The DEIS acknowledges that the effects of livestock grazing on showy Indian clover are not well understood. It notes that herbivory by cattle is a threat to the small populations in the planning area and that some historic locations with showy Indian clover could have been eliminated due to cattle grazing. Cattle grazing or trampling could cause plant injury or mortality, but could also benefit showy Indian clover via disturbance and reduced competition from non-native plants. Populations introduced to the D ranch in PRNS were separated by fencing, with one side grazed by cattle and elk, and the other side grazed only by elk. As of 2016 a subset of plants in the cattle-grazed area had the highest number of flowering heads, suggesting possible beneficial effects from livestock grazing.

Alternative B proposes mitigation measures to ensure that adverse grazing effects to introduced showy Indian clover are avoided on D Ranch. NPS claims it would manage livestock timing, duration, and grazing intensity in a manner that is compatible with the persistence of showy Indian clover.

### Sonoma Alopecurus

There are only 20 occurrences of Sonoma alopecurus remaining in the world. At one point, there were 10 Sonoma alopecurus populations in PRNS, but 4 have been extirpated leaving 6 of the 7 existing populations of this species in the park. Trampling and grazing by cattle has been one of the factors for decline of the species. One population in the planning area was reduced by 90% in 2001 after cattle were released onto the site. Grazing can result in trampling of individual plants, soil compaction, and influence the presence of competitive invasive species. Heavy grazing of this plant can also limit its ability to photosynthesize, which could result in death or diminished reproductive output.

Conversely, some grazing regimes may be beneficial and necessary to maintain Sonoma alopecurus in the face of competition from other plants. NPS monitoring of Sonoma alopecurus in the action area suggests that it thrives in wetlands that are grazed just enough to reduce competing vegetation. Moderate-intensity grazing would reduce competition from more abundant native plants or non-native species. Seasonal grazing appears to result in more Sonoma alopecurus inflorescence production than no grazing or year-round grazing.

Alternative B proposes mitigation measures for Sonoma alopecurus, including instituting seasonal grazing on the AT&T Ranch and seasonal exclusion of grazing around Population 5 near Abbotts Lagoon. The NPS claims it would use ROAs to direct the appropriate timing, intensity, and duration of grazing. Fence construction around populations would allow cattle to be excluded in the spring and summer to avoid impacts to plants during active growth, flowering, and seed-set. Adherence to RDM standards is supposed to ensure moderate grazing. NPS states it would monitor populations and coordinate with ranchers to adjust grazing if there are any documented adverse effects in pastures. The DEIS acknowledges that the extent of cattle grazing that is advantageous for Sonoma alopecurus is unknown and so the potential for inappropriate cattle grazing would still exist.

### Sonoma Spineflower

NPS has performed several introductions of Sonoma spineflower in grazed pastures in the planning area, at least five of which have been successful in establishing new occurrences. The DEIS notes that the one wild population and nearby introduction sites on G Ranch appear to have generally declined since 2011, and that intensity and timing of cattle grazing could be one of the factors in the decline. The DEIS acknowledges that the impact of cattle on Sonoma spineflower is unknown and that cattle grazing could have beneficial or potentially detrimental effects, depending on grazing timing and intensity. NPS presumes that Sonoma spineflower benefits from a moderate grazing regime, and that damage caused by livestock trampling is outweighed by the benefits of grazing reducing competition from other plants.

Alternative B proposes mitigation measures for Sonoma spineflower that primarily consist of NPS promising to monitor existing populations, and work to remove non-native or other plants that may compete with Sonoma spineflower.

#### Tidestroms Lupine

The DEIS notes that cattle grazing has been associated with the extirpation of Tidestroms lupine elsewhere in Marin County. In the planning area 85% of occurrences of Tidestrom's lupine are in areas largely excluded from cattle grazing. For 15% of the remaining occurrences, cattle currently directly affect the plants through trampling and indirectly affect them via increased weeds associated with grazing disturbance. Trampling by livestock was the cause of some plants at PRNS going from a reproductive to non-reproductive state.

Alternative B proposes mitigation measures for Tidestroms lupine, including a new 67-acre resource protection exclusion area on the F Ranch intended to protect all known Tidestroms lupine occurrences that are potentially impacted by grazing under existing conditions. The DEIS acknowledges that a small number of Tidestroms lupine occurrences could be negatively impacted if cattle breach pasture fences and loaf in coastal dunes. Cattle trespassing in coastal dunes could occur if pasture fences are poorly sited, inadequately maintained, or if gates are left open.

#### Other Sensitive Plant Species

The DEIS states that other rare and special-status plant species would continue to be adversely affected by cattle grazing or trampling, including coastal marsh milkvetch (*Astragalus pycnostachyus*), swamp harebell (*Campanula californica*), Point Reyes ceanothus (*Ceanothus gloriosus*), Marin checker lily (*Fritillaria lanceolata* var. *tristulis*), North Coast phacelia (*Phacelia insularis* var. *continentis*), and Point Reyes checkerbloom (*Sidalcea calycosa* ssp. *Rhizomata*).

#### Alternative F and Listed Plants

The DEIS has an inadequate discussion of the benefits to listed and special-status plant species following the cessation of commercial livestock grazing and restoration of a more natural ecology under alternative F. The DEIS does state that beach layia and Tidestroms lupine would likely benefit under alternative F. It does not factor into consideration the fact that planned prescribed seasonal livestock grazing which would occur under alternative F could be targeted to provide specific benefits Sonoma alopecurus, Tiburon paintbrush, Marin dwarf flax, Sonoma spineflower and showy Indian clover, plants which may benefit from managed cattle grazing regimes. The DEIS also fails to evaluate or consider whether elk and other native grazers and browsers could perform similar vegetation management functions as cattle, in terms of reducing competing vegetation to provide benefits to these listed plants in the absence or regular cattle grazing.

#### Western Snowy Plover

The negative impacts of cattle grazing and ranching impacts on snowy plovers at PRNS are well documented and discussed in the DEIS. The biggest impact is from unnatural elevation of populations of common ravens near snowy plover beaches, which increases predation upon snowy plover eggs and chicks. Large raven populations are subsidized by ranch activities that provide food sources, such as livestock feeding and forage mowing that kills birds and small mammals, attracting ravens.

There are also direct impacts to plovers from cattle, including disturbance to birds or trampling of nests and crushing of eggs. The presence of cattle within nesting areas could also result in nest failure due to western snowy plovers being flushed from their nests for extended periods of time. The DEIS acknowledges that livestock do escape pasture fences and trespass onto beaches and coastal dunes occupied by western snowy plovers, but only rarely. Our organization has reported trespass cattle at PRNS within snowy plover nesting areas.

Under alternative B, the DEIS claims that NPS would continue to take actions to reduce feeding opportunities for

ravens at ranches and dairies, such as covering feed troughs, cleaning up waste grain around troughs, removing and placing troughs in enclosed structures, and storing harvested crops in enclosed structures. The DEIS also states that NPS has coordinated with ranchers to limit raven access to supplemental feed and shelter and worked with ranchers to install covered feed bins. However, large congregations of ravens can still be observed feeding at uncovered food sources at PRNS ranches and dairies. Every observation of forage mowing at PRNS has a large number of attendant ravens. The DEIS admits that it is uncertain whether alternative B would reduce indirect impacts of ravens.

Alternative B proposes mitigation measures for western snowy plovers intended to reduce the attraction of ravens by ranches and dairies. These include inspection by ranchers of all pasture fences prior to moving cattle into a pasture, a highly unlikely scenario. ROAs would require annual fence maintenance, but how this would be enforced and whether maintaining on an annual basis would be adequate are not discussed. NPS has eliminated the existence of carcass dumps which attract ravens and the DEIS claims NPS would find ways to ensure that afterbirths and dead livestock are disposed of quickly by ranchers, but does not detail how this would be accomplished.

Under alternative B, where agricultural diversification is proposed to be allowed, NPS claims it would require methods to reduce feeding opportunities for common ravens at ranches and dairies, including requiring ranches to cover or remove feed troughs or place them in structures where possible, storing harvested crops in enclosed structures, and cleaning up waste grain around troughs. These are measure supposedly already in place for cattle which are not being complied with by ranchers and not monitored and enforced by NPS.

Under alternative B, mitigation measures to reduce wildlife mortality during forage mowing include conducting harvest mowing outside bird nesting season, mowing from inside the middle of a field toward the outside to increase likelihood for wildlife escape, using flushing bars on the mower to flush incubating birds and mammals before the mower reaches them, and not mowing at night when there would be higher wildlife mortality. The DEIS does not detail how these measures will be implemented, monitored, or enforced.

#### Listed Salmonids

The myriad of negative impacts from livestock grazing on salmonids and their habitat are well known and well documented, as discussed in the DEIS and the NMFS 2004 Biological Opinion for PRNS and GGNRA. These include increased erosion, sedimentation, and suspended sediment; damage to riparian vegetation and streambanks; increased water temperatures; and adding nutrients, sediment, bacterial contaminants, and other pollutants into streams. These impacts could degrade habitat for listed salmonids in the planning area, including California coastal Chinook salmon, Central California coastal steelhead, and Central California coast coho salmon.

The DEIS claims that these impacts are minimized due to adherence to RMD standards, grazing in riparian areas in grazed pastures that is managed for riparian health, fencing and topography which prevents livestock access to Olema Creek, Lagunitas Creek and numerous tributaries, and development of upland water sources which reduce livestock use of most intermittent streams.

Mitigation measures for salmonids under alternative B would include implementation of management activity standards in appendix D, and range management guidelines that minimize erosion and stormwater runoff. There would be new resource protection areas that would exclude cattle from approximately 2.4 miles of perennial streams in the Lagunitas and Olema Creek watersheds and 1.6 miles of streams in the Drakes Estero watershed. Fencing is expected to keep cattle out of salmonid-bearing streams, but habitat for salmon and steelhead could be directly affected if cattle breach pasture fences into excluded riparian areas. Impacts to salmonids in the Range sub-zone would also be avoided or minimized through adherence to the RDM standards. Use of commercial fertilizer would no longer be authorized in the park.

#### California Freshwater Shrimp

The DEIS acknowledges that under alternative B, cattle grazing would continue to cause localized, minor, adverse effects to California freshwater shrimp in some stream reaches due to sedimentation of streams, nutrient inputs from cattle manure, and reduced aquatic habitat and water quality. Adverse impacts to shrimp are not predicted in Lagunitas Creek and lower Olema Creek because livestock fencing keeps cattle out of Lagunitas and Olema Creeks and the reaches where California freshwater shrimp occur are bordered by substantial riparian vegetation, which the DEIS postulates could reduce potential impacts from pollutants or sediment in stormwater runoff from ranches. Mitigation measures for alternative B for freshwater shrimp include adherence to RDM limits as specified in individual ranch ROAs.

#### California Red-Legged Frog

Livestock and ranching impacts on red-legged frogs are complex, with habitat provided for frogs by stock ponds, but many adverse impacts from grazing including removal of vegetation, trampling and siltation of streams and ponds, trampling of individual frogs or eggs, reducing habitat for invertebrates that provide prey, and decreased water quality and increased nutrient inputs from cattle manure. The DEIS and the USFWS (2002) Biological Opinion extensively cover the numerous adverse impacts to frogs from grazing. The DEIS also notes that a variety of diversification activities could harm California red-legged frogs through mortality, capture, injury, and harassment.

The proposed mitigations for red-legged frogs in alternative B include monitoring and unspecified measures in individual ROAs, which NPS assures would specify areas to be avoided by certain ranch activities, including mowing, shrub management, weed management, and nutrient management. Impacts on California red-legged frogs would be reduced by zoning, with the NPS not authorizing ranch activities other than grazing in the Range sub-zone, which would comprise approximately 70% of the planning area and contain nearly all the surface water resources in the lands under grazing lease/permits. Necessary uplands and migration habitat for red-legged frogs could also occur in the Pasture or Ranch Core sub-zones, which NPS claims will be protected by avoidance, minimization, and mitigation measures. NPS claims that adherence to RDM standards would provide for maintenance of herbaceous vegetation cover and protection from soil erosion. Mitigation for diversification impacts on frogs consists solely of measures to minimize runoff.

#### Myrtles Silverspot Butterfly

The DEIS acknowledges that cattle grazing activities within the habitat of the Myrtle's silverspot butterfly may result in trampling of eggs, larvae, and adults, as well as potential destruction of host or nectar plants via consumption, trampling, soil compaction, erosion, spread of invasive species, and other deleterious effects. It acknowledges that heavy grazing could reduce nectar sources for the butterfly. Conversely, grazing activities could help maintain suitable habitat for these butterflies by removing competitive vegetation and minimizing vegetative cover, which increases the density of nectar sources. The DEIS cites studies which suggest that managed grazing may be necessary to ensure the persistence of nectar sources, and by extension Myrtles silverspot butterflies, in coastal annual grasslands. The DEIS concludes that a moderate grazing regime does not significantly affect the distribution of Myrtle's silverspot butterfly, and that well-managed grazing is compatible with conservation of the butterfly. The DEIS admits that the effects of livestock grazing on Myrtle's silverspot butterfly host plants and its food sources are under debate, and that the optimal grazing regime most beneficial to Myrtles silverspot is not yet known.

Under alternative B, the DEIS claims that adverse effects to Myrtle's silverspot butterfly from overgrazing would be avoided by adherence to the parks Range Management Guidelines, which specify minimum levels of RDM of 1,200 pounds per acre.

#### Visitor Use, Experience, and Access

The DEIS acknowledges that the experience of park visitors who enjoy elk would be adversely affected by alternative B because the Drakes Beach herd would not be allowed to expand. The DEIS claims that lethal control, i.e. shooting of elk in the most viewed free-roaming elk herd would somehow not affect visitor experience or

enjoyment.

The DEIS makes the unsubstantiated claim that viewing livestock and ranching operations brings visitors to the park. The DEIS provides no evidence or substantiation for this assertion, nor does it provide any context of what proportion of park visitors come to view native wildlife and intact ecosystems versus to see ranching operations. The DEIS also notes that under alternative F visitors would no longer be able to experience working ranches in the planning area and claims that removing operating ranches would eliminate a unique experience that the park currently provides. Cattle ranching in the parks is in no way a unique experience. There are numerous working ranches surrounding PRNS and GGNRA, throughout Marin and Sonoma counties, many of which offer tours or farm stays. There is no loss to public use or enjoyment of the parks by removing these commercial activities, especially when they are ubiquitous in west Marin and Sonoma. The DEIS acknowledges that under alternative F, NPS would continue to offer and possibly expand interpretive opportunities related to ranching history.

There is little meaningful discussion of ranchings negative impacts on the publics use or enjoyment of the park. The DEIS cites electric fencing, interactions with cattle, and manure management as ranching operations which diminish the visitor experience; but fails to fully discuss the negative aesthetic impacts of the ranches and industrial scale dairy operations, including odors, lighting, noise, abandoned agricultural equipment, barbed wire, and trash. The DEIS does not discuss the safety danger from ranching to park visitors, including potential trampling and injury from aggressive cattle and bulls, and road hazards and damage to roads from oversized farm equipment.

The DEIS acknowledges that alternative F would be beneficial to visitor opportunities related to experiencing natural sights and sounds in the parks, and that the negative impacts of cattle and ranch operations on natural resources such as vegetation, wildlife, water resources, and air would cease as the park is restored to a more natural environment. The DEIS acknowledges that potential expansion of the elk population in Point Reyes under alternative F would result in long-term, beneficial impacts on visitor use and experience for visitors who enjoy observing elk in their natural and historical habitat, which is the vast majority of the American public and visitors to the park. The Drakes Beach and Limantour herd populations would increase, providing additional opportunities and new locations for visitors to view elk. In addition to the Drakes Beach and Limantour herds, the Tomales Point elk fence would be removed, and all elk would be free ranging throughout the park. The Tomales Point herd would likely expand into the planning area, which would benefit visitor experience by increasing viewing opportunities.

#### Greenhouse Gasses

Cattle are the overwhelming source of greenhouse gases at PRNS. The DEIS quantifies that ranching activities and livestock emissions are responsible for 87% of the park's CO<sub>2</sub>-equivalent emissions (24,611 of 28,345 metric tons per year).

The DEIS fails to evaluate the significance of these emissions in the context of the 2008 designation of PRNS as a Climate Friendly Park and the development of a Climate Action Plan to attempt to reduce the parks carbon footprint, and how ranching and dairying activities subvert PRNS goals in the Climate Friendly Parks campaign.

There is no discussion of mitigation for cattle impacts to the climate in any of the alternatives. Methane, produced by cattle, is a greenhouse gas 25-100 times worse than carbon dioxide. For any alternative which allows continued dairy ranching, the EIS should disclose whether the NPS will require methane digesters.

Under alternative B, emissions from ranching would be generally the same type and intensity as described under the existing conditions. Alternative E eliminating dairy ranching would lead to a measurable reduction in ranching-related emissions of NH<sub>3</sub> (98%), VOC (56%), and CO<sub>2</sub>e (66%). Under alternative F virtually all ranching-related emissions of criteria pollutants and GHG emissions would end within five years, and the remaining emissions would eventually also cease. Vehicle trips associated with the ranches would be eliminated, further reducing overall emissions.

So-called carbon farming, or rangeland carbon sequestration, is raised in the DEIS as a possible measure to reduce GHG emissions from ranching in the park units. This is an proven experiment, so the EIS should discuss whether any peer-reviewed science supports the concept of carbon sequestration through livestock grazing, what can realistically be sequestered versus the CO2 footprint of ranching operations, and what the environmental impacts and tradeoffs are. Many carbon farming schemes fail to account for numerous ranching sources of GHG emissions (including vehicle trips and equipment), rely on inflated estimates of grassland sequestration potential, and assume unrealistic grazing regimes. The NPS should not allow compost use on rangelands before any CO2 offset impacts are proven. The NPS should promote restoration of native grassland to sequester carbon.

### Diversification

The Center opposes allowing any diversification, or new agricultural activities, under any alternative, due to unacceptable potential impacts to native wildlife and wildlife habitat. Diversification is included in all the alternatives except No Action (A) and No Ranching (F). It would allow each rancher to add crops and previously unauthorized small livestock such as pigs, sheep, goats, and chickens to their operations. The DEIS fails to fully evaluate the impacts of this expanded agriculture on the parks wildlife or natural resources. There is no discussion of what measures will be taken when inevitably park predators such as coyotes, bobcats or foxes take chickens, lambs or other small livestock. For context, the NPS has already shot 25 elk and harassed them out of ranch areas, and under the GMPA is planning to continue to shoot and harass native elk. This is the NPS response to unsubstantiated claims by ranchers of impacts to cattle operations, for one of the signature native wildlife species at PRNS, and a major attraction for park visitors. The DEIS is obligated to contemplate and evaluate what lethal and exclusion methods the ranchers will insist on and what methods NPS will consider once conflicts inevitably arise with native predators due to presence of small livestock, and after predation by native birds on new row crops.

Proposed mitigation measures for diversification activities are contained in Appendix D, table D-11. The problems with these mitigations are discussed below.

### Grazing Lease Succession

Under the Point Reyes Act, ranching leases were given to the owners of ranches at the time of their acquisition by the National Seashore, and their heirs. Allowing for "multi-generational ranching" was an early accommodation to the ranchers who sold their land for the park. In addition to generous compensation (the equivalent of \$340 million in today's dollars), ranchers were allowed to lease back their land either for 25 years or for lifetime estates. The NPS later agreed to allow the heirs of the original ranch owners to stay on in the park as long as they continued ranching. After that, the ranches would be retired.

Under alternative B, NPS would not retire ranches when the heirs of the original ranchers retire. Instead, NPS would offer those leases to other relatives, and if they decline, to neighboring ranchers, and if they decline, to anyone who wants to lease land in the park. No prior connection to the Seashore would be required for grazing leaseholders. This is an attempt to make ranching leases in PRNS permanent, which would be illegal under the framework of the Point Reyes Act.

### Recreational Development

Under alternatives B, C, D, E, and F, the NPS proposes to increase visitor use and enjoyment through new trails, expanded recreation, and addition of day use and overnight accommodations. These will all likely require likely require additional project-specific environmental review.

The Center supports the concept of improved public access and new trails, especially if they are sited as contemplated in the DEIS, with most new trail routes using existing administrative roads, including ranch roads, and with limited new trail construction. Trail opportunities would focus on loop routes, connectivity with adjacent public lands, and facilitation of north-south connectivity across the landscape. Most routes would be minimally maintained and would have a rural, backcountry character. Routing of individual trails and allowable

trail users (such as bikes and horses) will need to take into consideration sensitive natural resources, such as habitats for endangered species, wetlands, highly erosive areas, etc.

Under alternative F many of the former ranch areas and their associated facilities would be converted and offered for public not-for-profit education, research, outdoor experiential activities, and other public recreation and visitor opportunities. We support this concept. Under alternative F the GMPA also proposes to use vacant ranch infrastructure for overnight stay concession operations (e.g., hostel in the buildings; campground in the pasture; possible yurts, tent cabins, or other similar structures that offer an overnight option between tent camping and commercial lodging). Allowance of such operations would need to take into consideration sensitive natural resources and the localized impacts, and include measures to reduce visitor impacts. There should be programs in place to reduce trash generation at these locations. Any new campgrounds or overnight stay operations would likely require additional project-specific environmental review.

The GMPA also contemplates drive-in, hike-in, and boat-in camping sites with limited services and amenities. It suggests several locations to consider for expanding overnight camping, such as Schooner Bay near Drakes Estero or Home Ranch. Under no circumstances should any boat-in camping be allowed in the Drakes Estero wilderness area. The NPS underwent a long and expensive process to remove the commercial oyster farm from this estuary and clean up and remediate all the infrastructure, garbage and invasive species left behind by the oyster farm. The wildlife and habitat of Drakes Estero is still recovering from that commercial legacy. Boaters already flush and disturb resting seals and birds in the estuary. Drakes Estero is too fragile an ecosystem and too important a resting area for marine mammals and birds to sustain such increased visitor use and human disturbance. There is already boat-in camping on Tomales Bay, and those activities result in overuse, trash, and trampling of habitats by boaters landing on shore. Such intensive impacts should not be introduced to Drakes Estero.

The DEIS proposes to expand interpretation and education of historic districts and ranching in the park. This effort seems focused on solely on "sharing the story of ranching in the park." We raised the issue in scoping that the GMPA should also dramatically expand interpretation of the Coast Miwok people and of pre-grazing natural ecosystems at Point Reyes. The DEIS does not address non-ranching interpretation and education.

### Inadequacy of Mitigation Measures

The proposed mitigation measures for all of the significant environmental impacts from livestock grazing and ranching activities discussed above consist of eight main approaches: 1) new sub-zoning of ranches to avoid cattle grazing in areas with sensitive resources and to concentrate more intensive activities and impacts in ranch core zones; 2) exclusion fencing to prevent cattle access to areas with sensitive resources; 3) some combination of ranchers and NPS managing rotation, timing, and duration of livestock to achieve grazing levels that are not detrimental or could be beneficial for certain habitat types and species; 4) adherence to RDM standards to prevent overgrazing; 5) a Ranch Operating Agreement specific to each grazing lease/permit that specifies what activities can occur; 6) a grab-bag of best management practices and standards from other agencies listed in Appendix D; 7) mitigations for impacts to ESA listed species contained in the Biological Assessments (Appendices K and L); and 8) some combination of rancher compliance and NPS monitoring and enforcement of lease conditions and promised avoidance and mitigation measures.

The DEIS is relying on some combination of these mitigation measures to reduce significant environmental impacts from the livestock grazing and ranching activities that would take place under alternative B.

While the sub-zoning is a promising concept, it relies heavily upon ranchers understanding and NPS enforcing which activities are not permitted in which zones. Resource Protection sub-zones would, at least on paper, remove grazing from sensitive resources such as riparian areas, surface waters, and federally listed wildlife habitat. The zoning maps make clear that this is going to be a confusing situation at best. For example, the I Ranch zoning map provided in the DEIS shows how difficult it will be to actually delineate, let alone protect resources or prohibit activities in Resource Protection sub-zones:

The responsibility for monitoring and maintaining exclusion fencing seems to lie with the ranchers, with some oversight from NPS. PRNS has had continuing problems with unmaintained fences allowing cattle to access supposedly protected areas. Likewise managing rotation, timing, and duration of livestock grazing will be the responsibility of ranchers, with some oversight from NPS. Presumably these responsibilities will be spelled out in the individual Ranch Operating Agreements, which have not yet been produced and the public has no chance to view or comment on.

PRNS and the NPS have a long history of complete failure to adequately monitor ranching operations or enforce the conditions of PRNS grazing leases. Because of past history and lack of public confidence, we asked NPS in our scoping comments to disclose the ongoing monitoring and enforcement problems with grazing leases, specifically: continuing instances of grazing lease violations by ranchers; if and how the NPS ensures compliance with lease conditions; and whether the NPS has ever taken any enforcement action for grazing lease violations, which it apparently has not. The DEIS utterly fails to disclose these issues or evaluate NPS ability to adequately monitor and enforce lease conditions and promised mitigations in the future.

NPS documents we obtained through a Freedom of Information Act (FOIA) request showed a pattern of grazing lease violations by some ranchers and a lack of any enforcement by NPS for lease violations. These violations included: harassing and hazing wildlife with vehicles and dogs; illegal dumping of debris on ranches, including tangled barbed wire strands that risk elk entanglement; trespass cattle regularly occurring for more than a decade; documented overstocking of cattle beyond numbers allowed in a lease; conducting hayage and silage tilling and mowing in unauthorized areas; dead cattle and calves dumped on a ranch in violation of the lease; and failure to pay permit fees on time. Some of these lease violations are posted on The Shame of Point Reyes web site: <http://www.shameofpointreyes.org/documents.html>. Grazing lease violations which our organization and other conservation groups and local residents have more recently reported to NPS were ignored and were not contained in the files turned over by NPS. The FOIA documents we received from the agency made it clear that NPS has no systematic or comprehensive program to monitor grazing leases or ensure compliance with lease conditions.

There should be very little public confidence in the willingness or ability of NPS to monitor and enforce any promised grazing lease conditions, given the history of rancher violations and NPS failure to enforce them. The ROAs contemplated in the GMPA will be much more complex leases, with numerous conditions and mitigation measures. Many of the promised mitigations in the DEIS are simply not credible absent a detailed, specific monitoring program conducted by NPS, not ranchers. The GMPA would need to identify dedicated staff and secure funding for regular monitoring, unannounced inspections, and an enforcement policy. It would need to show that these programs would be in place, funded, and effective for the duration of the grazing leases. It would require regular reporting to the public on grazing lease compliance and corrective measures.

Reliance on the RDM standards for mitigation is also flawed, due to unscientific forage calculations and rancher non-compliance with RDM standards. The NPS and the DEIS overestimate available forage at PRNS, based on overly optimistic and not up to date soil productivity data, animal unit calculations based on inaccurate average cattle weight, and an assumption that 100% of the forage above the required minimum RDM is allocated to cattle. The forage calculations also do not account for new livestock which will be introduced under alternative B. The DEIS is missing a detailed analysis of forage consumption for any new domestic animals. Furthermore, the U.C. Berkeley rangeland study which NPS commissioned (Bartolome et al. 2015) reveals that 33% of the studied rangelands at PRNS violated the NPS lease minimum RDM standards, the same standards that are included as mitigations in the preferred alternative.

Many of the mitigations for significant impacts are purportedly contained in Appendix D of the DEIS. Appendix D seems designed to be confusing and to obscure what mitigations are mandatory and what mitigations are required for which impact. It covers a lot of mitigations and standards for infrastructure, planting, water supply, water management, and discrete projects, for example road upgrades and fencing. There are a couple places in Appendix D where specific measures are called out for specific activities of concern, such as for mowing a

requirement for buffers and no mowing zones. The DEIS claims NPS staff will monitor to ensure mowing does not exceed agreed-upon areas, but again there is no identification of dedicated staff, funding, or a monitoring program to ensure this will actually happen. Table D-11 is just a slapdash assortment of guidelines and best management practices from other agencies assembled in a confusing and incoherent manner. Appendix D does not further the public understanding of what measures are going to be implemented to protect natural resources.

Many of the mitigations in Appendix D are simply non-binding Marin County RCD and NRCS best practices and standards with respect to things like soil, water and vegetation conditions. They include USDA farming standards (also non-enforceable guidelines) as mitigation measures for the conservation of soil, water, air, and related plant and animal resources. The DEIS is supposed to address mitigations for activities in national parks, not a farm.

What is glaringly absent from Appendix D are the three resource protection statutes which apply to PRNS and GGNRA, and the standards of maximum protection, restoration, and preservation of the natural environment, and leaving natural resources unimpaired for future generations to enjoy.

Many of the mitigation measures in Appendix D rely upon plans which have not been formulated yet, with unknown conditions, and no ability for the public to view or comment upon them, including Stormwater Pollution Prevention Plans, Weed Monitoring Plans, Nutrient Management Plans, Manure Management Plans, and Conservation Plans from NRCS or NPS for silage or row crops.

The proposed mitigations for ESA listed plants and wildlife are spelled out in Biological Assessments (Appendices K and L). It is clear that the purported beneficial effects from cattle grazing on native plants is highly dependent on the season, intensity and duration of grazing. This would require very highly managed grazing operations, which NPS and the ranchers have never proven capable of conducting at PRNS or GGNRA. Successful rotational, seasonal grazing of the type contemplated in the Biological Assessments would require frequent monitoring by NPS, rancher acceptance and responsiveness, willingness and motivation for lease holders to comply with difficult and confusing constraints, and enforcement. Some of the mitigations for the listed plants rely on adherence to RDM standards, which has been problematic at PRNS.

#### Failure to Disclose Costs of Ranching

Our scoping comments explicitly asked NPS to disclose to the public the dollar amount or portion of its budget that goes to ranching-related expenses. NPS management of ranching leases places increasing demands on dwindling park budgets, while park improvements, a backlog of maintenance, and public programs and interpretation go unfunded. Scarce park financial resources support 24 ranchers, who benefit from discounted grazing fees, below-market-rate housing, and maintenance and improvements to roads, homes, and farm buildings. They also benefit from implementation of mitigation projects to offset impacts from ranching, all covered at public expense. Ranchings environmental impacts have an untallied economic impact, which the DEIS fails to disclose. The ranchers also benefit from the NPS killing and hazing wildlife. PRNS and GGNRA ranches pay no property taxes. The NPS mission does not include guaranteeing commercial operators a living, yet every alternative except No Action (A) and No Ranching (F) allows diversification for the economic benefit of commercial leaseholders. Our scoping comments also asked NPS to predict the annual costs for each elk management strategy in each alternative. The DEIS fails to address this issue. The DEIS has not disclosed to the public the costs of ranching to taxpayers under alternative B, nor the savings that would accrue under alternative F with cessation of commercial ranching.

#### Failure to Consider Restoration

The NPS has a mandate and an obligation under its management policies (NPS 2006) to not only prevent impairment of park resources and values, but to actually improve natural, cultural, and physical resources and opportunities for enjoyment of the parks for the benefit of future generations. This requires a GMPA for PRNS

and GGNRA that improves these resources. Although more than a century of intensive cattle grazing has altered and diminished the natural ecosystems of PRNS and GGNRA, none of the GMPA alternatives include active, significant restoration of natural resources and natural ecosystems. A coastal prairie restoration alternative, which would maximize restoration of coastal prairie and other native plant and animal communities, was proposed during scoping but not even acknowledged in the DEIS.

Correspondence: Point Reyes was where I had my first view of the ocean. Beautiful and pristine. Please stop grazing and definitely leave the tule elk alone.

#6951

Name: ELLIOTT, HENRY

Correspondence: Alternative F, including free ranging Tule Elk and the elimination of livestock, should be NPS's Preferred Alternative: 1) It would substantially meet the legal requirements of NPS's founding legislation, subsequent policies and legislative intent for management of biodiversity and cultural resources at the Seashore as reviewed in comments to the DEIR by Carolyn Longstreth. 2) It would be less costly, thus more likely, to meet its requirements of "Appendix D - Management Activity Standards and Mitigation Measures" than all other Alternatives. Such measures have historically been underfunded at the Seashore with prospects for adequate funding of the enhanced requirements for the more involved livestock Alternatives unlikely. 3) Increasing density of free ranging Tule Elk, without or minimal livestock for resource management In the Pastoral Zone, will enable natural processes to restore the historic mosaic of coastal prairie and coastal scrub plant communities. Examples are habitats that have been devoid of livestock grazing for decades in the range of the Pierce Point and Limantour Tule Elk herds. 4) Per CDFW management goals "to emphasize managing tule elk in a free-roaming state to the maximum extent possible, as specified in the Management Plan for the Conservation of Tule Elk (Tule Elk Interagency Task Force 1985)." CDFW ELK CONSERVATION AND MANAGEMENT PLAN - December 2018 Justification for the removal of livestock is analogous to the biological justification by NPS for previous removal of axis and fallow deer at the Seashore: "The FEIS documents that the presence of invasive non-native axis and fallow deer is extremely disruptive to the natural ecosystem at PRNS. Some of the more serious effects these non-native deer have at the Seashore include competition with and displacement of native tule elk and black-tailed deer, the potential for transmitting paratuberculosis (Johnes's disease) and exotic lice to native ungulates, damage to riparian and woodland habitats, and indirect impacts to the native wildlife dependent on this habitat." Non-Native Deer Management Plan/Environmental Impact Statement – 2006. 5) Working ranches are not specifically required for maintaining the historic fabric of the areas' historic districts. Indeed, proposed ranch stocking operations and Best Management Practices are for the 21st Century, not the past two centuries that is the intent of establishing these districts. In Alternative F, livestock are only to be present as a necessary, short-term resource management tool to enhance plant community structure and biodiversity.

Correspondence:

Dear Superintendent, Sept. 23, 2019

Enclosed are comments on the Draft Environmental Statement (DEIS) for the General Management Plan Amendment process (GMP) for the Point Reyes National Seashore (PRNS).

#### Adequacy of DEIS and Appendices

DEIS page ii - Executive Summary - The Site Specific Analysis in the Vegetation Management section should be expanded to include specific restoration plans for habitats within the program planning area. Alternatively, another provision for a PRNS Habitat Restoration Plan(s) would benefit the Final EIS. This should include serpentine, coastal prairie, riparian, and wetlands. The description of dune habitat, restoration and species is excellent. I hope NPS can continue this excellent program.

DEIS - page vii - Executive Summary - The DEIS is not adequate in stating which wildlife will be positively or negatively impacted by various habitat restoration activities. Please give at least one example of a species that would benefit and one that would be detrimentally affected by the habitat restoration and protection strategies that exist and are proposed.

DEIS General - The DEIS is not adequate in describing Site Specific Restoration Analysis for coastal prairie. Arguably, coastal prairie habitat is one of the most popular in PRNS. I have experienced the crowds of enthusiastic wild flower viewers at Chimney Rock for decades.

I realize Chimney Rock is not in the Planning Area. However, coastal prairie remnants and the diversity of this habitat (coastal mesas, wet meadows, etc.) are mentioned in various ranch descriptions in the Planning Area. As stated in the DEIS, page 92 Ranches in the planning area encompass large portions of the coastal prairie ecotype. And ..coastal California grasslands are disturbance dependent and can convert to shrub land.(page 22) The integration and back and forth transitions of coastal prairie and coastal scrub need further understanding.

As stated in the DEIS, California coastal prairie has twice the number of species as other Western US grasslands. It is a unique, ecologically important and beautiful habitat. The DEIS is not adequate in describing any aspect of coastal prairie habitat restoration. For coastal prairie habitat to persist and thrive, the small remnants need to be enlarged and development of a larger, contiguous area would benefit the plants in this community as well as insects, birds, mammals and other taxa.

DEIS: page 11 - Range Management and page. - The coastal grassland section of the Point Reyes Natural Resource Condition Assessment (NPS 2019a) conducted between 1987 and 2011 to monitor spring vegetation composition is limited as it is under review. DEIS page 73: The Point Reyes Natural Resource Condition Assessment (NPS 2019a) is cited again with the following information : &analysis of 51 plots in Point Reyes grazed coastal grassland from 1988 to 2013 showed Coyote brush occurred in about half the plots. It increased in cover in 10 of the plots, 6 of them to a major degree, and decreased in cover on 8, although in some plots, cattle grazing ceased. The plots did not capture the full range of sites and vegetation. (NPS 2019a). While this study is inadequate to describe the composition and changes in the grasslands in the Planning Area, it is very valuable for use in designing a restoration study of coastal prairie and coastal scrub integration and their transitions and integrations. For example, it could be used to determine sample size, the number of replicates needed for each grassland type, and factors to consider in the restoration study. This and some other recent publications on central California coastal prairie restoration would enable addition of a Site Specific Analysis of coastal prairie restoration plan to be added to the Final EIS. (Example: Henneman, C., N.E. Seavy, T. Gardali. 2014. Restoring Native Perennial Grasses by Changing Grazing Practices in Central Coastal California. Ecological Restoration. 32:4. 352-354.)

DEIS: page 25 - Alternative B - Alternative B is identified as the preferred alternative by the NPS. The DEIS is not adequate in stating why this is the preferred alternative. The Final EIS would benefit from a rationale for Alternative B as the preferred alternative.

DEIS page 118 - Coastal Dune Restoration - This is an excellent program, please continue this program and apply what is useful to other habitat restoration programs.

DEIS page 129 to 132 - Environmental Consequences - Alternative A - Published literature on the benefits and impacts of grazing on Planning Area Federally Listed plants is complex, not definitive, positive for some species for certain duration, time of year, intensity of grazing and detrimental to other species. A well designed, adequately replicated study on grazing effects on the Federally Listed Plants and their habitats would contribute much to the Final EIS for the Planning Area. The lack of knowledge and understanding of grazing impacts on these species and their habitats strongly suggests a thorough study is needed. The DEIS does not contain adequate information, but I realize, much information may not exist. As this section of the Environmental Consequences states and the knowledge cited applies to all Alternatives, A, B, C, D, and E, Site Specific Restoration Analysis for these species and their habitats would increase the adequacy of the Final EIS. If Site Specific Analysis is not the appropriate mechanism for this addition to the Final EIS, provision for a PRNS, Site Specific Habitat Restoration Plans for Federally Listed Species should be added to the Final EIS in a way that is appropriate for the GMP.

DEIS - General question - While the fenced enclosure on Tomales Point, where the enclosed elk herd are located, is not in the planning area, have there been any studies on plant community changes there since the elk were re-introduced? If so, this information may be useful to the Tule Elk Management section of the Final EIS and for development of coastal prairie and coastal scrub restoration plans.

Appendix A - General: Resource Protection Zones habitat maps of individual ranches are inadequate. The specific protected habitats on the individual ranch maps are needed and would benefit the Final EIS.

Appendix A: Figures 8 to 31, (Pages A-9 to A-32). The general nature of the individual ranch maps showing the proposed Ranchland Subzone, Pasture Subzone, and Resource Protection Subzone is not adequate. The individual ranch maps should include serpentine, remnant coastal prairie areas, riparian, wetlands, and rare plant location and distribution. This would enable public comments on restoration strategies relative to ranchland management, to better understand where specific protected resources are located, to recommend restoration concepts for ecological connectivity and processes, and to comment on protection strategies, impacts and benefits. This information would benefit the Final EIS.

Appendix A: Vegetation map - Figure 44 (page A-45) - Where is the coastal prairie (all subtypes) located in the Planning Area? How many acres of coastal prairie remain in the planning area?

Appendix A: Wetland Map - Figure 45 (page A-46) - Addition to the legend of specific types of palustrine wetlands such as wet meadows, riparian, streams, seeps, etc. would benefit the Final EIS. For example, what type of large wetland is adjacent to the southern end of Abbotts Lagoon?

Appendix A: Figure 43, (page A-45) - Another area where coastal prairie information is not adequate is Appendix A, figure 43. The coastal prairie habitat and where it is known to occur should be included in this figure or a separate figure could be prepared. Grassland/pasture is not an adequate description of the grassland habitats in the Planning Area.

Appendix D: Table D-1, page D-4, section Vegetation Management - Upland and Vegetation Management and Planting - establishing native grasses, forbs, shrubs or trees in disturbed or eroding areas is another area where a Site Specific Restoration analysis, or other appropriate provision, would greatly benefit the Final EIS.

Appendix I: page I-12 - Forage Model. On this page the supplemental feed required for the livestock on Ranch C and D West states the 4. supplemental feed required for cattle is 631,000 /- 88,000 lbs. The aggregate supplemental

feed and the amount of fall/winter feed (DEIS page 10-12) required by all the ranches in the Program Planning Area should be included in the final EIS or the Appendices. The total elk forage consumption, not just that from C Ranch should also be given. The information given on supplemental feed is not adequate to understand the number of cows that could be supported in the Range Subzone and Pasture Subzone of the Planning Area without importation of supplemental and/or fall/winter feed.

Appendix K: page 58 - Rare Plant Monitoring - This program would benefit from designation as a dedicated program, not an opportunistic one. PRNS has many rare plants. They deserve a designated program with monitoring and restoration component in the Site Specific Analysis of the Final EIS and Appendices or elsewhere in the Final EIS as appropriate to NPS methods.

Appendix K: page 59 - Section 7.3.2 - populations of Marin Dwarf Flax, *Hesperolinon congestum*, and Tiburon Indian paintbrush, *Castilleja affinis* ssp. *neglecta*, would benefit from continued monitoring, as recommended by USFWS Biological Assessment.

Appendix K: pages 59-60 - Section 7.3.3 - As native species of the coastal prairie habitat now compete with a large number of non-native annual grasses and forbs and grazing is known to benefit some and impact other native species, the final EIS should contain a restoration strategy for some areas of coastal prairie using prescribed grazing and possibly other disturbances. This would likely be an experimental program with adequate sample sites, control sites and replication, to understand the effects of grazing, fire, and other disturbances on coastal prairie as well as its integration with coastal scrub habitats. The importance of a greater number of sites with coastal prairie habitat and one or more larger contiguous areas is essential for this habitat to persist and thrive in the Planning Area. The other species associated with coastal prairie would also benefit as would the Final EIS.

#### An Alternative

I recommend adoption of Alternatives D and E for the following reasons: " Alternative D: Alternative D would contribute meaningful beneficial impacts on soils compared existing conditions for an additional 8400 acres that would be included in the Resource Protection Zone because ranching related soil impacts would cease in those area. " Alternative D: Water resources and water quality in areas removed from ranching would improve compared to existing conditions. " Alternative E: Reduction of the animal units and forage production fields with conversion of dairy to beef would have noticeable long- term beneficial impacts on the soil by reducing erosion, runoff, and compaction. " Alternative E: Eliminating manure spreading and nutrient management on 2500 acres would have long term, beneficial impacts on soil fertility because soil fertility would slowly over years or decades return to natural conditions. Water resources and water quality would also benefit. " Alternative E: Cumulative, noticeable, long term, beneficial impacts compared to existing conditions from conversion of dairy to beef cattle operations include elimination of manure management systems, seeding, forage production, and diversification activities.

Alternatives D and E offer the most appropriate ranchlands management as they provide noticeable, long-term, beneficial impacts to PRNS resources and ranch operations. Cumulative impacts of alternatives A, B, and C are all adverse to soils and water resources when considering impacts from past, present and reasonably foreseeable actions. Forage production and continual reintroduction of invasive species will cease. Some range degradation will decrease in areas removed from grazing and conversion of dairy ranches to beef ranches. These benefits include reduced polluted runoff, sheet and gully erosion, and soil instability. There is a detrimental impact to the people who lease, work and live on the ranches identified in Alternatives D and E.

However, taken together, Alternatives D and E, will provide 19,000 acres of grazing lands in the Planning Area, an essential component to managing PRNS grassland and shrub land as well as providing for continued ranch operations. Soils and water resources will be beneficially impacted overall as there will be fewer acres subject to grazing and intensive use. An overall benefit to water resources results from less water use for livestock. The larger area of Resource Protection Zone will preserve more sensitive habitats and species.

Public use trails may increase. A trail through a coastal prairie restoration project would benefit PRNS. This could be done as an educational trail, showing restoration processes, providing employment and volunteer activities.

Diversification of ranching activities would not be adopted. No other livestock species and other proposed activities would be allowed. These uses and activities are not appropriate in a National Park.

Historic structures in the Ranch Core Subzone will be preserved and restored in Alternatives D and E. NPS has identified the need for substantial capital investment in many of the historic structures and will collaborate with volunteer groups and the ranchers to complete and maintain these improvements.

Thank you for the opportunity to comment.

Correspondence: Superintendent Ciceley Muldoon Point Reyes National Seashore 1 Bear Valley Road Point Reyes CA 94956

Dear Ciceley,

I am disappointed with the Park's preferred option for the Ranch Management Plan. I feel it gives far too much to the ranching and agricultural interests and fails to protect the very things that make the Seashore the special place that it is.

The proposed diversification in the preferred alternative will have a hugely detrimental effect on the the wildlife and recreation in the Park. Predator controls will badly effect the freedoms of both wildlife and park visitors who want the explore the wild places in the pastoral zone. They will probably have fatal consequences for countless coyotes, foxes, bobcats, raccoons, and red-tail hawks. Visual landscapes will be adversely altered as well.

In my perspective, the Park has been quite lax in managing the ranches as they are today. The current level of beef and dairy ranching already puts an undue strain on the Park's natural systems as well as on Park administration. Rather than compounding these problems with increased agricultural uses, I would ask that the Park use this management opportunity to bring the ranch leases back into line with the primary Point Reyes National Seashore purpose and values: preserving the natural environment and fostering recreational activities. Let the historic beef and dairy ranching continue, but with the broader recognition that this is a National Park on the coast and deserves much greater degrees of protection than it is receiving today.

Thank you and your staff for your ongoing efforts in these trying political times.

Sincerely, Sherry M Baty

Correspondence: I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with, and reduce habitat for, native wild animals.

I quote below, two of the primary goals of the management plan, as described in Table 2 of the EIS document:

Habitats and populations of threatened and endangered species, special-status, and rare species persist and are improved. Native plant and animal communities persist and thrive.

It is difficult to understand how the NPS can argue in good faith that Alternatives B-E are consistent with those goals.

The NPS should also consider recreational and educational opportunities that could be provided by working ranches, if Alternative F is not selected. One possibility is that ranching leases could have a required educational or recreational aspect, which would require ranches to provide educational programs or access opportunities for visitors to learn about historic ranching practices in the Seashore. Without such provisions, the NPS is just closing off public space for private benefit.

Correspondence: I travel the Bolinas Fairfax road frequently to reach the Meadow Club. While the posted speed

limit is 25 MPH, bikers traveling downhill often reach speeds of 40 MPH coming down the steep hilly decline. Bikers travel close to the midline of the road and also tailgate a car observing the speed limit. This practice is extremely dangerous and never in the past 10 years have I seen a police ticket such behavior or even post speeds directly to bikers. Please post and patrol this road to educate bikers to safety on this road.

#6960

Name: Vogt, Suzanne

Correspondence: The plan to shoot elk is a horrendous idea. The elk deserve to be on public lands as much, if not more than the cattle grazing there. The plan would allow conversion of park grasslands to artichoke farms and row crops and let ranchers introduce sheep, goats, chickens and pigs - a recipe for even more conflict with native wildlife.

#6961

Name: Wilburn, Patricia

Correspondence: After the elk were reestablished at Pt. Reyes National Seashore they were severely neglected during the decade long drought that California suffered and many died of thirst. Couldn't we have provided water to the herd in troughs like we do for cattle? Now after all they've endured we are planning to shoot them. Please reconsider this measure and work together with conservationists to find a better, more sustainable way to manage the herd going forward.

#6962

Name: Karlson, Fred

Correspondence: Tule elk should not be shot on public lands to protect the interests of private livestock owners. This is a terrible ruling that only benefits a specific class of people. It goes against the common good.

#6963

Name: Smith, Julia

Correspondence: I am writing to implore you to protect the tule elk at Point Reyes National Seashore. We too often put economic interests of humans before anything else. These elk are a natural treasure that cannot be replaced. They are native to the land, and are an essential part of the ecosystem. We need to stop destroying ecosystems in the name of agriculture and money. Once we lose a species, there's no going back. Please consider the health of our planet and of the native species who deserve to thrive.

#6964

Name: Milford, Mona

Correspondence: Cattle do not belong in the wild lands. The Tule Elk are amazing and need to be protected on their land. Quit selling off the things we Californians love and respect for greed. The Tule Elk are priceless, keep them safe and wild

#6965

Name: Knight, Anthony

Correspondence: Dear Sirs:

I would like to raise my voice to join others who oppose expansion of commercial development in Point Reyes National Seashore. As had been pointed out innumerable times, I feel that a National Park or Seashore is not a place where private personal gain, such as ranching, should be encouraged - - but rather a place where preservation of the environment and protection of wildlife should take top priority.

The dairy industry dominates the Marin County landscape, and for that matter, landscapes everywhere. There are ample opportunities for ranchers to carry on their industry outside of parks. The point of the parks is to preserve just a small piece of the natural landscape without the degradation which accompanies cattle raising.

The tule elk are now part of the natural habitat - - whether or not they are a historic part of it. They should not be "culled" under the argument that they take away feed from cattle. The cattle, in my view, have no business there - - and the elk do. Cull the ranches, do not extend leases. Give us back this beautiful landscape.

#6969

Name: Frandsen, Michelle

Correspondence: Hello,

I am a frequent visitor to Pt. Reyes National Seashore. It is a very special place with all of the biodiversity and wildlife that exists there. It is truly a national treasure. We are very lucky to have had this area established as a National Park.

I am very concerned with a number of aspects of the current proposal.

### Culling Elk and New Use

Firstly, I am absolutely opposed to the culling of elk. Especially because the reason behind the culling is that they are competing for grass with cattle. I would like to see data that should show how culling the elk would actually settle the conflict. I go to the park often to watch the elk and photograph them with my daughter who is studying photography. These elk are native and should be protected.

The cattle are not native and I don't think they should be raised within the park and that the rancher leases should not be renewed. These ranchers have been paid for their land and have been given ample time to locate elsewhere. Given that they are currently still within the park however, at a bare minimum we should not be expanding their leases in any way. I certainly do not agree with the idea to allow the ranchers to grow row crops. This will set up further conflicts between ranchers and wildlife. This park was purchased for the American people, not to provide ranchers with land to lease for their cattle or any other use.

I would like to understand how it is that funding will be available to pay for the additional park personnel that will be needed to manage the new use. You need to provide analysis of the actual habitat loss and the impact of increased fencing. We need to understand how the use of pesticides will impact bees, butterflies, insects and birds. As someone who grew up farming in Wisconsin, I know first hand that there will be many impacts including an increase in the rodent population which will alter the balance in the park and adversely impact the wildlife.

Again, you should provide us with the specifics of a formal management plan that outlines the numbers of employees and the responsibilities and activities that will need to be regularly conducted to support what has been proposed in the plan.

As I said before, as a visitor, I don't want the ranchers using our park. I don't want my experience in the park to be changed as additional cattle turn grassy fields into dry dust. I don't want this pristine landscape further marred by farming. I am also very concerned about the impact the additional commercial traffic will have to wildlife, visitors and what it will do to the roads. We need to understand all of this and have the costs and funding sources laid out in full detail.

New Farm Animals You also need to provide us with an analysis of predator species that will prey on the new farm animals being proposed. What are the specific costs associated with the management? Why aren't you proposing that cow numbers decrease to compensate for the increase in other animals? Where will the pig urine go and how will that impact the land and water around them? Provide us with a specific plan, costs and analysis. As I mentioned before, these new animals will cause conflict with the existing wildlife. This park was established for the preservation of the land, plants and native wildlife. It is not the responsibility of the NPS or the American tax payers to ensure profitability of the ranchers. We should not be subsidizing their ranching. These diversification strategies should not be allowed for any reason. The long term result of implementing these strategies will be detrimental to the land and wildlife and will eventually lead to less visitors and donations to the park. Please do not move forward with any of this proposed plan. It will further destroy the beauty of the park and undermine its purpose for existing in the first place.

Name: Lease, Ariana

Correspondence: It makes me sick to my stomach that the NPS is considering the lethal elimination of Tule Elk for the benefit of ranchers. These elk have the ecological right to the land, and are the reason so many people visit Pt Reyes at all. These actions reflect terribly on the NPS, an organization I have found to have ecology and natural resources as a top priority. It goes against the mission of the NPS. As stated by the Sierra Club, "All the ranching alternatives in the Draft Environmental Impact Statement involve the impairment of natural resources. Three National Park Service laws prohibit actions that will impair natural resources (the 1916 NPS Organic Act, Point

Reyes National Seashore legislation Section 459c-6, and Golden Gate National Recreation Area legislation Section 460bb). Consequently, the Park Service should prepare a supplemental DEIS with ranching alternatives that comply with applicable laws requiring the protection of natural resources. The Park Service should then circulate that supplemental DEIS for public comment."

Name: Harris, Brent

Correspondence: As a 35-year resident of West Marin and a frequent cyclist I am elated by the proposals to increase access and connectivity for cyclists in the National Seashore. The existing smattering of routes accessible for off-road cycling is, with the exception of the Bolinas Ridge, McCurdy, O.V.T. Randall loop, fragmentary and consists of very short sections of trail. Cyclists must either drive to the trailheads or ride long sections of pavement to get from one short section to another.

Please consider the following list of new routes:

1. From the top of Olema Hill, across the highway from the Bolinas Ridge Trail, to Point Reyes Station. As a resident of Point Reyes Station I would use this connector weekly.
2. From Bolinas Ridge to Five Brooks. The old Lupton Ranch Road used to provide this connection but the upper section of it has disappeared from lack of ranch use in the past decade. This route will provide connection between the greater trail system that ties into Bolinas Ridge and both the Olema Valley Trail and the dirt road to Wildcat Beach.
3. From Devils Gulch to Platform Bridge Road. A new connector here would provide numerous possibilities for those who are riding on the Cross-Marin Trail, Devil's Gulch Trail, Jewell Trail, Shafter Fire Road, and The Bolinas Ridge.
4. From Abbot's Lagoon to Drake's Estero. This would provide both a much longer ride for those who are riding out and back from the Abbot's parking lot, and a road/off-road loop for the more adventurous.
5. A connector from Pierce Point Road to the Marshall Beach trailhead would further increase the possibilities in the area of the Abbot's Lagoon Drake's Estero route mentioned above.
6. Speaking of Drake's Estero, some sort of loop trail from the Drake's Estero trailhead on the ranch roads in the area would provide a nice shorter ride in some beautiful countryside.

I would encourage the use of existing ranch roads where possible for these new routes. I think that the decades-old experience on Bolinas Ridge has taught us that ranching, hiking, and bicycling can coexist when the fences, gates, and education are adequate. I am no expert on cows, except from the standpoint of someone who has bicycled past them on Bolinas Ridge scores of times, so I would encourage soliciting the input of the ranchers on how to best manage the cow/visitor interface.

Thank you.

Correspondence: Regarding the Elk at Point Reyes Park, I support Alternative F, which would discontinue farming and ranching opportunities in the park and expand visitor opportunities. Grazing negatively affects ecosystems, causing water pollution and soil erosion, spreading invasive species and disease, and harming endangered species. Thank you.

#6973

Name: Bruns, Trisha

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

Cicely Muldoon, Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes, CA 94956

RE: No to NPS Preferred Alternative, Alternative B

Dear Superintendent Muldoon,

Thank you for the opportunity to submit comments on the Draft Environmental Impact Statement (DEIS) for a General Management Plan Amendment (GMPA) for Point Reyes National Seashore and the North District of Golden Gate National Recreation Area.

I am a wildlife biologist, educator, and outdoor enthusiast. I oppose the NPS Preferred Alternative, Alternative B, because it proposes management actions that are not permissible under NPS Management Policies; that would impair park resources; that would have significant environmental consequences and impacts; and which are incompletely or inadequately analyzed in the DEIS. In addition, some of the proposed mitigation measures would themselves impair park resources, or have foreseeable consequences which are not adequately analyzed.

Many of the impacts on, and impairment of, park resources stem from the proposed action of allowing diversification of ranching activities. The stated purpose of the proposed action is to allow "ranchers to react to poor forage production years and fluctuations in the economic market." (DEIS, page 20). Management actions whose purpose is to promote or protect the economic interests of leaseholders are not legitimate because they are fundamentally at odds with the mandates of the Organic Act of 1916, the PRNS enabling legislation, and current NPS Management Policies.

The DEIS does not specify any Need for Action or Desired Condition that would be met by diversification. On the contrary, the DEIS, in Alternatives Considered but Dismissed from Further Analysis, specifies that diversification of livestock to species other than beef and dairy cattle "...would have too great of an environmental impact" if the diversified species were ducks, geese, turkeys, or rabbits. (DEIS, page 60). The adverse effects from those species

include “. . . potential increase in predation; disease or parasites; loss or degradation of habitat; construction of additional infrastructure (e.g. watering facilities, feed storage facilities, and pens); or the need for the use of non-wildlife friendly fencing.” (DEIS, page 60). Those same adverse effects can also be associated with diversification to chickens, sheep, pigs, goats, and even row crops, all of which would be allowed. The DEIS fails to explain how the very same adverse environmental impacts are “too great” on the one hand while on the other they would have no impacts, or impacts that can be adequately mitigated.

Specific significant impacts and foreseeable consequences of diversification not adequately analyzed in the DEIS include:

**Impairment of Wildlife Resources.** The DEIS states that “[m]anagement of any predators associated with new livestock species would not be allowed,” a demonstrably false statement given that the very next sentence says that “[g]uard animals (i.e. dogs, llamas, donkeys) would be allowed. . .” [DEIS, page 38]. The use of guard animals is a form of predator management. Similarly, the DEIS states that “[m]anagement of any wildlife associated with protection of row crops would not be allowed in the planning area: however, ranchers would be allowed to fence row crops to exclude wildlife.” [DEIS, page 38]. Exclusionary fencing is a form of wildlife management.

Appendix D includes a number of other wildlife and predator management strategies, techniques, and equipment that would be allowed in connection with diversification. These include: parking a vehicle in an area of loss by predation [page D-39] and repellents and frightening devices [page D-39] in addition to exclusionary fencing and guard animals.

Statements that wildlife and predator management will not be allowed in connection with diversification are plainly untrue, and the DEIS does not analyze the significant impacts that the proposed actions will have on park wildlife resources. Predators such as coyotes, bobcats, foxes, and badgers, for example, will have reduced hunting areas and opportunities, and will come into conflict with guard animals. Their movement patterns will be disrupted. The DEIS should analyze these foreseeable significant impacts, and determine if they collectively constitute impairment of park resources. The DEIS should also analyze the cumulative impacts on wildlife of all diversification proposals that are likely to be approved, in addition to the impacts from individual proposals.

**Impacts on Visitor Use and Enjoyment and Scenic Values.** The DEIS notes that diversification activities, including new types of livestock, row crops, new fencing, and other new infrastructure would result in adverse impacts to visitors use and enjoyment opportunities, and to scenic values [DEIS, page 168]. The DEIS does not analyze or mitigate for these impacts, either individually from the various ranches, or cumulatively from all diversification activities that could be approved.

Other impacts not fully analyzed or adequately mitigated for in the Preferred Alternative include:

Livestock that escape from ranch boundaries can have significant impacts on sensitive park resources. On numerous occasions over an extended period of years, we have observed, documented, and reported to park management the impacts of cattle in and around Abbotts Lagoon, for example. Cattle that had escaped from ranchlands blocked trails, defecated in and around the lagoon, trampled vegetation, and impeded the movement of wildlife. The Ranch Operating Agreements should contain an explicit provision requiring the ranch operator to retrieve escaped livestock as soon as possible (within 24 hours). Failure to do so should result in the cattle being treated as trespass or feral livestock in accordance with NPS Management Policy 8.6.8.3.

The impacts of Development to Support Day Use and Overnight Accommodations are not analyzed or adequately mitigated and may cause impair of park resources. For example boat-in camp sites on Schooner Bay [DEIS, page 32] foreseeably will have significant impacts on the wilderness area of Drakes Estero, due to trash, human waste, and substantially increased visitor usage, as has happened at boat-in campsites on the west shore of Tomales Bay. Migratory birds and marine mammals will also be negatively affected. The DEIS includes no quantitative or descriptive details of any kind regarding boat-in camping that would allow analysis of, or mitigation for, its impacts.

Impacts to Water Resources are not adequately analyzed because the DEIS contains no meaningful quantitative data on water quality. The DEIS states that “. . .existing conditions serve as baseline against which the impacts of each action alternative are compared.” [DEIS, page 112]. However, the existing conditions are not described in quantitative or detailed manner. Pursuant to NPS Management Policy 4.6.3, NPS must “take all necessary actions to maintain or restore the quality of surface waters and groundwaters within the parks. . .” Under that standard, if the existing condition of any surface or groundwater in the planning area is impaired, a proposed action alternative should restore water quality, not maintain a baseline impairment. The DEIS is deficient in not identifying existing impairments to water resources.

The native tule elk are a park wildlife resource that should only be managed for the benefit and non-impairment of the resource, not for the economic benefit of commercial leaseholders.

The Draft Foundation Document rightly places ranching within the context of a 5,000-year continuum of human use of the Point Reyes landscape. In contrast, the NPS Preferred Alternative, Alternative B, attempts to put all of the Park's Fundamental Resources and Values squarely in the context of ranching. As a result, the DEIS ignores or glosses over significant impacts that will foreseeably result, individually and cumulatively, from the proposed actions. I ask that NPS develop and analyze a new alternative that mitigates impacts from current ranching activities, eliminates activities that impair park resources, and does not expand the agricultural activities beyond the present multigenerational ranching and dairying.

Thank you for the opportunity to comment on the Draft Environmental Impact Statement for the GMPA.

Sincerely,

Stori Oates

Correspondence: September 23, 2019

Dear Superintendent,

Thank you for the opportunity to comment on the draft Environmental Impact Statement for the Point Reyes General Management Plan Amendment (Draft EIS).

### My Connection to Point Reyes

My name is Andrew Schlickman, and I live in Evanston, Illinois. I have been visiting and exploring Point Reyes National Seashore since 1974. Since, then, I have visited Point Reyes at least 20 times. I have hiked many of the trails and beaches there, and I have witnessed abundant and diverse wildlife, including bobcat, Tule elk, sea lion, and harbor seal, and dozens of species of birds and waterfowl. I look forward to continuing to visit the park over the upcoming years.

I have had many special experiences during my visits to Point Reyes. In 1976 I witnessed for the first time migrating whales in the ocean from the headlands above the lighthouse. In 2003 I kayaked Tomales Bay and paddled from Marshall to the beach at the mouth of White Gulch. We were accompanied by harbor seals, and we witnessed a herd of Tule elk at White Gulch. A few years later I drove in the fog and wind along the road to Pierce Point Ranch. Out of the mist appeared dozens of Tule elk; I felt like I had been transported back 200 years in time. Just a few years ago, I watched at sunset as a bobcat quietly crouched through a meadow looking for food, and then pounced on a rodent it trapped. I will never forget these special moments, and the park should be managed in such a way that other visitors will have the opportunity to experience what I have seen and felt there, without interference from activities that detract from the natural beauty and ecological magnificence of the place.

Unless otherwise stated, all references to Point Reyes should be deemed to include both Pt. Reyes National Seashore and the north unit of Golden Gate National Recreation Area.

### My General comments on Draft EIS

Since my first visit to Point Reyes, it has been my understanding that over time the ranching and dairy activities (hereinafter just ranching) in the park would gradually be phased out. I recall being told by park personnel that the ranches would continue to exist for a reasonable and limited period of time as long as they continue to be owned, managed and operated by the families who were there when the park was established, but that they would not be there indefinitely. I continue to be surprised that the ranches are still there - over 40 years after my first visit and over 60 years after the park was first established. Point Reyes is a national park and should be treated like our other treasures in the national park system.

Ranching is a relatively new activity on Point Reyes, and NPS should be seeking to restore, preserve and make accessible to the public the environment and ecosystem that thrived on Point Reyes for the hundreds and thousands of years before European immigrants came to the area. The overall goal should be to restore the park, as much as possible, to the condition in which it existed before the mid-1800s. The ranching operations should be given a reasonable time frame in which to wind down, and the hardships to the families who continue to live and actively ranch in the Park should be minimized, but this should have been done during the first few decades after the Park was established, not 60 years later. Such a phase-out should now be a high priority. To the extent there is tension between the goals for the park and the requirements of the National Historic Preservation Act, all doubts and inconsistencies should be resolved in favor of restoration and ecologically sensitive management.

### Alternative F Should be the Preferred Alternative

Of the six alternatives set forth in the Draft EIS, Alt. F should be the one that is implemented in the General Management Plan. It is far superior to the other alternatives. Alternative F would come closest to how Point Reyes should be managed to restore the park, as much as possible, to the condition in which it existed before the mid-1800s.

The five-year and one-year time frames for winding down ranching activities seems appropriate. As stated above, all doubts and inconsistencies between the goals for Point Reyes and the requirements of NHPA should be

resolved in favor of restoration and ecologically sensitive management. The Park Service should make recommendations to the State Historic Planning Office (SHPO) consistent with the goals outlined in these comments. The overall objective should not be preservation of all historic buildings, but implementation of a strategy that would restore the park, as much as possible, to the condition in which it existed before the mid-1980s. This does not mean the demolition and removal of all historic structures, but instead a selective reuse of certain structures consistent with the new management goals.

The statement regarding use of ranch complexes at page 48 is backwards; the strategy should be to minimize impact of the historic districts on the overall restoration and ecological goals for Point Reyes, not the other way around.

I am troubled by statements in the Draft EIS that suggest that management of the remaining historic structures would be done in such a way that commercial activities might inappropriately be expanded within Point Reyes. The following language - "adaptive reuse in ways compatible with park purpose and desired conditions" (p. 47) - seems vague and subject to possible abuse. Any plans for commercial activities on any of the historic properties should be subject to a further public planning process.

All the other alternatives - A through E - should be rejected in favor of Alternative F.

Alternative B Should Not be the Preferred Alternative

For all the reasons set forth above, Alternative B should not be selected for the General Management Plan. It is clearly not consistent with the goals that should guide management of Point Reyes.

The general description of this alternative is also disingenuous and misleading. At page iii of the Draft EIS, the Service says that this alternative "would allow for continued ranching with terms of up to 20 years and would set a population threshold for the Drakes Beach herd." And at page 25 the Service says under Alt. B it "would allow for continued ranching and establish a population threshold for management of the Drakes Beach herd." All of this suggests the Service is proposing to allow the ongoing level of ranching to continue. This by itself is troublesome and inappropriate for the reasons set forth above.

But then you see this language buried in a long paragraph at p. 26: "Additional diversification activities would be authorized in specific subzones in a manner consistent with this EIS." To find out what these additional diversification activities might be, you have to turn to p. 37 to a subsection entitled "Diversification." And here we learn that the concept of "additional diversification activities" is a euphemism for expansion of ranching activities and permission to undertake wholly new ranching and commercial activities. So Alternative B does not really contemplate continued ranching; to the contrary, it is proposing a substantial and significant expansion of ranching and commercial activities at Point Reyes. This is all the more reason to reject Alternative B.

The bottom line is that ranching and commercial activities are fundamentally inconsistent with preserving park resources and improving the visitor experience. How can these goals be achieved when habitat is denied to the indigenous and wild species, and access to public land for visitors is restricted to protect ranching and commercial activities?

Thank you for the opportunity to comment on this very important matter.

Andrew Schlickman

Correspondence: I have lived in Point Reyes for 30 years. I came here primarily for the park. I spend much of my free time in the park, hiking the trails to see the wildlife and flora.

I am unhappy that the DEIS alternatives being considered fail to adequately protect our natural resources on the Point Reyes peninsula. Why would we continue to subsidize ranching operations on public land that degrade it and threaten native wildlife? Congress established the Point Reyes National Seashore to protect this land for the public and for future generations, and clearly not for ranching in perpetuity. NPS needs to reconsider its General Management Plan including its "preferred alternative" and engage appropriately and lawfully with its mission to protect the natural resources in our National Seashore.

#6987

Name: B, Lindsey

Correspondence: I care about protecting California's wildlife. I oppose the National Park Service's plan to kill native tule elk and expand commercial agriculture in Point Reyes National Seashore and Golden Gate National Recreation Area. I urge the National Park Service to instead restore the lands for wild animal habitat.

We should prioritize the preservation of our public lands and wildlife, not the economic interests of private ranchers. These commercial cattle ranches have serious negative environmental impacts on the park - polluting waterways, causing soil erosion, and harming the many endangered and threatened animals who live on Point Reyes. National parks exist to protect our natural resources and native wildlife. This park should be managed accordingly.

#6988

Name: N/A, N/A

Correspondence: Thank you for engaging with the community on this important issue and thank you for your time in reading my words here. I have visiting Point Reyes National Seashore multiple times, and each time has been a wonderful experience. This area is a both a wonderful place for people to experience the joys of nature and also crucial habitat for a number of threatened animal species, such as the Snowy Plover. Of all the options proposed in the Draft Management Plan, the only one I can support is Alternative F. Whereas Point Reyes is a critical habitat for flora and fauna, I cannot see how it is critical that ranching is carried out in exactly that location. There are plenty of other locations where this can be done. I'm not aware of any national shortage of milk brought about by the exhaustion of all other available land that would necessitate use of precious national park lands to increase production.

