Comments" section.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. My husband and I were in Grand Tetons National Park in June of this year. We were on the Moose-Wilson Rd. looking for wildlife (moose, owl, waterfowl, etc.)and it was very clear that the road was being used as a back way into the National Park by locals, construction workers, ski town

resort residents and vacationers. This made for a rather unpleasant and almost dangerous proposition when attempting to drive slowly and occasionally stopping for wildlife viewing. I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed flavor of the road to preserve the historic character, solitude, scenic and wildlife values of this special area.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 4:

I have worked within Grand Teton National Park and the Snake River corridor. It is critical to protect the wildlife character of the Moose Wilson Road Corridor. Please limit traffic, close the road seasonally, create one-way traffic, or close the road entirely. A valuable resource is no longer valuable once lost.

Thank you.

Topic Question 1:
I don't have enough information about that.

Topic Question 2:
same answer

Topic Question 3:
same answer

Topic Question 4:
I just wanted to make a comment. As you well know, the Grand Tetons National Park is a treasure! I have very fond memories of my family's visit to the park and how spectacular it was. As you contemplate what should be done about the Moose-Wilson corridor, I hope you will keep uppermost in your decision-making how your decisions will affect the visitors' experience of the Park. I would imagine that most visitors have the same reaction as I had when I was there. The wildlife and the grandeur of the GTNP just fills your soul and your being to overflowing. I would be so saddened if you are not able to preserve that experience for your future visitors. Please be good stewards of the Park! I pray that you are able to make good decisions that will help with any problems that you are having with the corridor, but yet not harm peoples' enjoyment of an incredible experience! Thanks in advance for your considerable care in making these decisions.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road which I have traversed many times since 1998. However, I have become increasingly aware of and concerned about the unacceptable traffic impacts on this area. Additionally, the calls for increased development could destroy these qualities. I believe it is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special place.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, with the aim to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:
Strategy D

I believe a separate realigned pathway from Moose to Wilson is a unique experience not found within our area or the US. I believe it will offer an alternative for our the greater areas visitors, adds to park values and protects wildlife from a currently congested route. We need to move vehicle access from the habitat that attracts animals to their desired areas and give them the isolation they are looking for. This strategy will only add to the successes of the pathways from Moose to Jenny Lake along with the pathway from Stilson through Teton Village to the park entrance north

Topic Question 2:
A,B,C

I don't think they address public needs and growing concerns as the greater area grows for the future. Change can be scary and certainly questionable but often times offers good solutions. D addresses our future

Topic Question 3:
Possible winter recreation from both sides for skiing and snowshoeing

Topic Question 4:
Change continues to come to this greater area so let's manage it smart. Just because one person doesn't ride a bike or recreate on a path doesn't mean others won't. The public use on our new pathways are proof of the success.

Give our wildlife what they desire and our public what they deserve.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park.

So much of our wilderness has already been ruined by development, drilling, pollution, and logging. Enough is enough!

The wilderness is supposed to be a place of peace and quiet for us, and the wildlife which live in it! The animals are running out of places to live and be safe. Our wildlife are under threat from so many angles. They desperately need to be protected, mainly from humans.

Life is hard enough for people, let alone the animals.

Can't we please offer them some much needed help?!

PLEASE save the wilderness for all future generations before it is permanently ruined. Some damage cannot be undone!

As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you for your time.

Sincerely,
JAKE HODIE

Topic Question 1:
I support Alternative D because it reduces overall traffic.

Topic Question 2:
Gates and closures (Alternatives B and C) don't work. Keep the way open at least for bikes.

Topic Question 3:
A separate Moose-Wilson pathway is a safety need, not a want, and it is imperative for the Preferred Alternative.

Topic Question 4:
Bike paths in the Jackson area are proven success. Also, with bikes, I think a lot more people are getting out of their cars to experience Teton Park and Jackson area.

Topic Question 1:

The Moose-Wilson Road which connects Grand Teton National Park(GTNP)to Teton Village has long been an incredibly scenic, intimate and wildlife-rich corridor. The road must be preserved to allow for opportunities for solitude and quiet, to enhance the amazing wildlife habitat and to maintain its historic character. Commercial use of the road has degraded the experience of it for park visitors over time and should be curtailed. The rich habitat for species such as moose and beaver and myriad bird species must be maintained.

Topic Question 2:

Anything that does not preserve or enhance habitat, solitude and the historic character of the road should not be undertaken.

Topic Question 4:

We have traveled the Moose-Wilson Road for almost 40 years. It is a real gem that must be allowed to retain its character. Gail lived in Jackson from 1975-78 and then worked in Yellowstone for 10 years. John worked in Yellowstone from 1976-1986. We have been recreating in the GTNP over the decades and have seen the visitation climb. Perhaps the road should be closed at certain times of the day to enhance wildlife security, such as evening hours. It should definitely be closed to commercial vehicles, and to recreational vehicles over a certain length because of the tight curves.

Comments: Thank you for listening and for doing your best to enhance the intimacy, wildlife habitat and historic character of the Moose-Wilson Road.

Topic Question 1:
improve the road surface is a must.
a narrow road as is, is ok provide pullover areas and parking

Topic Question 2:
you should not have to have a reservation to visit a park.
bicycle use should not be a high purpose

Topic Question 4:
This area is very important to the horseback user as it can be done with minimal conflict with other users

Topic Question 1:

I support any Park strategy that reduces human traffic along the corridor in order to protect the wildlife there. There are ample areas of GTNP that provide safe biking, wildlife viewing and access for the disabled without further impinging on an already fragile corridor. The Moose-Wilson pathway should be re-named the Wilson-Teton Village pathway and the public be reminded that the road inside the Park is not a county road to and from the airport or a county pathway for children to ride.

Topic Question 2:

I think paving the road and/or creating more paved pathways of any kind would be detrimental to the experience of any creature that either inhabits or visits the corridor. In my view, such actions would be inconsistent with the mission of a National Park.

Topic Question 3:

Although this is mentioned, national park fees should be collected on both ends of the road through this corridor, pavement minimized as roads are not in keeping with wilderness habitat and whatever changes are made to the current road should be to enhance the safety of the wildlife which resides there.

Topic Question 4:

Remember what you are - - a National Park, beholden to all visitors and charged with protecting its natural resources, not a county road or pathway to be changed at the whim of Teton county residents, businesses and local government. Do not worry about being popular; worry about carrying out what is best to preserve the special resources and character of Gran Teton National Park. Thank you.

The Moose-Wilson road in the Grand Teton Nat'l Park is a major wildlife corridor. It is not a "super highway" between Teton Village and the Jackson airport !!!

This tiny road provides unique wildlife viewing opportunities and should NOT be ruined. I would like to see only one change, make it ONE WAY only. Do NOT destroy valuable wildlife habitat and very important fall natural food sources. Do NOT add a "biking/walking/etc" walkway, this area is too small for that and many other walkways are available.

Civilization encroaches enough already, let the wildlife win this battle !!!

Thank you for the opportunity to express my views and concerns over this wonderful area of the park.

Topic Question 1:

In their present form, Alternative B seems best. It solves the problems with paving and realignment but preserves access by interested parties (tourists, cyclists, commercial users, horseback riders, etc.) and seeks to protect wildlife. Also, it attempts to prevent the road from being used by commuters to and from the airport.

Topic Question 2:

Alternative A, which I like second-best, fails to address all the problems motivating this discussion. Alternatives C and D are both unacceptable for largely the same reasons. Enforced traffic limits is a typically cumbersome government solution. Some problems can be foreseen (back-ups at the gates, irritated motorists, idling, tourists who aren't aware of closure days, and park service personnel placed in awkward enforcement situations) while many unintended consequences are also likely. The concessions made to cyclists are also unacceptable. Closing the road so cyclists get exclusive use 2 days per week or building a new pathway are totally unacceptable. They cater to a vocal minority of the population at the expense (literally, considering the cost of building and maintaining a pathway) of the majority. There has never been any survey of bike traffic on existing pathways to justify their existence and cost. Cyclists claim they are environmentally friendly but not when it comes to the impact of their impervious surfaces on environmentally sensitive areas - like the Moose-Wilson corridor. There are many, many opportunities for cyclists to ride on pathways in the valley. It would be refreshing to have them say "We don't need more at the expense of such important wildlife habitat." Furthermore, many seem to ride on roadways ignoring the adjacent pathways?

Topic Question 3:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

I like the idea of allowing unrestricted use of the road to cyclists, walkers, etc. after the road is closed for the season and maybe even grooming for cross country skiers during the winter - as with the Teton Park Road. As long as the road is open to automobile traffic, I think it should be closed to bike and pedestrians as it is just too dangerous in its present form. Hikers/walkers can still have access to trails and don't need to walk on the road. I abhor the use of the road by commuters to/from the airport or points north/south but how to prevent that is a thorny issue. Maybe the road should be closed at some point in the middle so one would have access from the south to the middle and from the north to the middle but not all the way through. This would work but who knows what problems it would also cause.

Topic Question 4:

I think it is time for all of us - commuters, bikers, commercial users, walkers, etc. - to back off and realize we can't all have everything we want. We have to recognize that individual sacrifices must be made for the common good and for things like our beautiful valley/environment and the wildlife we love which are more important than our individual wants.

Topic Question 1:
I personally propose making the road 1 way to the south from the Laurance Rockefeller Center toward Teton Village. I do not support encroaching on more land for a specified pathway. I believe Teton County and the Park have provided enough pathways throughout the County, especially the one by the Elk Refuge. I also don't feel that the County, City or other entities have the "right" to tell the Park what to do. It is because of the Park that we continue to live in an area that is rich in scenic beauty and wildlife. Without it we would probably see a McDonalds on top of the Grand. I believe the Park needs to help protect this valuable corridor and the wildlife that resides there. There will always be inconvenience and unfortunately private selfish reasons often prevail but for long term preservation need to limit use.

Topic Question 3:
Yes - please see question 1. I wonder why that was not an alternative

Topic Question 4:
Please stand your ground and do not let self-serving entities influence your final decision.

Topic Question 1:

Alternative B: During peak season, use tools such as one-way traffic to decrease overall traffic and discourage THROUGH (as opposed to destination visitor) traffic on the Corridor. Add shuttle vehicles which had been shown to be extremely successful in managing auto traffic in other national parks

Topic Question 2:

Alternative D's ideas of adding new constructed paved pathways and adding operational practices to increase use (grooming, adding guided tours) is not sound and would not achieve the purpose of the plan. New construction would adversely impact the "seven fundamental resources and values previously identified within the corridor: [quoting from NPS documents]

1. scenery
2. geologic processes
3. ecological communities and wildlife
4. aquatic resources
5. cultural history and resources
6. natural soundscapes and acoustic resources
7. visitor experience in an outstanding natural environment

Continuing to provide visitor access while managing non-visitor use of the corridor through Alternative B WILL achieve or come close to achieving most of these goals; while Alternative D of constructing new paved pathway will inevitably detract from the natural qualities visitors are coming for. The answer is not to add pavement and vehicles, but to manage what already exists in such a way as to least detract from visitor experience (ie not closing the trail two days a week, as that would be very difficult to manage successfully in terms of visitor experience.)

Topic Question 4:

Thanks for the opportunity to comment. I dream one day of being able to visit this jewel national park with my family, so please do what you can to keep it as natural and healthy as possible for the sake of all those who have not yet visited as well as for those who visit frequently.

Topic Question 2:

I think limiting the traffic on an hour to hour or day to day basis is unworkable and will end up generating a lot of criticism and ill will. You need to put in place a consistent policy so that the public know ahead of time what the situation is. For this reason, I am in favor of eliminating private vehicles and instituting a shuttle service as has been done at Zion.

Topic Question 3:
shuttle service

Topic Question 4:

A road through a national park should not be a transportation corridor for the convenience of residents or non- residents.

Comments: Although we want as many people as possible to experience our fantastic natural heritage, if we destroy it in the process of making it accessible, have we gained that goal? I think not.

And we could look at it another way. What is one of the most important things that the American people could do to improve their health? They could increase their exercise. What we could be doing here is encouraging people to see the area in the most natural of ways, walking or hiking.

Topic Question 1:

None of the four alternatives presented address the plan that I would prefer....which is a one way road plan that begins at Moose and travels south. The initial south based road would have to be two way until it reaches the Rockefeller Center and then the road would change to the one way south going to Teton Village.

Topic Question 3:

I have addressed the plan of a one way south bound road (two way to the Rockefeller Center) in my comments to question #1.

Topic Question 4:

Please don't just respond to business interests currently being pushed by many groups within the Jackson Hole business community. The Grand Teton National Park was created for a national community and just the Jackson Hole community. I believe that a county transportation plan should be devised separate from utilizing National Park lands for a solution.

Comments: The current road configuration established at the Jenny Lake one way loop allows for one way auto traffic and a bike lane which seems to satisfy all parties. This same road configuration could be established without changing the current foot print in a most sensitive part of this wonderful national park land.

Topic Question 1:

A- No action

In 100 years the Park plan could really state that their strategy plan "ensuring that resources are protected unimpared for future generations" held true. Don't lose the magic and slow pace of the Moose Wilson corridor let the comuters take the HWY around.

Topic Question 2:

D- Disneyland the full build out

This would be the tour de Grand Teton as all other pathways in Teton County have evolved into, and so disturbing to wildlife and the character of the corridor. IF 54% ae using it now as a commute connector what would really happen w Action D and really who would pay for the "improvements"?

Topic Question 4:

Please consider Action A - there are so many other examples of popular accessable front country trailhead and/or viewing points in this area, that have been built up for the masses. Creating a backcountry, wildlife experience that is a fast pace "connected" frantic rush, almost a must see to check off the "been there" check list. The Park has an opportunity to gift the next generations a glimpse into a true wildlife and National Park experience of the natural world.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

The C strategy best fits. Cyclists would have car free days to ride and could plan around the closures and like wise cars would have 5 days a week to use this corridor and plan accordingly. People will adjust. There would be minimal disruption to the forest and less cost to the county and Parks. The one way loop on Jenny Lake road is a good example. Everyone has adjusted.

Topic Question 2:

With the adoption of C, a huge disruption of this corridor would not be needed to accommodate bicycles. Not to mention cost.

Topic Question 4:

Perhaps a one way street heading south to north would relieve the congestion even more during peak season.

Topic Question 4:

I may have commented a couple of months ago, but would like to (somewhat) refine that comment by simply stressing that I am strongly in favor of the alternative(s) that generate the least environmental impact, and that most reflect the values of our National Park System. I drive the Moose-Wilson road through GTNP all the time, but I would support closing it altogether, or closing parts of it, permanently (for instance, as outlined in Peter Moyer's recent letter to David Vela). This sort of downgrading of roads is done all the time in national parks, and indeed I applaud the alternative of closing the dirt section of the road leading to the present Death Canyon trailhead. I realize that the option of closing the road altogether may not be politically viable, so I would push for other restrictions, such as making most of the route 1-way (esp. north of the Granite Canyon trailhead), as suggested by Kim and Jim Springer. Closing the route to vehicles 2 days per week is a good suggestion. In terms of the alternatives that are likely to be most discussed, I would summarize that I am not in favor of road realignment, and I'm also not in favor of creating a separate bike path. Thus, doing nothing is probably the single definable camp that I would fall into. With thanks for your time. Broughton (Brot) Coburn

Topic Question 1:

Please restrict any commercial development along the Moose Wilson access road at Teton National park area-

Just maintain the road as it is- -

Topic Question 2:

Developing the road will interfere with the wildlife in the area- -

Creating a theme park or commercial will be counter to addressing the required area for observation of wildlife.

Topic Question 3:

Just maintain the road as it is- -no widening,

Topic Question 4:

When I travel the Tetons I always access the park area via the moose-wilson Road. It allows the visitor views of animal wildlife - - further on into the park the commercialized areas are designed for human occupation - -they do not reflect habitat of the wild- -

Comments: Just maintain the road for auto access - - at slow rates of speed

Topic Question 1:

Realignment of the north end of the road will remove intrusions into the wildlife rich wetlands area around Sawmill Ponds. It will also require southbound traffic to go through a park entrance station. Establishing a Whitegrass Trailhead at the end of the current paved area or at the former Whitegrass Coral location would end the heavy and growing impacts from cars creating denuded parking pullouts along the road.

Topic Question 2:

A separate bicycle pathway will cause huge resource impacts and ongoing wildlife disturbances. Road bikers do not use the pathway from Moose to Jenny Lake due to the large number of slow users blocking their progress. They prefer to take their chances on the roadway. The park is under NO obligation to create new venues of entertainment for visitors. Visitors already have safe access to the area on several miles of well maintained trails and miles and miles of paved pathways. The new attraction of a pathway will increase the number of visitors from the rapidly growing Teton Village and West Bank areas. The impacts from that use is already happening in the Moose-Wilson corridor.

Topic Question 3:

There is no alternative that would end through travel or have one-way travel on the route. Leaving the unpaved section as-is for its rustic appeal and having a bike lane like the Jenny Lake Scenic Road should be considered. Shuttle transportation should also be considered.

Topic Question 4:

The entire park is in a state of catastrophic traffic and parking congestion. Much of that problem is caused

by the Park; with increased concession use of the Moose-Wilson corridor, huge increase of ferry traffic on Jenny Lake etc. The Moose-Wilson road would lend itself well to a shuttle system as in use in Yosemite for over 40 years. Communication between Concessions Management actions, Interpretation Division promotion of over crowded venues and the Park Management seems to be non-existent. Working piecemeal on the Moose-Wilson road alone is short-sighted and will do little to help the overall problems. The phenomenal impacts occurring in the corridor are not a recent issue. Most of the problems are merely increasing to the point that they can no longer be ignored so that the Park is now in a crisis management situation; a situation that rarely allows for good, long term solutions.

Comments: It is vital that final decisions are based on resource driven considerations and forecasted future increases in local and national populations. Grand Teton National Park is a national treasure and not the personal piggy bank of Teton County businesses or the personal playground for special interest groups.

Topic Question 1:

YES EVERY TIME to wildlife and habitat! Put these creatures first like we've said we'd like to but never seem to act upon. I'd like to see the NPS step forward proudly with intention to preserve the park and not succumb to the whims of the insatiable appetites of the "me- me me first" folks. This area is vital for our animals to survive and with more populous and encroachment on their habitat from subdivision development to bikers to campers, where will the animals go? Are we blind to the fact that they are readily telling us they are already crowded by their movement through this corridor and onto adjacent lands they've never been?

Topic Question 2:

NO to construction a multi-use pathway adjacent to existing road. NO NO NO
This would further encroach on wildlife habitat and add to stressors to these animals who are currently being pushed into areas they otherwise have not been like the grizzly bears using this habitat now. Removing trees for the pathway is ludicrous. We already have a bike path to Moose. Why on earth do we need "more"...?
NO to two way traffic.
NO to commercial use like taxis and wild life tours...it's like a circus now!

Topic Question 3:

Make it one-way south to north with Bicycles allowed either direction.
NO taxis or commercial use such as "safaris" tours!

Topic Question 4:

PLEASE CONSIDER THE WILDLIFE FIRST.

THERE IS ALREADY A BEAUTIFUL AND EXPENSIVE BIKE PATH FROM TETON VILLAGE TO TOWN TO MOOSE AND JENNY LAKE. WE DON'T NEED ANOTHER BIKE PATH IN THE PARK!

Comments: THANK YOU....Please make this an opportunity for folks to really consider their wildlife values and how they can actually walk the talk here. More is not better. Every time man puts his or her stamp on something that is natural, it gets wrecked!

We all need to sacrifice something in order for our #1 resource to be viable. wildlife.

The park service has done an extraordinary job over the years making so much available to the public but we need to curtail the endless whims and wishes of humankind in order to protect this beautiful place for generations. New roads need repair. Bike paths fall apart as well. We don;t need to wastefully spend dollars here.

Dear Superintendent Vela,

The Moose-Wilson road as it is today is the best thing about Grand Teton National Park - - it's the first place I tell friends who are visiting the park to go - - and to savor the every moment. Please don't do anything that will change the corridor's peaceful and primitive beauty.

Thank you!

Topic Question 1:

I Believe that it is best to not change the road itself. No realignment and no paving of the existing road. The wildlife is used to things being the way they are. There is nothing gain by tearing up more land, destroying more vegetation.
I vote for Alternative A. Although Alternative C would be acceptable.

Topic Question 2:

I do not believe that a bike path is a good idea. The main problem with the road is traffic. A bike path would not alleviate traffic. The bike path would mostly be used by a few locals, this is a luxury that would not help with traffic. Most visitors to the park drive. The number of trees and disruption to the wildlife is not warranted. There are many underused pathways in the valley.

Topic Question 3:

Traffic is a problem and something needs to be done to address this issue. Other National parks have started using buses to reduce traffic, why not GTNP. You could have a regular bus service along the Moose - Wilson road. Many people just go to LSR and back they can ride a bus. I would support closing the road to private vehicles between 9am and 5 pm during the peak summer months of July and August. That way workers could still get to work and hikers to the the trail heads if they feel like they need a vehicle.

Topic Question 4:

NO NEW PATHWAYS OR REALIGNMENT OF THE ROAD ALONG THIS DELICATE CORRIDOR
!!!!!!

Topic Question 1:
Sort of Plan B, but there are some good parts in the other plans, also.

Topic Question 2:
Plan A and Plan D

Topic Question 3:
Start out with your top 3 priorities for the first year or two, then add on. Just try to address the major issues first and not get too complicated.
My priorities would be: Realign the road between Death Canyon turnoff and Sawmill Ponds away from the wetlands; Replace and relocate the Moose entrance station; pave the unpaved southern section of the M/W road.
I personally think these are the 3 top priorities. I have been visiting the park since the 1950's and have lived in JH for 35 years. I use this road numerous times every week mostly for recreational purposes.

Topic Question 4:
If the above 3 priorities were taken care of, I'd then suggest that small shuttle buses be available from Teton Village and from Moose to help cut down on vehicular traffic to LSR, etc. Also, some sort of bathrooms "port-o-potties" need to be located at Granite Canyon Trailhead and Sawmill Ponds or ??? I find toilet paper and human waste along the trails in these area and feel like this issue needs to be addressed.

Comments: I am an avid cyclist, but do not want to see a bike path built in this corridor. It would be too damaging to the environment and way too expensive. Please do not build a pathway in this area!!!!!!

Topic Question 1:

Realignment of the northern segment of the road should be done. This will provide a route which is less intrusive & easier to maintain.
Nighttime ,seasonal or other appropriate closures should be used to protect wildlife & habitat resources.

Topic Question 2:

Closures & reservations for private vehicle use are too onerous & complex. They should absolutely NOT be used.
A separate non- motorized path is unnecessary & too inavsiive.
Maintaining the "status quo" is unacceptable.
No commercial traffic should be allowed. This includes taxis.
Winter snow grooming is unnecessary.
Speed bumps, additional singage or other speed control measures won't be necessary with the shuttle bus system in place.

Topic Question 3:

A motorized shuttle system, with terminals in Moose & Teton Village, should be used.Paving the southern section of the M-W road will be part of this solution. Clearly, this system will be phased in,but it must be started soon.
This shuttle will allow any visitor equitable access to THEIR park, greater saftey for non-motorized users & for wildlife & eliminate the need for private vehicle parking lots.
GTNP should retain the right to effect seasonal closures for the protection of wildlife. A shuttle spur would go to the Death Can. TH,thus eliminating the need for expanded parking there.

Topic Question 4:

The MWC is NOT a transportation corridor or part of our Teton Co. transportation system. It must be kept primarily as wildlife habitat & for scenic value.

Please have the courage to protect OUR park while having the foresight to implement a progressive transportation system which offers equity to all visitors, greater safety to visitors & wildlife & does not "sell out" to commercial & automobile interests.

Comments: I am an avid & longtime cyclist, yet I am not in favor of a new non- motorized "road" in the MWC. Eliminating private auto use will have an immense beneficial effect. A motorized shuttle system is an equitable way to meet most of our goals.

Topic Question 2:
new developments will not increase the environmental values in this area and are to be discouraged

Topic Question 4:
Seasonal closures/prevent winter disturbance to wildlife
(please see comments below)

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS

alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

susan delles

Topic Question 1:

Alternative A. Because the issues are negligible and should be managed as problems arise.

Topic Question 2:

Alternative C/D because of the need to destroy so many trees in order to build a bike path.

Topic Question 3:

How about only a park authorized public transport system to each destination within the moose wilson corridor and make people park in Teton Village or Moose.

Topic Question 4:

See Question 3.

Comments: The Grand Teton National Park is a true gem in the entire National Parks system. It must be a beacon and example for all other parks. In addressing these concerns it is important to remember precedent-setting actions and listening to not just the 'majority' but to the heart of the National Park's ethos.

Topic Question 1:

Please include Alternative D in the plan for the Moose Wilson corridor. Alternative D is the best option for enhancing the visitor experience, best for the environment in keeping the road slow and narrow while providing for safe travel by foot or bike.

Please keep the rural character of the Moose-Wilson road.

Topic Question 2:

Road closures cause a negative experience for the visitor, create long lines and would not be ideal. The safety of visitors biking or walking along the Moose Wilson road should be taken into consideration and the best alternative is a pathway separated from the road.

Topic Question 4:

I congratulate the Park Service for recognizing the positive value of active transportation, one only needs to look at the participation of bikers and hikers along the existing pathway during the summer to know you have done the right thing for the health of the public, Park and future generations. All visitors should be able to experience the Park outside of the car. I currently bike the pathway and the existing Moose-Wilson corridor a dozen times a year. In the 35 years I've lived in the valley, I've spent many days enjoying the wildlife, scenery and peaceful nature of the road particularly during the off season. During the summer months biking the road can be dangerous due to the size and number of vehicles trying to co-exist on the narrow road. Please consider Alternative D for the future of the Moose-Wilson corridor.

Topic Question 1:

There are multiple strategies that should be carried forward. In Alternative D, one of the more prominent is that of adaptive management of pathways for motorized transportation. Seasonal and time of day restrictions seem to be the most reasonable and effective means of both preserving wildlife, while also allowing a variety of transportation means into the corridor.

Topic Question 2:

Commercial activity strategy in alternative B could easily backfire. Seems it would be very easy for this road to become overpopulated and full of unwanted traffic. This is a proposed strategy I think should not be carried forward.

Topic Question 4:

After reading Alternatives B,C and D with no outside influences, sounds like Alternative D is the most thorough, most thought out and covers a wider scope of concerns. Alternative D is the best option because it focuses on keeping the natural rural feel of the road while simultaneously protecting and nurturing wildlife. It also focuses on minimizing signage to be subtle, honing in on safety for pedestrians and cyclist and concentrating on reducing environmental risks.

Topic Question 1:

I strongly support having a separate bike/pedestrian path alongside (or slightly separated from) the road. Bike paths now connect almost all the areas from Jackson up through the park. Why leave this one stretch without a bike path? Bike paths are friendly to animals, plants, and people. They encourage people to go slowly and enjoy the natural surroundings.

I also support keeping the M-W road unpaved, at least the part that is now unpaved. That will help keep the traffic at a slower pace. And I like moving the road to the east side of the beaver ponds to lessen the impact of the road on wildlife. Providing pull-outs for gawkers is a good plan for safety.

