

Today's travelers to the Northwest are witnesses to a story that puzzled geologists for years.

s u m m a r y

This section presents a brief overview of the Glacial Lake Missoula Floods story, two of the key people involved with discovering the Floods and the glacial lake from which the Floods originated, and events that led up to the initiation of the Ice Age Floods Alternatives Study.

s e c t i o n d

BACKGROUND

1. Geologic Background

In recent geological history, portions of the United States have been the site of several massive flooding events caused by the abrupt drainage of glacial lakes. The most dramatic of these are the Ice Age Floods, which covered parts of Montana, Idaho, Washington, and Oregon. For a better understanding of the Floods, perhaps a good place to start is to first look at the geological and climatic changes that led up to these cataclysmic floods.

Generally accepted scientific evidence indicates that the earth is around 4.5 to 4.6 billion years old. Glaciation can be traced all the way back to the Proterozoic Era, approximately 2.3 billion years ago, when the earth was covered with ice. Near the end of the Proterozoic Era, between 850 and 600 million years ago, rock records indicate another global glaciation period.

About 200 million years ago the Atlantic Ocean began to open up and the continents drifted into their current configuration, the dinosaurs became

extinct 65 million years ago, and about 20 million years ago, in late Cenozoic Era, the Pacific Northwest started to look much as it does today, with its mountains, valleys, and shorelines.

Ice Ages have occurred sporadically throughout the earth's history, although they represent a relatively small part of geologic time. Many of the still visible effects of the great ice sheets that periodically covered parts of North America were produced during the last Ice Age in the Pleistocene Epoch. These ice sheets left a distinctive record in the

Background

form of till scraped by the ice and fine grained deposits in lakes, moraines, and scratches and grooves in the bedrock.

From 17 to 13 million years ago, lava flows emanating from a series of volcanic extrusions spread across the Columbia River Basin, constructing a broad lava platform across northeast Oregon, southeast Washington, and central Idaho. These extrusions were among the largest and most spectacular lava flows of their kind. The Columbia River basalts flooded across the Pacific Northwest consisted of more than 42,000 cubic miles of lava. In places, the basalt is more than two miles thick. In

the Columbia Basin, the lava basalts were covered with windblown glacial dust and silt, called loess, that is up to 175 feet thick. The Cascades were formed during the later part of these basalt extrusions.

During the Pleistocene Epoch Ice Age, beginning about 2 million years ago, virtually all of southwestern Canada was repeatedly glaciated by ice sheets that also covered much of Alaska, northern Washington, Idaho, Montana, and the rest of northern United States. In North America, the most recent glacial event is the Wisconsin glaciation, which began about 130,000 years ago and ended around 10,000 years ago.

Floods of molten lava poured across western Idaho, eastern Washington, and Oregon.

2. Story of the Floods

During the last Ice Age, a finger of the continental ice sheet crept southward into the Idaho panhandle, forming a 30-mile-wide ice dam that blocked the mouth of the Clark Fork River, creating a massive lake 2000 feet deep containing 500 cubic miles of water. Glacial Lake Missoula stretched eastward for more than 200 miles and contained more water than Lake Erie and Lake Ontario combined. When the ice dam failed, lake water burst through, shooting out at a rate 10 times the combined flow of all the rivers of the world.

This towering mass of water and ice literally shook the ground as it thundered toward the Pacific Ocean, stripping away hundreds of feet of soil and cutting deep canyons—“coulees”—into the underlying bedrock. With flood speeds approaching 65 miles per hour, the lake would have drained in as little as 48 hours.

Over time the Cordilleran ice sheet continued moving south and blocked the Clark Fork River again and again, recreating Glacial Lake Missoula. Over approximately 2,500 years, the lake, ice dam and flooding sequence was repeated

dozens of times, leaving a lasting mark on the landscape.

Today we can see that the floods impacted the landscape. They carved out more than 50 cubic miles of earth, piled mountains of gravel 30 stories high, created giant ripple marks the height of three-story buildings, and scattered 200-ton boulders from the Rockies to the Willamette Valley. Grand Coulee, Dry Falls, Palouse Falls—were all created by these flood waters, as were the Missoula and Spokane ground-water resources, numerous wetlands and the fertile Willamette Valley and Quincy Basin.