I would like to add the following comment on the mission of the NPS. The following statement is shown on <https://www.nps.gov/aboutus/index.htm>

"The National Park Service preserves unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations"

Based on this mission statement, NPS has an obligation to PRESERVE Point Reyes National Seashore. It is well-documented that cattle ranching (and virtually every kind of animal agriculture) degrades the land. One only needs to compare the muddy pens of the Point Reyes ranches with the beauty of the area surrounding Coast Camp for evidence of this. Cattle ranching is also one of the most damaging activities for the climate. Surely it is therefore aligned with the NPS mission to support a REDUCTION in ranching. So allowing ranching to occur ON NPS lands must surely be considered inconsistent with the NPS mission. Requiring the ranchers to vacate Point Reyes will decrease methane emissions, allow the re-establishment of carbon-sequestering native ecosystems and hence act to preserve not only Point Reyes, but each and every invaluable park in the NPS system.

I support Alternative F.

#6989

Name: Sullivan, Cecelia

Correspondence: I appreciate that Point Reyes is designated as a space to see wildlife and natural landscapes. But, when I visit the park, rather than getting to chance upon elk (a species I rarely see in my life), I am instead seeing cattle which I already see everywhere.

I support phasing out ranching to restore the shoreline to its more wild existence enhance visitors experience to see the location as what it was intended to be-a wildlife refuge. Tule elk were successfully reintroduced to the area. At a wildlife sanctuary, I believe their health and safety should be prioritized.

#6990

Name: Danaher, Kathryn

Correspondence: We need to protect the earth, the animals, water, and air from the destructive practices of animal agriculture.

I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

#6991

Name: Vellutini, Ph.D., Michael

Correspondence: Dear Point Reyes National Seashore Superintendent, Please select the preferred alternative, "Alternative B" for the future of ranching in the Point Reyes National Seashore. I support agriculture in the Seashore and think it is a vital part of the region's history, culture, current economy, sustainability and biodiversity of the Point Reyes National Seashore. I appreciate the time and effort that has gone into researching all options for the draft EIS. I support 20-year leases, the ability for farmers and ranchers to succession plan, and the opportunity for farms and ranches to diversify their operations to viably and sustainably adapt their operations for generations to come. I wish that the diversification was not so limited in scope or size, 2.5 acres around structures in ranch core with no irrigation and other restrictions is cumbersome and inefficient. In addition, the draft EIS would have been more complete if research was done on an option that includes an Elk Fence between the agriculture and wilderness area and/or Elk relocation to the wilderness area. Agriculture is a partner in natural resource conservation and preserving open spaces. Many of the beautiful natural landscapes in the US near large urban areas are preserved because agriculture was there first to curb development. Agriculture and nature do co-exist and I support the farmers and ranchers in the Seashore for their part in providing for the local foodshed in a sustainable way. Agriculture plays an important role in combating Climate Change by providing local food, carbon sequestration and greenhouse gas drawdown. Studies and empirical evidence prove that properly managed livestock grazing improves biodiversity, reduces invasive species, and helps reduce wildfire potential on rangeland. Livestock grazing helps renew the landscape by helping seed distribution, aerating and fertilizing the

soil. These things equate to healthier plants, a greater plant diversity, and more plants on the soil surface, which equates to more roots in the soil, which means more carbon sequestered. Agriculture is important to me in the Point Reyes National Seashore, the preferred Alternative B is the best option from the draft EIS.

Thank you,

Michael Vellutini, Ph.D.

Name: Roberts, Jaima

Correspondence: I support Alternative F, phasing out cattle and dairy industry and returning the land to its natural state. The enabling legislation of the National Seashore supports wildlife protection and does not mention upholding private industry. The original leases to ranchers were to be 25 YEARS. Ranchers have already been paid handsomely for their land, so it is long overdue to phase out the ranches. Private business has no place on public land. Allowing industry and ranches to diversify their business is a bad idea. Already these ranches have been negatively impacting the land, mismanaged to allow soil erosion, scarring in the landscape, e.coli contamination in waterways and more. If you allow EVEN MORE agricultural practices on the seashore, there is no way to know the impact and there is no historical evidence you will be able to manage any negative impacts on the environment. Tule Elk should be protected for the survival of their species. They have already gone through a huge genetic bottle neck when they were almost completely wiped out except for 20 individuals. Every gene allele is important for the long term sustainability of the herd. The National Park should be protecting ALL Tule Elk, and allowing new herds to form and to TAKE DOWN THE FENCE at Pierce Point and allow all Tule Elk to roam free. Allowing business that has been linked to water pollution, species extinction and in Point Reyes is the culprit of over 60% of the greenhouse gas emissions, it is NOT a good idea to give that same industry a 20-year lease to continue degrading our national park. Point Reyes is a refuge to thousands of plants and animals. Point Reyes can be a leader in the fight for climate justice, and it starts with phasing out Beef and Dairy operations and restoring the land to its natural state. The EIS has NO MENTION of the effects of climate change in it, and does not include any information of the cattle and dairy's impact on climate change within the park.

Correspondence: Addendum to previous letter submitted.

An evacuation plan must be developed for Pt Reyes in the event of wildfire, earthquake, road collapse, etc before allowing more visitors to the Park. Funding must also be secured to ensure enough rangers are hired to enforce current regulations regarding visitors including abuses to parking, bikers on single track trails, bike night riders on trails, off-leash dogs, etc that degrade the wild lands of the park and threaten wildlife by too much human presence.

#6995

Name: Tilley, Sharon

Correspondence: I'm writing to express my support for the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. As a Marin resident and avid bike rider, I love riding in the wide open spaces of West Marin. However, the speed of car traffic and lack of comfortable bike shoulders in the Point Reyes area prevents me from riding there as often as I would if it was safer and more accessible to bikes. Just two weeks ago, as I was taking a quick roadside break on my bike near Five Brooks Stable, a pickup speeding in the opposite direction made a hostile crude gesture to me - since I wasn't even riding, and was on the other side of the road, it made me wonder how safe it is to ride in the area.

To maximize bike recreational use, please consider the following trail connections and plan elements: - Devil's Gulch to Platform Bridge Road connection using existing ranch roads. - connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail. - Bolinas Ridge Trail to Five Brooks Stables connection using existing ranch roads. - Drakes Estero to Abbotts Lagoon Trail connection using existing ranch roads. - Marshall Beach Trailhead and Pierce Point Road using existing ranch roads. - Estero Trail loop using existing ranch roads.

I would feel much safer riding in Pt. Reyes National Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic.

Thank you for your consideration,

Sharon Tilley

Name: Savage, Allison

Correspondence: I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits. Cattle ranching is a significant contributor to greenhouse gases, and as stewards of the land, NPS should not be in the business of increasing it on the people's land.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with, and reduce habitat for, native wild animals.

I quote below, two of the primary goals of the management plan, as described in Table 2 of the EIS document:

Habitats and populations of threatened and endangered species, special-status, and rare species persist and are improved. Native plant and animal communities persist and thrive.

It is difficult to understand how the NPS can argue in good faith that Alternatives B-E are consistent with those goals.

The NPS should also consider recreational and educational opportunities that could be provided by working ranches, if Alternative F is not selected. One possibility is that ranching leases could have a required educational or recreational aspect, which would require ranches to provide educational programs or access opportunities for visitors to learn about historic ranching practices in the Seashore. Without such provisions, the NPS is just closing off public space for private benefit.

Correspondence: I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands.

The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Correspondence: My family has been hiking in the Point Reyes Seashore for the last 30 years. Over this period of time it is quite evident that dairy farmers have not been required to meet basic environmental requirements for methane emissions. The amount of manure from dairy cattle is not being adequately treated and there is obvious environmental degradation in the national park. When I read that the NPS planned on killing off large numbers of Tule elk due to overpopulation, I was surprised that the mention of overpopulation of cattle was not mentioned. That is a far bigger problem and it is not addressed in the EIS. In fact the opposite is the case as farmers concerns have received more consideration than the habitat they are negatively affecting. The water in the park is also

negatively affected and resources are being diverted to ranchers and cattle that should be allocated to the Elk, birds and other natural habitat systems. One explanation for such a skewed evaluation by the study is that the relationship between ranchers and the Park personnel is too close to be objective. No doubt over the many years of connection between these groups, friendships have developed and objectivity of the goals and responsibilities of NPS has been lost. A new group. With no contact with farmers looking at the same data would have reached different conclusions. The report does not take into consideration that the farming methods employed in this area are below the standards set by regulatory agencies dealing with waste disposal, water use, and contamination of water and soil, not to mention that there appears to be no requirement for the ranchers to protect wildlife from destruction from their activities. The farmers in this area were paid \$350 million dollars to give up this land after the expiration of their 20 year leases. This makes it clear that these ranches were limited to a 20 years period to clean up and leave. Ranching is not compatible with wildlife in this area (probably not anywhere). The drought made that more obvious. Tule Elk are not the problem they are being blamed for. The public has been misled by the pro-rancher slant to the EIS. Independent action such as lawsuits will be necessary in the event that this degradation by ranchers continues. The public trust necessary for protection if the land is being put aside and ignored in order to allow ranchers to continue these ventures. The leases have expired and should not be extended. The ranches need to be shut down and the land restored to enable native habitat to thrive in the park. This is an important function of the NPS. I feel strongly that the EIS has not been reviewed fairly and needs to be re-evaluated by an independent entity taking into consideration all of the issues involved but with the goal of determining the appropriate end goal of restoration of the park for the protection of native species and the environment.

Correspondence: Raising livestock for meat consumption is one of largest known contributing factors to climate change. I vote that the lease to the ranch lands NOT be renewed, and to turn the land back over to the parks for elk conservation efforts, and to help combat climate change.

#7000

Name: N/A, N/A

Correspondence: I am concerned that plans to permit current occupants of government owned ranch complexes to offer overnight accommodation to visitors to the Seashore or north district of GGNRA violates standard concession award procedures. Surely, if any structures or parts of structures are no longer required for ranching operations on government owned lands, those structures should be removed from the ranching lease and revert back to the National Park Service. NPS would then be in a position to modify the structures to make them suitable for visitor overnight accommodation and then seek bids for a concession contract for overnight accommodation. Any NPS action to simply allow the current lessees of government owned ranch complexes to establish businesses offering overnight accommodation or other visitor services in government owned structures without providing the general public an opportunity to bid on these business opportunities would provide an unfair and unjustifiable opportunity to the current lessees. I, myself, would be interested in bidding on such a business opportunity. I will consider legal action if the current lessees of these government owned ranch complexes are provided the opportunity to establish visitor service or business activities other than ranching on these complexes without providing the general public an opportunity to competitively bid for an opportunity to provide these services.

Name: Leary, Barbara

Correspondence: I am writing in support Alternative F of the Park Service Plan - this should be the first and only plan that will be considered. Cattle and Dairy industry activities at the site should be phased out. The enabling legislation of the National Seashore supports wildlife protection and does not mention upholding private industry. The original leases to ranchers were to be 25 years. Ranchers SOLD their land for PUBLIC use; it is long

overdue to phase out the ranches. "Cultural Resource" and "Historic" do not apply to ranching or dairy business which are 20th century developments that have taken place on valuable habitat and Native American sites.

E. Coli contaminates the ground water, streams and ultimately our ocean; there is no evidence that the short funded Park Service will be able to manage any negative impacts on the environment. I oppose 20 year leases of this land, these should be phased out and the cattle and dairy industry be given a time frame in which to move their operations to lesser impacted sites. The National Park should be protecting the Tule Elk which have already barely survived extinction, the Park Service should be allowing new herds to form and to TAKE DOWN THE FENCE at Pierce Point and allow all Tule Elk to roam free.

Point Reyes can be a leader in the fight for climate justice, and it starts with phasing out Beef and Dairy operations and restoring the land to its natural state.

Finally I have noted that the EIS has NO MENTION of the effects of climate change in it, and does not include any information of the cattle and dairy's impact on climate change within the park, therefore rendering it non-compliant with environmental regulations that exist for the protection of our valuable resources.

Name: Elliott, Ann

Correspondence: I address these key points: 1) The DEIS documents that Alternative E should be the preferred alternative (a compromise); 2) Ranchers need to embrace NPS Core Values and their leases and Ranch Operating Agreements (ROAs) need to reflect that; 3) The requirements of Appendix D Management Activity Standards and Mitigation Measures need to be insured with incentives, training, continuing communication, and consequences for ranchers; Appendix D inadequately addresses aesthetic issues of ranches and solutions to those issues; 4) If ranching is going to continue in the park, NPS should begin a program for ranchers to enhance rather than harm natural processes in the park; 5) NPS should avoid controversial reduction of the Drakes Beach Tule Elk herd.

1) THE DEIS DOCUMENTS THAT ALTERNATIVE E SHOULD BE THE PREFERRED ALTERNATIVE: The DEIS documents that overall the natural environment would be best served with Alternative F (no ranching). Since the political climate seems to favor continued ranching in Point Reyes National Seashore and Golden Gate National Recreation, NPS has identified Alternative B as the preferred alternative. However, from the Cumulative Impacts section in each category of Chapter 4: Environmental Consequences it is clear that Alternative E (phasing out dairy operations) equals and usually exceeds outcomes of Alternative B. Therefore, Alternative E is the logical compromise between Alternatives B and F. Below are excerpts from the Alternative E sections of Chapter 4: Environmental Consequences supporting that: Soils: Overall, soil conditions would improve compared to existing conditions from the implementation of a zoning framework, management activity standards and mitigation measures, and conversion of dairy ranches to beef operations. (DEIS 111) Water Resources: Overall, water resources would improve under alternative E compared to existing conditions from the implementation of a zoning framework and cessation of dairy operations. (DEIS 123) Vegetation: Alternative E would contribute beneficial and adverse impacts from continued grazing and ranching activities, depending on the species, especially in grasslands where grazing would occur. Alternative E would implement a zoning framework that would focus the most intense uses associated with ranching operations in areas that are already highly disturbed and/or altered and remove areas from ranching to protect sensitive species, resulting in beneficial impacts on vegetation compared to existing conditions, especially in riparian areas. In addition, the conversion of the six dairy operations to beef cattle operations would reduce the adverse impacts of concentrated livestock use and continue the same types of adverse and beneficial impacts from beef cattle grazing as described above. (DEIS 138) Wildlife: Overall, impacts on wildlife would be reduced compared to existing conditions from the implementation of a zoning framework and cessation of dairy operations. (DEIS 159) Tule Elk: Alternative E would contribute beneficial impacts from habitat modifications and improved pasture conditions from conversion of dairy ranching to beef ranching as well as a reduction in hazing, resulting in a beneficial impact compared to existing conditions. Adverse impacts would result from fencing. When the impacts of alternative E are combined with the impacts from past, present, and reasonably foreseeable actions, the overall cumulative impact on elk would be beneficial

compared to existing conditions. (DEIS 165) Visitor Use, Experience and Access: The incremental impacts of alternative E would contribute noticeable beneficial impacts, particularly from the potential additional opportunities to view elk and reduction in noise and odor impacts associated with dairy operations. (DEIS 170) Cultural Landscapes, Historic Districts, and Historic Structures: While alternative E would maintain the pastoral landscape across all 24 ranches, it is anticipated that dairy infrastructure would become vacant on 6 dairies, resulting in adverse impacts on historic structures. (DEIS 174) However, The ranches in the Point Reyes Peninsula Dairy Ranching Historic District are in poor to good condition (table 7). (DEIS 87) Funds from NPS and the proposed maintenance account & funded through a portion of the rental payment (DEIS 173) would be needed to improve the condition of those structures in all the alternatives. Socioeconomics: Alternative E would contribute to regional employment and gross regional product from continued support of employment, incomes, sales, and taxes by ranchers, park spending and projects, and visitation to the park. However, conversion of dairy ranching to beef ranching would result in adverse impacts compared to existing conditions from the loss of \$14.4 million in annual revenue and 27 jobs at ranches in the planning area. When the incremental impacts of alternative E are combined with the impacts from past, present, and reasonably foreseeable actions, the overall cumulative socioeconomic impacts would remain beneficial. The incremental impacts of ranching under alternative E would contribute 0.01% of gross regional product and employment in the study area. (DEIS 184) Similarly, The incremental impacts of ranching under alternative B would contribute 0.03% of total regional employment and 0.01% gross regional product in the study area. (DEIS 181) That is the same 0.01% as alternative E (not a significant portion of gross regional product). Economic viability of dairy ranching is in jeopardy around the world (Barrett 2019), much less in the restrictive confines of a National Park Historic District. Air Quality: Alternative E would have impacts that would be adverse from beef cattle, fugitive dust, and mobile source emissions. The elimination of dairy cattle would result in beneficial impacts compared to existing conditions; however, alternative E would also add a small amount of PM2.5 from an increase in beef cattle AUs. (DEIS 194)

## STRENGTHS AND DEFICIENCIES IN THE DEIS AND ASSOCIATED DOCUMENTS.

2) NATIONAL PARK CORE VALUES NEED TO BE EMBRACED BY RANCHERS: The DEIS, Draft Lease agreement and ROAs need to clearly state that these ranchers are leasing National Park Land (a special place owned by all Americans and visited by the world), and that ranchers are partners in the mission of the National Park Service as detailed in the Draft Foundation Document for PRNS and the Desired Conditions (DEIS 2-3). NPS leasing code states The lease will not result in degradation of the purposes and values of the park area. (USC 2011) These ranches are not leased from the Shafters, the Howards, or a large corporation (with a different set of ethics). Ranchers must agree to adopt NPS Core Values and work with NPS and others to care for the natural and cultural resources of the park, so that we all can be proud of it. If they want to embrace other values, they can move their operations to less restrictive private lands.

3) ZONING FRAMEWORK A GOOD TOOL BUT NEEDS TO BE STRENGTHENED: I applaud the new Zoning Framework and associated Appendix D Management Activity Standards and Mitigation Measures which are to become part of the annual Ranch Operating Agreements (ROAs). NPS has clearly communicated to the Ranchers standards for vegetation, wildlife, and ranch management. DEFICIENCIES: To insure compliance, Appendix D should identify incentives for ranchers to adopt these standards and measures, training to help them with their use, requiring periodic (annual) communication with NPS and other agencies, consequences for not following the guidelines. Ranch Aesthetics need to be addressed in the Management Activity Standards, as well as the one line in the draft lease agreement. The ranches along with all the park lands are visited by the American Public and international visitors. The ranchlands and natural areas are a showcase of our American stewardship of our natural and cultural resources. The section Visitor Use, Experience, and Access of the DEIS Executive Summary states: Alternatives D and E would have some beneficial impacts related to experiencing natural sights and sounds by reducing ranching and closing dairy operations, respectively. However, discontinuing dairy operation in alternative E would result in an adverse impact by removing the opportunity for visitors to observe and experience active dairy ranching in a historic district. (DEIS viii) However, the DEIS does not directly address many of the negative aesthetics of dairy operations that I have witnessed, and other Seashore visitors might experience: - Pastures mown and or grazed so more soil is evident than plant material, often with that soil blowing across the road with the wind. - Sight and smell of manure spread across fields at the edge of roads, trails, and

parking areas. - Manure-spreading trucks covered in manure parked along the park road. - Waist-high thistles and other weeds growing on pastures caused by spreading manure the previous summers. - Pregnant or just delivered cows and calves lying in or lumbering through a foot of mud in small pens. - Tens of newborn dairy calves isolated in shelters. - Unused calf shelters scattered along a fence. - Broken or unused ranch implements and vehicles strewn about ranch core areas along park road. - Furniture and personal items (seemingly broken or unused) overflowing from the decks and steps of worker houses along park roads. - Vultures feeding on the carcass of a dead cow. - Ranch truck speeding on the park road to Drakes Beach and almost hitting a group of elk that were crossing the road. Solutions to some of the above issues are addressed in the Management Activity Standards. Further solutions include higher RDM in poor soil areas, 100-foot buffer for manure spreading from any public thoroughfare, more proactive prescriptive grazing and mowing of weedy pastures, humane treatment for cattle and wildlife, and proper storage of ranch and personal items out of public view.

4) **MODIFY RANCHING TO ENHANCE RATHER THAN HARM NATURAL PROCESSES:** The ROAs are designed to minimize the adverse impacts of ranching. NPS should go beyond that and work toward improving natural processes on park lands. Any alternative which includes ranching should include incentives (grants, rent reduction, etc.) for ranchers to modify their ranching techniques (reduced AUs, prescriptive grazing, restoration of pasture to native vegetation, improved manure management systems) to improve habitat for wildlife species which increases natural biodiversity, and to improve soil, air and water quality.

5) **NPS SHOULD AVOID CONTROVERSIAL REDUCTION OF THE DRAKES BEACH TULE ELK HERD:** Seasonal patterns of elk use in the Drakes Beach area, particularly by the main herd, reduce the likelihood of competition because elk use of ranches is more concentrated following the peak growing seasons of winter and spring. All the ranches where elk occur adhere to the RDM monitoring standards. (DEIS 82) Therefore, the amount of forage consumed by Tule Elk on these ranches and their presence predominately during the summer and fall result in adequate RDM and hence little forage competition with livestock. NPS should continue to monitor the seasonal presence of Tule Elk and their effect on livestock forage. If competition is documented, instead of establishing a maximum population size for the Drakes Beach Herd, NPS should reduce cattle AUs and associated rent on affected ranches and / or otherwise offset the documented costs by ranchers for supplemental feed. Increasing densities of Tule Elk will naturally promote better species composition and structure of the areas plant communities.

Correspondence: Hello NPS. I appreciate and support the improvements in public and bicycle access outlined under Alternatives B, C, D, E, and F. As a long-time rider, I find myself shying away from Pt. Reyes riding for a number of reasons. Any improvements to access and safety that can be made in the region will certainly open a new world of riding opportunities in Pt. Reyes and I look forward to riding there more often.

Pt Reyes National Seashore GMP Amendment- Draft EIS c/o Superintendent, Point Reyes National Seashore, 1 Bear Valley Road, Point Reyes Station, CA 94956

RE: Formal Comments on DEIS

Dear Supervisor:

As a resident of Marin County I visit the PRNS regularly to experience the unique and unparalleled natural resources found on these public lands. As one of only seven National Seashores, with unparalleled natural resources, these lands exemplify our country's Public Trust Resources.

**Public Interest** The DEIS does not adequately disclose how the NPS, in selecting its preferred Alternative B, meets the Congressional mandates articulated in the enabling PRNS Act. The statute stipulates as follows: PRNS shall be administered by the Secretary without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment of the area. 90 Stat. 2515

How does Alternative B comply with that mandate? To date the NPS has documentation of continual water quality non-compliance of state and federal standards, annual native bird kills caused by agricultural practices, groundwater depletions, soils degradations, elk die-offs, illegal No Trespassing signages on leaselands meant for public access, population decreases of listed threatened and endangered species, no accounting of predator control practices (annual coyote, fox and other species kills), and no meaningful restoration activities at a landscape level.

I understand that a recent visitor survey found that over 80% of PRNS visitors come to the Seashore for the wildlife and other natural resources, while less than 20% of the visitors come for ranching and dairying appreciation. Please describe for the public how NPS finds Alt B in the public interest.

Greater discussion of NPS actions over the last 35 years concerning environmental impact and the numerous federal actions NPS has taken that impact public resources would help the public review of the Alternatives. The ongoing and cumulative impacts of 35 years of agricultural practices, or the cumulative impacts of NPS management practices, are not given enough discussion. The public has not had the benefit of disclosures and reviews of Seashore resource losses for three decades, while resource degradations appear to be increasing. More details on these issues would better inform the public for understanding what could be expected for Alternative B.

A review in the EIS of leaseholders violations of lease conditions and what actions the NPS took to remedy those lease violations will help the public understand lease compliance issues. In addition, a description of leasehold and land management (wildlife conflicts, water quality, water resources, and soils) monitoring and reporting practices need to be further described, as the DEIS provides limited information on this topic.

**Water Quality** Water quality conditions on several leaselands do not meet state or federal water quality standards. Please explain why allowances or exemptions are allowed on public lands, especially since these ongoing allowances conflict with the law? The DEIS does not adequately address the groundwater contamination and depletions that have occurred over the past 35 years, leaving the public unable to assess what the future conditions would be with Alternative B. For example: over the last two drought periods how much groundwater extraction occurred? What was the recovery period for the groundwater resources (location-specific). And given the models regarding climate shifts how will NPS manage (ie protect) the groundwater resources so recovery is consistent with natural, changing processes? The EIS needs to describe how our water resources (quality and quantity) will be protected during the upcoming longer term and more severe droughts. Alternative B does not appear to adequately address how the NPS intends to remedy these ongoing and future impacts, given that there will be less water available going forward. In fact, Alternative B appears to inevitably increase our water quality and water resource degradations. Please explain how the NPS is determining that past and future water resource

degradations, that benefit a handful of commercial interests, should take priority over our threatened species and elk? Please explain the NPS position on this issue regarding the public interest.

**Soils** The NPS has studies documenting soil compaction and RDM impacts to soil health. The available public information does not indicate the NPS has taken any substantive remedial or restoration actions. It would benefit the public to have a clear description of what the soil impacts have been over the past 35 years, what the NPS has done to remediate soil degradation, and what the NPS plans to do for restoration. How many acres does NPS anticipate need to be and (under Alt B) will be restored? Will the leaseholders responsible for the soil degradations be responsible for the needed restoration activities? Will the new leases stipulate specific actions, schedules, management practices, monitoring and penalties for non-compliance? Has the NPS required any leaseholder to remedy soil problems (if so, where)? Can the public expect to see these measures written into the new leases?

A well-credentialed soils scientist with a 35 year career with the (then) Soils Conservation Service and the BLM visited 5 leaseholds in 2017. (He served on the national federal lands task force that developed the Rangelands Management Guidance for federal lands). His assessment of our Pt Reyes lands found that the soils have been severely damaged by overgrazing and soils compaction. He found that very focused soils restoration actions are needed on much of the Seashore lands used for ranching and dairying. Additionally, carbon sequestration opportunities are clear and could be very successful if the ranching and dairying practices were greatly reduced or removed from the Seashore. The public would benefit if the EIS provided more disclosure of the soils conditions, the likely future degradations with Alternative B, and more meaningful restoration opportunities for the future. The DEIS lacks any specificity as to how the NPS will change agricultural practices sufficient to restore and regenerate our soils. Additionally, the EIS would do well to develop an alternative, or part of Alt F, that describes what could be achieved with a management plan that prioritizes carbon sequestration.

**Native Birds** The DEIS is not clear regarding estimated losses of native birds each year by mowing and other farm practices. The NPS has been aware of these bird kills for decades. It would be helpful to know the estimated annual losses, whether some locations or habitats suffer more than others, and what the estimated population impacts over time have been. The EIS needs to better describe what mitigations the NPS has employed, how successful have they been, and how Alternative B will improve the situation.

Predation of the endangered snowy plover has increased over time. There have been links to the agricultural practices and how those activities have changed certain species populations and behaviors, related to food and water availabilities. The DEIS was not clear regarding these relationships and did not describe what actions NPS has taken or intended to take to mitigate these indirect species impacts. Alternative B, intending to expand agricultural practices, will clearly have additional impacts on the native bird populations. The EIS needs more explanation regarding the NPS science around this and how Alternative B would likely exasperate these conditions.

**Public Costs of Ranching/Dairying** It would help the public if the EIS would more clearly disclose the public costs of ranching and dairying at PRNS, both historically and projected (for each alternative) over the next twenty years. What are the current annual costs to NPS for providing consulting, meetings, monitoring, fencing, road maintenance and other management and operational costs? What is the public subsidy annually for the below-market leases, and what is the total to date since the public acquired these lands? In today's dollars, how much did the public pay for the land acquisitions? In total, since the Seashore was established, what has been the public's cost for these ranches and dairies in current dollars? How many of the leaseholders receive additional federal, state or local farm subsidies? How much in public funds have been expended for these agricultural uses and how much will the public pay for the next twenty years under Alt B? This information will help us understand the full cost accounting of the public's expenditures for providing these leases.

If Alternative B were to be approved, what will be the NPS annual budget for leaselands management and operations? Adding more animals, row crops, B&Bs etc, per Alt B, could substantially increase NPS costs, yet the DEIS provides limited information re: these public funding commitments. The expanded agricultural activities would increase public road maintenance costs, as well as other infrastructure costs (utilities to more farm

buildings and B&B housing, more fencing, more water extraction, storage and distribution requirements, etc). The EIS needs to disclose the anticipated future costs of Alt B, what will be the public's cost and what will be the leaseholder costs? Since any land improvements would be on public lands, will the public own any new or upgraded buildings, utilities and other land assets? If not, why not?

The DEIS does not provide information for the public regarding the business plans and financial models that the DEIS leads us to believe are the basis for selecting the Alt B agricultural, lodging and other commercial expansions. The DEIS provides no background or independent economic assessments of these assertions, leaving the public to wonder if Alt B would in fact be economically sustainable, or a further continuation of economic challenges. Both beef and dairy consumption, for example, may well diminish on a per capita basis as society adjusts its carbon and water consumption habits to meet climate change demands.

Alt B will increase GHG emissions in all its aspects. At what cost to the public? Please disclose what the total GHG tonnages will be for all aspects of Alt B (ranch, dairy, soil, transportation, etc) and estimate the public costs based on current life-cycle cost accounting models for GHGs.

Historic and Cultural Resources (H&CRs) The DEIS suggests the historic and cultural resource values of agriculture at PRNS are unique and must be protected. Yet the DEIS is not clear on how the NPS made this assessment and reached the conclusion that it is in the public interest to protect these resources. Were all the H&CRs evaluated for their individual merits? For context, please inform the public as to how many acres of ranching and dairying currently exist on public lands in California, compared to PRNS? How many acres in Marin County are in beef and dairy with presumably similar cultural or historic value? The DEIS does not distinguish what are technically of historic value (buildings) versus livestock on our public lands. It will benefit the public to have more explanation of context for NPS to determine H&CR significance, how expanded operations would benefit these resources, and what is most important to the public (ie cattle versus elk and other wildlife). Pierce Pt Ranch appeared to have captured the best of C&HR values, but without any livestock, for years. The DEIS suggests Alt B is the preferred means to protect C&HRs, but doesn't explain what Alt B does that Pierce Pt hasn't already accomplished for the public, and could be easily replicated. Please explain why Alt F could not accomplish everything Pierce Pt has accomplished, without all the environmental impacts and public resource losses.

Based on the Seashore Act creating the PRNS, the fair market price paid by the public to remove commercial interests, the documented species and habitat losses caused by the commercial farming operations, the significant growth of visitors seeking natural resource experiences, and in the interests of climate and future generations, Alternative B appears arbitrary and politically based, capricious in its dismissal of the science, and a failure regarding the NPS Public Trust stewardship responsibilities.

Alternative F meets the intent of the enabling Act and best serves the public interest.

Please move forward with a management plan that fulfills the promises of a protected national seashore that benefits all natural resources and serves the public at large, versus an alternative (B) that primarily serves a small and select group of commercial interests.

Sincerely,

Daniel D Heagerty

Name: Silva, Mark

Correspondence: My preference is for Plan F. Commercial operations in the park should have ended 20 years ago! They're continued operations within a national park threatens our entire park system. All the ranchers agreed to leave when they accepted their government buyout checks and were all set to sell to developers if the government didn't step in. These subsidized "welfare" ranches should end, finally.

Correspondence: Ms. Cicely A. Muldoon, Superintendent National Park Service Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, California 94956

Subject: Draft Environmental Impact Statement for Point Reyes National Seashore General Management Plan Amendment, Marin County, California (EIS No. 20190187)

Dear Ms. Muldoon: The U.S. Environmental Protection Agency has reviewed the above-referenced document pursuant to the National Environmental Policy Act, Council on Environmental Quality regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act. The EPA provided several recommendations to the National Park Service in our November 30, 2018 scoping letter pertaining to the Point Reyes National Seashore General Management Plan DEIS, including the suggestion to analyze and discuss the potential impacts to water quantity and quality associated with the NPS authorizing new diversification activities (such as the production of row crops and the raising of new livestock) in the proposed Ranch Core and Pasture subzones. The EPA suggested the NPS include a comparison in the DEIS of the water usage requirements of each alternative, describe the source(s) for the water to be used for the new activities, and analyze and describe the potential impacts from activities such as fertilizer and pesticide use and livestock waste management. Potential Impacts from Proposed Diversification Activities The DEIS states that new diversification activities could be allowed in specified subzones under the preferred alternative, Alternative B. These diversification activities could include new types of livestock (pigs, chicken, sheep, and goats), row crops, horse boarding, ranch tours and farm stays, small-scale processing of dairy products, and sale of local agricultural products. The DEIS describes that these diversification activities would be required to be incorporated into an individual Ranch Operating Agreement prior to implementation, and the ROAs would include required mitigation measures and best management practices. Additionally, the DEIS notes that confinement of livestock species would be required to meet the State Water Resources Control Board regulations for waste management and any other applicable regulations, and that row crops would be limited to 2.5 acres per ranch, could not be sustained by irrigation, and would be allowed only in previously disturbed areas in the Ranch Core subzone. The EPA recognizes the efforts made by the NPS to ensure impacts associated with these diversification activities are addressed. We suggest the NPS provide additional information in the FEIS, however, regarding the potential impacts associated with these activities. For instance, some of the land contained in the Ranch Core subzone, such as the areas within alluvial fans, are in low-lying areas that could be vulnerable to flooding, and existing or proposed BMPs may not be sufficient to prevent or mitigate impacts from areas subject to repeated flooding events. Similarly, while we

commend the NPS for limiting proposed crop production to previously disturbed areas, we have questions regarding the amount of water that will be required to sustain these crops, and whether row crops may be sited in low-lying areas susceptible to erosion, runoff, and flooding, thereby potentially introducing fertilizers and pesticides into impaired water bodies, including Tomales Bay, which is on the Clean Water Act section 303(d) list for pathogens, mercury, nutrients, and sedimentation.

Recommendations: Include in the FEIS an assessment of the water usage for all proposed diversification activities, across all ranching and dairy operations. Identify the source(s) of water, and proposed water transport, for these activities and describe how reasonably foreseeable changes in climate could impact future water supply. Assess the potential for erosion and flooding for all low-lying areas in the Ranch Core subzone, including all livestock confinement operations with waste management requirements. A void proposing diversification activities in low-lying areas and flood zones. Where activities cannot be avoided, coordinate with the San Francisco Bay Regional Water Quality Control Board to identify all project design commitments to reduce future impacts from flooding events.

We note that effective October 22, 2018, the EPA no longer includes ratings in our comment letters. Information about this change and the EPA's continued roles and responsibilities in the review of federal actions can be found on our website at: <https://www.epa.gov/nepa/epa-review-process-undersection-309-clean-air-act>. The EPA appreciates the opportunity to review this DEIS, and we are available to discuss our comments. When the FEIS is released for public review, please send one hard copy and one CD to the address above (mail code: TIP-2). If you have any questions, please contact me at 415-947-4161, or contact Jason Gerdes, the lead reviewer for this project. Mr. Gerdes can be reached at 415-947-4221 or [gerdes.jason@epa.gov](mailto:gerdes.jason@epa.gov).

Sincerely, Connell Dunning, Acting Manager Environmental Review Branch

Name: Gilbert, Dori

Correspondence: Dear National Park Service:

I am opposed to the plan to shoot tule elk in California's Point Reyes National Seashore to appease private livestock owners who already get subsidized grazing of their cows on MY public land (paid for by MY tax dollars).

Native wildlife and the public's ability to enjoy them should take precedence over private interests.

Cattle ranching should not be allowed on public land if it's going to destroy that land and the wildlife on it!

Furthermore, • Point Reyes National Seashore is supposed to be managed under the Point Reyes Act for "maximum protection, restoration, and preservation of the natural environment." There's no mandate for prioritizing commercial agricultural

Thank you, Dori Gilbert

Correspondence: NEWS TAKE ACTION SHOP DONATE

Don't Shoot Point Reyes Tule Elk! August 29, 2019 - Posted by Lisa Levinson TAG: TAKE ACTION, TULE ELK  
The National Park Service (NPS) plans to kill native Tule elk in California's Point Reyes National Seashore,

convert park grasslands into crops, and let cattle ranchers expand their businesses to kill sheep, goats, chickens, and pigs. After decades of activism, this is an outrage! Submit your comment to stop the NPS's diabolical plan by selecting Alternative F.

When the Seashore was established in 1962, ranchers were permitted to continue their business in park for their lifetime or twenty-five years. Ranching was not even considered a reason for establishing the Seashore. Now the National Park Service plans to shoot up to fifteen elk annually to "compromise" with cattle ranchers who graze their animal victims within the Seashore.

#### What YOU Can Do

We've still got time to stop the National Park Service from shooting Point Reyes Tule elk! Follow the instructions below to submit your letter to the National Park Service no later than Monday, September 23, and then please make sure to tell us you've taken action. Please note that comments will ONLY be accepted and counted by NPS via this method involving its web submit form.

Send your comments to the National Park Service.

Step 1: Copy our letter below.

As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

Step 2: Go to this National Park Service webpage and click "comment now." You

Correspondence: We are concerned about the NPS draft plan for cattle ranching at the Pt Reyes National Seashore and believe the proposals do not protect the environment nor do they honor the agreement established 44 years ago when Ranchers were compensated for their land and it was agreed they could remain in the park or their lifetime of 25 years. Instead, their offspring have continued ranching without concern for the land, water and its wildlife. It wasn't long ago that because of current practices, 250 Tule Elk died because of drought and fencing. To actually give permission to ranchers to shoot elk if they are believed to be interfering with their ranching is inexcusable.

We believe NONE of the alternatives proposed are compatible with the agreement reached in 1962; however, unless the NPS goes back to the 'drawing board,' only Alternative F appears to be the most feasible.

It is hard to understand why an agreement made between NPS and the ranchers 44 years ago has not been implemented. The Seashore's water, land, and wildlife need to be protected.

Correspondence: The National Park Service Is Sacrificing the Environment for the Perceived Economic Benefit of the Elite Ranching Class

I am concerned about the environmental impacts of NPS's Preferred Alternative B management plan. It seems that the National Parks Service has considered many detailed options for the future of the Point Reyes Seashore. All the plans are well thought, and their impacts adequately considered.

However, one specific plan, Alternative F, has massive benefits over the others.

The National Parks Service has outlined 5 desired conditions for future park management (2-3): 1) preserve ecological function 2) preserve native species, including threatened and endangered species 3) manage invasive, non-native species 4) preserve cultural resources 5) ensure good conditions for public use and enjoyment/visitor experience

Alternative F meets these requirements better than all other alternatives, including NPS's preferred Alternative B.

1) Alternative F best preserves ecological function. a) Alternative F best protects soil. Under alternative F, cessation of ranching would eliminate all impacts on soils associated with ranching (vi). All of the other alternatives, including NPS preferred Alternative B would continue to affect soils because of erosion, compaction, and alteration of soil fertility, primarily from livestock grazing, forage production, high intensity use areas, and manure spreading (vi). i) Soil plays an essential role in ecological function. Soils play an important role in all of our natural ecological cycles-carbon, nitrogen, oxygen, water and nutrient. Soil supports plant growth which in turn feeds native species and fuels the entire system. b) Concerning vegetation, Alternative F is the least risky plan: i) The NPS report claims that the cessation of grazing would eliminate adverse impacts such as high-intensity-use areas and impacts on other federally listed plants that occur in certain habitats, such as dune or serpentine habitat, may be beneficial because the potential for cattle to trample individual plants would be reduced (vii). ii) However, the report also claims that Eliminating livestock grazing [via Alternative F] could also adversely affect several federally listed plants that occur in coastal grassland because grazing is the most effective tool for promoting their persistence with respect to competition with other non-native grassland species (vii). (1) Why is grazing the most effective tool for reducing competition with non-native grassland species? Ranching has goals that are unrelated to preserving native plant species. Wouldnt a targeted park management program that's explicit goal is native species protection, for example, be more effective? c) In terms of maintaining water quality, Alternative F is yet again the best option: Under alternative F, impacts on water quality would be noticeable, long term, and beneficial because ranching activities would be phased out across the entire planning area (vii). 2) Alternative F is the best solution for wildlife concerns. a) Where cessation of grazing occurs on lands under alternatives D and F, impacts on wildlife related to dairy and beef ranching would cease, including disturbance, trampling, erosion, and nutrient inputs. Ecological succession would occur as grassland habitats transition into shrubland or forested habitats, which would increase habitat for some wildlife but decrease it for others. Alternatives E and F would eliminate impacts of forage production, manure spreading, and diversification and would reduce high-intensity-use areas compared to existing conditions (vii) b) Alternative F would eliminate impacts on the native tule elk related to hazing and fencing and would allow for the free-range population to expand across the planning area. i) Alternative F manages invasive, non-native species by ceasing ranching. Livestock animals, by definition, are invasive, non-native species. How can you justify keeping ranching when you have a goal that is explicitly against it? 3) Alternative F would recognize the Point Reyes Peninsula Dairy Ranches Historic District and the Olema Valley Dairy Ranches Historic District listed on the National Register (46). It would still consider the area historic. 4) Under alternative F, removing ranching operations would eliminate a unique experience for visitors to experience the role of coastal prairie ranching in California and in the historic districts, resulting in an adverse

effect for visitors seeking those opportunities. However, other visitor opportunities related to experiencing natural sights and sounds would be expanded, and there could be additional recreational trail linkages and public opportunities through the adaptive reuse of ranch complexes no longer used for active ranching, resulting in beneficial impacts for visitors seeking these experiences. Similarly, the potential expansion of the elk population under alternative F would result in long-term, beneficial impacts for visitor use and experience related to observing elk in their native habitat (viii) a) Why would visitors want to see a bunch of sick cows (that they can see at farms across the US) when they could see a species that is unique to the area? b) There are zero instances where a tourist stated they were there to see the ranches. Their statement is unsupported c) There is ample ranching on private land that is visible to the public in the area 5) The cessation of ranching under alternative F would contribute to the loss of approximately \$16 million in annual revenue, which constitutes 0.01% of the study areas gross regional product. In addition, 63 direct jobs at ranches in the planning area would be lost, representing less than 0.03% of regional employment. Under all alternatives, visitation levels are not expected to change compared to existing conditions. Therefore, no change to jobs, income, sales, and taxes in the study area are anticipated in the short or long term related to public use and enjoyment. (ix)

The National Parks Service has decided to ignore these benefits in favor of Alternative B. Alternative B mirrors the requests posed by ranchers in a 2014 letter. Alternative B prioritizes ranching over recreation, wildlife and protecting natural resources. It commits our national seashore to commercial cattle grazing for decades to come.

By law, the National Park Service is mandated to manage all national parks in a manner which provides maximum protection, restoration, and preservation of the natural environment for generations to come.

The long-overdue General Management Plan Amendment (GMPA) for Point Reyes National Seashore must make the preservation and restoration of the parks natural values, its native wildlife, archeological resources, and public use and enjoyment its highest priority.

Ranching on public land is not a right, it is a privilege. Commercial lease holders should not dictate wildlife removal or exclusion policies. Confinement, fencing, removal, hazing, and killing of wildlife in the national park for the benefit of private ranch operators is unacceptable. Given the founding purposes of Point Reyes National Seashore, commercial leases or activities at the Seashore should not conflict nor interfere with the protection of natural or cultural resources or public access to the park.

Tax dollars subsidize ranching in the national park, but taxpayers have limited access to large parts of the Seashores, at times further limited by fences, locks, signage posted by ranchers and beach closings due to pollution caused by ranching. The GMPA must ensure, and the NPS must enforce the publics right to access the park. Why are ranching families given privileges the rest of us are not?

Allowing private ranches to expand operations at the Seashore would reduce public access to the park, damage wildlife habitat, and degrade water quality. I am opposed to the ranchers demand to grow commercial row crops and introduce sheep, goats, pigs, turkeys or chickens to the national park, which would create conflicts with and pressure to kill native predators like bobcats, coyotes, and foxes.

Why are ranching families trusted as stewards of the land when the nature of their work is exploitative?

Alternative F would not allow ranching. It would phase out cattle and disallow domestic livestock in the park. It would prioritize biodiversity and not kill wildlife to accommodate commercial interests. Under this alternative, it will be easier to restore the Seashores Pastoral Zone for wildlife habitat, native plant communities, scientific research and education, and historic ranch buildings can be repurposed for scientific research, interpretation and public education.

You say The purpose of Golden Gate National Recreation Area is to offer national park experiences to all, including a large and diverse urban population, while preserving and interpreting the outstanding natural,

historic, scenic, and recreational values of the park lands (2). Well, I am a part of that urban population, and I want a park, not a ranch.

The National Park Service is subsidizing wealthy leaseholders with the public's tax dollars.

Sincerely, Kat Despain

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

The beef and dairy farmers in the Point Reyes area have been given preferential treatment far too long and have been adequately notified that their leases will be terminated upon expiration or sooner if the original farming families cease operation. The suggestion to slaughter native elk and remove access to public land is absolutely unacceptable and could only be promulgated by our currently depraved national administration. This is California! We are better than this.

Name: Contaxis, Patricia

Correspondence: My daughter and I attended the public presentation in Sausalito on August 28th. I am 63 years old, my daughter is 24. We are both volunteers for the National Park Service.

I came of age during the Cold War, in the shadow of the atomic bomb, and in a political and existential atmosphere of crisis driven by a policy of Mutual Assured Destruction. These concerns seem to have drifted out of consciousness today, although they are still the robust threat they were in my youth.

In middle age, grown used to compromise, lulled into perhaps false hope by the fact that I've made it through decades of adult life skating the worst fear of my youth - that is, nuclear holocaust, either by war or accident - and numbed by the current political atmosphere of winner-take-all bullying and inflexibility, I took in the presentation in Sausalito, and accepted that the National Park Service favors Plan B. I could see that it was the plan that offered compromise between the Park and the ranchers, offering a 20 year lease in which both Park and ranchers could move ahead with their differing goals and objectives, to be re-evaluated around the 20-year mark. I am loyal to the Park, and read into Plan B a kind of respect and willingness to be good neighbors with existing ranchers.

After the presentation, my daughter and I discussed our impressions. As I said, my daughter is 24 years old, coming of age now, in this time of climate crisis and gross indifference to this issue by both science-denying politicians and slow-footed potential allies. Her generation's primary concern, as evidenced during the Climate Strike last Friday, is the climate crisis my generation has largely caused and to which my generation has not adequately responded. I could feel her distress.

I told my daughter that I thought a 20-year lease was a reasonable amount of time for the Park and ranchers to work together, gather data, analyze the results, and make changes to future agreements. 20 years to me, at 63, is not such a big chunk of time - half a career, two-thirds of a mortgage, etc.

To this, my daughter, who has a Bachelor of Science in Environmental Studies, rattled off statistics on ranching, destruction of habitat, increased methane emissions with increased cattle, and the effect on global warming. Her final coup de grace to my complacent, good-neighborly, political weariness was this: "20 years is the time frame in which we either make radical change or face dire consequences."

That woke me up.

It should wake you up, too.

Every single one of us should be doing whatever is in our power to do to make that radical change, to reduce our contribution to global warming, and to put our personal, financial and political resources into practices, technologies and policies that move us away from dependence on fossil fuels, and away from uses of land and water that are inefficient and destructive to the environment.

The Park is in a tough situation. Funded by monies controlled by an administration that seems ready to sell off public lands, to undo everything our country has built-in to protect our natural resources. But administrations come and go. Climate crisis is here to stay. I urge the Park to use this moment to educate the public on the effects of ranching on global warming, and to use this opportunity to work with the local community to develop sustainable food production. To this end, the Park would do well to look at the World Resources Institute at Princeton, which just published an important paper on best farming practices to feed the estimated 10 billion people we will have on our planet by 2050. Below are resources that would serve us all, should the Park choose to address this most important issue of our time, arguably of all time.

Correspondence: Please do not kill any Tule Elk! I understand the relationship Point Reyes has with ranchers is long-standing, but as a National Park it is essential that you put the well-being of the environment as your highest priority. As a California resident I urge you to move forward with a plan that does not take any lives of the rare and beautiful Tule Elk, and considers the detrimental effects that cattle grazing has on the local ecosystem.

Thank you.

#7015

Name: Musgrove, Donna

Correspondence: I grew up in California and my Parents took me camping in the National Parks. I am shocked you are considering pandering to special interest groups to allow hunting to benefit them. Please stand up for the natural environment and stop this madness!

- Point Reyes National Seashore is supposed to be managed under the Point Reyes Act for "maximum protection, restoration, and preservation of the natural environment." There's no mandate for prioritizing commercial agricultural leases on these public lands.

- Natural values, native wildlife, public access and enjoyment should take priority over commercial activities at Point Reyes.

- Tule elk are an important part of the landscape at Point Reyes. Their recovery is a result of successful native ecosystem restoration, which is a key element of the Park Service's mission. It's taken a lot of time, money and effort to restore tule elk to Point Reyes, the only national park where they live. Tule elk should be allowed to roam free and forage in the park - not shot, removed, fenced or treated as problem animals.
- Right now the Point Reyes ranches enjoy not only subsidized grazing fees and housing, but also taxpayer-funded infrastructure and road improvements, and publicly funded projects. But commercial activities at Point Reyes should be required to accommodate native wildlife - not the other way around.
- The Park Service shouldn't allow any new agricultural activities at Point Reyes. Planting artichokes or other row crops will attract birds. And introducing sheep, goats, pigs or chickens will attract native predators such as coyotes, bobcats and foxes. Expanded ranching would only create new wildlife conflicts.
- Cattle ranching should only be allowed if it's consistent with preserving the natural environment. And agricultural activities such as mowing shouldn't be allowed in park areas where they harm endangered species or wildlife habitat, impair water quality, cause excessive erosion or spread invasive plants/diseases.
- Cattle are the seashore's primary source of greenhouse gases. So the Park Service's preferred alternative is inconsistent with its own "Climate Friendly Parks" plan.

Correspondence: I am very disturbed by what is happening at Point Reyes Seashore due to operation of the Ranches. There is flagrant abuse of natural resources by way of polluting ocean with cow manure and killing native Tule Elks, I would like Park Service to adopt Alternative F. This should include phasing out all ranching, as originally intended. The Seashore should be managed for the natural values it was created to preserve its land, water and wildlife. The Point Reyes National Seashore should be restored and preserved for future generations to enjoy.

Name: giammona, michael

Correspondence: Giammona Family Ranch

Cicely Muldoon 9-23-19 Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes, CA 94956

Dear Superintendent: Thank you for the opportunity to comment on the draft Environmental Impact Statement (EIS) concerning continued ranching in the Point Reyes National Seashore and Golden Gate) Recreational Area. (GGNRA). This letter is our family's response to the draft EIS.

Ranch specific We have a small Lease in the Olema valley located within the boundaries of the GGNRA, that we have been our family cattle operation on since 1995. Over the last twenty-four years we have concentrated on habitat protection of a small stream that runs on the edge of our border line, by voluntarily fencing it from cattle at our own expense and using the small pasture next to the creek in dry months at very limited times. We are also working with NPS as well as NRCS on a water distribution plan, that would allow us to rotational graze our pastures and distribute the cattle more evenly and allow us to better control grazing to help manage forage intake, as well as help control invasive plant species. Last year with completed a very successful partnership project involving NPS, RCD and ourselves, to improve water quality in the olema valley. Moving forward we are excited about the possibilities to work with NPS on a long-term goal, were we can develop a ranch management plan that can help us implement the best management practices available while being good and responsible environmental stewards of the land

Housing I would like to re-iterate from our last comment letter, how crucial it is, to our ranch operations that we would be able to lease the house on the ranch for a family member or ranch worker to live in. This very critical and would help us better manage the ranch and re-act to possible emergency situations that can occur, from possible animals getting sick and needing crucial prompt treatment, or monitoring the building and culverts during winter storms. As of now, we must make numerous trips to the ranch at all hours of the day and night to check on the cattle during calving season or other situations that need immediate attention. We have had problems with theft and vandalism in the past, by having a family member be able to live in the house on the ranch, it would help eliminate possible criminal activity that's been ongoing for a while, at the same time help us care for the cattle and the ranch infrastructure.

Diversification We think that allowing some types of limited diversification opportunities even under a trial basis could greatly enhance the sustainability of ranching operations, which in turn would increase flexibility of the lease operator to manage the land in a way to help in protecting environmental sensitive areas. In our situation, for example, one of our sons has a pasture egg business outside of the NPS borders, he would like to be able to use one of the barns periodically to raise day old chicks in.

Thank you for the opportunity to comment and look forward in working with the NPS in the future.

Mike, Connie, Ryan and Morgan Giammona

Correspondence: September 20, 2019 Brannon Ketcham Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956 Email: brannon\_ketcham@nps.gov

Subject: Comments on Environmental Impact Statement for a General Management Plan Amendment, Point Reyes National Seashore and North District of Golden Gate National Recreation Area, Marin County

Dear Mr. Ketcham:

San Francisco Regional Water Quality Control Board (Water Board) staff appreciates the opportunity to comment on the Draft Environmental Impact Statement (draft EIS) for a General Management Plan (GMP) Amendment, Point Reyes National Seashore (PRNS) and North District of Golden Gate National Recreation Area (planning area). The EIS for the GMP Amendment will establish guidance for all lands currently under agricultural lease or permit within the planning area, relating to preservation of natural and cultural resources and management of infrastructure and visitor use. Based on the information provided in the draft EIS, we offer the comments below. These comments are to advise NPS of our concerns, so they may be incorporated into the planning and regulatory compliance process at an early date. We have focused our comments on the preferred alternative identified in the draft EIS, Alternative B.

We strongly support continued grazing and dairy operations on PRNS lands as identified in Alternative B and the development of longer leases up to 20 years. These longer leases should provide ranches and dairies with the ability to build needed improvements and infrastructure. We will continue to work closely with NPS and ranches/dairies through our permitting and 319(H) grants program to upgrade facilities and eliminate existing water quality impacts. In our work on PRNS lands, we have found that rangeland and dairy infrastructure and operation improvements can lead to significant water quality and habitat improvements.

The draft EIS, however, does not adequately identify all potential adverse water quality impacts for the proposed land-use changes, including diversification in the Range (goats, sheep, chickens) and Ranch Core Subzones (pigs, sheep, goats, chicken), row crops in the Ranch Core Subzone, and increased public use facilities. Further, the draft EIS does not adequately incorporate mitigations for these impacts. The most significant of these impacts may occur in the Ranch Core Subzone.

Through our confined animal facility (CAF), grazing, and grants programs, we have worked closely with NPS to improve rangeland and dairy operations and management. All the actions identified as "high priority" in the NPS rangeland assessment have been implemented. As demonstrated through ongoing water quality monitoring (draft EIS pages 68-69), these efforts have resulted in significant water quality improvements. However, additional improvements are needed because water quality standards exceedances still occur. With NPS, we will evaluate recent data to determine what additional actions are needed to resolve existing water quality standard exceedances. We are concerned that many of the proposed Ranch Core Subzone diversification activities will lead to new exceedances which cannot easily be remediated due to technical or financial feasibility.

The Water Board listed Tomales Bay, and major Tomales Bay tributaries, including Lagunitas Creek and Olema Creek, as impaired for nutrients, pathogens, and sedimentation/siltation under section 303(d) of the Clean Water Act (SWRCB 2010). The proposed diversification and increased public use facilities (trails, picnic areas, and housing with associated restrooms and septic systems) could potentially increase discharges of sediment, pathogens, nutrients, and pesticides. Further, these activities may alter watershed hydrology (surface water and groundwater flows) and degrade wetland, riparian and stream integrity and function. Increases in the discharge of pollutants above existing baseline levels and loss of habitat critical to beneficial use function would violate State Antidegradation Policy (State Water Resources Control Board Resolution No. 68-16).

The draft EIS identifies Alternative B as the preferred alternative. In this alternative, the ranchland zone is divided into Subzones: Resource Protection Zone, Range Subzone, Pasture Subzone, and Ranch Core Subzone. Our comments below focus on Alternative B and activities in the latter two Subzones because this is where most impacts would be expected to occur.

#### Alternative B comments

#### Resource Protection, Range and Pasture Subzones - Vegetation, Erosion and Water

We support the delineation of Subzones as described in Appendix H. The increase of 1200 acres in the Resource Protection Subzone will provide for significant water quality and habitat improvement.

The Pasture Subzone is identified "as lands where no sensitive resources are known to occur". In this area diversification will allow pasture use by sheep, goats and chicken. If properly managed, this diversification should have only minor and limited impacts. However, the draft EIS discussion does not clarify how these livestock and chickens will be managed. What mechanism or BMP prevents the sheep and goats, placed into the Pasture Subzone, from foraging in adjacent areas that are zoned differently and where sensitive resources do exist? Further, will the existing water infrastructure be adequate to effectively rotate the sheep and goats between fields to prevent overgrazing? It is unclear if the measure preventing sheep and goats from moving between Subzones is steep slopes (> 20%) and if so, if this effective. The draft EIS should fully identify the potential impacts to sensitive resources, water quality, and soil in the Resource Protection, Range and Pasture Subzones resulting from diversification in the Pasture Subzone, and how these Subzones will be managed to prevent impacts from goats, sheep and chicken.

#### Alternative B - Diversification - Water Resources

In our comments on the Notice of Intent (Nov. 30, 2018) we noted that the list of Impact Topics should be expanded to include watershed scale processes such as geomorphic and hydrologic processes. Geomorphic processes should include sediment generation and transport processes, as well as stream and floodplain geomorphic functions. Hydrology should include impacts to stormwater runoff characteristics (e.g., runoff volume and timing, percolation, Horton overland flow due to soil compaction); stream flow (e.g., volume, peak flow magnitude and timing, seasonal persistence) and groundwater recharge and discharge. These impacts may be significant in the Ranch Core Subzone (see below) but were not identified and evaluated.

#### Diversification in Ranch Core Subzone

The Ranch Core Subzone comprises a small lease/permit area (< 1% of total). However, the Ranch Core Subzone's potential to increase pollutant loading to streams, groundwater, wetlands, and degrade water quality and sensitive habitat greatly exceeds its relative size and may be very significant. These areas are the most likely of the newly proposed Subzones in the GMP to cause significant water quality and stream habitat degradation under the proposed diversification practices for the following reasons:

1. Location of Ranch Core Subzones: due to historic practice of siting dairy complexes and ranch facilities adjacent to creeks and on flat areas, several core areas are in low-lying areas at the base of a sub-watershed in alluvial fans or historic (now drained) wetlands. These areas are subject to frequent flooding, high volumes of converging stormwater flow from upslope hillsides, and creek planform instability (alluvial fan). Other ranch core areas, situated closer to the ridgetops, may discharge pollutants directly to headwater swales and small tributaries or be susceptible to more extreme weather than low-lying areas.
2. Impact of existing degradation in Ranch Core Subzone: Due to existing degradation of habitat and vegetation, these areas have little pollutant buffering and pollutant assimilative capacity. The proposed diversification activities will generate a higher pollutant loading and direct discharge to adjacent waterbodies in these areas due to a lack of existing vegetative buffers (filter strips, soil vegetative cover, and complex riparian zones. For instance, in many areas an increase in diversified livestock use will generate additional erosion due to presence of bare earth and there will be less pollutant filtration due to the lack of a complex riparian zone.
3. Diversification activities in Ranch Core Subzone: the actual proposed diversification activities have the potential to generate significant pollutant discharges due to the nature of the activities (see below - diversification activity impacts).
4. Technical or financial infeasibility of implementing appropriate BMPs, management or mitigation measures to eliminate or reduce impacts: In some Ranch Core locations, the suggested mitigation measures, such as "comply with requirements in the General CAF permit" may not be adequate. For example, the requirement to eliminate stormwater run-on into areas containing waste products, may be technically or financially infeasible. In the locations where the measures cannot successfully be implemented, there will be significantly greater impacts than identified in the EIS. Further, the actual impacts of installing the necessary measures, for many of the diversification activities have not been fully considered. Examples include: • Rerouting stormwater or altering the drainage patterns in row crop fields which may alter groundwater recharge and affect stream hydrology (low and high flow) • Disposing of manure and urine-soaked bedding in horse boarding facilities, or high nitrogen chicken manure through composting. See also Attachment A of CAF Order No. R2-2016-0031 (General CAF WDR).

#### Impacts from Specific Diversification Activities in Ranch Core Subzone

1. Waste generation: The proposed diversification activities related to increased livestock diversity (pigs, sheep, goats, chickens, horses), horse boarding, and small-scale processing of dairy products may generate wastes that include manure, process wastewater, animal wash water, and any water, precipitation, or rainfall runoff that contacts animal confinement areas and/or raw materials, products, or byproducts such as manure, compost piles, feed, bedding materials, silage, eggs, or milk. Waste from such facilities can contain pathogens, oxygen-depleting organic matter, sediment, nitrogen compounds, compounds toxic to fish and other aquatic organisms, and other suspended and dissolved solids that can impact both groundwater and surface water if not properly managed. Daily operations can cause degradation of water quality as a result of waste discharges and activities that result in soil erosion and destruction of riparian habitat.

Adverse aquatic habitat impacts associated with improper waste management and application may include: nutrient enrichment resulting in algal blooms, organic waste loading resulting in lowered oxygen levels, siltation of gravel areas that can eliminate fish habitat, high levels of ammonia that are toxic to fish and aquatic invertebrates, and elevated levels of nitrates and other salts in groundwater. Additionally, animals whose movement is not controlled through fencing or other methods may further degrade riparian zone, wetland, or other sensitive habitat and lead to further loss of the function of those habitats, including pollutant filtration,

shade and stream temperature control, and streambank and soil stability. The draft EIS does not clearly indicate if the diversified livestock will be corralled/fenced or free range, nor does it identify potential impacts of free range livestock, such as loss of riparian zone and wetlands. If livestock are confined(1), the requirements of the General CAF WDR must be met. Even so, the EIS still should fully identify and evaluate potential impacts associated with CAF operations. As discussed above, the technical/financial feasibility of many of the proposed management and mitigation measures requires evaluation. Where such measures are not feasible, there will be impacts the draft EIS does not currently identify, and the impacts of those identified will be more significant.

2. Row crops: Row crops have the potential to increase soil erosion and discharge of sediment to streams; increase nutrient runoff from manure or compost application; increase the need for invasive plant control, as conditions for invasive plant germination and dissemination are improved (see integrated pest management discussion below); increase soil compaction; alter stormwater flow paths and increase runoff leading to a decrease in groundwater recharge and altered stream hydrology (low and high flow). Some mitigative measures proposed in the draft EIS may provide only limited erosion control depending on the site characteristics. For example, mulching and seeding have variable success at erosion control depending on factors such as slope, wind, soil moisture and temperature. The draft EIS does not fully discuss harvest methods, whose impacts can be significant depending on machinery used. Additional clarity is needed in the description of allowable row crop activities and identifying their impacts.

3. Integrated Pest Management (IPM) for invasive weed control: As stated in the draft EIS, "Vegetation management practices for invasive plants in crop areas would be subject to mitigation measures to minimize or prevent adverse impacts associated with these practices....using herbicides and biocides on cultivated or rangeland areas for purposes of weed management would continue to comply with NPS IPM regulations and procedures. Compliance with these regulations and procedures and applicable handling and disposal laws and the use of appropriate herbicide application methods (e.g., restrictions on spraying during windy or wet days) would minimize or prevent adverse impacts on surface water and groundwater quality." (pg. 115). This discussion does not fully identify the impacts of herbicides on groundwater and aquatic habitats that support salmonids and other species known to be sensitive to herbicides.

4. Public use and enjoyment: the proposed increase in farm tours and overnight use facilities would increase sewage production and water use. The draft EIS does not fully identify or evaluate potential impacts associated with increased sewage generation and appropriate management measures.

5. Water use: the draft EIS does not adequately identify all the increased water demands associated with the proposed diversification, row crop, and public use and enjoyment. The draft EIS identifies the volume of daily drinking water consumption by goats, chicken, and horses, and this increased use is relatively minor. However, numerous water demands are not considered including: pig and sheep daily drinking consumption; wash water needed for horse boarding facilities including horse and stall washing; wash water for management of CAF facilities; water use for public use and enjoyment including overnight facilities (cooking, showers, restrooms, etc.); flower/vegetable gardens associated with landscaping for overnight facilities; crop produce and equipment wash water; cheese making or other commercial process manufacturing water.

This increased water demand could be met through use of existing permitted stored reservoir/pond water, redevelopment of existing wells and springs, or new wells and new surface water diversions. In our work with NPS on existing rangelands, we have supported the redevelopment of existing wells to provide alternate water supply for cattle fenced out of creeks. In such cases, the overall water use is unchanged, and riparian zone and water quality benefits accrue from fencing cows out of creeks. However, we do not support allowing activities that significantly increase water demand, because it may further reduce stream flow, wetlands and groundwater recharge. Research in the Olema Creek watershed by the University of California-Berkeley has found reduced Coho growth and mortality in Olema tributaries due to low flow conditions. Further, increased demand on ponds/reservoirs could result in lowering of reservoir water levels, reduce their capacity to meet demands during droughts, and decrease pond wetland and amphibian habitat. The draft EIS states that no new wells will be

developed. However, the EIS does not identify potential impacts resulting from the development of new water supply reservoirs/ponds or diversions that may be allowed through a state water rights process.

Closing

In conclusion, we strongly support the issuance of longer leases and diversification into the Pasture Range Subzone. Additional clarity is necessary regarding control of livestock movement between Subzones. However, due to the sensitive location of the Ranch Core Subzone, high level of existing degradation, significant pollutant generation by diversification activities, and potential for technical/financial infeasibility of installing mitigation/manage measures, we find the EIS does not fully identify the impacts of Ranch Core Subzone diversification.

Sincerely Janet O'Hara Senior Environmental Scientist Planning and TMDL Division

Correspondence: It is unacceptable that the National Park Service and the Point Reyes National Seashore management are not in compliance with the park's mission, scientific studies, or public sentiment as it seeks to cull elk so as to perpetuate industrial dairy ranching within the park. I live over an hour from Pt. Reyes and for the past 40 years have visited the park on bimonthly basis. I have found park management to be inadequate and not in the public interest.

As both park and independent studies show, dairy farming is incompatible with preserving park native flora and fauna, promoting biodiversity, protecting surrounding marine environments, enhancing public use, and, on a broader level, addressing climate change.

That the Park is culling the native elk so as to enhance dairy farming is unconscionable. Dairy farming on Point Reyes is responsible for the poisoning of the water and land with their waste, the decimation of native plants due to grazing, the killing of native birds and mammals to maintain pastures and farm silage and hay, the propagation of the predatory crow population, and widespread erosion. All these factors ultimately impact shorebirds and marine life, including elephant seals, sea lions, sharks, plovers, and pelicans. That the park would think that the elk are problematic is an indication of how out of touch they are.

It is insulting to one's intelligence that Park management would attempt to extend dairy leases under the guise that the ranches have historical significance. Marin and Sonoma counties are full of coastal dairy farms. The primary difference between the Point Reyes ranches and those elsewhere is their adverse impact on the truly historic value of the park, namely that it is one of the last vestiges of native coastal prairie and our connection to the landscape through native populations -who have lived in the area for thousands of years.

The ranches have had 50 years to comply with the park's founding legislation. Closing the Point Reyes ranches is long overdue. I will be supporting every effort to make it so.

Sincerely, Thomas Bachand

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

Correspondence: At the time the park was created, ranch owners received financial compensation and 25 year leases, so that there could be an orderly transition back to the native habitat. It is past time for the National Park Service to implement the intent of the National Seashore's authorizing legislation and phase out the destructive effects of dairy and cattle ranching on more than one third of the park. I strongly urge the Park service to implement alternative F and phase out ranching.

The environmental impact of over 5000 head of cattle, with the attendant accumulation of 133 million pounds of manure annually has been devastating for water quality, and soil has suffered from compaction. Cattle have been responsible for well-documented damage to grasslands, birds, native plants, and wildlife. California has many acres dedicated to cattle ranching; it is inappropriate to continue to restrict public access to one third of a National Seashore for the benefit of private ranchers who were never intended to be on the park in perpetuity.

Alternative F is also preferable because it increases land available to the herds of native tule elk, which are compatible with the ecology and do not have a destructive impact on water quality or soil. In contrast, alternative B permits the killing of tule elk for the perpetuation of destructive cattle ranching. This is inconsistent with the interests of the millions of tourists who come to see Point Reyes with its natural geology and ecosystems, including the elk, not dairy and cattle ranches.

Correspondence: Dear Park Service,

I was appalled to learn about the plans to kill off some of the Tule Elk, in favor of the cattle industry at Pt Reyes National Seashore. How can this be happening in this day and age when we are all aware of the impact cattle raising has on the land and air of our planet? We have one small pristine place along the coast of California, with indigenous and endangered herds of elk and you are allowing this land to be corrupted. Move the herd of cows away from the seashore, in land and let the park become natural again. This area should be preserved and restored to its original wildness for future generations. I will not buy anymore milk from the companies that are presently entrenched until they leave. How dare you re-issue leases to these farms. The original leases were supposed to be temporary. Is it yet another example of money dictating the decision to extend these leases? Shame on you. You are the stewards of this unique landscape and its natural inhabitants.

The Alternative F proposition should be adopted immediately. The public is beginning to learn about these issues and will not remain silent.