Moving the entrance kiosk in Moose to a place a bit further east so that drivers must go through it in order to drive on the M-W road is a good idea.

Topic Question 2:

Paving the M-W road does not address either the speed of cars nor protection for animals. Having the M-W go one-way, or alternate N and S would be too confusing. It's true that it would lessen the traffic, but still doesn't make much sense to me.

Topic Question 4:

I'm really glad you are asking for community input. I was at the August open house at the library, and thought it was informative and well-run.

Topic Question 1:

I think that the Moose Wilson Road Corridor within the Grand Teton National Park should remain a low speed, winding, gravel road. I encourage the use of traffic management techniques along the road to reduce the number of vehicles and have those vehicles maintain slow speeds, and to eliminate commercial and commuter traffic along the road.

Topic Question 2:

This is a National Park that we are talking about not a highway. We have a responsibility to the wildlife living in this area to protect them from motorized vehicles.

Topic Question 4:

We have a responsibility to future generations to preserve our National Park System, not destroy them. We need to think very carefully in this particular situation what will happen down the road if the decision is made to allow more traffic on the Moose Wilson Road Corridor.

Correspondence Text

Topic Question 1:

None of the proposed alternatives as they now stand meet the most important mission of the NPS, and that is protecting the natural resources including both the landscape and wildlife. Resource protection should be the highest priority.

The only strategy in the existing document which effectively accomplishes that goal is:

-Rerouting the road from Sawmill Ponds to Death Canyon Trailhead would be desirable to protect the critical wildlife habitat in and around the beaver ponds along that existing section of road.

But . . .

That solution does not go far enough. See Question 3 below.

Topic Question 2:

Any alternative which keeps the road open to through traffic will not achieve the highest interest of protecting the unique natural resources in the area. There is no effective way to prevent ever-increasing vehicle traffic short of eliminating through vehicle traffic.

If the Moose-Wilson road is kept open to through traffic under any scenario it is only a matter of time until special interest pressure will result in a paved, two-lane road, open year round to through traffic thereby threatening the resource. We must eliminate the two lane road in any configuration including the existing gravel configuration to have any hope of permanently protecting the area for future generations. I am not in favor of a new and separate bike path. The thousands of trees and acres of landscape that would be disturbed cannot be justified.

Topic Question 3:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

1. Permanently closing the Moose Wilson road to through automobile traffic during all months and seasons.
2. Remove the section of road between LSR and Granite Creek trailhead. Narrow that section of removed road to make it accessible to walking and bike traffic, but do not pave it. Keep it as natural as possible. A gravel path that is wide enough for both walkers and bicyclists should be provided, but a separate path for walkers and cyclists is not necessary, i.e. all existing pathways in Teton County which are open to both. But paving is not required.
3. Foreclosing future possibility reopening the road due to political pressure or special interest pressure would best be accomplished by removing the section of road between the Granite Creek trailhead and LSR Preserve and restoring the disturbed land to a natural state.-Expand parking at Granite Creek trailhead.
4. Provide two-way access to LSR and Death Canyon only from the north on the rerouted road avoiding the critical wildlife habitat areas.
5. Provide two-way access to Granite Creek trailhead and expand parking there for users who want to access Granite Creek trails or who want to walk and bike to the north toward or to LSF or Death Canyon.

Topic Question 4:

Grand Teton National Park is just that. National. Solutions should not be dictated by local interests but should be determined first by what is best for the resource and second by what is reasonable public access. The NPS mandate to "preserve and protect" should and does come before "for the benefit and enjoyment of the people." This is especially true when endangered species such as grizzlies are involved which is the case with this area.

I beg you to act on behalf of everyone in the nation and not just local special interests when recommending a final alternative. In particular, I am a cyclist, but that does not mean that cyclists are entitled to special treatment. The solutions I have proposed provide reasonable access to all self propelled means of travel without preference to any particular group.

Comments: I am a long-time supporter of the National Parks through the National Parks Conservation Association and I may have given to the National Park Foundation. I hope you will keep the safety of the animals uppermost in your decisions. Fast-moving traffic, much noise and commotion along the Moose Wilson Road will be highly detrimental to the animals.

It is a shame when humans and their desires so many times win out over the welfare of animals. We have so many animals becoming extinct every year. Just watch shows like "Nature" and "Nova" on PBS and shows on the Discovery channel and others. Follow what World Wildlife Foundation is doing all over the

world to protect animals. Surely we in the United States can do better in thinking of the animals' welfare in this controversy about traffic in the Grand Tetons.

Topic Question 2:
I don't believe any of the strategies are great. They all impact this wild area way too much in my opinion.

Topic Question 3:
YES! How about making the road ONE WAY AND....lowering the speed limit to 15mph enforced by unmanned speed radar equipment...(which takes a photo of the license plate and sends the ticket in the mail). I am more than sure this equipment cost could be fundraised....if needed, however this idea would be far less expensive than the other proposed ideas I believe. :*)

Topic Question 4:
Lets start with this easy solution before ripping up land, bringing in heavy equipment and adding additional impact to our lovely wildlife in this special corridor.

Topic Question 1:

I think that there should be a realignment of the Moose Wilson Road, and a pathway next to the road should be built.

I think that a road to the east of the "moose ponds" makes sense to avoid the car jams and the disturbance of wild life in this area of the road. A pathway for the safety and use of non-motorists, or those who get out of their cars is a sensible way to provide another venue into the park and along this corridor. Some form of mass transit to lower the number of individual autos would also be helpful in the implantation of an overall traffic plan.

Topic Question 2:

I believe that a one way only plan does not make sense, and it would create a burden on those who travel into the park, both tourists and locals. It would indeed increase the miles driven, gasoline used, and needlessly increase traffic in the town of Jackson by making traffic go the long way around to get from or go to GTNP.

Topic Question 3:

A traffic plan to include busses or vans.

Topic Question 4:

I think that GTNP and the park service should rethink its mission insofar as making the parks a place where visitors only drive through and shop. It should add pathways and rethink certain prohibitions on rivers and in parts of the land in order to get more visitors to experience the outdoors in non-traditional

ways.

Topic Question 1:
Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,

Topic Question 1:

Wilson-Moose Road is one of our favorite parts of Grand Teton National Park. For that reason alone I don't want to see it changed. It's nice to know, even if I'm not there, that it is, wild and beautiful. Hence, I'd be more in favor of Option 1.

Topic Question 2:

Option 1 does not address too much traffic on the road.

Topic Question 3:

Perhaps a modification to option 1 to close the road when occupancy reaches an excessive level would solve certain problems.

Topic Question 1:

Leaving the road unpaved preserves the rustic character. Leaving the road twisting and turning also preserves rustic character. Both serve to reduce vehicle speeds. Limiting traffic during peak periods also preserves the rustic character and reduces human disturbance to wildlife. We believe limiting the total traffic by closing a gate at LSR Preserve would preserve rustic character and minimize disturbance to wildlife. It would also make the road safer for bikers and pedestrians. We are not sure how a reservation system would work, but believe it is worth exploring in more detail at the next level. It would improve the human experience and reduce human impacts to wildlife. Commercial vehicles (taxis, tour buses that are using the road to experience that section of the park (hiking, climbing, and wildlife viewing) achieve the purpose and meet the needs of the Plan.

Topic Question 2:

A separate pathway fragments valuable wildlife habitat and increases human disturbance. It should not be considered. There is already a pathway from Jackson along the Highway to Moose, building a new pathway on the Moose Wilson road will likely increase bike traffic "riding the loop." This could increase human conflicts with wildlife. The short sight distances mean that road bikes traveling at 20 mph could abruptly encounter wildlife and cause a conflict, especially with feeding bears. Closing the road two days a week solves nothing and would likely confuse people. It does nothing for wildlife or enhancing the rustic experience on days that it is open to traffic. Commercial vehicles (taxis, tour buses) that are using the road as a shortcut to the Park do not achieve the purpose and do not meet the needs of the Plan.

Topic Question 3:

Consider closing the entrances to the road at dusk and dawn to protect wildlife. Exits could be left open

to allow people to leave. After dark it is hard to view the scenery and there is increased risk of wildlife collisions. Any traffic after dark is most likely through traffic interested in using the road as a short cut from Wilson to the Park. Lowering the speed limit would greatly increase safety for pedestrians and bicyclists. Although we do not favor a separate pathway, if one is installed there should be speed limits for bikes to protect pedestrians. We already had one fatality on a local pathway due to a bike rider traveling at excessive speed. It would also minimize wildlife conflicts.

Topic Question 4:

The Moose-Wilson road should be managed as a park, not as part of the transportation network for Teton County. Town and County Elected officials need to solve their own transportation problems. The purpose of the Road should be to provide access to a unique portion of the Park, not to provide direct access to the Park from Teton Village. One of the things that makes Grand Teton National Park unique is that it has all of the animal species that were present before the area was settled. The highest priority should be given to protecting those animals and making sure that human activities do not have adverse impacts. Any proposal should consider the impact on wildlife as determined by wildlife professionals. Anecdotal observations by the general public should not be used to make decisions on wildlife. The best available science should be used to make decisions on wildlife. We cannot comment on proposed realignment of the road and changes to the turnouts without seeing an analysis of the impacts on all wildlife present in that part of the Park. Both long term and short term impacts need to be evaluated, including proposed reclamation of existing road segments. Seasonal closures and plowing should remain unchanged. No additional grooming of trails is needed. Grooming is counter to the rustic experience.

Comments: The reasons for relocating the Moose entrance are unclear. It appears to be mostly administrative, rather than enhancing the public's experience or protecting wildlife.

Topic Question 1:
Plan B-Reduce Speed Limits, Improve Roadside Parking, Pave the unpaved, Allow resource based guiding, eliminate taxis and other commercial use,

Topic Question 2:
Plan A-nothing done is not a solution
Plan B- -do not realign- a waste of money
Plan C- -This is management overload and would require continued expenses daily to manage
Plan D- -i will never support bike new paths in addition to any other improvements

Topic Question 4:
YES
Make the Moose-Wilson Road one way from North to South.
Pave the dirt.
Create parking turnouts
Strict speed limit enforcement
This allows for normal travel,wildlife watching, and safer bicycle travel. Bicycle travel could then be two way in marked directional bike lanes.

Topic Question 1:

I believe that there should be as little additional impact to the area as possible it is an extremely sensitive corridor and does not need to be expanded there are already a plethora of other recreational opportunities in the park.

Topic Question 2:

The realignment plan would be disastrous. The proposed route near sawmill ponds would irreparably damage a sensitive native site that was recently discovered. This area is one of the best archeological finds in the park and in addition to the cultural implications there could also be significant legal repercussions under the Native American Graves Protection and Repatriation Act and the Archaeological Resources Protection Act of 1979. Both of these could expose the park to significant legal action and potentially cost the NPS millions.

Topic Question 3:

The no change proposal should be seriously considered.

Topic Question 1:

I believe the strategies in Plan A with the exception of adding additional parking make the most sense. The current road, although occasionally backed up by traffic is generally sufficient to handle traffic. The current road. balances the needs of scenery, wildlife, soundscape, geological process, visitor experience, historical and cultural resources as well as aquatic are been met very well with the current arrangement. Human interaction with wildlife will always exist and continued education is them best route forward.

Topic Question 2:

Restricting or rerouting the current road would have a negative impact on the visitor experience.

Topic Question 3:

Why not establish a bike route? Many people enjoy experiencing the park on their bikes and a dedicated route could provide a safer way to do that and alleviate traffic congestion associated with the mixture of bike and auto traffic.

Topic Question 4:

None

Comments: During my last visit to the park I was dismayed that staff at the bookstore were vocal supporters of the Democratic Congress, critical of the Republicans for the government shutdown. The parks are no place for partisan bickering and this lady's left wing views cast a shadow on my visit. There are many things I disagree with interns of current DOI management but that does not mean either me nor

the Republicans in office do not care about conservation.

Topic Question 1:

I think that many of the options in the "no action" should be continued with changes as needed to protect the wildlife and habitat:

1. Do not realign the two segments of the north end of the Moose-Wilson road.
2. Do not pave the south end of Moose Wilson road. Leave as is.
3. In my opinion, the best solution to the traffic, excessive speeding, and using the road as a freeway to and from Teton Village to the airport and other places of business is to make it a two-way road from the village to the preserve and from Moose to the preserve. This would prevent through traffic yet provide access to the preserve and give visitors opportunities to enjoy beauty and wildlife along the way.
4. Regardless of where the road is, there should be at least some enforcement of speed limits.
5. There should be some small pullouts, marked with signs, created by the park in those areas where visitors are known to frequent most. This might reduce the numbers of visitor-created areas.

Topic Question 2:

I am opposed to many of the options listed in Alternative B, particularly the following:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

1. Paving the north end: This will encourage even more speeding which endangers people and wildlife. I have observed that it is mostly local cars and trucks that speed during morning and evening commutes on the current road.

2. Realignment of two segments of the north end of Moose-Wilson Road as described and illustrated will only increase the traffic speed, restrict visitor access to the most special and interesting habitats in the area, reduce the possibilities of observing wildlife and others special opportunities that the area holds. Yes people can walk from the new road to the old road area, but with the increase in grizzly activity, walking will most likely become dangerous and most likely will be prohibited by the park on numerous occasions.

3. The park has installed many miles of bike paths to offer riders a variety of scenery, and I am strongly opposed to the creation of more bike paths under any circumstances and in any location, especially this one. If the road is going to be closed to automobile traffic then it should be closed to bicycles as well. I think cyclists, walkers, and joggers disturb wildlife as much as automobiles if not more. We have more than enough paths in the park, and it's time to stop adding more. I'm in the park frequently and it is surprising how few bicyclists there are in relationship to miles of available pathways.

Topic Question 3:

In my opinion, one of the most important actions on the existing road or the alternative road is to control the speed limit, particularly during morning and evening commutes. I know that many people use the road as a shortcut to the airport or village and if that connection will continue, it must be patrolled and controlled to protect people and wildlife.

Topic Question 4:

I believe that when someone has first-hand experiences in observing and enjoying wildlife and their habitats, that they come away with a deeper appreciation of all species and the roles that those species play in the ecosystem as well as the importance of the preservation of all species and their habitats. The Moose-Wilson corridor, as is, provides incredible opportunities for such outcomes and the location of the present road offers those special moments.

I have lived in the valley for 31 years where I have worked as a freelance nature photographer, writer, and educator. For the last two summers, I spent considerable time photographing wildlife and habitat at the beaver pond and along the road between Moose and Rockefeller Preserve. It is a rich and diverse habitat that should be protected and enjoyed by visitors. It is an ideal place to experience the importance of wetlands in our ecosystems and to observe the diversity and interactions of plants and wildlife in a riparian area.

Three summers ago on many evenings, I stood with numerous families along the pond to observe the activities of a large beaver family. The children were able to watch the many behaviors that they have learned about in their textbooks. It was done without harming the animals and with respect. We were all thrilled and very appreciative of the opportunity to see beavers going about their lives.

Topic Question 4:

I like options A and D. Do nothing or the minor changes in D. I DO NOT like the idea of closing the road for a period of time but allowing commercial enterprises to enter- I don't think I should have to come up there and my only option to view wildlife along the road is to pay someone to take me through- if the road is closed for 6 months, it should be closed to all.

Also it was mentioned that part of the problem is human - wildlife run ins. Wouldn't biking and hiking along the road while being closed to autos, make this a more dangerous situation?

I come up several times a year and love the moose Wilson road- it does get crowded and it doesn't seem to matter how many times people are told- they still jump out of their cars to see how close they can get to any animal they can find (that's in any part of the Tetons and Yellowstone)

Topic Question 1:

The NPS could create several pull-offs along the corridor. (perhaps for 3-4 cars) Maybe eliminate bicycles from part, or parts of Moose-Wilson corridor. When we visit the Tetons, we give Moose-Wilson Road special attention. There is a pretty good chance to see wildlife along that stretch near Moose. It would be a huge disappointment to limit our access to that road.

Topic Question 2:

No action

Topic Question 3:

No action

Topic Question 4:

These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Overall, alternative D seems best. It would be wonderful to have a separate nonmotorized pathway to link into the existing and future system of regional trails. This would allow for exceptional recreational opportunities and facilitate the eventual "Grand Loop" pathway. I also prefer alternative D for not moving the Death Canyon Trailhead. Some of the hiking routes served by that trailhead are quite lengthy, especially the one-day trans-Teton routes. Adding another mile or even half mile would make an already long day longer.

Topic Question 2:

As much as I like the idea of closing the road to cars at times, instituting a two-days-per-week closure seems to create scheduling complexities, especially for people using the trailheads for multiday trips. I seems to be asking a lot of the wider public, tourists especially, to know which days which types of uses are allowed.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

Topic Question 1:

The road realignments along the beaver ponds north of Death Canyon Junction and between the Murie Center and Sawmill Ponds need to happen, as does the paving of the gravel section. The southern realignment will solve the problem of the road degrading and slowly sinking into the ponds and restore some animal habitat. The northern realignment, if it routes traffic inside of Moose Entrance Station rather than outside, will reduce wait times at Moose Entrance and lead to less visitor confusion (Many think somehow they've left the park on Moose-Wilson). The gravel section should be paved. Our efforts to maintain a smooth surface on it just don't last with the volume of traffic on it and lack of drainage from it. It should be properly built unless the park wants to severely restrict traffic.

Topic Question 2:

The bicycle pathway proposed in alternative D is an outrage. Let's not forget that part of our mission in the NPS is to protect the resources, be they plant, animal, or rock. I want no more destruction of plant communities and animal habitat for mechanized recreation. We should be trying to reduce human impact on the resource by removing unnecessary roads, not building more.

I'm disappointed by the proposal to move Death Canyon Trailhead back to the junction with the Whitegrass Road. This negatively impacts backcountry users but allows government workers to keep driving up that way on Whitegrass Road. If something must be done, let's decide on one road that goes that direction, ending near Whitegrass Ranch and providing a closer trailhead than proposed. This would serve government and visitor needs.

I don't see the benefit of restricting winter road maintenance. After the elk move in the fall, I don't see

much wildlife in there, so I don't see the harm in allowing skiers to use Death Canyon Junction as a winter trailhead. The only positive aspect of it I see is theoretical fuel savings from not plowing.

Comments: Alternative B is clearly the best of a bad lot.

Topic Question 1:

Realign North section per Alt B, reduce traffic to maintain character. No bike path.

Wildlife just react differently to bikes and hikers than autos or buses. I know just from first hand experience. If bike traffic increases significantly, large animals and bears will be spooked away. Otherwise, I'd be all in favor of more bike access.

Topic Question 2:

I oppose Alt. D with separate bike path. Same reasons as above, wildlife are spooked by bikes and hikers, so visitors would see less wildlife if there are more bikes.

Topic Question 3:

promote transportation that accommodates visitors not airport commuters. Don't allow airport shuttles and taxis.

Topic Question 4:

Bike paths are great, but I don't think Moose-Wilson is the place for it. As I write, the road is closed for grizzly bear activity. Encouraging more bicycles is obviously going to reduce bear sightings and could lead to an encounter with a bad outcome.

Note if the gravel portion is paved, bikes will take the newly paved road and it will still change the character for the worse. Also, If the separate bike path is constructed, the speedy road bikes will take the

pathway only as far as LSR Preserve then go on the paved road going north and skip the pathway around LSR Preserve.

Comments:

Good luck, I hope the Park gets it right.

Topic Question 1:
See Comments Below.

Topic Question 2:
See Comments Below.

Topic Question 3:
See Comments Below.

Topic Question 4:
See Comments Below.

Comments: We appreciate the intent of Grand Teton National Park staff in developing a comprehensive plan for the Moose-Wilson road corridor that balances access with preservation of important park resources, wildlife and their habitat. As we understand it, the impetus for this plan is largely to address increased vehicular use, congestion and associated impacts during the summer and early fall. When the road is open, locals and visitors use it for access to trailheads and sites like the Laurence S. Rockefeller Preserve, as well as for transport to and through the park. That said, winter use and access seem largely outside the scope of the core issues being addressed, and we focus our comments solely on that part of the plan to be developed.

Current management allows important access for walking and backcountry skiing access into this portion

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

of the park. Individuals - including our members - regularly for access to Albright Peak, Buck Mountain, Mavericks, and other popular backcountry destinations, as well as to cross-country ski in the area. Several comments reflected in the March, 2014, Public Scoping Report: Moose-Wilson Corridor Comprehensive Management Plan demonstrate the importance of the Moose-Wilson Corridor as a winter recreation destination, its value as an access point, and ideas for enhancing winter recreation opportunities. These ideas should be more fully explored in one or more alternatives in the EIS, rather than pursuing alternatives that would limit access or plowing unless clear evidence shows that recreational use is impacting wildlife species such as moose, elk or bighorn sheep or other key park resources.

Another measure of the importance of winter recreation access in GTNP is economic impact resulting from overall winter use. While this is outside of the core area of concern for the park - because it focuses on the Bradley-Taggart area, based on data provided by the NPS in 2013 - we found that over 5,000 unique visitors visited the GTNP backcountry in the winter of 2012/2013, with a total contribution to the local economy of over \$2.35 million. This goes to highlight the importance of the park as a year-round resource, as well as raising questions related to impacts of reduced or enhanced winter recreation opportunity. Details are from: Teton-West Yellowstone Backcountry Winter Recreation Economic Impact Analysis, Mark Newcomb, 2013 (available here: http://winterwildlands.org/wp-content/uploads/2013/11/winter_rec_eia3_final.pdf)

Specific Suggestions & Answers to Topic Questions:

â€¢ We support exploring the feasibility, costs, impacts, and recreational benefits of grooming the unplowed portion of the Moose-Wilson road through a partnership agreement.

â€¢ Analyze whether current winter parking at the end of the plowed section of the road is sufficient to meet current and future demand, and whether parking, increased access, or facilities could be improved for winter use without adversely impacting park resources. As we understand it, GTNP uses entrance traffic counters, but may not have reliable data for winter use for this area.

â€¢ Seriously consider the impacts of reduced winter recreational access due to decreased plowing into the park, or remove those elements from further analysis. Specifically, what would impacts to crowding and backcountry skiing opportunities be if use shifts to the Bradley-Taggart parking area?

â€¢ The winter elements of preliminary Alternatives B and C should not be carried forward. Only those strategies for winter use and access as outlined in Alternatives A and D, as well as other potential strategies devised by the Agency or recommended by the public, should be carried forward for detailed analysis.

Thank you for considering these comments. We look forward to staying engaged in the process as GTNP explores ways to preserve this special place, while ensuring that visitors are still afforded ample opportunity to explore and connect with the amazing winter backcountry.

Topic Question 1:
See Comments below

Topic Question 2:
See Comments below

Topic Question 3:
See Comments below

Topic Question 4:
See Comments below

Comments: I appreciate the opportunity to comment on the Moose Wilson alternatives, and I comment the NPS for the analysis represented in the various objectives.

I very much disagree with several aspects of Alternative B. Closing the road to the Death canyon trailhead would make the hike to Phelps overlook 4 miles round trip. This length would make it difficult for many people to complete, particularly elderly. In addition, it would add 1 or 2 miles to all other hikes and make some of them, such as up to Static Peak and back, not doable as a day hike. Perhaps, a system of loaner bicycles could be established. I also don't understand how it would work to have the road terminate at LSR during peak periods. How would people who were at Death canyon get back to Wilson or Teton Village? Similarly, how would people hiking Granite Canyon get back to lodging and campgrounds to the north? Realignment of the road should be dependent on meeting other objectives.

Option C proposes to close the road 2 days a week and only allow bicycles. This would mean one could not go to Yellowstone nor Grand Teton except by going all the way around. Hikers could not go to Granite Parking, Death Canyon nor LSR, and it would complicate it for overnight backpackers wanting to enter or exit those trails. Perhaps a better option would be to close the road to cars from 10am to 4pm for bicycles.

Option D proposes a separate bike path. Originally, I was fully supportive of this pathway. However, after reading an article in the News and Guide, I am less certain. The premise of the article was that we are incrementally squeezing the ecosystem into extinction. The options for the pathway should be either to put it right by the road so the impact is almost nonexistent or to put it totally out of any sensitive areas.

Notes: In addition to the correspondence text provided by Kerry Irons of Adventure Cycling Association, a hard copy letter was sent to Grand Teton National Park. This letter was postmarked on 15 September 3014 and received on 18 September 2014. The text in the attached letter is identical with the excpetion of the signature (Ginny Sullivan, Director of Travel Initiatives).

Correspondence Text

Topic Question 1:

From the standpoint of meeting the key elements of the Goals and Desired Conditions statements, Alternative D offers the best mix of elements. Particularly in the case of the Visitor Experience Alternative D would best engage the largest number of people in the experience of the corridor. There is a huge difference between walking or cycling through an ecosystem and driving through in a motor vehicle. Given that most people never get more than 500 feet from the parking lot when visiting a National Park, providing a multi-use path through the corridor would provide an entirely different experience for visitors. Alternative D would also serve to reduce the motorized traffic intensity in the corridor which would have numerous benefits.

Topic Question 2:

Alternatives B & C seek to control traffic density by limiting the number of motor vehicles on the roadway but would also likely increase the total amount of motorized users along the corridor. This increased traffic load would negatively impact the corridor in general and would also reduce the quality of the experience for all users, most specifically bicyclists and pedestrians. With higher traffic spread over a larger part of the day, it will become more difficult for cyclists and hikers to find peaceful times of the day to experience the corridor. The idea of eliminating motorized use for two days per week (Alternative C) will be confusing for visitors and tend to randomize visitor experience; those who show up on certain days will either get a vastly improved experience (as bicyclists and pedestrians) or be turned away (as

motorists) in what would seem a random fashion for one-day visitors.

Topic Question 3:

Other national parks have successfully implemented bus transit systems as a way to greatly reduce the impact of motorized traffic in sensitive corridors. The addition of a bus system in the Moose-Wilson Corridor would provide access to all elements of the area to day users who do not wish to walk significant distances. Combining a transit system with a multi-use path would encourage pedestrian use of the corridor while simultaneously reducing the negative impact of motorized traffic.

Topic Question 4:

The Moose-Wilson has a lot to offer non-motorized visitors in terms of scenic landscapes, ecological and cultural heritage, and wildlife viewing opportunities. Adventure Cycling supports preserving the slow, rural character of the existing Moose-Wilson road while providing a complete pathway. The existing pathways are a highlight of the park for cyclists, and are incredibly successful both locally and nationally. They have achieved America's Great Outdoors award designation and are immensely important in providing recreational connectivity between the park and surrounding communities. Eliminating the 3.5 mile gap along the Moose-Wilson would greatly enhance the connectivity of these pathways, so we support connecting this gap with a complete pathway along the corridor.

Adventure Cycling Association promotes bicycle travel and tourism and has developed many tours, routes and maps to help cyclists explore National Parks. Adventure Cycling also has a Memorandum of Understanding with the National Park Service to allow partnership with park units on projects to develop bicycle tourism, establish U.S. Bicycle Routes, and make National Parks better places to bicycle. We support inclusion of the 3.5 mile section along the Moose-Wilson in the proposed pathway plans to provide a complete pathway from the Granite Entrance to Moose so that non-motorized visitors and locals can enjoy Grand Teton National Park. Thank you for your consideration.