J. Tindall, B. Pettus, J. Sipes

More than 500 cubic miles of water swept across eastern Washington at tremendous speeds, carving the basalt bedrock into huge coulees.

During the last Ice Age, a finger of the continental ice sheet crept southward into the Idaho Panhandle, damming the Clark Fork River and creating Glacial Lake Missoula. Glacial Lake Missoula, at its maximum, contained more than 500 cubic miles of water and was 2,000 feet deep at the site of the ice dam.

About 17,300 years ago the ice dam broke, releasing a torrent of water that flowed toward the Pacific Ocean at a rate of 10 times the combined flow of all the rivers of the world.

As the flood waters thundered toward the ocean, they stripped away thick soils, cut deep canyons in the underlying bedrock, and scattered house-sized boulders across four states.

Unable to pass through a narrow gap near Kalama, Washington, the flood water backed up and flooded the Willamette Valley, Oregon.

More than 16,000 square miles of land was flooded in this first-of-many Glacial Lake Missoula floods.

Today, geologists and visitors to the region can see first hand the varied flood features created by the Ice Age Floods.

3. J Harlen Bretz—Hypothesis of Catastrophic Floods

In many ways, the story of the Floods is also the story of J Harlen Bretz (1882–1981), who proposed the theory that the Channeled Scablands of eastern Washington, and much of the Northwest as we know it today, were formed by catastrophic flooding.

Bretz became a high-school biology teacher in Seattle. He had earlier developed a keen interest in the glacial geology of the Puget Sound and had studied the area extensively. This interest in geology led him to the University of Chicago, where he was awarded a Ph.D. in Geology in 1913. Then, Bretz accepted a position as an assistant professor of geology at the University of Washington and later at the University of Chicago. His thesis was on the glacial history of the Puget Sound, and he quickly became recognized as an expert in the features of stream and glacial erosion.

Bretz began his field research in the Channeled Scablands of central Washington during the summer of 1922, and it quickly became clear to him that neither glaciation nor ordinary stream erosion explained the Scablands. The following year Bretz made his two presentations to the Geological Society of America on the Scablands. The first

paper provided a detailed physiographic description of the Scablands; the second suggested that it would have taken a massive volume of water to create the level of channel erosion that had occurred.

Bretz's second paper on the Scablands also discussed the mounded gravel deposits that were scattered throughout the area. He proposed the idea of a catastrophic flood and included the first detailed geological map that included all of the Scablands and showed the extent of the floods. Bretz used the name "Spokane Flood" because he assumed the source of the water for this flood was somewhere near Spokane, Washington.

Bretz was confident that a flood had occurred, but was unable to figure out where the water had come from. Originally, he proposed that the water was the result of increased runoff from melting glaciers. But even Bretz had a

NPS Photo

tough time imagining any significant volume of water melting rapidly enough to have such devastating impacts. Not until 1930 did Bretz consider Glacial Lake Missoula as the possible source of water he was searching for. But the geologic evidence was elusive, and he did not fully embrace the idea until 1956. Unable to provide a clear, scientific argument for the source of

flood water, Bretz eventually went on to other things.

Bretz lived to the age of 98 and late in life had the satisfaction of seeing his theories validated. Perhaps it is poetic justice that in 1979, Bretz, at the age of 96, received the Penrose Medal, the Geological Society of America's (GSA) highest award.

Bretz knew that the very idea of catastrophic flooding would threaten and anger the geological community.

Giant ripple marks can still be seen clearly in Camas Prairie, Montana.

4. Joseph T. Pardee—Glacial Lake Missoula

Joseph Thomas Pardee (1871–1960) also played a key role in understanding the story of the Floods. It was Pardee who proposed that the floods Bretz talked about occurred when the ice dam which had formed Glacial Lake Missoula was breached.

Pardee, a geologist with the U.S. Geological Survey, began studying the Scabland region near Spokane, Washington, and the intermountain basins of Montana in 1910. Pardee found geomorphic evidence of a large glacial lake in western Montana; strandlines (high water marks) indicating the maximum height of the lake are clearly visible today in the area around the city of Missoula, Montana.

Pardee spent years collecting, analyzing, and documenting other geomorphic evidence, and eventually the scientific community was convinced that Glacial Lake Missoula had indeed existed.