Correspondence: I have read the EIS and attended the public comment educational panel in Sausalito on August 28th. This document predicts the impacts of wildlife, recreation, and ranching on the environment on water, wildlife, and climate. Please follow its advice.

The EIS is structured in order to study the different options of frequency concerning wilderness and recreation land or ranch and pastoral land. The presentation given in Sausalito explained that The Parks Department supports option B. This option would allow for new zoning of ranch lands, extend the use of the land to other livestock and agriculture monitored by the parks, and lethally control the roaming Drakes Bay elk population to 120. Unfortunately, there are some essential environmental concerns within this plan, documented in the EIS. Effects on water quality, wildlife abundance and diversity, and especially climate must hold significance in the final plan decision. As plan B is written, these factors are not rightfully represented.

Cattle, particularly beef cows, in plan A, B, and C leave negative impacts on water and air quality. While plan F or even E allows for new park historical sites and park land supporting Tule Elk, an endemic California species, would support the longterm health of the Park and the people within it. Ranchers claim that elk compete with cows for food. However, elk eat browse, switching between food sources as they run low, explains a 2007 study by David A Christianson and also backed by research by Mark Hebblewhite and the Rocky Mountain Elk Foundation. This allows for native plants to thrive and water to be conserved. In contrast, cows eat a different category of grasses and eat them till the pasture is bare, causing patterns of erosion. This allows high levels of sediment to change the flow of water and nutrients. According to the USDA, especially in enclosed spaces, cows produce 90-120 lbs of manure per cow per year. This then gets in to streams and ground water. The excess

nutrients and ammonia in manure seeped into the watershed cause nitrification, reduced access to oxygen leads to fish and plant death. Additionally, the pesticides used in animal feed and the antibiotics given to the livestock stay in the water, bioaccumulating in the fish and animals who live nearby, and even reaching us downstream. The water quality effects the health of the ecosystem. As we come to the park for the beauty of the landscape, we must protect it.

By the 1960s, we knew, we had clear scientific evidence showing that the earth was warming and that our actions were driving this rapid increase in global temperature. Here we are in 2019, 60 years later, the UN Climate Report just released that we've got 10-12 years to get our act together before we start seeing extreme consequences. These may not effect most average citizens dramatically, but they will effect lower income people living along the coasts, they will effect farm workers and laborers. They will effect how much beach space there is for seals, how far in seawater becomes brackish. The temperature of the water and air will effect fish, plants, songbirds. And native species, endemic species are particularly at risk. Increasing or maintaining ranching within Point Reyes National Park will continue the release of methane, the most deadly greenhouse gas that is doubly as potent as carbon dioxide according to the Climate and Clean Air Coalition. Reducing our consumption of meat and dairy products is the #1 thing that needs to be done to reach our goals for 2020, avoiding catastrophic climate changes. These emissions cannot be removed once they have been released. The Parks Department has the chance to support this change away from meat consumption and protect the climate, protect our ecosystems, and I hope that these factors are carefully thought through in the final decision.

Name: Smith, Harvey

Correspondence: I have been a Bay Area resident for over 50 and have lived in San Francisco, Marin County and currently reside in the East Bay. I frequently visit Point Reyes National Seashore, the Golden Gate National Recreation Area and other national and regional parks. I also participate in the NPS Volunteer in the Parks program in Rodeo Valley.

I have worked as a horse rancher and environmental educator. I am a former board member of the Alameda County Fair Association and county cattle ranchers among my friends. I currently am part of a group that is the steward of 500 acres of East Bay Municipal Water District lands. We manage this land with about three dozen horses that rotate on about a dozen pastures. The horse grazing reduces the danger of brush fires, and human management of supplemental feeding and removal of invasive species of plants. I mention all this to underscore that management of pasturelands in a park environment is a familiar and longtime personal pursuit.

I am frankly baffled by your Preferred Alternative B that would continue and expand ranching activity in Point Reyes National Seashore. Recent news adds to this bafflement. An estimated more than 4 million people participated in last Friday's climate strike. A reported 3 billion birds have died off in the U.S. over the past 50 years. Milk overproduction in the U.S. was reported again this week. The law establishing the Seashore states that it "shall be administered... without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area."

I find it hard to imagine the expansion of agriculture in the park is in line with these legally established administrative guidelines. This seems more like the exploitation of public lands and resources for private gain. We all know that more and more of the public domain has been privatized or is under threat of privatization. However, it is shocking to see this happen here in the Bay Area. Having NPS resources diverted to care for the activities of 24 commercial ranches rather than having them used for the improvement of the park environment or for the benefit of the over two and half million yearly park visitors clearly shows that politics must be driving this EIS process. Is the NPS just going through the motions of getting public input when the outcome has already been predetermined?

There are many examples of dairy and cattle ranches that have been removed from public lands in the East Bay Regional Park District and in Tennessee Valley in the GGNRA. Park visitors may be fascinated by the few historic structures that remain, but I have yet to hear any lament the loss of cattle. However, the resurgence of wildlife and regenerated habitat do thrill and fascinate those who visit parks.

Giving cattle ranchers a free ride in the park without requiring them to contain methane or to move toward more sustainable ranching practices contrasts vividly with the practices of ranchers outside the park who are doing so. Range management practices in East Bay parks also shows that limited cattle or horse rotational grazing can over time improve natural values of the land. Expanded ranching in the park does not move toward restoring its pastoral zones or improving wildlife habitat or native plant communities. It does not improve the water quality or help endangered species - Tule elk and others.

Alternative A – No Action is obviously not working for anyone. Alternative B – NPS Preferred Alternative gives it all to ranching and little to the park and its users. Alternative E points clearly to the most harmful ranching practices for the environment - dairy farming; it should be phased out. Alternative F, discontinuing ranching operations, is posed by some as an extreme alternative, but over time this should be the preferred alternative. Grasslands need to be managed, and alternative F does include prescribed grazing so that cattle will probably continue to be a feature in the park for a long time to come, just not on a clearly industrial and environmentally destructive basis.

Correspondence: • Point Reyes National Seashore is supposed to be managed under the Point Reyes Act for "maximum protection, restoration, and preservation of the natural environment." There's no mandate for prioritizing commercial agricultural leases on these public lands. • Natural values, native wildlife, public access and enjoyment should take priority over commercial activities at Point Reyes. • Tule elk are an important part of the landscape at Point Reyes. Their recovery is a result of successful native ecosystem restoration, which is a key element of the Park Service's mission. It's taken a lot of time, money and effort to restore tule elk to Point Reyes, the only national park where they live. Tule elk should be allowed to roam free and forage in the park - not shot, removed, fenced or treated as problem animals. • Right now the Point Reyes ranches enjoy not only subsidized grazing fees and housing, but also taxpayer-funded infrastructure and road improvements, and publicly funded projects. But commercial activities at Point Reyes should be required to accommodate native wildlife - not the other way around. • The Park Service shouldn't allow any new agricultural activities at Point Reyes. Planting artichokes or other row crops will attract birds. And introducing sheep, goats, pigs or chickens will attract native predators such as coyotes, bobcats and foxes. Expanded ranching would only create new wildlife conflicts. • Cattle ranching should only be allowed if it's consistent with preserving the natural environment. And agricultural activities such as mowing shouldn't be allowed in park areas where they harm endangered species or wildlife habitat, impair water quality, cause excessive erosion or spread invasive plants/diseases. • Cattle are the seashore's primary source of greenhouse gases. So the Park Service's preferred alternative is inconsistent with its own "Climate Friendly Parks" plan.

I vote entirely on animal and climate issues. I will vote based on how my representatives vote in these crucial matters. You are either for or against the environment If you are against the environment and the animals I am against you.

Name: Watnick, Darya

Correspondence: I do not support granting 20 year leases to cattle and dairy industry. Climate science has indicated we have less than 12 years to mitigate the worst of climate catastrophe. Allowing business that has been linked to water pollution, species extinction and in Point Reyes is the culprit of over 60% of the greenhouse gas emissions, it is not a good idea to give that same industry a 20-year lease to continue degrading our national park.

Point Reyes is a refuge to thousands of plants and animals. Point Reyes can be a leader in the fight for climate justice, and it starts with phasing out Beef and Dairy operations and restoring the land to its natural state. The EIS has NO MENTION of the effects of climate change in it, and does not include any information of the cattle and dairy's impact on climate change within the park.

Name: Walensky, Michael

Correspondence: Point Reyes and these elk have been part of my life for almost all off the 50 years I have been living here. I care about protecting California's wildlife. I oppose the National Park Service's plan to kill native tule elk and expand commercial agriculture in Point Reyes National Seashore and Golden Gate National Recreation Area. I urge the National Park Service to instead restore the lands for wild animal habitat.

We should prioritize the preservation of our public lands and wildlife, not the economic interests of private ranchers. These commercial cattle ranches have serious negative environmental impacts on the park - polluting waterways, causing soil erosion, and harming the many endangered and threatened animals who live on Point Reyes. National parks exist to protect our natural resources and native wildlife. This park should be managed accordingly.

Michael Walensky

Name: Borg, Carolyn

Correspondence: I am very disappointed with NPS because this DEIS is so obviously biased and politically driven. Indeed, five of the six DEIS alternatives would continue some level of commercial livestock operations. The public fairly bought out these ranches decades ago but NPS is too weak to phase them out. NPS violates the law and its own policies to help these "welfare" ranchers. For example, NPS puts private cows ahead of public wildlife, such as ten cows for every tule elk. I support Alternative F as it is the only alternative consistent with the relevant laws, policies, and science. Cows are already ubiquitous on most federal lands in the West. They do not belong in NPS units including this national seashore. NPS managers need to grow a spine and respect that they work for the American people and not a small group of private ranchers.

#7033

Name: Kahn, Charity

Correspondence: Dear NPS,

Please protect our public lands for the uses they were originally intended (protection of biodiversity, land and ecosystems), rather than continuing support the financial bottom line of ranches whose leases were meant to expire decades ago.

I come to the Seashore because I want see the wildlife, not cattle or land heavily impacted and damaged by ranching.

It is my understanding that the mission of national parks is to protect native plants and animals. None of the proposed plans actually do this except for Alternate F, no ranching.

The Environmental Impact Statement says that the land, water, and wildlife of the national seashore are being harmed by the cattle. This is in direct conflict with the mission of the park service.

Please preserve some of our last remaining biodiversity. In an era of climate change and shrinking wildlife, there is absolutely no legal, logical, or emotional argument for continuing to use 1/3 of this precious seashore gem for ranching purposes.

Thank you for listening.

A concerned citizen, Charity Kahn

#7034

Name: Courter, Andrew

Correspondence: Thank you so much for taking this on! Unlocking more, respectful, car-free access to California's world-class natural areas is not easy and I'm grateful you're working on it. Specifically:

I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands.

The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Name: Curtis, Gavin

Correspondence: Point Reyes is one of the most scenic areas in the world. Stating the obvious, it has been designated a natural public open space. As such it deserves the opportunity to continue to evolve into its most natural state. Animal agriculture is in direct contrast to this evolution

"The National Park Service preserves UNIMPAIRED the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations."

This is your mission statement, maintaining a non native animal population in the Point Reyes Park is clearly contrary to your mission.

Please do not allow continued livestock grazing in this pristine area. It has also come to my attention that you may consider trying to adjust the numbers of the native mammals to enhance the land for non native animal grazing and this is truly horrifying.

Please stay true to your mission and choose option F

#7036

Name: Carter, Brenda

Correspondence: I've been visiting Point Reyes since the late seventies, so I have an investment in the Park Service plans for Point Reyes. I'm also a lay person, so I'm not in a position to give the kind of technical response that is crucial to this decision making process. I have done my best to look past the hasty reactions that are widely available and to get feedback from longstanding environmental groups and individuals involved in Point Reyes. I would like to share a few of my concerns based on what I've learned.

My understanding of the the park's mission-and my personal experience of Point Reyes-has always been the shared existence of both the historic ranches and the natural landscape. I'm concerned that proposed diversification based on market forces will upset this uneasy balance that is at the heart of the park. Preserving the ranches is one thing, but I don't see how their commercial sustainability is a legitimate National Park Service management goal.

The proposed forms of diversification will have negative impacts on the park. Allowing non-beef and dairy ranching agricultural practices will open up the possibility of raising sheep, goats, and pigs that will be the target of predators, leading to conflicts with wild life. There are already conflicts between tule elk and the ranches that the park is struggling to resolve. In addition, the possibility of farm stands and home stays shifts the balance away from the park as a place to experience nature. Preserve the beef and dairy ranches if at all possible, but the natural environment of the park must come before their profitability.

#7037

Name: seid, jessica

Correspondence: the ecological sustainability relies on the presence of tule elk being there. expanding ranching area to the highest bidder is not how this should work- -please value ecology and the natural environment over money.

Superintendent Muldoon Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Dear Superintendent Muldoon,

On behalf of Marin Humane we are writing to have our comments included in the Point Reyes National Seashore General Management Plan Amendment Draft Environmental Impact Statement (DEIS). Thank you for the opportunity to provide comments in this important process.

Marin Humane's long history dates back to our incorporation in 1907. For over a hundred years our organization has helped guide the values of our community when it comes to animal welfare for all animals, both wild and domestic. Our organization has also benefitted from the rich knowledge of ranchers from the Park who have served on our board of directors over the decades. We have also been deeply involved in local animal issues that involve wildlife management and coexistence, humane treatment of animals, and policies impacting animals and our environment. We currently provide an animal services contract to the County and all 11 cities through a joint powers agreement. As part of our contractual duties we respond to all wildlife and animal-related public safety calls, issue permits for all commercial animal establishments including horse boarding facilities, and issue dog licenses and ranch dog permits. Additionally, our animal services officers enforce all local ordinances involving animals as well as numerous state statutes involving animals, both wild and domestic.

The most concerning element of the majority of the proposed alternatives is the reliance on lethal removal of elk. History shows these methods bring tremendous negative public reaction and litigation. While we support further

study and research on a reliable long-term elk management plan, the importance of promoting proper coexistence and using non-lethal remedies are paramount to success and public support.

We have reviewed the DEIS and appendices and our comments will focus on domestic animal care, elk management, and general wildlife management and coexistence.

Alternative A (No Action) - We do not support Alternative A as a whole and we offer specific comments to the following issues: • This alternative is inadequate in providing a long-term solution for maintaining and effectively managing Tule elk herds in the planning area. • This alternative is deficient in providing proper coexistence between Tule elk, ranchers, park visitors, and neighboring properties. • This alternative has potential for increasing our organization's requirement to respond to wildlife issues, including those involving Tule elk. • We support the continued monitoring of the elk herds and specifically testing for Johne's disease and chronic wasting disease. • We support continued research on elk behavior as well as developing partnerships with other organizational experts to further understanding of elk behavior and management. • This alternative is deficient in providing a long-term elk management plan and specifically no effort has been addressed to consider the use of contraceptives. • This alternative is deficient in requiring improved quality of life and care standards for domestic animals and livestock currently on ranch properties. • This alternative is deficient in providing additional support and information on livestock guarding animals for ranchers. • We support efforts to determine appropriate animal grazing on lands determined appropriate for this activity as well as determining the appropriate number of animal units for these areas. • We support ranch diversification efforts but they are deficient in allowing ranches to be maintained with higher standards around energy use, manure disposal, and other remedies helping to combat climate change as demonstrated by many specialized Marin ranches outside of the Park. • This alternative may be deficient in helping to provide immediate corrections to ranch infrastructures that provide for appropriate shelter, fencing, and water sources. • This alternative is deficient in providing wildlife-friendly fencing. • This alternative appears to be deficient in ensuring all livestock water troughs are equipped with wildlife escape ramps. • This alternative appears to be deficient in providing guidance on pest management. We would support a complete ban on rodenticides and other poisons used on wildlife. We support the use of integrated pest management (IPM) concepts for weed control as outlined in this alternative. • We support continued efforts in this alternative to determine prescribed grazing efforts with ranchers. • We support efforts to eliminate forage production in sensitive wildlife areas as outlined in this alternative. • We support the continued efforts to ensure manure disposal on ranches is regulated pursuant to the California Code of Regulations. We are also very supportive to see this alternative will explore additional state-of-the-art manure disposal systems that have proved to be very successful on other Marin ranches. • This alternative allows in-residence trapping of rodents and bans the use of rodenticides and poisons which we support. We believe this alternative may be deficient in defining "in-residence," and suggest that other out buildings, barns, sheds be included in this language and definition. • As identified in this alternative, we support the continued elk management practices and assistance to ranchers when there are damages or mitigation efforts to maintain peaceful coexistence between elk and ranching, and visitors. • We fully support all efforts to maintain elk management techniques, including herd counting and the use of technology such as GPS collars on elk. Additionally, we support the Park developing a large pool of experts to enable state-of-the-art management plans that are effective, efficient, and valuable to conserving and managing wild elk populations in other areas of the state.

Alternative B (NPS Preferred Alternative) - This alternative appears to be the choice we would generally support, however we have very strong concerns about the lethal removal of any Tule elk. The following are our general comments with regard to this alternative: • We support the concept of "subzones" on individual ranches and we believe this concept may work beneficially for both ranchers and park management. • We support the 20-year terms for individual ranches, especially those with livestock. These enterprises are unique to Marin in the way they are managed and we believe long-term leases will enable park management consistency and will benefit those families willing to work within the Park rules. • We support the Park working collaboratively, as identified in this alternative, with various organizations and stakeholders. • We support this alternative prioritizing the Tule elk herd management in identifying trends, movement patterns, and habitat utilization. • We support this alternative exploring additional multi-use trails as well as improving many existing trails. • This alternative appears to be strongly deficient in the area of personal on-leash dog walking in any area. We would encourage and strongly

support consideration of any new and existing trails or other areas that accommodate responsible dog walking by individual dog guardians. As the Bay Area continues to grow in population and visitors, finding appropriate areas to recreate with family pets becomes more difficult and pushes users to limited areas which can have potential for negative impacts. • The proposed pasture subzone fails to allow compliance with state statutes with regard to providing proper shelter for animals in that it prohibits "permanent buildings." We believe this alternative is misleading and potentially deficient in describing how animals would have access to appropriate shelter in "non-permanent buildings." • We support the individual ranch operating agreements for ranching activities. We believe this document has the ability to determine additional factors for animal care, wildlife management, and potential negative impacts from elk. • We believe this alternative provides significant guidance on determining appropriate animal units on each ranch. We would support the park collaborating with agricultural and range management experts to develop appropriate standards that benefit both the park and the ranchers. • We support ranching diversification efforts in this alternative. Any horse boarding activities are currently monitored and regulated by Marin County Ordinance 8.04.240 and our animal services contract. We would request any new facilities be required to obtain a commercial animal establishment permit through our department. • This alternative is deficient in requiring horse boarding facilities to be in compliance with State Water Resources Control Board regulations, especially those that may end up in the Ranch Core Subzone. • This alternative fails to specify the use of wildlife friendly fencing to exclude wildlife in potential row crops in the Ranch Core Subzone. • This alternative offers misleading information with regard to the term "Guard Animals." All alternatives in this plan should correctly refer to animals (dogs, donkey, llamas, etc.) as "Livestock Guardian Animals." California Health and Safety Code 121881 defines "Guard Dogs and Sentry Dogs" as those used to protect premises against intruding persons. "Livestock Guardian or Guarding Animals" is the proper term that should be utilized for the animals assigned to guard livestock and poultry on ranch properties. We strongly support the use of Livestock Guarding animals on all ranches within the Park. Marin County specializes in having a non-lethal predator program that is the only one in the country. Livestock Guardian Animals and other non-lethal methods of predator control are essential to keep livestock as well as wildlife safe from harm. We support the mitigation methods proposed in this plan, but the proper definition should be utilized. • All canines housed on ranches should be required to be properly licensed pursuant to Marin County Ordinance 8.04.030 or if more than four adult dogs are housed on any property the requirement for a ranch dog permit pursuant to Marin County Ordinance 8.04.246 should be obtained. • This alternative is deficient in requiring proper shelter for animals by the way of proper temporary structures, it only addresses temporary fencing for animals. • We support the fencing in this alternative being wildlife-friendly fencing as well as the proper removal of abandoned fencing. • We support the grazing management in this alternative as outlined in Alternative A above. • We support the manure management in this alternative as outlined in Alternative A above. • We support the pest control restrictions in this alternative as outlined in Alternative A above. • We support all of the management measures of Tule elk in this alternative as outlined in Alternative A, with the exception of our strong opposition to any lethal removal of elk for population management purposes. • We support the use of hazing elk as outlined in this alternative.

Alternative C- We do not support this alternative. See comments made on Alternative A and Alternative B. Additionally, we provide the following comments: • This alternative fails to provide proper elk management techniques and relies on the lethal removal of elk which we strongly oppose. • This alternative inadequately addresses proper elk management techniques by simply relying on population control through only lethal remedies.

Alternative D- We do not support this alternative. See comments made on Alternative A and Alternative B. Additionally, we provide the following comments: • This alternative provides for one-year phase out periods for some ranching and grazing areas. This is insufficient in providing proper notice and alternatives to ranchers in these areas, especially those that house livestock. • This alternative is insufficient for elk management and relies on lethal removal of elk which we strongly oppose.

Alternative E - We do not support this alternative. See comments made on Alternative A and Alternative B. Additionally, we provide the following comments: • This alternative is deficient in evaluating if dairy ranches could be converted to beef ranches in a period of five years. • This alternative fails to disclose if the existing dairy ranches would be appropriate to be converted to beef cattle operations. • This alternative is incomplete in

determining other options for converting dairy ranches. • This alternative fails to provide a long-term elk management plan. • This alternative fails to promote proper coexistence strategies between ranchers and park visitors. • This alternative is deficient in describing the mitigation measures that would be taken for negative elk conflicts.

Alternative F - We do not support this alternative. See comments made on Alternative A and Alternative B. Additionally, we provide the following comments: • This alternative removes ranching from the park. This is in conflict with the park using contracts for livestock grazing. There seems to be inadequate measures described in this alternative for how grazing contracts would be managed and if they would prescribe the same tactic used in Alternative B. • This alternative fails to mention the use of Livestock Guardian Animals for potential grazing species. • This alternative fails to disclose which species of animals would be utilized for grazing purposes. • This alternative is insufficient in providing a long-term elk management plan. • This alternative utilizes lethal remedies for elk population control which we are strongly opposed to. • This alternative is insufficient in exploring the use of contraception options on the elk.

Other Alternatives Discussed but Dismissed from Further Analysis: • Comments do not include information on injection site abscesses of elk being treated for fertility control. This issue may be a result of improper placement of darts, improper dart removal, darting equipment, and improper pressure used in chemical capture equipment. • The findings fail to provide any new research results or current information on PZP and Gonac on which continue to be successfully used around the world on a large variety of species. • Ground darting strategies are important for the success of any contraception plan of wild species. No findings or information has been given on what ground darting strategies were used and why they became insufficient. • Surgical sterilization findings were not thoroughly explored. New techniques in this area continue to be successful in many wildlife management projects. The use of helicopters for this process is only one option. • Translocation research within the Park appears insufficient in numbers for it to be successful. The document describes translocation experiments done in 2015 and 2017 (page 62) on only five elk. We believe the small number of elk involved in this experiment would negatively impact the validity of the experiment. This remains another area that additional research may be helpful in developing long-term elk management plans. • Fencing of elk should remain a serious management strategy for long-term success. Specifics on fencing that works on elk should be tested in key areas of concern. • We strongly support no public hunting of elk on parklands as a management measure. • Hazing methods on elk should be supported. We support not using vehicles, dogs or drones, however there are many additional hazing tactics that may be beneficial and worthy of being tested.

Thank you for the opportunity to provide comment in a variety of ways. We are happy to offer additional expertise on wildlife coexistence, domestic animal care, pet guardianship as well as local and state animal enforcement issues. Please feel free to contact us at (415)506-6209 to discuss any issue in more detail or if we can be of further assistance to you.

Sincerely,

Captain Cindy Machado, CAWA Nancy McKenney, MNPL, CAWA Director of Animal Services Chief Executive Officer

Correspondence: To: GMP c/o Superintendent From: Mary Anne Flett, Wildlife Biologist, Citizen, Taxpayer  
Date: September 22, 2019 Subject: Comments on the Point Reyes National Draft EIS for the Seashore General Management Plan Amendment

I am a local wildlife biologist and naturalist. I have worked in my field for over 40 years. I've lived next to the Point Reyes National Seashore (the Park) for 23 years and know it intimately through hiking, horseback riding, bird watching, and kayaking here since the 1970s. The diverse, rich bird life for which Point Reyes is nationally and

internationally known and the opportunity to live near a beautiful natural area attracted me to live here. I've been leading bird watching trips in the Park and elsewhere in Marin for more than 10 years. I've conducted research for decades on a migratory, endangered bird species that breeds in mountain meadows in the Sierra Nevada. I've seen first hand how management of livestock grazing (beef cattle) and demands for human recreational use on public land impact habitat for endangered birds as well as other wildlife species. These issues are similar to the ones here in Point Reyes National Seashore. My comments are based on a lifetime of professional experience and familiarity with this Park.

The DEIS considers continued ranching but neglects to provide an alternative that prioritizes the Parks unique natural environments and its diverse ecology. The National Parks mission statement is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations (Organic Act of 1916). However, there is a complete absence of any alternative that leads with an emphasis on the ecology and ecosystems within the Seashore or addresses how to protect them. There is no discussion about balancing ranching with wildlife (not just Tule Elk) and holistic ecosystem management if ranching is to continue. None of the six alternatives addresses restoration, such as repairing stream banks eroded by livestock, replanting riparian vegetation in places where it used to grow, improving degraded water quality due to runoff from livestock operations. No provisions are presented about how that will be undertaken, funded, and how further damage will be prevented. In my opinion, destruction of Tule Elk herds and degradation of the landscape by ranching and intensive, under-regulated visitor use clearly constitute impairment of enjoyment for future generations.

In short, there isn't any alternative presented in the DEIS that I believe is acceptable and I do not support any of them. I hoped that a new General Management Plan Amendment would improve conditions for biological resources within the Park. Instead, the alternatives consider primarily ranching vs. Tule Elk management, as if those are the only two issues of importance. Although management strategies for ecological function are listed in tables at the end of the DEIS, they aren't included in the alternatives. No mention is made about how the Park plans to implement or fund the measures listed in the table under any of the alternatives. It is a serious oversight and a contradiction of the Parks Mission Statement that the DEIS neither prioritizes nor provides a discussion of a well-thought out holistic ecological program, nor incorporates a plan for restoring degraded landscape, wetlands, vegetation, or wildlife habitats as an integral part of all of the alternatives.

Alternatives that open up more intensive visitor use (opportunities) may result in significant adverse impacts even compared to those caused by ranching operations. If trails, car and boat-in camping, and new trails for hikers and bicycles are opened up for visitors, those users often create social trails and single track bike trails that degrade plant communities and disturb wildlife and habitat. (Also see Recreation, below). Allowing boat-in camping in Drakes Estero Marine Wilderness (and continuing at current levels it in Tomales Bay) would impact eelgrass. Eelgrass is a keystone organism because it hosts multiple species, provides nursery habitat for fish, and it sequesters carbon. Drakes Estero also provides pupping habitat for Harbor Seals, protected under the Marine Mammal Protection Act. Expanded visitor use opens up issues that the Park may not be able to manage effectively in terms of oversight and law enforcement, due to funding and staffing constraints.

Below is a summary of the reasons that none of the alternatives as presented in the DEIS is acceptable to me or aligns with the parks own mission statement:

- None of them is primarily oriented towards protection of natural or biological resources or proposes alleviating or restoring environmental degradation caused by current and past livestock grazing practices.
- Expansion of visitor opportunities proposed in all of the alternatives would increase human traffic and disturbance by opening up new areas in the park. Increasing human disturbance doesn't serve the Parks mission to leave natural resources unimpaired.
- Agricultural diversification, especially for private profit, within a National Park is inappropriate and would likely create conflicts with wildlife. It would also lead to more demand to grow and harvest silage for added livestock types (e.g., pigs).
- Four of the alternatives require lethal extermination of Tule Elk and one (F) allows extermination of elk until the ranches are phased out; this is unacceptable.
- Alternative E allows for conversion of dairies to beef cattle grazing. A deficiency in the DEIS is that tables don't show how many beef cattle AUs are

currently allowed or how many are usually or currently stocked by the lessees. Beef cattle have a huge impact on the land by compacting soil, degrading riparian habitat, eroding drainages and stream banks, and uncontrollably spreading invasive weeds. There is nothing unique about beef cattle ranching as a historic cultural resource in the park; it (and the degradation it causes) can be observed all over the American West. Although prescribed grazing with limited numbers of cattle may be sometimes be useful for managing native plant communities and species, raising beef cattle in Point Reyes doesnt seem to fit the definition of a cultural resource that needs to be preserved for future generations in a National Park, particularly given how many other opportunities there are to experience this elsewhere.

(photo) Beef cattle at D Ranch on September 22, 2019. (Note overgrazed and denuded landscape in this location)

I would choose Alternative A, if forced to support one of the alternatives presented in the DEIS. This alternative maintains the status quo and does not allow for extending 20-year leases to the ranchers. This seems to be the best approach until such time as the Park can come up with alternatives better than those presented in this DEIS. Shorter-term, rather than 20-year, leases would allow more timely adaptive management adjustments and would allow the park to work with or evict ranchers who violate their agreements and ignore protective measures for natural resources. Alternative A does not allow expanded diversification such as row crops (including small vineyards, etc.) and other types of livestock production. It would also keep human use at, or near, the same level as it is now rather than expanding visitor opportunities (read: impacts) in new areas of the Park with unforeseen consequences. However, in order for me to support Alternative A, ranching practices would need to change - a lot. The Park would need funding and more staff to hold ranchers to agreements and to implement measures that protect natural resources and keep the Tule Elk alive, remediate problems such as controlling Common Raven numbers and growing silage, and to instigate restoration of degraded habitats and water quality.

If any alternative including ranching is adopted, the following points must be addressed: RANCHING AND WILDLIFE

The Park, funded by taxpayer dollars, has expended huge amounts of effort and money towards re-establishing the Tule Elk herds and they are a native species that belongs here. According to the Parks own records, there are 730 Tule Elk and a total of 5530 cattle (2,400 AU of beef cattle and 3,130 dairy animals) in the Park. The carrying capacity based on available forage is currently supporting more cattle than Tule Elk. If there isnt enough forage to support both elk and cattle, it is the number of cattle that should be reduced, not elk. Tule Elk numbers will eventually have to be managed by humans due to lack of natural predators in the Parks ecosystem. But, as grazers, they could serve the same function as beef cattle if cattle were removed from the park. Tule Elk would reduce cover to benefit native plant communities and rare species, limit vegetation that could fuel a wildfire, and maintain grassland habitats for native wildlife. Tourists appreciate the parks wildlife and often stop to watch elk, coyotes, and occasionally, bobcats, gray foxes, or badgers and I doubt that most of them visit Point Reyes with the desire to experience the everyday function of a modern-day cattle ranch. Preserving Tule Elk populations is historic and also consistent with the Parks stated mission, which is to leave them unimpaired for the enjoyment of future generations.

Livestock numbers should be monitored and maintained at a level that the land can support. Grazing practices should be conducted in a manner that preserves the land and soil, enhances native plant communities, and provides ideal habitat for all native species, not just those that are federally and state-listed. Current conditions on some of the ranches include compacted soil, little to no remaining biomass at the end of spring and summer due to grasses and forbs that have been grazed down to nothing, and invasive weeds associated with disturbance and seeds in imported hay. If ranching is allowed to continue in the Park, there are examples of innovative ranching practices available as models to guide management in Point Reyes. TomKat Ranch in San Mateo is one example (<https://tomkatranch.org/who-we-are/>). Cal Polys Swanton Pacific Ranch in Santa Cruz County is another (<https://spranch.calpoly.edu>).

There is no provision for restoring degraded habitat in any of the alternatives. Restoration should be required under any alternative that is adopted in the General Plan Amendment and the DEIS needs to address this.

Ranchers and the Park must work together to repair and restore eroded waterways and to replant riparian vegetation where it formerly grew. A specific plan should be presented for restoring trampled and compacted wetlands. It should include how these habitats will be re-planted and monitored. Success should be guaranteed over time. High water quality standards should be reinstated and maintained throughout the Park with performance standards and monitoring included in the plans. The DEIS should discuss how such efforts could be funded, when it can begin, to what standards it needs to conform, and who will be responsible for implementing the restoration. If a rancher repeatedly allows cattle to escape into fenced-off protected habitat, the Park needs to follow up with consequences such as a reduction in allowable AUs or even non-renewal of their lease in case of repeat offenses.

Diversification practices that allow row crops (potentially including small-scale vineyards), pigs, sheep, goats, and chickens on the ranches will cause conflicts with wildlife. Crops will attract raccoons and other foragers that could reduce or decimate produce; chickens and other livestock will certainly attract predators. Ranchers would then ask the park to control or exterminate these animals (in the same spirit that is proposed for managing Tule Elk who graze on ranch lands) or worse, take matters into their own hands. According to the DEIS (p. 38), Any new diversification of livestock or row crops in the preferred alternative specifically prohibits management of predators and other wildlife by ranchers. Although the Park claims that ranchers will not be allowed to control predators if diversified activities are allowed, I doubt that the park has the resources or funding to oversee this., For-profit businesses do not belong on public land in general and it is not the National Park Services responsibility to ensure profitability of the ranches. If diversification is allowed in Point Reyes and ranchers are permitted to sell dairy products, eggs, produce, etc., the products should be sold through Point Reyes National Seashore Association and the profits reinvested into the Park to fund natural resource protection, restoration, and enhancement projects.

Eliminate the practice of growing and mowing silage for dairy cows (Ive commented on this at every opportunity in the past) and do not allow more land to be dedicated to silage production. If diversification is allowed on ranches, ranchers will request permits to grow (and harvest) more silage to feed pigs and other animals than they now grow only for cattle. Growing silage attracts nesting birds and small mammals and provides cover and forage for animals. The practice creates an ecological trap by displacing and destroying nests when the fields are mown. Ground and near-ground nesting bird species such as Grasshopper Sparrows (a declining species, listed in California as a Species of Special Concern), Northern Harriers, and California Quail are most vulnerable to mowing during nesting season. Secondary impacts of silage harvesting include attracting Common Ravens and other scavengers into the area who then feast on snakes and mammals that have been exposed or killed during mowing.

I have observed more Common Ravens in the Park in 2019 than ever before. There were 75-100 Ravens in the field at I Ranch in August, presumably attracted to seed in cattle manure. Jules Evens addresses the Raven issue in his comments on this DEIR (pers. comm.), and provided a photograph of 24 Ravens at a trough at B Ranch. They are intelligent and opportunistic and they prey on Snowy Plovers, Red-legged Frogs, and other bird and mammal species present in the Park. Snowy Plovers are federally listed as Threatened and California state-listed as a Species of Special Concern. State Parks (Big Basin, Butano, Patricks Point, Prairie Creek) provide strict guidance for visitors in order to prevent expansion of Corvids in their parks as a way to prevent predation on a different Special Status Species, Marbled Murrelets. If ranching continues in Point Reyes, the park should double down on Raven control measures including requiring tourists to carry out or dispose of trash and excess food, instigating trapping programs, and requiring ranchers to cease practices such as spreading manure and feeding grain in locations where Ravens can access it.

Tricolored Blackbirds, a nearly endemic species in California, are state-listed and rapidly declining. Small numbers of these birds formerly bred in western Marin County annually during the late nesting season (July-September; thought to represent second breeding attempts by birds that previously nested elsewhere until 2003 (Stallcup 2004). There has been no documented breeding in Marin County since then (CDFW 2018). Wintering flocks formerly numbering more than 10,000 birds assembled near dairies on the Point Reyes Peninsula, Marin County, by mid-October in the 1980s, but these numbers have been reduced to 3,000 or less in recent years (eBird

Dataset 2016). Flocks of Tricolored Blackbirds still occur during the fall and winter on the dairy ranches at the outer peninsula of Point Reyes, where they feed on insects, seeds, and undigested grain associated with cow manure in the loafing areas. This is an upside of dairy ranching that supports the notion of retaining at least some dairy ranching in the Park.

(photo) Dairy Cows and Tricolored Blackbird Flock at B Ranch, September 22, 2019.

There are some benefits to ranching in the Park; I'm not necessarily in favor of full-scale eviction of ranching operations. I like the dairy cows and it is a less-common opportunity to see a working dairy operation than it is to see beef ranching. However, if the ranches stay, the number of them should be reduced and they should be managed with innovative methods that prioritize and ensure the health of native organisms and ecosystems in the Park. There should not be for-profit businesses associated with them.

It is within the Parks mission to protect bird life and habitat for the enjoyment of future generations. A recent study (Pennisi 2019) found that bird numbers have declined precipitously; 2.9 billion birds, or 25% of the population of birds on our continent has been lost since 1970. Grassland bird species have declined by 720 million, a 50% population loss. Given these sobering declines, every measure to protect birds should be implemented in the Park, including protecting grasslands and other habitats from degradation by livestock and high-impact human recreation. Ranchers must abide by the federal Migratory Bird Treaty Act and the California Department of Fish and Wildlife laws protecting migratory and native birds, which includes not mowing silage and conducting other activities that cause take or harm to nesting birds during nesting season. The Park should require ranchers to abide by these laws.

Ranchers should be required to maintain their buildings and facilities to a reasonable standard and clean up their facilities and yards, including junk piles of abandoned appliances, vehicles, and toys. (photo) Mess and Junk pile at A Ranch, September 2019.

No outdoor cats or outdoor feeding stations should be allowed in the Park. An American Bird Conservancy report (2006) on the impacts of outdoor cats says that loss of habitat and fragmentation due to human development are the primary causes of bird population declines worldwide. Invasive species, including cats, are the second most serious threat. They also state that scientists estimate that our nations free-roaming cats kill hundreds of millions of birds, small mammals, reptiles, and amphibians each year, including endangered species. The report also says that free-roaming cats are capable of spreading zoonotic diseases and parasites to other cats, wildlife and people.

(photo) Outdoor cat feeding station at A Ranch, August 2014; feeding continues into September 2019.

## CULTURAL RESOURCES

Why are cultural resources in the park defined as historic ranching and not inclusive of the indigenous people, the Coast Miwok? This appears to be an oversight that disrespects the Parks original inhabitants.

The history of bird watching in the park should also be considered as a historic cultural resource. Over 50 years ago the well-known naturalist and ornithologist, Rich Stallcup, discovered the phenomenon of lost, vagrant migrating birds that land in the non-native pines and cypresses in Outer Point Reyes to rest and forage. Point Reyes also supports rich and diverse habitats for birds and this, together with the opportunity to view out-of-place migrants, attracts local, national, and international visitors to the Park. The DEIS should provide measures to protect historic habitat used by vagrant birds and specifically continue to allow for bird watching opportunities and access for the public.

## RECREATION

Expansion of bike trails into the park would increase human disturbance to wildlife, cause erosion on dirt trails, and make single-track paths where they shouldn't be. It's well known and documented that mountain bikes disturb

trails and cause erosion. They disturb the peace for people who desire to hike in peace and quiet without disturbance by fast-moving bicycles. Adding additional horse-boarding facilities is not appropriate within the park. Five Brooks facility provides regular horse rental rides that are eroding the trails nearby, particularly along the south side of the pond. Manure loads on the trail surrounding the pond, particularly the south side, is probably a source of high-nitrogen runoff into the pond, whose surface is now covered with Water Fern with invasive Parrots Feather weeds growing along the margins. Large-scale trail-based events are completely incompatible with the Park mission and are inappropriate in a National Park. There are visitors camping at Kehoe and Limantour Beaches on weekend nights, overnight campers and partiers at Tomales Bay boat-in camps with bright lights and loud music, commercial recreational enterprises who reserve and dominate camp spaces on the bay, and trash and human waste along trails and roadsides throughout the Park. Park personnel are already over-taxed and often unable to deal with or respond to these problems. It can be assumed that there would be similar issues if more facilities were added at Drakes Estero. As a Marine Wilderness area, Drakes Estero is unsuitable for camping.

How would the Park fund oversight and maintenance if there were more visitor facilities within the Park?

Farm stays, B&Bs, tours, cheese-making operations, sales of produce, eggs, or dairy products or any other private, for-profit enterprises on should not be allowed on the ranches. They are inappropriate in National Park or other public lands (see discussion of diversification, above).

Thank you for considering my comments. They are written with deep appreciation for the native environments, wildlife, and plants within the Park, for the efforts that the Park supervisors and biologists have made on behalf of the Seashores natural resources, and in hope that the new General Plan Amendment can improve on the efforts that have already been made to preserve our beautiful Point Reyes National Seashore.

Mary Anne Flett

Correspondence: Do not sacrifice wildlife for greed, wildlife & protected wilderness are much more valuable, once gone they are gone forever.

#7041

Name: Sousa, Paul

Correspondence: Western United Dairies (WUD), a statewide dairy producer trade association that represents dairy producers on a variety of issues, including six dairy farm-members located within the Point Reyes National Seashore (PRNS), offers the following comments on the draft Environmental Impact Statement (EIS) for the General Plan Amendment. First, it is important to mention that PRNS exists because the dairy and ranching families of Point Reyes voluntarily sold their land to the National Park Service with the understanding that dairying and ranching would continue to be a part of the historical and active function of the new park upon its creation. These families have a multi-generational relationship with the land that they steward within the park, and are a vital part of the culture of the park as it exists today. 1) We believe the Park Service should establish an Agricultural Advisory committee to provide input on the agricultural land uses within the Park. Decisions that affect dairy and ranching families within the Park must be made with input from those with working knowledge of farming practices, markets, economics, and regulatory factors. 2) The document must include a discussion on the importance of dairying and ranching to the creation and ongoing purpose of the park and surrounding community. 3) Elk should be excluded from the ranch land at the park. It has become apparent that the conflicts between cattle and elk in the park do not allow for viable ranching within the ranch lands. The elk consume forage, damage fences and other infrastructure on ranch lands and present a risk to the safety of livestock.

We would add that we are in full support of the detailed comments submitted by Point Reyes Seashore Ranchers Association, but would like to call out the above comments as specifically crucial to the success of our dairies within the PRNS. Dairying and ranching have a long history at Point Reyes, including the formation of the Park as we know it today. Ranch families were assured that they would have a place in the park to maintain that history and ongoing way of life, and ranchers should have a voice in this process as their livelihoods are on the line in the decisions reached on this issue. Thank you for the opportunity to comment and feel free to reach out to WUD if you have additional questions.

Name: Rogers, Dan

Correspondence: As a long-time visitor to our glorious National Parks, I urge the NPS to do what is right and eliminate all ranching and dairy operations from Point Reyes National Seashore. This will protect the Tule Elk populations, and restore the park to its original beauty. There is no excuse for the NPS to support a narrow agricultural policy at the expense of wildlife, and the elk have far more right to be at the park than the ranchers and farmers do. Ranching and dairy operations should have never been allowed in the park, and their operations should cease immediately.

The National Park Service's mission statement states that it "preserves unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations." In order to live up to your own values, you owe it to the country and to the native species at Point Reyes to rid the park of all dairy and ranching operations forever. Thank you.

Regards, Dan Rogers

Name: Hetherington, Kathryn

Correspondence: I support Alternative F. Beef and dairy production should be decreasing, it is deeply worrying that it is even a consideration to increase cattle and dairy ranching in this area of natural beauty and wildlife. The effects of climate change are threatening our way of life now and in the future our children are going to suffer immeasurably. 2019 is being dubbed the 'year of the vegan' but in the least humans should be greatly reducing their meat and dairy intake. Cattle and dairy ranchers are not interested in the health of consumers and sustainability of our planet and they have already stayed beyond the initial period of time that was originally planned. Animal agriculture is a violent and destructive industry and is responsible for a fifth of greenhouse gas emissions. We are living in a State that is drought prone and while we take shorter showers, do not water our gardens or wash our cars, dairy farms are using millions of gallons of water per day in milk production and using taxpayers money to do this. We are teaching our children to reduce, reuse and recycle yet the adults are meanwhile killing their planet and extinguishing so many different animal species. This is the home of the Elk not the rancher. We must stand for those who are voiceless.

Name: Schnapf, David

Correspondence: I have in the past twice submitted comments on the NPS plans for PRNS. My prior comments are incorporated by reference as though fully set forth herein.

The draft EIS is legally deficient and subject to challenge for at least the following reasons.

- 1) It ignores the legal mandate about how PRNS should be managed.
- 2) Other than the "no action" alternative, it fails to present or analyze alternatives that do not involve ranching. Specifically, it fails to present or analyze alternative uses for the park, such as more diverse recreational activities that are in harmony with the use of the land as a National Park.
- 3) It fails to adequately address regional impacts of subsidized farming in view of prevailing economics of farming in the region. In my prior comments I submitted clear evidence that continued ranching in the Park would mean the demise of other farms in the region, which would, in turn, result in farmland being converted to more intensive uses. This will have a profound effect on the region.
- 4) It fails to adequately analyze the effects of the green house gas emissions associated with ranching. PRNS will become the biggest source of greenhouse gas emissions in the county.

#7046

Name: Saied, Donya

Correspondence: To the National Park Service:

As a taxpaying citizen who is gravely concerned about all misuse of tax dollars, and misuse and abuse of public property, I am vehemently against Point Reyes private ranching companies and the NPS conducting deadly, destructive activities that will result in the shootings of rare California Tule Elk. As administrators, you are accountable for any corruption taking place on public land on your watch. The fact that ranchers receive taxpayer-subsidized grazing leases and handouts in the form of housing far below market value in a NATIONAL PARK intended for the benefit of me and everyone in the Bay Area, California, and America is terrible. In fact, NPS should officially recognize that cattle grazing is an outdated experiment in the land management practice at Point Reyes--because now that the Tule Elk population is recovered, growing, and thriving, the cattle are unnecessary for vegetation management and should be phased out entirely.

In regards to this specific the proposal:

- First, cattle companies should have to pay the market rate for anything they take from the me, all taxpayers, and America. These leases need to be re-negotiated and/or terminated.

- Second, taxpayers bought and maintain Point Reyes for the sake of our burning conviction that God's creation, nature, with its breathtaking awesomeness, majesty, and beauty that glorifies God, must be saved and shared with the world, our children, and generations to come. Taxpayers across the country, tourists coming from across the region who boost the economy, and fee-paying visitors who pay to see nature, not cows, demand that our majestic, rare, and inspiring Tule Elk be protected and not butchered. The herd size should be managed by acts of God and predators, as nature and the American people intended when they set up the NPS.

-Third, ordinary, privately-owned cows are eating hay or grass are everywhere and anywhere in the country, and their owners do not have the right to perpetually be on any NPS or American public land, and any leases should be terminated especially in cases such as this one - - where serious threats are being made against the lives the land is legally required to protect and enhance. Cows should be removed so that the taxpaying American public who owns the land can enjoy and protect our Tule Elk - - we have paid so much to restore, preserve, and conserve the Tule Elk. The cows can go back to whatever barn or pasture they came from.

- Fourth, the irreplaceable heritage of Point Reyes National Seashore is a being threatened by grazing and associated unnecessary and destructive behavior. As NPS administrators your job is to ensure "maximum protection, restoration, and preservation of the natural environment." Do not fail!

In conclusion, Tule Elk should be allowed to roam free and forage in the park - not shot, removed, fenced or treated as problem animals.

Taxpayer, citizen, anti-corruption advocate, and American, Donya Saied

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

Name: Barnett, Lindsay

Correspondence: To whom it may concern:

I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing, which poses a threat to the

environment and local wildlife. The Point Reyes National Seashore should be protected and used to serve the public good, not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

Please do the right thing for citizens and wildlife, rather than prioritizing a damaging for-profit industry.

Thank you for your attention to this matter.

Sincerely, Lindsay Barnett

Correspondence: We need to protect these areas - we have taken so very much from this earth and from the animals - please leave this area alone

#7050

Name: Evans, Jon

Correspondence: The preferred alternative is bizarre and wrong. This is a park. It is irreplaceable and irreproducible. There should be fewer-trending-towards-zero ranches and more elk, rather than the other way around.

#7051

Name: Porter, Jane

Correspondence: President Trump's National Park Service has put out a shocking plan to kill native tule elk in California's Point Reyes National Seashore, the only national park where these rare animals live.

The agency would shoot up to 15 elk every year to appease private livestock owners who enjoy subsidized grazing of their cows on this precious public land. Its plan would enshrine private, for-profit cattle-growing as the park's main use - while doing little to rein in the damage from grazing, including water-quality degradation and soil erosion.

But that's not all. The plan would allow conversion of park grasslands to artichoke farms and row crops and let ranchers introduce sheep, goats, chickens and pigs - a recipe for even more conflict with native wildlife.

#7052

Name: Thomas, Skyler

Correspondence: Please consider Alternative F. Dairies, ranching, and agriculture are not rare or special in Marin County nor even in California, in fact it is a state dominated by agriculture. What this seashore has to offer is what is rare and special and the locals have benefitted greatly from its existence. Imagine how much more tourism could still be increased if the rest of the seashore was restored to even half its potential. As of now, tourists drive past the overgrazed pastures to reach a handful of destinations that are still attractive enough to entice recreational users. These desired areas have one thing in common - they are free of ranching activities. Your own responsive management survey confirms that the public asked for a reduction in ranching and an expansion of wilderness. Documents published on your own website and studies conducted on behalf of the seashore show that ranching is having a devastating effect on the habitat in Point Reyes. Pretending that the already poor state of

land management can possibly improve by expanding ranching defies reason. FOIA documents show that the ranchers have been bad tenants, expensive, lease-violators, and difficult to work with. There is more to life than money and protecting your careers. Do the right thing, make a public stand, and you will be remembered for it.

#7053

Name: Poletti, Monica

Correspondence: I'm writing to voice my support for eliminated or reduced ranching and no lethal intervention in the Tule elk population in Point Reyes and the north district of Golden Gate National Recreation Area. First and foremost, I support allowing Tule Elk to continue to live, roam, and establish new herds as naturally as possible, with no lethal population control if human intervention is necessary. I also support reducing infrastructure from ranches as much as possible from these areas, allowing only grazing cattle in areas that involve vegetation other than just grasses and shrubs. I believe that the natural plants and animals of Point Reyes would thrive the best in these circumstances, and the overall ecosystem health, from soil to water to air quality to wildfire impact, would improve greatly across the board.

Tule elk are vital to the health of the Point Reyes ecosystem. Their grazing habits actually improve biodiversity in grasslands and native plants, and they help to keep understories and forest floors less dense, leading to more sustainable plant growth, and more importantly, less wildfire damage. A less dense understory leaves larger trees more likely to survive wildfires, which in turn leads to more stable and nutrient-dense soils, fueling healthier plant life in the perfect cyclical way that only a healthy ecosystem can accomplish. Allowing their population to increase naturally would bring their benefits to parts of Point Reyes that they currently can't reach.

While opposed to cattle grazing because of pollution and related environmental stress, reducing grazing cattle populations and allowing silvopasture in designated forested areas instead of focusing cattle only on grasslands could have some of the same benefits as allowing Tule elk herds to expand and roam freely. Cattle becoming part of the ecosystem is key to its longevity in Point Reyes and should be considered a top priority when it comes to environmental and socioeconomic sustainability.

Allowing elk populations to grow into new areas (and potentially a small number of cattle to graze amongst forests) will improve the health of the natural landscape with minimal impact and invasion. In turn, because Californians love recreation, the NPS would be able to consider more integrated and less invasive trails and camping options (meaning minimal pavement and infrastructure), even if they are in areas where elk or cattle could be encountered. If beef and dairy cattle infrastructure is allowed to remain in place and the Tule elk population is lethally managed, I would strongly oppose any expansion to recreation options in Point Reyes, as the existing impact on the ecosystem would already be quite sizable, less robust, and more susceptible to damage from human activities.

Thank you for reading these comments and I hope you consider them in your review.

Correspondence: I support the Tule Elk, not the cattle farmers. I urge you to NOT allow the killing of natural habitants of this eco-system in order for unnatural animals to take their place. This is wrong on so many levels. Save the Tule Elk and stop cattle ranchers. Thank you!

#7056

Name: MacKenzie, Michelle

Correspondence: I am a lifelong California resident and lover of our native wildlife. I live in Northern California and have visited the Point Reyes Seashore many times, camping and hiking there many times. We love to see the elk and other native creatures who call Point Reyes home.

I vehemently oppose Alternative F which would permit the National Park Service to kill these native Tule elk, grow commercial crops and allow I oppose the National Park Service plan to kill native elk and grow commercial crops. The alternative would also allow ranchers to keep additional domestic livestock, including pigs, sheep, goats, chickens and turkeys.

Point Reyes National Seashore is not a farm. It is a national park, designed to protect, restore and preserve land for wildlife. When it was created, the National Park was intended to phase out livestock ranching yet this alternative would add additional farming and ranching to the park and allow ranchers to increase their business opportunities. This is against the original intent behind the creation of the National Park.

Grazing is well documented to cause damage to land. Livestock displaces native wildlife. Soil is eroded and water quality is degraded. Riparian areas suffer damage. Allowing crops to be grown would potentially displace native plants and create more conflict with wildlife.

Alternative F is a terrible plan. It is inhumane. It is against the original intent of the park. It is bad for our wildlife and native plants. Instead, we should be working to restore the land and expand wildlife habitat. Please reject Alternative F - from a native Californian. Farmers have lots of land in California. Wildlife - particularly Tule elk - have very little land. Lets give Tule elk priority at the Point Reyes National Seashore.

Name: Mesney, Barbara

Correspondence: I lived in the San Francisco/Bay Area for sixteen years and can testify to the value and importance of Point Reyes and the surrounding headlands as a vital resource to the Bay Area community and to the wildlife that live there. As a plant-based environmentalist who's number one issue is our Climate Crisis, i am appalled that our National Park Service would even consider adding to this worsening problem by the addition of

cattle. We need to be moving AWAY from this paradigm, not contributing to the death of our species and all life on this planet.

I deeply care about protecting California's wildlife. I STRONGLY oppose the National Park Service's plan to kill native tule elk and expand commercial agriculture in Point Reyes National Seashore and Golden Gate National Recreation Area. WHAT AN APPALLING PROPOSAL.

I urge the National Park Service to instead restore the lands for wild animal habitat.

The BLM has had its way for far too long with protecting their private interests on our public lands, nationwide. We should prioritize the preservation of our public lands and wildlife, not the economic interests of private ranchers. These commercial cattle ranches have serious negative environmental impacts on the park - polluting waterways, causing soil erosion, and harming the many endangered and threatened animals who live on Point Reyes. National parks exist to protect our natural resources and native wildlife. This park should be managed accordingly.

I ask you to please reconsider this plan. PLEASE HELP LESSEN the demand for animal products-meat, dairy, poultry-and usher in an era of global healing, not continued desecration of our environment and wildlife. We need to GET REAL about the global Climate Crisis. We already know that Big Ag contributes MORE emissions than the entire transportation sector. THIS HAS TO STOP.

Thank you for listening and ACTING in accordance with the current situation.

Barbara Mesney

#7061

Name: potts, randall

Correspondence: I have spent countless hours hiking, birding and writing in Point Reyes National Seashore and I've seen first hand how cattle grazing has been repeatedly allowed to continue to the detriment of the entire ecosystem. But most importantly, the iconic Tule Elk are now being targeted in favor of increased cattle grazing. This is unacceptable and flies in the face of the mandate of the National Park Service.

Point Reyes National Seashore is supposed to be managed under the Point Reyes Act for "maximum protection, restoration, and preservation of the natural environment." There's no mandate for prioritizing commercial agricultural leases on these public lands. Natural values, native wildlife, public access and enjoyment should take priority over commercial activities at Point Reyes.

Tule elk are an important part of the landscape at Point Reyes. Their recovery is a result of successful native ecosystem restoration, which is a key element of the Park Service's mission. It's taken a lot of time, money and effort to restore tule elk to Point Reyes, the only national park where they live. Tule elk should be allowed to roam free and forage in the park - not shot, removed, fenced or treated as problem animals.

The mandate of National Parks is to preserve ecosystems so that the American people can experience how Nature works. I urge you to follow this mandate and preserve this invaluable landscape and the remarkable plants and animals that call it home.

#7062

Name: Davis, Stuart

Correspondence: The NPS should adopt Alternative F to preserve the Tule Elk in its entirety. Animal diversity underscores the longevity and vibrancy of every ecosystem. While increased access to farming and grazing lands benefits food production and local commerce, these benefits are outweighed by the costs connected with species extinction, including water pollution, soil erosion, disease spreading, and increased invasive species. Alternative F presents an opportunity to not only maintain the natural splendor of Point Reyes National Seashore, but materially improve the well-being of local residents.

#7063

Name: Bash, Carol

Correspondence: Please adopt Alternative F, which would discontinue farming and ranching opportunities in the park and expand visitor opportunities. The preservation of native wild species must take precedence over farming and ranching activities. Remind it that grazing negatively affects ecosystems, causing water pollution and soil erosion, spreading invasive species and disease, and harming endangered species.

#7064

Correspondence: We adamantly oppose allowing the cattle ranches to remain on Point Reyes National Park land. We understand that the ranchers were paid millions of dollars and given 25 years or the lifetime of the owner to vacate the land which they had sold. They should be required to comply with the contracts they signed. The Park should not be commercially exploited. The Park land should be returned to its natural state, encouraging native plants and animals to flourish. We live nearby and often enjoy the Park and wish to see it given back to nature.

#7066

Name: Dillon, Christine

Correspondence:

I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands.

The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Name: Oppenheim, Diana

Correspondence: Dear Point Reyes National Seashore Superintendent Cecily Muldoon

I have been a long-time volunteer within Point Reyes National Seashore. I have spent years working in the coastal dunes, restoring sensitive habitat and protecting 4 endangered species and several other rare and threatened species. The wildlife in Point Reyes is some of the most diverse in the state and spending time enjoying the coastline, the trees, the plants, the birds, butterflies, the Tule Elk and other wildlife has been such a gift.

I started to volunteer in the dunes because I understand the importance of protecting the very small amount of wild spaces we have left. We are in a state of climate emergency. In the past 50 years, humans have wiped out an astonishing 60% of wildlife on the planet. We need to be doing everything we can to uphold and protect our biodiversity, as diverse ecosystems are healthiest and will adapt more easily to the climate emergency. So my work in the coastal dunes, and restoring a previously-destroyed ecosystem has been something I considered to be one of the most important things in my life. I saw it not just as a pleasant time in nature, I saw it as vital to the survival of our planet.

The reason why the coastal dunes have been destroyed was due to cattle ranching. Ranchers have planted invasive grasses to prevent sand from encroaching on their pasture lands. The European Beach Grass took over the ecosystem and created a monoculture where almost no native plants and animals could survive. It has taken an enormous amount of resources to restore a small segment of the dunes. My takeaway is: If you can prevent a mistake first, you must prevent it because fixing mistakes takes a lot of time.

When I learned the park is planning to uphold and expand the ranching in the seashore, especially when there is a chance to phase out such a destructive industry, I had to learn more about why that could be. The more I learned, the more I became upset. I believe Point Reyes National Seashore is consciously mismanaging their land, and allowing ranches to continuously run their business in a way that causes harm to ecosystems.

After I became vocal on my stance that the park should save Tule Elk and wildlife within the park, I was contacted by the park staff and given an ultimatum. I was asked to censor myself and asked to go back and delete all

references of my volunteer work in the park from my personal social media pages. NPS said that they have to appear neutral in the planning process, and that members of the public might mistake my personal opinion for a park position. I refused to censor myself, and the park has banned me from volunteering.

I have helped to collect hundreds of comments from other citizens who also want the park to choose wildlife protection and restoration and to phase out ranching. Melanie Gunn and the NPS has refused to accept those comments stating a policy of not accepting bulk comments.

Meanwhile, ranchers have been allowed to give presentations of the benefits of ranching on other volunteer events. Meanwhile ranchers are allowed to continue operations during the planning process. Meanwhile, the parks preferred alternative includes killing Tule Elk and upholding and expanding ranching. This is not a neutral position. This is a clear preference to uphold, protect and choose industry over the voice of the public and over the protection of rare, threatened and endangered species, and over the protection and restoration of our native ecosystems.

Here are some of my comments surrounding the parks General Land Management Plan.

1. Tule Elk should not be shot or lethally removed. In fact, they should be allowed to expand and create new herds. Tule Elk have gone through genetic bottle necking as their original population of 500,000 was reduced to just 20 individuals. To support the long-term survival of the species, genetic diversity of the herds should be considered. The plans management of the Tule Elk seem to be coming from their affect on ranching operations. I would like to see a management plan conducted with the long-term survival of the Tule Elk and their genetic diversity included in the alternatives. I would like to see more in depth analysis of the ecological effects of Tule Elk grazing on the land. Tule Elk, being native to the area, have been known to help restore grasslands and coastal scrubland. Other than potentially competing with cattle grazers, what negative effects have the Tule Elk had on the land? Other than potentially competing with cattle grazers and dairy industry, what negative effects have Tule Elk had on the land? I do not believe the GLMP has thoroughly addressed these issues. (

2. GLMP did not consider the effects of climate change. According to the United Nations and the International Panel on Climate Change, we have less than 12 years to mitigate the worst effects of climate change. They also suggest that land use has to change and we need to reduce the amount of land used for cattle grazing. The GLMP did not consider the effects of climate change when looking at land and water quality assessments. Cattle and Dairy operations in the park compromise over 60% of the parks greenhouse gas emissions. Over 160,000 gallons of water are used for cattle operations. With wildfires raging in the state of California more and more every year, it is irresponsible for the national park to use water to feed cows. To offer ranchers 20-year leases is irresponsible as we have less than 12 years to turn things around to minimize harm caused by climate change. (

3. I oppose the diversification of ranches. The ranchers have already been bought out by the federal government. The enabling legislation of Point Reyes is to protect wildlife. It says nothing about letting ranchers operation their businesses. The original permits of 25 years have expired and there is no need to continue to allow the ranches to operate at all. Ranchers were paid millions of dollars for their land already. Ranchers pay no property taxes. Ranches are subsidized by the federal government. The dairy industry is heavily subsidized by the federal government. Diversification would put more stress on the National Park to invest more resources to manage more things. The GLMP does not adequately explain how the park intends to manage and enforce best practices around these new, allowed practices such as sheep, goats, row crops, chickens and airbnbs. The park has limited resources both people power and financial budgets. The park has already failed to properly manage the dairy and cattle operations as is. There is no way the park will be able properly manage this diversification. (

4. Running ranching and cattle operations is not historic. The park is under no legal requirement to allow business operations to continue on National Park Land. The cultural and historic resource is considered buildings- NOT business. Pierce Point Ranch is a historic building site where the actual day to day operations have ceased. The public can still view this ranch in a historical context and learn the history of dairy industry by reading info tables. There are over 6000 cattle on the seashore. Those cattle are causing permanent scars in the landscape, creating

over 133 million pounds of manure annually that have to be dealt with. The enormous amounts of manure produced have led to water contamination and negatively impacts streams and rivers where rare, threatened and endangered species live. The business operations of these ranches and all their cattle are not needed to maintain the title of historic and cultural. (

5. Silage mowing is a terrible practice and needs to be stopped. Every year, ranchers plant invasive grasses to grow and then be mowed down to feed their cattle. Native bird and mammal species wind up in these fields of grasses just to be mowed down. A study by Point Blue showed that native bird species richness declined after silage mowing. The only exception to this was an increase in the Raven population. Ravens are the number one threat to the endangered snowy plover. This is a direct link between the park allowing industry to thrive at the direct expense of an endangered bird. Not only is this devastating for wildlife, but the park should not allow ANY non native grass to be planted within the seashore. Any grass or plants that are planted should be native, and should be for the purpose of restoration. The grass planted by ranchers are invasive and for the purpose of their business. (

6. I don't believe the GLMP has adequately explained how they will pay for and execute mitigation efforts of the ranching operations. (

7. I would like there to be expanded analysis on the effects to wildlife and restoration efforts after the phase out of ranching. What would the actual benefits be to water systems, wildlife, native species, native grasses, and even the public pleasure of viewing more wildlife in the park as they will be granted access to over 28,000 acres after the ranches are phased out. (

8. The GLMP does not showcase the multiple breaches in lease agreements between ranchers and the park. Through FOIA requests, we have seen the park cater to ranchers, pay for damage repairs to ranch property without evidence, dispose of cattle carcasses improperly and more. Ranchers have surpassed the number of cattle allowed by their permits. Please make this information part of the planning process, and explain how you will mitigate.

I support Alternative F. This is the only alternative that will actually protect our natural resources. A National Park supposedly has the highest protections for wildlife. I hope that Point Reyes can see past the status quo of the cattle and dairy industry and return the land to what it was originally supposed to be, and was originally bought and paid for to become: a wildlife refuge.

With sincerity and hope, Diana Oppenheim

Correspondence: I appreciate the time taken on the presented plans. As a local resident who visits the Seashore very frequently, I am distressed by the present management plans, as even a casual observer can see that the current approach to management of the ranches goes against the park's stated purpose of resource protection. Some comments on the DEIS:

-The EIS should remove all types of diversification from DEIS consideration and programmatic planning as the DEIS does not evaluate cumulative, direct or indirect impacts, connected actions, or reasonably foreseeable outcomes of diversification. How can the Seashore possibly sufficiently analyze the impact of diversified use of ranch lands?

-The historic ranches have an opportunity and obligation to protect resources on parklands. The EIS should revise the development of Ranchland Zoning so that it prioritizes holistic planning areas and resource protection buffers that are connected to sensitive resources, watersheds, and wilderness areas that are within and outside of

the Planning Area. The DEIS does not sufficiently support or promote holistic practices that should be the standard for the ranches.

-The EIS needs to evaluate the impact of climate change.

-Water quality testing should be required, as a basic measure to assure ranches are acting as good neighbors and stewards to our waterways.

-To keep within the delegated authority and be consistent with the park's purpose, the Seashore must focus continuation of ranching on cultural and historical significance of multi-generational beef and dairy ranching and should not open ranching operations through competitive bidding process to the general public.

-Tule elk are a natural resource that need to be preserved. Resource protection is the highest value for the Seashore as intended by Congress in requiring the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area,..." 16 USC Sec. 459c (6)(a). The culling of tule elk goes directly against the intention of Congress in establishing the Seashore.

Name: Poore, Elizabeth

Correspondence: After reading the draft proposals for point Reyes, I am flabbergasted that such proposals are even being considered in this day and age. National parks really are America's best idea nthey draw billions of dollars from overseas in tourist money, and are a source of sanity for every American citizen as quiet, clean air, and healthy woodlands become more and more rare. The planet is facing unprecedented hazards from human overpopulation, habitat destruction world wide, and climate change... Every wild species in the world is declining, we have replaced what, 75% of the planets biomass with a few domestic species. There are over 98 million cows registered in the us alone..... And STILL that's not enough? How can we even be remotely ignorant enough as to consider keeping cattle and private profiteers on our declining public lands? If we protect point Reyes as a natural and healthy seashore, future generations will benefit for centuries. If we let it become yet Another welfare ranch, what to future generations get? More cow crap? The last tule elk in a zoo, if they are lucky? We don't need more ranches. We certainly don't need more dairies. We are grossly overproducing dairy as it is. And we definitely do not need to be subsidizing private profit at the expense of our national treasures. It's like selling off priceless family heirlooms so one person can go on a binge. It's despicable, selfish, short-sighted, greedy, and downright dangerous. Native species and their habitats that we all depend on too have got to be the very first priority.

#7070

Name: Edwards, Kate

Correspondence: I support Alternative F: Ranching operations to be discontinued and visitor opportunities to be expanded in regards to the proposed Pt. Reyes GMP Amendment EIS. I am strongly against the NPS preferred alternative.

In the 1960s and 70s California taxpayers bought out all the ranchers with millions of dollars, and at the time, the ranchers agreed to relocate out of the park. The NPS needs to honor this agreement.

The negative environmental impacts of ranching on the Pt Reyes National Seashore are horrific and need to end. Cattle grazing causes erosion and soil loss, water pollution, destruction of habitat, and spread of invasive plants. Cattle ranching also uses extreme amounts of water. Congress created this park to conserve it with maximum protection, restoration, and preservation of the natural environment.

I have brought many many people to visit the beautiful Pt Reyes seashore and see the elk. People love to see the native Tule in the only national park where they live. Nobody says to me, Oh, look at those cows. There are plenty of cows in California in other locations. I know myself and the majority of visitors would stop visiting this area and patronizing the nearby businesses if we knew the Tule Elk were being killed to promote ranching.

Name: SHEETS, RYAN

Correspondence: I am a 20 year resident of the Bay Area. I am a mountain biker. I have bike-camped or backpacked/camped at each of the four backcountry sites in Pt. Reyes many times. I take my kids along with me. I've been camping, hiking, and sometimes biking there for 20 years.

My view is MOST if not ALL of the trails should be open to mountain bikes. Pt. Reyes is very big. Only some parts are highly impacted by hikers or other visitors and those are the beaches and certain hikes only. I RARELY see other bikers on the fireroad climb/descent from Five Brooks to Wildcat. Bikes should be able to ride the single track trails that branch off of that route. Why shouldn't they be allowed? Pt. Reyes will not become an overused trail system, I predict, due to so many other places available to ride.