Comments: Adventure Cycling Association is a nonprofit with over 46,000 members that promotes bicycle travel through organized tours, mapped routes, the Adventure Cyclist magazine, equipment sales and the development of a national public network of recognized bicycle travel routes, called the U.S. Bicycle Route System. We hear from our members about their bicycle travel experiences and also recently worked with the Institute for Tourism and Recreation Research to survey cyclists. According to the survey, touring cyclists most highly valued scenic views, historic sites, wildlife watching, and local hospitality. The values expressed by the surveyed cyclists represent what cyclists across the country seek when traveling to places like Grand Teton National Park. Bicycle tourism is a growing sector of the tourism industry with substantial economic, environmental, and health benefits, and we encourage the Park to consider cyclists' needs and preferences in the developing plans for the Moose-Wilson corridor.

Topic Question 1:

I think that the Moose-Wilson Corridor should not be changed. We were on this road many times this summer and it is a treasure beyond compare. Paving the unpaved portion would be beneficial, but not necessary.

Topic Question 2:

No trees should be harmed and no bike paths should be built. Opening up the roads to White Grass will only harm that historic area.

Topic Question 4:

We spent many hours in the park in June and July of 2014. We hiked trails and were able to horseback ride in the park for 6 days. It was an amazing opportunity to experience the many historical areas of the park the way our ancestors did. Do not take away the rights or ability of the many people who love to ride horses in the park. There are enough bike trails.

Comments: Here are some additional comments.

Please, no bicycle pathway on the Moose-Wilson Road.

It would destroy over 3000 trees in a very pristine historical wooded area. It also increases the potential for wildlife and horseback rider conflicts.

With only 3% of park users currently using the bicycle paths, there is no benefit of such a large and disturbing project.

Do not close commercial horseback riding on the Sawmill Pond Trails.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

It is one of the most unique areas of the park that allows this activity without causing any conflicts with other parks goals. It has also been an activity that has been historically used in this area for over 90 years with minimal conflicts and requiring minimal park management. I don't understand why the park is attempting to eliminate historical horseback trails that have been previously approved for commercial use? This area offers access to unique and safe horseback riding trails unavailable in other parts of the park.

These trails are used to access the historical Whitegrass Ranch area, along with Sky Ranch and Trail Ranch. By taking interpretive rides through these historical ranches, the guides help reach a parks goal to Protect and maintain cultural resources as important links to the human history of the Moose- Wilson corridor, including historical and archaeological sites, cultural landscapes, and ethnographic resources.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Kay Lettner

Topic Question 1:

It is not a good idea to combine biking trails with long-established park usage by horse and riders. The west was discovered on horseback and that is how today's Americans would like to re-envision and enjoy this grand area.

Topic Question 2:

The Moose Road corridor and the riding areas through the Whitegrass Ranch area should remain for horse/foot path only. No bikes. I

Topic Question 4:

The Grand Teton National Park is one of my favorite parks along with Yosemite in Ca. Certain areas should be allowed for biking, but certainly NOT THIS AREA THAT IS BEING PROPOSED.

THESE TRAILS ARE FOR HORSES AND RIDERS AND SHOULD REMAIN.

Topic Question 1:

Creating a safe haven for wildlife is the priority. Human enjoyment only with pursuits that do not interfere with or cause harm to wildlife in anyway. services along the road be kept to an essential minimum. this is not Las Vegas. visitors must be well informed as to what amenities are available and accept the policies of the park. citizens will welcome an opportunity to have an experience that is nature oriented. if someone wants a video resort they can vacation elsewhere.

Topic Question 2:

there is no place in national parks for snow mobiles or off road vehicles. the vehicles destroy the vegetation and water sources. the noise is deafening and harmful to the hearing of humans and wildlife. humans can escape. wildlife that is trying to survive the winter cannot escape.

Topic Question 3:

reserve the option to close the road on a temporary basis to prevent harassment of wildlife during migration or breeding or at times of increased stress due to adverse weather conditions. special attention must be paid to protecting wildlife with young. young animals must not get used to humans; their innate avoidance of humans must be preserved.

Topic Question 4:

Please see the Comment section.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. We have some general comments that we would like to share:

1. We favor a 15 mph speed limit on the entire road;
2. We favor paving the unpaved part of the road;
3. We favor realigning the two segments of the northern road as outlined in Alternatives B and D;
4. Strongly oppose the multi-use pathway as outlined in Alternative D.

We are 15 year residents of Jackson, and we are Volunteer Summer Rangers at the LSR Preserve. We love the pristine and special nature of the Moose-Wilson Road. We have mixed feelings about any effort to control the number of vehicles on the road, but we would support a decision that includes some kind of traffic-control measures.

Topic Question 1:

My first priority is to disrupt the natural patterns of the wildlife as little as possible. I would prefer as few changes as possible. I have no problem with moving the park entrance gate at the end by Moose. I also believe that a few more turn outs in areas where the cars often block the road would be helpful.

Topic Question 2:

Improving the road will only add traffic and traffic traveling at a higher speed regardless of speed limits. This is because the more you improve the road the more it will be used as a short cut to the airport. I really dislike the plan that moves the road to the other side of the wet areas. As a visitor annually for over 15 years my main reason for traveling this road is to see animals. Through the years my children have called the early morning ride "going on the animal run". This road is unique in that it is so natural. Other roads can take you to the airport and there are plenty of improved bike trails all over the area. These well designed bike paths are nice if you just want to go bike riding but why disrupt the only road that has all of these natural areas where animals have been for years. The plan that closes the road a couple of times a week except for bikers is a TERRIBLE plan.

Topic Question 3:

First we need to look at why the park is so important.
Preserving nature which includes vegetation as well as wildlife.
When people can enjoy an area such as this they may want to be involved is protection nature and animals elsewhere.

Topic Question 4:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Maybe a sign at each end of the road stating:

This road may have congestion because of the viewing of animals. Please be patient. This is not the best road to use for rapid travel.

I do not understand why the bikers are so insistent about wanting a designated bike trail along side this road. If they really love nature and want to enjoy it then why do they want to do something that will change it so drastically

All of this makes me so sad. I have loved the Tetons for so many years. Early in the morning right before daylight there are some areas where I move off the road and sit quietly in my car and listen to the bugling of the elk knowing that in a few minutes they will start to cross over the road and head up the side of the hill. I have taught my children to appreciate wildlife and hope that my grandchildren have that opportunity also. Please don't turn this very special area into just another improved, paved bike trail and road to the airport.

Comments: I put "Other" when answering how I heard about this document. I have friends and relatives that live in the area so I heard about this from them.

Topic Question 1:

After talking to many people including avid bicyclers, I would do nothing with the road. I think Laurance Rockefeller would roll over with the removal of trees and addition of asphalt. I have been under the impression that he wanted the parking lot small at the LSR on purpose. If I know my history, the Rockefeller's rode horses and not bicycles on the JY. The road was full of dude ranches in the day....not sure it was ever meant as a thorough fare.

Topic Question 2:

I believe that closing the road for two days will not work as it will be too confusing for the tourists. I do not think there should be a bicycle path on the Moose Wilson Rd as it is one of the last pristine areas left in our area. If you look at the transportation results, most people were using the road as a means to get to the other end or the airport. I do not feel that the amount of trees, the disruption to the animals and the amount of asphalt is worth it. I really don't know how the park would be able to patrol the bicycles off the horse and hiking trails as the bicyclists are already on the trails in the off season and at night. The tracks are very visible. I know everyone would like a connection from the Village but I don't think it is worth the cost for 6 months and I really feel that there would be major conflicts with horses and the animals that reside in that part of the park.

Topic Question 3:

I would eliminate taxis, put a limit on the scenic guide cars, and possibly put in another lane for those with passes. Some pull outs would be nice then the slower cars could pull over. Might be a good idea for the visitors center to quit telling the visitors that to see animals, they should go down the Moose Wilson Rd.

Topic Question 4:

I think there will always be traffic and having lived near the road for 26 years, that's just the way it is. If you're in a hurry, perhaps you shouldn't use the road. I can still remember before we moved here and getting off the plane and traveling down the Moose Wilson Rd. You just felt at peace. I have spoken with a lot of visitors who have come out to our area for many years and they feel the same way. Yes, there is more traffic but that's ok with them. They love the drive no matter how long it takes them. One of the problems is with people that use the road to get to work and are in a hurry to the airport...go around.

Comments: The night of the open house, I spoke with several of the park representatives. I specifically asked why in two of the alternatives, they would eliminate concessionaire parking at the Sawmill pond area. None of them could give me an answer including the representatives that worked on the plan from Denver. I found that a little odd that not one person could explain the reasoning. I spoke with the Superintendent regarding the responses. A few other things bothered me about the open house as when I asked about the animal disruption and the amount of vegetation that would be removed, the response was more or less we have no idea. Well, the last plan I had read gave specifics regarding the amount of trees that would be lost. At this point, the only person to address this issue in the newspaper was our town councilman, Jim Stamford. Impressed with him!

Yes, I am a horse person but have thought about all of the alternatives very carefully. Yes, we run a ranch at the southern boundary of the park and feel strongly that I need to represent our guests. 80% of them are return visitors who have visited the park over and over. They have really strong feelings about the Moose Wilson Rd and the beauty of it as it is. They feel as stated above that changes to the road would be horrible for the animals that make that area their home. Yes, a lot of them also ride bicycles but they feel there are enough places for them to ride their bikes.

As I read your document, one of the things I see the park trying to preserve is the culture and history of the area. By changing the road, don't you feel this is going against your goals?

Dear Superintendent Vela,

As a frequent visitor to Grand Teton National Park and a regular visitor Moose Wilson Road, I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

I have seen some incredible wildlife viewing on off of this road including two yearling grizzly bears, moose, pronghorn, and more.

However, I would be in support the temporary closures of this road to benefit the protection of wildlife. I have experienced vehicles traveling much too fast on this narrow road.

Thank you.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:
Eliminating all commercial traffic. Only traffic should be visitors.

Topic Question 2:
Closing the road 2 days a week may prevent a visitor with limited time from entering on the only day they might be in the park

Topic Question 3:
I think traffic should be stopped at a point in both directions, then allow visitors to use the existing road that is now closed to traffic as a foot trail.

Topic Question 4:
Need to devote a large portion of this road to foot/bike traffic only.

Comments: This is one of the best spots for wildlife viewing but the narrow road and heavy volume makes it hazardous for everyone. The goal should be to limit vehicles while encouraging visitors to leave there vehicles and hike to see the wildlife.

Topic Question 2:
7220 N. Keeler Ave

Comments: I feel that we should not develop a plan that will put creatures, plants, etc in museums, dead and stuffed. We have an obligation to keep wild areas wild without snowmobiles blasting in the hard to reach areas where animals find solitude and rest. Sometimes the gov't has to say no to people who want more and more from nature and the environment. I have not responded to above questions because I simply feel that less is more in this case. Please maintain the wild areas as close as possible to what they have been for centuries. Some things are sacred and we continue to unbalance nature and every time we try to do a better job in that balancing act we fall on our faces. We spent tax payer money to re-establish wolves and now we are killing them. One aspect is the inhumanity and the other is how stupid all this looks to taxpayers. Is there no sanity in the gov't at the highest levels.
Thanks,

Topic Question 1:

Alternative A. The current state of the road seems to control the amount of traffic adequately. The only complaint about this alternative is there aren't sufficient turn offs in the areas with the most sightings causing dangerous situations with tourists and locals.

Topic Question 2:

Alternatives B, C and D. Closing the road would add confusion and inconvenience for both visitors and locals and would reduce the tourist experience. Also, the grizzly bear presence would create a dangerous temptation for tourists to tangle with this dangerous but beautiful animal.

Topic Question 3:

Yes, increase the size and number of turnouts for tourists to stop there cars. Adding more signage at the new turnouts explaining the dangers and educating the public with lots of details about the wildlife.

Comments: Keeping the unpaved section but increasing turnouts (size and number) but not adding a bike path would be my suggested alternative. Bike paths out in the open give humans and animals enough warning of each other. Putting a bike path in the woods is asking for trouble.

Topic Question 1:
Please protect the moose habitat of this area and reconsider plans for further development. The fragile ecosystem of this natural area and the rarity of such an important habitat for moose should not be ignored.

Topic Question 2:
Creating further roads and development in this area is detrimental to the natural environment of the area. The natural environment cannot be recovered once it is gone. It is our duty to protect these moose as well as motorists by ensuring that the moose have their own sanctuary free from human disturbance.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 2:

My family has spent 8 vacations on the R Lazy S Ranch. I have always felt like the ranch went out of its way to be a good steward of the park land. Historically, the dude ranches have been a part of the western experience and of course trail riding on safe and beautiful land is the major part of this experience. It is very important to keep the trails to Whitegrass open for horses. The old ranch is interesting and certainly gives a glimpse into the past...which is also a part of the park service's mission.

I am opposed to putting more bike lanes and trails on the Moose-Wilson corridor. To remove so many trees for a bike trail that will be used by so few is certainly not a good use of our natural resources.

Topic Question 1:

I agree with the stated Goals and Desired Conditions. The corridor is a visitor destination, not just a pathway for traffic.

Topic Question 2:

Do NOT realign the road nor construct any new segment. The old roadway cannot be restored to natural conditions. Do not construct a multiuse pathway parallel to Moose-Wilson Road. Limit commercial trips and development, perhaps to make the road/area accessible to handicapped persons who cannot drive, or to limit use of private vehicles IF not continuing through the park system (as to Yellowstone etc.), perhaps with a permit to be applied for in advance or at admission.

Comments: I value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. Topic Question 1:
Prefer Alternative A. No action approach. Keep area as wild as possible.

Topic Question 2:

1. A bicycle path (Alt D.) will ultimately degrade the habitat. See road closure for grizzlies 2014. Public resentment of present Park Pathways has been noted.

2. Keep unpaved portion of road as is-unpaved. Slow traffic down. Don't let this road become a high speed auto-bicycle short cut for West Bank-Teton Village residents. This is a wild life corridor, not a shortcut.

3. A 60 car parking lot for Death Canyon-White Grass Area (Alt B,C,D) will encourage heavy traffic on the road, Do not turn this area into another LSR Preserve-South Jenny Lake heavy visitor area. Parking on the side of the MW Road would become a reality quickly.

Topic Question 4:

Significant public and private dollars and will have built the White Grass Historic District. We should be mindful of this fact.

Comments: Again, Pathways and 60 car parking would contribute to a Disneyland attraction and distract greatly from the natural beauty that is still preserved under Alt A.

Topic Question 1:

The strategies outlined in Alternative D do the most to enhance the visitor experience and protect the resource.

Topic Question 2:

Any strategy that closes the road at any time during May-Oct., other than for wildlife/human conflict avoidance, would be difficult to manage by users. Any strategy that calls for paving the road would be detrimental to the experience and to the resource.

Topic Question 3:

No, there seem to be enough options. The NPS has done a good job listening to all sides of the debate and has included a range of strategies that satisfy the goals of many different types of users.

Topic Question 4:

I vote for Alternative D. In light of increased usage and a change in the type of users, presently and conceivably in the future, to be more apt to visit the park on a bicycle or on foot rather than in a car, Alt D is the best solution for the safety of the users and for the maintenance and protection of the resource (wildlife, environment).

Topic Question 1:
Think future! Eventually a bridge will have to be built over the Snake River. This would take a lot of traffic away from the Moose/Wilson road. I would keep the road as wild as possible.. Once it is paved and widened, there is no turning back. No pathways. Put in a one way road. The road should not be developed as a convenience for air travelers.

Topic Question 1:

1. Road realignment. The road needs to be moved out of the wetlands area between the Death Canyon Road and Sawmill Ponds as shown in alternatives B and D. The road also should be realigned on the north end to create a 4-way intersection at Chapel Rd and move the Moose entrance station to the south of this intersection. Additional entrance stations seems like a waste of money and will increase staffing costs. Fewer entrance stations and creating access to Moose-Wilson road inside the fee area will make for a better visitor experience and may decrease some traffic (southbound) on Moose-Wilson Road.

2. Gravel section of M-W Road should be paved. It will make a better visitor experience and decrease maintenance costs and closure times related to dust abatement.

3. Move Death Canyon trailhead to the White Grass road junction. This will decrease auto impact into the Death Canyon area and improve parking there.

4. Create a pathway between Moose and the Granite Canyon Entrance Station. This will create a better user experience and help complete a valley-wide pathway system.

Topic Question 2:

1. No action in alternative A is really not an answer. There are improvements that need to be made.

2. Roadway termination at LSR doesn't make sense. The closed portion of road is so small that, yes, it might cut down through traffic but there would still be traffic on nearly all portions of the road.

3. Relocating the Moose entrance station and building a new fee station on the north end of M-W Road seems silly: it's a waste of money and creates unnecessary stops for visitors. Realign the north end of the road and move the Moose station to the south of the road (or leave it where it is).

4. Temporary restriction of traffic and a reservation system seems complicated and creates unnecessary management requirements. The Park can't even manage some of the current needs. Why create more work for staff? It also seems like it makes for a confusing system for visitors.

5. Winter closure of M-W Road at Murie center is a bad idea. This effectively cuts off winter access to the Death Canyon area and the popular ski destination of Wimpy's and Mt. Albright. The winter plowing of the road should continue to the Death Canyon trailhead road as it currently does.

Topic Question 3:

If one of the goals is to protect and restore natural hydrologic features, as stated in the Aquatic Resources Goals and Conditions, why is there no mention of freeing up Lake Creek from the levys that confine it in the southern portion of the M-W Road area?

Comments: In summary, my personal opinions for an improved Moose-Wilson corridor for natural resources, wildlife and visitor experience include:

1. Pave the gravel section.
2. Realign the road to get it out of the wetlands area.
3. Realign the road on the north end to put the intersection inside the fee area. Driving from the south and having to go through 2 entrance stations is a frustrating and frankly terrible visitor experience.
4. Put in a pathway between Moose and Granite Canyon entrance station to help complete the valley-wide pathway system.
5. Relocate and improve the Death Canyon trailhead at the White Grass Ranch intersection.
6. Improve parking at the Death Canyon trailhead road.
7. Maintain winter plowing from Moose to the Death Canyon trailhead road as it currently is.
8. Do not implement any vehicular travel restrictions along the road until after above road improvements are made. Let people use it and see how usage has changed, if at all. I believe through-traffic from the north will be decreased if the north end of the road is realigned to be inside the fee area.

Topic Question 1:

None of the strategies in this should be carried forward. The road is already over-managed to segregate people from wildlife. The alternative I'd like to see would back off on policies that close the road to "protect wildlife" when in reality they're just trying to ease management headaches. Wildlife is not harmed by humanity that enjoys watching it from a safe distance.

Knowing that's not going to happen since the Park Service will do its own thing anyway, I will suggest that the roadway remain always open to through traffic and that areas where wildlife is often sighted should have more parking and access so tourists and locals can more thoroughly enjoy the wildlife without blocking traffic.

I say this because my family, coming from Wilson, frequently uses the road as both a thoroughfare into the park and as a destination simultaneously. We enjoy the experience of bypassing town and driving through a gorgeous area with the possibility of spotting some of our favorite animals like moose and bears. But when bears are most likely to be seen, the park frustrates our plans and deflects us through town.

I know the park and its wildlife is supposed to be protected, but the line has long since been crossed into over-management of resources. People's access to the land shouldn't be taken away to make management simpler. Open access should always be the No. 1 priority, regardless of if a grizzly bear is easy to see along the way.

Topic Question 2:

A paved bike path may not be a bad thing, but the things bundled with that plan again over-manage the

road. Access should always be open, even for locals who like to use the road as a scenic entrance to the park that bypasses the busy town of Jackson. A reservation system for a road is absolutely crazy. The bike path would alleviate some local traffic, especially. And the argument of "wildlife habitat connectivity" is a farce. Animals can safely cross the slow-moving traffic on Moose-Wilson road. I've witnessed it many times.

Topic Question 3:

Embrace the road as a wonderful asset to the park. I feel like the park too often sees it as a management hindrance and nothing else. People love the experience they have on Moose-Wilson. Make it more accessible, not less. See my comments on adding parking up above. Creating gravel pullouts along much of the roadway seems a small price to pay to allow people to love this road and use it as well. See comments to question 1.

Topic Question 4:

Please stop trying to lock me out of the park. It's public land and should be accessible to the people. Always.

Comments: I love Moose-Wilson road and can't stand the thought of not having open access to it. I know of hundreds of locals and tourists who would resoundingly agree that locking people off the road will only solve the park's problems, not the people's. Park management ought to reevaluate its positions toward the people, since the NPS was created to keep beautiful places open to the people. Blocking them off to the people they were created for in the name of wildlife is just wrong. People and animals can and do co-exist.

Topic Question 1:
I love Plan D: I love the idea of riding my bike safely through this part of the park. And the road changes are good. I have lived here 20 years, consider my self a conservationist, and am very excited about plan D. Thanks for all of your hard work on this issue.

Topic Question 1:

Reduce (or at least maintain) the speed limit: If people really are looking to "experience" a beautiful drive, with the potential for wildlife sightings, then they need to go slowly. Slow traffic minimizes the dangers of a road shared with cyclists. This will also discourage drivers using it as a "shortcut" from place to place.

Maintain the size of the roadway: It keeps traffic speeds down, and is part of the "charm" of this byway. Upgrade and define a few limited shoulder parking spots,.

Limit the winter grooming of any portion of the road. The Park should focus on doing a good job of grooming the Teton Park Road, and leave this road to skiers who are looking for a different experience.

Topic Question 2:

A separated bicycle pathway: While this would provide an exceptional recreational experience, I do not believe that it would reduce vehicle traffic, and do think it would create more habitat destruction and interference for wildlife.

Parking lots with interpretive kiosks along the roadway: Good information can be provided at each end of the road, then folks can travel along and "see what they see", without all of them stopping at pre-determined points.

Electronic warnings when the road is "congested" or parking lots are full. This set up would be difficult to

manage, and requires personnel to constantly assess parking lots and traffic flow. I already hate having NPS rangers be parking lot attendants at the LSR...it is a waste of money and professional expertise.

Closing the road to vehicles 2 days/week seems too complicated and sort of arbitrary. It could just create more traffic on the open days. I would be very frustrated by that if I was a visitor here on a limited time vacation.

Topic Question 3:

The proposal to turn the road into one-way, with a dedicated bike lane (like Jenny Lake road) is appealing, but has other consequences that may not be helpful overall. Still worth considering.

Rip out the asphalt and maintain as a true western "back road", with enough rocks and dust to discourage many folks, and slow the rest of them down.

Topic Question 4:

I'm uncertain how important it is to realign the No. end of the road, but support the professional assessment that it would be more suitable for wildlife protection, and still allow good critter-viewing.

I am supportive of seasonal or temporary closures based on the needs/activities of wildlife in that area.

Comments: Thank you for doing your professional best to develop a reasonable plan for this area that will safeguard it's natural and historical values into the future.

Topic Question 1:

Preserve the area as a way to experience nature undeveloped. Protect this precious wildlife habitat from further recreational development. Protect the area for future visitors who wish to experience solitude as it was decades ago. Do not allow new paths to be created which in any way would increase the number of human visitors (regardless of their chosen mode of transport). Please do not allow the Moose-Wilson road to become a human transportation corridor. Its only purpose should be to allow limited visitor access to the immediate area. Not add convenience to those who have chosen to live in Teton Village and want a faster or more convenient path to Moose or the rest of Teton Park. Carving up this wild area to create yet another new cycling opportunity for the insatiable Pathways lobby WILL NOT improve safety. Deaths have occurred on existing pathways due to reckless cycling.

Topic Question 2:

Adding new pathways, increasing parking, improving roads for any reason. Adding capacity to the transport infrastructure only serves to increase human incursion into the area. The only construction option presented which seems worthwhile is relocating the north portion of the old road away from the ponds. But only as long as the old road is abandoned and revegetated. The new road should be of minimal width with some turnouts to minimize destruction of the sage flats. Special access when motorized access is forbidden should be limited to those on foot only.

Topic Question 3:

Top level strategy statement:

Moose-Wilson will not be allowed to become a transportation corridor for those wishing to access the

greater Teton Park from the Teton Village area. The sole purpose for any road through this area is for accessing the adjacent Park areas as a destination.

Comments: Mountain cyclists do not recognize the impact that their use of trails has on wildlife, horses and hikers. Their use, and abuse, of trails displaces all these other users. Of course their response is "just build us more trails for our sole use". Such an attitude is incompatible with the core principles of a National Park. Teton Park is not an amusement park for human recreation. Wildlife and the protection of habitat must take priority.

Humans will always, if not constrained, overwhelm beautiful places. Just look at the Jenny Lake parking lot in July. It is overflowing into the sage. In my view visiting Jenny Lake during this human flood is not a very pleasant experience. Yet with ever more visitors each year, the Park's stewards (you guys) are faced with a choice. Protect and Preserve the Park or build larger parking lots. I hope you have the courage to choose the former option.

Topic Question 1:

I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Speed bumps are another option to keep speeds down and to reduce collisions with animals and people.

Topic Question 2:

I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

Topic Question 3:

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided. There are also options such as, speed bumps, and safe animal crossings above or below the road way.

Topic Question 4:

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States. We need to protect it for future generations.

Topic Question 1:

I like the paving & realignment of Alternative C and the pathway of Alternative D. If these are mutually exclusive, then I'd choose D and maintain the unpaved portion better.

Topic Question 2:

Alternative A does not do anything or achieve any goals. We need to improve the existing road at the very minimum. Alternative B does nothing to provide for safety of pedestrians or bicyclists or improve their experience and safety.

Topic Question 3:

How paving and realigning the whole the entire road and adding the pathway (maybe using the existing road in places where practicable.)

Topic Question 4:

I think the idea of reservations to use the road and the limiting of traffic on the road by turning away visitors, will lead to a very negative experience for visitors. In addition, it will require more labor and time on the part of Rangers and other Park Service Employees, leading to more cost.

Topic Question 1:
Alternative A- no action. The systems and roadways currently in action are working.

Topic Question 2:
All alternatives excluding alternative A (no action) should not be carried forward. By adding to and altering the Moose Wilson Road more congestion issues will arise, and it will be more invasive to the local ecosystem and environment. Leave it be.

Topic Question 3:
No other strategies should be included, no action should be taken on this matter. Issues should be dealt with as they have been on a case to case basis and the Moose Wilson Road should be maintained and regulated as it has been.

Topic Question 4:
Leave it be.

Topic Question 1:

I support Alternative D. It addresses a pathway and it manages resource protection as well as provides an outstanding visitor experience. The road realignment is an excellent idea too. My father, at age 82, is an avid cyclist. Riding down the dirt section of Moose-Wilson is no longer an option for him. I hope to continue to ride with him for years to come and the loop from town to Moose to Teton Village and back to town is an event he and I have not been able to accomplish in over ten years. With the swift addition of a pathway along Moose-Wilson, it is my hope that he and I will have many many years together to enjoy the amazing scenery and wildlife along this amazing bike route.

Grooming the unplowed section of roadway in winter is an excellent idea. As an ardent user of Death Canyon road / trailhead in Winter, I support the reconfiguring the winter parking aspect. How far north will parking be realigned?