Apparently Bretz and Pardee did communicate over the years, and Pardee suggested that Bretz consider the draining of Glacial Lake Missoula as a possible source of the Floods. But neither Bretz nor Pardee had the scientific evidence to back up such an idea.

Later, in the late 1930s at Camas Prairie in northwestern Montana, Pardee discovered a series of ripple marks left on the lake bottom sediments of Glacial Lake Missoula that could only have been formed by powerful currents that flowed over the bottom, shaping the sediments into smooth, parallel, ridge-rows. The marks were evidence that the ice dam holding back the water had failed suddenly, and Glacial Lake Missoula had drained rapidly. The ripple marks were up to 50 feet high and 500 feet apart. Because the ripples were so large, it was only when Pardee was able to view these unique features from the air that he recognized them as being formed by water. Once they had been identified and people knew what to look for, similar examples of giant ripple marks were found throughout the path of the floods.

In addition to the ripple marks, Pardee found other evidence of the ice dam failure, including severely scoured

constrictions in the lake basin and huge bars of current-transported debris.

Pardee first presented this evidence in 1940 at a meeting of the American Association for the Advancement of Science in Seattle, Washington. His conclusions were later published in the 1942 *GSA Bulletin* paper titled “Unusual Currents in Glacial Lake Missoula.” Collectively, these papers played a pivotal role in the scientific community’s eventual acceptance of the cataclysmic

flooding hypothesis. His work provided, for the first time, a logical source of water needed to support Bretz’s hypothesis. The ripple marks were a key piece of evidence that eventually helped convince skeptics of the cataclysmic-flood hypothesis.

Even after Pardee’s work was made public, acceptance of Bretz’s theories was slow in coming. It took another 20 to 30 years before Bretz’s theory of catastrophic flooding became generally accepted among geologists.

Bretz and Pardee were certainly not the only ones involved in solving the mysteries of the Glacial Lake Missoula Floods. For example, in 1871, geologist Thomas Condon proposed the idea that Oregon’s Willamette Valley was flooded sometime during the Ice Ages.

NPS Photo

Wave-cut standlines cut into bedrock of slope at left in photo. These cuts record former high-water lines, or shorelines of Glacial Lake Missoula near Missoula, Montana. Gullies above the highway are the result of modern-day erosion.

“They were all loaded for me and after letting me talk for two hours they opened fire.”

—Bretz, after a 1927 meeting of the Geologic Society in Washington DC.

It is usually interpreted as a contest of ideas between neocatastrophist Bretz and a platoon of diehard gradualists, an image Bretz himself promoted. . . .

—Richard Waitt, USGS

5. Scientific Debates—Uniformitarianism vs. Catastrophism

The debate over the origin of the Channeled Scabland region of eastern Washington was one of the great controversies in the history of geology. One reason Bretz encountered such vehement opposition to his hypothesis of catastrophic flooding was that there were no records of such floods in modern-day experience and the magnitude of the floods were at a scale that was difficult to imagine. The biggest difficulty, however, was that a catastrophic flood at the scale Bretz was describing was almost biblical in proportion, and this notion was directly at odds with the idea of Uniformitarianism.

James Hutton, a Scottish geologist, was the first to articulate the principle of Uniformitarianism, the accepted model in geology during the early 1920s when Bretz proposed his idea of catastrophic floods. According to Hutton, in his 1788 book *Theory of the Earth*, geological process is steady, slow, repetitious, and “uniform.” In essence, Uniformitarianism says that geological processes that can be observed in the present are likely to be the same as those that operated in the past. This model has served the geologic community well because, in general, geological changes averaged over eons do occur slowly.

Among geologists in the 1920s, the only acceptable catastrophic events were volcanoes and earthquakes. Beyond these events, catastrophism was considered to be “bad science” and virtually vanished from geologic thinking. Geologists from that era attributed the creation of the Channeled Scablands to glacial erosion, which was much more in keeping with theories of Uniformitarianism. It is perhaps understandable, then, that acceptance of Bretz’s theories of catastrophic floods took as long as it did.

With the eventual availability of more evidence, a plausible mechanism, and evidence for that specific mechanism, most geologists quickly accepted Bretz's hypothesis. . . .