If horse can be on the trails, then bikes should be allowed too. Horses damage trails far more than bikes. I believe this to be the case on ANY trail horses are allowed on but bikes are not.

If there is a concern about horse/bike trail conflict, the do what they do with the Tahoe Rim Trail, perhaps: allow bikes on even or odd days only.

Why can't riders ride from Palomarin on Ridge or Coast Trail? Those trails are wide, an appropriate grade, and not heavily used by hikers.

Move yourself into the future: 2019 and beyond. Bikes are here to stay. Bikes should be allowed in Pt. Reyes. Bike groups can and would help you build and sustain the trails. We ALL, bikers included, should share the trails. Thanks,

#7072

Name: Robles, Lisa

Correspondence: I oppose the National Park Service's plan to kill native tule elk and expand commercial agriculture in Point Reyes National Seashore and Golden Gate National Recreation Area. I urge the National Park Service to instead restore the lands for wild animal habitat.

I support Alternative F as being the most environmentally friendly alternative as it includes phasing out ranching as was the original intention and it protects wildlife over livestock. Furthermore, Alt. F manages the seashore for the natural value it was created to preserve- land, water, and livestock. It would restore the pastoral zone for wildlife habitat, scientific research and education as well as repurpose the historic ranch buildings for research and education.

Alt F is a financially sound plan because far more revue comes from tourism than ranching. And speaking from personal experience, I have only been to Point Reyes once BECAUSE of the ranches and veal crates. I did not know those operations were going on out there and it broke my heart. If I had known what I was going to pass such sights to get to that beautiful shoreline, I would have stayed home. Tourists do not want to see those ranches and poor babies in crates.

We should prioritize the preservation of our public lands and wildlife, not the economic interests of private ranchers. Preserving the park is better for the environment given the pollution and droughts caused by the ranches - commercial cattle ranches have serious negative environmental impacts on the park: polluting

waterways, causing soil erosion, and harming the many endangered and threatened animals who live on Point Reyes.

Thank you.

Correspondence: What would John Muir do? Wake up NPS. Make the park, a park. That was the PORE National Seashore's vision 50 years ago and should be the goal of the management plan going forward. You are clearly moving away from your guiding vision and prime mission. In light of the climate crisis, bird population collapse, and habitat mismanagement your favored plan is arguably criminal and certainly immoral. Shame on you and the blood on your boot heels.

#7074

Name: Donovan, Jen

Correspondence: If the rumors are true that the NPS plans to kill off the native Elk to make room for more agricultural farming then clearly the NPS is no longer protecting our natural resources. That idea goes against the very premise of conservation, Preservation and Recreation for the public to visit the shrinking number of places one can go to enjoy the natural outdoors.

Does this plan fall within the mission statement of what the NPS stands for, our has that changed to satisfy cooperate greed? It would be a shame to see the very people put in charge to protect this land, steal it from our future generations to be able to enjoy.

#7075

Name: Ward, Kae

Correspondence: This is totally not acceptable. Please do not allow this area to be used for livestock or 'farming'. It is truly a unique area and should be preserved as a national or state park. Please reconsider.

#7076

Name: Dielman, Michael

Correspondence: Save the animals

#7077

Name: Vandivort, Nicole

Correspondence: Keep industrial agriculture and ranching out of public lands!

#7078

Name: N/A, N/A

Correspondence: I am writing to urge the NPS to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This land should be used by native wildlife and for the undisturbed, natural use by the general public, not for commercial purposes. Livestock grazing does not belong in a national park or seashore.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

#7079

Name: Wenninger, Nancy

Correspondence: I am writing on behalf of the more than 400 members of the Mt. Diablo Audubon Society to urge you to select Alternative F for the future of Pt. Reyes National Seashore. This park is a critical stopover for a number of rare and migrant species of birds and is the premiere birding area for Northern California. For many years, Pt. Reyes has provided excellent opportunities for wildlife observation and public education. During a recent visit there, I observed over-grazing of some areas of the ranches which will cause problems with erosion and water quality, as well as loss of habitat for native species. Public access is being discouraged and, in some cases, eliminated. We need a new vision for the Seashore: No ranching. •Phase out the ranches. In the interim, no expansion to additional crops. •Disallow all commercial livestock in the park. •Prioritize wildlife over domestic cattle. •Biodiversity should not be sacrificed to private ranching. •Restore wildlife habitat and native plant communities. •Repurpose historic ranch buildings for scientific research, interpretation and public education. The emphasis needs to be on the "national seashore" as originally intended.

#7080

Name: Peranteau, Suzanne

Correspondence: As an American citizen I strongly object to killing native elk to continue to allow for ranching and domestic livestock pasturing purposes. The tule elk belonged long before the cattle. It's the ranchers duty to make sure they are accommodating to wild species, especially since they have a beneficial relationship with the native environment. No elk blood for cattle.

#7081

Name: Holtzman, Julie

Correspondence: Point Reyes National Seashore is supposed to be managed under the Point Reyes Act for "maximum protection, restoration, and preservation of the natural environment." There's no mandate for prioritizing commercial agricultural leases on these public lands.

- Natural values, native wildlife, public access and enjoyment MUST take priority over commercial activities at Point Reyes.
- Tule elk are an important part of the landscape at Point Reyes. Their recovery is a result of successful native ecosystem restoration, which is a key element of the Park Service's mission. It's taken a lot of time, money and effort to restore tule elk to Point Reyes, the ONLY national park where they live. Tule elk must be allowed to roam free and forage in the park - not shot, removed, fenced or treated as problem animals.
- Right now the Point Reyes ranches enjoy not only subsidized grazing fees and housing, but also taxpayer-funded infrastructure and road improvements, and publicly funded projects. But commercial activities at Point Reyes should be required to accommodate native wildlife - not the other way around. Citizens such as myself resent such concessions at the public's expense.
- The Park Service shouldn't allow any new agricultural activities at Point Reyes. Planting artichokes or other row crops will attract birds. Also, introducing sheep, goats, pigs or chickens will attract native predators such as coyotes, bobcats and foxes....and after all, what do you expect when humans foolishly introduce prey species into THEIR territory? Expanded ranching would only create new wildlife conflicts.
- Cattle ranching should only be allowed if it's consistent with preserving the natural environment. And agricultural activities such as mowing shouldn't be allowed in park areas where they harm endangered species or wildlife habitat, impair water quality, cause excessive erosion or spread invasive plants/diseases Native grasses in particular generally decline under such circumstances.

- Cattle are the seashore's primary source of greenhouse gases. So the Park Service's preferred alternative is inconsistent with its own "Climate Friendly Parks" plan.

Finally, just a reminder - people visit our national parks and monuments - a multi-billion dollar tourism industry - to marvel at America's purple mountain majesties and other breathtaking wonders. They do NOT want to see cattle and other domestic animals!!

#7082

Name: Lipmanson, Don

Correspondence: My family and I are frequent visitors (roughly 5-6 times per year) to Point Reyes National Seashore, where we go for day hikes and to watch for wildlife. Obviously this is a most extraordinary and unique place for us to see coyotes, bobcats, foxes, plus the seal and sea lion haul-out rocks along the southern edge of the peninsula.

I am appalled by NPS's proposal to devote 1/3 of the Park to cattle grazing and to kill native Tule elk for the supposed benefits of a couple dozen ranching families. Tule elk are indigenous to this location, whereas cattle are there solely "thanks" to European settlers and the federal government's historic subsidizing of ranchers. The federal government's support of cattle ranching is all the more toxic to the planet, now that animal agriculture has been identified a primary source of greenhouse gas emissions, especially methane.

Nothing in the Constitution or the Bill of Rights requires or allows NPS to violate NEPA and Public Trust Doctrine by allowing a small percentage of our country's population to effectively capture 1/3rd of a national park. By the logic at work here, why not dedicate Yellowstone's Lamar Valley to cattle as well?

It appears that NPS is succumbing to political pressure from a most corrupt federal administration, ready to do most anything to promote the financial interests of its backers regardless of what science shows to be the ecologically damaging effects of that activity. Specifically, it is appalling to see NPS acting just like USDA-Wildlife Services (WS) in its readiness to kill native wildlife on behalf of farmers and ranchers. A very recent DEIR addressing WS activities in nearby Mendocino County reports that Marin County ranchers are silently killing coyotes and bobcats, in defiance of that county's non-lethal program aimed at minimizing human vs. wildlife conflicts. What NPS is proposing here - killing a unique subspecies of elk - mirrors the current Administration's utter indifference to the natural world, rather than adherence to its historic mission of providing the public with places where we can experience intact natural ecosystems.

Leases always come with a limited "shelf life"; 60 years of cattle grazing is enough. The current ranches within the Seashore's boundaries offer acre upon acre of muck, a decided stench from overly concentrated manure and acres of revoltingly small plastic crates that appear to house young calves being tightly confined and left in relative darkness only to be killed for veal. Promotion of animal cruelty, pointless killing of elk and environmental degradation through intense cattle ranching are not what national parks were created for or what they still are intended to offer.

Protection of wild lands and wildlife are components of your agency's mission. You are NOT an arm of USDA. Please reject this ill-conceived proposal to displace wildlife for the benefit of commercial agriculture.

Yours truly, Don Lipmanson Attorney at Law

#7083

Name: N/A, N/A

Correspondence: Can't you leave well enough alone? Leave the native animals where they belong. Why must humans ruin everything? The more out of balance you make our planet, the more we all will suffer. We have devastating weather happenings almost every day now and it's not for no reason, it's from the humans having their

way with the environment. Catch a clue and stop being so greedy. Newsflash - there is more to life than profit. Wake up!

#7084

Name: Brokken, Petra

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

#7085

Name: Edgelow, Gillian

Correspondence: Pt. Reyes must prioritize wildlife over private industry in the park, particularly the tule elk. I oppose diversification. There are numerous studies that show it is harmful. The ranches need to leave Pt. Reyes. I oppose strongly any future leases for the ranches, as they pollute the land and water, and are detrimental to native species of all kinds.

#7086

Name: Marckwald, Kirk

Correspondence: Dear Sir/Madam - -

Having read large parts of the General Management Plan EIS, I believe that Preferred Alternative B best balances the original intent of the creation of the Point Reyes National Seashore. I support helping ranchers expand their economic activity to ensure future vitality. I support the concept of increased oversight and enforcement of agricultural activities. I support new formal and informal trails to allow hikers to enjoy the full breadth and length of the park.

Alternative B provides for and encourages all of these attributes which is why I think it is the best one for the Park to adopt.

Kirk Marckwald

#7087

Name: Turner, Johnathon

Correspondence: Please, no more ranching on Pt Reyes National Seashore.

We need a new vision for the Seashore: No ranching. (Alternative D)

Phase out the ranches. Disallow all commercial livestock in the park. Prioritize wildlife over domestic cattle. Biodiversity should not be sacrificed to private ranching, Restore wildlife habitat and native plant communities Repurpose historic ranch buildings for scientific research, interpretation and public education.

Thank you

Johnathon Turner

#7088

Name: N/A, N/A

Correspondence: The Point Reyes National Seashore is no place for cattle or livestock leases. I urge the National Park Service to discontinue grazing permits and allow this natural habitat to be enjoyed by the public.

#7089

Name: Barthelson, Roger

Correspondence: I am writing with regard to the proposed culling of Tule elk from Point Reyes National Seashore Park. This proposal is ridiculous. I have been to this place many times and the preservation of the land and the ecosystem is much more important than the increased income of any Western ranching operation. I support ranchers and see them frequently here in Tucson. I buy my beef exclusively directly from them. Raising cattle in the West is difficult, but that does not justify ever the environmental damage that they may cause or the killing of wildlife of any kind on federal lands. If it's so hard to raise cattle in the West, then don't. There are plenty of places in the US where green grass grows plentifully. Please do not allow the culling of Tule elk as proposed.

#7090

Name: Jones, Ken

Correspondence: Thank you for the EIS which I have read through. It is clear that the NPS choice of Plan B is favoring ranching and dairy interests - and the profits they accrue - over the interests of the vast majority of people and the the current needs of the planet to have its nature restored. Restoring this area was a goal and the current situation was supposed to be a transition to get us back to that goal.

We need to continue in that direction. I am strongly supportive of Plan F and least supportive of Plan B. It is remarkable that the EIS points to all the benefits of Plan F, including removing the ranching-related pollution to our atmosphere. Perhaps the distance these cattle are from where they would need to go to be butchered for eating was not even considered. Or even how much farther the dairy products are transported before they are used by coming so far from population and from other ranching and dairy concerns.

It is sad to me that NPS has become an advocate for large agricultural interests as that is who ultimately is benefiting from Plan B. These are not small family farms even if they look like they might be. We need to stop promoting meat products and dairy as they are hugely responsible for climate breakdown and Plan B would accelerate that. This not only takes us farther away from our possibility of meeting our Paris Accord commitments but California's climate goals, even if the same amount of dairy and cattle raising is done elsewhere in the state.

#7091

Name: Haliday, Emily

Correspondence: Dear Sir or Madame:

Please do not allow the extension of leasing of public lands to cattle grazing, or other commercial agricultural pursuit. I also have heard that you are considering expanding the type of commercial farming activity, i.e., diversification of farming species, to occur on public lands at Point Reyes seashore. Instead, I urge you to adopt Alternative F of the proposals, phasing out ranching, and managing the land, water and wildlife.

The public has already paid for this land to be kept wild. Currently, the Park Service is permitting this public land, and the native species which originally inhabited it, to be despoiled and destroyed. This is a travesty, a disgrace, and is certainly outside the bounds of the legislation which is supposed to protect the land from exploitation. The Park Service is clearly in breach of the fiduciary duty it owes to the people of the US who paid for this wild land to be set apart from exploitation. And of course, it is an utter betrayal to allow the native species to suffer and die, or to be displaced, due to what may very well be illegal exploitation of this land by commercial agribusiness.

There is no saving grace to be had in falsely identifying these commercial "farms", which are despoiling both land and species, as historical and/or bucolic! You simply must stop this activity, and allow the land to be returned to the public as was intended and authorized under the law. Please adhere to your responsibility on this matter, and reverse current plans to expand these destructive practices! Do what you are charged to do under law!

Very truly yours, Emily Haliday

#7092

Name: P. , Julie

Correspondence: Allowing the killing the the Tule Elks in Point Reyes will be an unprecedented and unjustified massacre of wildlife in a \*protected\* area in favour of commercial enterprises.

The park must instead enhance Tule Elk habitat and protect the elk.

The park must stop granting the continual renewal of 20-year permits and leases to cattle and dairy ranchers. Ranchers have already overstayed their original permit limits. Such renewals of long-term leases is setting a negative precedent in favor of private, commercial industry and jeopardize the future of all our parks and protected areas as well as the health of the ecosystem and its biodiversity.

No diversification of ranch operations should be allowed: any diversification (such as chicken coops, pigs, sheep, row crops, etc) will only serve to attract more predators like coyotes, foxes, bobcats that will be in conflict with ranch operations and will later have to be "managed" as well. A growing predator population will further endanger the biodiversity of the park.

The park, a protected area, established with the purpose of protecting the ecosystem and the animals living in it, should revoke permits for all cattle and dairy operations and restore the leased land to its original, pre-industry state.

The mission of the park should be to prioritize wildlife preservation and protection.

#7093

Name: Fertig, Laura

Correspondence: As a botanist interested in conservation of natural areas and ecosystem processes, I am concerned that the proposed management plan for Point Reyes National Seashore. By promoting destructive livestock grazing over preservation of native plants and animals, the plan violates the 1916 Organic Act that calls for NPS to manage for non-impairment of natural resources. It also goes against the National Seashore's own original direction to protect and restore objects and values. As someone who works on livestock grazing issues on

public land and a former employee of the National Park Service, I am appalled that a unit of the NPS is proposing to actually kill native Tule elk to remove competition for forage with non-native livestock. This represents a reversal of the original intent of the legislation, which was to phase out cattle grazing because it was contrary to NPS policy and resource protection. Ranchers have already been adequately compensated. They must not be allowed to continue to degrade our natural heritage. Preventing Tule elk from accessing water and forage improperly gives scarce natural resources on public land to private industry and, even worse, rises to the level of animal abuse.

Grazing can have devastating effects on the soil, hydrology, and vegetation processes on ecosystems. Indeed, photos from Pt. Reyes itself shows damage to all three of these ecosystem processes from livestock grazing. There is a reason most NPS units don't allow grazing. The National Park Service has an obligation to prevent this degradation. It must end ranching on our public lands in Pt. Reyes National Seashore, one of the few open spaces in the urbanized California coast.

I ask NPS to return to their original mandate and the spirit of the enabling legislation and manage to protect and restore native elk rather than propping up a failing industry that has devastating impacts on this NPS unit. Livestock grazing occurs on millions of acres in the United States. Surely we can spare a few of those for the maintenance of wild species?

#7094

Name: Abbott, Robert

Correspondence: I believe that it is time for the Ranchers and Dairy farmers to move off the parks land. They have been paid ample funds to purchase new land and move their Dairy cows and cattle operations elsewhere. I feel it is time to let the native animal community to be allowed back onto the land that they once inhabited. Fences should come down on the park and the deer and elk should be allowed to reestablish the park lands.

Thank you for allowing me to give my opinion on these matters.

Respectfully

Robert C. Abbott Jr.

#7095

Name: Booker, Susan

Correspondence: To Whom It May Concern:

As owners of the Certified Public Accountant firm for one of the ranchers in the planning area, we fully understand the economics of this small family farm. Any further restrictions on its operations could cause the farm to go out of business for financial reasons. Also, given the state of agriculture, especially in Marin County, being able to diversify will be critical to the survival of this family farm. The practice of diversification has been encouraged and applauded throughout the county. Our client will not be able to compete with their fellow county farmers if they are not allowed to diversify in a meaningful way. The DEIS failed to appropriately consider the economic effects of the restrictions in the zoning framework and diversification and must be revised for the final EIS.

Thank you for the opportunity to post our comment.

Philip N. Booker, CPA and Susan Booker Booker Accountancy Company

#7096

Name: Blair, Richard

Correspondence: Has the Park Service lost it's mind?

I support Alternative Plan F

As the former Park Photographer of Yosemite National Park I know what National Parks are all about- it isn't ranching. It is preserving and protecting nature. Point Reyes is a National Seashore. That is its reason for being.

I have written six books on Point Reyes and my work has contributed over \$100,000 to the park.

Farming here is a dirty, polluting business. It is clear that ranching is harmful to the park's natural ecology. Anyone can see that, unless they are making money with Ag.

You are just protecting your jobs (in the Trump administration) by having all these alternatives for people to comment on. One alternative is killing the tule elk, which are a threatened species. Yesterday I watched people having a magic moment in the park observing the elk.

Does NPS have morals? You can enforce wilderness and other park laws to protect land and wildlife but by allowing ranching you negate all your conservation efforts.

I tried to hike the trail to Kehoe yesterday but the smell on manure was so strong that I had to turn back. Perhaps silage was just applied. You should hike it soon and smell the air.

The American people paid for a park but got this experience?

The way the ranchers treat there farmworkers is also revolting. I know a farmworker (twenty five years of employment) whose boss won't let the family have a washer and dryer - too much electricity cost. These are the farmers that you are leasing to?

Shame on the National Park Service!

#7097

Name: Christianson, Steve

Correspondence: As a homo sapien, I am opposed to the preferred status that the US Federal Government continually gives to Bos taurus. I have visited the subject land in question on several occasions and am appalled that cattle are being considered priority over wildlife; this is shameful, disgraceful and another form of welfare for cattle ranchers. Socialism at its finest for the cattle industry, again, extremely shameful.

I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

#7098

Name: Gray, Richard

Correspondence: The National Park Service should honor the National Seashore's authorizing legislation by beginning the phase out of cattle ranching immediately. There was never an intention to continue cattle ranching when the park was founded. I insist on implementation of alternative F to end cattle ranching as soon as possible.

The beef and dairy industry and cattle ranching have been found to be a major driver of climate change and on that basis alone continuing ranching sends the wrong message to all park visitors. We need to have the nation and the world move to a plant-based diet for our own survival. Also, cows are not part of the natural environment on this site. Other native animals like deer and elk can provide the benefits of light grazing to grasslands without the destructive consequences of soil compaction in concentrated areas, water pollution from huge quantities of manure and habitat degradation for the rare bird species and native plants found at Pt. Reyes.

Moreover, 1/3 of the land area of the National Seashore is presently inaccessible to the public due to private use by ranchers. This is not Forest Service land where multiple uses are allowable. It is a National Park. The idea that Elk should be culled (killed) to make way for cows is abhorrent and inappropriate. There are millions of acres in California already in use for cattle ranching. This is one of the few areas on the West Coast where Elk live. Their habitat should be intentionally enlarged.

There was a time that I thought there was a benefit to supporting ranching in Marin by allowing continued use of NPS lands for cattle grazing. For the reasons stated above my thinking has evolved. Please implement alternative F and begin the process of restoring these lands to their natural state before ranching began.

#7099

Name: Eisenhart, Mary

Correspondence: Ranching is part of the way of life that was meant to be preserved by the creation of the Golden Gate National Recreation Area, despite its takeover by a park service apparently hell-bent on eliminating human recreation and building a nativist theme park.

I support solutions that preserve ranching, kill no elks, and recognize human activity, including ranching, agriculture, and recreation, as an integral part of why this land was saved from developers in the first place. It is a recreation area, not a wilderness park.

You have the intelligence and the resources to do this; please do it instead of throwing up your hands and caving to vocal nativist zealots.

Thank you.

#7100

Name: Smith, Brandi

Correspondence: we need to save our parks and animals

#7101

Name: Bishop, Greg

Correspondence: This is such a stupid idea. I thought the the National Park Service was meant to protect and conserve natural resources, not work in cahoots with those who want to destroy them. Throw this plan in the circular bin where it belongs.

#7102

Name: Patrick, Inna

Correspondence: This is madness like in mad cow disease. Do not shoot elk to allow more cows, sheep etc. non-native species. Trash the EIS.

#7103

Name: Goodwin, Kathleen

Correspondence: I support Alternative F and reject the NPS Alternative B as the "Preferred Plan".

Seeing degraded muddy fields in land which is supposed to be protected by the NPS is very distressing. There is no shortage of cows in the USA but there is a shortage of places particularly close to large urban areas where people can go to wind down and experience pristine environments. I tried to hike to Kehoe Beach recently and had to turn around because the smell of cow manure was so strong and persistent. That is no way to run a park.

Continuing to allow cattle in the Point Reyes National Seashore will perpetuate Johne's Disease, a.k.a. MAP (Mycobacterium avium paratuberculosis). Johne's Disease has been passed on to the Tule Elk. This disease has been linked to Crohns disease in humans. <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4894645/>.

The idea to even consider the culling of elk to protect land and cows for ranching is antithetical to the guiding principles of national parks which is to protect wildlife.

People come to Point Reyes to see elk, birds, wildlife, nature and beautiful vistas, not cows and farms, many of which are rundown and not well kept up. To allow roadside produce stands within a park, is not appropriate use. Many of ranchers in Point Reyes National Seashore do not have good track records for treating their workers well. The park service itself condemned a trailer in which a farmworker and his family had to live for about five years.

#7104

Name: Biandaescu , Deverra

Correspondence: I oppose President Trump's National Park Service shocking plan to kill native tule elk in California's Point Reyes National Seashore, the only national park where these rare animals live.

By killing up to 15 elk every year to appease private livestock owners who enjoy subsidized grazing of their cows on this precious public land is an abomination. This plan would enshrine private, for-profit cattle-growing as the park's main use - while doing little to rein in the damage from grazing, including water-quality degradation and soil erosion.

But that's not all. The plan would allow conversion of park grasslands to artichoke farms and row crops and let ranchers introduce sheep, goats, chickens and pigs - a recipe for even more conflict with native wildlife.

Do the right thing, for the people and by the people, stop this atrocity.

Deverra Biandaescu

#7105

Name: Quiñones, Hannah

Correspondence: I support plan of action F!

#7106

Name: Beurang, Pierre

Correspondence: Tule Elk are an incredibly important species, and their survival is completely in the hands of Point Reyes and the National Park Service. By allowing the culling of a threatened species, the ecosystem is going to be permanently damaged. While ranching is important, a species that is down to such low numbers is vastly more important. Option F would allow Point Reyes to be restored to what it once was, a vital habitat, thriving with biodiversity.

#7107

Name: N/A, N/A

Correspondence: I believe that we should go with option A because it protects the elk but also keeps the ranching and farming at a steady enough rate for economic benefits and that supports the needs of the general population.

#7108

Name: Lillevand, David

Correspondence: I believe that plan F is in the best interest of the reserve. Tule elk are a very endangered species, only found in Point Reyes. Therefore, I don't believe that shooting more elk and containing the population would be detrimental. Gradually phasing out ranches in the area and allowing the Tule elk to self populate is the best plan.

#7109

Name: MacDonald, Claire

Correspondence: I think we should go with option A, because if we have a current solution that is working then we don't need a new one that might cause more problems.

#7110

Name: Freund, Joylyn

Correspondence: I support Alternative F, as the Tule Elk don't deserve to be kicked out of their home or even to be hunted in their own home. The ranches moved into the Elk's home, not the opposite away around and the Elk have the right to live safely in their home, without being hunted.

#7111

Name: Dern, Serena

Correspondence: I support option F which means that Tule Elk will not be shot and ranching will stop. Tule Elk are an important native animal that have an impact on the local ecosystem. Without Tule Elk, the entire Point Reyes National Seashore ecosystem will be damaged.

#7112

Name: langer, anais

Correspondence: I support option F because Elk are more important than ranches/ ranch history.

#7113

Name: Greenholz, Lucas

Correspondence: As the Tule Elk in the area are a species entirely unique to this location, efforts should be made

to preserve the population present, not to cull them in order to allow for the betterment of ranchers. As option F allows for the preservation of the Tule Elk, I support this option in order to continue the viability of the species.

#7114

Name: Bergman, Aidan

Correspondence: Being a student at Drake High School, I have been taught to think critically about political issues, and using my thunkin' skills, it seems that the logical plan here is plan F. I support plan F, first of all, because there's no shooting of Tule Elk, a species that only lives in this one area of the world. Second, one of the main issues facing the environment is global warming, and one main contributing factor to global warming is ranching and all its products and byproducts. Removing ranchers and letting these natural habitats be the right thing to do, and we'd be doing a good thing in removing ranches, thereby helping the Point Reyes National Seashore ecosystem and doing our small part to reduce greenhouse gasses and waste in our world.

#7115

Name: N/A, N/A

Correspondence: I support option A because we have a system that works already!

#7116

Name: N/A, N/A

Correspondence: Please consider the fate and plight of eliminating the Tule Elk in Point Reyes. They are a wonder to behold.

In our ever more threatened world, animal welfare seems not to be a high priority, but their lives are paramount to them. It is a significant issue to me and many others, who do not think that any business, even long-established dairies have the moral right to cull animals that compete for their ability to make a profit.

Point Reyes is a nationally protected park, thanks in large part to your predecessors. Please don't let killing or removing wild animals in our protection be a part of your legacy.

Sincerely, Susan Stover

#7117

Name: N/A, N/A

Correspondence: I think it is best to not make a plan of action, as we need to find a humane way of controlling the population.

#7118

Name: Tabb, Lisa

Correspondence: I believe we should do nothing. Allowing the surrounding farmers to expand would impact the population of the Elk, but imposing that the surrounding ranchers cease their work would lead to a greater economic issue.

#7119

Name: Jackson, Madison

Correspondence: I am a citizen who has traveled to Pt. Reyes National Seashore several times to view the magnificent Tule Elk. It has been heartening to observe the increase in numbers of this iconic species and look forward to a time when the elk population has returned to the historic level and distribution described by

scientists. I honor the multiple-use needs of the park as long as the competing demands of the local ranching community do not impinge on the primary needs of the primary species (elk) being conserved for future generations.

The new information the EIS process must consider is the degree to which cattle numbers must be curtailed in our National Park to maximize the carrying capacity for elk. As a taxpayer, I come to see the native elk not the introduced cattle, which I can easily observe throughout California. One dairy farm or cattle ranch, which school children and the public can visit to learn about cows and local history, is sufficient to fulfill that multiple land use in the park.

Elk and cattle compete for grass. When estimating carrying capacity for these two species, I noted that rangeland scientists project two elk for one cow. There are currently about 5,000 cattle grazing in the park, outnumbering the 500 elk ten to one. With the commonly accepted ratio of two to one, elk numbers should be encouraged to rise substantially and cattle numbers should be held to one working ranch. The livestock industry has been and continues to be subsidized at taxpayers' expense. The public's interest in wildlife and native species is at an all-time National high. National public support for cattle ranching is at an historic low. Pt. Reyes National Seashore needs to honor the mission and the supporting scientific research for expansion of elk numbers throughout the park.

#7120

Name: Normandi, Iona

Correspondence: I support option F, renewing leases for ranching and not shooting the elk. I ask the park service to protect wildlife over industry profits.

Name: N/A, N/A

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

#7122

Name: Steiner, Moritz

Correspondence: I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands.

The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Name: Ward, George

Correspondence: Dear Friends, After waiting thirty-five years for the cows to go, I am greatly discouraged by the apparent direction this decision is taking. The cows should go where the oysters went: away. I believe the vast majority of the visiting public want to see the Peninsula as was five hundred years ago-not one hundred years ago. This is especially true given the scientific evidence regarding dairy farming and its destructive effect on the local environment, and its contribution to global warming. I believe this decision would be better made by following the mandate to preserve the natural environment-not ranching. Please cull the cows, not the elk. Sincerely, George Ward georgeward.com

Point Reyes Station, CA 94956

Subject: Review Comments on the Point Reyes National Seashore General Management Plan Amendment - Draft Environmental Impact Statement

Dear Superintendent Muldoon:

Introduction

Thank you for this opportunity to provide comments on the Draft Environmental Impact Statement (DEIS) for the Point Reyes National Seashore and Golden Gate National Recreation Area North District (PRNS/GGNRA) General Management Plan Amendment (GMPA). Marin Conservation League (MCL) compliments the National Park Services (NPS) authors on a well-organized and presented DEIS.

The mission of MCL since 1934 has been to preserve, protect, and enhance Marins natural assets. In accordance with MCLs mission and goals, our comments are based upon the following assumptions and principles:

Since its founding 85 years ago, MCL has been instrumental in setting aside many of Marins most valuable lands for the public and has served as guardian of their unique resources for the enjoyment of future generations. In that spirit, MCL is committed to protecting the diverse flora and fauna, sensitive and endangered species, geology, culture and history, and scenic resources of PRNS from unacceptable impact.

MCL has also long recognized the valuable contributions of Marins historic agricultural community toward preserving open space in the County. This includes the successful and precedent-setting minimum parcel size limits established in 1970, referred to as A-60 in Marin Countys zoning code. It also includes the willing sales of ranches that were instrumental in forming PRNS/GGRNA and, specifically, the planning area for this GMPA and

DEIS;

The capacity of working farms and ranches to protect west Marins open and connected landscape, including the ranches in PRNS and the North District of GGNRA, requires a critical mass of land area and operating farms to remain viable ; and

A comprehensive understanding of the purpose, goals, and management objectives for PRNS/GGNRA that are reflected in the enabling legislation and that uniquely establish an historic agricultural landscape, including the grazing livestock ranches and dairy farms within the GMPA area, as culturally significant resources within PRNS.

These principles are supported in MCLs Agricultural Policy Statements (attached) stated goal:

To continue to support the role Marins agricultural community plays in maintaining open space, protecting wildlife corridors, managing carbon, preserving a valuable local heritage, and contributing to food security and the local economy.

We emphasized and linked this goal to this GMPA planning process and pending outcome in our scoping letter dated November 13, 2017 (attached) with the following statement:

We hold that there is a direct and mutually supportive connection between the GMPA and our agricultural policy and seek to partner with the National Park Service (NPS) and the ranch and farm families on the Seashore to realize this connection.

MCL Supports NPSs Preferred Alternative (Alternative B)

MCL considers the preferred alternative (Alternative B) presented in the DEIS to represent the best opportunities for environmental improvements compared to existing conditions. Furthermore, providing 20-year leases to 31 ranches on 28,700 acres provides a term of sufficient length to support NPS and leasing farmers in their collaborative efforts to manage the natural, cultural, historic, and scenic resources in the planning area. Accordingly, MCL supports Alternative B. We do have concerns about specific issues as described in the comments that follow. Our specific requests and recommendations for correcting deficiencies in the GMPA and DEIS are presented in italics.

Specific Comments and Recommendations

Implementation of Mitigation Measures in Agricultural Lease/Permits and Ranch Operating Agreements: Appendices D, K, and L (respectively, Management Activity Standards and Mitigation Measures, Biological Assessment - US Fish and Wildlife Service, and Biological Assessment - National Marine Fisheries Service) provide detailed and appropriate management practices and mitigation measures for long-term protection of soil, water, air, and biological resources. The draft PRNS and North District GGNRA Agricultural Lease/Permit references Appendix D 13 times for its standards and mitigation measures to be incorporated into proposed Ranch Operating Agreements (ROA).

The GMPA and Final EIS should include the Agricultural Lease/Permit and ROA templates as appendices and clarify how proposed standards and mitigation measures will be selected and implemented within the planning area to ensure that preservation strategies proposed in the DEIS are achieved. Additionally, Appendices K and L should be referenced, where relevant in the Agricultural Lease/Permit and ROA, as resources for identifying additional standards and mitigation measures for protecting threatened and endangered biological resources.

Visitor Use, Experience, Access, and Capacity: The DEIS is programmatic in its approach to the topic of Visitor Use. As stated in Appendix E, &this appendix contains potential recommendations& and &establishes a vision of the future& for visitor use (emphasis added). Similarly, the DEIS Executive Summary explains that Implementation of some programmatic direction, such as future development to facilitate public use and enjoyment, would require additional project-level planning and compliance& (emphasis added) Although MCL has aspirations for increased visitor use experiences and strategies to improve PRNS/GGNRA visitor capacity, we are also concerned about this topic and previously provided extensive comments on how it should be addressed

in the DEIS in our scoping comments dated November 28, 2018 (attached, page 2).

The analysis of options to achieve improved visitor experience and capacity in the DEIS is inadequate for the following reasons:

" It fails to provide sufficient detail regarding methods and modes for improving traffic congestion and vehicle management, and for reducing impacts at trailheads both within and outside the planning area.

" The DEIS assumes that visitor volume will be similar to historical numbers of 2.5 million per year. An adequate analysis for impact assessment purposes must anticipate that visitor numbers will surpass this annual volume over time, analyze related impacts, and identify measures to accommodate and avoid or mitigate localized impacts from the demands that more visitors will place on new trail networks, trail heads, and other locations used by visitors.

This inadequacy of the DEISs impact assessment should be corrected in the Final EIS.

Working landscape and cultural resource preservation: Table 2 in the DEIS (pages 27-30) lists specific strategies for the preservation of area resources within the planning area. These include strategies for protecting ecological functions, native and nonnative species, and cultural resources. The strategies for cultural resources provide for the protection and management of historic features, such as fences, buildings, and historic and prehistoric archeological sites. Missing from this table and desired conditions is preservation of the current working landscape as a cultural resource. As summarized from MCLs scoping letter (dated November 13 2017):

The cultural and historic resources that have been preserved in PRNS/GGNRA are the combination of the historic pastoral landscape and the multi-generational farm families, who, four and five generations later, are the legacy of the historic period of ranching and farming on the Point Reyes Peninsula which dates to the mid-1800s. The working landscapes they manage exemplify the national movement to strengthen local food systems; and they have contributed to maintaining the scenic resources of coastal grassland and other ecological riches that are the hallmark of PRNS/GGNRA. They also must comply with stringent state and federal environmental standards.

We believe that a preservation strategy for managing the cultural resources represented by operating farms and ranches is important for achieving the intent of the PRNS/GGNRA enabling legislation and amendments. As reconfirmed in the recently published House Joint Resolution 31, multi-generational ranching and dairying is important both ecologically and economically and is consistent with Congresss intent for the management of Point Reyes National Seashore. This approach is supported by the NPS Management Policies 2006, which include the parks scenery, natural and historic objects, and wildlife, and the processes and conditions that sustain them, including, to the extent present in the park&cultural landscapes& as being subject to the no-impairment standard, and that a cultural resource may be a tangible entity or a cultural practice. Appropriately, the two Historic Districts are cultural resources that are made up of features such as fences and buildings, and by historic vernacular landscapes that continue to be maintained by the historic and cultural activity and practice of ranching.

NPS, through the GMPA and Final EIS, should recognize this current connection between historic and ongoing active agricultural operations as a cultural practice and, therefore, a cultural resource subject to the no-impairment standard. This ongoing cultural practice represents an important cultural resource and exceptional educational opportunity for the public. The environmental, ecological, cultural, educational, and other socio-economic benefits that active agricultural operations bring to PRNS/GGNRA support NPSs mission and should be fully addressed in the Final GMPA and EIS.

Zoning and Subzoning Framework: MCL supports applying a new management zone, the Ranchland Zone, to the planning area. This will clear-up ambiguities that currently fail to clearly demarcate the planning area. MCL also generally supports the Subzoning Framework proposed in Alternative B with some qualifications. Successfully achieving both natural resource and agricultural management objectives may require implementing some practices across the boundaries between the proposed resource protection, range, pasture, and ranch core subzones. Managing fire fuels for example, must, by necessity, cross subzone boundaries. Similarly, integrating soil and water conservation practices, including carbon beneficial practices (listed in Appendix D), should relate to where on the landscape they can be most effective. MCLs scoping letter of November 28, 2018 (attached, page

3) recommended a planning approach that invests the Subzoning Framework with enough flexibility to enable working across subzone boundaries. This flexibility will enable management activities to be more effective in achieving environmental benefits and avoiding/mitigating adverse environmental consequences.

We conclude that the DEIS has not adequately considered the potential environmental benefits to be gained by incorporating this kind of flexibility into ranch zoning. The Final EIS must fully consider the adverse environmental consequences (such as increased wildfire hazard and greenhouse gas emissions) that can be minimized or avoided, as well as beneficial environmental effects (such as carbon sequestration) to be gained by working across subzone boundaries where feasible. If NPS does not feel such flexibility is warranted or appropriate, the Final EIS should clearly explain why not.

**Agricultural Diversification:** The justification for diversification of ranching activities appears only once in the DEIS under the description of Alternative A (Page 20): Diversification of ranching activities allows ranchers to react to poor forage production years and fluctuations in the economic market (e.g., the price of cattle, grain, hay). To enable the economic resilience implied in this justification, MCL supports the inclusion of proposed agricultural diversification activities as described under Alternative B, including limited row-crop production, pasture poultry raising, alternative grazing livestock species, and farm tours and stays, among others, as conditioned by the subzoning framework (Resource Protection, Range, Pasture, and Ranch Core).

The descriptions of potential diversification activities, however, raise questions that must be addressed in the Final GMPA and EIS as follows:

1. Is the option for 2.5 acres of unirrigated agriculture both viable and advisable as an agricultural enterprise? This approach implies dryland farming - i.e., relying upon winter rains to produce crops such as certain cereals or potatoes by tilling and seeding in the fall and harvesting in the spring. As an alternative, irrigation would afford the opportunity to produce crops that are planted in the spring and harvested through the summer and fall, thereby increasing the options and the economic viability of row crop farming. The Final EIS should consider this option, including mitigation measures for any potential impacts.
2. Could grazing by alternative species in the range zone achieve natural resource objectives like fire fuel reduction and prevention of vegetation type conversion, as well as protection of sensitive resources? Could the use of multiple species in a prescribed and rotational manner provide a diversity of options and opportunities in achieving preservation strategies outlined in the DEIS?
3. For dairy operations currently without silage production, could this important forage source be added within the pasture zone, with specific mitigation measures to reduce unacceptable impacts?
4. Finally, how might NPS staff, working with management and mitigation measures presented in Appendices D, K, and L, obtain technical advisory input to improve the economic viability of these proposed diversification activities, to fulfill the integrated objectives of ranch sustainability and natural resource stewardship?
5. The Final EIS should address the possible relationship between types of diversification and proliferation of pest species; the allowable techniques that ranchers might use to control such pests, including Integrated Pest Management for pest like gophers; and the potential impacts of pest species on sensitive resources in the park.

Planning and stewardship of agricultural lands in the planning area. The NPS preferred alternative (Alternative B) identifies future authorized activities within the planning area. These activities include modest agricultural diversification in the Ranch Core and Pasture planning subzones. The DEIS requires mitigation measures to be incorporated into individual Ranch Operating Agreements (ROAs) for each ranch activity. Further, many mitigation measures require consultation with NPS staff before activities can occur. Specific activities for each lease will be authorized in the respective ROA. There seems to be no comprehensive planning effort that will be completed on a ranch scale, however.

As an example, carbon farming is a collection of standard practices designed to maximize the lands ability to sequester carbon and reduce new greenhouse gas emissions while making farmland more resilient to a changing climate. As outlined in a Carbon Farm Plan some of these practices are big long-term goals, while others address near-term priorities. A Carbon Farm Plan serves as a guide to realize the potential climate benefits on the land, enable many other benefits these practices can have on ranch productivity and the environment, and identify

potential funding partners to help implement these practices.

Carbon farming practices bring many co-benefits beyond sequestering carbon and reducing greenhouse gas emissions. Practices are designed to benefit the natural environment and the agricultural operation. Some examples include:

Increasing carbon in the soil reduces soil erosion, promotes plant growth, and helps the soil hold on to more water. That means plants can grow longer into the dry summers, produce more forage for livestock and sequester even more carbon.

Restoring creek vegetation increases wildlife habitat, stabilizes creek banks, improves water quality and reconnects flood plains.

Rotational grazing promotes vigorous grasslands with deep roots, encourages native grassland species, and improves productivity.

Planting diverse windbreaks and hedgerows provides shelter to livestock and reduces the drying effects of wind, allowing pastures to stay green longer into the summer. They also increase wildlife habitat and provide species for native pollinators.

Using a methane digester for manure generates gas that can be burned for electricity and results in a more stable waste stream for applying back to the land.

The GMPA and Final EIS should make it clear that lessees in the planning area are allowed to work with qualified resource professionals, the Marin Resource Conservation District, the Marin Carbon Project and USDA Natural Resource Conservation Service to complete ranch-scale conservation plans or Carbon Farm Plans in the planning area. These plans will help NPS staff and the lessees write appropriate ROAs to incorporate best practices into their planning.

Succession: Separate from the DEIS, NPS has provided a draft Succession Policy for Ranch Operations within the Ranchland Zone for Point Reyes National Seashore and the North District of Golden Gate National Recreation Area that would be used in the event that named Lessees: (i) do not wish to enter into a lease/permit; (ii) cannot agree upon an arrangement among named lessees for continued operations under a new lease/permit, (iii) have not consistently met performance standards for the agricultural operation and other named Lessees are not willing to take on responsibility for improved operations&

MCL supports this draft succession plan because it would help to ensure the succession from current to future agriculturalists in the planning area and also ensure that practices that are currently maintaining the cultural landscape and heritage would continue into the future.

The GMPA and Final EIS should clearly describe this succession plan and incorporate it into the GMPA so the public is fully aware of the terms and conditions of lease succession.

Establishment and renewal of 20-year leases. Preferred Alternative B contemplates the establishment of 20-year leases for the existing agricultural operations within the planning area. MCL agrees with the establishment of 20-year leases because they will give the operators the certainty of tenure necessary to invest in the long-term success of their operations, including necessary ranch infrastructure improvements, improvement and diversification of agricultural operations, and improvements to natural resource values. However, the DEIS does not adequately address what happens to the leases established by the GMPA after the conclusion of the proposed initial 20-year lease period.

The DEIS dismissed analysis of rolling leases because they have no fixed termination date, are & not consistent with ranching in a setting as complex as the planning area&, and &the 2013 Secretarial delegation of authority to NPS and Congressional guidance directed NPS to consider issuing leases with 20-year terms.

MCLs scoping letter (November 28, 2018) stated that while the proposed 20-year leases are a good first step. . . , longer leases would contribute greater confidence and stability. We suggested that the EIS should also describe methods for how the proposed 20-year leases could serve a longer time period (e.g., perhaps through 5-year

incremental extensions).

NPS has provided a copy of the Draft Agricultural Lease/Special Use Permit (draft lease) in response to prior public comments. The draft lease, on page 9, Section 5.3 contemplates an extension of the lease:

Six months prior to the Expiration Date of the lease, NPS may offer this lease, or a similar lease, to Lessee. If Lessee fails to execute a subsequent lease prior to the Expiration Date, the Provisions of this Lease regarding Lessee's obligations to surrender and vacate the Premise shall apply. Lessor has no obligation to offer a subsequent lease to Lessee.

The DEIS does not address the conditions necessary for NPS to offer this lease or a similar lease, to Lessee. This creates uncertainty for the future of ranching operations in the planning area after the 20-year leases reach their term and could potentially lead to unnecessary future litigation. The public should understand the conditions and terms of this or similar lease that may be offered to the lessee as well as the conditions that would lead NPS to not offer such a lease to the operator(s).

MCL believes that the topic of renewal and succession should be documented and understood as part of the GMPA and addressed in the Final EIS, in that both socioeconomic consequences (e.g., the cultural continuity of agriculture on the Seashore) and environmental consequences (e.g., the ability of ranchers to continue funding environmental improvements) could be either positive or negative depending on the manner in which renewal or succession is managed on the expiration of the initial 20-year term.

Therefore, GMPA and Final EIS should consider the environmental and cultural consequences of various options that may occur when 20-year leases are nearing expiration. The GMPA and Final EIS should make the procedure for lease renewal clear including a significantly longer time frame than 6 months prior to expiration to renew or issue new leases, and that includes the conditions and terms of the same or similar new lease and the conditions for not offering such a lease. Providing for renewal only 6 months prior to expiration is inconsistent with and may frustrate the purpose of an initial 20-year lease and is inherently inconsistent with Secretarial and Congressional guidance concerning the 20-year leases. The Final EIS should address and resolve this issue because not providing the analysis and approach for this impending decision at this time defers a lengthy debate and planning process to 20 years from now. It also places the cultural resource of active agricultural operations and continued funding support for environmental mitigations in a state of uncertainty and at risk in the future.

**Lease Appraisal Process.** Under its preferred alternative (Alternative B), NPS proposes to implement a master appraisal process managed by the US Department of Interior (DOI) to determine the FMV for park ranch operations. MCL could not find guidelines for such a master appraisal process on DOI's website or in the Uniform Standards of Professional Appraisal Practice (USPAP). Without a clear guide for the appraisal process, the referenced master appraisal process could lead to lease values that are fair for some leases but may not be economically viable for others. This could effectively price operators out of their leases.

The Final EIS should clearly explain the appraisal process for the proposed 20-year leases and explain what will be done to ensure that it is fair and equitable to all lessees given the significant mitigation measures that would be applied to all ranching activities allowed under the preferred alternative. The costs of implementing these measures should be considered for each lease when DOI appraises the value of the potential leases.

**Elk Management:** The DEIS and appendices provide a thorough description of the affected environment with respect to the tule elk herds in the GMPA planning area.

MCL believes that NPS has done a credible analysis of the management alternatives potentially available to it for the elk herds at PRNS, and generally supports the proposed elk management program described in Alternative B, the preferred alternative. We conclude that the overall approach to managing elk for coexistence with the cattle and dairy ranches at PRNS is reasonable and based on sound science and judgment by qualified professionals. MCL does, however, have specific concerns and comments regarding the proposed management program for elk, including some that involve adequacy of the DEIS as follows:

Model to Predict Rangeland Residual Dry Matter (Appendix I): The Forage () R model described in detail in Appendix I of the DEIS is a credible effort to provide an objective, scientific means to measure and manage for an acceptable level of competition for forage between elk and livestock on ranches impacted by elk. We understand that the model was developed for this GMPA and DEIS (i.e., it is not an established model that has undergone monitoring and refinement over a long period of time). As such, it can be regarded as untested, so there should be very clear procedures specified regarding how adjustments, exceptions, and professional judgment would be applied quickly in the event that any of the affected ranchers can demonstrate that it is not working as intended for their individual operations and, as a result, their operations are being adversely affected.

As stated in the DEIS on page 41, the intended objective for managing the Drakes Beach elk herd is to maintain the herd at a population level compatible with authorized ranching operations. However, there must be some recognition of, and method for dealing with, the variability among individual ranches in achieving this overall objective. The fact is, some ranches may not experience an acceptable level of compatibility/coexistence with elk as a result of applying this model while others will. This includes during extended periods of low rainfall and drought. There should be a clear procedure and criteria established to address a significant threat to the economic viability of any of the ranching operations. If any of the ranching operations prove to be in danger of failing as a result of not reaching an acceptable level of coexistence with elk, the stated objectives of the NPS for managing PRNS in the planning area cannot be fully achieved. Having a process defined that would do everything possible to prevent this would significantly help to avoid/mitigate potential adverse socioeconomic impacts to the region.

The GMPA should be revised to recognize and describe a procedure for addressing the potential seasonal and annual variability in the degree of success that may occur to individual ranching operations as a result of applying the model. The procedure should include a description of how the model will be applied, monitored, and adjusted to quickly respond to problems that may be identified at any of the affected ranches. The Final EIS should address the potential socioeconomic consequences should any of the ranching operations fail as a result of not doing so. We believe that the DEIS is presently inadequate without this analysis.

Fencing. The DEIS describes how fencing would be used as a management tool for a variety of objectives with respect to elk. The discussions, however, focus on using fencing as a means to enclose elk in a defined area. We did not find any discussion of how and whether it would be feasible and beneficial to use fencing to exclude elk from certain areas to reduce competition for forage or otherwise reduce conflicts with livestock.

The Final EIS should address fencing to exclude elk from certain areas in order for the public to understand if this is feasible and how it could be employed.

Lethal vs. nonlethal population control. MCL supports control of the Drakes Beach elk herd to maintain a maximum number of 120 animals as proposed in Alternative B. We encourage the use of nonlethal methods whenever feasible and understand this is not currently possible or practicable for reasons that are clearly explained in the DEIS. NPS has indicated that lethal methods will be employed as a last resort in the future to achieve the maximum herd size proposed. We support the use of lethal methods under those circumstances. We also concur that fertility control is not a practicable method of population control for the reasons explained in the DEIS. In evaluating population control options in the future, we encourage NPS to also consider humane treatment as an important criterion.

## Conclusion

MCL, as an established local environmental organization in Marin with an 85-year history, has the institutional experience to know, but for the fact that Congress, local conservationists, and the agricultural farmers and ranchers cooperated to create the PRNS, we could be living in an alternative condition of housing and recreational development. Therefore, among other significant policy decisions and opportunities, MCL actively supported the formation of PRNS and GGNRA as fundamental to preserving the diverse and priceless natural resources and scenic landscape that is west Marins condition today, enjoyed by millions of visitors from around the world. Working ranches on PRNS and GGNRA have played a major role in maintaining a landscape that

contributes to the economy and helps to protect natural ecosystems that are part of our national heritage. Because of these connections, ranching as an important element in the parks (PRNS/GGNRA) will continue to be important to MCL and to that end we offer these comments.

Respectfully,

Linda J. Novy  
President

Attachment 1:

Marin Conservation League  
Agriculture Policy Statement

## OVERVIEW

Two hundred and fifty-five families operate Marin County's farms and ranches. Most of these are multi-generational ranches with annual gross incomes of less than \$100,000.00 and an average size of 600 acres. These ranches are located on 167,000 acres of hilly grassland and mixed oak woodland in rural Marin County. Included in this number are at least 28,000 acres of ranchland in the Golden Gate National Recreation Area and Point Reyes National Seashore, which are subject to federal jurisdiction.

The most productive use of the great majority of Marin's agricultural land is livestock grazing. Relatively dry and cool marine climatic conditions along with steep rolling hills and relatively little water are defining factors. An exception is the less than 1% of prime land, which is suitable for row cropping.

Agriculture is one of the ten major business ventures in Marin, and therefore valued as a critical element in supporting Marin's economy. Flexibility and diversification over the last 30 years have enabled agriculture to remain economically viable. Where conventional milk and beef production were the foundation of the Marin agricultural economy for many decades, now value-added and specialty products and services augment the base. For example, grass-fed beef, pastured poultry and eggs, on-farm cheese-making and small-scale organic row and tree cropping, as well as bed and breakfast accommodations, are some of the newer agricultural ventures contributing to the agricultural economy. Organic milk production accounts for more than 40,000 acres being in organic certification, far above state and national rates. The purchase of conservation easements by the Marin Agricultural Land Trust (MALT) has helped about half of the ranch operations to stay in business.

On-going threats to Marin's agricultural community remain much as they have been in the past: skyrocketing property values, which encourages urbanization, family succession challenges, invasive plants, and, more recently, uncertain climate and rainfall conditions. Along with A-60 zoning, supportive Countywide Plan policies, and strong Coastal Zone protections, the purchase of conservation easements by the Marin Agricultural Land Trust and enrollment in the Williamson and Super Williamson Acts has helped stay the hand of developers and estate ranchers. Ninety percent of Marin's ranches are protected in this way.

The vast majority of ranches and farms are generational family enterprises, which has effectively raised sustainable standards and made owners better guardians of the land. As stated in the Land Use Plan (p. 12, 3rd para.) of the Local Coastal Plan, and adopted by the Marin Board of Supervisors, More than 85% of Marin farms had between one and four family members involved in their operation, and 71% had a family member interested in continuing ranching or farming.

Marin ranchers have demonstrated a high level of voluntary participation in beneficial conservation practices over the past 30 years. Implementation of conservation practices has improved water quality, created wildlife habitat, prevented soil loss and sequestered carbon. More than 25 miles of creeks have been restored and more than 650,000 cubic yards of sediment have been kept out of creeks and the bay. Marin ranches, with their extensive grasslands and forests, are expected to help Marin County reach its Climate Action Plan goals. Ranchers are supported in their conservation practices by a suite of strong federal and state laws, standards, and regulations and effective county policies and code, all designed to protect environmental resources on agricultural lands.

#### STATED GOAL

To continue to support the role Marin agricultural community plays in maintaining open space, protecting wildlife corridors, managing carbon, preserving a valuable local heritage, and contributing to food security and the local economy. This statement is consistent with MCLs previous positions and actions regarding agriculture.

#### POLICY

As approved by the Board of Directors on November 17, 2015

Following are policy statements that specify and clarify Marin Conservation Leagues goals and concerns.

Natural Resources Management:

1. Support sustainable management of grassland and rangeland, which provides critical forage for livestock, while fostering wildlife habitat and preserving native plants.
2. Support soil management practices that lead to increased water-holding capacity and an increase in organic matter in the soil.
3. Support soil management practices such as the use of the no-till drill, which minimize soil disturbance, prevent soil loss and reduce the flow of sediment into streams, bays and the ocean.
4. Encourage the alignment of local conservation programs and practices with the goals of the Healthy Soils Initiative as described on the California Department of Food and Agriculture website.
5. Support development restrictions within 100 feet or more of wetlands and stream conservation areas, as defined in the Countywide Plan (BIO-3.1 and 4.1) to protect wetland and stream habitats.
6. Support the management of invasive plants through Integrated Pest Management, including chemical measures, where other control measures are infeasible or ineffective.
7. Support the federal Clean Water Act 1974 and Endangered Species Act 1973, and Californias Porter-Cologne Act of 1969 because of their broad powers in protecting natural resources.
8. Encourage those conservation practices that reduce the delivery of pathogens, sediment, mercury and nutrients to our waterways and all bodies of water.
9. Promote the efficient use and reuse of water on farms and ranches to meet their agricultural needs. Maintain water infrastructure, and if old sources become insufficient, consider developing new sources of water only if adverse environmental impacts can be avoided.
10. Support carbon farm planning and implementation of the United States Department of Agriculture's Natural Resource Conservation Service's carbon-beneficial practices.
11. Support assisted ranch management planning and cost-share implementation of best management practices, rather than depend principally on enforcement to attain compliance with environmental regulations.
12. Encourage efficient energy management and the production of renewable energy resources on and for individual ranches, such as wind, solar and methane digestion, where adverse environmental impacts can be avoided.
13. Discourage the development of large wind and solar farms on agricultural lands for commercial purposes, due

to energy production inefficiencies, installation and transmission impacts, visual impacts such as disharmony of scale and inconsistency with rural character, and environmental impacts such as wildlife and habitat degradation.

14. Encourage greenhouse gas reduction and climate adaptation practices, as described in the U. S. Department of Agriculture's GHG and Carbon Sequestration Ranking Tool.

#### Partnering Agencies:

15. Support the Grazing and Dairy Permit Waiver Programs of the Regional Water Quality Control Board.
16. Support funding and technical support to farmers and ranchers seeking to improve water quality and fisheries habitat.
17. Support national, state, local, and private funding for conservation implementation programs through Marin Resource Conservation District, Marin Agricultural Land Trust, and Natural Resources Conservation Service.
18. Support landowner education and permitting facilitation through county-funded positions, such as the Marin Resource Conservation Districts Stream Coordinator position and the University of California Cooperative Extension's Agricultural Ombudsman position.
19. Encourage the County to control invasive plants on County rights of way and on open space preserves, to prevent invasives from spreading onto ranchland.
20. Support coordination programs between permitting agencies, such as the Marin Resource Conservation Districts Coastal Permit Coordination Program, which bundles permit requirements over several agencies to promote efficiencies and to reduce the financial burden on agencies and landowners.
21. Support the inclusion of the Local Coastal Program permitting requirements in the recertification of the Marin Resource Conservation Districts Coastal Permit Coordination Program.
22. Endorse the role of Marin Agricultural Land Trust, Marin Resource Conservation District, the Natural Resources Conservation Service, the Ag Institute of Marin, the Marin Dept. of Agriculture, the Marin Community Development Agency and the University of California Cooperative Extension Service, the Regional Water Quality Control Board, and the California Department of Fish and Wildlife in preserving and protecting Marin County's agricultural heritage and natural resources, and supporting the best management practices which foster long range productivity and environmental protection.

#### Zoning and Land use:

23. Support a critical mass of agricultural production (e.g., sufficient number of dairies, acres of beef production, small-scale crops, etc.) needed to maintain the demand for goods and services that are necessary to support a viable agricultural economy in Marin County.
24. Balance ranchers' desire for flexibility in cropping decisions with the need to not exceed impact thresholds or standards for grading quantities (e.g., terracing), irrigation, and setbacks from streams, wetlands, and other sensitive resources.
25. Support Marin Countywide Plan and Coastal Zone policies that limit residential development on agriculturally zoned land, and limit the size of farm residences.
26. Limit development of farm dwellings and ancillary structures to clusters within 5% or less of total ranch acreage. (See Marin Countywide Plan AG-1.6).
27. To facilitate intergenerational succession on family farms in the Coastal Zone, support up to two dwellings in addition to the farmhouse per farm tract (defined as all contiguous lots under common ownership), as conditioned in the Land Use Plan of the Local Coastal Program, adopted August 25, 2015 by the Board of Supervisors.<sup>[i]</sup>
28. Support affordable, safe and healthy housing for Marin's largely permanent farm workforce both on-farm and in nearby villages.
29. Support policies, programs and zoning that restrict subdivision of agricultural lands by requiring demonstration that long-term productivity of agricultural on each parcel created would be enhanced. (See Marin Countywide Plan AG-1.5).
30. Maintain a minimum A-60 zoning, as it has been instrumental in protecting agriculture, maintaining open space values, and preserving the rural character of West Marin.
31. Support the County of Marin's Affirmative Agricultural Easement Program and MALT's Mandatory

Agricultural Easement Program, which are listed in the LUP of the LCP as a program to evaluate: Program C-AG-2b Option to Secure Affirmative Agricultural Easements Through Restricted Residences&etc.

32. Support small-scale diversification and value-added production (such as cheese production), and services (such as bed-and-breakfast or non-profit farm tours) consistent with County policy and code, where adverse environmental impacts can be avoided.

33. Balance development of new retail farmstands with the need to protect viewsheds and safety on Highway One.

34. Encourage internet capacity expansion in the rural areas of Marin, avoiding negative visual impacts to ridgelines and viewsheds.

35. Discourage expansion of vineyards due to their negative impacts on soils, water quantity and quality, and wildlife habitat.

36. Support prohibition of incompatible and environmentally damaging recreational uses, such as motorcycle riding and off-road biking, on agriculturally zoned land.

37. Encourage the restoration of traditional and iconic ranch structures, such as wooden barns and outbuildings, to maintain the cultural landscape of agriculture in West Marin.

Footnote to Item #27 \_\_\_\_\_

[1] Excerpted from Land Use Plan policies C-AG-5 A. and AG-7, agricultural dwelling units, including intergenerational housing, may be permitted in C-APZ zoning districts, subject to the following conditions: dwelling units must be owned by a farmer or operator actively engaged in agricultural use of the property; no more than a combined total of 7,000 square feet (plus 540 square feet of garage space and 500 square feet of agricultural-related office space) may be permitted per farm tract; intergenerational farm homes may only be occupied by persons authorized by the farm owner or operator; a density of at least 60 acres per unit shall be required for each farmhouse and intergenerational house (i.e., at least 180 acres required for a farmhouse and two intergenerational homes); no more than 27 intergenerational homes may be allowed in the Countys coastal zone; permitted development shall have no significant adverse impacts on environmental quality or natural habitats; all dwellings shall be placed within a clustered development area; and development shall be sited to minimize impacts on coastal resources and adjacent agricultural operations.

Cynthia MacLeod  
Acting Superintendent  
Point Reyes GMP Amendment  
Point Reyes National Seashore  
1 Bear Valley Road  
Point Reyes Station, CA 94956

Subject: First Phase Comments for the Point Reyes National Seashore General Management Plan Amendment

Dear Acting Superintendent MacLeod,

Introduction

Thank you for this opportunity to provide comments during the first phase of the Point Reyes National Seashore and Golden Gate National Recreation Area north district (PRNS/GGNRA) General Management Plan Amendment (GMP Amendment) planning process. The Marin Conservation Leagues mission since 1934 is to preserve, protect, and enhance Marins natural assets. In 2015, MCL approved its Agricultural Policy Statement (attached) which includes the following stated goal:

To continue to support the role Marins agricultural community plays in maintaining open space, protecting wildlife corridors, managing carbon, preserving a valuable local heritage, and contributing to food security and the local economy.

In accordance with our goal, and consistent with MCLs previous positions and actions regarding agriculture and our mission to conserve Marins national park assets, we are in full support of the continuation of ranching and dairy production on the PRNS and GGNRA. We hold that there is a direct and mutually supportive connection between the GMP amendment and our agricultural policy and seek to partner with the National Park Service and the farm families on the Seashore to realize this connection. We further hold the GMP Amendment as a timely opportunity for NPS, working with the ranchers who have managed the land for generations and Marin partners, to lead the nation again by providing a solution that achieves the multiple objectives society holds for safeguarding

the unique natural resources as well as the working landscape within the Seashore.

### Specific Comments

We offer the following specific comments as initial considerations and recommendations for issue identification and the refinement and analysis of alternatives during the GMP Amendment planning process and environmental review under the National Environmental Policy Act (NEPA). MCL will continue to participate in the GMP Amendment planning and review processes during coming years.

### Land Allocation

Ranching and dairy farming should continue in the pastoral area on the greatest acreage possible as originally authorized. This will provide the best opportunity for each ranch to remain viable, assure the continued contribution of agricultural production on the Seashore to the local community and economy, and meet the larger goal of preserving this cultural and historic resource in the park. Additionally, any conversion of land from agricultural management by a farm family to alternative land uses would increase the management demands upon NPS staff which, in the face of a proposed 13% budget cut, would be difficult to provide.

Each of the three settlement-required alternatives represents real risks and compromises to these objectives. The six PRNS dairies represent 20% of the total number of dairies in Marin County and they ship to local processors such as Clover Sonoma and Straus Family Creamery. Removing them as proposed in the No Dairy Ranching alternative would eliminate an irreplaceable source of milk for the Marin-Sonoma milk shed, and would compromise this cultural use and landscape in both counties. The No Ranching alternative, in itself, acknowledges the ecosystem management role played by grazing livestock, with the point & NPS may coordinate prescriptive grazing in high priority areas to maintain native and rare plant communities. The proposed removal of 7,500 acres in the Reduced Ranching alternative would result in at least ten existing ranches being eliminated. The Environmental Impact Statement (EIS) should thoroughly analyze how the maximum allocation of land to grazing livestock and dairy farming provides needed on-the-ground resource management that might otherwise be beyond the capacity of NPS; how it maintains the contributions made to the strength of regional and local economy; and how it successfully achieves the cultural and natural resource preservation and management objectives of the NPS for PRNS and GGNRA.

The concept of buffers is, on its face, one that MCL supports. Buffers should be situated strategically to protect sensitive resources, but in ways that do not overly impact any single ranch. Additionally, significant consideration should be given to buffers that have already been put in place and not formally named. Management requirements of these buffers should be addressed, including the avoidance of undesirable invasive plant species and the unintended consequence of disrupting plant community structures and harming sensitive species that depend on a grazing regime for survival.

### Leases

Lease length is directly related to the strength and viability of farming and ranching operations. Long leases promote long-term viability of ranching operations by providing the ability to reliably forecast economic costs and returns. This includes investments in infrastructure upkeep, natural resource management, maintenance of healthy water and air quality, and assurances of farm employees welfare. The proposed 20-year leases are a good first step to create this environment for success. Longer leases would contribute even greater confidence and stability. When structuring leases, NPS should give consideration to these points, and also describe methods for how the proposed 20-year leases could serve a longer time period (e.g., perhaps through 5-year incremental extensions). For example, when a lease runs for five years, the lease should be extended for another 20 years so that the ranchers will have the "long term equity" to support their infrastructure upkeep, resource management, farm work force and necessary viable financing opportunities.

### Elk

Significant conflicts exist between some of the free-ranging tule elk and some of the ranches at PRNS. We recognize that long-term management solutions to these conflicts, as well as other issues associated with the elk herds (e.g., Johnes disease), must be found. The elk and agricultural operations are both valuable resources at PRNS, and a management solution that would provide a level of co-existence acceptable to the affected ranches would be ideal. MCL recognizes that this ideal may be difficult and/or costly to achieve. The six alternatives presented to the public to date have options for addressing the issue that essentially range from management in one form or another to removal of one or more of the free-range elk herds.

NPS has indicated that it intends to analyze this issue carefully with qualified resource management professionals. MCL supports NPS in this approach. We look forward to seeing the results of this analysis and will comment on a preferred management approach once those results are available, hopefully in the Draft EIS.

### Park Resources and Visitor Carrying Capacity

Much can be done to improve the PRNS/GGNRA visitor experience. Fundamental to this is an analysis of the annual, seasonal, peak-day, and even daily visitor volume that can be effectively supported by PRNS staffing and infrastructure resources. MCL views this GMP Amendment and EIS as an opportunity to explore and implement a variety of tools for visitor access and participation. Specifically, the EIS should examine visitor shuttle models that relieve congestion and parking constraints. This would contribute to a stronger visitor experience with PRNS/GGNRA by getting visitors out of their automobiles. This could also serve to mitigate environmental impacts by reducing vehicle traffic, idling time (emissions) resulting from congestion, etc. Examples and models are in operation throughout the NPS that achieve these objectives, so this is an important topic to evaluate in the EIS.

Similarly, a visitors experience and participation at PRNS inevitably crosses the boundary between portions of PRNS inside and outside the GMP Amendment planning area. This is also the case for the conflict posed by the free-ranging elk. MCL recommends that the alternatives identify and consider integrated resource management solutions that also apply to regions outside the proposed planning area. These solutions would be more holistic and comprehensive, and would recognize the inherent visitor and resource connections and relationships that exist across the proposed planning area boundary.

### Visitor Access and Experience

Coupled with our suggestions for Park Resources and Visitor Carrying Capacity, MCL supports enhancing visitor experience through the GMP Amendment. One specific option MCL recommends that the NPS explore is the growth of the trail network in the planning area. This could be implemented along the boundaries between ranch operations, and could include relevant cultural, historical, and natural interpretive information (e.g., brochures, audio tours, signage). Visitor experience would be expanded by providing access to selected portions of the pastoral area, and be made richer by the opportunity to learn about PRNS agriculture, its history, and the names and faces of the ranching community that continues the traditional historic family farms of the past - a tradition across the nation that is increasingly threatened by much larger industrial agriculture operations.

Another potential way to enhance visitor experience with respect to the ranching operations would be to consider some form of ranching and farming tours that would be available to the public. This could foster a better understanding of how ranching compatibly contributes to PRNS, NPSs mission for managing PRNS, the regional economy, and how the operations are managed to protect the natural environment of PRNS. MCL recommends that this be explored and analyzed in the GMP Amendment and EIS.

### Cultural and Historic Resources

The PRNS/GGNRA are unique among national park units in that they have successfully implemented the integration of a pastoral landscape and its active ranching traditions with large areas of natural landscape and wilderness. The cultural and historic resource that has been preserved in PRNS/GGNRA is the combination of

the historic pastoral landscape and the multi-generational farm families that are managing them. These local community members are the most direct link and now, four and five generations later, are the legacy of the historic period of ranching and farming on the Point Reyes Peninsula which dates back to the mid 1800s. The working landscapes they manage exemplify and manifest the national movement to strengthen local food systems and community agriculture. They are leaders in grass-fed and organic production. At the same time, they have contributed to maintaining the ecological richness that is the hallmark of PRNS/GGNRA and must comply with stringent state and federal environmental regulations. MCL recommends that the NPS, through the GMP Amendment and EIS process, recognizes this connection to historic agricultural operations, and describes the innovations in agricultural and resource management practices that are unique to the PRNS/GGNRA. These historic agricultural operations represent a tremendous resource and exceptional educational opportunity to the public. The environmental, cultural, educational, and economic benefits they bring to PRNS/GGNRA support NPSs mission for this area, and should be fully addressed and documented in the EIS.