Topic Question 2:

Gates and closures will only exacerbate traffic in other parts of the county. Roadway redundancy is poor in Teton County, let's not make it any worse.

Topic Question 3:

Please also consider transit as an option and opportunity to reduce vehicular traffic along the corridor.

Topic Question 4:

Thank you for the opportunity to submit comments.

Topic Question 1:

I think the concept of linking existing pathways within the Valley and the Park is an excellent idea. By providing safer alternatives for non-vehicular traffic, that eases some of my safety concerns surrounding biking the Moose-Wilson Road.

Topic Question 2:

I do not like the idea of paving the entire Moose-Wilson Road and maintaining it year round. I also do not like the idea of selecting certain days of the week as bike only days and other days as drive only days. These shortsighted options poorly merge different traffic patterns (some seasonally) within the Valley.

Comments: Please consider Alternative D as the best choice going forwards. Thank you!

Andy

Topic Question 1:

I prefer a combination of Alternative B and C. I like the idea of Alt B re-aligning the northern section of the Moose Wilson road away from sensitive habitat. I like Alternative C for the proposal to close the road 2 days a week to vehicular traffic. I am very afraid of any proposal that improves the road and allows for more traffic; otherwise, in 10 years this may become a major highway front eh airport to Teton Village with disastrous consequences for the wildlife.

Topic Question 2:

Any element that promotes MORE traffic flow is deleterious to the Park.

Topic Question 4:

see Question 1 for my overall thoughts. I am for minor improvements to the road and promoting non-vehicular use but I am against building a bike path as that is too disruptive to the eco-system in the area.

I am pleased to submit comments on the Moose Wilson Road proposals. I cannot endorse any one of the alternatives without reading the EIS that will be issued sometime next year. In the meantime, I would like to make the following recommendations pending the review of the EIS which could change my recommendations:

- 1) Pave the gravel portions of the existing right-of-way.
- 2) I support the turnout and parking recommendations suggested in alternative D
- 3) I support the road realignment that is part of Alternative D.
- 4) I support the Death Canyon proposal in Alternative C

In addition:

- 1) I would recommend continuous free bus/van transportation from the GTNP Visitors Center to the Rockefeller Preserve.
- 2) Drivers must be told, in whatever way is effective and reasonable, that the Moose Wilson Road is a slow speed, winding, scenic road maintained to enjoy the natural resources of this special place and the recreational opportunities near by and to be aware of people walking and riding bicycles.

I will await the EIS and will respond to that document.

Best Regards,
Bruce Hawtin

September 12, 2014

Grand Teton National Park
Attn: Moose-Wilson Planning Team
P.O. Drawer 170
Moose, WY 83012-0170

Sent via email to:

Dear Planning Team:

On behalf of our 1.2 million members and supporters nationwide, Defenders of Wildlife thanks you for the opportunity to provide comments on your preliminary alternatives for the Moose-Wilson corridor. Defenders of Wildlife (Defenders) is a national non-profit conservation organization founded in 1947 focused on conserving and restoring native species and the habitat upon which they depend.

The Moose-Wilson corridor is a unique and valued treasure for both visitors and residents. We recognize that maintaining the ecological integrity of the Moose-Wilson Corridor while balancing the needs of visitors and increased congestion along the road is challenging. National Park visitors are a vital component to this region's economy. By engaging visitors Grand Teton National Park creates long term understanding and awareness of conservation issues impacting the west. A recent study concluded that visitors would be willing to pay around \$41 more in Yellowstone entrance fees just to see a bear

(Richardson, et. al. 2014), a reason why people also frequent the Moose-Wilson corridor. Increasingly this region is witnessing development pressure south of the Park. However, we urge Park officials to be cautious when considering any plans for the corridor that may be contrary to the purposes of the Park.

Grizzly bears have now recolonized and frequent the Moose-Wilson corridor. Roads have been shown to increase mortality of grizzly bears, cause area avoidance and fragment grizzly bear habitat (Kasworm & Manley, 1990; Mace, et al. 1996; Proctor, et al. 2012). Park officials must take into consideration impacts to grizzly bears of any potential improvements to the roadway such as increased vehicle traffic and increased speed at which vehicles travel along the road. Increased speed and increased vehicle use can result in an increase in wildlife vehicle collisions which raises the number of wildlife mortalities and can become a human safety concern. Faster vehicle traffic may also diminish the visitor's anticipated unique and rustic wildlife viewing experience.

Alternative A - No Action

Defenders appreciates options presented in Alternative A but recognizes the need for changes that could provide improved balance between visitor and local use of the road with ecological integrity and wildlife security important to the area.

Alternative C - Balance of preservation and public use

Alternative C provides interesting suggestions that could minimize congestion within the corridor while sustaining an acceptable level of access. By not paving and maintaining the alignment and width of the corridor, speed through the corridor would presumably be less than through a paved corridor (also in Alternative A). This could prevent additional direct wildlife mortality on the road. We are also intrigued by the idea of timed sequence techniques for vehicles entering the corridor as a way to address congestion. Additionally, closing the corridor two days a week to allow only bicycles and pedestrians is worth exploring further, though bear-human and other wildlife conflicts with pedestrians and bicyclists would remain issues.

Alternative B - Visitor Destination

After reviewing all of the preliminary alternatives, Alternative B appears to be a conservative but balanced approach to improving the corridor while maintain the ecological integrity and the natural experience of the area. We would like to see this Alternative carried forward into the next steps of the process. While we are concerned about increased speeds that can coincide with paving the remaining unpaved section, we strongly support:

- The proposed action to realign the road to the east of the beaver ponds to restore wetland function and habitat connectivity.

- Reduced speed limits, restricting traffic during peak periods, closing the corridor to through-travel during these times and retaining the narrow, winding character of the road.

- The proposal to relocate Death Canyon trailhead to the end of the pavement and conversion of the 1 mile of currently unpaved road to trail

- White Grass Ranger Station conversion to a backcountry cabin.

Alternative D - Recreational and Broader Park Experience

While we do appreciate that this Alternative leaves the unpaved section unpaved and provides the option to move the roadway away from the wetlands, Defenders urges the Park to reassess impacts that the addition of a separate bike path will have on grizzly bears and those traveling in bear country. Bicyclists moving along a well maintained bike path can travel quickly and quietly. This can result in sudden encounters between bicyclists and grizzly bears. The sudden encounter is the most common situation associated with grizzly bear-inflicted injury (Herrero, 1990). We ask Park officials to coordinate new

consultation with the U.S. Fish and Wildlife Service, the Interagency Grizzly Bear Study Team (IGBST) and the state's grizzly bear biologist to discuss impacts that modifications or "improvements" on the Moose-Wilson corridor will have on grizzly bears and grizzly-human encounters. It is important that Park officials take into account the potential for increased grizzly-human conflict and the potential for additional grizzly bear mortality when developing this management plan.

Commercial and Through-Traffic

Defenders would like to see a limit or restriction on taxis and other through-traffic. Alternative B and D provide some prohibitions on commercial traffic including taxis. We feel this is an appropriate approach worth exploring further.

Pullouts and Parking

Alternatives B, C, and D include adding pullouts. Pullouts can be strategically placed to allow for safe viewing opportunities that do not degrade the surrounding habitat and can be useful for disseminating educational information. They can, however, provide people more opportunities to stay in the corridor longer, potentially with greater impacts to wildlife. We are concerned that there will be the potential for habituation of bears that frequent these areas. This would be a particular concern at parking areas for wildlife viewing. Park officials should provide a number of parking and pullouts that balances visitor use while not creating habitat fragmentation or wildlife conflicts. We feel Alternative D exceeds that balance.

We ask that Park officials ensure anthropogenic attractants are contained in a bear-resistant manner or removed from the area to avoid food conditioning bears in the area. This may include the placement of bear-resistant garbage containers at pull outs and interpretive stops. Wildlife viewing areas should be sufficiently monitored by park staff to address any wildlife conflict issues and appropriate wildlife viewing, and bear aware signage should be placed at entry gates. We also ask the planning team to outline how the park will address human-wildlife conflict potential.

Realigning road/junction away from wetlands

We strongly support moving the road and the junction away from the Sawmill Ponds wetlands (Alternative B and D). Sawmill Ponds wetlands is one of the most popular stops along the Moose-Wilson corridor due to wildlife viewing opportunities. This area is important wildlife habitat. Relocating the road away from the wetlands will improve wildlife connectivity and security, reduce vegetative impacts of visitor-created parking and still allow visitors viewing opportunities.

Death Canyon and White Grass Road and Ranger Station

We feel it unnecessary and against the goals and nature of this wild corridor to maintain a paved road and/or create a new connector road between Death Canyon and White Grass road as is suggested in Alternatives A, C and D. We would rather see, as suggested in Alternative B, the Death Canyon trailhead relocated to the current end of the pavement and the unpaved portion converted to trail and the conversion of the White Grass Ranger Station to a backcountry cabin. A backcountry cabin would be a more balanced approach at allowing visitor use while keeping in line with the corridor's Desired Conditions for Scenery "to provide visitors with opportunities to view wildlife and be immersed in the intimate natural settings of the corridor which are not diminished by development."

In Conclusion

We appreciate Grand Teton National Park's open and public process in developing a range of alternatives for the Moose-Wilson corridor. Any alternative should preserve the purposes, fundamental resources and values of Grand Teton National Park. This includes conserving the Moose-Wilson corridor's "critical ecological role" (GTNP Scoping Notice) which we believe to be a vital resource to the region. The

Moose-Wilson corridor provides an inherently unique opportunity for visitors to experience what makes Grand Teton and the surrounding Greater Yellowstone Ecosystem one of the truly rare wild places remaining. It should be conserved as such for future generations to appreciate. Thank you for the opportunity to comment. We look forward to continued engagement on this issue.

Sincerely

Erin Edge
Rockies and Plains Representative
Defenders of Wildlife

Topic Question 1:
They do not need to be carried forward

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

No new paving of existing road surfaces. Keeps the vehicle speeds down and maintains rural character.

Realignments at identified sensitive areas. Moves the traffic away from the sensitive areas animals tend to utilize thereby limiting conflict.

Topic Question 2:

No separated/dedicated pathway for peds and cycles. Forcing this demographic to share the road is a safety hazard.

Topic Question 3:

Should there be an alternative that removes the road altogether? It's not really ideal for anyone (speaking for human kind), but in the long run may be a nod to the larger picture of how we're loving our parks too much. Upgrades like what are being considered here always tend to take a little more of the scenic and wild character away from the overall park experience and for the flora and fauna that depend on this area for their very survival. Sort of like death by a thousand cuts. I realize it's not a popular opinion by any means but in the long run may be what's best for such a sensitive area. None of us can speak for the Murie's or Lawrence Rockefeller directly, but they've taught us to think bigger than any one special interest group or individual. I for one love riding my bike and would love to see a dedicated pathway through this area for safe travel to enjoy the park. I also love to ski from the Death Canyon parking area. That said, I would be willing to see the road be removed altogether if it meant this part of the ecosystem could recover and thrive more. I realize this would tend to limit the number of people that might access

this area in the future, but it also doesn't mean it's off limits completely either. It's just harder to access. I don't believe the Parks were created to guarantee 100% access to every single person in every square foot of the park's boundaries.

Topic Question 4:
See Q3

Comments: Of the 4 alternatives, I would choose Alt D. But as mentioned, I wonder whether we should be looking at this from a broader perspective...from 30,000 feet...to truly understand the impacts of what are being considered with this corridor.

Topic Question 1:

I believe we cannot have our cake and eat it too. Making the M-W corridor more easily accessible by improving the road or adding a bike path will inevitably negatively impact the very elements of the corridor that make it attractive to visitors. There are plenty of areas of the GTNP with easy access to vast multitudes of visitors with minimal effort on their part; it is better to keep this corridor more primitive, which will naturally limit the numbers of visitors. In fact, you should consider closing the corridor to commercial traffic between the airport and the village.

In addition, I agree that changing the location of the road in the northern end of the corridor would reduce the risks to wildlife and humans caused by the congestion that results from people stopping to view the wildlife. I agree with the suggestions from the group calling itself the Friends of Moose-Wilson Corridor, including changes in the northern end of the road, no changes in the southern end, and even considering ways of reducing traffic on the road in general, to allow the continuation of the proliferation of the very wildlife that makes the corridor so important and valuable.

Topic Question 2:

any strategy that increases the human presence will run counter to the most critical values of the corridor, that is, the safety and proliferation of the wildlife, so should not be carried forward. So the easiest answer to this question is : "all strategies EXCEPT rerouting the road on the northern end of the corridor are inconsistent with the purpose and do not address the most important needs of the plan.

Topic Question 3:

Strategies for reducing the number of cars going through the corridor should be considered

Comments: I believe we cannot have our cake and eat it too. Making the M-W corridor more easily accessible by improving the road or adding a bike path will inevitably negatively impact the very elements of the corridor that make it attractive to visitors. There are plenty of areas of the GTNP with easy access to vast multitudes of visitors with minimal effort on their part; it is better to keep this corridor more primitive, which will naturally limit the numbers of visitors. In fact, you should consider closing the corridor to commercial traffic between the airport and the village.

I have been vacationing at the RlazyS Ranch for the past 12 years. The horseback riding in Teton National Park is absolutely awesome and there is no where else in Wyoming I would rather ride horses. But if you actually DO put a bike trail through the park on the Moose-Wilson Rd. it will destroy everything about horseback riding in the park. Accidents WILL happen as horses are 'spooked' by the bike riders and you will certainly ruin the quiet beauty of riding horseback in the Tetons!!!! PLEASE DO NOT ruin this beautiful natural riding venue by putting a bike trail on Moose-Wilson Rd.!!!!

Thank your for your attention to this matter.

Sincerely,
Arlene Hayler

Topic Question 1:

The Moose-Wilson road corridor should be maintained as it is. Viewing wildlife is a precious opportunity which is rarely available to most people outside of parks.

Topic Question 2:

Any expansion of human impact should be avoided at all costs - even if visitors have to be limited to a waiting list. Otherwise we will lose that which we wish to protect. As human population expands, wild areas are fewer and fewer. Those remaining should not be degraded.

Comments: I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. Topic Question 1:

The main issue seems to be conflict with wildlife and habitat while allowing access for those who want to enjoy the park.

1. Re-align the road so it does not go near the pods and marshes -which should reduce the impact on wildlife habitat.
2. Enlarge the parking at death canyon trailhead so people don't park illegally.
3. Add a bike path to reduce the number of cars and allow folks to enjoy the park outside of their cars.

Topic Question 2:

Doing nothing.

the Gate idea. - I mean seriously - that is messed up in a public owned park.

Topic Question 1:

On behalf of the Wyoming Office of Tourism, we are pleased to have the opportunity to provide comment on the proposed preliminary alternatives for the Moose-Wilson Corridor. Grand Teton National Park is an incredible asset for resident and non-resident visitors alike. The delicate balance between preservation and accessibility ensures the grandeur of these significant resources for generations to come.

It is the opinion of the Wyoming Office of Tourism that Alternative D provides the greatest potential to connect all visitors to the broader park experience. The incorporation of a separated multi-use pathway supports and promotes year-round multimodal transportation alternatives, and expands winter recreational opportunities within the corridor. The commitment of a separated multi-use pathway also eliminates safety concerns that are presented with the other shared roadway alternatives. Finally, Alternative D maximizes the visitor experience and education/interpretation initiatives with the commitment to additional turnouts and viewing areas with the capacity for interpretive media, programs, and materials to enhance the visitor experience.

However, it is the recommendation of the Wyoming Office of Tourism to adopt the traffic management strategy presented in Alternative C rather than the reservation system proposed with Alternative D. Providing traveler alerts and queuing lanes on the north and south end of the corridor would allow for effective management of traffic volumes and self selection of alternative routes without deterring visitors before they arrive at the park. A reservation system may ultimately discourage or hinder visitation.

Domestic and International visitation to the United States, Wyoming, and to our National Parks continues to grow year over year. The US Department of Commerce forecasts 3.6%-4% average annual

growth in the travel and tourism related sector for the next five years. Alternative D provides a sustainable alternative to manage this growth without deterring or restricting the resident and non-resident visitor experience.

Topic Question 2:

Alternative C proposes the closure of the Moose-Wilson road two days per week for dedicated pedestrian and bicycle access. This proposed alternative will likely cause confusion and dissatisfaction with travelers who are unaware of the closure prior to arrival.

Topic Question 1:

The Moose Wilson Road has been determined eligible to the National Register. An archeological site is also in the path of the proposed road realignment. For those reasons the Teton County Historic Preservation Board supports all strategies that preserve both of these cultural resources: the creative adaptive management strategies outlined in the newsletter, such as reservation systems, time-of-day and week limits, public transit, queues, a gate at LSR, etc.

Topic Question 2:

The Moose Wilson Road has been determined eligible to the National Register, and the realignment of the road and the addition of a bike path would make the road ineligible to the National Register. An archeological site is also in the path of the proposed road realignment, and that would be disturbed, if not destroyed in the realignment process. While we certainly understand the thinking behind those measures, in the interest of cultural resources, the Teton County Historic Preservation Board does not support the road realignment or the bike path.

Topic Question 3:

We share with the Teton County Commissioners support for creative alternatives to managing traffic, such as public transit and limiting commercial traffic. It is our opinion that these alternatives should be prioritized over the bike path and road realignment.

Topic Question 4:

Please make clear to the public in the next planning document the impacts to cultural resources for each alternative. Cultural History and Resources were listed as a "Goals and Desired Conditions" category, but

it was not made clear which Alternative was preferable from the standpoint of Cultural Resource Management, and which alternatives had adverse effects on cultural resources. No where in the document was it made clear that the road itself is eligible to the National Register, and that realignment and the addition of a bike path, would affect its eligibility.

Correspondence Text

Topic Question 1:

For the sake of wildlife values, through traffic on this sensitive portion of the park should be eliminated. Also, a separate bike path should not be included.

Topic Question 2:

A separate bikepath should not be included in the plan. From my observations of wildlife, people on bicycles are much more disruptive to wildlife than people in automobiles. Just like in Africa, animals become very accustomed to vehicles. But, seeing the human form or shape outside a vehicle is frightening to wildlife. This is not to mention the fact that being on a bicycle and confronting wildlife can be dangerous to the bicycle rider. Bicycle riders already have sufficient access to the park. Also, we don't need or want the additional paved areas that a separate bicycle path would entail.

Topic Question 3:

Closing the road at night should be considered. Wildlife is often active during night time hours and is difficult for drivers to see. Give wildlife a break at night. Let them have the Moose Wilson Corridor to themselves for at least those hours.

Topic Question 4:

Could this road become a special use toll road? Could an extra charge be made to use this portion of the park, with the idea being that traffic would be reduced?

Comments: This area of the park is particularly rich in its wildlife values. Visitors flock to this area to enjoy wildlife. Pass through traffic needs to be eliminated. Adding a separate bicycle path will lessen the

wildlife value of this area of the park. Do not construct a separate bike path.

Topic Question 4:
Alternative D should not be adopted. No bicycles pathway should be constructed as it would adversely impact habitat and animals . Paving the unpaved portion should be done; the wetlands expanded and better protected ; better turnouts and parking are needed; better patrolling by law enforcement is needed; one-way traffic options should be strongly considered.

Topic Question 1:

Alternative C is my choice. I like keeping the current portion unpaved while grading it periodically throughout the year. This choice limits the environmental impact with some improvement. More importantly, 1) by not paving the entire roadway; 2) redirecting it; and/or 3) creating a new bike path will help limit the amount of vehicles and cyclists that would ultimately be attracted to using the Corridor under Alternatives B and D.

If not Alternative C, I support Alternative A.

Topic Question 2:

I am very concerned with the environmental impact of adding a new bike path and extensively redirecting roads. The wildlife is the single most important aspect of the Corridor. We have plenty of bike paths in the area. Alternatives B and D most likely will attract more vehicles and/or cyclists. That should not be the goal. BTW. I am a cyclist.

Topic Question 3:

No.

Topic Question 4:

None.

Comments: I live 4.5 miles from the South entrance to the Moose Wilson Corridor. I strongly support preserving the Corridor for wildlife and disturbing it as little as possible. Although I understand the desire

for more bike paths and connection to the North, more vehicles and cyclists would occur as a result. That ultimate result does not reinforce our commitment to wildlife and the environment as a whole. Thank you for your consideration.

Topic Question 1:

All the creative ideas to limit traffic without substantially changing the existing road. I support trying the adaptive management techniques.

Topic Question 2:

I spent four summers as a wrangler at R Lazy S, riding horses five days a week from Poker Flats to the JY area, and I appreciate the density of the of wildlife in that area. I am a pathway user and supporter, but I do not think this is an appropriate area to put pathways.

I am also a historic preservationist, and I do not support the measures that would affect the National Register eligibility of the road, or that would adversely affect the archeological site near the Beaver Ponds.

Topic Question 3:

With the Teton County Commissioners, I think public transit, like at Zion NP and others, should be considered as a way to limit traffic.

Topic Question 1:

I believe that Alternative D should be carried forward. The continuation of a link between Teton Village and GTNP is necessary for many reasons. Besides the bonus of convenience, the huge negative factor would be the extra carbon emissions caused by the much longer drive without the connecting road. This goes against environmental concerns. Also, Alternative D will help protect wildlife by shifting the road east around the wetlands and will help mitigate traffic congestion concerns when appropriate. It would be wonderful to have a separated bicycle path both for safety and for integrating the existing pathways inside and outside of the park for the large number of recreating visitors and local people.

Topic Question 2:

Alternatives A, B and C would not achieve all of the needs for the plan. Alt. A does nothing...no help in a situation that calls for change. Alt. B doesn't address bicycle safety and Alt. C would be too confusing with open days and closed days.

Topic Question 3:

Possibly widening the existing road (aside from routing around the wetlands area and still including numerous pullouts) to accommodate safe passage for bicycles would help. But it wouldn't be ideal, especially with the pot-hole situation on the dirt section which forces bicycle riders into the traffic lanes.

Comments: My husband and I appreciate the NP service's efforts to improve the Moose-Wilson corridor situation.

Topic Question 1:

Alternative D is clearly the best of the four. It would most closely achieve the goals of protecting the scenery, natural habitats, aquatic resources and sound scape, as well as enhancing visitor experiences.

Topic Question 2:

Paving and/or re-defining the width of the un-paved portions of the road is a bad idea. As it is, the current winding dirt road sends an important message to motorists, especially those coming from the south: this road is not a thoroughfare, it's a way to experience nature.

Closing the road to motorists two days a week is also a bad idea. It just maintains the status quo for five days instead of seven.

Topic Question 4:

The best part of Alternative D is the multiuse pathway. Such a pathway would offer visitors and residents a completely new and wonderful experience on the road. (Perhaps it goes without saying, but I would not favor Alternative D if it did not also include all the good parts of the other Alternatives: the new Moose entrance, the additional turnarounds, the improvements in the Death Canyon/Whitegrass trailhead, etc.) I have been an inholder in the Poker Flats area since 1959 and will gladly exchange the reduced convenience (i.e. the periodic restriction of automobile traffic) for the transformations that Alternative D offers.

Topic Question 1:

Please keep this road a gravel road to preserve the serenity and the rural characteristic of this area.

Topic Question 2:

Clearly there should NOT be a highway with 18 wheelers barreling down it or cars speeding through this area.

Topic Question 3:

Along with encouraging more pedestrian and bicycle traffic, electric trolleys designed with a Western motive could be used for tourist travel.

Topic Question 4:

I have been to Yellowstone Park and have driven past the Grand Tetons. I was visiting friends who lived there. It has been a long time ago now, I do not remember the road we were driving on, but the scenery was amazing!

I certainly would NOT want see it ruined by more traffic, noise, air pollution and light pollution, etc!!!

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable

traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Correspondence Text

Topic Question 1:

NO Strategy should be considered in its entirety but portions of each should be combined to create the best possible scenario. That being said, clearly Alternative A is clearly unacceptable as use has escalated with the building of the southern entrance station and the LSR Preserve. Alternative D best suits the character of the corridor, however I have serious issues with the Bike Path as designed, and other aspects. ALTERNATIVES B,C & D: TRAVEL ALERTS to inform visitors of congestion is very important to create a situation of self regulation- AGREE!
ALTERNATIVES B & C: low impact interpretive signage should be utilized in all areas of the corridor- AGREE!
ALTERNATIVE D: no substantial changes to unpaved section of road- AGREE!
ALTERNATIVE D: Winter Grooming on road only- AGREE!

Topic Question 2:

ALTERNATIVE D: A BIKE PATH constructed as wide and paved as GTNP pathway is totally against the character of the area. As use of the road for a transportation link is generally agreed to be discouraged (such use as route to airport) the same should be said for the bike path. This should not be built for use by high speed, road bike enthusiasts chalking up miles as they loop through the valley.
ALTERNATIVE B: new north parking lot at LSR would add more destruction to the area around LSR.
ALTERNATIVE B: Phasing out Commercial and individual horse use around Sawmill Ponds is arbitrary and shows the misunderstand by the Park Service of the historical use of horses and ranches in this area, and previous Park Service goals of providing horse activity areas that do not greatly overlap with hikers.

ALTERNATIVE B: Traffic management thru blocking off thru traffic at LSR would be extremely detrimental. LSR should not be designated as a primary destination by making it accessible from both directions.

ALTERNATIVE C: closing road 2 days a week would create a confusing situation for visitor and would only benefit Bikers.

ALTERNATIVE D: Reservation system- unfortunately the future may require such a drastic step but this would severely restrict the freedom to explore.

Topic Question 3:

BIKE "TRAIL", not a "Path"- If approved, pathway should be constructed as "SINGLE TRACK". As such, any addition of a path should adhere to the objective to "provide meaningful opportunities to experience and enjoy the rustic character and diverse ecosystems". Examples such as Cache Creek and Teton Pass trail systems should be used. The trail would require intermediate biking skills so would help regulate against over use by road bikers. This would be much more environmentally sensitive in reducing number of trees removed, as well as provide an experience to match the backcountry character.

A PAVED PATH can be developed on appropriate, open portions of the road such as Moose path to Sawmill ponds and South entry gate to Granite Canyon trailhead. This would allow families to utilize portions of it.

Any bike trail or path should follow the alignment of the road.

If road is realigned at Beaver Ponds / Hartgraves, and Moose to Sawmill hill, these areas should be left paved for walkers and handicap access only, not torn out! Seasonal closures in the fall when bear frequent the Beaver Ponds area should be managed as it is now.

Environmentally sensitive OPTIONAL open air shuttle buses from Moose and Poker Flats to LSR should be considered to provide easy access for hikers, and a way for road bikers to avoid the dirt sections.

ONE WAY TRAFFIC for the entire distance of the road during PEAK traffic dates and times. July 1- August 31. 9 AM to 2 PM South to North, 2 PM to 6 PM South to North. Other times open both directions.

This S>N then N>S would provide Teton Village Visitors accessibility to the park. Travelers coming from the Park to Town would have to take 191 to town in the AM, but could utilize the road in the evening.

ALTERNATIVE B: creating a horse parking area near the windy point turnout, similar to Poker Flats, would separate horses from car pull outs while still allowing use of the existing trails by horses.