—Andrew Macrae, University of Calgary,
Department of Geology and Geophysics

Bretz's scablands "evidence" was astonishing, and most of his descriptions remain today as fresh and accurate as when written. . . .

—Richard Waitt, USGS

6. Science's Modern-Day Evidence and Acceptance *b*

J Harlen Bretz spent more than four decades defending his theories on the Floods before the scientific community generally accepted them. Before this acceptance would occur, all of the pieces of the puzzle had to come together. And it certainly didn't hurt when scientists were finally able to study glacial floods in action.

In the 1960s and 1970s, glacial geologists began to develop a better understanding of how floods in glaciated lands could occur by studying *jökulhlaups*, outburst floods that occur from the tunneling by water through a glacier. Although the reason the flooding occurs is very different between *jökulhlaups* and the Ice Age Floods, many of the dynamics are the same. Most of these studies have occurred in Iceland, which has a unique environment, because it has active

volcanoes that create hot crustal conditions yet is a glaciated region. Basically, scientists discovered that in Iceland subglacial lakes formed when the lower surface of a glacier starts to melt. The water is typically trapped in a subglacial cavity until enough pressure builds up and the water escapes out from under the glacier, creating a glacial flood. In Iceland, this type of glacial flooding occurs regularly; the cycle repeats itself every 20 years or so.

NPS Photo

Modern tools, such as satellite imagery, help scientists to comprehend the scale of the Ice Age Floods.

It became evident that what was needed was the development of a coordinated interpretive and educational approach to tell the Floods story throughout Montana, Idaho, Washington, and Oregon.

7. Increased Public Interest

After the scientific community finally embraced the story of the Floods, research in the Channeled Scablands and other areas impacted by the Floods increased. The result of this research was a more thorough understanding of events that led up to the Floods and the impacts that they had on the landscape. This research, which has resulted in dozens of scientific papers (see the reference list in the appendix), has also helped create a greater public awareness of the Ice Age Floods. It is only within the past decade or so that the story of the Floods has become widely publicized via magazine and newspaper articles, books, brochures and pamphlets, and television documentaries.

Over the past decade the public has shown an increasing interest in the Ice Age Floods. In 1995, Smithsonian magazine published a feature article about the floods; several popular books have included Floods material; several newspapers have published stories; a number of videos have been produced; and Oregon Public Broadcasting televised a half-hour special on the subject.

The more the public learn about the Ice Age Floods story, the more fascinated they become. After all, this is a story that seems to belong more to the realm of

science fiction than to reality. The scale and immensity of the Floods is hard to imagine; standing in central Washington it is almost impossible to comprehend everything visible in all directions was covered by hundreds of feet of water during the height of the Floods.

People are asking that the Floods' story be told in an exciting and accessible way. It is evident that what is needed is the development of a coordinated interpretive and educational approach to tell the Floods story throughout the four-state area and beyond.

8. Formation of Ice Age Floods Task Force—The Early Days

While there has been more than a casual interest in the Ice Age Floods story on the local and state levels, very little appreciation for the national significance of the Flood events has been noted, except from within the scientific and professional geologic community. The Ice Age Floods story was published during the 1974 World's Fair in Spokane, Washington, with occasional articles featured in local and regional newspapers since that time. In addition, a descriptive and interpretive booklet, "The Channeled Scablands of Eastern Washington: The Geologic Story of the Spokane Flood," was published by the U.S. Geological Survey. The booklet, which is in its third edition, is available through the Eastern Washington University Press. To date, more than 125,000 copies have been printed.

In June of 1987, in response to a request from the National Park Service (NPS) Regional Office to document the status of the National Natural Landmark (NNL) sites, NPS representatives from (then) Coulee Dam National Recreation Area organized a field trip to those sites within a one-day drive of Coulee Dam, Washington.

Dan Hand, Interpretation Specialist at Coulee Dam (now Lake Roosevelt) National Recreation Area, laid out a route of travel to include the upper and lower Grand Coulee, Withrow Moraine, Haystack Rocks, a great gravel bar in Moses Coulee and some eskers and kames near Sims Corner. Others making

the trip were Superintendent Gary Kuiper, NPS, Craig Sprankle, Public Affairs Officer of the U.S. Bureau of Reclamation (USBOR), Judy Sprankle, Editor of the Star newspaper in Coulee Dam, and Phil Hansen, USBOR Geologist.

