

Plot 13 – surveyed by the Student Conservation Interns and Saguaro National Park Student Employment Program on August x, 2009

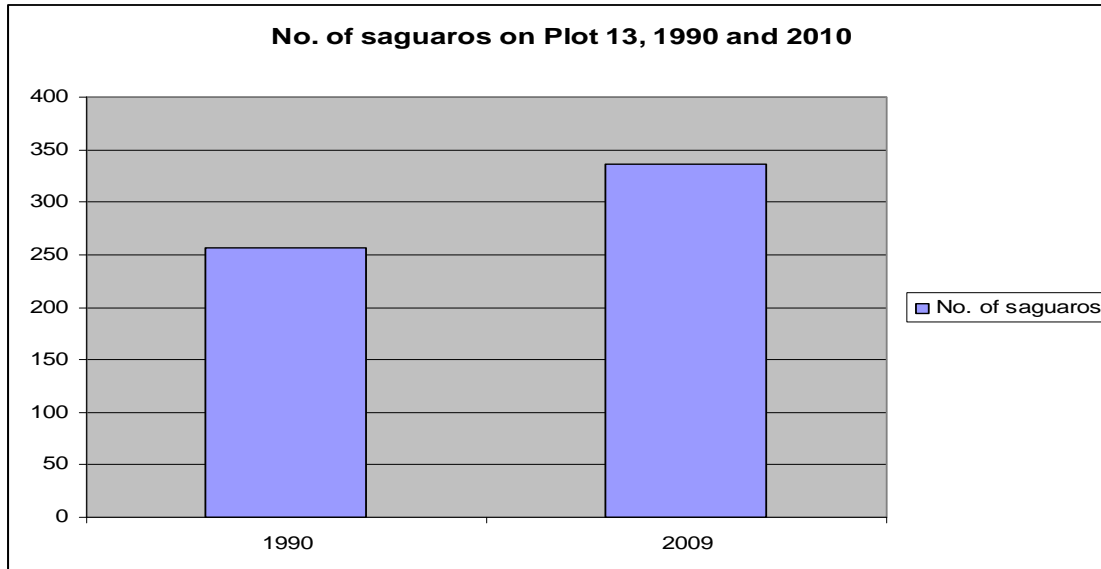

Notes:

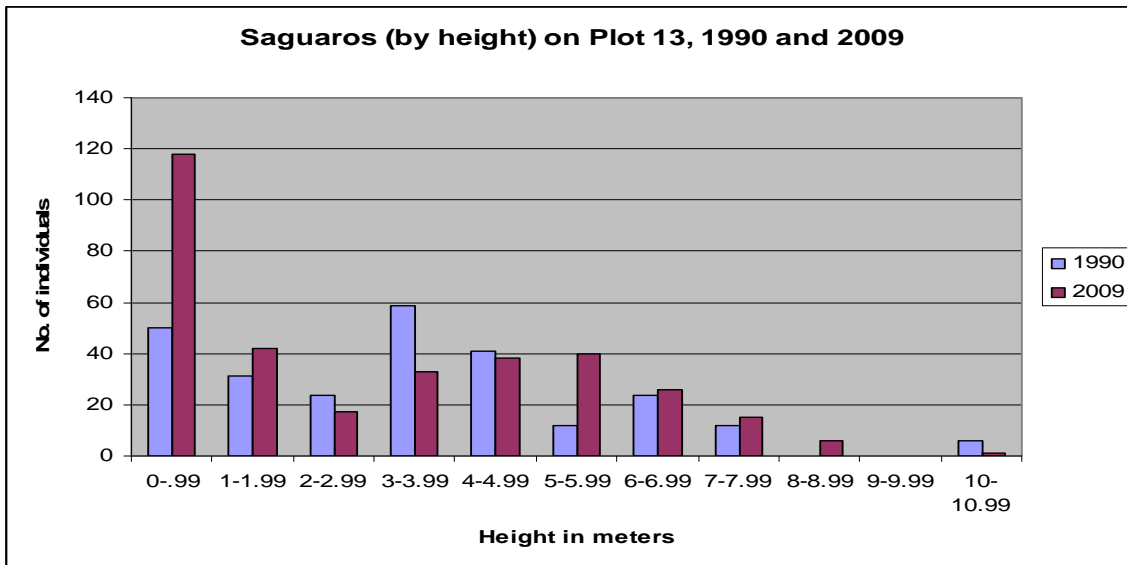

We could have a map of the saguaro plots, and visitors could click on it for the saguaro data.

They can access the data by use of their group name and date.

***Use calendar as a way to organize this data?**

Results: Saguaros (especially small individuals) increased by nearly 30% since the last time the plot was surveyed in 1990. Some older saguaros died – a few of them may have been killed in the 1994 Mother’s Day Fire.

Kara O'Brien and Mike Ward measure a small saguaro.

Justin Kolb, looking like a grand saguaro himself, takes in the scenery.

Mike Ward on the steep north slope.

A collared lizard we saw on the plot.