Topic Question 4:

The negative impact that the LSR preserve has had on the corridor needs to be addressed. Built without environmental assessment, it is now time to honestly assess the negative impacts this development has had to the corridor.

Horse use should be encouraged as well suiting the character of the area.

SINGLE TRACK BIKE "TRAIL", not PAVED BIKE "PATH"!!! The rally cry from the Valley bikers to finish connecting the park with the existing paths is to create a gigantic loop ride. Although this sounds awesome on paper, I think many do not understand the sensitive nature of the corridor. Not all areas of the park are appropriate for bike Paths! However, a lower impact bike Trail could allow bikers to enjoy this area without destroying 3000 trees!

I additionally have a big concern with how bikers be stopped from cutting off the path and creating new or utilizing the game trails? NO trail should be built unless bikers can be guaranteed to stay on it!

There seem to be 2-3 rangers at the south entrance however there is only one at the windows. At least one should be outside, assisting with the line by answering questions and describing the rural nature of the

roadway.

I have lived in this corridor for almost 50 years- first at the original location of the R Lazy S Ranch, now just south of the southern boundary of the park. I totally respect the desire and need to preserve and protect this amazing part of the park. Those of us who live on and nearby have learned to live with the growth during the past 5-10 years. I hope you will take the comments you receive seriously, and come to honest, ethical decisions!

Topic Question 1:

Pave the unpaved section of the MooseWilson Road. This would permit bicycles to use the road, would save on maintainence. It is so narrow that paving should not increase speed. Otherwise do nothing. It works OK and only issue is failure by Park to adequately handle crowds when bears etc are present. Realignment of road so entrance to rest of park without need to go through another entrance would be a plus in times of heavy use

Topic Question 2:

60 person parking on Death canyon road is grossly excessive and would not be helpful to hikers. The commercialization of White Grass is bad now and this would increase that. Rockefeller Preserv limits parking to control crowd and that is good solution.
Alt B closing road is poor solution and would cause massive inconvenience
No separate bike path: too much disruption to build. Why not send bikers to dike?

Topic Question 4:

Rather tan spend money on bike path on MW Road, extend bike path from Jenny Lake to Jackson Lake

Topic Question 2:

I think the plan to include a bike path on the Moose-Wilson Corridor would have mostly negative effects. The destruction of habitat and the high cost of the project is not worth the very small percentage of park users who bike. Additionally I am disheartened to see the plan to close areas of GTNP to commercial horseback riding. Riding is a low impact and effective way for visitors to see the park. Dude ranching and riding was and IS an important part of GTNP history. Families dating back to the early 1900's first saw this land by traveling to ranches and riding horses. I ask the question - "Why do you allow multiple commercial wildlife tours in vans and trucks and yet you want to close areas to commercial horseback riding?" In my view a vehicle poses more of threat to wildlife than a horse.

Topic Question 1:

Keep the Moose Wilson Road open, both ways for car travel. Realign the Beaver Pond area if necessary. No Bike Path on Moose Wilson Road. Pave the unpaved portion of the road from Granite Canyon to old JY entrance. White Grass Ranch commercial traffic (employee housing, guest cottages, staff and utility vehicles) should use the Road at unpeak hours only. No 60 car parking area at White Grass.

Topic Question 2:

No 60 car parking area at White Grass. White Grass Ranch has been commercialized by the Park and the spaces look like they are Park idea to accommodating their own issues. Parking there is too far from the Death Canyon Trailhead to be of much help to hikers.

Topic Question 3:

Put Bike Path on the Dikes if anywhere. Dikes are open areas, flat and vehicle free. No Bike Path on Moose Wilson Road/ Put it in the Park from Jenny Lake to Jackson Lake.

Topic Question 4:

How many trees come down if road realignment goes forward ? That should be a public discussion before the plan is decided. White Grass Ranch associated business traffic should be limited to unpeak travel times. That contributes to the increased traffic on the road.Spend the money to improve the Death Canyon Road. It's outrageous the paving just went as far as the Park's commercial White Grass Ranch community.!

Comments: The Park has spent too much money on a series of things: new entrance at Poker Flats

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

requiring reentering the Park twice. Paving only part of Moose Wilson Road, requiring multiple gradings every year. Closing the road to wildlife viewing re: realigning the road/. Paying Park Rangers to oversee Rockefeller Parking area instead of overseeing wildlife viewing and leaving the road open for wildlife viewing, safely. Building and Maintaning huge maintenance vehicle roads behind the LR Preserve. Enlarging the Moose Community Park housing, enlarging and Murie Center Park housing. The Park should STOP taking over historic sites for their own growth and use problems and if necessary, use the existing Park housing like Climbing RAnch cabin areas and others like it.

Topic Question 1:

The multiuse pathway for hiking and biking and relocation of the existing roadway utilizing existing entrance stations.

The multiuse pathway encourages Park visitors to get out of their vehicles and enjoy the natural beauty without being directly involved in road traffic. I would prefer to see this pathway on the existing road and the road moved east toward the Snake River but Alternative D would suffice with a very short stretch of hiking/biking in solitude without traffic.

The movement of the road towards the Snake in Alternatives B & D is great to move vehicles a little farther from the wildlife corridors however Alternative B with a single entrance at Moose could prove move cost effective to keep open and manned than running two separate entrances there. I am concerned as we have seen the visitor center close due to staffing that the same may happen at the North Entrance for the Moose-Wilson Road where it would either have to be closed or left open without the control that is being sought.

The tie in of White Grass Rd. to Death Canyon Trailhead is an improvement too. Hopefully this will improve the roadway up to the trailhead as it can get rugged, especially by the end of summer.

Topic Question 2:

I am not sure about the reservation system. Given the use of the road and the frequency that people can stop to admire the animals and sights it seems that managing the amount of vehicles could become overwhelming. This would be easier to manage in Alternative D's proposal of a separate entrance but I

fear the added cost of manning it will make it only feasible in the peak summer months.

Topic Question 3:

I would like to see the roadway moved towards the Snake River and then use the existing roadway as the multiuse pathway. My thought is that the new roadway could be constructed as such that there are better pull-outs for wildlife viewing, more thought to wildlife corridors and completely paved.

The multiuse pathway could then use existing road surface for its construction. Sections could be rehabbed to make it narrower in places or more easily diverted around sensitive wetland areas. There would be some more road crossings for the Preserve and Death Canyon but hiking/biking/skiing with the roadway below would be more tranquil and in line with getting people back to nature.

Topic Question 4:

This goes beyond the scope of what is listed in the alternatives, but a pathway from the visitor center out to the Preserve could be a great way to get people out of their cars to see this beautiful part of Grand Teton National Park. Perhaps a loop that goes out the Snake River and then back on multiuse pathway by Moose-Wilson Road.

Comments: Thank you for your time and effort on this project, it is greatly appreciated.

Correspondence Text

Topic Question 1:

Alternative B- addresses the need for moving the road to preserve the wetlands and better serve wildlife. Restoring the bulk of death Canyon Road would also be beneficial to wildlife and add a more remote character to this use area. Of the 3 alternatives proposing change seems to be of the least cost. This plan addresses speed limits! The reduction of congestion at peak times (mainly early August) would be achieved.

Topic Question 2:

Alternative D, though sounding very attractive to visitors, doesn't mesh well with Technical report data that shows that bike use is not sufficient to build a dedicated bike path. Alternative C maintains the route through the wetlands not addressing habitat and wildlife concerns appropriately. The Death Canyon improvements do not add to the "specialness" of this area.

Topic Question 3:

I do not see the harm in grooming the winter section of the road in Alternative B. The Tech report showed that winter use is negligible compared to the non-snow season. I would just like to add that if on-going studies show deleterious effects on wildlife in winter by those recreationists that access the high reaches of the tetons from the Corridor are proven out; than the Park should shut down such access; as it does in locations thruout the park during summer and shoulder seasons.

Topic Question 4:

Please keep the transparency of this process going. What a joy it is to be involved with the NPS and have

our collective thoughts valued about our beloved Tetons and all that dwell within. Additionally, as the process continues toward implementation, I would like to point out that a dedicated brochure from the park should be developed regarding the "New" Corridor and circulated throughout Jackson Hole.

Comments: For demographic purposes, our family of 4 splits time between Jackson and Illinois at a rate of about 1 day per week thruout the year. We rarely miss being in Jackson (and the park) at least a portion of any month during the year.

Topic Question 1:
All the alternatives should be carried forward to achieve the goal of this process.

Topic Question 2:
N.A.

Topic Question 3:
No.

Topic Question 4:
Give the public the opportunity to comment on the final alternatives.

Comments: I have been driving this section of the Moose-Wilson road since 1981. That is 33 years! There has been a significant increase in the use of this road both in vehicles and number of bicycles over that period of time. I have personally witnessed many near collisions between cars and bicycle riders. Alternative D is by far the best alternative for obtaining the goals of GTNP and safety for the general public.

Topic Question 1:

I think with all the development that's happened or going to happen around Yellowstone there has to be a way for the wildlife to move in and out and be safe. Animals know no borders and if they could have some way to the Tetons or Glacier park or others near it on our public land which does not belong to the cattle and sheep herders. So please keep these corridors open for them to travel freely. Thanks.

Topic Question 2:

I know all the killings of wolves and bison if they leave the park is no way to recover these species. There are non lethal ways to avoid livestock predation. First off these free grazers know their animals are in wild country and animals do what they have to to survive. So you have keep your animals safe through the night or pen them up. And the day for the bison to roam out of Yellowstone and back on to the Great Plains is way overdue to happen. There has to be other strongholds not just when they all get sick or something you rush a couple out for breeding. No have other places where they thrive.

Comments: Just please leave corridors for wildlife to roam to other parks or wildlife refuges. There is no way for these free animals to be contain in these parks and have nowhere to go in and around Yellowstone, the grand tetons, Glacier etc.

Topic Question 1:

I believe alternative plan C would best suit Moose-Wilson road. It seems that it would have the least impact/cost on the existing roadway but still accommodate everyone's favorite activities along the scenic stretch.

Topic Question 2:

I don't believe changing the roadway to another section would enhance wildlife viewing at all and would strongly disagree with the various objectives of the other options.

Comments: I strongly urge you to choose alternative C, thanks for listening!

Topic Question 1:
I believe Alternative D most completely addresses the goals and desired conditions. It takes into account protection of the scenery and wildlife viewing opportunities; protection of the natural communities; preservation and restoration of the natural soundscapes and acoustic resources; and provision of meaningful opportunities to enjoy the rustic character and diverse ecosystems. Realigning parts of the road, establishing a reservation system, constructing a multi-use pathway, and limiting commercial activity will all contribute to protecting the ecosystem and enhancing the visitor experience.

What about creating some kind of resident bypass. Residents don't have to pay to access this road. It's a throughroad with a an exit here and there. For all others INCLUDING NPS pass holders- -there would be a fee.

I believe locals would be in a better place to say where it would start and stop- -like say downtown Jackson to Moose. You still have speed limits and all but you don't have tourists doing 5 mph or bear jams (unless Mr. Bear is sleeping in the middle of the road!).

You might go all fancy and see if you can put an access road in UNDERGROUND. How to get air I and out would be left to an engineer as well as carbon monoxide from cars and trucks. See if you can't have some kind of animal proof gate so it's just vehicles. But you still might have speed limits.

I know my suggestions are NOT technically written. And some ideas may be way off. If it gives you an dea for something that might work then I'm happy.

Topic Question 2:

I do not support an additional lane of pavement for bicycles or realignment of the road. If the road is managed as "one way" for cars, bicycles can travel safely in either direction on the existing road. Reducing congestion and traffic should preclude commercial use.

Topic Question 3:

I do not see a strategy which includes the option of one-way traffic only, similar to the Jenny Lake Loop Road. A narrow lane reserved for bicycle use in either direction with additional turnouts would address the congestion while preserving a unique road in the Park. Your proposed ideas in most alternatives include managing of traffic with hourly limits, queuing areas, traveler alerts, and limited days. This seems unnecessarily complicated. It would be difficult to remember and difficult to manage.

Topic Question 4:

This is an opportunity to preserve a quiet corridor of the Park. Adding additional pavement to accommodate more traffic and commercial use will compromise this lovely area. I would urge you to keep it simple.

Comments: Thank you for the opportunity to comment.

Topic Question 1:

The most important strategy should be to preserve and protect the scenery and wildlife therein from further development and human interactions. Development should be confined to towns outside the park, not inside the park itself, or along the scenic roadway shared by federal agencies.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Topic Question 2:

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road.

Topic Question 3:

I work in another national park site, an area that is reached by paved road but that circles to other areas of the park over a graded dirt road. It is my fervent hope that this graded dirt road is never paved or dramatically improved, as it will destroy the unique character of the area. The paved road through the park is used as a shortcut between freeways, and visitors are frequently stopped by rangers traveling over 85 miles per hour. The litter and dead wildlife along that travel corridor shouldn't define the park, but it does.

Topic Question 4:

It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

I like Alternative D the best with a few changes. The separate pathway is a necessity for safety. Realigning north section helpful.

Topic Question 2:

Doing nothing
2 entrances within Corridor or a mid stop

Topic Question 3:

Use the preexisting road to the south and east of LSR to go to LSR from Granite Canyon. It would move the bike/multi-use pathway off road creating a new scenic route away from cars.

Topic Question 4:

I'm not sure which of the solutions for Death Canyon would be best. It does get crowded, the road is poor, turning around is hard but I love the hike the way it is. Winter access would be nice. Alternative A-not a solution, a stand still that will create more problems eventually. From Alternative B-I like 1 entrance station on the south end. 2 on the Moose-Village Road seems redundant for park visitation to Grand Teton. A Mid-way gate is cumbersome to manage and congesting.

The realigned road to the north is beneficial for traffic by ponds.
Alternative C-I support adaptive management rather than closure of the corridor. 2 gates not necessary.
Travelers alerts and alternating usage hard for visitors.

Topic Question 1:

Discourage use of the road by wandering "leaf/wildlife peepers" by leaving the section currently unpaved alone. The Moose-Wilson road should be sought out, not casually stumbled upon, just like any specific treasure of the park. Mni-buses from the Village to Moose/Dornans, privately funded and able to charge a fee, would also discourage increasing traffic.

Topic Question 2:

Barring through access with a gate in the middle would simply double the traffic, as every car would then have to make a round trip, albeit half the whole.

Topic Question 3:

Leaving it as is now.

Topic Question 4:

I am marginally in favor of a separate bike path, a few feet off the road. I am afraid such a bike path might simply encourage serious distance bikers to go all out, from the Village into the Park, endangering casual bikers and unwary wildlife not used to a pedaled vehicle going 20 or 30 miles an hour.

Comments: Would moving the short section of the present road east to avoid the piece of wetland it (reportedly) runs through really save any flora or fauna, especially when weighed against what would no doubt be months of heavy equipment and workers trampling around that area?? That piece of geography adjusted years ago to the presence of the road- -that damage has been done and probably long compensated for by nature.

Topic Question 1:

I think that alternative D best serves the visitor experience, while mitigating human/wildlife conflicts. I like the idea of relocating the road out of the wetlands. I also think that the southern portion of the road should be paved, without any realignment. Perhaps some more established pullouts would help with the congestion. At the north end of the corridor, I think it would make more sense to have one entrance station, rather than two. Perhaps it could be expanded into more lanes, and the junction between the Inner Park Loop Road and the Moose-Wilson road could be located just north of the current entrance station.

Topic Question 2:

Only alternative D addresses the need for a pedestrian/bike pathway. I think that such a pathway is needed for the safe enjoyment of the Moose-Wilson corridor from outside a car. I also think that the hike/horse trails should be signed and hiker friendly water crossings should be built and maintained on the existing trails to encourage multi-use.

Topic Question 3:

The aforementioned trail development strategy would help encourage hiking in a currently underutilized portion of the park.

Topic Question 1:

1. Somehow incorporate a bike pathway 2. Keep trails as is 3. Make speed limit lower-All for the reason of safety.

Topic Question 2:

1. Do NOT open Cheney roadway for bikes 2. Do NOT change Moose-Wilson to one way 3. Re-open some of the now closed trails, especially the trail across flat by Nature Center - Roadway needs improvement; however, NOT to the detriment of being able to enjoy the area safely - put bike path to one side of roadway itself, don't cut across wildlife area

Topic Question 3:

One side for bike pathway along roadway - lower speed for sure - no parking full length of road

Topic Question 4:

I am a regular recreational rider of the Poker Flats - Granite - Nature Center area. This area is needed for the rider & hiker. Speed - paving the road - putting bicycles inland are negatives - Trailer parking at Poker Flats should be made user friendly - now you block each other.

Topic Question 1:
I think an environmental impact study is important before anything else is done.

Topic Question 2:
Paved roads and increased traffic is not helpful to any park.

Topic Question 3:
Seasonal closings and reduced traffic to heavier vehicles.

Topic Question 4:
We need to preserve the natural settings of our parks...commercialization just ruins them and more paved roads with increased traffic just increases the number of road kills which are so distressing to families.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park

Correspondence Text

September 12, 2014

Grand Teton National Park
Attn: Moose-Wilson Planning Team
P.O. Drawer 170
Moose, WY 83012-0170

Dear Planning Team:

Thank you for the opportunity to comment on the preliminary alternatives for the Moose-Wilson Road Corridor. Our thoughts are sourced from over a decade of regular travel through this corridor, as both commuters and recreationists. As residents of Teton Village for many years, with jobs in GTNP, we have both traveled the corridor at all hours on all days - -- during its open season by car and by bike, and during the closure period by foot and by ski. Thus, we issue our comments from a place of intimate experience with the corridor and a great love for this unique stretch of road and habitat.

After reviewing the four alternatives, there is no singular alternative that we feel captures the best long-term management program for the very special Moose-Wilson Corridor.

We do believe that the following are strategies should be carried forward, as a new plan is crafted:

Traffic Management along Road:

• Realignment of the northern section of the road.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Death Canyon:

• Relocate TH to a site near White Grass.

Winter Use:

• Allow vehicular travel to the Death Canyon access point.

• Groom the unpaved section for Nordic skiing and snow bicycles.

Physical Characteristics:

• Pave the unpaved section. While we acknowledge that this short section has probably served to slow traffic slightly, we believe that the public and the habitat will be better served by paving this section, which will help mitigate the significant dust along that section as well as the knee-deep potholes that often develop.

Commercial Activity:

• Taxis should be prohibited on the Moose-Wilson.

• Learning-focused commercial services should be permitted, but in LIMITED numbers.

• Bus and shuttle services should become a PRIORITY for moving people along the corridor.

We believe that the following strategies should be eliminated from consideration moving forward:

• A reservation system (we do not see how this will serve the public or GTNP well).

• A multi-use pathway between Moose and Granite Canyon.

Additional Comments:

• Snow bicycles should be allowed on the road during the winter season.

• While we are opposed to an additional swath of new pavement to provide a segregated pathway for bicycles and other recreational activities, we would encourage the Park to exercise more visionary and long-term explorations into the viability of utilizing the existing road on the dike that runs on the west side of the Snake River as a potential pathway.

• We also urge Grand Teton National Park to take the long-view by not just encouraging, but mandating, shuttle service and mass-transit style options on this corridor. As GTNP officials know, there are wonderful models for this mode of access in a number of other National Parks, including Yosemite, Zion and Denali.

• We would also like to see GTNP reconsider a one-way option for the corridor. We recommend south to north for the flow of traffic in a one-way system.

Sincerely,

Amy Brennan McCarthy and Forrest G. McCarthy

Topic Question 1:

I think the best alternative is to establish the moose wilson rd as one way from both directions to the Rockefeller visitor center. This would insure that the traffic on the road is for the purpose of enjoying the park, rather than using the road as a thoroughfare The one way restrictions would be limited to car traffic, allowing bicycles to travel the entire road in both directions.

Topic Question 2:

I think limiting days of use for cars is much too complicated and difficult to enforce and would confuse and inconvenience both tourists and locals.

The plan to do nothing solves none of the existing problems

I am very against paving the whole road and particularly establishing a bike path. This seems to work against the goal of maintaining this section of the park in its natural state. It would increase traffic considerably. There are huge sections of bike path in the park and in the county. The moose wilson road doesn't need any more pavement. Also, given the bear population, this isn't a wise place to be on a bike anyway.

Topic Question 3:

I would hope that the sections of the road which are now unpaved remain so. I am not knowledgeable about the re routing of the north section of the road, but if the purpose of this is to preserve wildlife habitat, I am in favor.

Topic Question 4:

(See below)

Comments: I sincerely hope the park is not overly influenced by the monetary power behind those wanting the bike path. They have continued to misrepresent the cost of construction and maintenance of the pathways. The fuel saved by those who use bikes is minimal compared to the fuel and energy cost of construction and maintenance. I feel a bike path would have a huge negative effect on the wildlife and natural state of the moose wilson corridor. Though they are a very well organized and vocal group, I do not feel they represent the best long term interests of the park or the majority of those who enjoy it.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 4:
See last comment box

Comments: Please DO NOT BUILD A PATHWAY along the Moose-Wilson Rd. There is too much traffic (cars, hikers, sightseers, bikers etc) on that sensitive habitat road. I also oppose ANY construction along that corridor to realign the road.

I oppose the START bus using that road, as well.

ALL these things will impact wildlife and further use of the road.

I support reducing the number of people who use the Moose-Wilson corridor, but the options proposed by the NPS and the Teton County Commissioners DO NOT ADDRESS MY CONCERNS.

My alternative would be to reduce the use of that corridor by closing the road to vehicles, NOT building a pathway and doing NO construction there.

Moose-Wilson Rd

Problems with M-W Rd

- 1) Major wildlife corridor including both Grizzly bear and Black Bear
- 2) Poor sight distances endangering wildlife, bikers, pedestrians and other vehicles
- 3) Speeders, especially on S-curves
- 4) Northbound traffic experiences direct sunlight making it very difficult to see ahead in the morning even after using the visor
- 5) Congested parking or stopping of vehicles wishing to observe or photograph wildlife
- 6) Number five includes the many Tour cos. that do the same
- 7) Poor drainage due to hillsides with no gutter and/or high water at close proximity and/or inadequate fill under road and/or warm spring hydraulics perculating in some fashion under this road way...all leading to frost heaving of asphalt pavement.
- 8) One lane bridge
- 9) Unpaved section continuously needing maintenance
- 10) Open only seasonally

Main reasons for Rehab or New Construction

- 1) Recreational corridor for National Park wildlife viewing by vehicle to get from point A to point B and point B to point A
- 2) Recreational corridor for bikers, skiiers and pedestrian

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

- 3) Commercial related for businesses or park employees to get from point A to point B and from point B to point A
- 4) Vehicular travel for other reasons...primarily from point A to the airport and from the airport to point A

The Plan:

When first deciding to manufacture a new plan for this road, there are a few points to make.

You plan this road for the future, 20, 30 or maybe even 50 years ahead. Do not listen to people who do not wish to plan with this in mind.

You plan this road based on current LOS, projected LOS, recorded accidents and violations, danger areas if noted, current population, projected population, weighted primary and secondary usage, and energy consumption.

Once again, please do not listen to those that only focus on the now. Their intent is somewhat bias in wishing for what serves them now. Some will not care what happens in twenty years from now because they will not be here twenty years from now. You will hear those exact words throughout this process. Keep focused on what is best twenty years plus down the line.

What I Would Do:

Move a section of this road to its new location. I would start at Death Canyon and follow the old road near the "Three Betty's House" staying east of Sawmill Ponds and come out at the big overlook parking lot, then realligning somehow with the inside road.

Postion the road to avoid direct sunlight as best as possible.

I can not suggest moving the road's location south of Death Canyon, because I would not want to destroy forest, intrude on owned properties or deal with the water in that forest.

I would pave and widen the unpaved section.

I would provide parking areas.

I would entertain a bike path adjacent to the road from Teton Village to Moose.

I would plan for all-year vehicular use depending on the factors above as they become reason for this to occur.

Just remember, as LOS and population increase, so does energy use. And it takes longer to go from the village thru town and then to the airport. Engineers understand energy use over time, others may not.

I would make this existing section a nature walk. Maybe Park managed, maybe not. But I would remove the asphalt and designate it as a nature walk. Sign it. You might wish to be creative here but I won't interject unless I am appointed to the creative committee.

Make the One Lane Bridge a two lane bridge.

Move the Gate so everyone would have to have a park pass when entering M-W Rd.

Why Do This:

1) There is the old road blue print and it is relatively flat with proper sight distances (less winding). You also avoid water in the form of springs, ponds, beaver resevoirs, runoff and underground drainage from hillsides. You have far less of an Environmental impact (there is trout in them there waters) if you were to move, widen, add a bike path, add gutters, add parking areas, etc to the existing road. There is no room to avoid water.

2) If you used the existing road at this location, you would still need to excavate the existing road AND much of the fill underneath that road, and bring in all new. So why not start anew in more conducive location.

3) You wouldn't correct a thing if you used the existing road and placed a bike path adjacent to that road. You would still have your seasonal bear populations. Vehicles would still stop, slow, park. People would still leave those vehicles. Authority would still be needed to manage that congestion. The danger of wildlife/human interaction would still be present. Bikers would still be in danger. You have the road closed to bikers now and not pedestrians due to the presence of a grizzly bear...so why run a bike path thru this existing corridor where you fear biker/wildlife conflict already.

The newer location would not only offer proper sight distances for driving, but for bikers being able to see bears/moose from a distance and take proper cautionary measures.

4) NO ENVIRONMENTAL IMPACT about water. OR very little. I want to emphasize that.

5) You can now provide parking areas overlooking the area below this section of road. Elk and bear and birds and other wildlife can be viewed at safe distances.

I would do these things because future LOS, future popualtion of residents (year-round and seasonal), future estimates of visitors.....ALLLLLLL lead to a major headache if you leave that section of the road where it is.

The ONLY reason to leave that section of the road where it is, would be to satisfy those that want the best probability to see a bear in a seasonal situation, up close and personal. And that is not a good reason.

All other reasons dominate why this section of the road and a new bike path should be constructed.

The other point is whether or not to operate this road on alternating days and/or directions.
NO.

This only confuses the public, and will anger much of the public. It comes down to serving the population adequately, fairly, safely and utilizing the most efficient energy saving ideas possible.

And planning well into the future.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

You can start by keeping the road closed to traffic during the winter as you have done before, but some day this road will need to be open all year round. I would just do that immediately for reasons previously mentioned. You just need to maintain it during the winter. Do u have the monies to do this? I don't know.

Also, if can be done at all...I would straighten and increase sight distances in the unpaved section as well. Where ever this can be done efficiently and with practicality.

You probably have all these ideas on paper.....so I appologize for any redundancy. I just took this off the top of my head while briefly reading your alternatives and knowing what occurs on that road oh so very well.

It all depends on WHY you wish to change this road or just rehab it. It all depends on future estimates and the prioritized ideals of those who make the decisions.

I'm done.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Alternative D seems to address the natural biological concerns while enhancing the recreationist experience. Users are using the restroom without a facility in the winter at Granite. The alternative still allows a diverse use.

I like the idea of a separate bike path within 50 feet of the road to keep both motorized and non motorized uses allowed rather than separate days. This works elsewhere and is more logical.