From this initial field trip, it soon became evident that here was a story that needed to be told. Other than what the Washington State Parks was featuring within their system, there was not a single interpretive display or roadside exhibit along the entire length of the upper Grand Coulee or at the other sites that were visited. Hansen's interpretation of the geologic history leading up to the

Background

series of flood events left the tour group wanting to know more. And indeed, there was more to the story than could be covered in one day.

Judy Sprankle's article about the Floods in the *Star Newspaper* had the desired effect. Local interest developed and another tour was organized for the local Chamber of Commerce and others interested in learning about the Floods story.

About this time, Dan Brown replaced Dan Hand as the park interpreter at Coulee National Recreation Area. Brown hired an experienced photographer to develop a quality slide file. It would enable National Park Service interpreters to present the story of the Ice Age Floods to the public. Ed Soldo built a slide file with more than 3,000 slides, including aerial shots. His next season was dedicated to labeling and organizing the slides.

Brown also prepared the script for an Ice Age Floods slide program that was based in no small part on the recently published book, *Cataclysms on the Columbia* by John Allen, Marjorie Burns and Samuel Sargent, 1985.

While local NPS representatives realized that the Floods events were of national significance, selling the idea to

cooperating agencies and eventually the public was an important first step. Officially, the NPS Regional Director was notified by memo in August 1987 that, at least in the opinion of interested individuals, the Ice Age Floods events met the criteria for identification as being nationally significant. NPS Regional Director Chuck Odegaard was a former Washington State Parks Director

and was familiar with the state park interpretive program at Dry Falls. He gave the go ahead to pursue an initiative to inform agencies and the public of the value of the Floods resources.

Realizing that elected officials would eventually play an important role, efforts were made to work with county commissioners and Congressional delegation and inform them of the Floods resources in their

back yards. Moreover, project organizers took great pains to assure everyone that

NPS Photo

During the Ice Age Floods, Dry Falls was under 300 feet of water approaching at a speed of 65 miles per hour:

the NPS was not interested in acquiring more land.

Project organizers contacted geologists at each of the state universities and soon were networking with counterparts in Montana, Idaho and Washington.

In early 1993, the team of Dan Brown and Gary Kuiper hit the road, showing the program to more than 70 audiences, including the from Audubon Club, Grange and Chamber groups, Tribal officials and county commissioners, other federal officials, anyone, for that matter, who showed an interest. Each of the four states was covered, and long days and nights were the rule. In addition, an article in the *Spokesman Review* written by Becky Napi generated a lot of interest.

Kathleen Johnson of the USGS, Spokane Office, provided the necessary maps and connected project organizers with Richard Waite, USGS, and others in her agency. The BLM Spokane District Office staff added to the concept by suggesting that the Floods story be aimed at a wider regional audience. This expanded target was critical because the BLM had a

majority of the Floods landscape under its jurisdiction in eastern Washington. Soon there were solid contacts in Montana with USFS geologists Norm Smyers and Jim Shelden, and Karen Porter of the Montana Bureau of Mines and Geology. In Idaho, the project had the support of Roy Breckenridge of the Idaho Geological Survey. Others lending support were Dale Stradling and Gene Kiver of Eastern Washington University and Paul Weis, retired USGS, whose publication on the Scablands of Eastern Washington is still a popular item.

These early conversations and meetings led to a more formal approach, and on February 17, 1993, the first of seven Ice Age Task Force meetings was held. Such items as an organizational structure, purpose, action plan, strategy paper, inventory of flood features and existing interpretive waysides were identified. Most importantly, the membership of the Task Force was meant to include the interested general public and legal entities such as county commissioners, Tribes, Chambers of Commerce, tourism industry and political staffers. Although having all of these groups serving as active members of the Task Force was not the point, it was

essential that they be kept informed and be invited to participate in the process.

Gary Kuiper served as the first chair of the Task Force and remained in that position into 1993–1994. His tenure was followed by Coulee Dam NRA Superintendent Gerry Tays, who was elected by the Task Force to serve as chair. Superintendent Tays served for the next three and a half years and continued to promote the merits of a coordinated interagency approach.