### Community and Agricultural Economy

Agriculture on the PRNS/GGNRA represents about 19% of the areal extent and 19% of total production in Marin County. Per the 2016 Marin County Crop Report, total gross production value was \$96.5 M. Accordingly, the contribution of PRNS/GGNRA agricultural production to total county production is \$18.3M. This does not include multiplier effects through processing and value-added production, which can be 3 to 4 times that amount, resulting in a value of about \$73.2M. In terms of employment, every on-farm job is matched by 3 to 4 jobs in other off-farm related agricultural businesses. In 2012, Marin County employed 1,072 farm employees (USDA 2012 Ag. Census) resulting in as much as 4,288 off-farm jobs. PRNS/GGNRA's contribution to on-farm employment is 204 employees and a corresponding 815 off-farm employees. The loss of \$73.2 M in annual production, and as many as 1,019 jobs, would be devastating to the agricultural community and the region as a whole. MCL asks that, in analyzing alternatives for the GMP Amendment, full consideration be given to the impacts each proposed alternative would have to this significant contribution to the local and regional economy. Proactively, we recommend that these benefits be referenced, as appropriate, in NPSs purpose and need statement for the GMP Amendment.

### Sustainable Agriculture and Regulatory Compliance

The ranchers on PRNS/GGNRA rangelands and dairies are dedicated to achieving the synergy of working landscapes and environmental resource stewardship. To that end, they must comply with some of the most stringent and all-encompassing water quality management regulations for agricultural nonpoint source pollution in the United States. Two specific examples of federal and state environmental regulations are the respective Grazing Lands and Dairy Conditional Waivers for Waste Discharge Requirements approved and implemented by the San Francisco Regional Water Quality Control Board. In both cases, the agricultural manager must evaluate potential impacts to surface and groundwater from grazing livestock and manure management, and implement practices that mitigate those impacts. The EIS should describe the management measures that NPS staff and the ranchers are using to safeguard water quality. These include programs such as the US Environmental Protection Agency's 319(H) water quality grants, partnering with the Marin Resource Conservation District on other funding opportunities, and cost-share contributions from the individual ranchers and farmers. These implemented practices are providing the intended benefit and protections and represent the multi-objective solutions critical to achieving NPS goals and mandates for the PRNS/ GGNRA.

MCL, consistent with the State of California and beyond, is deeply concerned and committed to finding solutions for climate change, including greenhouse gas (GHG) emission reductions. Through its Climate Action Work Group, MCL has worked closely with the County of Marin and other stakeholders to develop a relevant Climate Action Plan (CAP) for Marin in response to California Assembly Bill 32. The Marin CAP provides an accurate inventory of GHG emissions for Marin County, including 5% from agriculture that is consistent with California and United States inventories. Furthermore, the Marin CAP recognizes the potential that agriculture represents, through conservation practices, to be a net sink of carbon and provide offsets that make significant contributions to obtaining Marin CAP GHG emission reduction objectives. To this end, the Marin County Board of Supervisors recently passed the Drawdown: Marin goal. MCL recommends that the GMP Amendment and EIS analyze GHG

reduction strategies that can be implemented at agricultural operations on PRNS/GGNRA (e.g., carbon sequestration management practices).

## Glossary and Index

We believe the GMP Amendment process would facilitate better community participation through the inclusion of a glossary of terms in the Draft EIS. Examples include but are not limited to terms like operational flexibility, carrying capacity, and visitor experience.

As described in the NPS NEPA Handbook (2015, page 95), we assume that an index will be included in the Draft EIS. MCL supports this and believes it would make it easier for the public to quickly find where specific topics are discussed.

## Conclusion

MCL played a significant role in the initial establishment of both PRNS and GGNRA and has supported them for decades as incomparable public assets. MCL has also enjoyed a long, successful, and rewarding relationship with Marins agricultural community that united with the NPS to realize the shared goal of protecting an open and connected landscape from significant residential development that could have decimated that landscape. The success of this relationship, a working landscape with strong community ties, economy, and connected landscapes and ecosystems, is a model that has been studied in an attempt to replicate it nationally. Those original benefits and achieved goals are being multiplied forward through new, unforeseen benefits such as the opportunity for a vibrant local food system and provision of climate change solutions, among other ecosystem services. These are ideals held and pursued throughout California and nationally. They are already being realized in Marin County, including on the PRNS/GGRNA ranches and farms.

The GMP Amendment process is a timely opportunity to again embrace the purpose and intent of preserving ecosystems and protecting working landscapes and the families that manage them because of the dividends this will pay going forward for the environment and community. MCL recommends that an alternative be considered and thoroughly analyzed in the EIS that embraces these mutual and integrated benefits, and reflects our comments above to continue PRNS/GGNRA ranching and dairy farming.

Thank you for considering these comments.

Respectfully,

Kate Powers  
President

November 27, 2018

Cicely Muldoon  
Superintendent  
Point Reyes GMP Amendment EIS  
Point Reyes National Seashore  
1 Bear Valley Road  
Point Reyes Station, CA 94956

Subject: Point Reyes National Seashore General Management Plan Amendment - Draft Environmental Impact

## Statement Scoping Comments

Dear Superintendent Muldoon,

### Introduction

Thank you for this opportunity to provide comments during this formal scoping phase of the Environmental Impact Statement (EIS) for the Point Reyes National Seashore and Golden Gate National Recreation Area north district (PRNS/GGNRA) General Management Plan Amendment (GMP Amendment). The Marin Conservation Leagues (MCL) mission since 1934 is to preserve, protect, and enhance Marins natural assets. In 2015, MCL approved its Agricultural Policy Statement (attached) which includes the following stated goal:

To continue to support the role Marins agricultural community plays in maintaining open space, protecting wildlife corridors, managing carbon, preserving a valuable local heritage, and contributing to food security and the local economy.

In accordance with our goals, and consistent with MCLs previous positions and actions regarding agriculture and our mission to conserve Marins national park assets, we are in full support of the continuation of ranching and dairy production on the PRNS and GGNRA.

Furthermore, MCLs position is consistent with PRNS enabling legislation and the statutory history that provided for ranching operations to continue within a designated pastoral zone (agricultural properties) and thus ensure that future generations would be able to participate in the parks working landscapes. This promise was reinforced by a 2012 directive from then Secretary of the Interior Ken Salazar, offering 20-year leases to the multi-generational ranching families.

In sum, MCL & holds that there is a direct and mutually supportive connection between the GMP amendment and our agricultural policy and seek to partner with the National Park Service (NPS) and the farm families on the Seashore to realize this connection as stated in our letter dated November 13, 2017 (attached for inclusion in the administrative record with this letter providing MCLs specific comments for EIS analysis of the proposed action and alternatives presented in the EIS NOI materials).

MCL also believes that a robust analysis under the National Environmental Policy Act (NEPA) of all alternatives in the GMP Amendment, including those required by a legal settlement, will enable NPS to understand and evaluate the possible mitigation and management measures that could improve the environmental sustainability of the ranches and dairies, and inform a broad range of land management policies and decisions, including lease/special use permit succession planning, elk management, visitor access, and conservation practices to protect natural and cultural resources, coastal rangeland, and water and soil quality, among others.

At this time, NPS is seeking comments on what topics should be analyzed in the EIS, as well as on potential refinements to the proposed action and other alternatives. MCL offers the following comments regarding the scope of issues that the EIS should address.

### Specific Comments

#### Visitor capacity, access, and circulation

" The EIS should evaluate visitor shuttle models that relieve congestion and parking constraints. Shuttle service could also contribute to a stronger visitor experience with PRNS/GGNRA by getting visitors out of their automobiles. This could also serve to mitigate environmental impacts by reducing vehicle traffic, idling time (emissions) resulting from congestion, etc. Examples and models are in operation throughout the National Park system that achieve these objectives.

" The EIS should analyze annual, seasonal, peak-day, and daily visitor volumes that can be effectively supported by PRNS staffing and infrastructure resources. MCL views this GMP Amendment and EIS as an opportunity to

explore and implement a variety of tools for visitor access and participation. MCL is supportive of many of the elements common to all action alternatives but believes they should be based upon a complete understanding of visitor capacity in the planning area to be evaluated in the draft EIS.

" The EIS should, for each alternative analyzed, identify and consider integrated resource management and visitor access solutions that address shared issues and provide solutions across the proposed planning area and surrounding region. Examples include loop routes, connectivity with adjacent public lands, and facilitation of north-south connectivity across the landscape. This is also the case for issues like vegetation and fire management and the conflicts posed by the free-ranging elk. A visitor's experience at PRNS inevitably crosses the boundary between portions of PRNS inside and outside the GMP Amendment planning area. These solutions should be holistic and comprehensive, recognizing the visitor and resource connections and relationships that exist across the proposed planning area boundary.

#### Ecological buffers and natural resource protections and

" The EIS should identify new infrastructure (e.g. fencing among others) required to create ecological buffers identified for all the alternatives, as well as plans for the long-term maintenance of new and existing buffer infrastructure. The concept of buffers is, on its face, one that MCL supports. While all ranches require infrastructure in place to protect sensitive resources, including rare and endangered plant and wildlife species, proposed buffers should be situated strategically to protect sensitive resources, but in ways that do not overly impact any single ranch. Additionally, significant consideration should be given to buffers that have already been put in place and not formally named. Management objectives and requirements of these buffers should be addressed, including the avoidance of undesirable invasive plant species and the unintended consequence of disrupting native plant communities and harming sensitive species that depend on a grazing regime for survival.

" The EIS should account for environmental benefits and protections provided by previously implemented best management practices (BMPs) and additional benefits derived by to-be implemented BMPs. Specifically, the EIS should describe the management measures that NPS staff and the ranchers are currently using and plan to use to safeguard and provide continued, needed improvements to water quality. These practices represent the multi-objective solutions critical to achieving NPS goals and mandates for the PRNS/ GGNRA. They are also the primary means for compliance with federal and state environmental regulations for respective Grazing Lands and Dairy Conditional Waivers for Waste Discharge Requirements approved and implemented by the San Francisco Regional Water Quality Control Board. These require that NPS staff and ranchers evaluate potential impacts to surface and groundwater from grazing livestock and manure management and implement practices that mitigate those impacts.

" The EIS should consider a transparent and rancher participatory process, using the best available information and science to develop the Conservation Framework and the Land Management Units. The NPS proposes applying this basic zoning framework of core, pasture, and rangeland zones to all action alternatives that include ranching, in order to streamline the permitting process [for ranchers and NPS staff] and provide consistent guidance to ranch operators while ensuring the protection of natural and cultural resources. The EIS also should consider as an alternative, whole ranch conservation and carbon farm planning methods already used to achieve integrated soil and water conservation on grazing livestock ranches and dairy farms. The impetus and opportunity with these methods is to use tools and approaches that facilitate consistency in conservation practices to identify and address resource problems and realize land management opportunities that might cross any proposed LMU boundaries or become evident after the GMP is completed.

" The EIS should comprehensively analyze both Green House Gas (GHG) emission reduction and offset strategies that can be implemented through all sectors across the planning area, including on PRNS/GGNRA farms and ranches (e.g., carbon sequestration management practices). MCL, consistent with the State of California and beyond, is committed to finding solutions for climate change, including GHG emission reductions. Through its Climate Action Working Group, MCL has worked with the County of Marin and other stakeholders to develop (by commenting on) a relevant Climate Action Plan (CAP) for Marin in response to California Assembly Bill 32. The Marin CAP provides an accurate inventory of GHG emissions for Marin County (including 5% from agriculture) that is consistent with California and United States inventories. Furthermore, the Marin CAP recognizes that agriculture, through conservation practices and by serving as a carbon sink, can offset emissions and make a significant contribution to obtaining Marin CAP GHG emission reduction objectives. The potential for a positive net change in agricultural carbon flux on the ranches and dairies over the range of

alternatives should be estimated.

#### Elk management

" The evaluation of elk management options should recognize the variability in scale of conflict between grazing livestock beef ranches and dairy farms. The EIS should analyze a full range of management methods, either individual or in some combination of methods and including separation, that respond to and reflect these differences to effectively relieve those conflicts.

#### Nexus of agriculture and resource management

" The EIS should also describe how NPS could benefit public knowledge of historic districts and ongoing ranching in the park by engaging ranchers and other partners in interpreting the agricultural story within the planning area and its connections outside the planning area. This EIS analysis point is also relevant to visitor experience.

" The EIS should thoroughly analyze how the maximum allocation of land to grazing livestock and dairy farming provides needed on-the-ground resource management that might otherwise be beyond the capacity of NPS and how it achieves the cultural and natural resource preservation and management objectives of the NPS for PRNS and GGNRA.

" The EIS should analyze the role farm families provide as partners in resource and infrastructure management in the face of decreasing NPS budgets and resources to do the same. This important long-term socioeconomic effect should be compared in the EISs evaluation of various alternatives, especially those that would severely limit or eliminate ranching.

#### Lease length and succession

" The EIS should evaluate options for lease continuation beyond the proposed 20-year term in the proposed action. This includes preparing the process and detailing a plan for lease renewal in advance of the proposed 20-year leases expiring. Lease length is directly related to the strength and viability of farming and ranching operations. Long leases promote long-term viability of ranching operations by providing the ability to reliably forecast economic costs and returns. This includes investments in infrastructure upkeep, natural resource management, maintenance of healthy water and air quality, and assurances of farm employees welfare. The proposed 20-year leases are a good first step to create this environment for success. Longer leases would contribute even greater confidence and stability. The EIS should thoroughly analyze longer term leases and the potential benefits that may be gained in environmental and socioeconomic effects. The EIS should also describe methods for how the proposed 20-year leases could serve a longer time period (e.g., perhaps through 5-year incremental extensions). In the event that a ranch succession plan anticipates that there will be no family successor in future years, the EIS should also analyze alternatives and recommend a process for determining a successor or other options that would either continue, discontinue, or modify agricultural operations on that ranch

#### Socioeconomics

" The EIS should analyze the socioeconomic benefits that the ranching operations on PRNS and GGNRA provide to West Marin and Marin-Sonoma communities, including employment, school enrollment, and support industries. Agriculture on the PRNS/GGNRA represents about 19% of the areal extent and 19% of total production in Marin County. Per the 2017 Marin County Crop Report, total gross production value was \$89 M. Accordingly, the contribution of PRNS/GGNRA agricultural production to total county production is \$17M. This does not include multiplier effects through processing and value-added production, which can be 3 to 4 times that amount, resulting in a value of about \$68M. In terms of employment, every on-farm job is matched by 3 to 4 jobs in other off-farm related agricultural businesses. In 2012, Marin County employed 1,072 farm employees (USDA 2012 Ag. Census) resulting in as much as 4,288 off-farm jobs. PRNS/GGNRAs contribution to on-farm employment is 204 employees and a corresponding 815 off-farm employees. The EIS should analyze the impact of potential loss of \$73.2 M in annual production, and as many as 1,019 jobs on the community and the region.

## Conclusion

MCL played a significant role in the initial legislative establishment of both PRNS and GGNRA and has supported them for decades as incomparable public assets that provide experiences in wilderness and natural lands, recreation, and working landscapes. MCL has also enjoyed a long, successful, and rewarding relationship with Marins multi-generational agricultural community whose voluntary sale of their land to the NPS made it possible for both PRNS and GGNRA to realize the shared goal of protecting an open and connected landscape from significant development that could have decimated that landscape. The success of this relationship is a working landscape within the two national parks and beyond, with strong community ties, a contributing economy, connected landscapes and protected natural ecosystems.

Respectfully,

Linda J. Novy  
President

#7125

Name: Smith, Logan

Correspondence: I support option A because I believe both the historic ranchers and the Tule Elk are important. The ranches have been in Point Reyes for hundreds of years, and shouldn't be removed. At the same time, the Elk are endangered and need to be supported/helped, and not killed.

#7126

Name: Kalber, Brandon

Correspondence: I support Alternative F: No ranching.

The mission of national parks is to protect native plants and animals, and the Environmental Impact Statement says that the land, water, and wildlife of the national seashore are being harmed by cattle.

Removing native Tule elk from the park to benefit the ranchers is built into four of the NPS alternatives, including the NPS's "preferred alternative." The EIS says that the Seashore's land, water and wildlife would benefit were ranching to cease. But there is no plan for protecting wildlife from ranching's impacts or mitigating habitat loss from cattle grazing or growing crops. Other than killing Tule elk, there is no discussion of avoiding wildlife conflicts. Alternative F: No ranching is the only option that avoids wildlife conflicts.

Cattle are the leading source of greenhouse gases at the Seashore. Methane, produced by cattle, is a greenhouse gas 25x-100x worse than carbon dioxide. There is no discussion of mitigation for cattle's impacts to the climate in any of the NPS's ranching alternatives.

Correspondence: As a taxpayer and wildlife lover I strongly oppose the National Park Service's plan to shoot native native tule elk in Point Reyes National Seashore to make room not only for beef and dairy cattle, but for new, expanded use that will include sheep, goats and chickens in the pastures, and pigs and row crops in other parts of the Seashore.

The Point Reyes National Seashore and the northern district of Golden Gate National Recreation Area were not preserved as national parks to for the purpose of cattle grazing and livestock raising. The ranches were purchased by the government and the ranchers were given more than adequate time to move elsewhere. The National Park

Service now has an unprecedented opportunity to end ranching on our public lands in these parks-doing anything else would be a grave disservice to the American people, as well as to the incredible diversity of native plants and wildlife that actually belong on these lands."

The proposed park management plan allows destructive levels of livestock grazing to continue on 28,000 acres of national park lands in this treasured Pacific Coast landscape, despite the many known adverse impacts livestock grazing has on coastal prairie, riparian systems, springs, wetlands, and coastal dune vegetation.

Many experts and wild lands preservation groups have weighed in and signed a comment letter on the draft Environmental Impact Statement demanded that conservation values must be placed first and I strongly agree. The proposed General Management Plan amendment being analyzed fails to protect and restore Point Reyes National Seashore and Golden Gate National Recreation Area.

The National Park Service should be managing the National Seashore for the benefit of wildlife and the natural ecology. Emphasizing livestock ranching while subsidizing welfare ranchers is a takings of public land. Livestock don't belong on our public lands where they degrade the land and pollute the water. This disastrous plan must be stopped. The American people don't want our public lands and wild places turned into livestock operations and our wildlife slaughtered.

Stop this irresponsible plan now!

Correspondence: I am writing to voice my opposition to the NPS plan calling for the shooting of native Tule Elk with the intent to expand cattle ranching and commercial agriculture at Point Reyes National Seashore and Golden Gate National Recreation Area (GGNRA). The elk would also be hazed off of 18,000 acres of the park to benefit expanded agricultural activities. Under this plan, the goal is to kill "excess" Tule Elk in to establish an arbitrary 120-member population threshold for the Drakes Beach herd.

Not only would this deadly plan sanction the senseless killing of Tule Elk but would greatly damage wildlife habitat, threaten endangered species, result in the degradation of water quality and spark new conflicts with other wildlife. Such destruction of wildlife and the environment is being proposed merely to pander to a small minority of special interests, namely livestock ranchers, who would be the sole beneficiaries of this misguided plan.

The plan would extend 20-year lease terms to 15 private dairy and beef ranches in the park, on approximately 26,100 acres. The plan would expand ranching leases into an additional 7,600 acres of the park that are currently not authorized for cattle ranching.

If this plan for expansion of commercial livestock farming, including the introduction of sheep, goats, pigs or chickens, were to be approved, how long would it be before ranchers with a sense of entitlement would call for the eradication of other wildlife such as coyotes, bobcats, foxes and birds they deemed a threat to their financial gain and to ensure their monopoly of this public lands area?

This plan also seeks to permit conversion of park grasslands and wildlife habitat at Point Reyes to artichoke farms and other row crops. Agricultural activities such as these would cause untold damage to the land and would be responsible for wiping out a native species.

The successful reintroduction of Tule Elk to the Point Reyes peninsula has had positive impact on the conservation of native species and restoring ecosystems, in keeping with the mission of the National Park Service.

Allowing unchecked commercial agricultural activities known to cause significant damage to our public lands is flies in the face of your stated mission to "preserve unimpaired the natural and cultural resources and values of the

National Park System for the enjoyment, education, and inspiration of this and future generations.” The expansion of commercial livestock and crops in this special place so highly valued by the public would, in fact, harm the majority of Americans by marring their visitor experience for the benefit of a few who seek special treatment for personal profit with no concern about the destruction they would cause to the area and its wildlife.

The Drakes Beach elk herd is one of two free-roaming herds in the park. Allowing elk to roam freely is critical to their survival. More than half the elk in the Tomales Point herd, which is fenced in on a peninsula to pacify ranchers, perished during a recent drought due to a lack of water and nutritious forage. Shockingly, invasive domestic cattle at the Seashore far outnumber native Tule Elk by nearly 10 to 1.

The majority of Tule Elk are confined to Tomales Point behind an 8-foot fence blocking them from eating grass leased to ranchers. Over 200 elk, half of the confined herd, Half the perished during the recent drought due to lack of water and nutritious forage. There is a free-roaming herd of Tule Elk herd near Drake's Beach, adjacent to parklands grazed by cattle. Ranchers bemoan these elk compete with their cows for grass they think is theirs alone.

To appease these ranchers, NPS proposed solutions including killing, restrictive fencing, and removing the native elk. At present, they conduct daily hazing, running the elk off the leased range. However, under the 1962 law that established Point Reyes National Seashore, cattle grazing is not mandated but is at the discretion of the Secretary of the Interior.

The negative environmental impacts caused by commercial ranching and dairy operations including overgrazing of invasive livestock is well known. Such commercial activities ultimately result in soil erosion, diminished water quality, damage to endangered species habitat as well as the spread of invasive plants.

For decades, NPS authorized grazing permits allowing 5,000-6,000 beef and dairy cattle to graze year-round on national parklands without issuing an EIS or allowing the public to speak in opposition. Thanks to a 2016 lawsuit, NPS must release an EIS on commercial ranching and dairy operation impacts at the National Seashore, including the negative impacts by ranchers and their destructive practices in this treasured place.

As an American citizen who cherishes our nation’s special wild places, I strongly OPPOSE this blatant anti-wildlife plan to kill or eradicate native Tule Elk from Point Reyes National Seashore and Golden Gate National Recreation Area. It will do absolutely nothing to mitigate the ongoing damage to the environment being wrought by cattle ranching. Expanding such destruction to make way for more harmful activities will ensure the ruination of this special place to the detriment of native Tule Elk, endangered species and other wildlife, native plants, the water and air, the local economy and the enjoyment of this unique area for myriad visitors.

I call on NPS to REJECT this disastrous plan to expand agricultural activities at Point Reyes National Seashore and Golden Gate National Recreation Area and plans to kill native Tule Elk, jeopardize other wildlife and wreak havoc on the environment in this irreplaceable ecosystem that should be protected and preserved for generations to come.

Thank you for your consideration.

Correspondence: Dear Sir or Madame: Please do not allow the extension of leasing of public lands to cattle grazing, or other commercial agricultural pursuit. I also have heard that you are considering expanding the type of commercial farming activity, i.e., diversification of farming species, to occur on public lands at Point Reyes seashore. Instead, I urge you to adopt Alternative F of the proposals, phasing out ranching, and managing the land, water and wildlife. Do not shoot the gorgeous Tule Elk!

The public has already paid for this land to be kept wild. Currently, the Park Service is permitting this public land, and the native species which originally inhabited it, to be despoiled and destroyed. This is a travesty, a disgrace, and is certainly outside the bounds of the legislation which is supposed to protect the land from exploitation. The Park Service is clearly in breach of the fiduciary duty it owes to the people of the US who paid for this wild land to be set apart from exploitation. And of course, it is an utter betrayal to allow the native species to suffer and die, or to be displaced, due to what may very well be illegal exploitation of this land by commercial agribusiness.

There is no saving grace to be had in falsely identifying these commercial "farms", which are despoiling both land and species, as historical and/or bucolic! You simply must stop this activity, and allow the land to be returned to the public as was intended and authorized under the law. Please adhere to your responsibility on this matter, and reverse current plans to expand these destructive practices! Do what you are charged to do under law!

Sincerely, Brenda Wallace

Correspondence: Public lands and native wildlife on Point Reyes National Seashore and Golden Gate National Recreation Area need to be conserved - not replaced with cattle and commercial agricultural expansion. I go to public lands to lose myself in the solitude of nature and renew my spirit by seeing native wildlife in their natural homes not to see denuded and overgrazed lands overrun with livestock.

#7131

Name: Runnion, Kathleen

Correspondence: The tule elk should not be killed for the sake of cattle ranching. Let the elk live their lives freely in their natural habitat within PRNS.

#7132

Name: VanderHoeven, Nakisha

Correspondence: I strongly urge the NPS to adopt Alternative F, to end ranching at Point Reyes National Seashore.

Cattle and for profit ranching and farming operations have no part in a nature reserve and are a detriment to the existing wildlife and the diversity of the natural area, and furthermore contribute to the destruction and pollution of the native habitat. I can visit anywhere to see cows, what I want to see is Elk and other wildlife in their natural habitat. Stop catering to a minority and listen to those who will use the land and appreciate it for what it is.

Thank you.

Name: Kingma, Kevin

Correspondence: I am submitting these comments on the Point Reyes National Seashore (PRNS) draft General Management Plan amendment and Environmental impact statement (GMPA-DEIS) on September 23, 2019.

Public Law 87-657 September 13, 1962 AN ACT To establish the Point Reyes National Seashore in the State of California. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled. That in order to save and preserve, for purposes of public recreation, benefit, and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped, the Secretary of the Interior (hereinafter referred to as the "Secretary") is hereby authorized to take appropriate action in the public interest toward the establishment of the national seashore set forth in section 2 of this Act

16 USC Sec. 459c 01/22/02 TITLE 16 - CONSERVATION CHAPTER 1 - NATIONAL PARKS, MILITARY PARKS, MONUMENTS, AND SEASHORES SUBCHAPTER LXIII - NATIONAL SEASHORE RECREATIONAL AREAS Sec. 459c. Point Reyes National Seashore; purposes; authorization for establishment - STATUTE In order to save and preserve, for purposes of public recreation, benefit, and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped, the Secretary of the Interior (hereinafter referred to as the "Secretary") is authorized to take appropriate action in the public interest toward the establishment of the national seashore set forth in section 459c1 of this title.

I. These laws make it very clear that the Point Reyes National Seashore (PRNS) was created (1) for its undeveloped characteristics and (2) for the public interest.

Any of the 6 GMPA-DEIS alternatives that propose "Diversification" - - adding crops, pigs, sheep, goats and chickens would be adding further development. They would have further impacts on the PRNS. Therefore alternatives B, C, D, E would be illegal and should be disqualified.

The public interest: the public interest is the total public of the United States, not just a small group that makes money on public land. PRNS was created by a national law, not a local ordinance. Reading DEIS comments makes it clear there is a select local group with ties to the ranchers. Their comments are notable for being about their own personal self interest, not about the national public's interest. It is no coincidence that a local congressman Jared Huffman is leading efforts to make ranching at PRNS permanent and to remove anything that interferes with the local ranching business (eliminating native Tule elk).

There are similar examples of why federal law was enacted and enforcement needed to protect scenic undeveloped land for all the people of the US to enjoy: the creation of Yosemite National Park - - to remove local homesteaders and sheepherders from Yosemite Valley, and the Bundy ranch - thinking and grazing as if they owned the public's land in Nevada.

To repeat - PRNS was created for its undeveloped character and for all the public's interest. Alternative F is the only alternative that follows the law that created PRNS.

II. NPS economics: "More than \$11 billion of repairs or maintenance on roads, buildings, utility systems, and other structures and facilities across the National Park System has been postponed for more than a year due to budget constraints. Collectively they are known as "deferred maintenance." Addressing deferred maintenance is a critical focus area of our core mission to preserve parks" <https://www.nps.gov/subjects/infrastructure/deferred-maintenance.htm> I assume the NPS realizes and is committed to being stewards of all of the public's lands and that this requires careful stewardship of public money. PRNS internal memos indicate that monitoring the ranches for environmental damage and lease compliance already places outsized demands on the Seashore's budget. Alternative F would be the least costly alternative and would allow attending to deferred maintenance.

The NPS has already purchased all the ranches at PRNS in the 1960-70's at a cost of \$341 million (est. today's dollars). It was a give-away to allow past ranchers to graze on NPS land. It continues to be a taxpayer paid subsidy to the ranchers descendants - currently they pay \$7-9 per head AUM for grazing as compared to \$15-20 on private land in Marin county.

[https://www.nps.gov/pore/learn/management/upload/planning\\_ag\\_report\\_response\\_090724.pdf](https://www.nps.gov/pore/learn/management/upload/planning_ag_report_response_090724.pdf) They also do not pay any property tax on the land compared to Marin county ranchers - another subsidy. Alternative F is the only way to end the unfair give-aways at taxpayer expense.

Regards, Kevin Kingma

Correspondence: 350 Bay Area is a grassroots environmental and Climate Justice non-profit organization working

for deep reductions in carbon emissions in the Bay Area and beyond. Founded in 2012, 350 Bay Area now represents more than 22,000 people primarily concentrated in the nine area counties.

350 Bay Area strongly urges the National Park Service to adopt alternative F and to reject alternative B. The ranches and dairy farms are the largest emitter of greenhouse gases in the National Seashore. In general, animal agriculture produces somewhere between 20% and 40% of the greenhouse gas effects contributing to our climate emergency. A National Seashore is a place to protect wildlife and ecosystems; it is completely inappropriate to lease National Seashore land to private ranchers for their profit-and in the process contribute to the destruction of the climate and the planet.

At the time the park was created, ranch owners received financial compensation and 25 year leases, so that there could be an orderly transition back to the native habitat. It is past time for the National Park Service to implement the intent of the National Seashores authorizing legislation and phase out the destructive effects of dairy and cattle ranching on more than one third of the park. 350 Bay Area strongly urges the Park service to implement alternative F and phase out ranching.

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

To: Cicely Muldoon, Superintendent, Point Reyes National Seashore (PRNS)  
National Park Service (NPS)

Re: PRNS General Management Plan Amendment (GMPA)  
Draft Environmental Impact Statement (dEIS)

Dear Superintendent:

Background: I represented Marin County on the GGNRA/Point Reyes federal Advisory Commission from 2000 until 2002, during which I successfully mediated disputes between GGNRA and Sausalito over Fort Baker and between PRNS and Bolinas over the Wilkins Ranch. I was a founding shareholder in Westbrae Natural Foods and have almost 20 years experience with food economics. I have also served on a number of environmental boards, including Marin Audubon and Marin Sierra Club. I have extensive volunteer experience with NPS and was the 2003 Volunteer of the Year for the National Marine Sanctuary Foundation. I now preside over Save Our Seashore (SOS) and support the PRNS Preferred Alternative B&subject to the following analysis and commentary, summarized below and as followed by detailed analysis.

Diversification: SOS supports the dEIS Diversification proposal but not justified as economic mitigation. We instead suggest that the dEIS consider diversification as mitigation for elk impacts, which would achieve a similar end. We also suggest that the dEIS consider where diversification could both be expanded and limited without altering the dEIS impact studies. We suggest that the dEIS consider that appraisals need to be strengthened in order to fairly compensate the public for use of its lands. We lastly suggest that the dEIS consider places where diversification text could be clarified and why transparency in appraisals would be helpful.

Elk Management: We support the dEIS proposal as consistent with elk management throughout National Parks and as needed to balance the NPS mandates for protection of both natural as well as cultural resources. We suggest that the dEIS consider additions to the Forage Model that may better clarify elk impacts on C Ranch and suggest that the dEIS consider additional forage offsets for C Ranch. Lastly, we suggest that the dEIS consider managing to the threshold of the impact of 120 elk rather than the number of 120 elk.

Best Management Practices/Mitigations: We support the dEIS list of mitigations, but we also suggest that the dEIS consider adding reasonable milestones. We further suggest that the dEIS consider transparency so the public can track the progress of mitigation projects.

Succession: We support the dEIS succession proposal as consistent with congressional intent, but also suggest the dEIS consider more specificity about NPS discretion over closed ranches.

Lease Template: We support the dEIS proposed Lease Template but also suggest that the dEIS consider adding prior health inspection observations. We further suggest that the dEIS consider the value of transparency re the annual meetings.

Public Use and Enjoyment: We support the dEIS proposals for use of abandoned buildings, but also suggest the dEIS consider better opportunities for ranch worker housing and affordable housing to offset visitor impacts. We support the dEIS proposal to open ranch roads to bicycles, but also suggest that the dEIS consider a commensurate reduction in less-used trails.

Thank you for the opportunity to comment, we hope you find our suggestions useful.

Sincerely,

Gordon Bennett, SOS President

ALTERNATIVE B: DIVERSIFICATION

DIVERSIFICATION: Rationale

The dEIS pg. 20 states the (sole) rationale for considering diversification as follows: Diversification of ranching activities allows ranchers to react to poor forage production years and fluctuations in the economic market (e.g., the price of cattle, grain, hay). SOS has expressed support for limited diversification, but not as justified in the dEIS.

First, multiple Department of Agriculture (USDA) programs already mitigate for poor forage production years and fluctuations in the economic market. Since 1995 (per the EWG website), the following non-exhaustive list of PRNS ranches have received such USDA subsidies: the Dan Evans Ranch, Mendoza Dairy, Stewart Ranch, David Evans Ranch, Nunes Dairy, Grossi Ranch, Spaletta Dairy, Kehoe Dairy, L Ranch Dairy, Lunny Ranch and the McClure Dairy. For example, the Nunes Ranch received nearly a half million dollars from eighteen different USDA programs. The existence of multiple USDA programs designed to mitigate for poor forage production years and fluctuations in the economic market undermines the rationale of the dEIS proposal that would duplicate the USDA economic mitigation by approving diversification.

Second, PRNS ranch families already have both potential and actual diversified income opportunities, including what appear to be extended family ranches in Marin and Sonoma (e.g. twelve Spaletta ranches relationship unknown but likely), second jobs by lessee family members and independent businesses owned by lessee family members, including, for example the Lunny family with a paving business, a compost business, a shellfish

growing/distributing business, and a quarry. The existence of these multiple opportunities for diversification undermines the rationale of the dEIS proposal that PRNS ranchlands should be a significant source of income diversification.

Third, nothing in the enabling legislation, related congressional testimony, or Salazar's directive specifically mentions diversification. On the contrary, the entirety of the record speaks to ranching and dairying being allowed to continue, with an occasional reference to agriculture as simply an abbreviation for ranching and dairying. Nevertheless, there are some who seek to re-interpret this occasional abbreviation to claim original intent for extensive agricultural diversifications based on everything that was grown, is rumored to have been grown, or could possibly in the future be grown in the dEIS planning area.

Such assertions have no merit and no relationship with ranching and dairying as practiced at the time these ranches were acquired by the NPS and when the original intent for continued ranching and dairying was discussed.

Last, we can find no reference in the National Environmental Quality Act (NEPA) that requires or allows mitigation of market impacts to NPS tenants/lessees. The purpose of NEPA is to assess the impacts of a project on the environment—not the impacts of the environment on the project. This rationale sets a precedent that could, for example, justify timbering a virgin forest in order to mitigate impacts on the logging company. SOS is concerned that the current dEIS rationale is subject to likely successful legal challenge, which would only prolong the uncertainties of this GMPA. For all of the above reasons, SOS suggests that the dEIS consider a more defensible justification for diversification that does not inadvertently undermine NEPA.

When the NPS purchased the ranches, the understanding was that the ranching families would be allowed to continue ranching subject to the NPS at its sole discretion managing (then-existing) wildlife impacts. But since those purchases, the NPS has introduced free-range Tule elk. According to the November 2017 CDFW Draft Elk Conservation and Management Plan, Conflicts between expanding elk and human populations are significant at some locales.

Thus it would seem reasonable for the NPS to mitigate elk impacts on PRNS ranches that were not anticipated in the original understanding. The dEIS (pg. 25) already acknowledges this rationale by its current actions to mitigate elk impacts, including providing pasture offsets, including identifying access to additional pasture for ranchers to offset forage lost to grazing elk. Thus we suggest that the dEIS consider amending its rationale for diversification as follows: Diversification of ranching activities allows ranchers another economic offset to impacts from elk to react to poor forage production years and fluctuations in the economic market (e.g., the price of cattle, grain, hay).

#### DIVERSIFICATION: Appraisal

In order to determine to what extent the dEIS diversification proposal represents a reasonable offset to elk impacts (as well as to determine an appropriate rent to PRNS for diversification operations), it will be necessary for PRNS to understand the economics of each diversification.

Under alternative B, NPS anticipates development of a master appraisal process managed by the US Department of the Interior to determine FMV for park ranch operations. Such a master appraisal process could be effective—provided it addresses the multiple problems with the prior appraisal process described by our 1/27/16 letter Appendix 6. But it seems clear that this master appraisal cannot determine FMV rents for diversification proposals yet to be made. Thus, case-by-case FMV appraisals will need to be made based on the specifics of each diversification proposal, as was done for the one existing (chicken) diversification operation. Our 1/27/16 letter pointed out that this former appraisal was deeply flawed, with a claimed FMV rent of only \$997 per year for a chicken operation with revenues estimated at \$143,258 per year (i.e. rent at 0.7% of sales vs PRNS grazing land rent at ~\$84AU/\$667=12.6% of gross sales). Unfortunately the current dEIS appraisal process for this same chicken operation is similarly deeply flawed, which points to the need for the dEIS to more clearly define (or significantly re-assess) how it intends to determine FMV for diversification operations.

Further, diversification needs to have enforceable and enforced limits so that it does not in any substantial way alter the historic ranching and dairying landscape or become a substitute for income from ranching and dairying. The dEIS sets explicit sideboards for diversification re the number of sheep, goats, chickens and acres of row crops, but sets no comparable limits on diversification income, without which diversification income could be so substantial that it could far exceed not just amounts needed for elk offsets, but could also exceed total ranch income.

We suggest that the dEIS consider limiting projected income from all diversification at the site to be at most a combined 10% of the projected income from ranching and dairying at the site (unless the rancher can document

the need for a greater offset for elk impacts). Such a 10% limit would also serve to quantify the dEIS language regarding small scale processing and would also likely be considered a de minimis departure from ranching and dairying as described in the enabling legislation, related congressional testimony, and Secretary Salazar's directive. Lastly, as an aside, the Marin County Crop Reports show that combined ranching and dairying income can fluctuate by 20%, so a 10% limit on diversification income intended to mitigate elk impacts would incidentally serve to flatten out those ups and downs. Thus we urge that the dEIS should consider how best to assess income from ranching operations, income from diversification operations and the appropriate rent for the diversification.

#### DIVERSIFICATION: Fixed Cash Rent

There are two common methods for agricultural landowners to assess rent for use of their land: fixed cash method and crop share method. The AU-based rent calculation for the current chicken operation represents (albeit poorly) the fixed cash method. If this AU method were to be carried forward for 18 chicken operations with 500 layers each, then that would result in a grand total of merely \$3,094 rent (0.64% of gross sales) for chicken operations grossing a combined \$481,950. This compares to the previous estimated rent percentage (12.6% of sales) for PRNS grazing land and standard crop share agreement that have rent at 25% of sales. In our opinion, such a fixed rent calculation for chickens based on AU would significantly short-change the public for use of its land and unnecessarily cripple PRNS in its ability to manage diversification activities and fund environmental protection. Assessing/monitoring for multiple diversifications almost certainly requires more effort and cost than for grazing land.

If the fixed cash method is used to determine diversification rent, then to avoid the problems in past and current FMV appraisals, it would seem necessary for industry specialists in each diversification type who could provide a fair estimate of both projected income and appropriate rent. The dEIS should consider the cost and complexity of multiple separate such appraisals.

#### DIVERSIFICATION: Crop Share Rent

Consequently, we urge the dEIS to consider the alternative, which is a crop share agreement that appears to be the easiest method to assess both income and the rent. A typical crop share agreement considers 25% as rent to the land owner and could generate as much as the dEIS socioeconomic estimate of total PRNS sales of \$16M x the suggested 10% diversification limit of 10% x the standard 25% crop share rent = \$400,000 in rental income for PRNS (vs ~\$480,000 in estimated rent from grazing). A 25% crop share agreement would help PRNS ranchers to offset elk impacts and also help PRNS by generating rental income that could go toward better monitoring, more effective management and additional environmental improvements.

A crop share agreement would also obviate the need for the specialized assessments of the fixed cash method because the rent would be assessed retroactively based on the rancher providing accurate sales records for the diversification (and ranching sales). Thus the dEIS should consider modeling such language requiring sales records on the similar language in Lease Template #7: Lessee shall provide all sales documentation to NPS upon request demonstrating that Lessee has an ownership interest in all cattle on the Premises.

Lastly, extreme care must be taken so that diversification operations allowed today do not become a new baseline against which new diversification proposals are measured tomorrow. To avoid such an outcome is why we suggest that the dEIS consider measuring diversification income against income from ranching and dairying so that the public can be certain that PRNS stays true to the original intent that ranching and dairying (rather than diversification) be allowed to continue as the principal use and be proportionate to estimated economic impacts from elk. The above suggested 10% limit could (if fully utilized on all PRNS ranches) generate as much as \$1.6M in gross sales for ranchers.

Further, elk impacts on the average ranch (with the exception of C Ranch) are not expected to exceed 10% of sales for the average ranch and thus the proposed 10% diversification income limit would seem to provide reasonably adequate mitigation for elk impact costs (see our Elk comment).

#### DIVERSIFICATION: Definitions

Consequently, we urge that the dEIS should consider making its programmatic policy clearer (example follows) when it describes allowed diversifications (pg. 37).

Diversification of ranching activities under alternative B could include new types of livestock, row crops, horse boarding that includes a public component, public-serving ranch tours and farm stays, small-scale processing of dairy products (e.g., cheese) produced on site, and sale of local agricultural products produced on site.

Diversification activities authorized in the Ranch Core subzone:

New Types of Livestock species (pigs, chickens, sheep, and goats)

Horse boarding activities that include a public component (riding/renting)

Row crops

Public-serving ranch activities that support park goals for interpretation and education (i.e., farm stays, ranch tours)

Small scale processing of dairy products from milk produced on site.

DIVERSIFICATION: Ranch Core Opportunities

There appear to be discrepancies between the Appendix As Alternative B Ranch Maps and the underlying leases on the PRNS website, which introduce confusion as to whether diversification limited to ranch cores would be allowed. For example, Figure 20 shows Home Ranch with a developed complex, but leases AGRI-8530-9007 and -1003 do not include this developed complex, and instead reference only incidental use of a ranch house. The dEIS should consider clarifying that AGRI-8530-9007 and -1003 will not be authorized for diversification that is limited to ranch cores (i.e. incidental use of a ranch house qualifies as neither a developed complex or a ranch core).

Figure 27 show the McIsaac/Cheda Ranch (Lease 8530-1000-9012) with 2 developed complexes, but the dEIS should consider clarifying that if a ranch has a developed complex ranch core, then the lessee will have one ranch core diversification opportunity, no matter how many ranches with ranch cores are in the name of that lessee. This same logic should apply throughout the dEIS, including but not limited to A and E Ranches (Leases 8530-2600-9002 and -9009) and the Percy Ranch (Lease 2600-10-1002).

A related issue concerns families with multiple ranches with ranch cores, at least one of which are in (or could be changed to) virtually the same, but not identical lessee names. Simply changing one name from a list of lessees on should not add a ranch core diversification opportunity. Thus the dEIS should consider making clear that when names on different leases that are substantially (>50%) the same and more than one of the leases has ranch core, then only one ranch core diversification opportunity will be allowed per family. For example, two ranches with ranch cores that are leased to same four lessees per the prior paragraph should have one ranch core diversification (e.g. 5 pigs) opportunity and changing one of the four lessee names on one ranch lease should not create a second diversification opportunity (i.e. 10 pigs).

DIVERSIFICATION: On-Site

Without such clarification re on-site origin, the dEIS could be interpreted to mean, for example, that milk could be trucked in from dairies outside PRNS for small scale processing&or that 18 farmers market could be established to sell local agricultural products from outside PRNS, We do not believe that any of these examples represent the intent of the dEIS, but we urge that the dEIS further clarify that intent.

We also note that first sentence of the above dEIS diversification references sale of local agricultural products but the bulleted list below of activities potentially authorized in the Ranch Core subzone does not reference sale of local agricultural products. We assume this to mean that the dEIS has reasonably concluded that the traffic, health- and- safety and liability impact of 18 farm stands (whether in ranch cores or roadsides) is unacceptable. Instead, we suggest that the dEIS consider expressly prohibiting such sales and instead expressly authorize sale of agricultural products produced on PRNS ranches at weekend seasonal farmers markets, e.g. in Point Reyes Station or in the visitor parking lot at Bear Valley or Drakes Beach.

DIVERSIFICATION: Horses

PRNS has had legacy horse boarding operations operating on public land that were de facto private facilities open only to family and friends with no public component. These operations have now or will soon end but the dEIS diversification proposal should not breathe new life into this legacy. The dEIS allows farm stays and ranch tours as diversification only when they support park goals for interpretation and education. A similar logic should apply to boarding private horses, so the dEIS should consider authorizing horse-boarding only when the boarding opportunity is open to the public and there are rental horses available so as to support park goals for recreation and public access. This is the same public component logic the GGRNA applied to the Golden Gate Dairys then private-only horse boarding.

The dEIS should also consider whether more publicly available horses on diversified ranches would materially impact existing public horse boarding/riding concessions in the Seashore and if so, should consider a cap on the

number of horses or operations that would be allowed as diversification.

#### DIVERSIFICATION: Row Crops

The dEIS also describes the 2.5 acres potentially authorized for diversification in potentially contradictory ways, so the dEIS should consider clarification. The predominate definition (emphasis ours) is per Page 37: Up to 2.5 acres of row crops not requiring irrigation would be allowed in previously disturbed areas in the Ranch Core subzone. However Pg. 51 reads differently: Ranch Core subzone: the developed complex of buildings and structures on each individual ranch including up to 2.5 additional acres of disturbed land immediately adjacent to the developed complex. Page 51 (and similar phrasings) should be corrected to conform to the Page 37 description of the 2.5 diversification acres as being within the ~10 acre Ranch Core, not 2.5 acres in addition to the ~10 acre Ranch Core.

Further, the dEIS does not make explicit the definition of its term row crop. This leaves open the possibility that any crop planted in a row is a row crop. We urge the dEIS to consider referencing the USDA California definition of a row crop that explicitly excludes a crop planted in rows. This would eliminate the previously cited extreme example cited of exotic mushrooms planted in rows and would also eliminate the growing 2 acres of livestock food.

Although this more explicit definition of row crop would also presumably eliminate the growing of grain that could be processed (by a small scale craft distillery) into whiskey for on-site bottle sales of agricultural products produced and processed on site, the dEIS should consider explicitly prohibiting crops grown for alcohol distillation. At the USDAs estimate of 34 bushels of rye per acre and two gallons of 190 proof whisky per bushel, then the 2 acres could produce 2,027 of 750ml-bottles of 80 proof whisky for sale. This is just another example of the Pandoras Box that diversification could open and why diversification needs to be carefully defined, monitored and limited. Cannabis is another crop now illegal on federal land, but perhaps not for long, so the dEIS should also consider explicitly prohibiting diversification into cannabis.

#### DIVERSIFICATION: Pasture / Chickens

The dEIS Alternative B (pg. 37) reads Diversification activities authorized in the Ranch Core and Pasture subzones are&Pasture subzone: Livestock species (sheep, goats, chickens). But there appear to be two separate issues here that have been rolled into one sentence. Sheep and goats are proposed to be eligible to be authorized in the pasture zone of all ranches, but chickens are proposed to be eligible to be authorized in the pasture zone of only the 18 ranches with a ranch core (dEIS pg. 187: if all 18 ranches that are eligible to raise chickens&).

The dEIS does not make clear the rationale for this distinction. Appendix D pg. D-48 states: Conduct daily inspections and quickly pick up livestock (i.e., sheep, goat, and hog) and fowl (i.e., chicken) carcasses& The requirement for daily inspections for sheep and goats is not a function of having a ranch core because they are authorized on pastures without a ranch core. Chicken huts need to be moved and inspected daily, so it is not clear why chickens are limited only to pastures with a ranch core. Further, if diversification is going to offset elk impacts, the handful of ranches without a ranch core could benefit from diversification into chickens just as much (if not more) than diversification into sheep and goats.

The dEIS also does not make clear the rationale for the 500 chicken limit. A 500 chicken cap produces wildly disproportionate income impacts: income from 500 chickens a small PRNS ranch would equal 100% the income from beef on that ranch, while income from the same 500 chickens on a PRNS dairy would represent less than 1% of dairy income. But, as we have suggested, income from diversification should remain supplemental to, not a replacement of income from ranching and dairying.

Further, chicken huts need to be moved daily so that the intensity of chicken manure can be spread rather than concentrated (dEIS pg. 187), so 500 chickens on a 100-acre PRNS ranch would appear to have 5 times the potential impact compared to the same 500 chickens on a 500-acre PRNS ranch. Further still free-range chicken and cattle are synergistic (chickens control bugs from cattle dung while fertilizing the soil for cattle forage). For all these reasons, we urge the dEIS to consider whether it would make better economic, elk offset and environmental sense to retain the dEIS-impact-analyzed 9000 total chickens but divide them among ranches in the same way that sheep and goats are allocated (as a percentage of AU vs the current 500 cap).

Using the AU adjustment suggested below for sheep and goats, the 2,400 beef AU plus the 3,130 dairy head (dEIS pg. 52) would represent an AU equivalent of 3,443 for all PRNS ranches combined. Dividing 9,000 chickens by 3,443 AU equals ~2.6 chickens per AU. Thus under this allocation logic, the smaller (40 AU) PRNS ranches could be authorized for ~100 chickens, while the larger (~285 AU) PRNS ranches could be authorized for ~750 chickens.

The dEIS also limits the number of chicken sheds to 3. The dEIS should consider whether limiting the height and color of the sheds could result in less visual impact than limiting the number. For laying hens, the existing chicken operation uses large plastic covered hoop sheds, with a peak that appears to be 10-12 feet high (broiler coops are only ~ 2 feet high). Other Marin pastured egg producers use old travel trailers with a height roughly the same. Fifty-four dilapidated aluminum-sided travel trailers scattered across PRNS pasture land could create 54 unnecessary visual impacts. Thus the dEIS should consider limiting the height of chicken huts to 6 feet (to allow walk-in egg collection) and limiting the colors to those beiges and greens that correspond to the pasture colors. Further because the dEIS (pg. 187) notes that chicken manure could adversely affect soil because of its high content of nutrients and heavy metals, and Moving chicken huts using motor vehicles could result in adverse effects& it would seem that, for example, six half-sized huts could be more easily moved by hand than 3 full-sized huts. Thus the dEIS should consider removing the limitation on the number of huts and adding a mitigation that requires any chicken hut on pasture to be moved only by hand and no less than once per day.

#### DIVERSIFICATION: Pigs

The dEIS puts a maximum limit on sheep (50) and goats (67), on chickens (500) and on row crops (2.5 acres), but there are no limits on the number of pigs that could be raised within each of the 18 ten-acre ranch core zones. Assuming 5 acres (1/2) of the ranch core could be devoted to pigs as a diversification, the number of feeder pigs per ranch could be as high as 250 with the total number on PRNS ranches at  $18 \times 250 = 4,500$  pigs. The dEIS should consider whether it is appropriate to set an expectation with ranchers and the public that the number of pigs allowed as diversification is limited only by available space in the ranch core and if that expectation is not appropriate, then establish a limit per below:

Our understanding (Point Reyes Rancher personal communication) is that pigs were historically used on PRNS ranches to consume both kitchen waste and agricultural waste (chiefly whey from cheese operations) and thus their numbers were de facto limited to a few pigs per ranch due to the limited amount of food available from on-site sources. Pigs also are escape artists that can root under standard fencing. Escaped pigs go rapidly feral and do great environmental damage&with a conservative annual estimate of \$1.5 billion in economic damage nationally to agriculture and the environment. Having as many as 250 feeder pigs in a ranch core would make containment difficult and the discovery of one missing pig out of 250 also more difficult. Thus the dEIS should consider prohibiting the importation of hog feed from off-site sources and limit on the number of allowed pigs to no more than five.

#### DIVERSIFICATION: Pasture / Sheep and Goats

The dEIS pg. 38 states: For individual ranches, grazing by sheep and goats in the Pasture subzone would not be allowed to exceed 10% of their authorized AU or 10 AU equivalents if the authorized AU is greater than 100 (whichever is less). But the problem with the way this limitation is stated is that most PRNS dairies do not have authorized AU&instead they have an authorized number of cattle. It should not be the intent of the dEIS to de facto prohibit dairies from diversifying with sheep or goats. Thus we urge the dEIS to consider how to apply the 10% AU concept that works for beef ranches also to dairy ranches. A rough method could be to consider that organic dairy cows must get a minimum ~1/3 of their dietary needs from in-ground forage, whereas beef cattle get closer to 100% of their needs from in-ground forage, thus 10% of authorized beef AU is approximately equal to 3.33% of authorized dairy head.

#### DIVERSIFICATION: Structures

Lastly, we urge that the dEIS consider requiring a bond to guarantee that any structure or alteration proposed to be built for use in any diversification operation will be removed and the area restored to its prior condition. We dont want a repeat of the Drakes Estero clean up that cost the NPS \$4M to remove nearly 1800 tons of mariculture debris.

#### DIVERSIFICATION: Transparency

The dEIS (pg. 37) states that proposed Alternative B fair market value (FMV) master appraisal process would allow for&more transparency regarding rental rates in the park. But the dEIS does not explain how that transparency would be achieved. We request that the dEIS commit to posting these appraisals on the PRNS website (with appropriate and necessary redactions). Prior leases gave only the lessee the right to challenge an appraisal. We request that the dEIS allow the public the same right as Lessees to review and challenge these appraisals.

We also urge that the dEIS consider ways to make sure that the master appraisal process fixes problems noted in our 1/27/16 letter (incorporated by reference), including (for structures) : Poor/Unidentified Comps; Special Lease Provision (Maintenance) Discount; Bulk Lease Provision Discount; Buildings claimed as Surplus to ranch use may not be surplus to residential or diversification use, Hay Barn Rent; and Buildings Not Used. Our 1/27/16 letter also identified problems in the former appraisals for grazing land, including Poor/Unidentified Comps; Distance from Petaluma Discount; Public Access Discount; Possessory Tax Discount; Chemical Restriction Discount; Limits on the Eradication of Non-Forage Ground Cover Discount; and Regulations on the Control of Predators Discount.

## ALTERNATIVE B: ELK MANAGEMENT

### ELK: Overview

According to the US Fish and Wildlife Service and the California Department of Fish and Wildlife (CDFW), November 2017 Draft Elk Conservation and Management Plan, Tule elk are neither threatened nor endangered. Elk populations are booming with 5,700 Tule elk and Conflicts between expanding elk and human populations [being] significant at some locales.

In the absence of natural predators, lethal management measures for ungulate populations are in widespread use both nationwide and in California . Consistent with the widespread use of lethal management, the NPS already stated in 1998 that it would use lethal means to manage the free-range elk herd .

Many of the public appear inconsistent in their belief that the NPS should not manage elk (a charismatic megafauna), but at the same time the public expresses no concern about NPS management of non-charismatic wildlife. But, in our opinion, the NPS must manage its wildlife based on science, rather than charisma .

Further, many of the public believe that the NPS is only responsible for protecting wildlife, but this belief is contradicted by the statutory requirement that the NPS must also protect cultural and recreational resources (without impairing natural resources). The public's confusion is understandable, given that most NPS-managed sites are either wildlife-oriented (Yosemite) or culturally-oriented (the Presidio), whereas PRNS is a blend. Thus, PRNS management of the Drakes herd to protect cultural resources (historic ranches) is consistent with both NPS management elsewhere and with other PRNS wildlife management efforts .

Some of the public have argued for the elimination of the ranches to benefit the elk while others have argued the opposite position for the elimination of the elk to benefit the ranches. But the dEIS states: NPS has set a population threshold of 120 adult elk [for the Drakes Beach herd]. This appears to be a reasonable compromise between these two opposite positions.

### ELK: Inconsistencies

The dEIS (pg. 24-25) describes a number of elk impact mitigations in Alternative A, including : Providing pasture offsets, including identifying access to additional pasture for ranchers to offset forage lost to grazing elk.

The dEIS (pg. 40) re Alternative B describes all the actions on pages 24-25, but omits Providing pasture offsets : NPS&would continue to take actions described for alternative A to reduce conflicts related to the presence of elk on ranches (e.g., hazing); mitigate elk damage to ranches; and conduct monitoring, disease testing, and reporting. The dEIS should consider making these two statements consistent by adding pasture offsets to the page 40 Alternative B description.

### Elk: Forage Model additions

To provide a more complete context within which to assess the proposed 120 elk, we urge the dEIS to consider breaking out components of the Appendix I Forage Model, which now does not quantify the amount of forage that disappears per the Appendix I references. Some of this forage disappearance is likely be due to life cycle of the forage plants themselves, but we believe another important component is the impact of multiple other forage-consuming wildlife, including deer, birds, gophers and rabbits. We believe it would help the public better understand elk impact on ranch forage if the elk impact was considered in the context of other wildlife impact on ranch forage.

We also suggest that the Forage Model could be a better predictor if it broke its current use of total annual rainfall data into at least two segments (early and late). The impact on forage of the timely rainfall can be more important than total annual rainfall.

### Elk: Impact of the 45 Roaming Limantour Bulls

The dEIS (pg. 81) states: Approximately 45 males spend time on ranch lands at any one time with most

concentrated use on Home Ranch, N Ranch, D. Rogers Ranch & Most males return to the wilderness areas & from summer into fall. According to PRNS wildlife biologist Dave Press (8/26/19 email): Tule elk at Drakes Beach are the equivalent 0.26 to 0.47 animal units based on the actual weights. Assuming the higher .47 AU for elk males, then those 45 roaming Limantour bulls represent  $21.15 \text{ AU} \times 9/12 \text{ months} = 15.86 \text{ AU}$  of forage consumed. We will use this figure in the subsequent analysis of the 45 Roaming Limantour Bulls.

The dEIS appendix K shows Home Ranch with 300AU, N Ranch with 90 AU and D, Rogers Ranch with 55 AU for a total of 445 AU. Assuming all the bulls were concentrated only on these three ranches, the AU impact would be roughly 3.6%.

However, we also believe it is useful to look at absolute economic impact in dollars in addition to looking at the forage impact in percentages. Using the dEIS estimate of \$1.6M in beef sales and 2400 beef, one head of beef represents \$667 in sales. Thus the estimated 15.85 AU of forage consumed by the roaming Limantour elk represents roughly \$10,567 in lost sales (3.6%) out of an estimated \$296,815 in estimate sales for these 3 ranches combined.

Thus, it would appear that the 10% limit on income from diversification (if fully implemented on these ranches) would more than suffice to mitigate for the lesser percentage elk impact on income.

Lastly, the dEIS (pg. 41) commits to maintaining this minor level of impact when it states: Elk from the Limantour herd would be allowed to wander & and they would be monitored closely and managed in consideration of ranch operations. Hazing and lethal removal may be used & to mitigate for impacts on ranching operations. Thus, for the 45 bulls, the dEIS appears to commit to maintaining an (un-quantified) level of ranch impact rather than a specific number of elk. Committing to a level of impact provides NPS with operational flexibility in managing elk.

For example, if all 45 roaming bulls began to concentrate only at the D. Rogers Ranch with its 55 authorized AU, then this might be determined to be an excessive 28.8% ( $15.86/55$ ) impact on forage and income and thus action might be taken to reduce the number of not-roaming elk on D, Roger Ranch below 45. Conversely if the 45 roaming bulls began to spread out evenly across all PRNS ranches (rather than just on Home, N and D. Rogers Ranches), then it is possible that more than 45 bulls could be allowed yet have the same minor level of impact per ranch.

Elk: the Drakes Beach Herd and C Ranch

The Forage Model (Appendix I) for C Ranch (the most impacted by elk) shows that the difference between 3 elk and 170 elk is the difference between an 81% chance of meeting the 1200 RDM vs a 75% chance & a seemingly trivial 7% difference. Thus it would appear that more than 120 elk could be supported on C Ranch without unduly impacting forage.

The dEIS references but does not quantify the non-forage impacts of elk on C Ranch (broken fences, pipes, injured cattle etc.), which the dEIS commits the Seashore to mitigate. We acknowledge that such mitigation would be facilitated if C Ranch would submit documentation of impacts, which to-date has been lacking. Lack of documentation allows stories of valid one-time/occasional impacts to be repeated, making it appear that the impacts are chronic. As most of the public who have insurance policies understand, insurance companies require extensive documentation before issuing reimbursement checks. PRNS, as custodians of the public's money, is no different, so it is not clear to us why the C Ranch operator would fail to document elk impacts in order to support the long-term viability of the ranch.

Regardless, it would be useful if the Forage Model disclosed more detail. Unfortunately although numerous percentages, numbers and durations are given on dEIS page 91 for the time males vs females spend in one place or the other and at one season or the other, the crucial question of how much forage these elk consume of C Ranch remains unclear in the dEIS, although it presumably is a specific value that is entered into the Forage Model.

Assuming the midpoint (of the Dave Press 8/26/19 email) of 0.365 AU for Drakes Beach elk, then that is an effective AU equivalent for the 120 Drakes Beach herd of  $0.365 \text{ AU} \times 120 \text{ elk} = 43.8 \text{ AU}$  of forage consumed. But that 43.8 AU is consumed on a combination of three different areas: C Ranch, E Ranch and unpermitted grazing areas. For purposes of this analysis we will assume that absent hazing, the elk would spend 1/3 of their time on the C Ranch portion of the three areas which would result in a forage impact on C-Ranch of 14.6 AU. Further, the dEIS (pg. 98) discusses the effect of hazing in some detail but again without disclosing the specific value that is entered into the Forage Model: During initial hazing efforts, the elk were hazed in the morning but often returned by evening. Through repeated efforts, hazing has been more effective at keeping elk away from C Ranch for longer periods. Hazing has not been very effective for bachelor groups. For purposes of this analysis we will assume hazing is 50% effective at reducing forage impacts on C Ranch, which results in a net forage impact on C Ranch of 7.3 AU. As we have stated re the usefulness of providing the impact of other wildlife on ranch forage,

we similarly believe it would help the public better understand the reasonableness of the calculated elk impact on C Ranch forage if the actual values entered into the Forage Model were disclosed. Absent this data, our net elk forage impact of 7.3 AU on C Ranch is necessarily rough.

We also note that the Forage Model incorporates the mitigating effect of hazing, but appears to ignore the 2003 pasture offset that also serves to mitigate elk impacts, as noted on dEIS page 25: Providing pasture offsets, including identifying access to additional pasture for ranchers to offset forage lost to grazing elk.

When D Ranch closed, the Drakes Beach herd had already established itself. D Ranch was ultimately divided between C Ranch, E Ranch and the Drakes Beach elk. As a result of this division, C Ranch got an additional 36 AU. The omission of this offset from the Forage Model demonstrates the same concern we expressed in our Diversification comment: Extreme care must be taken so that diversification operations allowed today do not become a new baseline against which new diversification proposals are measured tomorrow. In the case of elk at C Ranch, it appears that the pasture offsets made yesterday have become a new baseline against which elk impacts are measured today.

#### ELK: Dollar vs Forage Impact

Using the previously estimated 7.3 AU of forage consumed by the Drakes Beach herd, it would appear at first blush that the previously-added 36 AU for C Ranch cattle has already more than compensated for the forage consumed by 120 Drakes Beach elk on C Ranch. This may be why the Forage Model shows little impact difference between 3 elk and 170 elk. However, not all forage is created equal. Dairy cows need to be milked twice a day, so there is a limit to how far they can forage. The D Ranch Pasture A that was given as an offset appears to be at such a distance from the C Ranch milking barn that it is used only for heifers (that are not milked). Consequently, if the offset is 36 AU for un-milked heifers, while the elk impact is on the forage used for milk cows, the two situations are not the same.

Further, if the estimated 7.3 AU of forage consumed by the Drakes herd at C Ranch is translated into absolute dollars of economic impact (rather than forage percentage impact), the result appears different than the trivial result of the Forage Model. Because organic dairy cows must consume at least 1/3 of their forage from in-ground forage, the estimated 7.3 AU consumed by elk reduces dairy cow numbers by 21.9. Using the dEIS estimates of dairy cow income (\$14.4M) and dairy cow numbers (3,130), a dairy cow represents \$4,601 in sales and 21.9 less cows represents an income loss of \$100,754 to C ranch. Applying that \$4,601 figure to Appendix K (Table 3-1) figures showing C Ranch with 200 milk cows, 40 dry cows, 100 heifers, 2 bulls, then C ranch has an estimated total income of \$1,573,542 and the loss of \$100,754 represents roughly 6.4% of C Ranch income. Our estimates are rough, but they do appear to show that the dollar impact from elk on C Ranch may be more significant than the Forage Model appears to show.

Although it would appear that the 10% limit on income from diversification (if fully implemented on C Ranch) would more than suffice (as it did for the Roaming Limantour bulls) to mitigate the percentage of elk impact on income at C Ranch, we urge the dEIS to consider whether the estimated absolute dollar impact of \$100,754 may warrant additional forage offsets if the Drake Beach herd is to remain at 120. Added forage offsets would be consistent with dEIS page 25: Providing pasture offsets, including identifying access to additional pasture for ranchers to offset forage lost to grazing elk.

To this point of forage impact, there appears to be two anomalies in Appendix K Table 3-1 that could be usefully applied to C Ranch mitigations. As noted above, when D ranch was divided, E Ranch got Pastures B and C, which lease # AGRI-8350-2600-9013 states is for Grazing heifers on Pasture B at 72 Animal Unit's for 6 months per year (432 AUM's) and grazing beef cattle on Pasture C at 51 Animal Units for 6 months per year (306 AUM's), for a combined total of 738 AUM's annually. Thus this lease language shows  $738/12 = 61.5$  AU, not the 123 AU shown in Appendix K table 3-1, which appears to assume that the specified Animal Units are for 12 months instead of the actual 6 months. Thus the dEIS and Appendix K and L analyze the impacts of an overstated (by 61.5) number of cattle AU. Rather than correct this anomaly, it could better be used.

Table 3- 1 correctly shows A Ranch with 350 milk cows, 50 dry cows, 90 heifers, and 6 bulls permitted but only 200 milk cows, 45 dry cows, and 35 heifers actual. Consequently, there appears to be more than enough capacity at A Ranch itself to absorb the 61.5 AU from D Ranch's Pastures B and C, which are currently used by A Ranch and which we suggest could instead be used by C Ranch with no change in the number of AU studied by the dEIS. Thus in light of the growth of the Drakes Beach herd between 2003 and now, we urge the dEIS to re-consider the 2003 split of D Ranch and re-allocate its Pastures B and C to C Ranch. The additional 61.5 AU may not all be

useable for C Ranch due to the distance from the C Ranch milk barn, but at least part of Pasture B is west of Drakes Beach Road. Even if none of Pastures B and C can be used to supplement dairy forage, and all went to beef forage, the added 61.5 AU combined with the previous offset of 36 AU would represent roughly  $97.5 \times \$667 = \$65,033$  of added income to offset (~64.5%) the estimated \$100,754 in income lost to elk impacts.

We note that D Ranch was a closed ranch that before the 2003 division and was not part of A Ranch. We have suggested that moving forward, (see Succession comments) that the dEIS should make clearer that new operators of closed ranches will not have the expectation of succession or 20-year leases because closed ranches provide PRNS important opportunities to make adjustments in ranch management as new situations arise. The D Ranch is a perfect example of this need to make adjustments. Such a re-consideration of the 2003 D Ranch split would benefit ranching because it would mean no loss for A Ranch, yet also provide more pasture offset for C Ranch, which has been hardest hit by elk impacts and the most vocal in pressing for complete removal of the elk. Thus we would also argue that PRNS could make this change on a purely environmental basis in that it would relieve pressure on the elk and insure that elk and cows could co-exist.

#### ELK: Manage to Impact vs Number

Lastly, while we support the concept of the 120 elk threshold for the Drakes Beach herd as mitigated above, we also suggest that the dEIS consider maintaining the level of impact from 120 elk, rather than the specific number of 120 elk. As noted re the 45 bulls, committing to a level of impact provides the NPS with useful operational flexibility in managing elk.

#### ALTERNATIVE B: APPENDIX D BEST MANAGEMENT PRACTICES (BMPS)

##### BMPS: Milestones

One of the rationales for extending leases to 20 years (with succession) was to allow ranchers to recoup their investments in environmental mitigations. We understand that these mitigation funding is usually split between agency and rancher&is not 100% within the control of either party and thus occurs as funding, permits, and priorities dictate (Appendix pg. H-1). But the dEIS, as written, could result in conditions being in 20, 50 or 100 years exactly as they are now.