Topic Question 2:

I think you need to plan now for snow bikes. Where are they specifically allowed to be. We need to designate places for this relatively new use.

I am concerned about the hourly uses. How would that be managed? The document doesn't have enough detail to allow you to visualize how that work (same for the one way traffic in Alternative B).

Horses are a part of Wyoming's history. I think alittle more emphasis on an equine trailhead would be a good thing. The folks I pass when on horse back, love seeing us out there.

The prelim alternatives talk about signs but what is the sign plan? The NPS can cause visual pollution with all the restrictive signs so how will we manage the need to inform the public without polluting the scenary? Can we rely more on the stations to provide that rather than actual signs?

I think closing the road two days a week for non motorized use can be an issue. Why not have non

motorized use from 6 pm until 8 am or something like that? Bike riders can get an early start before the parade of cars. Maybe the days can work like the Smokey Mtn but for those who only have one day to see that portion of the park but can't ride or hike....not sure how I feel about that although personally I would love it as a biker, hiker.

Topic Question 3:

Dogs were not addresses or dog sledding. Like winter time near Signal Mountain, will dogs be allowed on lease on the main road or not? It would be nice to have some areas dogs could go with their skiiers but more importantly need to be clear on that. Will dog sledders be allowed as a commercial use? Snow bikes? what will they be able to do or not.

Speed limits on the bikes...the road bikers go fast and blow by the recreational bikers. Road bikers should be required to slow down or get on the road with the cars.

Topic Question 4:

Thank you for the opportunity.

Topic Question 1:

Establish traffic management techniques
For winter use, maintain the current traditional non-motorized access

Topic Question 2:

Reservation system/vehicles per hour system, and/or closing the road to vehicles two days/week.
A multiuse pathway parallel to Moose-Wilson Road along any segment
Allowing winter grooming
Increasing disturbance.
Fragmentation of habitat.
Removal of large numbers of trees and vegetation

Topic Question 4:

I would like the corridor to remain as wild as possible with out any additional disturbances. I definitely do not want a separate bike path, Bikes should be accommodated beside the motor vehicle road. The Moose Wilson corridor is a special road and I would like to maintain the quality of the scenic experience while traveling on it.

Topic Question 2:

I do not think we need a bike path on this road. I enjoy all the bike paths in Teton County now, particularly from Jackson to Moose. My favorite bike trip is the Jackson-Moose-Wilson loop. I do just fine on the Moose-Wilson road currently on my thin-tire bike. You just have to slow down and watch for the potholes. I think it very selfish for Pathways to advocate for cutting thousands of trees and paving 35 acres of asphalt.

Topic Question 1:
Option D is the best that will meet the communities needs and protect wildlife.

Topic Question 2:
Not addressing the historical use of the Moose/ Wilson road, and by ignoring the obvious recreational uses such as biking and trail head access.

Topic Question 3:
Option D is the best solution. Please include this in your planning efforts.

Topic Question 4:
I've lived in this valley for over 35 years. For many of those years I have been a active climber, mountaineer and hiker in the Teton Range. Trail access from the Moose Wilson road has been a major component and one of the reasons the Tetons are so unique. It's been about access! reasonable access. In addition biking riding on the Moose Wilson road is also a historic use that needs to be encouraged and made more reasonable and safe.

Topic Question 1:

We are frequent visitors to the Grand Teton area. Like most visitors, we value the quiet, calm mountainous area with abundant wildlife. Please keep the roads as winding, slow travel areas and do not allow too much development.

We are concerned about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Topic Question 2:

We think if you allow road development, you will adversely affect the wildlife and wilderness areas in the parks.

Topic Question 3:

If you work with the city of Jackson Hole and create more affordable housing for workers there, you will not have as many people commuting to work from their campsites in Grand Teton.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of

alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Topic Question 1:

I think the limiting of vehicles through timed sequencing is a good idea. It is not and should not be a commuter road. If realignment would benefit the WILDLIFE, then I'm for it, but I would like to see as little disturbance as possible.

Topic Question 2:

Even though I'm a cyclist, I don't believe there is enough demand to justify a complete road closure two days a week. Maybe create hours within the day with reduced vehicle volume per Q1 above and post well in advance (time and farther from the entrances to the road have message boards with wait times). I am NOT in favor of any changes that worsen circumstances for the wildlife. We are the VISITORS to their HOMES.

Topic Question 3:

I liked the thought of one way from Granite Canyon trail head to LSR. It is NOT a commuter road, no matter what the town and chamber say. Don't be bullied by them. The road should be for visitation, with allowances all in favor of the WILDLIFE.

Topic Question 4:

Do whatever you can to make people go slow. Pave the whole road, make it 15 -25 mph from end to end and one way from GC to LSR.

Topic Question 1:
The most important is to protect the wild life
To this end, I would like to see the M-W road moved to the east of the moose ponds. I would like a path for pedestrians, and the width of the road to remain the same. I am favoring more and more the idea of cars from the South, having access only to the LRP. Cars from the North could access the road only to the LrR and then return North.I

Topic Question 2:
I would not like to see the road widened. I don't think that closing the road for pedestrian use only 2 days a week and cars the rest of the time, will handle the problem.Do
,

Topic Question 4:
Do not widen the road or make it easier to drive.

Topic Question 1:

Reducing overuse, preventing human-dagerous animal conflicts, maintaining access, keeping financial expenditures within reasonable limits and maintaining the current character of the road and adjoining areas.

Topic Question 2:

massive expenditures on bike path and new road construction vs limited improvements. Restricting access to all (thereby excluding groups such as elderly or disabled from using the road while enhancing the experience for a small select few,i.e. bicyclists. Degradation of the natural elements by increased construction and increased mechanized or commercial use, ultimately leading to more overuse and a need for further "improvements".

Topic Question 3:

Moving the lose entrance station east to a point near the Snake River Bridge, but still far enough back from the hi way that it would not impede access to the Dornan's compound or impede hi way traffic. Requiring park access would reduce "commuter" use to Teton Village and hi way 22, and make the M_W road more of a "park" venue and would be a reasonable alternative to rerouting the road. Consider shuttle access to the LRP from Moose instead of the limited parking, as this center is one of thee major contributory factors to increased use. Allow permit only commercial traffic. During peak months (July and August) terminate traffic at the LRP in both directions, which would still allow access to all points, but prevent through traffic during these periods. Also maintaining access to popular and historic uses such as hiking , horse back use, etc. should be a primary consideration and not be curtailed or sacrificed to commercial or mechanized use.

Topic Question 4:

The proposals to restrict access during varied hours, days, etc. is too complicated and restrictive and would be ungainly to manage and disruptive, inconvenient and confusing to park visitors. In reality it would not only limit road use but in effect close the entire southern end of the park at peak times. While changing access points and parking is a good idea in some ways you might consider that doing so may very well lead to further congestion and new problems. Certainly some of the less disruptive, more necessary, and less expensive ideas such as road repair, parking, or those mentioned above might be implemented, to help the situation. Some of the more elaborate and grandiose should be reconsidered.

Comments: In summary, after studying and considering the stated goals and the 4 alternative plans, there are several parts of each plan that are consistent with these goals but some that are inconsistent and even contradictory to them. Unquestionably there are problems here that need to be addressed, but these proposals, as they now stand do not present a reasonable or satisfactory resolution. The M-W road is important not only as a "recreational" route, but also as the only vehicular alternative south from Moose should the main hiway be disrupted and for that reason the possibility of thru access should be maintained. The proposals to reduce access to the vast majority of users while allowing it to one specific group is bothersome and unfair. This would severely impact the chance for those such as the elderly, physically limited individuals or the disabled to enjoy the natural attributes you tout while giving preferential treatment to a small special interest group. I assume this was simply matter of oversight, not a deliberate attempt at exclusion, but it is disturbing and completely unacceptable.

While I realize that the "bike path" proponents are a very vocal and aggressive faction, in reality they are a very small segment of the overall population. I am bothered by the idea of giving them priority to access when denying it to the general public. While I like the idea of pathways/bike paths I, the park has already provided an extensive system to this activity, and I seriously question adding one to the M-W corridor. It would not only be inconsistent with preserving the area and result in more expense and problems. Also, as the # of "dangerous animals" is increasing, the potential for conflicts would be enhanced.

With regard to financial considerations, at a time when the park claims to be strapped for funds, and has curtailed services as basic as maintaining visitor center access among others, and has to institute new or higher fees to meet expenses, I seriously question the justifications for the enormous outlay of funds for construction and rerouting the road. Not to mention the costs involved with constructing and maintaining an additional recreational system and other massive improvements.

Therefore I suggest, that at this time you go "back to the drawing board", revise these plans to simpler, more workable alternatives that eliminate some of the more prejudicial, expensive, and unwieldy proposals, but incorporate the ones that are reasonable to execute.

Topic Question 1:

I think that the road should be kept as it is; for walking and biking only.
An alternative road should be paved for shuttle buses going one way.
I think this will maintain the integrity of the environment.

Topic Question 2:

I think that all of the strategies mentioned will address the need for the plan.

Topic Question 3:

As I mentioned above; an alternative road should be paved for shuttle buses.
I think this will allow the environment surrounding the road to be undisturbed.

Topic Question 4:

No cars and new development allowed.

Comments: No comments.

Topic Question 1:

The wildlife habitat along the Moose-Wilson Rd. is just that: wildlife habitat. I think the best approach since roads and trailheads have already been carved out of the area, that minimal improvements should be made as I have outlined in the Comments section below Question 4. Vehicular traffic is a given so some upgrades to the roadway and parking are in order but the total area of the roadways should not be increased, just reconfigured....and there should not be a separate bike path.

Topic Question 2:

With proper vehicle control a separate bike path is unnecessary; enough wildlife habitat has already been destroyed.

Comments: *Relocation of existing Moose-Wilson Rd. as illustrated on Alternatives B and D to allow wildlife better access to the streams and ponds without crossing the current roadway*

Pave the currently unpaved section of the Moose Wilson Rd.

Use Whitegrass Rd. for all access to Death Canyon Trailhead

Eliminate all commercial traffic except wildlife viewing tours, photography and painting workshops, and conservation/wildlife related vehicles/tours

No separate bike path

â€¢ Various parking lot and restroom upgrades

â€¢ Installation of a new ranger station at the north entrance to the Moose Wilson Rd.

â€¢ Have a ticketing and camera system installed at each end of Moose Wilson Rd. to reduce speeding through the corridor. A time stamped ticket would be given to each vehicle at either end of the Moose Wilson Rd. and then checked at the opposite end. If the vehicle exceeded a predetermined time for transit of the Moose Wilson Rd., then the camera would take a picture of the vehicle's license plate and the Park could issue a citation.

Topic Question 1:

I believe horseback riding, including commercial, is an important economic, cultural and cost efficient way to introduce the public to the park. Any plan should maintain or expand this use of the park.

Topic Question 2:

I strongly oppose a bicycle pathway on Moose-Wilson road. It will be a large, expensive and very disruptive project, and bicycles are scary and challenging to wildlife. A friend of mine was actually chased by a black bear while on her bicycle on the road. The current bicycle paths are greatly underused (3%) by park visitors. The number of trees destroyed by the proposed pathway and the construction process would ruin the current pristine historical wooded area.

I strongly oppose the proposal to close the Sawmill Pond Trails to commercial horseback riding. They have been approved trails for decades, and there have been few conflicts and minimal need for park management. This area offers a unique opportunity for visitors like myself to understand and appreciate the area, thus furthering the goal to protect and maintain cultural resources through education.

Topic Question 3:

Horseback riding in the park is an excellent way to get visitors to appreciate the pristine and historical aspects of the park. If anything, riding should be encouraged and expanded. It is the least disruptive way for visitors like myself to see wildlife up close. In our rides in the park, we have passed through resting herds of elk without causing them to even stand up or quit eating. We saw a coyote trot by, look at us then sit down and scratch his ear. The animals see a horse as another animal and are not disturbed, unlike with bicycles.

Topic Question 4:

I hope you seriously consider the importance of horseback riding to the visitor experience in the park. My husband and I come to the park every summer for a week and have spent thousands of dollars and countless hours in the area. Disturbing the current equilibrium between people and wildlife on and around the Moose-Wilson Road would be a mistake.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

Alternative D should be carried forward to get visitors out of their cars to experience nature more fully& to cut down on vehicle congestion,This alternative also provides a more complete opportunity for visitors to really see& experience GTP& Jackson Hole via a more complete pathway. The separate pathway should be constructed to connect with the other pathways in the park,allowing disabled,children& elderly an opportunity to get out of their vehicles.

Topic Question 2:

not sure about the reservation system,but it should be considered as a way to decrease congestion during the peak periods

Topic Question 1:

I believe the strategies in the preliminary alternatives that should be carried forward to best achieve the most desirable use and protection of the MWR is as follows:

- 1) Pave the unpaved portion of MWR. By doing so, this would help to eliminate the extremely slow movement of cars, etc. in between the dust abatement periods which are not sustaining;
- 2) Realign the north portion of MWR between the Saw Mill Ponds Overlook and the Death Canyon Road junction; restore the old road back to its natural condition
- 3) Only a specific number of commercial trips would be permitted within the corridor;
- 4) Provide travelers alerts at the entrances to MWR from both the North and South to inform them of full parking lots, wait times, etc. The ranger at the entrance station would know that the parking lots were full because he/she would have provided passes to the various destinations to the travelers when they entered the Park.
- 5) NO BIKE PATHS; This is a natural habitat that should not be disturbed any more than necessary. The building of the paths, alone, would absolutely destroy more habitat, not to mention disturbing the animals and birds during the building of the path. A good example of the longevity of building bike paths is to look at the bike path being built at the Wilson Bridge that is still not completed.
- 6) Create a definite number of parking spots at both Granite and Death Canyon trail heads; adding toilet facilities would be advantageous;
- 7) Create better pullover options along the MWR to help eliminate the present traffic jams when observing wildlife;
- 8) When the road is closed during the winter months, allow access to bikers, pedestrians when it is free of snow and ice.

9)Relocate Death Canyon Trailhead and provide parking access to 60 vehicles which would be monitored by the entrance stations.

In essence, I am promoting most of what Plan B is suggesting. In my opinion, there is now a problem with the traffic on MWR, particularly during the busy summer season. My family and I have been visiting Jackson for over 30 years.

Moose Wilson Road has always been a "destination" for us, as well as a connection between Moose and Wilson, which is where we reside. Over the years, traffic and wildlife jams have become a negative for the area. If these alternatives suggested above, can aid in sustaining the beautiful, natural habitat and protect the wildlife, then I am a supporter of making these necessary changes. Our responsibility should be to find a way to co-exist with the wildlife, while still maintaining a thoroughfare that works between Moose and Wilson.

Topic Question 2:

As stated above, my biggest concern is building a bike path through the MWR corridor. We do not need to destroy any more habitat than needed to fix the present problem. The damage, the time taken to build the bike path, as well as the cost would NOT be worth the outcome. This would be the biggest mistake the decision makers could make. Please do not let this happen to our precious, NATURAL jewel, Moose Wilson Road.

Topic Question 4:

I have no further comments other than when you are making the final decisions, please maintain a BALANCE between enhancing MRW for visitors and a serene natural habitat for our precious wildlife.

Topic Question 1:

I approve #1. This is our escape route for flood or earthquake. The ditch bridges need to be a foot wider. No cyclists or hikers are safer.

Topic Question 2:

I do not want this road improved so drivers can increase their speed. Having the traffic stopped on special times or days would be very difficult.

Topic Question 3:

Keeping as much of it dirt as possible will also slow drivers. Potholes should be less than a foot deep but not smoothed too much. Just enough to not tear the cars' undercarriages.

Topic Question 4:

The park has done a marvelous job building alternatives for this concept.

Thank you, Mardie Muries' goddaughter, Lou Breitenbach

Topic Question 1:

I support several elements of Preliminary Alternative B which includes the concept that the Moose-Wilson corridor should be mainly a visitor destination, which is consistent with achieving the goals and desired future conditions set forth in the plan. I do not think this can be achieved if the corridor continues as a two-way through road during peak season. I support directional vehicle traffic or one-way traffic as tools to decrease heavy through traffic use not related to people visiting the park. Adding shuttle vehicles to transport people and manage traffic should also receive additional consideration and is a strategy I support. I fully support realigning two segments of the northern portion of the road to move human activity out of the riparian zone and give wildlife more space for people to view from a distance and lessen human impacts. I believe the unpaved section of the road should remain unpaved to maintain its rural and historic character. I support cyclists continued use of the existing roadway surfaces.

Topic Question 2:

I strongly oppose Preliminary Alternative D which calls for establishing a new use and constructing 7.1 miles of separated paved pathway through heavily forested and critical wildlife habitat. I do not support adding new winter recreation in this sensitive corridor, including grooming the road for cross country skiing, skating, potentially snow bikes, and adding commercially guided tours. The development and visitor use described in this alternative does not support the basic premise of the planning process, which is that operational changes should be compatible with the goals and desired future conditions that are described at the outset of the document. The key elements of Preliminary Alternative C should not be carried forward. Although there is some merit in the strategies presented, I can not support the alternative because I believe it would be very problematic to manage and to communicate to the public. I also do not

support Preliminary Alternative A - No Action because the corridor and the road cannot sustain the current traffic loads in excess of 2000 vehicles on busy days without adversely impacting natural and cultural resources and visitor experience.

Topic Question 3:

Any strategy should emphasize preserving the unique natural and cultural resources of the corridor while providing a quality visitor experience.

Topic Question 4:

Thank you for the opportunity to comment.

Correspondence Text

Topic Question 1:

The Moose-Wilson corridor provides some of the valuable wildlife habitat in the ecosystem, but it is threatened by increasing vehicle traffic, which must be ameliorated. The proposed realignment of the northern portion of the Moose-Wilson Road is an important step toward reducing habitat disturbance and potentially dangerous interactions with wildlife.

The new road should be designed to maintain the slow speeds and meandering character of the existing road, which should be removed and the area restored to natural conditions. Winter use should continue to be restricted to non-motorized access without any trail grooming and should avoid areas heavily used by wildlife.

Topic Question 2:

The no action alternative is unacceptable as there is already too much through traffic on the road. Commercial traffic should be discouraged. Also consider limiting traffic to one-way at a time. Unfortunately a reservation system or periodic closures of the road would be difficult to administer and pose challenges to visitors. Instead, to encourage visitors to treat this as a destination area and not just another transportation link, please consider requiring all vehicles to spend at least an hour in the Moose-Wilson Corridor. This could easily be monitored if there were entrance stations at both ends of the road.

Topic Question 3:

Unfortunately, the existing road goes through a lot of the best wildlife habitat and creates undue risks of dangerous interactions with wildlife, requiring periodic closures. Please consider and analyze realigning the entire Moose-Wilson Road out onto the flat open areas on the eastern side of the corridor, west of the Snake River flood plain and wetlands. Specifically, the proposed realignment of the northern portion of

the road should be continued southwest past the east side of the LSR Preserve to connect with the existing paved road just southeast of the Lake Creek bridge. This realignment would minimize disruption of the best wildlife habitat, provide more open sight lines for avoidance of accidental encounters with wildlife, provide better views of the Tetons and provide easy access to the LSR Preserve parking lot as well as to spur roads to Granite and Death Canyons. The realigned road should be designed to provide a meandering, narrow country road experience with sufficient turnouts for visitors to observe wildlife, admire the views and explore the landscape. The entire existing road from the Sawmill Ponds south to just north of the Granite Canyon parking lot should be removed and restored to natural conditions, as has been done so well throughout the old JY Ranch.

Topic Question 4:

Thank you for providing an opportunity to comment on the process at this stage. The long-term preservation and protection of the valuable biodiversity of the Moose-Wilson Corridor is essential to maintaining the Park's character and visitor experience values. Please take your time to consider and study all ideas, not just the current preliminary alternatives.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. I've visited Grand Teton, Yellowstone, and many other national parks because I love wildlife and nature and value the opportunity to experience them. I am concerned that traffic impacts and calls for increased development could have a significant negative impact. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Correspondence Text

Topic Question 1:

Reading the documentation, one of the (major) driving reasons for developing a new comprehensive plan was "...notable increases in potentially dangerous wildlife have been observed..." then linking that observation with "increased motor and bicycle traffic" indicating that a increased incidence of interaction between wildlife and humans exist.

Hard to deny, but in reality there is limited interaction on the road between humans and wildlife. If this is a realistic concern, the Park service would be better served by addressing backcountry usage, assuming that traffic is picking up. I have been driving the Moose-Wilson Road for years, and other than the moose that frequent the sawmill ponds and the beaver ponds at the south end of the road- -we have rarely seen wildlife on the road itself. I do not believe that the alternatives presented here realistically address any wildlife issues. They do cater to the biking lobby, who desire more (separate) biking trails.

Topic Question 2:

The destruction of habitat required for the realignment of the road does not seem to have an equal beneficial impact, at least as presented here. Similarly, a separate bike path, desirable from the cycling lobby's point of view, does not seem to have a demonstrable need that offsets the habitat destruction required to support it, or the disruption on the road itself during construction. Neither of these expensive projects provides significant benefit to the general public.

The notion of a reservation system to utilize the road seems to be a cumbersome process that should not be pursued. One way traffic should only be considered in conjunction with data that shows what local commuter patterns are so that one way traffic is minimally disruptive to workers (generally underpaid

already...not enough of them, etc).

Topic Question 3:

Groom the road for cross country skiing and snowshoeing in the winter. Minimal environmental impact.

Contrary to the bulk of the recommendations, the dirt portion of the road should be paved and maintained to the same standards as currently exist for the paved portions of the road. The road conditions on the dirt section vary from passable to horrible depending on the last time it was graded, etc. Keeping a small portion of the road as a dirt road serves no purpose.

Topic Question 4:

Several of the suggestions are spot on. Increased turnouts for vehicle parking. The Rockefeller reserve does not have enough parking and needs more (most folks are hiking to Phelps lake). Perhaps some additional interpretive trails/signage could be developed in less sensitive areas- -these simple signs, identifying particular habitat, wildlife, flowers, etc are important bridges to visitors learning about the "why's" of the National Park and building support for it in the future.

Comments: The Moose-Wilson road is a backcountry experience that has always required people travelling along the route to take their time, exhibit courtesy when passing, and allowed the enjoyment of a relatively undeveloped areas of the park. My most enjoyable moments have been the moose feeding in the ponds adjacent to the road and in autumn, the sound of the bull elk bugling. The point here is the experience of the "wild"-enhanced by a narrow road that encourages us to look and experience nature. Bicycles whizzing by on a separate path, inconvenient and aggravating reservation systems- -(I have never heard a complaint about slow or congested traffic- -it's just part of the experience) will substantially reduce the quality of the experience available today. To the maximum extent, the experience of the road should be maintained as it is- -with simple, minor improvements as suggest above to enhance the experience as it exists.

As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road, could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Dear Superintendent Vela,

I am greatly concerned about the future of the Moose Wilson Road Corridor within Grand Teton National Park. My husband and I visited Grand Teton about 2 weeks ago. We also visited Yellowstone and some of the only wildlife we saw...we saw along this back road.

I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. Topic Question 1:
Should be left completely pristine. And noiseless as possible.

Topic Question 2:
Any increase in noise or traffic will increase stress and a reduction in animal populations.

Topic Question 3:
Hiking, camping, and quietly done activities. Back to nature, life's natural resources to calm the savage beast.

Topic Question 4:
No commercialization or mining, leave this for future generations to mess up, we have already done more than our share to mess our planet up. Let's hope that they are more intelligent than we have been.

Comments: Native American cultures teach we should look seven generations back and seven generations forward in making our decisions for change to our children and their children's children.

Topic Question 1:

Preliminary Alternative B should be carried forward

Protects wildlife and wetlands

No commercial traffic such as taxis but allows controlled access to commercial tour vehicles

Incorporate some improved visitor wildlife viewing areas to allow safe viewing off the roadway and less disruptive to traffic flow

Bike access in off season

Topic Question 2:

Alternative A does nothing

Alternative D bike paths could be invasive/disruptive to wildlife and habitat particularly when routed far away from road at LSR

Topic Question 1:

I believe that NO ACTION should be taken. So I say Alternative A. We should not be disrupting the homes of all the wildlife that live around this area at all. I like the way it is the only real changes I believe need to be made is having the speed limit lowered to 15mph and really bikes should not be aloud on the road at all it is way to narrow of a road and unsafe. There's plenty of other places they can bike. As for the speed limit it's really certain locals that speed on that road because they are in a hurry just passing through and don't care if an animal walks out on the road! (GIVE OUT TICKETS) I say move or don't drive the road. I have been coming out to the Tetons since 2006, nine years, why you say, because I love it out here and I love the wildlife I enjoy this road and it so beautiful as is. it's nice to be able to stop and watch a moose or a bear off that road in it's habitat and that's why people come here and we spend lots of money so you should really listen to what the visitors want and all the people of the town. However you do need to pull off the road and not stop on the road at all, I do agree that is a problem.

Topic Question 2:

I don't believe any of the out plans would achieve any good purpose for either the wildlife or the visitors. Way to much disruption for both and really a certain amount of people at a time can only park at the parking lot? Closing the road 2 days a week, I don't see that point other then controlling the visitors. And last closing the road at the end of September, I don't see the point to that either. It's such a short season as is please let the visitors visit that's why they come here.

Topic Question 3:

Like I said in the first question lower the speed limit people drive way to fast on that road and on other road for that matter. 2nd not allowing bikes would really make it safer. Putting up better signs to stress

that trailers and RVs are not allow on the road because it is too narrow, they should also be ticketed. I have seen way to many people with trailers and RV's on that road and they shouldn't be.

Topic Question 4:

Allow the visitors to view the wildlife in a safely manner with nice Ranger/brigade Like Larry or Aaron who really do a great job at making your visit an enjoyable one without yelling at everyone as if we are all criminal like some of the brigade act. Train them, and if they are afraid of the wildlife they shouldn't be there.

Moose Wilson road has been like that forever and it would just be a shame to see it change by taking out that road people will not be able to watch the wildlife that happen from that road any more and you know that. That's where they hang around the ponds and the berry bushes. It was there home first not ours.

Dear Superintendent Vela,

The strength of Teddy Roosevelt's great idea lay in leaving the wilderness alone. Developing more and faster traffic inside the Grand Tetons weakens the effect of wildlife in wild places, and turns the area into a zoo, instead. Traffic should be encouraged to move slowly, stop at will, and soak in the majesty of the park and its residents. Bicycling and hiking should take precedence over vehicular traffic.

Having lived in Santa Fe, I am acutely aware that residents need regular respite from tourists. So I encourage occasional closures, banning snowmobiles and other winter disturbances, and close monitoring of visitors to give the wildlife the privacy and respect they need and deserve.

Please fight for the wildlife that make Grand Teton such a special area.

Sincerely,

Dinah Lea Jentgen

Topic Question 1:

I hope that the Moose-Wilson Road will remain as undeveloped as possible for the sake of the wildlife that lives there and its rural nature. If a bike path goes in, the impact will be felt quickly and will only get worse in the coming years. As well, keep the road narrow and winding- cars moving slow. Please don't let the park road be an extension of the mortal danger to wildlife already met on the Village Road.