One of the most influential events in carrying the story of the Floods to a wider audience was the production of a video of the Floods. Initially Ann Herdrick of the Odessa (Washington) Economic Development Committee (OEDC) approached Jim Sipes, Washington State Professor of Landscape Architecture, about using the Floods story to help increase tourism in the Odessa area. They started work on a video that would tell the story of the Floods and guide people to significant Floods features, specifically around Odessa. Around the same time both Superintendent Kuiper and Interpretive Specialist Brown realized they could not

Background

continue indefinitely to take their “road show” to every group that requested it. The decision was made to combine forces, and the result was the 13-minute video, “The Great Floods: Cataclysms of the Ice Age.” (A video called “Floods of Fire and Water” was subsequently developed for OEDC in June 1994.) The video combined the narrative and some photos of the slide show with video and computer animation sequences developed by WSU that showed the Floods roaring across the landscape of northwestern Montana, Idaho,

Washington, and Oregon, and finally out to the Pacific Ocean. Three WSU students, Bruce Morrow, Mike Spencer, and Andrea Blake, assisted Professor Sipes in the effort. The product was an instant success, having been aired on PBS, shown at visitor centers and schools, and receiving several national awards.

While the notion of a coordinated interpretive approach remained a primary goal, the Task Force became inactive pending the availability of study funds.

9. Formation of the Ice Age Floods Institute

Toward the end of 1993, members of the Task Force discussed the need for a private, nonprofit organization that would complement the interagency Task Force. The consensus was that the private sector could more readily support and participate in the development of a coordinated interpretive program. A number of individual citizens and representatives of business groups had already been attending Task Force meetings.

With assistance from some members of the Task Force, the Ice Age Floods Institute was organized early in 1994. Officers and a board were elected, bylaws and articles of incorporation were adopted, and the process to qualify as a Washington nonprofit corporation and to be granted 501(c)(3) status with the IRS was initiated. Mikki Kison, a Ritzville, Washington, resident served as its first executive director. Dale Middleton currently serves in that role and has been instrumental in the development of this Study of Alternatives. The first Institute newsletter was published and sent to individuals from the Task Force's mailing list. Institute members adopted a logo, and Task Force members helped design and produce a brochure that is still being used. The purpose of the brochure was both to promote interest in the Floods and to recruit members for the Institute.

The Spokane Chamber of Commerce provided a home base for the Institute in this formative period.

Over the course of the year (1994), the Institute became active and visible in promoting the concept of a comprehensive interpretive program. Presentations were made to tourism and business groups, and statements of support were received from several Chambers of Commerce. One Institute member in particular, Karen Wagner of Moses Lake, Washington, Chamber of Commerce, became a leading advocate for the Floods initiative. The Institute and its objectives were featured in a number of newspaper articles.

As a functioning group, the Task Force became less active, and then went on standby, intentionally awaiting funding for a study. The Institute continued the

NPS Photo

The gorge below Palouse Falls, Washington, with talus slope.

NPS Photo

Park Lake, Sun Lake State Park, within the lower Gran Coulee.

effort, relying on interest and support from the private sector. The Institute benefited from the continuing interest and participation of some agency and university personnel and retired staff who were members of the Task Force. In addition, the BLM Spokane office provided meeting space to the Institute for a number of years.

An important legacy of the Task Force period is the “Great Floods” video, which became available in 1994 and has been selling steadily ever since. The video has proved to be very useful in making presentations to a wide variety of audiences.

In 1995 an important item appeared—Michael Parfit’s excellent article, “The Floods That Carved the West,” in *Smithsonian* magazine (April 1995). The article immediately became one of the prime informational pieces about the Floods; the Institute was included in the list of “additional sources.”

One of the remarkable events in the history of the Institute was its collaboration with NASA, Arizona State

University and the Jet Propulsion Laboratory (JPL) in the fall of 1995. In preparing for the Mars Pathfinder mission, NASA, ASU and JPL sent a team to the Channeled Scablands to examine Floods features that apparently are analogues to features on the surface of Mars. The Institute helped with arrangements for the visit, and in the exploration of the Scablands. The project was very well publicized.

At the time, the publication of the *Smithsonian* article and the visit by NASA were encouraging, but overall the Institute was facing a rather difficult period. Substantial commercial support had not materialized, and there was little apparent progress toward the goal of a comprehensive interpretive program. The Institute moved its base of operations from Spokane to the Ritzville Chamber of Commerce, then to the Odessa Economic Development Committee, and finally to the Moses Lake Chamber of Commerce, where it currently has its headquarters.