For example, Appendix L 8.2.2 notes: approximately 370 acres... includes resource protection exclusion areas to prevent cattle grazing along the Drakes Estero shoreline, including portions of Creamery Bay, Schooner Bay, and Home Bay. But there is no indication of what percentage of the Estero shoreline protection this represents&.and the maps (dEIS Figure 6) are at such a gross scale, with each ranch map at a different scale that it is impossible for the public to understand the proposal. Similarly, Appendix L 8.2.2 notes: In the Olema Creek watershed, new resource protection exclusion areas would restrict grazing from approximately 1.9 miles of riparian habitat&but no indication of the extent of this habitat, what percentage has been protected, what remains to be protected and what percentage the proposed 1.9 miles represents.

This contrasts with aborted 2010 GMPA Figure 24, which graphically represents the proportion of fenced vs unfenced creeks and pg. 307 that quantifies: &440 acres&of herbaceous wetlands are in areas&used for livestock... Thus we suggest that the dEIS should consider the importance of describing in both text and graphically each problem proposed to be mitigated, the percentage already mitigated and reasonable milestones by which the public should expect the remaining portion to be mitigated. The dEIS should also consider a webpage map to allow the public to see how the ranch zonings fit together, which may reveal other problems currently un-knowable. The dEIS should also consider posting mitigations on its website so the public can follow progress toward these milestones. For example, the dEIS should consider setting a goal that within 10 years, cattle will be fenced out of creeks, herbaceous wetlands and shorelines.

Various practices are listed to manage impacts from sacrifice areas (feed and watering sites), but nothing is said about minimizing sacrifice areas such that no bare ground is exposed. Thus the dEIS should consider setting a goal that within 5 years, sacrifice areas shall be minimized by rotating among several beef feed areas such that no feed area has exposed ground.

Appendix D pages D-10 to D-11 provide reasons that ranchers should install alternative water sources but do not encourage installation of a single such alternative water source. The dEIS should consider setting a goal that within 5 years, watering areas shall be interconnected and water piped among disparate troughs such that no watering area has exposed ground.

Appendix D page D-10 states: The area around the spring or seep would be fenced to control livestock access and improve habitat value. Nothing is said about ponds. The dEIS should consider setting a goal that within 5 years, spring and ponds shall be wildlife-friendly fenced at a minimum of 50 feet from the source in order to control livestock access and improve habitat.

Appendix page D-19 lists manure management actions that reduce greenhouse gas and California law (SB 1383) that targets a 40 percent reduction in methane emissions from 2013 dairy and livestock. The dEIS should consider setting a goal that within 10 years, dairies would convert to management methods that achieve a 40% reduction in greenhouse gas.

Appendix pg. H-2 defines: as Range subzone where Native grasses [are the] dominant species. Given that only 1% of Californias native grasslands remain and that 90% of the states threatened and endangered species are dependent on [these] grasslands, the dEIS should consider that native grass is a "keystone" species whose importance is not a function of being merely >50% in abundance or biomass (dominant) in a plot. Thus the dEIS should consider a much lower metric than 50%...for example, the ratio of the planning area dominated by native grass (9% per dEIS pg. 74). The dEIS should also consider proactive native grass restoration projects vs only reactive re-planting with native grass after a disturbance (Appendix pg. D-4).

Further, the dEIS should consider resolving the apparent conflict between Appendix L pg. 70 which states The zoning framework would specify that only grazing would be authorized in approximately 70% of the action area and the dEIS pg. 35, which notes that the 28,700 acre planning area (aka the action area) is divided into a Resources Protection Subzone of ~2,600 acres (where only prescriptive grazing would be allowed), plus a Range Subzone of ~16,900 acres and a Pasture Subzone of 9,000 acres in both of which grazing would be allowed. Thus dEIS would allow grazing in at least 91% of the action/planning area (not 70%).

BMPs: Guard Animals

Appendix D pg. 49 establishes criteria for guard animals (dogs, llamas, donkeys), to protect sheep, goats and chicken in the pasture zone. We suggest that the dEIS consider (in order to reduce impacts on hikers and wildlife) limiting these livestock species to fenced sub-pastures. Further, according to PRNS chicken ranchers, a herd-trained guard dog will react to a perceived threat by defensively positioning itself between the flock the threat. A perimeter-trained dog will aggressively confront the threat at the limit of the pasture. The dEIS should consider approving only herd-trained guard animals because no inadvertent hiker should be confronted by an aggressive guard animal defending the entire pasture though which the hiker may be passing. The dEIS should also consider adding that guard animals aggressively approach hikers must be removed permanently from the pasture. Lastly, it appears inconsistent for the dEIS on page 49 to allow dogs to haze wildlife to protect livestock, but on page 63 to prohibit dogs from hazing elk to protect livestock. Studies show the utility of dogs for this purpose. The dEIS should consider whether properly trained dogs under the management of trained on-site PRNS staff could assist in the effort to reduce elk impact.

BMPs: Compost

We suggest the dEIS consider amending pg. 126 (underlined below) to read: manure, compost and fertilizer spreading increases soil nutrients, which increases forage species production but may have adverse impacts on native grassland plant species. We also suggest that the dEIS consider amending pg. 35 to read: The Range subzone is identified as lands where grazing would be authorized, but more intensive activities would not be allowed because of the documented presence of sensitive resources, including native grassland species, rare plants, wetlands, riparian/stream/pond habitats, forested areas, and critical habitat&.

The spreading of compost on dairy pasture subzone (where no sensitive resources are known to occur), is both environmentally and agriculturally superior to spreading slurry, but this comparative benefit does not extend to rangelands. The dEIS correctly concludes that spreading compost on rangeland may have adverse impacts on native grassland plant species. But short-term species composition studies funded and promoted by compost advocates show little impact on native species, whereas species composition trends require long term analysis. As the California Native Plant Society 9/28/15 letter noted: critical questions must still be answered before Californians can be assured that the addition of compost will not adversely alter native species composition and structure of grassland habitats where the practice is applied. Further native grasses sequester far more carbon than the annuals. Thus we suggest the dEIS consider amending pg. 190 (Carbon Farming) to point out potential risks to native species and their carbon sequestration from application of compost to previously un-fertilized rangeland.

Not only does the dEIS (pg. 190) fail to point out the potential environmental risk of reduced native species due to the application of compost to rangeland but it also fails to point out the potential greenhouse gas risk from

increased forage species due to application of compost to rangeland. Studies funded and promoted by compost advocates (dEIS pg. 180 footnote) show increased carbon sequestration in the soil, but fail to account for the substantially greater GHS impacts of the increased enteric emissions in the atmosphere from the additional cattle able to be sustained on the land by the increases [in] forage species.

Instead, these studies claim that increased forage does not increase cattle numbers and only reduces the need for supplemental forage. That claim is likely true for dairy operations, where nitrogen from compost simply replaces nitrogen from slurry. But when compost is applied to previously un-fertilized rangeland in beef operations (emphasis ours) spreading the fertilizer over his land will eventually result in more forage, more beef and more profit. More beef creates more enteric methane, whose GHS impact is far greater than that of carbon.

Further, the benefit of carbon sequestration in the soil plateaus, but the greater GHS impacting methane emitted into the atmosphere by more beef continues indefinitely. Analysis by SOS indicate that the GHG benefit of carbon sequestered in the soil (by more compost) is surpassed within a few years by the more than offsetting impact of enteric methane (by more beef). Thus, the applying compost to rangelands not only risks impacts to native species but it increases (rather than decreases) greenhouse gas. Compost application to rangeland is thus an environmental expense that is coincidentally an economic benefit to the PRNS rancher who owns a composting facility and advocates spreading his product throughout PRNS rangeland.

#### ALTERNATIVE B: SUCCESSION

SOS supports the GMPAs draft Succession Policy (Policy) as consistent with long-standing Congressional intent, but the dEIS should consider making it clearer that under all circumstances when a ranch closes, the NPS will first determine whether it is still appropriate to maintain the lease/permit area in agriculture and if so to what extent and under what conditions. This is the same type of determination made for D Ranch and which resulted in some of the ranch (the steepest parts) being taken out of grazing for resource protection and the remaining (flat) parts being divided between nearby existing ranchers.

Thus, the continuation of the exact same prior grazing regime on a closed ranch newly offered to an existing PRNS rancher has not been and should not be automatic. Such closed ranches could be used to offset elk impacts, or to swap less environmentally valuable portions of that closed ranch with more environmentally valuable portions of an existing PRNS, or to spread existing AUs, or for short-term commercial grazing as a placeholder, or to experiment with prescribed grazing. The NPS should retain full discretion on these closed ranches without creating any false expectations of how they should be used, Thus the dEIS should consider making this important initial consideration about closed ranches clearer by transferring language now in Succession paragraph 2 to instead be in paragraph 1.

Further, the dEIS should consider that same offer proposed to be first extended to PRNS ranch lessees to take over the operation of a closed ranch, should (if no takers among lessees) then be offered to PRNS ranch workers. We point out that many of the PRNS ranch workers have a longer history working on PRNS ranches than younger lessees. Further, many current PRNS ranch lessees are themselves descendants of former tenant farmers who owned neither the land or the cows on what is now PRNS (Livingston: Ranching on the Point Reyes Peninsula). Before the NPS seeks RFPs, the NPS should consider offers from PRNS ranch workers.

Per above suggestions, see underline strikeout below.

The NPS would use the following process to maintain active ranch operations within the Ranchland Zone in a manner that supports park natural and cultural resource objectives.

1. In the event that named Lessees: (i) do not wish to enter into a lease/permit; (ii) cannot agree upon an arrangement among named lessees for continued operations under a new lease/permit, (iii) have not consistently met performance standards for the agricultural operation and other named Lessees are not willing to take on responsibility for improved operations; and NPS determines that it is appropriate to maintain the lease/permit area in agriculture (and if so, to what extent and under what conditions), the NPS would consider proposals from other leaseholders operating in the Ranchland Zone to continue ranch operations. In evaluating other park leaseholders, the NPS would assess proposed operations for consistency with the activities authorized as part of the final EIS and Record of Decision and past performance based on adherence to lease/permits and Ranch Operating Agreements.

2. In the event that no other park leaseholders are interested, and NPS determines that it is appropriate to maintain the lease/permit area in agriculture, the NPS would consider proposals from ranch workers on PRNS ranches to identify a new operator. In evaluating PRNS ranch workers, the NPS would assess work history on PRNS ranches and the criteria for review would be identified at that time.

3. 2. In the event that no park leaseholder or PRNS ranch workers are interested, the NPS would pursue issuance

of a request for proposals (RFP) to identify a new operator. The RFP process would be conducted consistent with NPS policy and regulations, and the criteria for review would be identified at that time.

The dEIS should also consider making clear that rancher operating under Reservations of Use and Occupancy (RUOs) will be offered leases (when their RUOs expire) subject to the same succession policy offered to current lessees. Conversely, the dEIS should also consider making clear that new operators of closed ranches (portions of which may be re-distributed to existing ranchers or to RFP awardees) do not qualify for the dEIS proposed on-going succession policy and such closed ranches will instead be managed on a case-by-case basis under conditions and terms wholly determined by the NPS.

#### ALTERNATIVE B: Lease Template

The dEIS should consider whether Agricultural Leases and associated documents should be a public document posted on the PRNS website with appropriate and necessary redactions. To that end, for example, the Lease Template paragraphs could be amended as follows (See underline strikeout below).

4.3 The Ranch Operating Agreement (ROA) shall be a public document posted on the PRNS website with appropriate and necessary redactions.

4.4 Minutes of the Annual meeting shall be a public document posted on the PRNS website with appropriate and necessary redactions.

The dEIS should also consider whether Agricultural Leases should include language to make lease conditions (including recommendations from Pacific West Regions Public Health Consultant) easier to monitor and enforce and to insure that diversification income is accessory to, not a replacement of, ranch income. To that end, for example, the Lease Template paragraph could be amended as follows.

7. &Lessee shall provide documentation to NPS upon request demonstrating that Lessee has an ownership interest in all cattle on the Premises. Lessees with diversification operations must provide annual sales information for both their beef/dairy operations and their diversification operations to NPS. Lessee is not permitted to allow use of the Premises for any cattle in which Lessee does not have an ownership interest. Cattle must be branded in a way that allows easy visual identification and Lessee shall include in this document (and thus make public) a copy or description of Lessees brand.

9. Except as authorized in the ROA, Lessee shall not engage in any Diversification Activities on the Premises, including in the Pasture and Ranch Core subzones. If Lessee seeks to undertake any Diversification Activities, Lessee shall follow the approval process set forth in Article 21. Lessee shall provide documentation to NPS upon request demonstrating that Lessee has an ownership interest in any other diversification activity authorized under the ROA. Lessee is not permitted to allow use of the Premises for any diversification activity in which Lessee does not have an ownership interest.

14.1. Wildlife management, including management of elk, removal of non-native species, and the restoration of native species, is the responsibility of the NPS. Lessee shall not engage in any activities that impact wildlife or that support or increase populations of non-native or invasive plant or animal species, Except as specifically for ranching, diversification, residential and maintenance activities authorized in the ROA, Lessee shall not engage in any other activities that impact wildlife or that support or increase populations of non-native or invasive plant or animal species.

18.3. If NPS authorizes Lessee to provide ranch worker housing, Lessee shall ensure, at its sole cost and expense, that such housing is safe, sanitary, and decent and that the physical condition of such housing complies with all Applicable Laws, including building codes. Lessee shall provide a copy to NPS of all health and safety inspections/reports received by Lessee, which, together with all such reports received by NPS, shall be a public document posted on the PRNS website with appropriate and necessary redactions. Lessee is also responsible for keeping exterior areas around such housing units clean and sightly.

19.4. Lessee shall maintain all water systems from the main line including the water meter, well pump and controls to the building(s) and outlying water spigots, water troughs, faucets, and stand pipes on the Premises. Lessee shall maintain water systems to show no evidence of leaks. Lessee shall also take all reasonable measures to conserve water through the use of water-restricting/low flow devices and low volume flush toilets. Lessee shall replace or repair any damage or loss to the water system within the Premises. Lessee shall prohibit livestock access within 100 feet of a water source used for human consumption. Lessee shall perform a Microscopic Particulate Analysis (MAP) on all water sources used for human consumption to determine if the source is under the direct influence

of surface water add if so, will filter the water.

The dEIS should also consider whether Agricultural Leases should include language to clarify maintenance responsibilities on ranch roads newly proposed for additional public access and recreational purposes . To that end, for example, the Lease Template paragraph could be amended as follows.

19.11. Lessee shall maintain ranch service roads on the Premises in a serviceable and safe condition regardless of whether the service road is also designated for public access. No new roads or truck trails shall be established without prior written permission of the Lessor. Mitigation measures and other conditions related to ranch service road maintenance activities approved by NPS will be included in the ROA.

## ALTERNATIVE B: PUBLIC USE AND ENJOYMENT

### PUBLIC USE AND ENJOYMENT: Vacant Structures

In order to better support ranching and ranch worker housing in PRNS, and to provide affordable housing for those in the local community displaced as long term residents by use of local housing as Airbnbs for park visitors, the dEIS (pg. 33) should consider altering the decision making sequence as follows (per underlined additions and struckout deleted sections:

When a contributing structure, structures or an entire ranch complex becomes vacant, NPS would use the following process to determine its future use:

" NPS would first consider if the structure or complex is needed and could be sufficiently used for NPS operational uses, such as housing, operations, visitor services, or partner use.

" If NPS does not have a use for the structure or complex, NPS will offer the structure or complex to both PRNS ranchers and PRNS ranch workers for ranch operations, rancher housing, or ranch worker housing. A vacant complex taken over by a PRNS rancher or PRNS ranch worker does not create a diversification opportunity in that complex or create any grazing opportunity in the surrounding ranchland, or any succession opportunity.

" If NPS a PRNS rancher or PRNS ranch worker does not have a use for the complex or structure, NPS may will issue a request for proposals, seeking proposals for adaptive reuse in ways compatible with park purpose and desired conditions, including use by a non-profit to provide affordable housing. Stabilization techniques such as mothballing structures may be implemented to arrest deterioration.

" NPS may also offer a complex or building to the rancher on the surrounding lands for ranch operations and/or rancher or ranch worker housing if the facilities could be sufficiently utilized&

" If ultimately no use can be found for the complex or structure, NPS would consider demolition of the complex or structures after consultation with the SHPO.

" Structures that are non-contributing to the National Register historic district may also be demolished after consultation with the SHPO.

The dEIS pg. 39 notes: Under alternative B, ranchers would continue to use residential units, barns, and other structures. Occupancy of residential units in the building complex would be limited to immediate family members of lease/permit holders, employees of that ranch (and their immediate family), and, with NPS approval, employees of other park ranches. However, we urge that the dEIS should instead consider whether use of residential structures in a ranch complex should be limited to that reasonably needed for ranch operation and intergenerational transfer.

We note that ranch families can be large and without this reasonable limitation, for example, a ranch owner with 4 married adult children each of whom has 4 married adult children could seek to occupy 21 residences, which would result in many members of that family commuting off-ranch to jobs while at the same time occupying on-ranch space that could house workers at PRNS ranches who would then have to commute from off-ranch sites to work on the ranch. Thus without this reasonable limitation, what the dEIS intends to be a ranch complex could turn instead into de facto family compound.

### PUBLIC USE AND ENJOYMENT: Visitor Access

According to Ranching on the Point Reyes Peninsula (pg. 48) the H Ranch Road is the historic Original Road from Olema to Point Reyes. We also request that the dEIS consider a walk-over or fat-man gate at the current vehicle gate on the road to H Ranch because this gate prevents hikers from experiencing this historic roadway The dEIS should also consider officially connecting this roadway to the trail to Muddy Hollow and including it on official trail maps. We know of no other historic roadway in PRNS that is similarly blocked to hiker access. Appendix E already plans to consider alignments around the core of Home Ranch and these could be designed to protect the

privacy of occupants and use of the ranch buildings while still allowing the experience of the historic roadway. Appendix E also suggests: Create a new trail alignment that highlights Drakes Estero. To that end, the dEIS should consider a trail to and interpretation of the site of the historic town of Point Reyes and its adjacent (former) wharf on Schooner Bay.

The dEIS should also consider adding new trails only when funding is also available for the de-commissioning of surplus trails and roads that do not meet sustainability standards. For example, Appendix E suggests new trails connecting the Bolinas Ridge Trail with Highway One, but the November 2003 Trail Inventory and Condition Assessment also recommends decommissioning existing trails (McCurdy) connecting the Bolinas Ridge Trail to Highway One.

In light of the new Interior Department directive to allow electric bikes with speed up to 28 mph on all roads/trails now authorized for bicycles and in light of the dEIS proposal to newly open certain ranch roads to bicycles, the dEIS should consider prohibiting bicycle use of former ranch roads that have devolved into de-facto single track trails (e.g. Abbotts Lagoon, Kehoe, Chimney Rock and Estero Trails). The dEIS should also consider metering out such new bicycle prohibitions commensurate with ranch roads newly opened to bicycles so that there will be no short-term diminution of bicycle opportunities and as more ranch roads are open, a possible long-term increase in bicycle opportunities.

In light of the continuing inability of PRNS to manage both official and un-official boat-in sites on its parklands along the east and west shores of Tomales Bay, the dEIS should consider whether PRNS should demonstrate effective management of these official and un-official existing boat-in sites before adding any new boat-in sites.

#### TYPOS:

##### Appendix L

8.1.4 (coho - species) text says "likely to adversely impact but Table 9.1 (line 1 col 4) also says "NLAA" and col 5 also says "unlikely."

8.2.4 (steelhead - species) says "likely to adversely impact and Table 9.1 (line 3 col 4) also says "LAA" but col 5 says "unlikely" (same as line 1).

Tables 7-2 and 7-3: Last columns refer to NMFS, but footnote c) refers to USFWS.

#### Lease Template

18.3: Lessee is also responsible for keeping exterior areas around such housing units clean and slightly sightly

#### END OF SAVE OUR SEASHORE PRNS GMPA DEIS COMMENTS

#7137

Name: Sackett, Nickolaus

Correspondence: Social Compassion in Legislation strongly opposes the expansion of cattle grazing in the Point Reyes National Seashore and the northern portion of Golden Gate National Recreation Area, and supports option F as described in the General Management Plan Amendment Draft Environmental Impact Statement.

The enabling legislation that Congressionally created these parks intended it for conservation and public recreation on the "diminishing seashores of the United States," with "maximum protection, restoration, and preservation of the natural environment within the area." Option F most closely aligns with that original intent, as well as being the option reflecting the need to protect our wild spaces for just that, the wild. If we are going to combat climate change we must scale back our animal agriculture, not expand it. Wild areas are under pressure from expanding human development and pollution. Social Compassion in Legislation and our members implore you to choose option F.

#7138

Name: N/A, N/A

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle

at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

#7139

Name: Donovan, Elizabeth

Correspondence: Please save the Tule Elk! The park is their home, not the ranchers. Given the current climate crisis, it's time for the ranchers to find a new gig. It's a scientific fact that cattle farming is destroying our lands and climate, and that consuming red meat is detrimental to humans and cows alike. Given the health conscious, educated, and enlightened citizens of California, we should be the standard bearers of promoting a plant based diet while promoting healthy activities, like hiking in our parks among the Tule Elk. If the cattle ranchers must continue to graze their cattle, they should find elsewhere to go.

Millions of people visit Northern California every year to see the majestic beauty of our parks. The Tule Elk are a key element to the beauty of Pt. Reyes.

Thank you!

#7140

Name: N/A, Stewart

Correspondence: Please let this park be only a park. This land is so beautiful and rare and the dairy farms mar and pollute the land. I think we can treat the farmers fairly and allow the public to have the wilderness they deserve.

Respectfully, Stewart

#7141

Name: CARDO, SHERI

Correspondence: As a longtime Petaluma resident who frequently hikes at Point Reyes National Seashore and has an immense appreciation for our "national park" and how it came into existence, I find the ongoing ranching there to be an ecological blight. The legislation clearly shows that ranching was never intended to exist in the park forever - the original ranchers were paid a considerable amount of taxpayer money for their land and given 25-year permits to phase out over time; those permits expired more than 20 years ago and the ranchers are still there. This is an abrogation of justice. Americans deserve better of their national lands.

I recently had the opportunity to kayak at Drakes Estero and was fascinated at how wild it is now that the oyster farm is gone. The Park Service did a great job of dismantling and cleaning up that area - truly, you'd never have known it was there. This is what I hope for the ranchlands, sooner rather than later.

These lands belong to the American people, this park is a National Park, and the ranches need to be returned to the wild. Environmentally and as a social justice issue, it is the only right thing to do.

Name: Lazzar, Patricia

Correspondence: Please do not legislate to kill or remove the TULE ELK from their natural habitat at Point Reyes

and DO NOT ALLOW the corporate AG people use the land and forest that is natural to the ELK and HORSES. Ranching is NOT the best use of the land ...THANK YOU. JUST SAY NO !

#7143

Name: CHRISTOPHER, LORI

Correspondence: I urge the National Park Service to adopt Alternative F, ending ranching in Point Reyes. I am quite disturbed to see the Park Service recommending an increase of ranching, and the recommendation that some of the Tule Elk be killed. This goes directly against the Park Service's stated mission of protecting natural resources. Cows are non-native and they are severely negatively impacting the land, native animals and ocean water quality in the Seashore. Tule Elk have always been native to this part of coastal California, and I'm one of thousands who come to hike the trails of Point Reyes every year hoping to see and photograph the elk. To this end my family and I have spent money taking interpretative classes, staying in local Point Reyes Station lodging and patronizing the shops and restaurants of Point Reyes Station and Inverness. We don't come to Point Reyes to see cows! We come to see and experience wildlife. The National Park Service's obligation to preserve historic and cultural resources can be achieved through interpretative displays of historic ranching. The cows in the National Seashore are not historic; the ranch buildings and infrastructure are. Some of the ranches clearly don't want visitors, as evidenced by No Trespassing signs. I urge the Park Service to focus on preserving and interpreting historic ranching buildings to show how ranches operated, instead of perpetuating the environmental damage that the ranches are causing. The NPS's mission doesn't include guaranteeing ranchers a living, and doesn't include allowing them to increase their operations on our public lands. There has been no discussion on how increasing ranching would impact the Seashore, and indeed no discussion of the serious negative impact to land and water from the livestock that are already at the Seashore. Further, the NPS has recommended increasing commercial ranching operations with no mind to impacts on the numerous native animals who inhabit the park. As someone who visits Point Reyes specifically to see wildlife, I'm very concerned about the negative impacts to native species from both existing ranching and the threat of increased ranching and other commercial operations. I am against the proposed changes to succession which would permanently commit the National Seashore lands to ranching. The Environmental Impact Statement discusses negative impacts of cattle grazing to native plants and animals, water pollution from cattle manure and greenhouse gasses from cattle ranching. Yet none of the proposed alternatives address mitigation efforts for the damage done over more than a century of cattle grazing. This is a gross oversight, and should be remedied. There should be discussion of costs and a timeline for mitigating the impacts of ranching to the Seashore. In sum, I strongly urge the National Park Service to uphold the stated values of protecting natural resources by selecting Alternative F, to end ranching at Point Reyes National Seashore. This is the best and clearest way of insuring that future generations of visitors will also be able to benefit from and enjoy a true wilderness experience with native wildlife.

#7144

Name: Garrett, Josh

Correspondence: Please don't destroy the beautiful elk herd to appease the cattle ranchers. Point Reyes is a true gem of the California coast and must be preserved and protected.

#7145

Name: Bartolini, Mark

Correspondence: I am submitting the following comment pertaining to the Draft Environmental Impact Statement (DEIS) and related documents for the General Management Plan Amendment process (GMPA) for the Point Reyes National Seashore (PRNS or Seashore).

Comment on the Foundation Document

I would like to begin by commenting on the Foundation Document. As a past Executive Director of the Point Reyes National Seashore Association (PRNSA), a native of Marin who began coming to the park with my mother

since the moment of its establishment in 1962 a 33-year full-time resident of the Seashore (Inverness Park) and as senior nonprofit and government official with a career dedicated to social justice issues related to climate change, I am familiar with the issues described in the Foundation Document. For the most part, I think the NPS did a good job in developing this- -but there are important missing or understated elements.

The first relates to the uniqueness of this park and its wilderness attributes being so close to a major metropolitan area of over 8 million people. In documents I have read about the aspirations of some park founders, it was clear that they saw this park as a unique opportunity to connect under-served communities with the fundamental attributes of a national park: solitude, beauty, abundant free-ranging wildlife, and relatively easy and free access. Unlike other National parks such as Yosemite or Yellowstone or Glacier Bay where travel distance, expensive accommodations, and entry fees put them out of reach of many individuals and families who simply don't have the financial resources to travel and overnight to these parks, Point Reyes can be relatively easily accessed to and fro in a day (including with public transportation) and has no entry fee. Building on this important detail of Point Reyes' accessibility for underserved communities, it cannot be overstated how important this park is for children from all Bay Area communities, including underserved communities. During my tenure as PRNSA's director, I oversaw the implementation of education programs at the park's Clem Miller Environmental Education Center. Up to 60% of children participating in these programs were from underserved communities who attended on scholarships procured by PRNSA staff. For some of these children, their attendance was transformational.

In an age when children are transfixed by technology and deeply concerned about climate change, the importance of experiencing nature is critical. Research on the developmental deficits suffered by children who are denied this experience (*Last Child in the Woods* is a seminal book on this topic) describes a "nature deficit disorder" that can impair children's social and academic developmental processes. In addition, the benefits of immersing one's self in nature as an aid in processing a range of psychological trauma and as a venue for inspiration has been extensively documented. While our National Park's are one of America's best ideas, they are, especially those that offer abundant wildlife, for many Americans physically or financially inaccessible. Point Reyes is a rare exception. And its physical and financial accessibility to the widest possible social strata of Bay Area residents should be incorporated as a foundational element to guide management decisions.

#### Comments on the DEIS

I am confused by the NPS designation of Option B as the preferred option. I believe there needs to be a justification section in the FEIS that describes what issues the park considered and how they weighted them to arrive at their final determination. The deficiencies I believe exist in the DEIS, and my confusion over the preferred alternative, are based on the following:

" The environmental assessments which cite significant negative impacts from ranching on the park's soil, water quality, native plants, visitor access and experience and wildlife, yet still allow for option B " The lack of any legal basis that would supersede the obligation of the NPS to comply with the Organic Act and its enabling legislation " The lack of a justification section that allows for the public to understand and comment on the particular factors the NPS considered and weighed in making its selection " The lack of critical baseline data, monitoring, evaluation, for introducing and managing additional commercial activities that will undoubtedly create new threats to the park's native wildlife from newly introduced non-native species. This constitutes insufficient mitigation measures as required by NEPA, to address adverse consequences. " The preference for continued commercial ranching versus a focus on its historic interpretive value to the park. " Per my comments on the Foundational Document, I believe the NPS has failed to appropriately weigh the value of a traditional national park experience (no fences, trails from Tomales Bay to the ocean no commercial activity beyond concessionaires, free-ranging native wildlife, no smell of manure or signs of commercial activity to provide an experience typically denied the underserved communities that were prioritized in the park's creation and remain of special concern to the NPS in part due to legal requirements such as the ADA. For instance, the enjoyment of the park by a person that is visually impaired may be even more impacted by the smell of manure and the sounds of heavy equipment. " The failure to cite, based on surveys commissioned by the Park's own nonprofit association (PRNSA), an

overwhelming public preference for protecting the parks natural resources, in particular its native wildlife, over commercial ranching operations.

" NPS, has disregarded both the letter and the spirit in the 1916 Organic Act, as well as Seashores own enabling legislation by dismissing their intent that natural resource protection goals (including native wildlife) and public use and enjoyment should shape the GMPA and that the preservation of cultural and historical aspects of the park should advance and not weaken the Seashore's overall purpose of natural resource protection and enhancement. Please explain why and under what authority?

" The DEIS makes it quite clear that option B would benefit a handful of commercial ranchers allowing them to increase their footprint in the park (with negative environmental impacts) so that they can improve their profit margins at the expense of resource protection and public use and enjoyment. " The DEIS fails to describe a baseline of how many coyotes, foxes, weasels, raccoons, marmots, bobcats, mountain lions elk, deer and other potential native predators and foragers that currently inhabit the park might be impacted by allowing diversification. Requiring cages and instituting a "no-kill" policy for predators does not ensure that impacts will not occur. How would the park know?

Moreover, as was demonstrated with the Tule Elk, the ranching community feels it is entitled to hire lobbyists to seek political support to ignore laws protecting natural resources when they have concerns that wildlife will negatively impact their bottom line. What legal justification does the park have for approving a whole new range of activities that could lead to similar responses to other wildlife/commercial activity conflicts? And on what basis is the park managing public lands based on the profitability of a commercial leaseholder rather than the organic act and its existing enabling legislation?

" The park has I believe appropriately protected several species from negative impacts including elephant seals (establishing restricted areas, allowing them to use whatever beaches they please and closing these to public access, no thought of culling when they do intrude on public areas), harbor seals (establishing a closure on Drakes Estero for pupping season) and snowy plovers establishing restricted areas during nesting season). What legal justification does the park rely on to apply a different standard for the protection, free-range restrictions and potential culling of Tule Elk in the park?

" And with respect to Plovers why does the park protect nests from human disturbance by visitors, but not address the impact of ranching activities, according to the DEIS attracting ravens, which heavily predate these nests?

While I am not suggesting that introducing children to ranches would have negative impacts, I do assert that there is a significant difference in viewing cows- -which are ubiquitous on Bay Area ranches, and native wildlife found in Point Reyes such as Tule Elk and Elephant Seals. Moreover, facing the ravages of climate change and biodiversity loss, children have a right and a need to experience such wild places. For many lower-income families, Point Reyes may offer their only National Park option.

Again, I raise these issues to question the weight being given to working ranches versus the importance of protecting and enhancing the natural attributes of the park including its wildlife, scenic beauty, auditory and olfactory sensations.

The impact of ranching on the visitor experience in Point Reyes

Commercial agricultural activities as practiced within the Point Reyes National Seashore include the grazing of over 6,00 beef and dairy cows, heavy equipment, plowed fields, cow excrement virtually everywhere in this zone, "poo ponds" where effluent is collected and then spread over fields giving off a noxious manure aroma, eroded landscapes, on-site storage of feed and manure, using tarpaulins and old tires, fields of white plastic calf huts, aluminum buildings, extensive fencing, loud, large and road-damaging commercial trucking, algae inundated water sources, impaired water bodies and an omnipresent smell of manure present a diminished national park

experience for visitors, by introducing sounds, smells and visual elements that are contrary to what one would experience in a national park that did not permit agriculture such as Yosemite or Yellowstone.

It does not have to be this way. Adopting option F would enhance the visitor experience and the welfare of the park's natural resources by allowing for hiking trails to run between Tomales Bay and ocean beaches, cleaner water, ocean vistas unimpaired by ranching heavy equipment trucking and fencing, free-ranging native wildlife including elk herds, greatly reduced erosion and the smell of ocean breezes and native plants rather than manure and methane emanating from cows. The Giacomini Wetland's restoration which the ranching community erroneously claimed would have major economic repercussions for ranching outside the park is a visible tribute to how these areas of the park could be restored.

Moreover, these sentiments are reflected in surveys PRNSA conducted to assess what visitors to the park most valued. Wildlife and natural resource protection was listed as the top priority by over 90% of respondents with ranching prioritized by below 30%. In the interest of transparency, the FEIS should include this public input.

These surveys correlate with my own experience over more than three decades of taking visitors out into the pastoral zone of the park. Their primary interest is seeing marine mammals, elk, coyotes bobcats and birds, the lighthouse, ocean vistas and beaches. They find it hard to understand how cows and commercial operations ended up in a national park. A Modified Option F

I urge the NPS to adopt option F to meet the legal requirements of the organic act and its enabling legislation. The reliance on a Congressional Resolution or a statement by a public official are not legally binding and should not be relied upon to support and expand ranching activities in the park. I would add one important addendum to F to at least mitigate the regrettable and divisive aspects of displacing ranchers and their workers. At the expiration of their leases and ranching activities, the park could establish concessionaire arrangements whereby they and employees could remain living in the buildings while offering fee-baed lodging and interpretative services to the public.

Finally, I offer my support for the plan to provide boat-in camping on Drake's Estero as it is consistent with NPS guidelines for enhancing visitor's experience and recreational opportunities. The park has a dearth of campgrounds, and such accommodation will allow public access to one of the most unique environments in the park.

Thank you for the opportunity to comment.

Name: N/A, N/A

Correspondence: In the preferred Alternative B, it appears that more weight is given to the value of cattle than to elk, which seems to be the opposite of what you would expect in a National Park. Since tule elk are the native species, it would seem that the number of cattle should be decreased rather than the number of elk to maintain the sizes of the respective herds at manageable levels. There are many opportunities to see cattle ranches in other areas. Tule elk are found in so few areas that keeping their numbers high enough to help increase the odds of wildlife encounters with the public would seem to be of a much greater public value than the chance to see more cattle. I doubt many people travel great distances to Point Reyes in the hopes of seeing a cow, while many come to see elk and other wild native species.

#7147

Name: Roach, Marti

Correspondence: we need to keep point reyes national seashore, first and foremost, a healthy, natural ecosystem. This enables other benefits for recreation and appreciation of the natural world, which we need in order to sustain

the health of our environment. I oppose Plan B which would negatively impact the natural features of Point Reyes in favor of agriculture. I believe that Plan F is a better approach.

#7148

Name: Timpone , Tracey

Correspondence: Remove the privately owned livestock (cattle) from this park and preserve the Native Elk that draw people to visit. I have been to this park a few times but won't return due to the cattle and their feces that are everywhere. Our Parks were created to protect and preserve nature. They should not be destroyed by welfare ranchers who are subsidized by the government. Ranchers need to keep their livy on their private land.

#7149

Name: ADAMS, Matt

Correspondence: Hi there, I'm writing to express my support o fthe improvements in public and bicycle access outlined under Alternatives B, C, D, E, and F. I currently ride occasionally in the Pt. Reyes area but there are not enough places to ride, especially when trying to plan nice loops or connect some areas to others.

I'm specifically in favor of the following potential projects:

A connection between Devil's Gulch and Platform Bridge Road using existing ranch roads.

A connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail.

A connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads.

A connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads.

A connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads.

An Estero Trail loop using existing ranch roads.

Many of these improvements would enable me to visit the Seashore by bike, rather than car. And I would feel much safer riding in Pt. Reyes National Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic.

Correspondence: These comments are submitted by Northwest Resource Information Center.

Since its inception in 1976 NRIC has been actively engaged in public land management issues, notably the adverse impacts of livestock grazing on public lands. NRIC has focused on how government has failed to mitigate or eliminate those adverse impacts, has imposed the cost of same on the public, and has conspired with private interests to, in effect, allow them to exercise de facto ownership of public lands.

All of these issues are manifest in the National Park Service's long-standing mismanagement of Point Reyes Seashore which is a nationally notorious betrayal of the public trust.

The NPS was sued because of its past mismanagement of the Seashore. It was forced to develop an environmental impact statement under the National Environmental Policy Act. Incredibly, all of the NPS alternative management

strategies except Alternative F would continue to violate the intent of Congress in establishing the seashore, violate the letter and intent of the contracts buying out private landholders, and continue to damage public values. In fact, all of the alternatives except Alternative F would make the situation worse than the status quo.

Incredibly, in its "preferred alternative" (B) the NPS proposes to offer what- -based on experience to date- -are in effect perpetual leases to anyone. And further, to allow the leasees to diversify their commercial operations, thereby increasing their sunk costs and their grip on public land, and further diminishing the public values the Seashore was established to protect.

It is long past time to stop subsidizing livestock grazing on the Seashore at public expense and stop putting non-Seashore livestock grazers at competitive disadvantage.

It is long past time for the NPS to at long last do what Congress intended in establishing the Seashore. Time to enforce the sweetheart deal the original landowners agreed to. Time to stop trying to fabricate alternative rationales for not doing either of those things.

Alternative F is the only legally and morally responsible path for NPS to follow, with the addition that current occupants of public lands within the Seashore should be proscribed from making any additional capital investments on public lands pending their evacuation.

#7152

Name: Walthall, Nicole

Correspondence: While the National Environmental Policy Act (NEPA), and its Environmental Impact Statement (EIS) requirements, do not dictate the outcome or direction of a final project, it is equally true that NEPA and the EIS process do not allow a federal agency to wholly abandon its legislative mandate and purpose by putting forth a preferred alternative that would exacerbate an already polluting, threatening, and dangerous use of public land inside a National Park. Here, the National Park Services preferred alternative of expanding ranching and dairy operations inside the Point Reyes National Seashore (PORE) while killing off Tule Elk to support the dairies and ranchers is as far from a legally supportable alternative as possible - - it would laughable, if it weren't such an arrogant political power grab by wealthy ranchers in one of the wealthiest counties in the United States, who have used their big dollars to corrupt US Senators and Representatives to do their bidding.

Alternative F is the only alternative fully supported by applicable federal laws and NPS policies. Each of the other alternatives violates the NPS Organic Act, 16 U.S.C. § 1 and the legislation creating PORE, 16 U.S.C. §§ 459c, and other applicable laws, including additional legal protections that mandate an even greater level of protection than the NPS laws, regulations, and policies alone. Important federal environmental laws, including the Endangered Species Act, the Marine Mammal Protection Act, the Clean Water Act, and the Wilderness Act, provide an overlay of protections that can strictly limit allowable uses of park lands. The NPS is legally obligated to apply these laws before permitting any special uses of park land.

The NPS derives its authority to authorize special uses on park lands through law and policy, some dating back to 1916:

[The National Park Service] shall promote and regulate the use of the Federal areas known as national parks, monuments, and reservations hereinafter specified . . . by such means and measures as conform to the fundamental purpose of the said parks, monuments, and reservations, which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations. (16 U.S.C. § 1)

The Seashore was created in 1962 to save and preserve, for the purposes of public recreation, benefit, and inspiration a portion of the nations diminishing seashore. 16 §U.S.C. § 459c. The Seashores 1962 authorizing legislation requires the Park Service to administer the Seashore without impairment of its natural values and in a manner that is supportive of the maximum protection, restoration, and preservation of the natural environment. 16 §U.S.C. §§ 459c6.

Statutory allowance of grazing and dairy farming inside the boundaries of PORE is not a green light to violate federal laws that protect water resources and national park resources. Statements by Congress in the Appropriations Act of 2019, even more so, do not magically erase enabling legislation and environmental laws. In fact, such "statements" reveal the hard push back on any actual lawmaking that would thwart the purpose and mandate of the National Park Service and the Point Reyes National Seashore.

All of these laws direct the NPS to Alternative F. It is time for the dairies and ranches, who have already been paid more than their fair value of buy-out money from federal funds, to be phased out. Killing native species to protect polluting practices that are already ongoing on 80% or more of West Marin private lands is unspeakable. No expansion of ranching activities - no more wildlife deaths, no more pollution.

Adopt Alternative F!

#7153

Name: Winslow, Kraemer

Correspondence: I am in SUPPORT of ranching/farming on Pt. Reyes National Seashore. I have been to several farms and have otherwise met many of the ranchers/farmers and am extremely impressed with the level of stewardship they show in taking care of the land. I also very much appreciate having the diversity of land use in our county. Further, I purchase food from many of the farmers and appreciate that in that way I am able to lower my carbon footprint.

Also, I have learned that one of the big objections of those who wish otherwise is not founded in fact - that the cows on the land cause more pollution. NOT SO. By using intelligent grazing methods, the cows aid in MORE carbon being stored in the ground. This is because of the increase in deep-rooted native grasses.

PLEASE do not change the beautiful system that we now have. It would be a tragedy to lose this beautiful diversity in our County.

Thank you in advance.

Kraemer Winslow

Correspondence: I would rather see elk than cows at Point Reyes.

#7155

Name: Painter, Sigrid  
Correspondence: Dear Superintendent Muldoon,

As a longtime resident of Marin Co. my husband and I worked hard for the establishment of Pt. Reyes National Seashore at a time when developers had already started to build houses and tried to prevent public access to the beautiful beaches along the coast.

When the legislation was finally signed by President Kennedy in 1962 it stated clearly the intentions and purpose of Pt. Reyes: to save, preserve for recreation, benefit, and inspiration for the citizens of this country now and for future generations. Certainly the expectations among the public and, I dare say, the ranchers as well was that ranching would eventually be phased out. After all they sold us their land with the provision of leasing it back every five years for continued farming.

This original purpose and vision for Pt. Reyes should finally be implemented after almost 60 years!

I urge you to adopt Alternative F which comes closest to the legislation establishing the Park.

I strongly object to the expansion of any further agricultural activity, be it raising other farm animals, growing crops, or introducing more commercial activities of any kind. I want to point out that it is incredible to accept the idea that a herd of 180 Tule elk are a problem when over 5000 heads of cattle are tolerated even though they turned Pt. Reyes into one of the 10 most polluted fecal coliform areas in California!!

And this in a National Park?

It is a judgment against the stewardship of the farming community, and the Park Service quite obviously did not exercise sufficient oversight either.

This issue should be settled once and for all. Again I urge you to adopt Alternative F.

Sincerely,

Sigrid D. Painter, Ph.D.

Correspondence: I support Alternate F.

#7157

Name: N/A, N/A

Correspondence: The DEIS as currently drafted could violate the Congressional mandate that requires the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area,..." "16 USC Sec. 459c (6)(a)

Specifically, the DESI should not allow for diversification of ranching to include other businesses besides the historical ranching activities related to dairy and beef production, without a thorough analysis of the environmental impacts this would entail both through introduction of additional crops and animals to the Seashore, and through the additional tourist traffic it would bring. The roads in the Seashore are already in terrible condition and cannot support increased crowds, and the introduction of chickens, goats, etc will bring new conflicts with the wildlife.

In addition, business succession should be limited to multi-generational ranching families, consistent with the original intent of Congress, and not allow for competitive bidding open to the public.

#7158

Name: Thorsen, Diego  
Correspondence: kill em

#7159

Name: Lipari Maxson, Amanda  
Correspondence: I support option A, because the history of ranchers in Point Reyes is very strong, so the ranches should be allowed to stay, or (maybe begin to be phased out, if anything), however, the Tulle Elk in Pt Reyes are the only Tulle Elk in the world, and as such deserve to be preserved, seeing as humans put them in Pt Reyes in the first place.

#7160

Name: Michelotti, Erika  
Correspondence: The proposed plan is irresponsible and out of alignment with the mission of the parks to protect land for future generations. Please explain how the proposed option to allow ranchers in the park, who pay no property taxes and are granted below-market rents and discounted grazing fees, is in the economic interest of the park. Can you in good conscience permit this land use despite the current scientific literature that indicates the following: Two recent United Nations reports cite greenhouse gases and land conversion for cattle grazing as among the leading causes of two existential threats: the climate crisis and unprecedented species extinction. The reports call upon governments, industry and individuals to take action before it's too late. Native Tule elk here exist in no other national park. Once believed extinct, the reintroduction of the elk is a case study in species recovery. Yet, cows outnumber elk 10 to one at the seashore, and under the preferred alternative the elk that trespass on land leased for cattle will be shot. NPS says it will kill 10-15 elk annually to prevent "conflicts" and shore up ranchers' profits. The proposed action is managing the area for local audiences not as a national reserve. Please consider putting future generations first, addressing climate change, and acting as a national body by preserving this area rather than destroying it with cattle.

#7161

Name: Romano-Silverstein, Juliana  
Correspondence: I support option F because cattle ranching heavily disturbs the surrounding environment, and killing off the elk will only perpetuate the already existing harm done by cattle ranching. Killing the tule elk could motivate ranchers to want to kill other native wildlife that affects their ranching practices, which would consequently disturb that natural food web of the Point Reyes ecosystem.

#7162

Name: romanowski, christa  
Correspondence: Please consider my comments regarding changes to the management plan for Pt. Reyes National Seashore.

I urge you to implement only Alternative F: No ranching.

The presence of somewhere around 6000 dairy cattle (or any livestock, for that matter) degrades the land, air, and water of this NATIONAL SEASHORE! The EIS affirms this, stating that the presence of cattle harms the air, water, and wildlife of this public land.

The original agreements with the families of those who sold this land for the creation of the Park, have expired. I respect the hard work of family farmers, but this was the agreement. They ought to leave as their leases expire.

My husband and I have driven through some of the land utilized by the dairy farms...and it is an ugly wasteland. Bare, de-nuded of ground cover or vegetation, muddy, and manure everywhere. As taxpayers and citizens, I believe we should be able to enjoy our public lands without the presence, and destruction, caused by such commercial activity.

Please choose and act to protect this lovely coastal plain and seashore (increasingly "developed" in California) , its water, air, and the wildlife that calls it home. It is no place for these large dairy operations. Christa Romanowski

#7164

Name: Nemec, Molly

Correspondence: Shooting wild animals in a National Park to raise cattle and other poor, farmed animals? THIS IS INSANE!

Not only should we as a nation be consuming less meat and dairy to combat climate change and prevent animal cruelty...and to improve our health, but letting ranchers use PUBLIC LAND, especially those in the billion-dollar farming industry who already take mega billions in bailouts and subsidies from our government???? This is just plain. wrong!!!

NO NO NO!!!!!!

#7165

Name: Harrington, Karen

Correspondence: I am urging the National Park Service to support alternative F and NOT B. Parks belong to the public not private interests.

#7166

Name: Kushner, Pinky

Correspondence: I am commenting on 4 topics, Cultural Landscape, Socioeconomics, Air Quality, and Visitor Use.

Cultural Landscape- - 1. The EIR needs to expand its conception of what is a cultural landscape. Times are changing. No longer is it appropriate to consider merely the use of, for instance, farming on close to 30,000 acres, as the only part of the cultural landscape. The cultural landscape is not 100 years or 150 years, but should include the cultural history of the landscape from ages ago. An appropriate expanded view of historical time will put cattle grazing into an appropriately small context. This miscalculation needs to be corrected in the EIR.

Socioeconomics- - 1. The EIR needs a more exact economic evaluation of the farming industry by comparing the income from agricultural leasing to the income from visitors to other California National Parks, specifically Muir Woods and Yosemite, two parks that are about 'nature' and have little emphasis on 'historic landscape.' That is, the economic success of these parks comes from the natural world rather than from historically recent cultural considerations. 2. Muir Woods and Yosemite have active conservancy programs with a virtual army of hundreds

of volunteers. The EIR should consider the economics of this essentially free labor should agricultural uses be removed from Pt. Reyes and its conservancy volunteers increase accordingly. 3. The EIR needs a more thorough investigation of what "entertains" visitors and consider that visitors are more interested in natural history than farming history. 4. The EIR evaluates the calculation of employment affects dependent on employment losses with the removal of grazing. It does not take into account, with credulity, the employment opportunities these 28,000 acres offer as a natural as opposed to agricultural landscape. The EIR needs to correct and expand its economic considerations.

Air Quality- - 1. The EIR makes little of the loss of vegetation due to grazing. There are no extensive calculations of CO2 capture of the natural landscape. Nor is there an honest comparison of CO2 capture in the degraded agricultural landscape compared to the natural landscape.

Visitor Use- - As stated above in my comments about socioeconomics, the visitors of today want birds, bees, and flowers, not cows. 1. The EIR numbers on this topic are not realistic and need to be recalculated with nature lovers in mind. The wildflowers in those Pt. Reyes lands that are not under agricultural use are spectacular and draw thousands and thousands of visitors in the spring even though the sights are few compared to some locations in California. 2. With the population base of the Bay Area, the numbers of visitors who could come to see the spring show has not been explored in depth. The EIR should correct this deficit by basing its calculations on those visitors to the Anza Borrego spring display, and increasing that number by factoring in the very near-by and very large population of the Bay Area.

Correspondence: A

#7174

Name: Mahl, Aidan

Correspondence: I support alternative F because the ranching in Point Reyes is not beneficial to the natural environment and native plant and animal species in and around the ranching zones. Additionally, cows have a large negative impact on the atmosphere as they produce large amounts of methane and should be removed so that the Tule elk can expand their population.

#7175

Name: N/A, N/A

Correspondence: Hello,

I want to start out by commenting on the comment process :)

I found it exclusionary, given that there's not enough time to read and understand all the documents in depth before one can make what you call a substantive comment. In my point of view, I don't need to be a scientist to have a fact-based opinion on the issue under consideration. I can learn the necessary facts from sources other than these documents, use them to inform my opinion, and then make a comment on this issue.

Now, regarding the issue, I am in favor of Alternative F. I would like ranching to be phased out, fences taken down for the elks to roam freely, and repurposing of Historic ranch buildings for operations other than ranching. Needless to say, I am vehemently against any diversification of the ranching operations.

National Park land is public land. I am not in favor of my hard-earned dollars to be steered towards private profits. National Parks are supposed to be a sanctuary for wildlife, esp. as rare as the Tule Elk. In 2018, there were 9.4 million dairy cows

([https://www.nass.usda.gov/Charts\\_and\\_Maps/Milk\\_Production\\_and\\_Milk\\_Cows/milkcows.php](https://www.nass.usda.gov/Charts_and_Maps/Milk_Production_and_Milk_Cows/milkcows.php)) in the US. As of 07/01/2019, there were 32.4 million beef cows

([https://www.nass.usda.gov/Charts\\_and\\_Maps/Cattle/jul\\_bcow.php](https://www.nass.usda.gov/Charts_and_Maps/Cattle/jul_bcow.php)). By contrast, the count of Tule Elk at the Point Reyes Seashore is less than 150! We don't need to further cull their population for more dairy and beef on the American dining tables.

I would also like to point out how this extensive dairy and beef farming impacts the environment:

1. To quote <https://news.un.org/en/story/2018/11/1025271>, "According to the World Economic Forum, the beef and dairy industry is responsible for more greenhouse gas emissions than the world's biggest oil companies, with the combined emissions of the top meat and dairy companies exceeding those of highly industrialized nations such as Germany or the UK."

2. Almost exactly a year ago, the United Nations dubbed meat as the world's most urgent problem: <https://www.unenvironment.org/news-and-stories/story/tackling-worlds-most-urgent-problem-meat>

3. Here's another article in Time calling on all of us to eat less meat: <https://time.com/5648082/un-climate-report-less-meat/>

I am disheartened to see that the National Park Service, who I deem as the protectors of the environment and wildlife, is further jeopardizing their safety to further private interests. I sincerely hope this comment helps you make the right choice for the environment and the dwindling Tule Elk populations.

Best.

#7176

Name: Westhead, Joey

Correspondence: I care about protecting California's wildlife. I oppose the National Park Service's plan to kill native Tule elk and expand commercial agriculture in Point Reyes National Seashore and Golden Gate National Recreation Area. I urge the National Park Service to instead restore the lands for wild animal habitat.

We should prioritize the preservation of our public lands and wildlife, not the economic interests of private ranchers. These commercial cattle ranches have serious negative environmental impacts on the park - polluting waterways, causing soil erosion, and harming the many endangered and threatened animals who live on Point Reyes. National parks exist to protect our natural resources and native wildlife. This park should be managed accordingly.

#7177

Name: Pelletier, Julia

Correspondence: The NPS should choose alternative A. The native species (Tule Elk) are important for promoting Point Reyes biodiversity and are accustomed to our environment. It's important to not disturb the peninsula food web, which could alter plant & animal levels and subsequently further decrease the elk population.

#7178

Name: Lundbaek, Anika

Correspondence: I support alternative F, which stands for no ranching, no renewed leases for ranching, and no shooting elk!!!

#7179

Name: N/A, N/A

Correspondence: I support Alternative A (no changes/taking no action). Tule Elk are extremely important to the ecosystem and shooting them is simply inhumane. They will not compete with the ranches as long as there are fences in place, and therefore it is drastic and unfair to consider killing the elk.

#7180

Name: Griffin, Zianah

Correspondence: Do not kill the Tule Elk, they are a unique and beautiful species that are native to California. They have been extinct from their native California areas and if they are not re-introduced their, than they should not be culled in Pt. Reyes. I know many community members who value the rare Tule Elk and go to Pt. Reyes specifically to sight them, my family included. If the elk are killed, many people will be upset and my family and friends with not continue to visit the beautiful Pt. Reyes area. I support option A, or option F.

#7181

Name: Taylor, TORY

Correspondence: As a life-long hunter and public lands conservationist, I strongly oppose your plan to kill the

Tule elk while allowing private cattle to destroy the Point Reyes National Seashore wildlife habitat. Please manage these public lands for native wildlife, not non-native cattle. Signed, Tory Taylor

#7182

Name: Frye, Apryl

Correspondence: I believe Point Reyes should chose option A, and not take action in shooting the Tule Elk, because we brought them to point reyes to protect them, and wouldn't make sense in shooting them and making them more endangered.

#7183

Name: davis, camille

Correspondence: I support alternative F because I feel it lets the elk live and we don't inter fear with them anymore then we already have.

#7184

Name: Feichtl, James

Correspondence: I love to visit Point Reyes to hike, camp and view wildlife. I don't visit to see cows. Point Reyes National Seashore is supposed to be managed under the Point Reyes Act for "maximum protection, restoration, and preservation of the natural environment." There's no mandate for prioritizing commercial agricultural leases on these public lands. Natural values, native wildlife, public access and enjoyment should take priority over commercial activities at Point Reyes. Tule elk are an important part of the landscape at Point Reyes. Their recovery is a result of successful native ecosystem restoration, which is a key element of the Park Service's mission. It's taken a lot of time, money and effort to restore tule elk to Point Reyes, the only national park where they live. Tule elk should be allowed to roam free and forage in the park - not shot, removed, fenced or treated as problem animals. Right now the Point Reyes ranches enjoy not only subsidized grazing fees and housing, but also taxpayer-funded infrastructure and road improvements, and publicly funded projects. But commercial activities at Point Reyes should be required to accommodate native wildlife - not the other way around. The Park Service shouldn't allow any new agricultural activities at Point Reyes. Planting artichokes or other row crops will attract birds. And introducing sheep, goats, pigs or chickens will attract native predators such as coyotes, bobcats and foxes. Expanded ranching would only create new wildlife conflicts. Cattle ranching should only be allowed if it's consistent with preserving the natural environment. And agricultural activities such as mowing shouldn't be allowed in park areas where they harm endangered species or wildlife habitat, impair water quality, cause excessive erosion or spread invasive plants/diseases. Cattle are the seashore's primary source of greenhouse gases. So the Park Service's preferred alternative is inconsistent with its own "Climate Friendly Parks" plan.

#7185

Name: Grady, Jasmine

Correspondence: hi, My name is Jasmine, I am a student at Drake Highschool, and I am part of an environmental science communitiy at my school. The concern of this comment is towards the news that Tule elk will be killed for the sole purpose of benefitting farmers and their income/farms. I am in support of option F. In our society, we need to understand the priority of the extinction of a species above a few farms. Farming should be cut completely because things can always be planted to grow in other places, but tule elk exist nowhere else, and they should not be killed for those purposes, but insted they should get even more room to grow and thrive as a population.

#7186

Name: Love, Natalie

Correspondence: I support option A because these are living creatures, and reproduction is normal. Killing an endangered species in inhumane and un nessasary

#7187

Name: Chaplin, Katherine

Correspondence: I think that elk are necessary for the ecosystem of the park but should not be brought because the population should not over populate ecosystem.

#7188

Name: Podboy, Ava

Correspondence: Hello, I am a junior at Sir Frances Drake high school, and I would like to express my opinion on the issues regarding Tule Elk. I'm in support of option F because it has the most benefits both for the animals, and for farmers and keeping healthy ecosystems. It's extremely important to preserve our native plants and increase biodiversity among the small percentage of land that hasn't been industrialized yet. Tule Elk play an immense role in this process because their ecosystem is dependant on them. Killing the Elk, and the land would have negative consequences on the land and animals/plant populations.

#7189

Name: Hernandez , Raymond

Correspondence: Alternative F: No Ranching is a great option Tule Elk are native and should be able to expand just like they a are supposed to.

#7190

RE: Draft Environmental Impact Statement for a General Management Plan Amendment, Point Reyes National Seashore and North District of Golden Gate National Recreation Area, Marin County, California

Dear Superintendent,

Western Watersheds Project, Resource Renewal Institute, Conservation Congress, Wilderness Watch, Sequoia ForestKeeper, ForElk, White Shark Video/Shame of Point Reyes, John Muir Project, Ban Single Use Plastics, Defense of Place, Ballona Institute, and the undersigned individuals (conservation organizations and individuals) submit these comments on the General Management Plan Amendment Draft Environmental Impact Statement (Draft EIS, or DEIS) for Point Reyes National Seashore (PRNS or National Seashore) and Golden Gate National Recreation Area (GGNRA) (collectively, the Parks), which addresses the future of 28,000 acres of park lands currently leased for 18 beef cattle ranches and 6 dairies.

Western Watersheds Project is a non-profit conservation organization with more than 9,500 members and supporters, many of whom reside in California. Our mission is to protect and restore western watersheds and wildlife through education, public policy initiatives and legal advocacy. Western Watersheds Project and its staff and members use and enjoy the public lands and their wildlife, cultural and natural resources for health, recreational, scientific, spiritual, educational, aesthetic, and other purposes.

Since 1985, Resource Renewal Institute has facilitated the creation, development, and implementation of practical strategies to solve environmental problems in a comprehensive framework. With over fifty years of experience in business, government, and nonprofit sectors, RRI founder Huey D. Johnson favors a diverse focus on many environmental issues.

The Conservation Congress is a grassroots 501(c)3 nonprofit conservation organization incorporated in the state of California in 2004. We work to protect National Forest lands and native wildlife in northern California. The Conservation Congress is part of Voices for Public Lands (VPL), an informal coalition of public lands conservation groups united by a commitment to the values enumerated in VPL's Declaration of Principles for Public Lands. We believe these public lands that are owned by the American people and paid for with taxpayer dollars should have a strong public voice. Therefore, Conservation Congress especially provides a voice for the voiceless - the wildlife, trees, water and the interconnected ecosystems that cannot speak for themselves.

Wilderness Watch is the leading national organization whose sole focus is the preservation and proper stewardship of lands and rivers included in the National Wilderness Preservation System (NWPS). The organization grew out of the concern that while much emphasis is being placed on adding new areas to these systems, the conditions of existing Wilderness and rivers are largely being ignored. We believe that the stewardship of these remarkable wild places must be assured through independent citizen oversight, education, and the continual monitoring of federal management activities. Wilderness Watch is committed to citizen oversight, public education and when necessary, legal and legislative action, to protect Americas finest environmental

legacy for present and future generations.

Sequoia ForestKeepers (SFK) mission is to protect and restore the ecosystems of the southern Sierra Nevada - including both Sequoia National Forest and the Giant Sequoia National Monument - through monitoring forest conditions, awareness of laws, education, and litigation. By acting as the eyes, ears, and voice of the forest, SFK seeks to improve land management practices, to promote land stewardship, to enforce existing laws and regulations, to implement public awareness programs, to offer assistance to local land management agencies, and to save natural forest ecosystems.

For Elk is a volunteer grassroots organization organizing to save the tule elk of Point Reyes National Seashore.

White Shark Video/Shame of Point Reyes is a documentary project on Point Reyes National Seashore by independent film-maker Skyler Thomas.

John Muir Project of Earth Island Institute is dedicated to the ecological management of our federal public forestlands. Our goal is to ensure that these lands are managed to provide optimal ecological conditions to support and restore the full complement of native biodiversity in these forest ecosystems, which have been severely degraded and damaged by decades of commercial logging and suppression of wildland fires.

Many individuals who value Point Reyes National Seashore, Golden Gate National Recreation Area, the tule elk, native wildlife, and our public lands, helped us with these comments by collecting information and photographs, and offering their expert advice.

I, Laura Cunningham, am a biologist specializing in historical ecology and native California grasslands, and so I have a keen interest in protecting and restoring the coastal prairies and other native plant communities in the planning area. I have made three extensive field visits to the ranching area in 2018 and 2019, so I have personal knowledge of the area. I participated in the previous steps in this planning process by sending in scoping comments to the EIS. I have read the entire DEIS, as well as other related documents such as the 2019 Grazing Plan and the 2019 Natural Resources Condition Assessment.

We would also point out that the manner in which public comments are allowed to be sent to NPS for this project are unusually restrictive in our experience with federal agency public lands projects. Form letter comments that include individual names and often also additional hand-written comments are not accepted, even when hand-written sentences are added to a form. Hundreds of public comments have thus been rejected.

In addition, the clunky comment form window removes formatting of comment documents and also deletes footnotes. Therefore, we are adding footnotes parenthetically into the main body of the text. NPS should accept emails with attachments, as well as accept and at least count form comments, in order to fully involve the public as required by the National Environmental Policy Act.

These are the major items we will be covering in our comment letter:

I. The Draft General Management Plans Preferred Alternative Violates the National Park Service Organic Act, the Enabling Legislation for PRNS and GCNRA, and the National Park Service Management Policies and Regulations.

National Park Service Organic Act 16 U.S.C. 1.

16 U.S. Code /459c. Point Reyes National Seashore; purposes; authorization for establishment.

16 U.S. Code Subchapter LXXXVI-Golden Gate National Recreation Area Establishment.

NPS Management Policies.

National Historic Preservation Act

- A. Ongoing Impairment of Native Coastal Prairies
- B. Ongoing Impairment to Native Wildlife and Habitats.

## II. The Preferred Alternative and the Draft EIS Violate the National Environmental Policy Act.

- A. The Purpose and Need Is Impermissibly Narrow and Inconsistent With NPS Purposes and Goals.
- B. The Draft EIS Is Too Broad and Vague In Its Analysis.
- C. The Draft EIS Fails to Analyze and Disclose the Effects of Foreseeable Future Actions Because It Defers the Relevant Management Plans to an Unspecified Future Process.
- D. The Draft EIS Fails to Take a Hard Look at the Issues with Manure Management and Fecal Contamination Leading to Impairment of Natural Resources.
- E. The Draft EIS Contains an Inadequate Range of Alternatives.
- F. The Draft EIS Fails to Take a Hard Look at the Ecological Benefits of Reintroduction of Native Predators.
- G. The Draft EIS Fails to Adequately Assess and Disclose the Baseline Conditions of the Project Area.
- H. The Draft EIS Fails to Take a Hard Look at the Impacts of Proposed Ranching Alternatives on Wildlife.
- I. The DEIS fails to Take a Hard Look at the Impacts of Proposed Ranching Alternatives on Mammals.
- J. The DEIS fails to take a hard look at the Impacts of Proposed Ranching Alternatives on Birds.
- K. The DEIS Fails to Take a Hard Look at Impacts of Proposed Ranching Alternatives on Amphibians.
- L. The DEIS Fails to Take a Hard Look at Impacts of Proposed Ranching Alternatives on Salmonids.
- M. The DEIS Fails to Take a Hard Look at Impacts of Proposed Ranching Alternatives on Invertebrates.
- N. Significant Impacts to Water Quality and Water Bodies Are Not Fully Analyzed.
- O. Important Proposed Policies Were Not Given Their Due 'Hard Look Under NEPA.
- P. The DEIS Fails to Take a Hard Look at Impacts to Public Recreation and Inspiration.
- Q. The DEIS Fails to Take a Hard Look at Impacts to Wilderness.

## III. The Definition of National Historic Places is Too Narrow Under NHPA.

## IV. Conclusion.

We support Alternative F, including the permanent removal of beef and dairy ranching from Point Reyes National Seashore (PRNS), dismantling of all internal fences (including the Tomales Point enclosure fence), and allowing the natural expansion of free-ranging tule elk herds to fill all available habitat on PRNS and Golden Gate National Recreation Area (GGNRA). In addition, the General Management Plan should include restoration of native coastal prairie and other native vegetation types, and elimination of non-native weeds. Current management allows the planting of non-native vegetation (DEIS at 22), and this is unacceptable on a National Park Service (NPS) unit whether for silage production, site restoration, or any other purpose.

The ranches occupy nearly a quarter of the park lands, yet the intent behind the creation of the parks was never to support private ranching activities in perpetuity. In the 1960s and 70s, the federal government, through the American taxpayers, paid ranch owners over \$57 million to purchase the ranches, for the benefit and enjoyment of the public and protection of natural resources. There is simply no proof Congress intended in 1962 that ranching would go on forever.

The 1978 amendment to the enabling legislation by Congress provided that the Secretary could lease for ranching where appropriate in his discretion, after the 25 years or life estate, as long as the ranches do not impair resources. The 1978 reservation language applied to ranchers and homeowners. But the 1978 language makes it very clear that any leasing to a rancher is conditional on there being no impairment of natural resources.

Such lease shall be subject to restrictive covenants& (16 U.S.C. Sec. 318b)

In our scoping comments of November 29, 2018 (attached hereto: Western Watersheds Project et al. 2018, Attachment 27), and as detailed in these comments to the Draft EIS, we have provided the Park Service with

numerous examples of impairment, both in the past (from Freedom of Information Act documents), in the last few years, and ongoing. All of the filings from the complaint filed February 10, 2016 (Resource Renewal Institute, Center for Biological Diversity, and Western Watersheds Project v. National Park Service), which are in NPS possession already and should be part of the record for this plan. The ongoing grazing at Point Reyes National Seashore and Golden Gate National Recreation Area ranches violates any restrictive covenants and ranching is obviously not appropriate in National Park Service lands where impairment of natural resources, degradation of cultural resources, and even the health of visitors is put at risk by poor water quality. Therefore, the NPS must make Alternative F its management plan for the planning area in order to protect and restore these park resources.

We object to the preferred alternative for the following reasons:

I. The Draft General Management Plans Preferred Alternative Violates the National Park Service Organic Act, the Legislation for PRNS and GCNRA, and the National Park Service Management Policies and Regulations.

National Park Service Organic Act 16 U.S.C. 1.

All plans and management actions approved by the National Park Service (Park Service or NPS) must comply with the agency's Organic Act, as amended. This legislation states,

[The National Park Service] shall promote and regulate the use of the Federal areas known as National Parks, monuments, and reservations hereinafter specified & by such means and measures as conform to the fundamental purpose of the said parks, monuments, and reservations, which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.

16 U.S.C. 1.

The Organic Act mandates that NPS provide the highest level of protection: to leave park resources unimpaired for future generations. 54 U.S.C. 100101 (originally codified at 16 U.S.C. 1). This is distinctly different from the "multiple use" missions and mandates of other federal land management agencies,

Furthermore,

Congress further reaffirms, declares, and directs that the promotion and regulation of the various areas of the National Park System, as defined in section 1c of this title, shall be consistent with and founded in the purpose established by section 1 of this title [the Organic Act provision quoted above], to the common benefit of all the people of the United States. The authorization of activities shall be construed and the protection, management, and administration of these areas shall be conducted in light of the high public value and integrity of the National Park System and shall not be exercised in derogation of the values and purposes for which these various areas have been established, except as may have been or shall be directly and specifically provided by Congress.

16 USC 1a-1.

The NPS has a narrow mandate "...to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." (1916 Organic Act, 16 USC 1).