Topic Question 2:

Alternative B is the plan for least harm.

Topic Question 1:

I don't believe any of the four alternatives achieves the desired goal - that is allowing some traffic without harm now and in the future to the natural resources.

Topic Question 2:

I think alternatives A,B,C all have reasonable feature, but they all allow TWO-WAY traffic. I have studied all the alternatives, attended the library open house, read all the newspaper letters, and spoken at length with many friends. I find all of the alternatives lacking, especially D which simply must not be adopted.

Topic Question 3:

I am absolutely convinced that a ONE-WAY road system should be adopted. A few years ago the NPS recommended this solution and I am puzzled way they didn't stick with it. This road is simply too crowded, and therefore there must be LIMITATIONS on the public's use. Parks across the country are doing so, and in GT we have the wonderful and popular LSR, which wisely limits use by a parking lot. Without that limitations the experience that Lawrance desired for the visitor could not be accomplished. The public now accepts the need for their PLANNING and limitations on their use. We presently have the Jenny Lake one-way road (with bicycle path) that works well. Something like this is necessary. Perhaps the road could be opened to the North in the morning, and the South in the afternoon? Planners can work out the details, but it is the only satisfactory solution.

Topic Question 4:

Obviously, there is no perfect solution. I think everyone agrees that in the northern wetland area the road

must be rerouted to the sage brush of the East. Also, at least among my friends the bike paths lobby has been given quite enough, especially since the Antelope flats area will soon be open to their use (at great expense). A separate bike path is simply unnecessary and unwarranted. A one-way system will meet their needs.

Comments: I feel I have made my position quite clear, without all the details worked out. A two-way system delays a permanent solution and will lead to continued frustration for visitors, wildlife, and the NPS. There is no perfect answer, but a ONE/WAY road system will best achieve a permanent solution.

Topic Question 4:

I have experienced the Moose Wilson Road corridor many times with friends and family members. It has been one of the highlights of each trip, watching beavers cross and recross the road to build a dam, seeing a moose cow and her newborn calf, watching elk graze. PLEASE protect the wildlife, scenery and historic values of this road. Development can happen anywhere. The glory and beauty of nature and its wildlife cannot.

Comments: Dear Superintendent Vela,

Topic Question 1:

We favor Alternative D for the Moose Wilson corridor because we strongly favor a separate bike path for biking and walking which is located away from the road as much as possible.

Topic Question 2:

We would not be in favor of any plan that closed the road for periods of time. However, if or when a so-called North Bridge is built across the Snake River , which we are in favor of, then we think a complete closure of the road, with the possible exception of public busses, should be investigated.

Topic Question 3:

No

Topic Question 4:

We are strongly in favor of trails, bike paths,restrictions, and any other methods which encourage people to get out of their cars.

Topic Question 1:

As a member of the local Jackson Community for over 20 years I am distressed to read that none of the Alternatives really address about truly preserving this critical wildlife habitat.

My business involves working with people who relocate to Teton County WY precisely because of the pristine nature of the area and the unique magnificence of our most diverse wildlife.

I believe that in order to maintain any level of true conservation of the most special area of the Moose Wilson Rd, a total reduction of motorized traffic needs to be addressed, it is NOT and should NOT be a thoroughfare between Moose and Teton Village.

As well, for the safety of any visitors and of the resident animals, I believe that all other forms of transportation should also be strictly regulated and controlled.

Topic Question 2:

Not one of the alternatives really directly addresses the problem that have become rampant on the Moose Wilson Rd. These include not only increased wear and tear of the road but mostly include the destruction of the habitat for the local animal residents.

Increased traffic is not only an invitation for the animals to become agitated, get themselves into trouble and harms way and is seriously contributing to their disappearance altogether.

Topic Question 3:

To preserve the special and unique feature of the Moose Wilson Rd I believe that it should be made into a one way , one lane road for all modes of transportation.

The positive impact of this thought should be obvious and could potentially save the habitat, animals and human safety altogether.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is

owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Brian Fink

Topic Question 1:

My ideas on the Moose-Wilson corridor are entered in the comment box below. Thank you for this opportunity to comment.

Comments:

The 1916 Organic Act states that the mission of the National Park Service is "to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." It is the duty of Grand Teton National Park, as an arm of the National Park Service, to honor that mission. When it comes to the area known as the Moose-Wilson Corridor the park has no obligation to provide a highway for personal and commercial traffic between Teton Village and Moose, points north, or the Jackson Hole Airport. For such traffic it is the responsibility of Teton County and the state of Wyoming to increase capacity on existing county and state roads outside the boundaries of the National Park. These should include the existing state highways 390 and 22, county road Spring Gulch, the Tribal Trails right of way and studies for a road crossing the Snake River between Teton Village and Gros Ventre Junction. It is important that these options be thoroughly explored and acted on before accommodating through traffic on the Moose-Wilson Road.

The Moose-Wilson Road area within Grand Teton National Park is priceless wildlife habitat, thoughtfully protected by the gift of Laurence S. Rockefeller. In order to provide the utmost protection to this area there should be no through motor vehicle traffic. The road should dead-end at the Laurence S. Rockefeller Preserve from both the north and the south, permitting vehicle access to the LSR Preserve

from either end of the corridor thus leaving safe conditions for bicycles and hikers on the existing road. Access for National Park Service emergency vehicles would be maintained through the area. Many National Parks, including Denali, Zion, Glacier and Yosemite, have realized that in order to protect the resources under their care the numbers of visitors must be limited. It is time for Grand Teton National Park to also take this important step. It is understood that Grand Teton National Park will continue to expand visitor capacity at some popular sites, such as Jenny Lake. By contrast the LSR Preserve warrants having limited visitors who may thus enjoy the very special experience there as envisioned by Laurence S. Rockefeller.

Topic Question 1:

Protecting the vegetation, trees and the animals should be the first purpose of the park. Therefore doing as little possible to improve the road, and decreasing human use of the road should be the strategy carried forward.

Topic Question 2:

A bike path is the most ridiculous of the ideas since it's construction would destroy so much of the adjacent vegetation, and endanger the animal population in the future. There is no need for another bike path through the park. There are already plenty.

Topic Question 3:

Since the traffic is being partially generated by the Rockefeller Preserve, the parking lot and the gate at the Preserve should be closed. A ticket and bus service should be run from the Craig Thomas Center. This should be the only way to access the Preserve. This should be the only bus allowed on the road. Since the other traffic problem comes from the Teton Village build out, the Village needs to find other strategies, such as running their own transportation to and from the airport, having it go through town. They could also acquire the land needed for another bridge over the Snake.

Topic Question 4:

There are any number of reasons to leave Moose Wilson Road an unimproved road. If it stays that way it discourages use. First, take down the sign at the north end that states 'Teton Village 9 miles' -it encourages use. Do not fill the potholes. Do not pave it. There are no reasons, except short sighted public policy and

profit to expand it or add a bike path. A bike path will put people in danger of contact with the bears that live there. The bears will suffer. In the park, when there is a grizzly sighting close to the road, the ranger rushes to the site and insists everyone STAY IN THEIR CARS. Does this not tell us something!

Comments: Lets face it, the only reasons we are even talking about improving the Moose Wilson road is the political clout of Teton Village and the Pathways. There is no reason to drastically do anything to the road. It will not fix the problem long term.

If you did a poll outside this area and asked " is it safe to build a bike path in known grizzly bear habitat" - seriously what do you think the answer would be. OF COURSE IT IS NOT SAFE.

If you did a poll and asked" should we kill 3,000 trees and 24 acres of vegetation so a few people could ride a bike through an area" - what do you think people would say. REALLY, OF COURSE NOT!!

Especially when there are miles of trails already.

Foremost, it will be the bears that will suffer. The more human contact the more bears will have to be "relocated". All the animals will suffer but the bears the most. This is wrong.

None of the alternatives you have outlined will solve the problem long term. The West Bank is scheduled for density in the Teton County Comprehensive Land Use Plan. If the road is improved the pressure for use will only grow. There need to be another bridge over the Snake. PERIOD. THIS IS THE ONLY LONG TERM SOLUTION TO WEST BANK TRAFFIC. The county needs to accept that and start working toward it not trying band aid approaches.

It is also nonsense to think this road is part of the county transportation plan. Just who bikes Moose Wilson to work. It would be purely recreational use. A bike path is just not needed. It should not be built.

Topic Question 1:

The Horse should stay in their grasslands.The Horses were there before man,cattle,sheep etc.

Topic Question 2:

The Horse were born & raised there,and they should live there life out there.I only wish I was a horse do I could run free of technology and GPS.Let them LIVE!

Topic Question 4:

This whole program is wrong.It does not take into consideration the Mustangs need to keep running free and breeding.These Horses,and I am A full Blooded Cree American Indian and the horses on the plains belong to the "HUMAN BEINGS".Why do you want to sell our horses for \$20 to ship to Europe & Canada.Makes me SICK!

Comments: I am a Native American.I am A Full Blooded Cree Woman.The lands that we were "given" (which were our own before you ever stepped in the New World) were the worst and most dangerous.My Brothers had to mine URANIUM only so that they got sick,so sick they had trouble breeding and they died young.Their crops suffered from the URANIUM DUST and the children all developed all sorts of mental illness.

Why do you place every URANIUM MINE or other TOXIC MINE on a Reservation? This now destroys the fish,the water,and the game.You destroyed America.

Topic Question 1:

Keep the Moose-Wilson Road "as is" ..with a few upgrades.
Pave the currently unpaved section on the south end of the road...to provide a safer road for vehicles.
Provide additional pull-outs...for smoother traffic flow.
Go back to the "drawing board" to address the Death Canyon upgrades...more maintenance to the current road?

Topic Question 2:

Limiting horseback riding...the wildlife in this corridor have established a healthy relationship with the horse over these many years of use/interaction, the horse is a historical and cultural part of this specific area of use in the Park.

Providing a pathway...this corridor is a "back country" experience and habitat, we do not see "paved runs" when skiing back country :) I fear for the results of what could be an "invitation" to more wildlife-human encounters.

Topic Question 4:

Please protect the integrity of this special corridor in the Park.

THANK YOU

Topic Question 1:

Do not improve the road as in no new pavement to minimize impact from higher speeds of travel and to maintain the rustic appeal.

Maintain the winter non-motorized access as it has traditionally been to help protect wintering moose especially.

Improve the Death Canyon trailhead road without paving, as in grading, but maintain same number of parking places.

Prohibit taxi and other shuttle commercial use as this is not a piece of the transportation plan for teton county. these commercial uses are using it to skip paying at the gate by coming down through from the north. One-way travel only to the north would eliminate this and eliminate the need for another kiosk which we wouldn't need

Topic Question 2:

Doing nothing is not viable, traffic must be reduced, there is too much impact and conflict to the environment.

a pathway through the corridor would further impact the resources by tree removal and disruption of fragile resources. There already is a pathway to the park via the outside road. This road can not be used to become a playground for a select group of special interests (bikers) and it is unrealistic to think that those handicapped would be able to use the pathway because of the distance. This is a way for the pathway supporters to push their agenda by saying it would be multi-use. Get real, I can't see anyone pushing a person in a wheelchair nor a handicapped person being able to propel themselves the length of the corridor.

A reservation system or restriction of vehicles would not be necessary with one way travel to the north and elimination of taxis and other commercial shuttles.

No grooming of the road in winter. Keep it rustic and natural as there are other places for groomed winter use.

No addition of an expensive kiosk in the north we don't need with one way travel.

Topic Question 3:

One-way travel north through to Moose for cars and bikes. This would eliminate conflict with car-bike head-on situations and eliminate the need for a pathway. Those that want to bike a loop could do so by returning on the bike path on the outside road. The road would not have to be widened or re-located. It would eliminate the need for a kiosk and would eliminate taxi and shuttle commercial use of the corridor for transportation and commercial financial gains.

Topic Question 4:

Please consider re-introducing the alternative of one-way travel to the north for vehicle and bike travel, continue with winter closure as it is and do not add more to this pristine, rustic corridor that gives visitors a unique experience found no where else in the park. Do not improve the road or add more stuff.

Correspondence Text

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. I have only been able to make to the park twice, but it one of the most beautiful and memorable places that I have ever had the pleasure too travel. I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

Topic Question 1:

In general I ask that you adopt Alternative A and make as few changes as possible. I suspect that deciding not to take much action is something alien to a bureaucracy, but first do no harm would be a good motto for a steward of such a precious resource as Grand Teton National Park. In addition it would seem the most economical. I did think the proposal for traffic alerts was a good one.

Topic Question 2:

I would not build new facilities to "manage" or "interpret" the experience; the more one manages the more one changes, and the best interpretations may be the ones one comes to on one's own. In addition, new facilities will only tend to create more congestion and more problems.

Further, I would not build a new bicycle path (Proposal D) that would destroy trees and eat up more of the parkland. To the extent it attracts more bike riders it will only increase potentially dangerous interactions with wildlife.

One-way traffic and a turn-around at the visitor center will not appreciably reduce congestion and will just lead to more time in a car and less land.

Horseback riding has been a part of Jackson Hole for a long time and is a part of what gives it its character. In addition, based on experience, my impression is that hiking and driving visitors appreciate seeing riders. I would do nothing to restrict the current permitted riding trails.

Topic Question 3:

Why not consider having an entrance cabin at the North end of the road like the one built at the South end. It's odd to permit free entry going South but charge an entrance fee going North. Doing so would raise revenue fairly, reduce congestion and permit traffic control if that became necessary. In addition, it would be in an area that is now already built-up so would not impact the rest of the Park.

Of all the potential users of the Moose-Wilson Road it seems to me that bike riding is the least consistent with the Park Service's objectives. While I might not ban it, I would do nothing to encourage more use.

Comments: I've been coming to the Tetons for the past 25 years with my family. Thank you for all your work maintaining it. Please try not to change it.

Topic Question 1:

I only know of my experience working in parks to preserve wildlife and nature that once you allow more functions, development and more traffic it threatens the quality of the park that was once preserved for nature and it's inhabitants. By compromising this it will bring in unwanted influences and create instability that will be hard to come back from.

Topic Question 2:

Traffic kills and brings trash- I have tried to find your plans for the park but the downloads you have are 9 hours long so I did not download them. But mainly the goal is to keep the park from being a tourist site that is noisy, harmful to wildlife and in the best interest of maintaining quality of life as it is already there.

Topic Question 3:

That studies be done by naturalists or qualified people that love and care for nature because at the rate we are going untouched and pristine areas of nature need to be looked after and cared for!

Topic Question 4:

Use it for an outdoor teaching school for children so they can realize the importance of nature. But keep it limited so as not to disturb the inhabitants. Build a nature center if there is not already one.

Topic Question 2:

As a hiker, the bicycle only access of the Moose-Wilson corridor two days per week as stated in Plan B is unsettling. How would a hiker get in to Granite Canyon trailhead, the LSR Preserve, Death Canyon trailhead, etc? Wouldn't this violate the agreement between TNP and the Rockefeller family? What about summer visitors, I'm thinking families with small children, that are only here for a few days? If the access to LSR was bicycle only during their visit, they would lose the experience to visit one of the most easily accessed, user-friendly and exquisitely beautiful areas of the park.

I am also upset by the idea of the elimination of historic horseback trails.....My family and I have enjoyed these trails for years, originally as dude ranch guests and now as summer residents. Keeping these trails is right in line with the park's goal to "Protect and maintain cultural resources as important links to the human history of the Moose- Wilson corridor, including historical and archeological sites, cultural landscapes, and ethnographic resources."

Topic Question 1:

Alternative D in the scoping process includes innovative ideas that are smart and forward-thinking for the Moose-Wilson Corridor. Alternative D will enhance wildlife habitat and connectivity through road realignment, manage peak traffic flow with technology and allow for safe non-motorized access along a separate pathway.

Topic Question 2:

Alternative A, B and C. Road closures cause an imbalance of traffic flow, idling lines and erratic visitor experiences with negative impacts to the environment and the public. Without a separate pathway, the Moose-Wilson road cannot be enjoyed safely outside of a car

Comments: As a passionate user of our national parks, I want to thank you for including Alternative D in the scoping process which includes innovative ideas that are smart and forward-thinking for the Moose-Wilson Corridor. Alternative D will enhance wildlife habitat and connectivity through road realignment, manage peak traffic flow with technology and allow for safe non-motorized access along a separate pathway.

I greatly appreciate being able to experience the Park outside of my car, and as a father of two small children, I feel enabling future generations to experience the park in a safe manner is imperative to the future of park preservation. Alternative D is the best for enhancing the visitor experience by keeping the road slow and narrow and safe for enjoying the Park on foot or bike. Alternative D also enhances wildlife habitat with the road realignment.

The other alternatives do not address serious safety concerns for the corridor or allow for the enjoyment of the Park from outside of the car.

Please complete the separated user pathway loop by pursuing Alternative D in GTNP.

Thank you.

Topic Question 4:

I want to preserve the beauty and natural wildlife habitat of Grand Teton National Park. My husband and I were in awe of its beauty when we visited this particular park. I personally felt that Grand Teton's beauty exceeded that of Yellowstone due to the unique and colorful landscape. I cannot offer any one specific strategy at this time. However, any increased traffic will severely affect the park's inhabitants.

Comments: Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. Topic Question 1:

Eliminating all through commercial traffic, would reduce traffic volume on the MW Road, and remove drivers that are simply trying to get through and around the many who are enjoying the corridor. This can and should be done under any scenario.

Eliminating the need to go through two entrance stations, one at Granite and one at Moose. This can significantly increase time as lines, particularly at Granite can be very long. If the park implemented some form of automated reader, like Parks Canada uses for pass holders, the two entrance stations would not be a problem.

A pathway would be nice, and may be necessary if some other traffic management solution is not implemented. The current road offers one of the "best" stretches of cycling in the area. At the current posted speed limit, many bicyclists are moving at close to the same speed as motor vehicles. This should be a compatible situation (lowering the speed limit would further enhance it!) Bicycles and cars could enjoy the same road together, if motorists understand that a bicycle has equal right to the full lane and that passing a bicycle on the road is extremely dangerous given the frequent short line of sight. As one who rides the road regularly, the biggest issues I have experienced are with aggressive passing in a short line of sight area.

Depending on the design of the pathway, cyclists may continue to choose to ride on the road. A pathway would likely open the corridor to more and less experienced cyclists as the other paths in the park have done, creating immense enjoyment. The current park pathways are a wonderful way to experience the park and would open the MW corridor to a similar experience for many.

Topic Question 2:

Any plan that periodically closes the road or changes the traffic pattern should be discarded. While the benefit is theoretically understandable, these ideas would drive people crazy! Driving all the way down Teton Village road to the Granite entrance station to find the sign that says the road has been closed or its Tuesday and its a bike only day, will raise the ire of the public, waste resources and generally frustrate everyone.

Topic Question 3:

While not specifically proposed an alternative would be to close the Moose Wilson Road to all private and commercial motor vehicles and utilize shuttle services, leaving the road as is for non-motorized use and shuttle use. This is attractive as it would require no improvement to the road or disruption to the environment, it would allow folks to access the LSR and other points, and walkers, bikers and other non-motorized travel would have full access to the road. This has been implemented at many other National Parks in areas. I was surprised not to see it as an alternative.

A reservation system for LSR. As LSR has limited capacity, allowing visitors to reserve their time there would enable predictability, no waiting, reducing traffic volume and a better overall experience.

An automated reader for passholders at Granite Entrance (other entrances too).

Topic Question 4:

Close MW all together, leaving it open to shuttles and non-motorized.

Leave MW open, eliminate through commercial traffic, institute a reservation system for LSR

Consider a pathway design, that will really offload bicycle traffic from the road

Eliminate the need for two entrance stations, or institute an automated pass holder reader.

I would encourage the Park to carefully consider the environmental merits of rerouting the road as compared to the environmental damage from doing so. Its a magical road, with its imperfection. Its good. And better is often the enemy of good. :)

Topic Question 1:

Alternative # 2. The plan needs to prioritize our wildlife and conservation requirements in line with it's stated goals, promises and the basis upon which the Service was founded.

Topic Question 2:

An improved road or any two-way road would disturb wildlife and degrade the undisturbed and wild values we all cherish by creating increased traffic and disturbance.

The road and accessibility alternatives are being carried out by a public relations consultant for the J.H. Resort in order to create additional revenues at the expense of Park values.

Topic Question 3:

Closing road in the winter, no further paving and closures when needed for wildlife reasons.

Topic Question 4:

Our community will lose revenues and tax dollars as visitors perceive our community to be more like "anywhere else" and find less reasons to visit.

Comments: ALTERNATIVE #2 is the best one to meet the needs of our community.

Topic Question 1:

Of the four alternatives, we believe that Alternative A is the best solution, as the others are far too restrictive or invasive of the Moose-Wilson corridor. We do not like any of the alternatives outright. A bike path running parallel to the road would increase conflicts between wildlife, pedestrians, and cyclists. Shutting the road down a few days a week is ludicrous as you would be turning people (the taxpayers!) away from their park. These alternatives smack of pandering to special interest groups that plague this valley.

The only sound proposition within these alternatives is the paving of the entire road.

Topic Question 2:

See above, please.

Topic Question 3:

We at BrushBuck believe that the following actions should be taken to improve the Moose- Wilson corridor:

Pave the entire road. Install speed bumps / dips from Granite canyon to the sawmill ponds that are marked by signs throughout the corridor. Increase the amount of pullouts available within the corridor, especially in areas that are regularly congested with wildlife observation. Decrease the speed limit to 15 miles per hour.

Topic Question 4:

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

We feel that the issue of the Moose-Wilson corridor is an issue that is a lot smaller than it needs to be. With simple traffic realignments, the road can be reigned in from unsafe drivers and be a multi-use road that is safe for cyclists and motor vehicles alike. This corridor is an important asset of Grand Teton National Park. Like the other national parks and monuments throughout our great nation, Grand Teton is the people's park. The federal government does not need to waste anymore of the taxpayer's money to exercise further control over a non-issue. Tour operators are the safest pilots of the Moose-Wilson corridor, yet we feel we have been the subject of the most scrutiny. We are constantly passed by aggressive drivers while operating on the Moose-Wilson Corridor, and the majority of those drivers are locals either trying to get to work in the park or going to recreate. The majority of the tourists we see on the road are the safest drivers, mainly because the narrowness and unfamiliarity of the road forces them drive cautiously. I sincerely hope that the park service will take a hard look at our suggestions for the betterment of the people traveling to Grand Teton. Our suggestions are also fiscally responsible to a park whose funding has been cut due to the recessions as well as the loss of revenue that occurred in October of 2013.

Topic Question 1:

I DO NOT think that the existing Moose-Wilson corridor should be enlarged to accommodate bicycles thereby destroying over 3000 trees in a pristine wooded area- In this area of the GTNP the wildlife habitats are already affected too much, and bicyclists already have the 15 or - mile existing path to more than please both the tourist and local biker-Moreover, I am incensed that horseback travel that makes the Whiegrass area accessible to dude rancher guests is potentially to be limited-This a 90 year activity in the GTNP that should be preserved and in no way restricted-I have been an annual visitor to this area for over ten years and I believe that the existing use structure and the existing culture should be strictly preserved-New and bigger are not better! Don 't let the local biking community overwelm you!

Topic Question 2:

See above

Comments: See answer to Question 1- In this case, doing nothing to detract from the current park experience, and to limit horse activity that has been in place for over 90 years in any way is folly-Isn 't the park supposed to protect history and longstanding practices ? Thank you

Topic Question 1:

The realignment of northern portion of the road should provide for better habitat protection and less wildlife conflict.

Agree that trailers and commercial vehicles including taxis should be prohibited.

Possibly two days for bikes and pedestrians only would be helpful, as long as bikes and pedestrians would be prohibited on other days. This gives bikers safe access without requiring the massive disruption of a separated bike path.

In Alt. D, the idea of a reservation system could be workable. For consistency, you should consider allowing only those with reservations to use the road - - no "first come, first served." At least everyone would know what to expect.

Topic Question 2:

Alt. A apparently will not meet the needs of expected increased traffic and result in continued degradation of road and surroundings.

Alt. B strategy of no through traffic at peak periods would result in confusion and uncertainty about what is permitted when, but it's hard to comment realistically without knowing what would be considered "peak periods." Is that June-September? Is it 9-11 a.m. and 3-5 p.m. every day? Only on days when rangers count too many cars arriving? Do not support paving south end of road - - I don't see any justification for paving it in this alternative and not the others.

Alt. C also results in too much uncertainty, lack of consistency, plus hourly limits and waiting areas would be a bureaucratic nightmare for park to organize and execute. You would have lots of surprised, unhappy visitors. If you have two days open only to bikes and pedestrians, then the bikes and pedestrians should be

prohibited the other five days. Adding speed bumps that actually maintain 25 mph speed would help on days vehicular traffic permitted, as well as additional signage and personnel to limit pull-out blockages. Alt. D would create unacceptable disturbance of habitat by putting a separated bike path in virgin terrain. How can this destruction of trees and general habitat be condoned?

Topic Question 3:

If a bike path is determined to be necessary, please consider making one adjacent to the road. It could be separated from the road by a curb for safety of bikers. Bikers ride all over the national forest on dirt roads, so it shouldn't have to be paved.

I would like to see the impact of having the road one-way going north in the first half of the day, one-way going south during the last half, and closed dusk to dawn. I believe studies show the heaviest traffic levels go in those directions at those times.

I would like to see a proposal that includes use of the road predominantly or exclusively by public transportation, as is done in Grand Canyon and other parks. This might be combined with use by bicycles/pedestrians.

Speed bumps should be considered under all of these alternatives to assure the 25 mph limit. Additional signage and personnel to control pull-outs and wildlife jams also would help preserve the road.

Topic Question 4:

It's difficult to comment on most of these alternatives, because they include too many unknowns. For example, what are peak periods? Or how many vehicles would be allowed under a reservation system, and how does this number compare with the average use now? Without knowing the likely impact of these proposals, it's hard to make a realistic analysis.

Comments: One last thing to consider is the potentially broader impact of severely limiting traffic on Moose-Wilson. This likely would result in yet another big push to construct a north bridge over the Snake River. While this would not be built inside park boundaries, it would certainly effect the wildlife that pass beyond those boundaries as they migrate to seasonal habitats, look to enlarge their range, or simply move around. I don't mean that nothing should be done to control use of the road, but that judicious steps can be taken to limit speed and numbers of vehicles using the road not as a destination but as a thoroughfare.

As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery and historic values of our national parks. I am concerned that unacceptable traffic impacts and calls for increased development could degrade these qualities along the Moose Wilson Road Corridor near Grand Teton National Park. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you for considering my views.

Topic Question 1:

Two way Summer access to the park with alternative transportation besides auto only. Winter access by grooming the roads. A single access to the Whitegrass Ranch/Death Canyon Trailhead.

Topic Question 2:

Closure to thru traffic at the Rockefeller Center is not a desirable consideration for Teton Village residents or visitors - it denies access to Grand Teton National Park.

Topic Question 3:

Multiple pathway options should be considered.