Some individuals who had been involved in the Task Force and the Institute

dropped out. A small group remained to hold the Institute together and to keep the idea of a coordinated interpretive program alive, and they succeeded. No one could know that within about three years, a ground swell of media and public interest would emerge.

This small, yet growing group of dedicated individuals persevered for several years, sharing their enthusiasm amongst themselves and with others. In October 1996 the Institute offered its first field trip, led by a retired USGS hydrologist. It included sites in the Spokane and Idaho Panhandle area. It was originally hoped that field trips would be an annual activity, but none was offered in 1997.

A new guidebook appeared in 1997: *Fire, Faults & Floods: A Road & Travel Guide Exploring the Origins of the Columbia River Basin*, by Marge and Ted Mueller (University of Idaho Press). The book covers the Columbia River Basalt flows, as well as the Ice Age Floods.

After years of effort, a dramatic turning point came in 1998. From the following

events, it is clear that interest in the Floods had reached a remarkable level:

- Grant County Commissioners (WA) voted to assist financially in the operation of Dry Falls Interpretive Center, in order to keep the center open seven days a week in the summer season.
- The governing boards for Washington State Parks and Idaho State Parks passed resolutions of support for the proposed NPS Study.
- KSPS (Spokane) began production of a one-hour TV show on the Floods, to be shown in the fall of 2000.
- Oregon Public Broadcasting (Portland) aired a new half-hour show on the Floods.
- Discovery Channel included a segment about the Floods in a two-hour show titled “Amazing Earth.”

A particularly significant event in 1998 was the publication of the large map, “Glacial Lake Missoula and the

Channeled Scabland,” by Region 1 of the U.S. Forest Service. The map, which shows the whole region affected by the Ice Age Floods, went on sale late in the year and quickly became a best seller. By February 2000 the map had gone through three printings and 15,000 copies had been sold. As a gauge of public interest in the Floods, these figures are hard to ignore.

None of the projects listed above were a direct result of Institute initiatives, but the Institute was active in encouraging and/or publicizing these projects.

In the Institute’s own program, three developments were noteworthy in 1998:

- The Institute’s website was established and continues to be hosted by the Idaho Geological Survey, at the University of Idaho. The site has attracted new members to the Institute, some from outside the region.
- A major field trip was conducted to explore the Glacial Lake Missoula area in Montana, and it received an

enthusiastic response in print and broadcast media. The tour was organized and led by a USFS member of the Task Force.

- The Institute, largely through its newsletter, became established as an effective source of information about Floods activities and resources.

The Institute and the Study

After years of effort to have the Floods formally recognized for their significance, the first procedural “giant step” came early in 1999, with the announcement by the National Park Service that funding for the Study of Alternatives had been secured through the appropriations process. The Institute has taken an active part in the conduct of the Study and wholeheartedly supported its objectives. Participation in the Study was the most important activity of the Institute membership in 1999 and 2000, and interest in the Study can be credited for a substantial increase in Institute membership. The prospect of successfully launching an interpretive program has proven to be very effective

in generating even greater interest and involvement. Institute members have made presentations on the Floods and the Study to local groups, and have been working with these groups in order to encourage their participation and input.

Institute meetings have been scheduled to be held in conjunction with Study Team and Study Zone meetings. For the October 1999 Study Team meeting, the Institute organized a major field trip to important sites near Moses Lake (WA). Two members of the Task Force, from the USGS and BLM, were tour guides. The field trip was subscribed to capacity and very well received. Other field trips were organized for Study meetings at other locations in the region using expert guides from the USFS, USGS, Pacific NW National Laboratory, and Idaho Geological Survey.

At the October 1999 meeting, the Institute voted to form an expert Scientific Advisory Panel because of concern about the reliability of Floods information being presented to the public. The Panel will review technical information developed for Institute projects and materials as well as drafts submitted by reporters and other writers who turn to the Institute for advice. The Panel will also prepare a basic fact sheet about the Floods, which will serve as a guide for writers and interpreters, and also as a source of general information.