In this National Park Service founding statute, it is made clear: "&no natural curiosities, wonders, or objects of interest shall be leased, rented, or granted to anyone on such terms as to interfere with free access to them by the public: Provided, however, That the Secretary of the Interior may, under such rules and regulations and on such terms as he may prescribe, grant the privilege to graze livestock within any National Park, monument, or reservation herein referred to when in his judgment such use is not detrimental to the primary purpose for which

such park, monument, or reservation was created& (1916 Organic Act, 16 USC 3. Emphasis added).

A significant amendment to the Organic Act is the 1978 Redwoods National Park Expansion Act. The Redwoods Act amendments, which expanded Redwood National Park to address the impacts of resources from logging outside the park, also amended the Organic Act. The amended provision states that all park management activities shall be:

[C]onducted in light of the high public value and integrity of the National Park System and not be exercised in derogation of the values and purposes for which these various areas have been established, except as may have been or shall be directly and specifically provided by Congress.

Pub. L. 95-250, Title I, 101(b), Mar. 27, 1978, 92 Stat. 166 (amending 16 U.S.C. 1a-1).

This amendment reaffirms the mandate set forth in the Organic Act and directs the National Park Service to manage park lands in a manner that would not degrade park values.

Congress reaffirmed the Organic Act's non-impairment mandate through enactment of the NPS Act in 2014. 54 U.S.C. 100101(a).

16 U.S. Code /459c. Point Reyes National Seashore; purposes; authorization for establishment

The legislation that established PRNS provides, in pertinent part, as follows:

459c-6. Administration of property

(a) Protection, restoration, and preservation of natural environment

Except as otherwise provided in sections 459c to 459c-7 . . . the property . . . shall be administered by the Secretary without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with . . . the maximum protection, restoration, and preservation of the natural environment within the area . . .

16 U.S.C. 459c-6 (emphasis added).

This makes clear that, like the Organic Act, the Park Service is required to manage the Seashore in such a way as to not cause impairment of its natural values. The law goes on to state that even traditional uses of national parks, such as recreational, educational, historic preservation, interpretation, and scientific research opportunities are allowable [only] to the extent consistent with . . . the maximum protection, restoration, and preservation of the natural environment within the area . . . (Id.). The highest priority is to not impair natural values. Recreation, education, historic preservation, etc. are all subject to that highest priority, not equal to it.

16 U.S. Code Subchapter LXXXVI-Golden Gate National Recreation Area Establishment.

The GGNRA legislation provides, in pertinent part, as follows:

460bb - Establishment

In the management of the recreation area, the Secretary . . . shall utilize the resources in a manner which will provide for recreation and educational opportunities consistent with sound principles of land use planning and management. In carrying out the provisions of this subchapter, the Secretary shall preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area.

16 U.S.C. 460bb.

NPS Management Policies.

NPS defines "impairment" as any authorized activity that "would harm the integrity of park resources or values, including the opportunities that otherwise would be present for the enjoyment of those resources or values." NPS Management Policies 1.4.5 (2006, Attachment 21). To ensure that an authorized activity will not violate the non-impairment mandate, NPS must determine the activity will not impair park values or resources prior to authorizing the activity. See, e.g., *Sierra Club v. Mainella*, 459 F. Supp. 2d 76, 103 (D.D.C. 2006).

In 2006, NPS updated its nation-wide Management Policies and established a precautionary approach to ensure no impairment of park resources. Rather than merely prevent the impairment of park resources, the 2006 Management Policies require NPS to prohibit "uses that would cause unacceptable impacts." NPS Management Policies 1.4.7.1 (2006). Under the Park Service's policies,

unacceptable impacts are impacts that, individually or cumulatively, would be inconsistent with a park's purposes or values, or impede the attainment of a park's desired future conditions for natural and cultural resources as identified through the park's planning process . . . or diminish opportunities for current or future generations to enjoy, learn about, or be inspired by park resources or values . . . .

Id.

As an official interpretation of the Organic Act's non-impairment mandate, 1.4 of the Park Service's Policies have been held to be enforceable against the agency. *Greater Yellowstone Coal. v. Kempthorne*, 577 F. Supp. 2d 183, n. 1 (D.D.C. 2008).

The NPS Management Policies further elucidate that the Derogation and Impairment standards, which NPS must not violate, are a single standard:

The Senate committee report stated that under the Redwood amendment, The Secretary has an absolute duty, which is not to be compromised, to fulfill the mandate of the 1916 Act to take whatever actions and seek whatever relief as will safeguard the units of the National Park system. So, although the Organic Act and the General Authorities Act, as amended by the Redwood amendment, use different wording (unimpaired and derogation) to describe what the National Park Service must avoid, they define a single standard for the management of the National Park system- not two different standards. For simplicity, Management Policies uses impairment (or a variation thereof), not both statutory phrases, to refer to that single standard.

NPS Management Policy 1.4.2.

The non-impairment standard applies specifically to the purposes for which the park unit was created, and the resources it protects:

The fundamental purpose of the National Park system, established by the Organic Act and reaffirmed by the General Authorities Act, as amended, begins with a mandate to conserve park resources and values. This mandate is independent of the separate prohibition on impairment and applies all the time with respect to all park resources and values, even when there is no risk that any park resources or values may be impaired. NPS managers must always seek ways to avoid, or to minimize to the greatest extent practicable, adverse impacts on park resources and values. However, the laws do give the Service the management discretion to allow impacts to park resources and values when necessary and appropriate to fulfill the purposes of a park, so long as the impact does not constitute impairment of the affected resources and values.

NPS Management Policy 1.4.3, emphasis added. NPS must fulfill the "fundamental purpose" of the National Park System, which is to "conserve park resources and value" and provide "for the enjoyment of park resources and values by the people of the United States." NPS Management Policies 1.4.3 (2006).

See also Attachment 24 (Ross 2013).

The Park Service is directed to further distinguish between uses mandated in the enabling legislation for that Park unit, and those uses merely authorized:

In the administration of mandated uses, park managers must allow the use; however, they do have the authority to and must manage and regulate the use to ensure, to the extent possible, that impacts on park resources from that use are acceptable. In the administration of authorized uses, park managers have the discretionary authority to allow and manage the use, provided that the use will not cause impairment or unacceptable impacts. In determining whether or how to allow the use, park managers must consider the congressional or presidential interest, as expressed in the enabling legislation or proclamation, that the use or uses continue.

NPS Management Policy 1.4.3.1.

Even when a park's enabling legislation mandates particular uses, NPS has "the authority to and must manage and regulate the use to ensure, to the extent possible, that impacts on park resources from that use are acceptable." *Id.* 1.4.3.1.

Park resources and values subject to the non-impairment standard include the parks scenery, natural and historic objects, and wildlife, and the processes and conditions that sustain them, including, to the extent present in the park: the ecological, biological, and physical processes that created the park and continue to act upon it; scenic features; natural visibility, both in daytime and at night; natural landscapes; natural soundscapes and smells; water and air resources; soils; geological resources; paleontological resources; archeological resources; cultural landscapes; ethnographic resources; historic and prehistoric sites, structures, and objects; museum collections; and native plants and animals&. NPS Management Policy 1.4.6. Opportunities for the public to experience, enjoy, and be inspired by these resources and values is also key to the non-impairment standard.

The Park Superintendent has a legally-binding responsibility to determine (1) the extent to which activities and uses (in this case, both beef cattle and dairy cattle ranching) are either mandated or authorized for Point Reyes National Seashore, and the extent to which these uses and activities are causing impairment for the resources for which Point Reyes National Seashore was established, per its enabling legislation as amended.

The Park Service may issue regulations that allow the agency to grant the privilege to graze livestock within a System unit, such as Point Reyes, but only when the use is not detrimental to the primary purpose for which that System unit was created. 54 U.S.C. 102101(a)(2) (previous version at 16 U.S.C. 3). Subsequently, the Park Service issued regulations in 1983 that prohibit livestock grazing for agricultural purposes within System units, unless a) specifically authorized by Federal statute, b) required under a reservation of rights, or c) designated as a necessary and integral part of a recreational activity or as required to maintain a historic scene. 36 C.F.R. 2.60(a). These exceptions do not apply on Point Reyes National Seashore.

Perhaps most germane to this planning process,

Before approving a proposed action that could lead to an impairment of park resources and values, an NPS decisionmaker must consider the impacts of the proposed action and determine, in writing, that the activity will not lead to an impairment of park resources and values. If there would be an impairment, the action must not be approved.

NPS Management Policy 1.4.7.

This written determination is subject to Administrative Procedures Act prohibitions on decisions that are arbitrary, capricious, or otherwise an abuse of agency discretion. The Park Superintendent must connect the facts found with the decisions made. This section also specifies that agency decisionmakers must identify unacceptable impacts that may not rise to the level of impairment, and prevent these as well. *Id.* For the purposes of NPS policy, in relevant part, unacceptable impacts are impacts that, individually or cumulatively, would

" be inconsistent with a parks purposes or values, or

" impede the attainment of a parks desired future conditions for natural and cultural resources as identified through the parks planning process, or  
" create an unsafe or unhealthful environment for visitors or employees

Id.

The Park Superintendent must also work to meet the non-discretionary standard for Improving Resource Conditions:

The Service will also strive to ensure that park resources and values are passed on to future generations in a condition that is as good as, or better than, the conditions that exist today. In particular, the Service will strive to restore the integrity of park resources that have been damaged or compromised in the past.

NPS Management Policy 1.4.7.2.

Another regulation promulgated pursuant to agency authority under the Organic Act requires NPS to prohibit livestock use in National Park System units except:

- (1) As specifically authorized by Federal statutory law; or
- (2) As required under a reservation of rights arising from acquisition of a tract of land; or
- (3) As designated, when conducted as a necessary and integral part of a recreational activity or required in order to maintain a historic scene.

36 C.F.R. 2.60(a).

The Park Services 2006 Management Policies declare that the agency will phase out the commercial grazing of livestock whenever possible. NPS Management Polices 4.4.4.1. These policies explain that the agency will only allow commercial grazing where it does not cause unacceptable impacts on park resources and values. Id. at 8.6.8.2.

The preferred alternative, and the continued livestock grazing operations within the PRNS and GGNRA violates the NPS Organic Act, the GGNRA legislation, and the Point Reyes legislation, Park Service policy and the agencies non-impairment standard for a variety of park resources ranging from tule elk to water quality to native coastal grasslands. In the case of Point Reyes National Seashore, livestock operations have heavily impaired numerous park resources, and the Park Service has an affirmative obligation to restore the integrity of those resources that have been damaged.

The draft EIS indicates that neither the stated purposes of the two parks (Point Reyes National Seashore and Golden Gate National Recreation Area), or the stated desired conditions for the parks say anything about ranching in perpetuity. Point Reyes National Seashore was established in 1962 by Public Law 87-657, the Point Reyes National Seashore Act for "purposes of public recreation, benefit, and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped." For GGNRA, In order to preserve for public use and enjoyment certain areas of Marin and San Francisco Counties, California, possessing outstanding natural, historic, scenic, and recreational values, and in order to provide for the maintenance of needed recreational open space necessary to urban environment and planning, the Golden Gate National Recreation Area (hereinafter referred to as the "recreation area") is hereby established. P.L. 92-589. The document (DEIS at 2) states Point Reyes National Seashore was established for public benefit and inspiration and was designated as a national seashore to protect a rugged and wild coastal peninsula and surrounding waters that connects native ecosystems, enduring human history and recreational, scientific, and educational opportunities. Ranching cannot be done in the planning area if there is impairment of natural resources. We have observed abundant examples of impairment, as detailed throughout this comment and supporting documents. The requirement to protect, restore and preserve the park resources are incompatible with ranching.

The stated purpose of Golden Gate National Recreation Area is to offer National Park experiences to all,

including a large and diverse urban population, while preserving and interpreting the outstanding natural, historic, scenic, and recreational values of the park lands. The Draft EIS (at 2 and 3) lists desired conditions that include preservation of ecological function, preservation of native species, management of invasive, non-native species, preservation of cultural resources, and public use and enjoyment/visitor experience such as hiking and wildlife viewing. Desired conditions do not include perpetual ranching. The draft EIS (at 3) explains that in 1976, Congress amended Point Reyes legislation: NPS shall administer Point Reyes without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, and based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area (16 U.S.C. 459c-6). This further indicates park lands are to be managed with no impairment to their natural values.

Contrary to the park legislation, the Organic Act, and the intention of Congress, beef and dairy grazing and associated farming practices are permanently impairing the natural resources of the park. We provided photographs and descriptions of this impairment in our scoping comment letter, attached. We adopt these comments and photographs by reference into these comments.

Further examples of impairment of park resources by ranching follow:

Figure 1. Invasive, European bull thistles (*Cirsium vulgare*) in the Point Reyes National Seashore ranch area, where coastal prairie would be. (Photo: Chance Cutrano)

Figure 2. I Ranch (McClure Dairy) on Point Reyes National Seashore by August is almost completely bare of vegetation and grazed down. This was formerly coastal prairie. (Photo: Chance Cutrano)

Figure 3. Confined Animal Feeding Operation (CAFO) on L Ranch, Point Reyes National Seashore, significantly impairing native plants, native coastal prairie, and tule elk. (Photo: Chance Cutrano)

Figure 4. Noxious weed Poison hemlock (*Conium maculatum*) from the Mediterranean region, on grazed land in Point Reyes National Seashore on a dairy, where formerly coastal prairie grew. (Photo: Laura Cunningham)

Figure 5. Dairy cow at L Ranch CAFO, Point Reyes National Seashore. Introduced alfalfa hay and silage is fed to supplement the cattle because the poor range quality of the pastures cannot sustain these large numbers of cattle. (Photo: Laura Cunningham)

Figure 6. Poor quality of the grazed range in the California annual grassland pastures on dairy ranches at Point Reyes National Seashore, formerly coastal prairie plant communities. The stocking rate is too high here, and lack of rest for grassland pastures contributes to impairment of park resources. (Photo: Laura Cunningham)

Figure 7. Industrial commercial dairy near Kehoe Creek, Point Reyes National Seashore. Alfalfa hay is stockpiled in the back of the buildings. The manure and introduced weedy plants are visible here. (Photo: Laura Cunningham)

Figure 8. Dairy operation next to Kehoe Creek in Point Reyes National Seashore, showing pastures infested with weedy poison hemlock, as well as manure trucks parked next to the liquefied dairy manure pond (on the left). This impairs park native plant communities, wildlife, and water quality. (Photo: Laura Cunningham)

Figure 9. Closer view of the liquefied dairy cow manure pond, which stores manure to be spread by truck onto fields and pastures. (Photo: Laura Cunningham)

Figure 10. Manure truck loading liquefied dairy cow manure from holding pond next to Kehoe Creek, Point Reyes National Seashore. (Photo: anonymous)

Figure 11. Dairy truck spreading liquefied cow manure on pastures and fields in Point Reyes National Seashore. Manure runs off land surfaces during winter storms and contributes to lowered water quality in streams, Pacific

Ocean beaches, and Tomales Bay. (Photo: anonymous)

Figure 12. Dairy cow on L Ranch Road, Point Reyes National Seashore, causing trampling, heavy loads of manure deposition, and replacement of native deep-rooted coastal prairie bunchgrasses with shallow-rooted annual grasses from Eurasia. (Photo: Laura Cunningham)

Figure 13. Excess cattle manure from beef and dairy operations runs off pastures and into water bodies, causing nutrient loading. This in turn causes blooms of aquatic plants far above natural levels. Pond covered with excess aquatic plant growth, impairing water quality and habitat for amphibians. This should be open water. Point Reyes National Seashore. (Photo: Laura Cunningham)

### C. Ongoing Impairment of Native Coastal Prairies

NPS has completely failed to address our scoping comments on our native coastal prairie baseline descriptions and observed impacts (we are incorporating our scoping comments by reference into this comment, as well as including our field notes-Cunningham 2018).

Beef and dairy ranching on Point Reyes National Seashore directly causes and maintains non-native weeds and foreign plant assemblages, particularly in areas with heavy cattle use. Invasive weeds, including but not limited to milk thistle, Italian thistle, poison hemlock, and Italian ryegrass, are present and even dominant across the vast majority of lands used for livestock pasture on Point Reyes. By contrast, native coastal prairie plant assemblages occur only in parts of the National Seashore that seldom if ever are accessed by livestock (see Attachment 7, Cunningham, Point Reyes National Seashore March 18, 2018 field notes). Non-native crops planted for silage, notably wild mustard and wild radish, are invasive weeds that not only destroy the native plant communities where silage is planted and harvested but also invade surrounding lands, and are spreading throughout the National Seashore. NPSs impact analysis appears biased toward maintaining livestock, arguing that native plants would be harmed by removing livestock (see DEIS at 137), even though the cover of native plants is far greater, and non-native weeds are less prevalent, in the Tomales Point Elk Reserve, which has had no livestock grazing since 1980 and provides a foretaste of what the agricultural areas of Point Reyes would look like if allowed to return to nature. In addition, while NPS impacts analysis forecasts complete conversion of coastal prairie to coyote brush in 15-25 years as a possible outcome of livestock removal (DEIS at 139), it is instructive to note that this has not happened on Tomales Point after 40 years post-livestock-removal, where coastal prairie remains a dominant habitat type (see Attachment 7, Cunningham, Point Reyes National Seashore March 18, 2018 field notes). For current conditions, NPS states, the same level of cattle grazing on approximately 27,000 acres would perpetuate altered vegetation structure, species composition, and biomass production. DEIS at 125. On Tomales Point, grazed by elk only, native plants are slowly making a comeback from disturbed conditions propagated by Pierce Point Ranch operations, and the cover of native plants in this area is far greater than the cover of native plants on areas still used actively for beef or dairy cattle ranching.

Grazing is potentially harmful to rare native species of plants, and present harmful impacts would be mirrored under the agency's preferred alternative (DEIS at 133). According to NPS, Species that would continue to be adversely affected by cattle grazing or trampling include beach layia, coastal marsh milkvetch (*Astragalus pycnostachyus*), swamp harebell (*Campanula californica*), Point Reyes ceanothus (*Ceanothus gloriosus*), Marin checker lily (*Fritillaria lanceolata* var. *tristulis*), North Coast phacelia (*Phacelia insularis* var. *continentis*), and Point Reyes checkerbloom (*Sidalcea calycosa* ssp. *Rhizomata*). DEIS at 129. Listed plants also are being negatively impacted by livestock:

The other 20% of beach layia occurrences are on remnant dune features in grazed pastures on the B, C, F, and AT&T Ranches, where cattle could directly affect plants through trampling, as well as indirectly via increased weeds associated with grazing disturbance. Since 2004, the estimated beach layia population in the park has declined 84% from an estimated 35,893 plants in 2004 to 5,689 plants in 2018 (NPS 2019f). Although beach layia occurrences have increased in areas where coastal dune restoration has occurred (NPS 2019f), those subject to grazing have declined in abundance since 2004 (NPS, Parsons, pers. comm. 2019b).

DEIS at 129. NPS also notes adverse effects from heavy, poorly managed livestock grazing on Sonoma alopecurus (DEIS at 130), yet argued that some grazing may be necessary to alleviate competition from native annual grasses. Were 2,000 tule elk, rather than almost 6,000 cattle, to provide the grazing pressure, we believe that the negative effects of livestock grazing would be alleviated, while providing a more modest (and ecologically adaptive) form of grazing to supply the positive benefits. Tidestroms lupine is known to be extirpated by livestock grazing, and 15%

of the Parks population is currently in grazed areas. DEIS at 131. Irrespective of whether USFWS makes a finding of jeopardy for listed species, NPS has a responsibility to prevent impairment, which it is not presently doing. These adverse effects of livestock noted above constitute impairment of plant communities. Some alternatives would permit mowing of coyote brush to favor grasses and forbs. See, e.g., DEIS at 127. NPS should not be in the business of mechanical vegetation treatments to artificially influence the distribution of native species like coyote brush, particularly in cases where the vegetation poised to increase includes non-native weeds. Brush mowing, which is done to increase livestock forage, also kills small mammals. DEIS at 142. This practice violates NPS's nonimpairment standard. Instead, vegetation treatments should be limited to prescribed fire, which better mimics pre-settlement conditions, when indigenous Miwok peoples set fires to influence vegetation dynamics (Keegan 2012, Attachment 17).

All alternatives except Alternative F will continue unacceptable levels of impact to riparian plant communities. According to NPS,

Cattle are attracted to the shade, green vegetation, and water provided in riparian zones and tend to concentrate in riparian areas; therefore, they would continue to cause direct and indirect damage to riparian vegetation in certain locations (Spiegel et al. 2016). Overuse by cattle can degrade riparian areas by reducing vegetative cover, affecting water quality, and damaging creek banks (Bush 2006).

DEIS at 113.

The present and future degradation of riparian plant communities, which are of elevated ecological importance because they are hotspots of biodiversity, violates the Park Services nonimpairment standards.

Concerning range management, the Park Service says:

Recently, NPS contracted with the UC Berkeley Range Ecology Lab to review existing ranch management practices and make recommendations that NPS could consider and incorporate as part of this planning process. Collectively, these guidelines set forth standards and best management practices (BMPs) for ranching operations with the overall goal of administering the grazed rangelands in the park in a manner that provides for environmental protection and restoration, public recreation opportunities, and a visually aesthetic pastoral scene, while simultaneously permitting ranchers to continue traditional and viable agricultural operations. (EIS at 11)

The NPS is not required or mandated to provide for commercial, for-profit viable agricultural operations in a National Park unit. That goes against the legislation that formed PRNS and GGNRA, and Organic Act, as we detailed in our scoping comment.

Having reviewed the UC Berkeley Range Ecology Lab reports (Bartolome et al. 2015, Aoyama et al. 2018), we note that many of the recommendations are not being followed on the ranches, nor are management changes or enforcement mechanisms analyzed in this EIS that would move range conditions towards these recommendations. Plus, these academic recommendations are out-of-date with respect to the latest federal agency range management science.

The 1990 NPS Range Management Guidelines (Attachment 21) using such range measures as Residual Dry Matter (RDM), are considered outdated by other federal agencies such as Bureau of Land Management, and more up-to-date range management concepts and guidelines are used, such as indicators of rangeland health, natural range of variability, disturbance regimes, proper functioning condition, and landscape ecology approaches. Yet NPS is basing its proposed future range management on RDM, as detailed in the DEIS:

The Range Monitoring Handbook (NPS 1990b) outlines monitoring methods to ensure that the standards as set forth in the 1990 Range Management Guidelines are met and incorporated into ranch lease/permits. Specifically, it outlines the methodologies used to assess rangeland vegetation species composition (condition and trend) and conduct residual dry matter (RDM) monitoring. Monitoring is designed to determine range carrying capacities, evaluate the effectiveness of current grazing management in maintaining or improving range resources, and provide baseline data on range plant community successional dynamics. NPS established RDM and vegetation species composition monitoring locations in each ranch or pasture unit between 1986 and 1990, based on the concept of key areas, a widely used rangeland monitoring concept.

DEIS at 11.

For instance, Pellant et al. (2018 at 11, Attachment 23) describe the modernization of range management in the last 20 years:

The science of assessing rangelands changes as concepts and protocols evolve. In 1994 the National Research Council presented the concept of rangeland health as an alternative to range condition&

Rangeland health refers to a suite of soil, vegetation, water, air parameters, and ecological processes, that need to be balanced and sustained. It is important to note that NPS rated 31% of the planning area as having severe to very severe erosion hazard, 58% of soils as having low resistance to soil compaction, and 95% of the planning area as moderate to highly susceptible to wind erosion. DEIS at 65, 66. Yet NPS persists in using old-fashioned simple parameters such as RDM to permit cattle on ranches.

Even if RDM is used as a measure of rangeland health, NPS is still impairing natural resources by violating range standards. In Bartolome et al. (2015), Figure A.2 shows the residual dry matter data for the grazing leases and most violate the minimum RDM standard for the fall period. Several ranches violate the standard for all, or almost all, years in the 2000-2016 period. It seems that the NPS is not enforcing the policy to limit grazing on ranches that violate their lease-permit conditions.

In its Natural Resource Condition Assessment for Point Reyes National Seashore (NPS 2019, Attachment 21), the Park Service admits that current ranching practices have a significant impact on native plant species and coastal prairie communities:

One current conceptualization of the probable controls over plant species distribution in the coastal prairie of Pt. Reyes is that [h]istoric and current ranching practices have the largest influence on rangeland composition. This was a major conclusion of a study conducted by Robert J. Steers, 20 Years of Rangeland Monitoring in Point Reyes National Seashore, presented at the San Francisco Bay Area Science and Learning Science Symposium of 2012. Our analysis evaluates the utility of augmenting such current conceptualizations of the Point Reyes grassland landscape with ecological site concepts.

Page 117 (emphasis added).

#### Coastal Grassland Condition Summary

Coastal grasslands form a major landscape component at Point Reyes, are the primary resource for sustaining Point Reyes authorized pastoral activities, and are of high conservation interest and value. Exotic plants have extensively invaded and occupied Point Reyes coastal grassland, especially ryegrass [*Festuca perennis* (*Lolium multiflorum*)] and common velvet grass (*Holcus lanatus*). The prospects for significantly reducing common exotic annuals are poor. In addition, the native shrub, coyote brush (*Baccharis pilularis*), has encroached into Point Reyes coastal grasslands. An important coastal prairie native grass, California oatgrass (*Danthonia californica*), declined significantly at Point Reyes between 1988 and 2011, decreasing on 24 of the 37 transects on which it occurred . . . .

Pages 131-132 (emphasis added).

(NPS has failed to meet its statutory duty to preserve, restore and protect the coastal prairie by allowing overstocked pastures in both the beef and dairy ranches in the park units.

Ground disturbance is the number one factor in eliminating coastal prairie- -whether from bulldozers and development/urbanization, or trampling/grazing by heavy cattle. Another major stressor to native coastal prairie communities are invasive weeds, which are maintained and increase because of livestock grazing disturbance, as we detailed in our scoping comment.

The park describes a minimum level of current livestock management on PRNS and GGNRA:

Beef cattle are generally allowed to graze on open grassland year-round. Ranchers in the park typically provide fall/winter feed to cattle in upland areas because of winter access constraints and limited forage growth during those seasons. Mineral supplements such as salt licks or molasses are also placed in certain pastures. (EIS at 10)

Forage constraints of the California annual grassland are made quite obvious with the additional hay and supplements needed. The Park Service has still not addressed the apparent over-stocked condition of the range, nor mandated better practices such as rest-rotation grazing instead of year-long grazing, in its Preferred Alternative.

Further, the EIS says:

The dry cows are typically kept and fed in outdoor paddocks and small pastures. Heifers are fed regularly and generally graze in pastures similar to beef cattle. Current minimum organic production standards require dairy cattle to remain on pasture for a minimum of 120 days per year, and animals older than 6 months of age must get at least 30% of their dry matter intake from pasture during the grazing season&(id.)

The small pastures and paddocks where dry cows are kept are largely sacrifice zones, devoid of vegetation or harboring invasive weeds. These concentrated animal pastures act as source populations for weeds and noxious plant species that then invade native plant communities further away from the dairy core areas. The significant impacts of these small paddocks and pastures is unaddressed in the EIS.

All of this impairment caused by livestock grazing is occurring in violation of the Organic Act, PRNS and GGNRA legislation, and Park Service policy, and therefore the preferred alternative to maintain and expand livestock use is unlawful.

Mitigation measures in the DEIS Appendix D for Vegetation management, at D-14, describe Range planting:

Range Planting (550). The Range Planting practice involves the establishment of adapted vegetation on grazing land. The practice applies to rangeland, native or naturalized pastures, grazed forest, or other suitable areas where the principal method of vegetation management is grazing. Range planting is commonly used where existing stands of vegetation are inadequate for natural reseeding to occur and can be used to increase carbon sequestration. Plantings commonly include grasses, forbs, legumes, shrubs, and trees that are selected based on site-specific characteristics, erosion control and water quality improvement goals, wildlife values, carbon sequestration goals, and other management objectives such as restoration of a plant community similar to the Ecological Site Description reference state for the site or the desired plant community, or to provide or improve forage for livestock. Seeded species would be approved by NPS. Successful establishment of seeded species may require rest from grazing. Other practices, such as Herbaceous Weed Control, may be used to ensure successful planting.

We are concerned that non-native forage plants will be used to mitigate overgrazed ranges, instead of a better mitigation measure of reducing livestock numbers, restricting seasons of use, or other better range practices. NPS does not show how planting forage species would help to sequester carbon. This needs a much more thorough review. Erosion control would be better achieved by reducing stocking rates or resting pastures for several years, rather than attempting to plant cattle forage species that may not be native.

Mowing, mechanical treatment of brush (such as native coyote brush), and prescribed grazing, are also summarized in this mitigation table (DEIS Appendix D), which all pertain to cattle ranching and range management. No mitigation measures strive for restoration of native coastal prairie plant communities, which does not follow the park mandate to restore the Seashore.

Targeted grazing is a proposed mitigation measure for weed control (DEIS Appendix D at D-40), yet targeted grazing only compacts soils more, and is not an appropriate method for control of invasive species.

Figure 14. Native coastal prairie bunchgrass community along L Ranch Road, Point Reyes National Seashore, on

the ungrazed edges of a dairy pasture. This diverse community has Idaho fescue (*Festuca idahoensis*), red fescue (*F. rubra*), blue wildrye (*Elymus cinereus*), California buttercups (*Ranunculus californica*), and other native grasses, sedges, rushes, forbs, and shrubs. April 2019. This old-growth coastal prairie type was not analyzed in the DEIS, nor were our comments on this rare native plant community addressed, from our scoping comments (Western Watersheds Project et al. 2018 at 20, Attachment 27). Nor was our suggested Alternative to restore more of the planning area to this native coastal prairie. (Photo: Laura Cunningham)

Figure 15. Ungrazed native coastal prairie plants on a fenceline in a dairy ranch edge, Point Reyes National Seashore, near the Marshall Beach trailhead. Idaho fescue and Tolmie star-tulip (*Calochortus tolmiei*) were not seen on our field trip in April 2019 in cattle-grazed pastures in the planning area. (Photo: Laura Cunningham)

Figure 16. Harlequin lotus (*Hosackia gracilis*) native wildflower in the ungrazed coastal prairie remnant on L Ranch Road. April 2019. (Photo: Laura Cunningham)

Figure 17. Native coast clover (*Trifolium wormskioldii*) on the ungrazed coastal prairie remnant on L Ranch Road. April 2019. (Photo: Laura Cunningham)

Figure 18. Ungrazed native coastal prairie with deep-rooted perennial bunchgrasses, such as Idaho fescue, in the relict patch near Marshall Beach, Point Reyes National Seashore. Idaho fescue has deep roots, and the grassland knits together to hold the soil together. No erosion happens here. The coastal prairie is a sponge to rainwater. The DEIS fails to address this rare native plant community. April 2019. (Photo: Laura Cunningham)

Figure 19. By contrast, in the adjacent dairy ranch pasture within a quarter mile of the relict coastal prairie patch, coastal prairie has been eliminated, and the ground is churned to mud by cow hooves concentrated in fenced pastures, feed lots, and watering facilities. Bare ground, mud, invasive weeds, and annual grass and forbs from Europe are the only plant species in evidence. L ranch Road, Point Reyes National Seashore. (Photo: Laura Cunningham)

Figure 20. Introduced European annual grasses and forbs, such as hare barley (*Hordeum murinum* var. *leporinum*) and milk thistle (*Silybum marianum*) pictured here on a roadside south of Olema, dominate the grassy hills and valleys of Golden Gate National Recreation Area where beef cattle graze. Coastal prairies have largely been eliminated. April 2019. (Photo: Laura Cunningham)

#### D. Ongoing Impairment to Native Wildlife and Habitats.

The tule elk is a genetically-restricted, rare, and endemic California subspecies of elk. Free-ranging herds occur at only a few places, including Point Reyes National Seashore. Most of the elk here are confined behind an enclosure fence, on lands that lack adequate water and dietary nutrients to sustain elk in a healthy condition. Alternatives A, B, C, and D would artificially limit the size and range of the elk herds on PRNS. This is unacceptable. In the absence of cattle and ranching operations, the elk herd would be permitted to expand (as under Alternative F) to 2,000 animals. NPS states, in the context of current management, Competition with grazing livestock would not limit elk population size or affect the overall health of the herds. DEIS at 162. Furthermore, Overall, continuation of elk management actions under alternative A would not result in adverse impacts at the herd or population level. Id. These are ridiculously misleading statements. In fact, ranching (and NPS hazing and lethal control), together with competition with cattle for forage, is what is presently suppressing the elk population well below this 2,000-animal threshold, at approximately 700 animals. Furthermore, the elk population at Tomales Point is cordoned off from the rest of Point Reyes by an 8-foot-tall fence, specifically to block these elk from accessing Park Service lands where ranchers presently run their cattle. These outcomes represent a major impairment to Park wildlife resources, in derogation of the agency's legal mandates. At the end of 2018, the confined Tomales Point herd had 432 animals, the free-ranging Drakes Beach herd consisted of an estimated 124 animals, and the free-ranging Limantour herd had an estimated 174 animals. According to the California Department of Fish and Wildlife, as of 2018, there were approximately 5,700 tule elk present in 22 herds across California. This is up from a total of three tule elk present in California in 1870. Prior to non-indigenous settlement, it is estimated the elk population (three different species) in California was more than

500,000 animals. Failure to adequately protect and restore tule elk on Point Reyes National Seashore and Golden Gate National Recreation Area may contribute to the need to list this subspecies under the Endangered Species Act.

Tule elk numbers were severely reduced in the mid-1800s, primarily due to uncontrolled market hunting and displacement by cattle. Tule elk once inhabited the grasslands of the Point Reyes peninsula, the Olema Valley, and other grasslands in Marin County. They were the dominant grazers on these lands until they were hunted out of existence in the 1850s.

As of 2018, there were approximately 5,700 tule elk present in 22 herds across California. By comparison, as of February 2019, there are approximately 650,000 beef cows on about 11,000 different ranches in California. In addition, there are 1.8 million dairy cows in California. All told, there are currently 5.15 million cattle of all types in California ([https://www.nass.usda.gov/Quick\\_Stats/Ag\\_Overview/stateOverview.php?state=CALIFORNIA](https://www.nass.usda.gov/Quick_Stats/Ag_Overview/stateOverview.php?state=CALIFORNIA)).

The NPS purports to be proud of its tule elk reintroduction program, yet is willing to sacrifice elk every year for the benefit of ranchers. Point Reyes National Seashores website states:

Reintroduction of tule elk to the National Seashore and the further establishment of the free-ranging herd has been an important component of the restoration of the natural systems historically found in this unique and treasured place. ([https://www.nps.gov/pore/learn/nature/tule\\_elk.htm](https://www.nps.gov/pore/learn/nature/tule_elk.htm))

Point Reyes is the only National Park unit where tule elk occur.

The majestic animals you see as you travel through the park embody the restoration of the dominant native herbivore to the California coastal ecosystem. They shape the landscape around them as they did for centuries before they were extirpated by humans. They symbolize the conservation of native species and ecosystem processes, one of the primary missions of the National Park Service. (id.)

Tule elk are treasured by visitors, photographers, naturalists, and locals alike. Their image has been expressed in the local folk art, numerous local and nationally published photographs, and even on the local trade/barter currency where they are depicted alongside coho salmon and local produce as being emblematic of the community.

NPS currently hazes tule elk away from agricultural lands within PRNS. DEIS at 24, 25, 82. This constitutes harassment of wildlife, and Park Service personnel and ranchers alike should not be permitted under any conditions to engage in this activity. Hazing impairs the ability of elk to access habitats within PRNS that they require to complete their life history requirements.

Lethal removal of elk is permitted under current management (DEIS at 25), and NPS's Preferred Alternative B will include shooting elk every year to keep elk numbers down to a specified level. Instead of using the term lethal control the draft EIS should be more direct and say NPS will be shooting the elk. This killing of tule elk for the benefit of ranchers runs contrary to everything the National Park Service represents.

The Preferred Alternative would suppress the natural recovery of free-ranging tule elk by imposing an artificial population threshold (DEIS at 25) that is unnatural and violates the non-impairment standards with which NPS must comply. Tule elk breeding and population and range expansion are natural processes that NPS must allow to proceed without interference. Population sizes specified for the Preferred Alternative (120 animals for the Drakes Beach Herd, DEIS at 41) are less than minimum viable population thresholds. Lacava and Hughes (1984) (Attachment 18), calculated Minimum Viable Population for elk and determined that minimum viable size is 214 animals. Meanwhile, with the removal of cattle from PRNS, the elk population could expand to its natural carrying capacity, estimated by NPS at 2,000 animals (DEIS at 48). The prevention of elk herd growth to this level constitutes an impairment of the natural wildlife resources on PRNS.

This Preferred Alternative would continue, and even expand cattle and diversified agriculture on 28,700 acres of

the proposed Ranching Zone on national seashore lands. This proposed action would allow approximately 2,400 animal units (AUs) of beef cattle and 3,130 dairy cattle in Point Reyes National Seashore and the northern district of Golden Gate National Seashore. DEIS at 13.

In contrast, numbers of native free-roaming tule elk herds are miniscule. The Drakes Beach tule elk herd consists of 124 animals and the Limantour herd has 174. Yet the park is proposing to shoot these elk if they cross over barbed-wired fences into the cattle pastures, and their meat donated to charities or tribal groups. Elk would also be hazed out of the cattle pastures, chased back into the wilderness area. This is unacceptable in a National Park unit.

We are concerned that ranchers are actively harassing wildlife, particularly tule elk, during the course of daily ranching operations. Ranchers have been caught harassing tule elk with vehicles and with dogs (see Attachments 9 and 10, FOIA 2 and FOIA 3).

This goes against the goals of the 1998 Tule Elk Management Plan to maintain viable populations of a free-range elk herd in Point Reyes and to manage with minimal intrusion to regulate population size, where possible, as part of natural ecosystem processes.

Tule elk on Point Reyes National Seashore have been infected with Johnes disease, a livestock wasting disease spread by dairy and beef cattle. NPS has, from time to time, tested tule elk for Johnes disease, often entailing lethal removal. This activity would continue under all alternatives in the GMP. DEIS at 57. Yet the agency has failed to test domestic livestock for this disease which livestock are transmitting to elk. If any livestock are allowed to remain on PRNS, they should be comprehensively tested for Johnes disease, and infected animals should be slaughtered to prevent transmission of the disease to wildlife on PRNS or anywhere else in the State of California. It appears that no alternative requires the testing and removal of infected livestock. In addition, we are concerned that Johnes disease carried and transmitted by livestock on PRNS presents a public health risk to human visitors. Spreading livestock diseases to National Seashore visitors constitutes a significant impairment of public health and safety, in conflict with NPSs legal responsibilities.

We are concerned that fences on Point Reyes National Seashore represent wildlife movement obstacles and/or barriers. According to NPS, Fences in the planning area can affect the movement of deer and other large mammals and cause injury. DEIS at 78, and see 142. The livestock fences on Point Reyes are considerably taller than standard barbed-wire fencing for cattle, and we are concerned that ranchers deliberately build their fences this way to obstruct the movements of elk. Woven-wire fencing prevents smaller wildlife from crawling under the fencing. All fences on Point Reyes National Seashore should be removed, as they impair the movements of native wildlife. To the extent that fences are not removed, they should be replaced by wildlife-friendly fencing, at the expense of the entity seeking to continue the fence in place, consisting of three strands of wire, with the top strand no more than 36 inches above the ground, the bottom strand at least 16 inches above the ground and of smooth wire, the middle wire at least 12 inches below the top wire, and woven-wire fencing should be prohibited.

NPSs proposed management of Tule elk is inconsistent with the agencies substantive duties under the Organic Act, and the PRNS and GGNRA legislation described above. Further, under Public Law 94-389, Congress has specifically recognized the importance of tule elk restoration and preservation on public lands in California and thus directed the Department of Interior to make federal lands under its jurisdiction available for the preservation and grazing of tule elk. NPSs proposed management of tule elk is inconsistent with this duty as well.

## II. The Preferred Alternative and the Draft EIS Violate the National Environmental Policy Act

The National Environmental Policy Act (NEPA) is the "basic national charter for protection of the environment." 40 C.F.R. 1500.1(a). Congress enacted NEPA with the objectives of "encouraging productive and enjoyable harmony between man and his environment" while "promoting efforts which will prevent or eliminate damage to the environment and biosphere stimulating the health and welfare of man; and enriching the understanding of the ecological systems and natural resources important to the Nation . . . ." 42 U.S.C. 4321.

In an EA or EIS, an agency must fully analyze all direct, indirect, and cumulative impacts from a proposed action in its environmental analysis. See *id.* 1502.16. "Direct effects" include those "which are caused by the action and occur at the same time and place." *Id.* 1508.8(a). "Indirect effects" include those "which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." *Id.* 1508.8(b). "Cumulative impacts" result from the "incremental impact of the action" on the environment "when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions." 40 C.F.R. 1508.7. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time. *Id.* Cumulative impact analyses include private, state, and federal action. *Id.* 1508.7.

NEPA requires that the information an agency uses in conducting its environmental review must be "of high quality," and agencies "must insure the professional integrity, including scientific integrity," of their discussions and analyses, and "shall identify any methodologies used" and "scientific and other sources relied upon for their conclusions." *Id.* 1500.1(b) and 1502.24. "Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA." *Id.* 1500.1(b).

Underlying all of NEPA's procedural requirements is the mandate that agencies take a "hard look" at all environmental impacts and risks of a proposed action. See *Natural Res. Def. Council v. Morton*, 458 F.2d 827, 383 (D.C. Cir. 1972). This review cannot be superficial, but rather agencies must take this "hard look" in light of comments submitted by the public as well as high-quality scientific information. This "hard look" standard ensures the agency gathers the needed factual information and provides sufficient information to support its conclusions.

The Draft EIS fails NEPA for the following reasons:

A. The Purpose and Need Is Impermissibly Narrow and Inconsistent With NPS Purposes and Goals.

The purpose of the EIS is to establish guidance for the preservation of natural and cultural resources and the management of infrastructure and visitor use in the planning area. (EIS at 1)

Cultural resources must be managed so as not to impair natural resources. A cultural landscape without working cattle ranches or agricultural operations would fulfill the needs of a cultural landscape and historic properties. Indeed, the historic Pierce Point Ranch, which is abandoned is the ranch that best fulfills cultural and historic obligations due to its accessibility by the public and its historic structures, which contrast markedly with many of the modern, prefabricated or industrial agricultural structures present at many Point Reyes ranches, which actively detract from the historic setting of the area. Modern ranching paraphernalia and structures actively detract from the historic setting and features of contributing structures. In order to maximize the historic value to National Seashore visitors, the ranches must be closed, noncontributing and detracting structures and features removed, and full public access be provided, as it is at Pierce Point Ranch.

The Organic Act and the two park statutes prohibit actions that permanently impair park resources unless a law directly and specifically allows for such actions. An action constitutes an impairment when its impacts harm the integrity of park resources or values, including the opportunities that otherwise would be present for the enjoyment of those resources and values. NPS Management Policies 1.4.3.

Congressional policy set forth by the National Historic Preservation Act of 1966, as amended (NHPA) (16 USC 470 et. sequential) includes preserving the historical and cultural foundations of the Nation and preserving irreplaceable examples important to our national heritage to maintain cultural, educational, aesthetic, inspirational, economic and energy benefits.

In contrast, the proposed General Management Plan amendment for Point Reyes National Seashore and the northern district Golden Gate National Recreation Area is unbalanced toward untenable commercial ranching operations within what should be Historic Districts that are open for the education and enjoyment of the public.

The EIS at 1 says that 28,000 acres of leased grazing land is the highest priority issue in park planning. But the EIS fails to analyze the extent to which degraded and sometimes dangerous water quality persists, severe erosion on salmon streams occurs, and several threatened, endangered, and sensitive species are not being protected and restored due to livestock grazing. The EIS also fails to analyze and disclose the rationale for the needs of millions of park visitors to be regarded as less of a priority than a two dozen or so commercial operators who have impaired park natural resources and thus violated their covenants.

The park purpose includes a basis in the Point Reyes National Seashore foundation statement, which was only very recently made available to the public (August 9, 2019). The preferred alternative of expanding ranching and agricultural activities, and culling native tule elk is inconsistent with the purposes and other items outlined in the foundation documents.

The EIS at 1-2 lays out the purpose statements identifying the specific reasons why Point Reyes National Seashore was established and what is most important about the park. The purpose statement for Point Reyes is as follows:

Established for public benefit and inspiration, the Point Reyes National Seashore protects a rugged and wild coastal peninsula and surrounding waters, connecting native ecosystems, enduring human history and recreational, scientific, and educational opportunities.

The purpose statement for Golden Gate National Recreation Area is (NPS 2014a):

The purpose of Golden Gate National Recreation Area is to offer national park experiences to all, including a large and diverse urban population, while preserving and interpreting the outstanding natural, historic, scenic, and recreational values of the park lands.

Preserving waters, ecosystems, natural values, and historic values is again inconsistent with expanding commercial private agricultural production on National Park lands. Will facilities need to be modernized to keep up with economic production and profitable business models, such as modern factory-farmed dairies, potential cheese-production facilities, row crop agriculture, and diversification? The large modern loafing barns, other facilities, and silage fields in the planning area are already distractions to the visual resources and natural vistas of Point Reyes, as well as intruding on the historic district and cultural landscape (see Figure 21.).

Figure 21. Modern dairy buildings and silage fields of a commercial dairy in the planning area are not historic (Photo: still frame from video by Skyler Thomas, White Shark Video/Shame of Point Reyes, 2019).

Within the planning area, the Draft EIS at 2 points out that Desired Conditions must be achieved, consistent with NPS Management Policies 2006, as follows.

Desired conditions for preservation of ecological function:

Ecological function, connectivity, and processes persist and thrive in communities, including wetland, grassland, forest, scrub, and dunes.

Sources of air, water, noise, and light pollution are limited.

Desired conditions for preservation of native species, including threatened and endangered species:

Habitats and populations of threatened and endangered species, special-status, and rare species persist and are improved.

Native plant and animal communities persist and thrive.

Desired conditions for management of invasive, non-native species:

Populations and extent of invasive, non-native species are limited such that they do not, or only minimally, affect ecosystem processes and/or functions.

Desired conditions for preservation of cultural resources:

National Register of Historic Places (National Register) historic districts, including contributing landscapes and structures, are preserved in a manner that maintains their integrity.

Historic and prehistoric archeological sites and ethnographic resources are preserved and maintained.

Desired conditions for public use and enjoyment/visitor experience:

Visitors have opportunities for diverse educational and learning experiences.

Visitors have opportunities to enjoy expanded connections and greater access to diverse recreation including, but not limited to, hiking and wildlife viewing.

We maintain that these desired conditions are not being achieved, as detailed in our scoping letter and in this comment letter on the Draft EIS. In addition, our concerns about these points remain unaddressed by the park.

Desired conditions to preserve ecological function of coastal prairies, meadows, and other native plant communities are not being met, and in our observation many native grassland and wetland communities have been seriously degraded or eliminated within the planning area. Water pollution is severe in the dairy areas such as at Kehoe Creek, and not mitigated or prevented. This creek feeds into a major public beach, posing a serious public health hazard. We detailed these concerns in our November 18, 2018 scoping comment letter. Most of our concerns have not been addressed.

Desired conditions have not been achieved to preserve native species, including rare, Threatened and Endangered species, as we describe in our November 18, 2018 letter. Conditions for coho salmon, California freshwater shrimp, tricolored blackbird, Myrtles silverspot butterfly, California red-legged frog, Western snowy plover, and numerous rare plant species are not improving, and may not persist under the conditions of high stocking rates of cattle. Native tule elk are proposed to be culled inside the park for reasons other than carrying capacity, but instead for reasons that seem to favor private ranch operations and cattle. Native coastal prairies are on the edge of extirpation within the planning area due to heavy livestock grazing rates and yearlong seasons of use, and are not thriving.

Populations of non-native and invasive plants are uncontrolled in the park, and dominate the vegetation in grassland zones. Noxious weeds are continuing to be spread by livestock with no hint of planning for reduction so that these invasive species do not affect the processes and function of native ecosystems. NPS concedes that non-native weeds are a major problem in the planning area. DEIS at 76. There is even a program wherein NPS is spending taxpayer dollars on a program to eradicate invasive weeds (DEIS at 102), even as livestock and silage operations continue to propagate them. The process of continual heavy grazing and trampling with high cattle stocking rates holds these grasslands at an early seral state which favors nonnative weeds, and does not allow the formation of native coastal prairie and valley grassland within the planning area.

The construction of modern dairy facilities, trucking in of alfalfa hay, harvesting of modern silage seed mixes, and proposal for agricultural diversification flies in the face of preserving the integrity of historic structures and cultural landscapes. Furthermore, existing and additional chicken operations adversely affects soils through excessive nutrient inputs and heavy metals content (DEIS at 106); this constitutes impairment of Park resources.

The presence of fenced, gated ranches that appear private (but are in fact publicly-owned) conflicts with and impairs visitor enjoyment and public use. See, e.g. Attachment 6 (Coda Declaration August 12, 2016). Hiking and wildlife viewing, in particular, are restricted in the planning area. Cattle have replaced native wildlife in the planning area-particularly, the tule elk. The preferred alternative would exclude tule elk further from the planning area, which does not allow for wildlife viewing opportunities to expand within this National Park unit.

The enabling legislation, quoted above, remains strong and clear on the original intent of the Park, to preserve and restore natural resources, and ensure historical interpretation for visitor benefit. Regarding the EIS claim at 3, that a Congressional conference report (House Rep. 116-9 at 720-21 (Feb. 13, 2019)) that accompanied the Consolidated Appropriations Act, 2019, somehow authorizes continuing ranching at Point Reyes National

Seashore under 20-year lease/permits, this is simply a wish-list by a few congressmen. This language claiming to authorize 20-year leases was not in the House Joint Resolution 31, Consolidated Appropriations Act of 2019 (<https://www.congress.gov/bill/116th-congress/house-joint-resolution/31/text>), and therefore is not law.

This language was included in the report at the request of Senator Feinstein (D-CA). However, report language is not law and is not binding. It only conveys the opinion of a particular subset of Congress. The NPS cannot rely on report language except to say that it supports their decision in a rhetorical sense. It is not a legal basis to justify the decision.

The report language itself is flawed in several ways, and does not represent the true intent of Congress in designating Point Reyes National Seashore. The report language says in full:

Point Reyes National Seashore.-The Conferees note that multi-generational ranching and dairying is important both ecologically and economically for the Point Reyes National Seashore and the surrounding community. These historic activities are also

fully consistent with Congress intent for the management of Point Reyes National Seashore. The Conferees are aware that the Service is conducting a public process to comply with a multi-party settlement agreement that includes the preparation of an environmental impact statement to study the effects of dairying and ranching on the park. The Conferees strongly support the inclusion of alternatives that continue ranching and dairying, including the Services Initial Proposal to allow existing ranch families to continue ranching and dairying operations under agricultural lease/permits

with 20-year terms, and expect the Service to make every effort to finalize a General Management Plan Amendment that continues these historic activities. (House Rep. 116-9 at 720-21 (Feb. 13, 2019) (<https://www.congress.gov/congressional-report/116th-congress/house-report/9/1?overview=closed>))

Dairying and beef ranching are principally ecologically impactful because cattle degrade plant communities, water quality, rare species habitat, and native plants and animals. There is absolutely no support for dairy farming contributing to the healthy functioning of native ecosystems. The Park Service cannot justify the continuation of livestock grazing on PRNS on ecological grounds.

As we have detailed in our scoping letter and in this letter, cattle ranching and dairying are not consistent with Congress publicly-supported intent for the management of Point Reyes National Seashore. No amount of private interest lobbying can change the original public intent that Congress followed, to form a National Seashore that would conserve wild natural resources for the enjoyment of the public.

#### B. The Draft EIS Is Too Broad and Vague In Its Analysis.

The Draft EIS follows a programmatic model of NEPA, with too many details subsumed in a broad, high-level, vague outline. Programmatic NEPA reviews often defer important analyses into the distant future, resulting in less public involvement and a lack of detailed site-specific review. We request, for instance, that each proposed new Ranch Operational Plan be analyzed as an Environmental Assessment in the future, rather than be tiered off of this proposed programmatic General Management Plan which purports to cover numerous individual ranch plans, each of which has unique and significant impacts on the environment. A vague, general analysis such as this Draft EIS cannot cover the needed detailed public review of each ranch's individual impacts to the environment.

For example, on our field visits to different ranch units in the parks, we observed very different plant communities, stages of grazing pressure, native and introduced species, and impacts from cattle (or no cattle). Next to the town of Bolinas in far-southern Point Reyes National Seashore is the Commonweal/Niman Ranch, mapped in Alternative B in the DEIS Appendix on page A-23 (Figure 22).

We made a field visit to the southernmost section of this ranch unit on April 14, 2019, from popular social trails on the Mesa of Bolinas next to the park boundary. This section was ungrazed, and appeared to be ungrazed by cattle for a very long time. The grasses and rushes were tall, and the old pasture was dominated by reed fescue (*Festuca arundinacea*), a European introduced livestock forage grass (Figure 23). Yet as we hiked in the ranch zone, we

found native coastal prairie species: California oatgrass (*Danthonia californica*) (Figure 24), and some native sedges and rushes.

The EIS fails to make clear what the future management on this area will be. It does not analyze or disclose whether the ranch operations will impair currently ungrazed grassland, or if these coastal prairie relicts will be protected or restored. The DEIS fails to analyze whether beef cattle will be introduced into this recovering grassland and degrade the native species, or whether popular hiking trails will be cut off by ranch operations expanding into this ungrazed popular Bolinas mesa area.

Equally troubling are the generalized activities and mitigation measures proposed in the DEIS Appendix D, which are not specific to ranches or locations. NPS is proposing non-public meetings with ranchers annually: The park would work with ranchers during annual meetings to identify projects and consolidate and coordinate review of ranch projects to complete compliance and authorize implementation, (DEIS Appendix D at D-3). These projects would include potentially new fences to control the movement of animals and people (id.), potentially new or moved water facility infrastructure such as pipes, trenches, and spring development (at D-4). Mowing, prescribed grazing, manure storage facilities, and many other activities described in the Appendix D are vague and non-localized. NPS should develop detailed maps and geographic locations of proposed new fences, trenches, manure storage ponds of facilities, and other ranching activities. The public has no ability to analyze or comment on such vague geographic locations of new fences, manure storage areas, and other activities, and their impacts on natural and cultural resources. A Supplemental EIS should be drafted by NPS to detail these proposed activities ranch by ranch, with maps of each ranch showing locations, miles of fencing, and locations of manure storage areas.

Figure 22. Alternative B map proposal of zoning of the Commonweal Ranch/Niman Ranch next to Bolinas.

Figure 23. View from the southern section of the Commonweal Ranch/Niman unit in the mapped planning area, southern Point Reyes National Seashore, next to Bolinas. Looking north. We observed ungrazed grasslands consisting of European reed fescue (*Festuca arundinacea*) pictured here, ungrazed for several years with old overgrown livestock water facilities. What are the specific NPS proposals to ensure this recovering coastal grassland will remain unimpaired into the future as coastal prairie is passively restored without beef cattle? Beef cattle in the ranch unit to the north of the canyon are visible in this photo, within the Seashore. (Photo: Laura Cunningham)

Figure 24. We found a few native coastal prairie bunchgrasses such as this California oatgrass (*Danthonia californica*) in the southern section of the Commonweal Ranch/Niman unit near Bolinas, in the vicinity of the photo taken in Figure 3. above, along social trails. How will NPS ensure these native grasses will be protected from beef cattle grazing if this is proposed in this unit. This ranch needs more specific and detailed management proposals, not a generalized treatment tiered off the vague DEIS. Again, we would be willing to take NPS personnel to these localities to survey these natural resources. Our offers in our scoping comment went unaddressed with no response from the National Park Service. (Photo: Laura Cunningham)

C. The Draft EIS Fails to Analyze and Disclose the Effects of Foreseeable Future Actions Because It Defers the Relevant Management Plans to an Unspecified Future Process.

Parts of the EIS propose deferred action, give no specific information and no public review:

Application of animal manure and compost generated in the planning area would be allowed with an approved nutrient management plan& (EIS at 39).

The DEIS Appendix D on ranch activities and mitigation measures has numerous deferred plans which the public will not be able to see or comment on, such as this proposed mitigation measure to protect water and wildlife:

Prepare and implement a spill prevention and clean-up plan, Stormwater Pollution Prevention Plan, or similar document for all construction projects to address polluted runoff and spill prevention policies, erosion control

materials required to be available on site in case of rain or a spill (e.g., straw bales, silt fencing), clean-up and reporting procedures, and locations of refueling and minor maintenance areas (DEIS Appendix D at D-24

Also deferred are such important park management activities such as silage planting: Planted species would be approved by NPS and not contain species considered noxious or weeds, DEIS Appendix D at D-22.

NPS should not have delayed additional management provisions but rather fully evaluated and disclosed the impacts of these activities in the DEIS. Without fully accounting at this stage, NPS is improperly segmenting its decisions under NEPA and failing to ensure its decisions comply with its substantive mandates under the Organic Act, the PRNS and GGNRA legislation, and other laws.

#### D. The Draft EIS Fails to Take a Hard Look at the Issues with Manure Management and Fecal Contamination Leading to Impairment of Natural Resources.

According to the DEIS, Compared to beef cattle operations, dairies produce large quantities of concentrated manure waste because of the need to keep dairy cows close to dairy headquarters for milking twice a day. DEIS at 10, and see 113. The enormous scale of manure creation results in the harmful practice of manure spreading on National Seashore lands. According to NPS, dairies manage animal manure by accumulating it in storage ponds and then spreading the liquid or slurry on fields by means of trucks or pumping through pipes that drain waste out onto fields. DEIS at 23. The EIS (id.) says, [t]ypical beef operations do not require manure management systems because cattle are regularly distributed across the landscape. Yet manure is still deposited by beef cattle on pastures, and potentially in streams and water bodies. See DEIS at 112. According to NPS, manure spreading increases soil nutrients, which increases forage species production but may have adverse impacts on native grassland plant species, some of which are less abundant in fertilized soils (Weiss 1999; GeaIzquierdo, Gennet, and Bartolome 2007). DEIS at 126. Conversely, removal of manure spreading will alleviate to some extent the invasive weed problem in cattle pastures. DEIS at 137. Stormwater runoff will still create water quality problems, and this is unaddressed. Irrespective of waivers issued by the state, this water quality degradation violates NPS nonimpairment requirements.

Concerning dairies, the Park Service says, [d]airies are high intensity operations that require extensive milking, feeding, and waste management infrastructure to meet current production and water quality management standards. DEIS at 23. According to NPS, The main sources of water quality degradation in the planning area are potentially pathogenic bacteria and nutrient loading from nonpoint sources associated with ranches, dairies, septic systems, and stormwater runoff (NPS 2013a; Pawley and Lay 2013). DEIS at 67. Regarding current activities on PRNS, NPS states, Alternative A would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, nutrient management, and water use consumption related to ranching activities. DEIS at 117. For the Preferred Alternative,

The impacts from past, present, and reasonably foreseeable actions would be the same as those described for alternative A. Alternative B would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, nutrient management, and water use consumption related to ranching activities.

DEIS at 120.

In other words, impairment of Park resources. Uniquely Alternative F would improve water quality and quality on lands currently dedicated to livestock production. DEIS at 124. These high-intensity industrial agriculture practices have no place in a National Park unit, especially one with such sensitive biological resources as PRNS.

The production of excess manure by the dairies is apparent in this description from the DEIS:

Compared to beef cattle operations, dairies produce large quantities of concentrated manure waste because of the need to keep dairy cows close to dairy headquarters for milking twice a day. Waste management is required for

manure produced in the heavy-use, high-impact areas of cattle concentration, including feeding and loafing areas, the milking parlor, and corrals. Many dairy operations include loafing barns that allow the operator to keep the milking string indoors through much of the winter, which is important for both manure management and cow health. Loafing barns are covered areas where cows can shelter, particularly during inclement weather. The barns have concrete floors and drainage systems that ensure appropriate containment and management of liquid manure. These barns also make it easier for dairy ranchers to manage manure in these confined areas. Regular manure management includes scraping and storing manure in a manure management system. These areas are managed to avoid pollution of nearby streams. The barns, milking parlors, and travel lanes between the structures are cleaned by scraping or washing manure into ponds, where the manure slurry is stored. Small pastures where cows are held between milking are typically scraped by a tractor, and the manure is stockpiled. Generally, liquid manure is sprayed or spread on pastures through a pump and irrigation system. Large trucks also spread slurry and solids by driving over pasture lands and distributing manure. These activities are conducted outside the rainy season or during dry periods. (EIS at 10-11)

This is unacceptable in a National Park unit. Yet we also have seen that this manure has not been adequately contained or managed. Not all dairy ranches have loafing barns, and the few that do, may have conflicts with National Historic District standards since at least one loafing barn is a modern industrial facility built within the last 10 years. We have seen trucks taking up liquid manure from a containment pond next to Kehoe Creek during the rainy season, apparently to be spread on pastures. We provided photo-documentation of this in our scoping comment. Therefore, we do not believe that the Park is able to restrict manure management to the dry season, and we see no stricter management controls in the Preferred Alternative that would protect water quality. While NPS notes measures that have been implemented to reduce pollution from dairies in to Kehoe Creek (DEIS at 69), there is no claim that federal Clean Water Act or state water board compliance has been achieved, and indeed in recent face-to-face meetings between NPS and WWP personnel, the NPS represented that these problems have yet to be solved. Indeed, water quality in places such as Kehoe Creek remain dangerously poor, and waivers given to dairies with no ranch manure mitigation plans in evidence. NPS should have disclosed these problems and that further ranching will likely be inconsistent with the Clean Water Act.

The spreading of manure on the hilltops of the National Seashore not only represents a biohazard and safety issue for members of the public, but it also results in an offensive smell that represents an unacceptable impairment to the environment for recreational visitors. PRNS is by law supposed to be managed primarily for public recreation and inspiration. How are members of the public supposed to find inspiration here, when the National Seashore, quite literally, smells like shit? This degradation of the scent-scape of Point Reyes represents an unacceptable impairment of Park resources. And because dairy operations would cause even greater contamination problems were the manure not liquified and spread on dry areas, it becomes obvious that the present and future operation of dairies on PRNS is impossible without violations of federal law.

We also remain concerned about the contribution to contamination of Tomales Bay posed by manure and runoff from ranches in the planning area. Some 7% of the watershed draining into Tomales Bay is occupied by ranches in the NPS planning area. DEIS at 67. Tomales Bay is currently considered impaired for nutrients and pathogens, and livestock operations are documented as a source of these contaminants. DEIS at 68. We are concerned not only about fecal coliform poisoning, which is a significant risk, but also about the possibility that Johnes disease could be transmitted to members of the public. NPS concedes that 7% of the fecal coliform samples in Lagunitas Creek exceeded the single sample contact recreation objective. DEIS at 68. The DEIS seems to be written to suggest that serious contamination problems are only an issue during periods of low water. Does this mean that NPS finds it acceptable that visitors might be sickened, or even die, from livestock-related contamination whenever low water conditions occur? Because that sounds negligent to us. Any measure greater than zero constitutes significant impairment from a public safety standpoint. Members of the public recreating on PRNS may come into contact with estuarine waters of Tomales Bay, and to the extent that contaminated runoff from PRNS ranches either is directly responsible for or contributing to dangerous levels of estuary contamination, NPS is violating its own nonimpairment standards.

NPS should carry out a cumulative analysis of all polluters into Tomales Bay, including ranches on park lands.

## E. The Draft EIS Contains an Inadequate Range of Alternatives.

The DEIS at 59 lists as an Alternative that is considered but dismissed from further analysis:

### Management of All Park Lands for the Protection, Restoration, and Preservation of Natural Resources

Commenters suggested NPS should manage all park lands solely for the protection, restoration, and preservation of natural resources. In addition to managing park lands for the protection of natural resources, NPS also must manage cultural resources and provide for visitor use and enjoyment in a manner consistent with applicable legal requirements. As a result, management decisions cannot solely be based on impacts to natural resources. This approach was dismissed from further analysis because it would not address impacts on other NPS resources and values that NPS is mandated to consider.

Moreover, the action alternatives in this EIS that include ranching would implement activities and mitigation measures to minimize impacts on natural and cultural resources while also protecting them. Additionally, the no ranching alternative would be similar in nature to an alternative focused on the protection, restoration, and preservation of natural resources on all NPS lands.

EIS, page 59 (emphasis added).

This is not simply an alternative, but is the law that must be followed by the National Park Service.

The statutory obligation to avoid impairment and to protect, restore and preserve natural resources was never proposed as an alternative. It is the law and it must therefore be followed for all the alternatives. Furthermore, protection of natural resources trumps historic preservation, recreation, etc. as clearly stated in the enabling legislation as provided below:

#### 459c-6. Administration of property

##### (a) Protection, restoration, and preservation of natural environment

Except as otherwise provided in sections 459c to 459c-7 of this title, the property acquired by the Secretary under such sections shall be administered by the Secretary without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area . . . .

(Emphasis added.)

The 1916 Organic Act has similar language providing natural resource protection a higher priority.

The range of alternatives does not include an alternative that would allow tule elk to expand into Golden Gate National Recreation Area. This violates NEPA. Even under Alternative F, which would phase out ranching on PRNS, NPS would not allow elk to expand into Golden Gate or lands outside park boundaries. DEIS at 48. Tule elk are native to GGNRA. Who is the NPS to block a native species from restoring its original populations on Park Service lands that are supposed to be managed for recreational and aesthetic purposes? The exclusion of tule elk from one administrative unit (GGNRA) while permitting their persistence on another (PRNS) is arbitrary and capricious and an abuse of discretion. Furthermore, NPS has statutory duties to permit native wildlife, particularly rare and charismatic ones like tule elk, to restore themselves to natural population levels in areas where they are ecologically suited. The entire planning area encompassed by this EIS is suitable tule elk habitat, and tule elk should be permitted to expand to fulfill their natural ecological role throughout both PRNS and GGNRA, without restrictions or impediments of any kind.

Finally, the park has never adequately protected, restored and preserved the planning area in the past. There is no reason to believe it will under the Preferred Alternative now.

The Appendices reveal that the park will be following non-binding Marin County and National Resource Conservation Service standards with respect to soil, water and vegetation actions. We do not see any mention of the three protection statutes, quoted above, that apply to the two parks as higher priorities to follow.

The management activities as described below are analyzed in the draft environmental impact statement (EIS) for a general management plan amendment for Point Reyes National Seashore (Point Reyes) and the north district of Golden Gate National Recreation Area (collectively referred to as the park). These management activities are grouped into broad categories referred to as activity types, for example, road upgrade and decommissioning (table D-1). This appendix was adapted from numerous compliance documents, including the Marin Resource Conservation District Permit Coordination Program (which was established to streamline permitting for many of the activity types listed herein), as well as previous National Park Service (NPS) National Environmental Policy Act compliance for projects, and previous Biological Opinions from US Fish and Wildlife Service and National Marine Fisheries Service. Wherever possible, activity types are also associated with one or more established US Department of Agriculture (USDA), Natural Resources Conservation Services (NRCS), Conservation Practice Standards-technical guidelines for the conservation of soil, water, air, and related plant and animal resources when implementing activities (referred in this document as practices).

Appendix, D-1 (emphasis added).

In short, the National Park Service will be following USDA farming standards. The EIS goes on for many pages listing possible actions and what USDA National Resource Conservation Service standards apply. They cover soil, water, air, and related plant and animal resources when implementing activities (referred in this document as practices). The Countys standards were not written with the Organic Act and the two park two statutes as controlling. Instead, the Park should be developing its own standards and best management practices that prioritize the preservation and restoration of natural values, sensitive species, and historic interpretation for the public.

Mitigation measures allow an agency to comply with NEPA to reduce potentially significant impacts to less than significant. But this abbreviated DEIS, with mitigated measures quickly summarized in tables in the DEIS Appendix D are too generalized and do not address each ranchs specific and unique natural resources that may be impaired. These tables do not address each Alternative or the parks Preferred Alternative, and do not provide the public with inadequate information on NPS plans.

NEPA requires NPS to consider appropriate mitigation measures and disclose the impacts of such measures. But the Draft EIS fails to do so because NPS is relying on measures that are non-binding and thus uncertain to occur. Further, NPS does not disclose how it will fund such mitigation, or whether ranchers have funding or the ability to fully implement these measures. This does not satisfy NEPA's mandate, and does not ensure that impacts are mitigated to below the impairment threshold under NPS's substantive duties.

The DEIS contains contradictory language as to how the park will mitigate significant impacts to resources. For example:

To ensure protection of natural and cultural resources, the NPS would streamline the permitting process for typical ranch maintenance activities and would provide consistent guidance to ranchers by using a management zoning framework of Resource Protection, Range, Pasture, and Ranch Core subzones.

DEIS, Appendix D, D-1 (emphasis ours).

Ensuring protection of park resources is incompatible with streamlining the permitting process for cattle grazing activities, as streamlining typically lessens public involvement, shortcuts important environment reviews, makes agency analysis insufficient, jeopardizes public land access, reduces scientific input, and compresses public

comment periods arbitrarily.