Comments: As a long time valley resident, I believe in multiple accesses to the park. As a Teton Village resident I believe we are a "Gateway Community" that deserves access by locals and visitors alike. Since the volume of visitors is increasing on this link to Grand Teton National Park (and all the other entrances) we should embrace alternative methods of travel - including mass transit and pathways. The suggestion of closing the road at the end of September is also too restricting - wildlife conflicts on this segment of Park roads has been minimal due to slow speeds. I notice that other Park roads do not close when wildlife are sighted, and this segment of the Park should be managed in that same way. I support a single access/ parking area for the Whitegrass Ranch/ Death Canyon Trail head - unimproved is adequate. And unimproved turnouts are adequate along the main road.

More than one pathway alternative could be considered in the final study. The D alternative at the present time only presents a pathway which has lots of impact making it a less desirable one. Another alternative

could be minimal realignment/construction of the main road with unimproved turnouts and a pathway designed with minimal disturbances. There are power lines, old roads and trails, fibre optic corridors, and open sage meadows that could be used for pathway alignments that could minimize its impact.

Winter use, when wildlife issues are minimal, could be considered in each alternative. Minimal grooming of the roads which are presently "skied in" by users would result in a great Park experience. I believe that skiing to the Whitegrass or Moose is a low impact desirable use of this corridor. A connection to the existing parking areas of Teton Village could be considered in the Alternatives - - minimizing the parking problems of the Granite Creek Trailhead in Winter.

Thank you for the chance to comment on the alternatives.

Dear Superintendent Vela,

I am writing to express my concerns about the future of the Moose Wilson Road Corridor within Grand Teton National Park. As a lover of the national parks and a strong supporter of the national park system, I greatly value the wildlife, scenery, and historic values of this road and am concerned that unacceptable traffic impacts and calls for increased development could destroy these qualities. It is critical that the park service maintain the low-speed, winding, gravel road to preserve the historic character, solitude, scenic and wildlife values of this special area.

Please ensure that as the Environmental Impact Study begins, you prioritize this road as a quiet park destination and wildlife-viewing area; not as a busy traffic route. I encourage the use of traffic management techniques to reduce the number of vehicles, maintain slow speeds, and to eliminate commercial and commuter traffic along the road. These goals, combined with consideration of alternatives such as a one-way road option, or temporary or permanent road closures of all or part of the road could allow for safe pedestrian and bicycling use within the existing road prism. Although the NPS alternatives mention the use of a future small shuttle system, I encourage the park service to develop a more definitive plan that outlines how shuttle buses will be used to decrease traffic impacts.

I also support the use of seasonal closures, efforts to limit winter disturbance of wildlife and planning alternatives that protect wildlife security and movement corridors from human disturbance. Most importantly, development in areas that have not been previously impacted should be avoided.

Grand Teton is certainly a gift to the residents of the local community; but it is also landscape that is owned by, cherished, and enjoyed by people from across the United States.

Thank you.

We appreciate your efforts to support park protection around the country. Grand Teton National Park is a special and beautiful place and your action will really make a difference in how the park will manage a critical road corridor in the future.

Sincerely,
Mrs James Denison

Topic Question 1:
To Whom It May Concern:

My name is Taylor Phillips owner of EcoTour Adventures, a wildlife touring company that holds CUA permits with Grand Teton and Yellowstone National Parks. I am very familiar with this road and its users. When you, the decision makers, plan for this rich wildlife corridor please don't forget the NPS mission: "The National Park Service preserves unimpaired the natural and cultural resources and values of the national park system for the enjoyment, education, and inspiration of this and future generations". To me this means the natural resources comes #1. Please don't get persuaded by interest groups that think their constituents come first.

Obviously vehicle use is a problem. The vast majority of the use comes from folks that are using the road to access other locations in the park or Yellowstone NP. Strategies need to be developed to minimize this use.

Question #1

I commend you on trying to eliminate through traffic during peak hours. By eliminating through traffic, many if not all of the issues will be eliminated.

Paving the southern portion of the road should be considered. Please evaluate the effects of paving and having asphalt on the ground (leaching) vs, periodic grading, dust abatement treatments, the noise of traffic on dirt roads, and the effects on the nearby vegetation from dust.

Strategically placed pullouts along the entire corridor are crucial! It's important that vehicles don't stop on the road and important the visitors have the opportunity to view wildlife.

Great idea to eliminate taxi use of the resource.

Please consider large viewing areas with interpretative signs to concentrate visitor use. Short nature trails would be a plus to get visitors out of their cars and to have a unique experience.

Topic Question 2:

Question #2

I believe that realigning the north sections of the road would do more harm than good. The current road has some impacts on the natural resources, but a new road would have impacts as well. I believe that the impacts on wildlife are negligible on the current road as much wildlife is present and not affected by visitors. Remember that beaver ponds are rich with wildlife but they come and go, and over time will fill in with sediments changing the environment. If you do realign the road many visitors will then create social trails to explore the rich riparian habitat that they use to know which will disturb wildlife. Wildlife, with my experience, is comfortable with people and vehicles on the road. However when people are off the roads wildlife moves away.

Please don't limit the number of interpretative tours that can use the resource. By touring with a guide, the visitor is getting a meaningful experience and is carpooling. On the vast majority of our tours there are multiple parties in one touring vehicle. Please promote carpooling vs single group travel. On tours we educate our guests and keep visitors and wildlife safe. We are stewards for the resource. Please don't limit what is good for the park!

I think that a parking lot for 60 cars is unnecessary for the proposed death canyon TH. Please don't pave a section of the park that big! Please keep the 1-mile dirt road and the current trailhead. Especially by removing the last mile of the road, more use will be directed to the LSR Preserve, as hikers will want to access Death Canyon for a shorter option into the canyon.

Please don't stop plowing at the Murie Ranch Road. This will increase backcountry skier traffic into Garnet Canyon and other high avalanche danger locations, as Garnet would then be closer than Maverick and Albright. Backcountry skier traffic will explode in the coming years. Lower angle slopes needs to be easily available to the newer backcountry generation skier. Fatalities will increase with the higher use of the steeper terrain.

Please keep the Moose Wilson Open Daily for visitors that want to explore that specific area.

Please DON'T build a pathway adjacent to the road. Keep the park pristine with as little pavement as possible. With fewer vehicles using the road, travel would be safe for bikers. Please note that bikers are pushing for a path for THROUGH bike traffic. The moose Wilson road needs to be a destination not a through road!

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

Thank you for your time. If you have questions please let me know.

Taylor Phillips

Topic Question 4:

Topic Question 1:

I believe Alternative A would best achieve the purpose and need for a plan because the overriding need and purpose should be to preserve and protect the natural integrity of this unique corridor. The actions and modifications proposed in the other alternatives would compromise that integrity while ignoring the obvious need for a North Bridge which would better service the economic interests of Teton Village and remove the surface usage pressures on the Moose Wilson Corridor. Adoption of Alternatives B,C,and D would amount to the incremental destruction of a priceless natural resource that can never be recovered

Topic Question 2:

As stated above, the strategies called for in Alternatives B,C and D would bring about to the incremental destruction of a priceless natural resource that could never be recovered.

Topic Question 3:

Siting and completion of the North Bridge would be a better option in the long run

Topic Question 4:

The general public would applaud a No Action strategy that rejects the short-sighted demands of convenience and economic self-interest. Small sacrifices here and there and one thing but to authorize the incremental and permanent destruction of the Moose Wilson corridor would be unforgivable.

Topic Question 1:

If I had to choose one of the suggested alternatives I would select Option C. I select this option because it provides minimal disruption to the wildlife and habitat while reducing traffic problems AND giving bicycles a safer pathway option. I believe Option C represents the best presented compromise.

That being said, I don't believe it is a great option.

Topic Question 2:

I love cycling but but I firmly believe an additional pathway should not be built in the Moose Wilson Corridor. Would I love to ride on it? Yes! But that doesn't mean it's the right thing to do in terms of the Park's mission and purpose.

Numerous times I have watched ungulates work hard to match up a break in bike traffic, then the TPR road in order to cross; watched songbirds scatter out of the sage as I ride my bike along the pathway and noted lots of animal scat on the bike path as animals move across the path and roadway. I believe that studies in Yellowstone have found that bikes effect/startle animals more than vehicles do. I do not see how the Park can honestly justify how an additional bike path would be in the best interest of the Park's flora and fauna, especially in a sensitive area like the MW corridor, simply so that we can have another recreation venue.

Bike path supporters argue that a MWR pathway will get cars off the road. I don't believe this is true. I believe it will just displace the cars to other places. I have traveled along the TPR bike path daily since its inception and the VAST majority of users are not commuters or people biking in from Jackson. They are people recreating who have driven their car to one of the Park's lots and began biking from there. It is recreation, not transportation. The cars are still on the road- their use patterns are simply different. The

associated parking with a MWR bike path is one element that the Pathway proposal fails to address. There will undoubtedly be a need for increased parking if a bike path is put along the Moose Wilson road- where will that go? I don't believe that impact being figured in by the Pathway supporters and/or presented to the public, including the ranger-power needed to patrol the new parking area, impact to the resource, etc.

Is biking on the Moose Wilson road dangerous in its current state? Yes, without a doubt. But so are a lot of activities one can CHOSE to pursue in the Park. Ultimately, it is a cyclist's CHOICE to decide to ride on the road or seek a controlled pathway elsewhere and there are plenty of elsewherees out there. Those elsewhere might not be EXACTLY the elsewhere that a cyclist desires, but is the job of the Park to cater to the desires of all recreationalists? No. The Moose Wilson corridor is too special an area for an increased human footprint.

Topic Question 3:

I have a difficult time envisioning the successful implementation of a traffic limit on the MWR, except lots of angry, agitated visitors and/or a long line of people waiting to be let in (where does that line of cars wait?)

I believe a shuttle system along the Moose Wilson road should be STRONGLY considered with exceptions made for Park vehicles, handicapped visitors and a few wildlife tours (but WAY fewer.) As in Zion, exceptions could be made for climbers that are attempting longer routes that necessitate an early start and getting out very late- or perhaps there is a quota of "off hours" permits available per day day- just like backcountry permits with quotas and the 24 hour time advance policy.

The shuttle could stop at trailheads, the LSR and a few other points if visitors want to get out and explore some. The shuttles could be timed flexibly enough so that if there's a cool wildlife moment, then there's time for a stop to watch.

This would likely redirect traffic to Moose and the CTVC where the shuttle would be located and bike rentals for those that want to continue on bike into the Park.(Encouraging people to utilize the CTVC's large parking lot and It would also likely alleviate the parking issue at LSR, thereby freeing up a ranger to do other work than that of parking attendant, and free up Wildlife Brigade for patrolling in other areas. Because traffic would be significantly reduced it would be a more pleasant walking and biking experience for all that choose to do so. Not perfect- but a really good compromise. Closures could be in effect when grizzlies are present- otherwise it's walk and bike at your own risk, just as it is in the Park's mountains, rivers and trails.

The Park needs a long term transportation plan- lack of parking is impacting visitor experience and damaging the resource- this would be a good step in that direction.

True, there would be impact in building a bigger parking lot at the Wilson gate- but much smaller compared to the cumulative impact of a bike path and the impact would be in a less sensitive area.

Topic Question 4:

I have regularly commuted on the Moose Wilson Road for nearly a decade and there has been a notable increase in the number of wildlife tours utilizing the road. I have inquired about many of these outfits and have been told they are Park-sanctioned. The Park has contributed to the MWR problem by allowing so many companies to utilize these roads. Often these tour operators are among the worst offenders of poor driving and if they slow down or pull over, because of their expert status, other tourists follow suit.

This demonstrates what seems to be a disconnect between what Concessions is permitting to occur in the Park and the relevant consequences on visitor experience and resource impact- in this case on the MWR. I hope the Park realizes a flaw in the use studies being conducted- they are not including 1T drivers (Teton Valley), which includes many park employees in both the public and private sector, as local traffic that utilize the MWR for commuting and accessing the Park for fun. If the MWR is shut down, these drivers will reroute through Spring Gluch Road or Jackson. While I don't believe commuters' needs are a

reason to keep the road open, it would be short sighted of the Park to not consider the consequences on their neighbors. There is already a traffic problem in the rest of Jackson and I doubt home owners in Spring Gulch are going to be happy with the influx of commuters. Perhaps a speedier commuter shuttle from the Wilson Gate into Moose from where additional shuttles are available to take workers to their destination (or people can ride their bikes on the pathways!) Or a pass that allows commuters through with proof of employment in the Park.

Topic Question 1:

I would like a modified version of Proposal C, but I do not support extra bike paths. I would like a two-way road to the Granite Canyon Parking Lot and a two-way road to the Rockefeller Center, but closed permanently between those two points.

Topic Question 2:

Strategy D brings in too many people and destroys the land.

Topic Question 3:

Close the road to commercial traffic and find a short-cut from the Village to the airport to reduce traffic altogether.

Comments: I'm not opposed to paving the section that is dirt and potholes today. I'm also not opposed to diverting the road to protect the Moose Ponds.

I do not have specific suggestions, but know that the tetons and other national parks are being affected by smog and traffic on their boundaries and this need s to be constantly given attention to preserve our national and beautifull resources! thanks so much, dianea

William B. Resor
[REDACTED]
Wilson, Wyoming 83014

September 14, 2014.

Dear GTNP,

Thank you for releasing your newsletter with the four draft alternatives. They show careful consideration of the issues and make it much easier to comment effectively.

The purpose of my letter is to suggest a new alternative- --Alternative D2- -- to be analyzed through the EIS process. A detailed description of this D2 Alternative is at the end of my letter.

By cutting and pasting from your alternatives and by adding a few additional ideas, I have develop an alternative similar to Alternative D, but one that should better meet the Goals and Desired Conditions for each of the seven fundamental resources and values listed in your newsletter. The primary change from Alternative D is the addition of a "traffic control station" at the north end of the M-W Road that would be designed to allow adaptive management of private vehicles entering the road while encouraging shuttle vans and bike use of the corridor. This Alternative D2 would maximize adaptive management of the traffic without closing the road at any time, except for extraordinary circumstances and winter.

The unique 1950 legislation establishing a new GTNP states that the NPS is obligated to designate and open rights-of-way for certain purposes within the park, but it also clearly states that the NPS is allowed to regulate the use of such roads. How this obligation applies to the M-W Road is not clear, but closing the road might be construed as a violation of this provision. Regulating the use of the road, as long as it is still open for the summer as it has been historically, is clearly consistent with the act. This Alternative D2, as well as your Alternatives A and D, would clearly be consistent with the unique 1950 legislation. Alternatives B and C may or may not be fully consistent with that legislation. It would be beneficial if the final selected alternative were clearly consistent with the legislation, so that the Park Service can move forward without delay and implement improvements and new management that will protect park resources and promote safe visitor enjoyment.

My Alternative D2 is informed by my personal knowledge of this area for over fifty years. I have driven, walked, ridden horses, and skied throughout this corridor for both work and recreation. I have camped in it in summer and winter. I have read much of the history of this old dude ranching area and I have known many people that worked or stayed on those ranches. The area has changed greatly. In some ways human use has increased, but in many ways it has decreased. It was not long ago that the Trail, White Grass, R Lazy S (original location), JY and Bear Paw Ranches were operating each summer, with many buildings and employees and guests in residence and hundreds of horses pastured in this corridor. There were also private homesteads and outfitters located within the corridor and using it regularly. There were year-round residents. There was ice harvested from Phelps Lake and there were spring cattle drives. Due to the end of these uses and the removal of almost all the buildings and due to the protection provided by the park, the wildlife use of this corridor has increased greatly from what it was 80 years ago. I believe that the corridor can accommodate both wildlife and more visitor use, as long as private vehicle use can be restricted and managed appropriately.

My Alternative D2 or something similar might eventually be the preferred alternative, but, for now, it should be only one of several alternatives. I will withhold my final decision until I see the analysis provided by the EIS process. I have great faith in the professionalism and public service of the NPS. I strongly believe that your open, collaborative NEPA process will result in the best solution for this corridor, balancing the protection of park resources with visitor enjoyment and safety. I look forward to your continued analysis of this important issue.

Sincerely,

Bill Resor

â€f

Alternative D2.

Alternative D2 is described below. I have tried to follow the format used in describing your alternatives. Generally, I have noted where this Alternative D2 differs from Alternative D.

Alternative D2 would start from Alternative D. It would have the following modifications, generally listed from north to south.

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

1. The north end of the road would be re-aligned as shown in Alternative A, forming a four-way intersection just inside the existing entrance station. However a second traffic control station for road management purposes would be retained as shown in Alternative D. This second station would only be manned during high traffic periods to allow adaptive management. The station would be designed with a bypass lane for shuttle vans and other authorized vehicles.
2. The Death Canyon Trailhead would be relocated north 0.4 miles as shown in Alternative C. However the two parallel roads would still be combined as shown in Alternative D.
3. The unpaved section of the road would be paved and narrowed as shown in Alternative B.
4. The alignment of the pathway would be more flexible in order to minimize disturbance, to avoid increasing the sight distance for vehicle on the road, and to increase visitor enjoyment.

Concept.

The concept of this new Alternative D2 would be identical to that stated for Alternative D, however the shuttle service would be added as a key part of the concept, not just an option. This could either be a Park Service shuttle and/or private shuttles, but serving the corridor and providing transit and information for park visitors. Also, with bypass lanes at the stations at either end of the corridor, the design would maximize adaptive management of vehicles.

Key Elements.

1. (Realign two segments.) Identical to D
2. (Construct a multiuse pathway.) Identical to D except that the alignment of the pathway would be more flexible and site-specific, and not generally limited to the 50-foot strip adjacent to the road. Specific details on the pathway alignment are given below.
3. (Limiting the number of vehicles entering the corridor.) Similar to D except that the reservation system for managing the number of vehicles would be a backup, and additional strategies, including transit, would be implemented first, as described below. Also, the design of the stations at either end of the corridor would allow for limiting certain vehicles while encouraging others, such as shuttle vans.

Traffic Control along Moose-Wilson Road.

The separate traffic control station at the north end inside the existing park entrance station would allow adaptive traffic management on the M-W Road at peak times while not needing to be manned at low traffic times. This alternative with two stations allows for control and management with less manpower. At peak traffic times, a visitor approaching the park entrance station would be alerted by signs and could ask for clarification from the ranger. Then the visitor might choose to go to Jenny Lake and not need to turn onto the M-W Road. Also, vehicles queued up would be visible and discourage use of the M-W Road when it was busy.

Both north stations and the Granite Entrance Station would have separate bypass lanes for park shuttle

vans and possibly private tour vans. This would provide an incentive to use the vans instead of private vehicles. Not only would increased use of vans reduce traffic by private vehicles, but it would also provide opportunities for visitor engagement and education. These vans would run from Teton Village to Moose, with appropriate stops along the corridor.

By having direct control of access to the road and separate control of private vehicles versus shuttle vans, the NPS could modify its traffic objectives over time as conditions changed. For example, as the number of shuttle vans increased, the maximum number of private cars per hour could be decreased. This alternative would give the NPS the broadest management options and greatest flexibility to protect fundamental resources and values as conditions change. However, this alternative would still maintain the historic connection between Moose and Wilson and would be clearly consistent with the 1950 legislation establishing the park.

Physical Characteristics of M-W Rd.

In addition to the two northern re-alignments, the unpaved section would be paved and narrowed to the 18- to 20-foot width of the existing paved sections. This would not only reduce maintenance, but would also avoid the continued damage to trees and other vegetation caused by the dust control compounds.

Moose-Wilson Road Realignment.

Identical as stated for Alternative D. However, note that the statement for Alternative D reads: "The 0.6-mile section of roadway between Murie Ranch Road and the base of the hill near Sawmill Ponds would be abandoned and a new segment constructed to intersect with Teton Park Road at its junction with the Chapel of Transfiguration Road." This is appropriate for this Alternative D2, but not the same as drawn on your map of Alternative D. This alignment allows for the placement of the traffic control station on the M-W Road itself at a location to allow sufficient room for stacking cars to manage maximum vehicles per hour.

Turnouts and Parking. Same as Alternative D.

Bicycle Use.

Same as Alternative D, except that the alignment of the pathway would be designed in a more flexible, site-specific manner. See details below.

Commercial Activity. Same as Alternative D.

Death Canyon.

The Death Canyon trailhead would be relocated to a site near White Grass Ranch, approximately 0.4 mile from its current location. A parking lot would be provided for 60 vehicles, serving both the trailhead and visitors to White Grass Ranch. The abandoned section of the trailhead access road would be converted to a trail. A new road segment between Death Canyon Road and White Grass Road would be constructed. White Grass Road would be improved to allow for one-way traffic with staggered pullouts. The remaining portion of Death Canyon Road would be removed and the area restored to natural conditions. (This is a combination from Alternatives C and D. It reduces the road length, removes the road from the stream crossing area, and consolidates parking in a shared area. However it still allows convenient access to the

trailhead.)

Winter Access and Use. Same as Alternative D.

Visitor Use and Experience. Same as Alternative D.

I tried to make the above description mimic the NPS's format so as to be as useful as possible in creating a new alternative. Below are additional specific comments that relate to the pathway alignment. I hope they are useful as you proceed into more detailed analysis.

Additional Design Details for Pathway Alignment.

The following pathway design details, listed from south to north, are intended to minimize impacts and maximize visitor enjoyment and safety. A key concept behind this proposed alignment is that the pathway should have minimum impact on the view corridor from the road. This is for three very different reasons. First, by not increasing the sight distance the road will remain a slow, safe road. Second, the historic character of the road will be maintained. Third, the visitor experience on the pathway will be enhanced.

1. Bridge Granite Creek. (Outside of Park Boundary, therefore Teton County obligation.)
2. Cross to southeast side of Moose-Wilson road before entrance station.
3. Stay on southeast/east side of road until intersecting main park road. (No additional crossings.)
4. Swing south of horse trailer parking area opposite Poker Flats Road.
5. Cross Granite Creek Supplemental Ditch about 290 feet upstream of road bridge. (This separation minimizes tree cutting and does not increase sight distance for vehicles.)
6. Generally near road until after crossing Kaufman Creek, however meandering away from road to minimize grading and avoid increasing sight distance for vehicles. (This section of road has some grades that exceed ADA grade requirements. Therefore by meandering farther east the need for cut and fill can be reduced.)
7. Leave road corridor heading east-northeast to levee access road about 700 feet south of existing levee road gate. Relocate the levee road gate to the path location with a net reduction of 200 feet of levee road, or, alternatively, leave the levee road as is so the vehicle gate is separate from pathway. (This alignment saves a significant number of trees when compared to paralleling the M-W Road to the existing gate.)
8. Follow the levee road until the ATV trail to the LSR Preserve parking area.
9. Follow the ATV trail to the parking area.
10. Add bike rack south of the Restrooms Building.
11. Follow the trail through the sagebrush northeast to old R Lazy S Ranch Road. (See 1967 aerial photo for old R Lazy S Road. Although part of this road has grown in with young trees, the gravel base is still

Correspondences - Moose-Wilson Corridor Comprehensive Management Plan - PEPC ID: 48252

intact.)

12. Follow the old R Lazy S Ranch Road to the M-W Road corridor.

13. Generally parallel M-W Rd for 3500 feet to Stewart Creek through forest. Meander the pathway to minimize clearing, to avoid specimen trees, and to avoid increased sight distance for vehicles. (Although this area looks consistently forested on aerial photos, it has significant clearings and old trail corridors so the amount of tree cutting would be less than expected, if the pathway is allowed to meander.)

14. After crossing the creek, stay roughly 200 feet from the road and follow openings through the lightly forested area for 1400 feet. (This alignment uses the old irrigated meadows east of the road.)

15. At the old homestead area, both the realigned road and the new pathway would follow a new alignment, mostly through open sagebrush to avoid the wetland area. Use the subtle terrain features to make the road and pathway curvilinear. (Since roads and pathways have different grade requirements, the two should not be parallel, but each should use the terrain to its best advantage. Also, there are both active and abandoned road alignments and other disturbed areas in this section that might be utilized.)

16. At north end of the new alignment, the pathway should follow the old two-track road near the edge of the bluff, while the road should be farther west and use the power line alignment to cross through the thin stand of trees and small wetland area before rejoining the existing road alignment. (I assume the power line will be buried concurrently with new construction, both to minimize visual intrusion and reduce wildfire potential.)

17. Generally parallel the existing M-W Road until about 1200 before the road drops off the bench. At this point, the pathway should separate and use the old dugway about 260 feet east of the M-W Road to drop off bench. (This will allow the pathway to have a less steep grade than the current road, which greatly exceeds ADA requirements. It will also create less disturbance since the bluff is slightly lower and already disturbed in that area.)

18. At the existing curve in road at bottom of dugway, the road and pathway would follow a new alignment northeast to create an intersection opposite the Chapel of Transfiguration Road. (This eliminates a net 500 feet of road and creates an open section of road where stacked vehicles will be visible at the new traffic control station.)

Topic Question 1:

The strategies essentially contained in Alt D should be carried forward in the process
Alt D most closely captures the theme of offering continued access and safety
While reasonable straggles should improve upon the alternative I would support a seperated pathway and
one that follows existing open areas and not constrained by a ridiculous 50 foot standard
Also the road should be maintained as a slow and rural character

Topic Question 2:

Alternatives B And C would close the road to some. Degree which I do not support
Those alternatives do not support open access to GTNP

Topic Question 3:

By all means combine the entry stations
I am certai there are capacity management strategies that could be developed with the support of Teton
County and Teton Village

Topic Question 4:

Complete the commitment to non motorized access by completing the bike path
Safety is paramount with the understanding that educational strategies must be employed to minimize the
wildlife interactions

Topic Question 1:

I think the Moose-Wilson Road should be a one-way access, south to north. I don't think the road should be altered to circumvent the Moose Ponds, nor do I think it should be realigned for any reason. Rebuilding the road is costly and taking it out over the sagebrush will not reduce the traffic. It may even invite more trouble. Paving the south end is all right, but the road should be left just as narrow and winding as ever to slow down cars. It should be closed in winter.

Topic Question 2:

Proposal D. Bikers should not take precedence over all other vehicles on the road.

Topic Question 3:

I would like to see the park limit the number of cars per hour on the road. If it were a one-way stretch open only a few months a year, the rangers could limit the number of cars that go through at any given time, much like the way art museums limit the number of people who can go through a popular special exhibit. The controlled number of cars would reduce stress on the wildlife and the one-way traffic would allow room for bicycles without building more road to the east.

Topic Question 1:

The Northern section of the road should commence within the park Moose entrance. This will prevent non-passholders from using the road as a transportation corridor. The road should be moved away from the beaver house to protect the peace of the beavers.

Topic Question 2:

Any strategies which would encourage more use should not be implemented. This includes new pathways, bike paths, multi-use paths, and expanded parking spaces. The animals should be of paramount importance. The main purpose of the road should be that of a wildlife-protecting viewing corridor. It is not a thruway or an exercise path for cyclists.

Topic Question 3:

No.

Topic Question 4:

Protect the wildlife. If the animals disappear from this unique viewing corridor, we will all be the losers.

Comments: I wish the Moose-Wilson road could return to a former condition. Wilder, quieter, less-used. As this wished-for state is probably not likely, the next best thing would be to prevent more harm (in the form of more paths, more parking, more convenience for human users). Keep the park park-like!