The Institute was also active during 1999 in a number of activities:

- Working with the American Automobile Association (AAA) to include more information about the Floods in forthcoming AAA regional TourBooks.

- Providing referrals to help the Port of Walla Walla (WA) develop an interpretive installation at Wallula Gap, a major site in the Floods story as well as in the cultural and overall natural history of the region.
- Working with charter flight companies to promote aerial sightseeing services over the landscape created by the Floods.
- Beginning discussions with CarTours, an organization that produces cassette and CD touring guides and is affiliated with the Northwest Interpretive Association.

These connections are indications of the interest of the general community in the Floods story and of the ways the Institute can bring people together and make efficient use of resources and talents.

10. Partnerships

From the beginning of interest in the Ice Age Floods in the late 1980s, partnerships have been an important ingredient. The creation of the Ice Age Floods Task Force brought federal and state agencies together with tribal governments, academia, and private enterprise to examine the potential for creating a structure to interpret the Ice Age Floods story.

Throughout this Study, the need for forming partnerships becomes evident. These future partnerships will have to be formalized by written agreements defining the roles and responsibilities of each partner. These partnerships will have to cover a broad spectrum and not be limited to land management agencies. Examples of the broad extent of partnerships include:

- Chambers of commerce
- Tourism councils and commissions
- County governments
- State agencies
- Tribal governments
- Conservation and environmental groups
- Historical societies
- Geological societies
- City governments
- Visitor and convention bureaus

- Tour companies (automobile, aviation, and marine)
- Federal agencies
- Colleges and universities
- Museums
- Publishing companies
- Economic development councils
- School districts
- Energy corporations
- Private landowners whose land contains Floods resources

A start in developing partnerships has already begun. There are nine federal agencies, six tribal governments, 17 state agencies, and seven colleges and universities involved in some degree of the early planning. Numerous chambers of commerce and visitor and convention bureaus are active in support of the concept. The private sector has been helpful and involves representatives

Background

from the hospitality and tourism industry to large power companies such as Avista.

Additional informal partnerships have been developed over the past year. The Seattle (Washington) Public School District is working with the study consultant to develop an inquiry-based earth sciences program using the Ice Age Floods story. Various computer and video techniques will be used to develop a teacher's guide and resource section to accompany the student version. Oregon Public Broadcasting (OPB) from Portland, Oregon—the producers of the 28-minute video *Ice Age Flood: Catastrophic Transformation of the West*—and study consultant project manager Jim Sipes are working with the Seattle Public School District to produce an

educational poster using the Ice Age Floods story to stimulate the students to learn more about earth science by using the Floods story.

Study consultant Jones & Jones has also assisted the Northern Rockies Heritage Center in Missoula, Montana, by producing computer graphics. On a Study Group level, Bruce Bjornstead, Study Zone Chair for the Mid-Columbia Zone has been working closely with the Columbia River Exhibition of History Science and Technology in Richland, Washington.

As more information becomes available to the public, the public responds by offering to help, and the network of potential partners and partnerships will rapidly grow.

11. Commencement of the Ice Age Floods Alternatives Study

The Ice Age Floods Study Team consists of members of the original Ice Age Floods Task Force, members of the Ice Age Floods Institute, the project consultants (Jones & Jones), and the National Park Service.

In an effort to develop a coordinated interpretive and educational approach to telling the Floods story across four states, the National Park Service funded the Ice Age Floods Study of Alternatives and Environmental Assessment through their Special Resource Study Program. There was consensus within the region among public agencies and private sector partners within the region that such a study was needed. Analyzing Flood features through an inventory system, the study addresses the suitability and feasibility of federal designation and assistance, as well as various options for forming partnerships and developing cooperative strategies. The Study of Alternatives will culminate in a Final Report, to be presented to the Secretary of the Interior for transmittal to Congress.

The work of coordinating the study and completing its reports was contracted to consultant Jones & Jones, a Seattle firm noted for its planning and design expertise. To assist in the project a Study Team, which served as a steering committee, was formed. The Study Team consists of members of the original Ice Age Floods Task Force, members of the Ice Age Floods Institute, the project

consultants (Jones & Jones), and the National Park Service.

The study process relied heavily on a partnership between public and private participants. Across the Floods region many local workshops were held to answer questions and invite the participation of residents throughout the region.