#### F. The Draft EIS Fails to Take a Hard Look at the Ecological Benefits of Reintroduction of Native Predators.

NPS dismissed alternatives that considered alternative elk management strategies other than lethal control, such as reintroducing natural predators and restoring more complete food webs. The Park incorrectly states that gray wolves were never native to Point Reyes (EIS at 61). Historical ecological studies (such as CDFW 2012-Attachment 3, Schmidt 1991-Attachment 25) summarize historical accounts, early surveys, museum specimens, and anecdotal accounts that suggest wolves were present across California from coastal areas around San Francisco Bay to the Sierra Nevada before the Gold Rush, and quickly were eliminated from the state with the influx of Euro-Americans during the settlement and market hunting phases of the late 1800s and early 1900s.

Fitzgerald et al. (2013, Attachment 8) give more detail on possible gray wolf historic range in California: The gray wolf historically occurred across most of North America, from as far north as the Arctic tundra, south through the high mountains and plateaus of Mexico, and from the maritime provinces of Canada, west to the Pacific. Wolves are habitat generalists, occupying diverse habitat types based largely on the abundance of prey, availability of den sites, ease of travel, and topography that gray wolves occupied a variety of habitats in California, where there was sufficient ungulate prey. In part, because of the extirpation or near extirpation of prey species such as the bison, Tule elk (*Cervus canadensis nannodes*), and pronghorn, it will always be difficult to precisely determine the historic range of wolves in the State.

Nevertheless, there is some consensus that gray wolves were present in the northern part of California and the Sierra Nevada mountains (Young and Goldman 1944, Hall 1981, Nowak 1995, (1987, 1991) reviewed the historical record of gray wolves in California back to the 1750s and determined that wolves likely were present in the Coastal range, the Central Valley, and the western slope of the Sierra Nevada at the time of European and Weckerly (2007) compared four early accounts of wolf distribution throughout the West to identify where wolves likely had occurred. These records indicate that wolves were likely to have occupied significant portions of California, including the Sierra Nevada mountains, the Modoc plateau and other mountainous areas of California north of San Francisco and Sacramento. The CDFW report on the historic distribution of gray wolves in California indicates that wolves were present in the northern portion of the State, and potentially as far south as the Santa Monica Mountains, north of present-day Los Angeles.

Pages 2-3 (emphasis added).

Several authors discuss spatially-explicit population models as a tool for addressing appropriate recovery goals and strategies for the gray wolf in the western U.S., depending on public lands largely. Studies have concluded that significant areas of potentially suitable wolf habitat occur in California. In the process of evaluating the status of the gray wolf in the Pacific Northwest, the US Fish and Wildlife Service overlaid predictions from three habitat models. Extensive areas in the regions described above are identified as suitable habitat by at least 2 of the 3 models. Point Reyes National Seashore and Golden Gate National Recreation Area are included in one model of potentially viable wolf habitat (see Figures 25 and 26 below).

NPS failed to analyze this reasonable alternative that has been studied by US Fish and Wildlife Service (USFWS), and supported by conservation biologists.

Figure 25. USFWS model of potential wolf habitat (in, Fitzgerald et al. 2013).

Figure 26. Detail of map in Figure 2., showing one model delineating portions of Point Reyes National Seashore and Golden Gate National Recreation Area as potential wolf recolonization habitat.

#### G. The Draft EIS Fails to Adequately Assess and Disclose the Baseline Conditions of the Project Area.

Long-term trend data are essential in a Draft EIS as part of the affected environment discussion as a baseline against which to measure changes (impacts), and are necessary to identify alternatives, which are intended to remedy those past problems, and are necessary for the NPS to set standards for each environmental indicator that

mitigation measures must then meet.

Yet the Draft EIS is wholly inadequate in describing baseline conditions for areas such as native plant communities in the planning area.

NPS statutes include those on resource inventory and management:

(Subchapter I-System Resource Inventory and Management  
(100704. Inventory and monitoring program

The Secretary shall undertake a program of inventory and monitoring of System resources to establish baseline information and to provide information on the long-term trends in condition of System resources. The monitoring program shall be developed in cooperation with other Federal monitoring and information collection efforts to ensure a cost-effective approach.

And,

100706. Integration of study results into management decisions

The Secretary shall take such measures as are necessary to ensure the full and proper utilization of the results of scientific study for System unit management decisions. In each case in which an action undertaken by the Service may cause a significant adverse effect on a System unit resource, the administrative record shall reflect the manner in which System unit resource studies have been considered. The trend in the condition of resources of the System shall be a significant factor in the annual performance evaluation of each superintendent of a System unit.

54 U.S.C. 100704, 100706.

A common method for establishing baseline conditions for an inventory and monitoring program are to use the Affected Environment portion of an EIS. Affected Environment is a description of the environment as it exists today. The Affected Environment is essentially a snapshot in time, but also can include descriptions of ongoing trends. Yet NPS has failed to field-survey a large part of the current environment at PRNS/GGNRA, and many of these areas were missed in older surveys, therefore not taking into account important native plant communities such as ungrazed coastal prairies that we photographed and described in our scoping comments, but that NPS failed to analyze (see Attachment 7, Cunningham 2018 Field Notes). The park did not respond to our scoping comments about these unsurveyed parts of the park within the planning area, where we summarized our field notes and professional observations.

NPS did not sufficiently establish baseline data for the EIS and thus is not considering all relevant factors before determining that the actions will have no significant impact. Baseline conditions are necessary to determine what effect the project will have on the environment and thus to comply with the requirements of NEPA. Great Basin Res. Watch, 844 F.3d at 1101.

Baseline conditions must provide a reasonable basis for determining the effect of the activities authorized by the agency, using the best available scientific information. The Draft EIS is already inadequate.

The Natural Resource Condition Assessment (Attachment 21, NPS 2019) concludes that the Park Service at Point Reyes National Seashore has a lot of catching up to do with simply having a current baseline vegetation map that can be used for future monitoring of trends:

The ecological communities discussed in this assessment included coastal dunes, forests, and grasslands. Assessment of these communities, as well as focal resources such as rare plants, would benefit from an updated vegetation map for the park. The detailed vegetation map for PORE is an indispensable tool for management and research. However, it is more than two decades old. Given that we are experiencing an era of accelerated ecological dynamics, the vegetation map needs to be updated as often as possible to understand ongoing shifts in the vegetation.

Page 269.

And again:

[Point Reyes National Seashore] faces some significant challenges in the coming decades including climate change, exotic pests and pathogens, the presence of non-native species, and habitat loss due to human activity. In addition, although park staff have gathered a considerable amount of information regarding natural resources, there are still many significant gaps in the existing data for natural resources and stressors. NPS resource managers need to establish and continue comprehensive monitoring projects in order to ensure that management strategies can be implemented in a timely and effective manner, so that these challenges do not result in the degradation of these valuable natural resources.

Id. (emphasis added).

The Park needs to establish baseline conditions in order to understand how ranching and livestock grazing is impacting sensitive resources. This has not been done yet and equates to a serious and significant gap in the EIS.

Accurate and up-to-date monitoring is fundamental to ensuring the effectiveness of monitoring commitments, meeting legal and permitting requirements, and identifying trends. Under NEPA a federal agency has a continuing duty to ensure that new information about the environmental impact of its proposed actions is taken into account (40 CFR 1502.9(c), requiring supplementation of an EIS where there is substantial new information or circumstances relevant to the environmental effects of the proposed action). The Park failed to analyze the significant impacts of cattle ranching and other proposed actions on a degraded landscape, and does not have a proper baseline to carry out an accurate monitoring program to ensure that decisions do not further harm the environment.

In our scoping comment, we recommended that NPS use Ecological Site Descriptions (ESDs) for monitoring plant communities and range conditions in the planning area, yet this remains unanalyzed in the Draft EIS. The UC Berkeley Range Ecology Lab, in its Natural Resource Conditions Assessment (Attachment 21, NPS 2019), also recommended the park use ESDs, for instance:

Developing more detailed Ecological Site Descriptions with associated state-and-transition models will require more widely distributed transects and better small-scale soils information.

Page 131.

Yet this recommendation failed to be taken into account so far during this public review, and the NPS has failed to respond to our comment on this subject.

Furthermore, the UC Berkeley Range Ecology Lab notes that there are large data gaps in the parks baseline information about the coastal prairies that form the rangeland base for livestock grazing in the planning area. In Table 3.2.2 on p. 30 (Attachment 21, NPS 2019), reference sites for coastal grasslands were listed as "not available." So the park has no basis for assessing trends or management of coastal prairie, having no baseline. In our scoping comments we offered to show the park the reference sites we found. This was not addressed in the summary of comments provided by the park.

NPS admitted this in its EIS:

Point Reyes recent Natural Resources Condition Assessment (NRCA) includes an analysis of 51 plots in Point Reyes grazed coastal grassland from 1988 through 2013. Coyote brush occurred in about half of the plots. It increased in cover on 10 plots, 6 of them to a major degree, and decreased in cover on 8, although in some plots, cattle grazing had ceased. The plots did not capture the full range of sites and vegetation (NPS 2019a).

Page 73 (emphasis added).

These uncaptured vegetation types include native coastal prairie species that are particularly sensitive to the stresses of livestock grazing and trampling, yet would actually be the type of original vegetation that once covered much of the planning area. These native coastal prairie and meadow species include such grasses as red fescue

(*Festuca rubra*), Idaho fescue (*F. idahoensis*), blue wildrye (*Elymus glaucus*), pacific reedgrass (*Calamagrostis nutkaensis*), and tufted hairgrass (*Deschampsia cespitosa*) (see Cunningham 2018 Field Notes). The EIS does nothing to analyze these relict native grassland vegetation types, and protect them from significant impacts of the Parks proposed large-scale agricultural activities.

The existing transects used for baseline conditions of grasslands (Figure 4.5.1, p. 113, NPS 2019) seem to be non-randomly distributed in the middle of pastures and vegetation types. This completely misses the rare relict intact ungrazed coastal prairie sites outside of pasture fences, on roadsides, and on ungrazed far pasture corners such as along L Ranch Rd, with native grasses and forbs not even mentioned in this report - - because the old survey sites completely miss them. We pointed these reference sites out to the park in our scoping comments and offered to show park staff these locations.

There are so many data gaps with coastal grassland baseline information that we cannot see how the park can justify any management alternative scientifically, in their Draft EIS.

Concerning monitoring to discover trends from any baseline, the NPS is committing itself to a very large amount of monitoring work to ensure ranchers are complying with mitigation measures. The park needs to indicate how it plans to budget for all of the wide variety of actions and monitoring work, in order to ensure proper long-term monitoring is accomplished and publicly reported. If the Park Service cannot provide the requisite baseline information in the context of an EIS, then how can the public be expected to believe that this level of field monitoring will actually take place during monitoring and mitigation?

Using Page 27 Table 2 of the EIS: Strategies for the preservation of area resources as an example. In the first box in the table alone, the NPS claims it will do the following on all lands:

Identify community types, ecological sites, their extent and distribution.

Periodically evaluate for large-scale changes.

Research and evaluate connectivity of ecosystems and flexibility of species niches.

Conduct management actions that promote habitat heterogeneity, connectivity, and species considered ecosystem engineers.

Identify previously damaged or degraded natural systems and restore where possible.

Identify and implement practices that protect soil health and minimize soil erosion.

Continue to seek funding and partnerships to restore structure and process to habitat types such as creeks, wetlands, and coastal dunes.

Implement the Point Reyes National Seashore Fire Management Plan, and update the plan as necessary, consistent with federal law and departmental management policies.

Locate and design visitor use improvements to minimize impacts to ecological function.

Based on our experience with NPS management of our public lands, this would cost millions of dollars to accomplish just these tasks. The Draft EIS should fully explain finding sources that would assure the public that their National Park units would be fully funded in order to meet the management needs of this high-value Seashore and National Recreation Area.

Claiming the Park Service will [i]dentify previously damaged or degraded natural systems and restore where possible is very misleading; clearly where possible depends on funding and staff capacity.

On page 29 of the draft EIS, at the top right, NPS would expect increased effort in management, early detection, and likely different IPM strategies for many areas where ranching is no longer occurring. There is no commitment here to do anything concrete, using the words expect and likely.

In Appendix D, Table D-11 in the draft EIS, the Park does not indicate who is responsible for monitoring or what the consequences are of non-compliance. The public should not have to rely on the ranchers monitoring themselves. Proper oversight and management of the ranches will not be possible under current budgets and meager staffing. NPS needs to better explain how monitoring and compliance of its Preferred Alternative actions will be funded and undertaken. This is inconsistent with NPS's duty under NEPA, as explained above, to evaluate mitigation measures and their impacts in detail, and disclose whether their uncertainty will prevent them from being effective. Further, ineffective and uncertain mitigation measures will not fulfill NPS's substantive duties under the other legal requirements listed above.

#### H. The Draft EIS Fails to Take a Hard Look at the Impacts of Proposed Ranching Alternatives on Wildlife.

The UC Berkeley Range Ecology Lab reports (Attachment 21, NPS 2019; Attachment 1, Aoyama et al. 2018; Attachment 2, Bartolome et al. 2015) observe that many ranches regularly violate the Residual Dry Matter (RDM) minimum required in the fall, intended to prevent erosion. Fencing cattle away from creeks also seems to be insufficient to protect water quality; removal of cattle solves water quality problems without the added ecological impacts of fencing.

Described as routine activities on the ranches that would be allowed to continue under the Preferred Alternative, the park describes driving, discing, and harvesting practices on National Park unit lands at the Seashore:

Ranchers drive vehicles and small equipment across pastures for routine ranch operations. Such operations include checking on and moving cattle, repairing fences, and distributing hay as supplemental cattle feed. In areas where silage production is authorized, tilling or discing and seeding may be conducted in the late summer, and silage harvest with mowers and harvest equipment is conducted in the late spring while the cut silage is still green. (EIS at 11)

Park visitors are told not to drive their personal vehicles across natural areas, yet private ranchers are given a pass to do this. Off-road vehicle use has a slew of significant impacts, including erosion, soil compaction, crushing of any remaining native plant species, and unintended mortality of native animal species. The Park Service has failed to take a hard look at the impacts of off-road vehicle use by ranchers, in violation of NEPA.

We are concerned that trespass grazing and/or exceedences of permitted livestock numbers has been prevalent in the past (see Attachments 11, 12, 13, 14, 15, 16: FOIA 5, FOIA 6, FOIA 8, FOIA 10, FOIA 11, FOIA 12), indicating that NPS is ineffective at managing livestock operations on PRNS.

Silage planting and mowing has very large significant impacts, such as causing mortality to nesting birds-and potentially the state endangered tricolored blackbird-and also to small mammals and the young of deer and elk. See DEIS at 143. Yet the EIS fails to quantify the magnitude and significance of these impacts in its analysis.

The park is apparently proposing in its Preferred Alternative to increase silage production in a modified Pasture subzone, in order to maintain the same stocking rates of dairy cattle, and make up for excluding a few areas from grazing, such as riparian areas and threatened/endangered species habitats.

Pasture Subzone. The Pasture subzone is identified as lands where no sensitive resources are known to occur; therefore, a suite of vegetation management activities, including seeding and mowing, may be conducted in addition to grazing. The Pasture subzone includes grazed lands that are outside the Range subzone where introduced or domesticated native forage species exist and would be used primarily for the production of livestock. Approximately 9,000 acres (nearly 34%) of the area under lease/permit would be identified as Pasture subzone. Nutrient management on dairies would be authorized in the Pasture subzone. Under alternative B, some diversification activities would be authorized in the Pasture subzone as described in the Diversification section, below. Forage production would be authorized individually as described in alternative A; however, areas of forage

production already occur in the proposed Pasture subzone.

DEIS at 35-36.

Current and future conversion of coastal grassland to silage fields planted with invasive weeds (European mustard, wild radish) that then escape into surrounding habitats and propagate themselves to the detriment of native plants constitutes an impairment of Park vegetation resources that is legally unacceptable. Net impacts on greenhouse gases should also be discussed. The NPS is also required to evaluate the visual and noise impacts of all of its activities.

#### I. The DEIS fails to Take a Hard Look at the Impacts of Proposed Ranching Alternatives of Mammals.

According to the Draft EIS, at least 40 native mammal species occur in the planning area, including black-tailed deer, coyote, gray fox, American badger, bobcat, brush rabbit, black-tailed jackrabbit, raccoon, striped skunk, and several species of bats, rodents, and shrews, and that most of those species could be affected by ranching through disturbance, competition for resources, and habitat alteration. The document states ranching could affect small mammals such as California meadow voles, black-tailed jackrabbits, Bottas pocket gophers, and western harvest mice. Could affect is not accurate-the wording should be will most likely kill. Fences in the planning area do affect the movement of deer and other large mammals and cause injury. The wording here should read does interfere with the movement&.

The draft EIS states: Mammals also include the limited number of animals that ranches are authorized to keep for personal noncommercial use (e.g., pets or guard animals), consisting of non-native species such as horses, cats, and dogs. Domestic cats are a major predator of birds and small mammals. At the very least, domestic cats kept on park lands should be required to be indoor cats only, and dogs must always be kept on leash. This is the requirement for resident employees of other National Park units, ranchers should not be exempt. And if they require guard animals, this is another strong indication that the presence of livestock is totally inappropriate on park lands.

The draft EIS states: The planning area is adjacent to beaches used by elephant seals throughout the year and occasionally other marine mammals. Although infrequent impacts to marine mammals could occur if livestock were to escape pasture fences onto beaches, it is unlikely they would affect marine mammals. What about impacts to water quality that would affect marine life? Thus, impacts on marine mammals are not analyzed further. Impacts on marine mammals should be further analyzed.

#### J. The DEIS fails to take a hard look at the Impacts of Proposed Ranching Alternatives on Birds.

Point Reyes hosts the greatest avian diversity of any National Park unit in the United States and nearly half of the bird species of North America, with around 490 species recorded from approximately 60 bird families. Many birds use the planning area for a portion, or all of their life history, particularly during spring migration and summer nesting.

Ground-nesting species, such as California horned lark, savannah sparrow, grasshopper sparrow, song sparrow, western meadowlark, California quail, and northern harrier could be susceptible to impacts from cattle grazing and vegetation management (e.g., plowing and harvesting). The DEIS fails to discuss impacts of silage mowing to these bird species.

Agricultural activities that affect songbird populations could also affect the foraging of American peregrine falcons and merlins. Several other special-status raptors rely on grassland habitats, including the burrowing owl, white-tailed kite, and ferruginous hawk, and could be affected by habitat alteration from livestock grazing and vegetation management. The draft EIS should analyze actual mortality impacts to bird populations from ranching activities, and word the EIS to reflect how affected impacts may actually mean population impacts and declines.

Agricultural activities in the planning area attract and concentrate birds that would not be there in such abundance otherwise, including common ravens, brown-headed cowbirds, European starlings. Nest parasitism by brown-headed cowbirds or competition with non-native European starlings for cavity nesting sites negatively affects native birds. Ravens are nest predators of the federally threatened western snowy plover, which nests on beaches adjacent to the planning area. NPS has documented ranching operations directly subsidizing concentrations of ravens in close proximity to nesting snowy plovers (See Attachment 11, FOIA 5; Attachment 5, Coates et al 2016), and DEIS at 102, 143). Furthermore, Ongoing dairy ranching activities would continue to promote an unnatural abundance of corvids, European starlings, and brown-headed cowbirds that compete with, prey upon, and parasitize nests of native birds, resulting in continued impacts to birds over the long term. DEIS at 144. NPS admits the significant impact on this listed species: USFWS (2002a) found that because of the indirect impacts associated with increased raven numbers, renewal of permits for ranches in the planning area 'may affect, is likely to adversely affect the western snowy plover. DEIS at 143. This statement is an admission that impairment of Park resources is ongoing as a result of continued livestock operations on PRNS.

Mitigation measures to protect nesting birds are inadequate. The DEIS only mentions this mitigation measure:

Activities (e.g., harvesting, mowing, shrub management, and seeding) would not occur during rainy or saturated soil conditions.

DEIS, Appendix D, D-2.

No mention is made of halting the harvesting, mowing, shrub removal, or other plant-disturbing activities during the bird nesting season in plant communities in Point Reyes National Seashore, which goes against the Migratory Bird Treaty Act of purposeful take of nesting birds. NPS has tracked nesting birds in the Seashore and knows that nesting birds are a risk in silage fields using eBird (D. Press PRNS biologist, personal comm. 2018). The U.S. Fish and Wildlife Service recommends:

The Service recommends conducting activities outside the bird nesting season to avoid the need for active nest relocation or destruction, when appropriate. This is because (1) successful reproduction is essential to healthy bird populations; (2) measures can often be taken in advance to prevent nesting where it will create a problem; (3) inactive nests and nests under construction may be proactively destroyed without a permit; and (4) most bird species have short nesting cycles, and it can be practicable to delay an activity until the nestlings have fledged. (<https://www.fws.gov/migratorybirds/pdf/policies-and-regulations/Nestdestructionfaq.PDF>)

Native bird species are at continuing risk of direct mortality from silage mowing activities, and other ranch management activities, without adequate mitigation. As we detailed in our scoping comments, the state endangered Tricolored blackbird has nested in Point Reyes National Seashore silage fields in the past, and has been observed numerous times in the Seashore. This fully state-protected bird could be at risk of direct mortality by silage mowing, yet we see no mitigation measures to lessen this significant impact.

Figure 27. Ravens gathering at dairy facility on Point Reyes National Seashore, attracted to introduced feed. August 19, 2019. (Photo: Skyler Thomas, White Shark Video/Shame of Point Reyes, still from video).

The park should consider Alternative F as the best way to reduce the impacts of ravens subsidized by ranch waste, instead of these minimal mitigation measures such as these:

feed livestock in a manner that discourages or precludes raven access to feed (e.g., use covered feed bunks); control access to carcasses, grain, and ranch-related and household trash/waste to reduce attracting wildlife, including ravens (DEIS Appendix D at D-38).

Figure 28. Silage mowing in the planning area, Point Reyes National Seashore. (Photo: Skyler Thomas, 2019, White Shark Video/Shame of Point Reyes, still from video)

Figure 29. Coyote scavenging an animal from newly-cut silage, Point Reyes National Seashore. (Photo: Skyler Thomas, White Shark Video/Shame of Point Reyes, 2019, still from video)

NPS has failed to take hard look at the impacts to birds and mammals such as deer, from silage harvesting and the extensive mowing of grasslands and pastures to eliminate native shrubs such as coyote brush (*Baccharis pilularis*). This is done simply to increase cattle forage and has no benefit towards restoring or protecting native plant communities. Mitigation measures such as this do little to ensure nesting birds and wildlife are protected:

As appropriate, attach flushing bars to the mower to help to flush birds and mammals (especially deer and rabbit) before the mower reaches them and mow from the middle to the outside to minimize impacts (DEIS Appendix D at D-37).

NPS should evaluate a non-mowing alternative as the best way to halt these ongoing resource impacts to native birds and wildlife.

#### K. The DEIS Fails to Take a Hard Look at Impacts of Proposed Ranching Alternatives on Amphibians.

A dozen species of reptiles could occur in the planning area. This implies more data are needed to really understand the impacts of ranching on reptiles.

The western pond turtle, a California species of special concern, uses freshwater ponds and backwater areas of large streams in the planning area. Four lizard species occur in almost every habitat, except the dampest, most interior forests and tidal salt marshes, and eight snake species could occur in the planning area.

Amphibians in the planning area, found in and near streams and ponds, include six species of salamanders and four species of frogs and toads, including the non-native bullfrog. Although extirpated or greatly reduced throughout its range in California, the federally threatened California red-legged frog is still locally abundant in the planning area. Several populations inhabit the park, and the NPS has recorded 136 known occurrences in the park, primarily associated with stock ponds. Also, the coast range newt, a subspecies of the California newt, is a special-status species found in the planning area.

The Draft EIS states (at 146): Agricultural activities could affect habitat suitability and water quality for reptiles and amphibians. This is far too vague and the potential impacts on reptiles and amphibians should be described in much more detail.

#### L. The DEIS Fails to Take a Hard Look at Impacts of Proposed Ranching Alternatives on Salmonids.

Three federally threatened anadromous fish that could occur include coho salmon, steelhead (an anadromous rainbow trout), and Chinook salmon. The Lagunitas Creek watershed supports one of the largest remaining spawning populations of the Central California Coast coho salmon evolutionarily significant unit. Steelhead from the Central California Coast distinct population segment occur in the planning area in the Lagunitas and Olema Creek watersheds and in tributaries to Drakes Estero. Chinook salmon from the California Coastal evolutionarily significant unit are sporadic visitors to the Lagunitas Creek watershed; only a few adults have been observed in 12 of 17 years. Sediment and pollutants from livestock operations adversely affect salmon and steelhead and their spawning habitats. DEIS at 144. This constitutes an impairment of Park resources.

Other special-status fish in the planning area could include the Pacific lamprey, western river lamprey, and the riffle sculpin.

Historical logging, development, and grazing in the planning area have negatively affected fish habitat as a result of sedimentation, loss of habitat complexity, and diminished riparian ecosystem function. Major perennial streams and tributaries that are habitat for federally listed fish in the Tomales Bay watershed (Lagunitas and Olema Creeks) have agricultural activities contributing to habitat degradation and reduced water quality and quantity for fishes. The EIS should detail which reaches of these streams and their tributaries are fenced from direct cattle

access. Our observations in 2019 show that cattle are still actively eroding salmonid streams directly, with ineffective mitigation.

Table 2 in the Opinion shows that cattle have access to about 3% of Lagunitas Creek that is bordered by grazing lands, about a quarter of Olema Creek bordered by grazing, and a third of Drakes Estero similarly. The average for all creeks was 16%. NMFS staff observed bare soils in pastures adjacent to creeks. Another problem documented is lack of shade plants near to the creeks. We documented similar observations of bare ground and erosion in 2019.

Figure 30. Photo taken April 15, 2019, near Five Brooks Trailhead in the Olema Creek watershed, of extreme erosion due to beef cattle along a stream in Golden Gate National Recreation Area, and failed mitigation measures such as planting grain grass and using hay rolls. The photo was full of cattle tracks still accessing this stream, and eroding the banks. Coho salmon and steelhead trout habitat here is very degraded due to beef cattle erosion. Photo by L. Cunningham.

Figure 31. Ungrazed roadside relict native plant community on the outside of the fenceline of the beef cattle-grazed pasture, Golden Gate National Recreation Area near Five Brooks. Native soap plant (*Chlorogalum pomeridianum*) and native thingrass (*Agrostic pallens*), both species highly sensitive to cattle grazing. These species were not observed on the grazed side of the fence. Native plant communities such as these are not analyzed in the DEIS, yet these native plants help hold soils together and halt sedimentation of salmonid spawning gravels. Photo by L. Cunningham.

Some efforts were made in the early 2000s to fence cattle away from creeks and to plant trees next to creeks. This restricts and impairs both wildlife movements and public access. Another related issue discussed is the dewatering of creeks due to wells taking groundwater for cattle use, in a few areas. These are all rudimentary problems in grazing management, revealing poor overall practices and weak lease enforcement.

#### M. The DEIS Fails to Take a Hard Look at Impacts of Proposed Ranching Alternatives on Invertebrates.

Thousands of aquatic and terrestrial invertebrates inhabit the planning area. Limited information about the diversity and distribution of these species is available.

Numerous flying insects are important pollinators of native plants, which could be affected by livestock grazing and vegetation management activities. Other aquatic invertebrates, including numerous insects, are important indicators of water quality and support aquatic food webs that could be affected by runoff from agricultural activities.

Two federally endangered invertebrates are known to occur in the planning area, the Myrtles silverspot butterfly and California freshwater shrimp. Surveys done in 2004 for Myrtles silverspot butterflies showed occurrences on 13 ranches, all of which support livestock operations. California freshwater shrimp are found in Lagunitas Creek and lower Olema Creek. Impacts of this species from ranching activities are ongoing. DEIS at 147. These impacts constitute an impairment of Park resources.

We discussed these concerns in our scoping comment, but these went unaddressed in the draft EIS.

#### N. Significant Impacts to Water Quality and Water Bodies Are Not Fully Analyzed.

Impacts of livestock grazing on wetland, meadows, coastal prairie, riparian areas, as well as the significant impacts of erosion, sediment input to waterways, nitrogen and phosphorus input, and coliform levels in creeks, Tomales Bay, and Drakes Estuary, and other waterways need better and more detailed analysis to comply with NEPA's hard look requirements. Again, NPS should have disclosed these problems and that further ranching will likely be inconsistent with the Clean Water Act.

Tomales Bay is in non-attainment for fecal coliform, nitrogen, and sediment, all of which come primarily from ranching and dairying operations. The Northern District of the Golden Gate National Recreation Area grazing lands drain into Olema and Lagunitas Creeks, which deliver fecal coliform, sediments, and nitrogen into Tomales Bay. To what degree are ranches on Point Reyes National Seashore contributing to this contamination problem?

This is not adequately analyzed.

Entirely missing from any environmental impact analysis are the National Marine Sanctuaries. Point Reyes National Seashore is surrounded by National Marine Sanctuaries managed by NOAA. Cordell Banks and Greater Farallones National Marine Sanctuaries protect marine resources and provide opportunities for research and birdwatching and wildlife viewing. The EIS fails to analyze the pollution levels and threats coming from beef and dairy cattle ranches where large levels of manure wash into the ocean during large rain storms. We detailed this threat in our scoping comments, but this has not been addressed. The NMFS (2004) Biological Opinion (Attachment 19) for the NPS livestock grazing program in Point Reyes National Seashore says that grazing in the Seashore and related GGNRA leases in Olema Valley damages (incidentally takes) the coho and chinook salmon and steelhead threatened species, but are not likely to jeopardize their continued existence. This Opinion says that residual dry plant material is measured in the fall and where the standard is not met, "the duration of grazing or the allowed number of cattle is reduced" (at 3). As noted above, the RDM data seem to show that the NPS does not require the lessees to reduce herd size and/or grazing duration, to improve vegetation. The NPS is said to have committed to monitoring water quality and managing permits accordingly. The NPS "will incorporate" specific salmonid protection measures such as improving stream buffers and reducing excessive sedimentation from roads. The NPS "proposes" to undertake several mitigation measures focusing on grazing damage to Olema Creek, Schooner Creek, and Home Ranch Creek. In our scoping comments we showed in photographs taken in 2019 that these creeks are still in a state of extreme erosion and cattle trampling.

In its Appendix C, the DEIS dismisses from further analysis marine resources surrounding the park units:

#### Marine Resources

Generally, the actions proposed in the EIS would not affect marine resources because they would occur outside the planning area. In cases where a particular resource may be affected, it is included for analysis under other resource topics (i.e., salt marshes are covered under vegetation). Therefore, marine resources as a stand-alone topic was dismissed from detailed analysis in the EIS.

DEIS, Appendix C, C-2.

The marine resources are not outside of the planning area, and would indeed be significantly impacted by ranches because of manure runoff during winter storms, which contributes to high fecal coliform levels and poor water quality in beaches along the Pacific Ocean of Point Reyes National Seashore, and Tomales Bay.

Tomales Bay is a Wetland of International Importance under the Ramsar convention. It is in the UNESCO Golden Gate Biosphere Reserve and is a California Critical Coastal Area. It is within the Gulf of the Farallones National Marine Sanctuary. It is a critical resting and feeding area for several species of shore birds during migration periods. The Tomales Bay Wetlands Restoration (2007-2012) report by the State Water Resources Control Board (2013), Attachment 26, found no downward trends (improvements) in fecal coliform, Nitrogen, or sediment, which are some of the standards violated there. Indeed, the aquaculture operators are not allowed to sell their shellfish for 60-100 days per year, due to fecal coliform pulses after winter rainstorms that wash manure spread on dairies into waterways and neighboring bays and the Pacific Ocean.

The San Francisco Bay Regional Water Quality Control Board (Attachment 4) found that in 2018 dairies and cattle ranches contributed to fecal coliform, Nitrogen, and sediment loading in the Bay. The Regional Water Quality Control Boards discharge permit waivers for the dairies and ranches in this watershed have increased the regulation of manure, especially for the dairies, steadily over the past 30 years, but water quality has not improved on a widespread basis for these pollutants. Waivers are given contingent on proper mitigating ranch management plans that ranches must undertake to lessen the impacts of manure on water quality. We do not see an adequate analysis of this in the Draft EIS.

To fail to even mention the basic facts about these important receiving waters below some of the grazing permits being evaluated seriously hampers the public's ability to understand the problems with current grazing leases and to propose alternatives to improve the situation. Since this history must be included in the Affected Environment section of the DEIS, the NPS should have provided this information, all of which the staff possesses, to give explanation of these problems and so facilitate better commenting on the current EIS.

Manure management, and fertilizer application plans are not detailed or specific as to location. For instance, mitigation measures are deferred into the future: Develop a nutrient budget that considers all sources of nutrients, (DEIS Appendix D at D-43). A Nutrient Management Plan is proposed to be developed by each ranch (id. At D-44), and mitigation measures are listed such as:

Apply solid or liquid waste discharges to land at rates that are reasonable for crop, soil, climate, special local situations, management system, and type of manure: Apply manure and wastewater discharges to land during

non-rainy or non-saturated conditions, ensuring that discharges do not result in runoff to surface waters and that discharges infiltrate completely within 72 hours after application; do not spread compost, manure, or fertilizer when the top 2 inches of soil are saturated or when enough precipitation to cause runoff is forecast (id.). Other than record-keeping by each rancher, no system of park monitoring protocol is discussed, so that the public can be assured that manure management will not impede water quality in the future. Nutrient Management Plans should be analyzed now for each ranch, and not deferred into the future after the Record of Decision.

#### O. Important Proposed Policies Were Not Given Their Due 'Hard Look Under NEPA.

A draft Succession Policy is found on the Point Reyes National Seashore website, yet this was not analyzed as part of the draft Environmental Impact Statement (EIS).

Ranch succession is only mentioned a few times in the DEIS, such as:

It also allows NPS to consider agricultural diversification, increased operational flexibility, promotion of sustainable operational practices, succession planning, and similar ranch management practices as part of any action alternative except the no ranching alternative. (DEIS at page i)

Succession policy is mentioned in passing under Alternatives, such as:

[Alternative A, No Action] Succession. In the rare instances where a ranch family has relinquished a lease/permit, NPS has offered the relinquished land to neighboring ranchers, removed portions of the lease from ranching for natural resource purposes, or in the case of RUO expiration, initiated a lease/permit with the longstanding grazing operator. This approach would continue under alternative A. (DEIS at 13)

[Alternative B, the Preferred Alternative] Succession. In the event an existing rancher decides to discontinue ranching, NPS would implement succession planning that is consistent with maintaining multi-generational ranching in the planning area. (EIS at 37)

Vaguely stating that succession planning would occur, and failing to mention the draft Succession Policy in this public review, does not give this significant management action its due hard look under NEPA. The draft Succession Policy proposes to continue commercial livestock ranching indefinitely, by finding outside operators in the case that a ranch lessee decides to retire the permit. No mention is made of permanently retiring these lease-permits and closing the ranch to livestock, for conservation values. This is a large significant impact that the GMP could have that is unanalyzed. Any draft Succession Policy needs to be included as part of the public review process, and its impacts on park resources analyzed.

#### P. The DEIS Fails to Take a Hard Look at Impacts to Public Recreation and Inspiration.

NPS has failed to take a credible 'hard look at the impacts of the various alternatives on public recreation and enjoyment, and on visitor carrying capacity. NPS admits that once ranches are gone, the lands they currently occupy become available for trail systems, public recreation, car camping sites, and enjoyment of historical structures. Under present management (and Alternative B, which extends present management), recreational use, enjoyment, and visitor carrying capacity are constrained by the presence of the ranches, which discourage public

access and recreation. According to NPS, under a continuation of present management, Visitor opportunities related to experiencing natural sights and sounds would continue to be affected by the machinery, structures, odors, and noise associated with operating ranches. For these visitors, ranching operations in the planning area would result in continued direct, adverse impacts on their use and experience. DEIS at 166. NPS argues that Alternative B would also authorize diversification activities such as ranch tours that would result in additional beneficial impacts by creating new opportunities for visitors to observe and learn about ranch operations. The treatment of public observation of ranching operations as a recreational opportunity is a joke, because visitors opportunity to observe active ranching at Point Reyes is neither better nor even different that their opportunity to engage in exactly the same activity while passing through private ranchlands on the way to the National Seashore. The one exception is the Peirce Ranch, where the recreational opportunity is improved by being able to enter the ranch grounds and examine the buildings, all of which is only possible because Pierce Point Ranch is abandoned, and no longer a working ranch.

Furthermore, the removal of ranches allows the expansion of the elk herd to 2,000 animals, according to NPS estimates. Because tule elk are a major recreational draw for the wildlife-viewing public, this means, by itself, that Alternative F offers substantially more recreational opportunity than all the other alternatives. Yet NPS asserts that [c]ontinued management of elk would not affect visitor experience because elk viewing opportunities of the Drakes Beach and Limantour herds would continue unchanged (DEIS at 167), ignoring the indisputable fact that the prevention of elk from expanding their range and numbers, and their exclusion from actively-ranchled lands along Sir Francis Drake Road (the main thoroughfare for public access) means that fewer visitors will have the opportunity to view any elk at all. And for public use and enjoyment and visitor carrying capacity, NPSs impact analysis erroneously lists the environmental impact of Alternative F as Same as Alternative B with some additional caveats. DEIS at 50. These are mis-statements of environmental impacts among alternatives. Indeed, under Alternative F, The potential expansion of the elk population in Point Reyes would result in long-term, beneficial impacts on visitor use and experience for visitors who enjoy observing elk in their natural and historical habitat. DEIS at 171. The suppression of elk populations and the curtailment of their range on PRNS therefore is an impairment to public recreation and inspiration on the National Seashore.

As even the Park Service concedes in the Draft EIS, ranching operations diminish the visitor experience. Visitors encounter cattle on trails and roadways in the park, and have noted concerns regarding electric fencing, interactions with cattle, and manure management. Fencing interferes with visitor access as does the presence of occupied homes and ranches. The dairies in particular are unsightly and they stink.

Recreational activities are greatly curtailed in the Pastoral Zone, with fences and gates, and lack of visitor facilities, trails, and interpretive signs and displays. This is inconsistent with the purpose of the Seashore, which is for public benefit and enjoyment, not private commercial profits.

The proposal by the NPS to retain and expand ranching activities on park lands is purely political. A few very recent developments affecting the planning area illustrate this point. First, the Olema Valley Dairy Ranches Historic District was listed in the National Register on April 9, 2018, and the Point Reyes Peninsula Dairy Ranching Historic District was listed on October 29, 2018. Why didnt these listings happen earlier? Because the listings were done to try to more firmly anchor ranching into the parks. Second, Congressman Jared Huffman sponsored a bill that directed the Secretary of the Interior to manage agricultural properties consistent with Congress longstanding intent that working ranches and dairies continue to be authorized to operate on agricultural property within the Point Reyes National Seashore and Golden Gate National Recreation Area and authorized issuance of leases or special use permits of 20 years. The bill was passed by the United States House of Representatives, but fortunately the bill died in session. There are fears that even if the NPS decided to adopt Alternative E and phase out the ranches, that certain politicians would quickly try to end run the agency yet again. On the other hand, Alternative F uniquely implements the organic legislations direction to manage PRNS for public recreation and inspiration by expanding and improving recreational opportunities. This alternative entails trail linkages that connect new visitor opportunities in former ranch complexes. DEIS at 46. Furthermore, all ranch complexes would become available for adaptive reuse to support visitor opportunities. DEIS at 47. The change in land use could create additional opportunities such as a string of lodging or camping sites connected by trails. Id. Opportunities for preservation and enjoyment of historic features would also expand under this alternative, as NPS would use a wider range of techniques to interpret the history of ranching in the park,

potentially including exhibits in historic structures that are no longer actively used for ranching. Id. Thus, Alternative F uniquely among the alternatives manages the National Seashore to prioritize public recreation and inspiration. All other alternatives dedicate substantial acreage to commercial livestock production, to the detriment, and often exclusion, of public recreation.

Figure 34. Industrial agricultural equipment on park roads causing traffic and recreation hazards is incompatible with park purposes. Near Abbotts Lagoon, Point Reyes National Seashore. (Photo: Jim Coda)

Figure 35. Gated road a ranch on Point Reyes National Seashore public lands appears to limit recreation on park-owned land. This is not a private drive and gives visitors and recreational users of the park the impression that these ranches are private. (Photo: anonymous)

#### Q. The DEIS Fails to Take a Hard Look at Impacts to Wilderness.

Wilderness Areas are mentioned in the DEIS, such as where free-roaming tule elk herds dwell: The range of the Limantour herd includes designated wilderness areas (DEIS at 80). Yet the DEIS fails to analyze the impacts of the Alternatives on wilderness, especially where hazing and lethal elk removal may encroach on to or impact wilderness.

Our scoping comments on impacts to wilderness (Western Watersheds Project et al. 2018 at 86-89, Attachment 27) are unaddressed in the DEIS.

#### III. The Definition of National Historic Districts is Too Narrow Under the National Historic Preservation Act.

It is not clear that the Park Service fulfilled its duties under the National Historic Preservation Act (NHPA) to analyze the impact to cultural resources, such as to the native Miwok and other tribes, and to properly consult with all tribes. Further, the listing of the ranching district under the NHPA imposes a new host of duties on the Park to analyze, and that authorizing modern dairies and ranches, particularly when diversification is added, is inconsistent with the agency's duties under the statute

Cultural resources and infrastructure do not imply the need for the park to manage human residence and private commercial operations inside a park unit. Cultural resources can be managed for interpretive and historical needs, without working ranches or livestock being present.

Ranches and associated facilities can be managed under Alternative F perfectly well within NHPA mandates, to administer federally owned, administered, or controlled prehistoric and historic resources in a spirit of stewardship for the inspiration and benefit of present and future generations (16 U.S.C. 470-1a).

The historic and uninhabited Pierce Point Ranch in Tomales Point fulfills the need for a cultural landscape management zone and historic property. This type of management would allow for maximum protection of natural resources and restoration of such resources in the surrounding areas—here, the tule elk and coastal prairie. To fulfill the management needs for a cultural landscape, working ranch operations are not required, and in no manner are needed to educate the public and provide inspirational and aesthetic visitor experiences.

The NPS manages the Pierce Point Ranch as a non-working historic ranch, open to visitors, as described on the Point Reyes National Seashore website:

The Pierce Ranch ceased operations in 1973. Beginning in 1980, the National Park Service invested in the rehabilitation of the ranch core, citing it as the best example of a west Marin dairy ranch from the 1800s. Among the many ranches of the Point Reyes peninsula and of the nearby Olema Valley, Pierce Ranch is the one with the greatest degree of integrity of early buildings in its physical complex. Pierce Ranch is probably the least altered, least modernized, physical complex of ranch buildings in the area. Part of the ranch's main house dates to 1856, making it the oldest surviving ranch house in the Point Reyes region, if not in the whole coastal section of Marin County. Pierce Point Ranch was added to the National Register of Historic Places in 1985, and was subsequently opened to the public as an interpretive site.

Visitors are welcome to walk through the ranch complex, where interpretive signs describe the history and function of the various buildings. Historic features include the main house, a schoolhouse, a blacksmith shop,

barns, dairy houses, and many other structures. ([https://www.nps.gov/pore/planyourvisit/tomales\\_point.htm](https://www.nps.gov/pore/planyourvisit/tomales_point.htm)) NPS should describe a more complete history of this property. Pierce Point Ranch may have operated until about 1980, and Johnes disease may have spread from cattle there to the elk. This history should be detailed.

The many other historic ranches in the Pastoral Zone could equally be made into educational, historic, and interpretive areas, which would fulfill the areas recent addition to the National Register of Historic Places in 2019. To fulfill this need, we emphasize that working ranches are not necessary, and the presence of cattle are not required.

There are recent precedents where the National Park Service has managed formerly working cattle ranches as cultural landscapes and historic properties that are uninhabited, and non-working. One example is the Tassi Ranch Site within Grand Canyon-Parashant National Monument. The February 2019 approved Environmental Assessment detailed a management plan that fulfilled the need to maintain viable habitat for the special status riparian and aquatic species in the project area, and provide sustainable visitor use. The need for the proposed action is to protect the integrity of the cultural landscape, including historic structures, modern visitor infrastructure and historically appropriate vegetation (NPS and BLM 2019 at 2, Attachment 22).

This presents a balance of sustaining both natural and cultural landscapes, along with visitor benefits, and without commercial livestock and agricultural operations. The management plan for the Tassi Ranch Site ranch structures and historic landscapes conforms with the Grand Canyon-Parashant National Monument General Management Plan/Resource Management Plan in that conservation treatments are planned for structures; the cultural landscape will be maintained without working livestock commercial operations, and only certain irrigation structures will be maintained for rare amphibian conservation at springs. In balance with maintaining these historic structures, the park here will also undertake rare species conservation, restoration of springs for ecological benefits, and interpretation of the biological, hydrologic, and cultural features of the area (id.).

WiFi satellite dishes (small-scale telecommunications installations, EIS at 29) do not fit into the definition of a historic cultural landscape, and should not be allowed. Modern loafing barns and sheds do not fit within the definition of a historic cultural landscape, and should be dismantled. Plastic calf crates do not fit within the definition of a historic cultural landscape, and should be removed. Mobile homes and other prefabricated structures do not fit within the definition of a historic cultural landscape, and should be dismantled. Structures such as these impair the integrity of the two historic districts.

Cheese-processing should be a living history exhibit from the early 1900s, with interpretive staff and volunteers in period dress. The park is proposing modern industrial state-of-the-art cheese processing facilities.

Figure 36. Modern dairy loafing barn on ranch in Point Reyes National Seashore is not historic, but built within the last few decades. (Photo: Laura Cunningham)

Figure 37. Pierce Point Ranch inside the Tomales Elk Reserve is a historic ranch with visitor trails, parking facilities, and interpretive signs. There are no cattle and this is not a working ranch with human inhabitants. The grasslands here are recovering well from past dairy and beef cattle grazing, and currently have tule elk inhabiting this area. We found native grasses in the foreground of this photo: purple needlegrass (*Stipa pulchra*). This should serve as a model for how ranches can be used as historic interpretive park facilities. (Photo: Laura Cunningham)

#### IV. Conclusion.

The Draft EIS violates at least four laws: the National Environmental Policy Act (NEPA), the 1916 NPS Organic Act which requires the protection of natural resources, and the PRNS and GGNRA laws which also require the protection of natural resources.

The National Environmental Policy Act provides that agencies may analyze and evaluate alternatives that are beyond the agency's authority to implement. However, an agency may not adopt an alternative that violates federal law, regulation, or agency policy.

The NPS has for decades turned a blind eye to the adverse environmental impacts of the ranches. Leases have

been renewed repeatedly, and the NPS did not take serious steps to address the issue of the ranches until they were forced to do so because of litigation and a multi-party Settlement Agreement. Natural resources are greatly impaired in these park units, violating protective laws, conditions, and covenants that consider renewal of leasing of ranches. Ranch lease-permits are so out of bounds for protecting natural resources from impairment that the only realistic Alternative is F, to end ranching.

It is important to note that ranching on Point Reyes is insignificant in terms of the regional economy. Removal of all ranching would eliminate the production of \$16 million, which sounds like a lot of money, but is only 0.01% of the gross regional product of the study area. DEIS at ix. Conversion of dairy cattle to beef cattle results in elimination of \$14.4 million, almost the same as eliminating all livestock entirely. This demonstrates that conversion to beef cattle eliminates most of the economic inputs of the livestock industry, while retaining most of its impacts to wildlife, the land, and waters. Current visitor direct contributions to the local economy, by contrast, were \$108.5 million in 2017. It is equally important to note that NPS has failed to assess the positive economic impacts of removing livestock from PRNS on public recreation. The agency provides economic losses from elimination of the livestock industry, but fails to account for economic gains from expanded public recreation (see DEIS at vi), even though the agency concedes that recreation will indeed expand as a result of removing livestock from the National Seashore.

Now, by selecting Alternative B, the NPS continues to ignore the adverse impacts of ranching on park lands; opting for the business as usual model. This will allow the same numbers of cows that presently occur (more than 5,500), plus includes the even more egregious step of allowing diversification on the ranches-permitting pigs, chickens, sheep, and goats; horse boarding; row crops; processing of dairy products, and providing public farm stays and tours. All of these additional animals and uses will increase impacts to the environment, both on and off the ranches (direct and indirect impacts to park resources). This alternative would manage a paltry 2,600 acres as a Resource Protection zone, where no grazing would be authorized, yet limited prescribed grazing by livestock might still occur. DEIS at 35. This is absurd given that the agency has an obligation to protect resources across 100% of PRNS and GGNRA. Some 9,000 acres would be managed as the Pasture subzone, where no sensitive resources are known to occur, and seeding and mowing would be permitted. DEIS at 35. Again, this is a nonsequitur, as there are no acres on PRNS that qualify on the basis of no sensitive resources are known to occur. Native coastal prairie is a sensitive resource, for example, and species from this assemblage occur throughout the National Seashore.

Based on the PRNS and GGNRA legislation, as well as the stated purposes and desired conditions of lands in the planning area, the only legally acceptable alternative presented in the Draft EIS is Alternative F.

Language in the Draft EIS itself supports the adoption of Alternative F, not Alternative B. Alternative F would benefit soils, water quality, air quality, elk, and the experience of park visitors. DEIS at 111. Impacts of Alternative F on vegetation and soils cannot be easily summarized, but if the NPS would commit to habitat restoration after the cows are removed, both vegetation and wildlife would benefit overall from cessation of ranching. The same cannot be said about any of the other alternatives. The answer is clear: adopt Alternative F.

According to the Draft EIS, under Alternative F:

- -cessation of ranching would eliminate all impacts on soils associated with ranching activities (i.e., beneficial to soils)
- -impacts on water quality would be noticeable, long term, and beneficial (i.e., beneficial to water quality)
- -ranching-related emissions of criteria air pollutants would end (i.e., beneficial to air quality)
- -would eliminate impacts on elk related to hazing and fencing would be eliminated and the free-range population would be allowed to expand across the planning area (i.e., beneficial to tule elk)
- -visitor opportunities related to experiencing natural sights and sounds would be expanded, and there could be

additional recreational trail linkages and public opportunities through the adaptive reuse of ranch complexes no longer used for active ranching, resulting in beneficial impacts for visitors seeking these experiences (i.e., beneficial to visitor experience)

- -the potential expansion of the elk population would result in long-term, beneficial impacts for visitor use and experience related to observing elk in their native habitat (i.e., beneficial to visitor experience)

The Conservation organizations and individuals signed on to this letter support Alternative F, namely, the termination of all dairy and beef cattle ranching and commercial agricultural production on Point Reyes National Seashore and the northern district of Golden Gate National Recreation Area, and the full restoration of tule elk, coastal prairie, and other native animal and plant communities to these important and unique National Park units for full public enjoyment.

#7192

Name: Riemer, Sophia

Correspondence: I support alternative A because first of all, killing the elk is not the humane way to solve this problem and there are plenty of other solutions to this issue besides murder. If the ranchers are so unhappy with the elk then they should build sturdier fences and realize that the main purpose of the land isn't just for ranching. The land that I have grown up hiking and exploring around is diverse and the elk make it part of what it is. Please try to realize that elk are beautiful creatures that impact our environment in a positive way.

#7193

Name: N/A, N/A

Correspondence: It's very disappointing to hear that even in Marin county the youth and environmental stewards have to fight to protect the land you advertise and market for tourism. Biodiversity is threatened now more than ever before and without protections, we will lose that which California holds so dearly. Point Reyes peninsula is one of the lost special places on Earth and with the damage the T word is doing to the environment, I would expect ALL of CA to fight back - but ESPECIALLY Marin, the Bay Area, and Point Reyes!!! Almost everyone I know goes there to hike and comes back talking about the beauty, the geographic wonder, and the variety of animals! I urge you not to fall captive to capitalism or greed and to protect the nature and wildlife. It sucks to have to write and vote and speak up against that which is wrong, but I guess that's the world we live in. Please protect this land - your children's lives depend on it.

#7194

Name: Martin, Max

Correspondence: Of the 6 possible plans for the future of the Cervus canadensis nannodes (Tule Elk), option "F" is ideal for the future of the peninsula. The elk population, which has been confined to the very tip of Pt Reyes, is expanding and pushing the boundaries of the ranches. Elk were not originally native to the peninsula, but they have established themselves in the ecosystem and now could be relocated across the entirety of the park. If the ranches were removed and the elk were given a larger range, predator populations such as mountain lions could thrive, and plant populations could be held in check. Over all the ecosystem would thrive in its natural condition, which removing the ranches and freeing the elk would do.

#7195

Name: Flores, Brianna

Correspondence: There should be either reduced ranching, or no ranching whatsoever. Killing the elk, can cause

a major damage to the wildlife habitat, and create conflicts for other species living there. This species of elk, is only found in this unique location, while cattle grazing take place pretty much anywhere. It's not worth to endanger this unique native species to benefit cattle ranching, that doesn't benefit the natural environment in any way.

#7196

Name: Mainland, Edward

Correspondence: I strongly support "No ranching" alternative. Point Reyes should be returned to nature and the 24 ranches culled and extirpated, along with their cows. No matter how NPS twists things, the original intent of Point Reyes formative legislation was to protect nature. The leases to ranchers were to be 20 years only, with no intent to perpetuate ranches for all eternity. As to the idea that ranches are some kind of "cultural legacy", tell that to the Miwok. What a joke.

#7197

Name: N/A, N/A

Correspondence: Having spent time as a visitor to the Point Reyes area, I am interested in the preservation of this natural area for its ecosystem functions, and for the benefit of future generations. As an academic researcher in food-energy-water systems, environmental engineering, ecology, and atmospheric science, I am well aware of the long term consequences of land use change, and, in turn, the benefits of biodiversity and undisturbed land. The relatively "short term" economic benefits of expanding ranching simply do not balance out the long term benefits of restoring Point Reyes National Seashore. Ecosystem functions and biodiversity are not easily "engineered" and the long term consequences of destruction in Point Reyes should be judged in that regard.

#7198

Name: N/A, N/A

Correspondence: What do we want the future of the Seashore to be? Problems with funding, understaffing, and the horrible state of the current federal government aside, how can we best proceed to fulfill our duty to protect PoRe NPS: The Elk They shouldn't have been hunted out of the area in the first place and maybe shouldn't have been reintroduced to the Point at all but now that they're here the herds are growing of course. I feel like this wasn't properly anticipated and depending on your point of view or alliance (mainly Rancher v Environmentalist) there're different ideas on how to "manage" the herd. A simple hunt or responsible management compromise is the best solution to appease/anger both sides. More important issues include \*Climate Change \*the maintenance backlog and dangerous roads/trails/facilities \*understaffed Rangers and overworked volunteers \*overused areas destroying wilderness \*pollution from Ranches, local towns, visitors, etc. \*unsafe areas, closed areas, non ADA accessibility \*resources for need projects Like the Oyster Farm closure issue, the Elk issue is making this GMP about Wildlife v Rancher. Truth is, both the Elk and Ranchers wouldn't co-exist at all. However, the Elk are there and majority of people like the Elk. The Ranchers are making a profit on public lands and should be held accountable to their organic small farm standards, and they are historic and are legal family lettered farms so they are protected too. With no other predators, a responsible cull/hunt is a sensible solution, but NPS isn't about the bottom line so Rancher's need to learn to live with the herds. If it were up to me all of the Point Reyes National Seashore would be real wilderness, but since millions of people come here, many people work and live here, and they're so many roads/trails/beaches/buildings in need of maintenance and repair, we should do everything to protect and take care of PRNS

#7199

Name: Gimelli, Julianna

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat

to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

#7200

Name: Xanos, Constantina

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

#7201

Name: Muthukumar, Anitha

Correspondence: Adopt Alternative F

#7202

Name: Ray, Thomas

Correspondence: All the ranching alternatives in the Draft Environmental Impact Statement involve the impairment of natural resources. Three National Park Service laws prohibit actions that will impair natural resources (the 1916 NPS Organic Act, Point Reyes National Seashore legislation Section 459c-6, and Golden Gate National Recreation Area legislation Section 460bb). Consequently, the Park Service should prepare a supplemental DEIS with ranching alternatives that comply with applicable laws requiring the protection of natural resources. The Park Service should then circulate that supplemental DEIS for public comment.

Thank you!

#7203

Name: Alvarado, Melanie

Correspondence: I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

#7204

Name: Gescheidt, Jack

Correspondence: Dear NPS,

Point Reyes Nat'l Seashore is a stunning, precious public land set aside for wildlife and human visitors. Cattle ranching and ranching of ALL kinds should be terminated so that ONLY wild animals, wildlife, and human visitors can enjoy it.

To know that ranchers are applying political pressure to KILL tule elk, or in their terms "cull the herd," is extremely upsetting. Their businesses-for-profit grazing pollutes Point Reyes' clean water, the Pacific ocean, the land and even the air (with, among other pollutants, methane) harming wildlife and inevitably human health.

I am a fervent supporter of Alternative F, which would phase out the cattle and dairy industries in the park.

My local, Marin County-based environmental organization has an email list representing over 2,000 environmentally-minded citizens.

Sincerely, Jack

#7205

Name: kennedy, judy

Correspondence: Preservation of wildlife is more important than more hamburgers. We could all use a little less meat in our lives; and in pursuit of saving more of our environment and wildlife, we'd also be supporting a sustainable environment. We all feel joy and freedom when observing wildlife pursuing its own goals.

#7206

Name: Weisblatt, Jonathan

Correspondence: Please do NOT kill Elk here. Please do NOT put more cattle, cows, goats, chickens, etc. there. Think of the land. Think of the complex biological diversity and the very few places where we can allow Nature to be Wild. This seems like an absurdly obvious choice. Please don't be clouded by colonialist-capitalist opinions. Listen to the seventh generation into the future, listen to the wilderness, listen to all our relatives. Thanks.

Name: Rose, Sheryl

Correspondence: I Strongly Oppose the scheme to kill native elk and expand corporate agriculture in Point Reyes National Seashore and Golden Gate National Recreation Area.

Our Public Lands belong to the People and Must be preserved for the benefit of this and future generations.  
Commercial use destroys Our environment!

Thank you.

#7209

Name: GOODMAN, TERESA

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

#7210

Name: Gahm, Tara

Correspondence: Please select option F and discontinue farming and increase visitors.

#7211

Name: Hollander , David

Correspondence: Cows do not belong in Pt Reyes. Elk do belong in Pt Reyes.

#7212

Name: Harte, Jean

Correspondence: Not only should ranching not be expanded in Point Reyes National Seashore, it should be removed entirely, as was the original intention, when in 1962, each ranching family was paid \$57 million (\$340 million in today's dollars) and given the generous 25 years, with tax breaks and low rent, in which to phase out their operations.

Fifty-seven years later, they are still there, with their 6000-odd cows trampling and polluting the land and water, their use of land to grow food for those cows to eat, and their silage machinery that decimates native birds and other small wild creatures, and have the audacity to argue that they have a natural, cultural "right" to be there. The purchase of the land from the ranchers was specifically to establish a national park, in which to protect the whole of the delicate ecosystem, of which the Tule Elk and all other creatures play an essential part.

I support Alternative F because ranching, with all its water pollution, destruction of land, native plants and wildlife essential to the ecosystem, has no place in a national park, especially one that is in the top 25 most biologically diverse in the state.

Much of the state, indeed much of the planet, is already given over to cattle farming, a practice that the UN report tells us must be radically reduced to head off climate change.

#7213

Name: Gerbode, Colin

Correspondence: The function of a park is not to be agricultural land, rather as a space for the public to enjoy, for recreation. Destruction of iconic native species like tule elk in order to open the land for agriculture runs directly counter to the entire concept of 'park' and as a California resident and park user I vehemently oppose this decision.

#7214

Name: Humphries, Debbie

Correspondence: Public lands, such as our National Parks, belong to all of us. Or I should say are supposed to belong to all of us. Sadly anymore much of it belongs to ranchers. Those of us who enjoy the outdoors should not have to visit National Park areas where there is cow manure on the trails and waterways. Nobody goes outdoors to hike, fish, camp, and see wildlife hoping to see cows! Too much continues to be taken over in the name of greed. Our environment is suffering because of it. We also should not be killing or displacing native wildlife for non native farm animals.

#7215

Name: McClintock, Amy

Correspondence: Are you out of your minds? Do NOT shoot native elk for farm animals, please.

#7216

Name: Hopkinson, Douglas

Correspondence: Please discontinue farming and ranching opportunities within the Point Reyes National Seashore and do not allow the culling of Tule Elk. Protection of wild native species should take precedence over business interests including farming. Cattle grazing negatively affects ecosystems, causing water pollution and soil erosion, spreading invasive species and disease, and harming endangered species.

Thank you for your consideration.

#7217

Correspondence: The public lands and native wildlife on Point Reyes National Seashore and Golden Gate National Recreation Area need to be conserved - not replaced with cattle and commercial agricultural expansion.

#7221

Name: Painter, Michael

Correspondence: Dear Superintendent Muldoon:

I am writing on behalf of the more than 920 members and supporters of Californians for Western Wilderness (CalUWild), a citizens organization dedicated to encouraging and facilitating participation in legislative and administrative actions affecting wilderness and other public lands in the West. Our members use and enjoy the public lands in California and all over the West.

We appreciate this opportunity to comment on the Draft Management Plan Amendment for Ranching in the Pt. Reyes National Seashore.

We strongly urge the Park Service to adopt Alternative F-phasing out ranching. We strongly support Alt. F for several reasons.

First: Alt. F is the only alternative that is legally consistent with the Park Service Organic Act of 1916. The Organic Act states that national parks (and by extension, national seashores) must be managed to conserve the scenery, natural and historic objects, and wild life& and to provide for the enjoyment of the scenery, natural and historic objects, and wild life in such manner and by such means as will leave them unimpaired for the enjoyment of future generations. The key word is unimpaired.

Second: The legislation establishing Point Reyes states as its purpose to save and preserve, for purposes of public recreation, benefit, and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped. And again, it shall be administered by the Secretary without impairment of its natural values, & consistent with . . . the maximum protection, restoration, and preservation of the natural environment within the area. Ranching is nowhere mentioned as a purpose for the Seashores establishment.

The DEIS makes it abundantly clear that every alternative besides F will impair the resources and the ecosystem. Therefore, none of them is legally adequate or defensible under existing law.

Third: When the Seashore was established, the expectation among the public and the ranchers themselves was that ranching would not continue indefinitely. In furtherance of this understanding, legislation was passed that appropriated funds to buy out the ranchers. They were then given leasebacks, and restrictions were placed on the length of those leases, in addition to restrictions on ranchers ability to transfer them outside of their families. Leases could be extended for shorter terms, but there was and has never been a firm requirement that leases be extended.

The Park Service should finally implement the original vision for the Seashore. Alt. F is the only alternative that comes close to doing this.

We oppose the Preferred Alternative, Alt. B, for many reasons.

First: Alt. B allows ranchers to actually increase their commercial operations at the Seashore to include the raising of other animals, such as turkeys and pigs, to grow vegetables and row crops, and to allow paying overnight guests at ranches and other tourist activities such as ranch tours. None of these activities is a historic use of the land, which might support some sort of exception. Furthermore, National Parks and Seashores are not established in

order to be commercial hubs for private businesses, particularly not within their boundaries, and even more particularly on land that no longer belongs to the business owners. The ranchers at Pt. Reyes are now lessees, please remember. These proposals are completely unacceptable in a national seashore.

Second: We object strongly to the killing of Tule Elk that come into conflict with ranching operations. While it may be necessary to cull the herds in some way for ecological reasons in the absence of predators (non-lethal methods are preferred), doing so to assist private commercial interests is completely antithetical to the purpose of any National Seashore. It is unacceptable.

Third: Alt. F. is not a balanced plan. It offers the ranchers almost everything they asked for during the scoping process, as set forth in the scoping letter from the Ranchers Association dated 2 June 2014. The ecosystem itself and the general public for whose benefit the Seashore was created receive no benefit from the Plan.

To the extent that the alternatives other than Alt. F include these undesirable aspects, we oppose them as well.

The question comes down to this: What is a National Seashore for?

CalUWild and most Americans believe it is to save and preserve, for purposes of public recreation, benefit, and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped, precisely as the establishing legislation states. It is not to foster private businesses, especially when it has been clearly demonstrated-by the Park Services own DEIS-that their activities are damaging the very resources the Seashore was originally established to protect.

Pt. Reyes National Seashore appears on a list of places most contaminated by fecal coliform bacteria-among the 10% most polluted areas in the United States and top 10 places in California. (<https://therevelator.org/wasted-water-crappiest-places/>, the data coming from the U.S. Geological Survey.)

Ravens have been documented feeding on the remains of small mammals after the mowing of silage. Raven are known to be predators of other species, such as the Snowy Plover, which is on the Threatened and Endangered Species list and which the Park Service is supposedly working to protect. No activities that artificially support raven populations should be allowed. Its as if the right hand doesnt know what the left hand is doing. Mowing also destroys the nests of ground-nesting birds, as well. Part of the Park Services mission is to protect wildlife species, not promote their destruction.

Grazing alters the natural vegetation of the landscape. This is clear to any visitor driving though the Seashore. Areas with cattle have few or no native plants. Huge areas are fields of mud, especially around dairy facilities, and even more so in the rainy season. In the rainy season, Seashore roads are often a muddy mess.

The ranches and the Park Services record of protecting the resources of the Seashore is dismal in the ranching zone. There is no reason to have confidence that the situation will change now.

Instead, Pt. Reyes National Seashore should be managed for its landscape and its wildlife-the natural ecosystem.

Wildlife should always take priority over livestock. Dairy and beef ranching should be phased out as was originally intended, preferably within five years. There should absolutely be no increase in the level of commercial activity allowed to leaseholders in the Seashore. Areas impacted by ranching should be restored to naturally functioning landscapes for wildlife habitat, native plant communities, scientific research, and education. And historic ranch buildings should be repurposed for public education, scientific research, and interpretative uses.

Repeated studies by the Point Reyes Bird Observatory/Point Blue Conservation Science and others have made recommendations along these lines. They have never been implemented. The time to do so is now.

Thank you for the opportunity to comment. Please inform us of your decision in this matter and please also inform us of further opportunities to be involved in your public decision-making processes.

Respectfully submitted, Michael J. Painter Coordinator

Superintendent Cicely Muldoon Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Re: DEIS-GMP Public Comment Oppose Plan B - Support Plan F

My name is Mark A. Walsh. I have walked along the lands, beaches, forests, estuaries, bays, creeks, and ocean of Point Reyes National Seashore (PRNS, the Seashore) since 1978 - 16 years after President John F. Kennedy signed the 1962 U.S. Congressional enabling legislation into law, specifically to protect this rugged California coastal region from development for all Americans and for peoples of the world.

This law establishing our Seashore states it is not created to preserve ranches and ranchers, but to save and preserve, for the purposes of public recreation, benefit, and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped. Further, the Purpose Statement for our Point Reyes National Seashore states: Established for public benefit and inspiration, the Point Reyes National Seashore protects a rugged and wild coastal peninsula and surrounding waters, connecting native ecosystems, enduring human history, and recreational, scientific, and educational opportunities.

The National Park Service (NPS) and Department of the Interior (DOI) grievously, irresponsibly, and callously err and abdicate sound stewardship with their strenuous promotion of the current DEIS-GMP Plan B - an asymmetrical near-militaristic assault on our national parks lands and waters. Past and current Seashore management leadership officials likewise actively deliver shameful and disingenuous words and actions, seemingly as pawns of or agents for special-interest commercial- and industrial-level private rancher, livestock, ag, and land development business owners, lawyers, and lobbyists. As often do our federal U.S. Representatives and Senators, who likely have never truly witnessed and experienced with boots-on-the-ground experiences the travesty wreaked upon lands, waters, wildlife, and flora of our national Seashore.

I have studied, learned, observed, and experienced myriad natural settings, fauna, and flora throughout the Seashore at all times of day, evening, and night. This has extended into similar experiences throughout the Golden Gate National Recreation Area (GGNRA).

My substantive public comments come from using the rightfully-purchased publicly-owned lands and waters of PRNS and GGNRA - witnessing and experiencing for over 4 decades the willful attacks and abuse on these national parks by 24 private, law-breaking, uncooperative, disruptive, and destructive dairy/beef rancher and related ag businesses who have controlled and expanded their influence and destruction for nearly 6 decades. The majority of these 24 erstwhile quaint family farms and ranches opposed the enabling 1962 PRNS legislation, and have metastasized into commercial- and industrial-level dairy/beef ranching, livestock, ag, and development operations - polluting public lands and waters, and traumatizing or killing wildlife and wild flora in their private business pursuit of profits with the help of government subsidies and tax schemes.

Rather than weight 5 of the 6 PRNS DEIS-GMP plans for private ranching, livestock, ag biz, and retail expansion, the NPS should adhere to all NPS laws and policies to restore and protect lands, waters, wildlife, and wild flora - as prioritized and required in its own founding legislation, and in the enabling PRNS and GGNRA legislation. The Interior Department, NPS, PRNS, and GGNRA should implement Plan F's principles.

Time did not start with ranching on the Point Reyes peninsula - whether with 24 private rancher businesses in 1962, or during 1800s Americanos property takeovers, or with earlier Spanish mega-hacienda land-grants. This was an ancient open landscape with true native cultural icons and stewards of wildlife, wildlands, wildwaters, and wild flora. To compare respectful and honorable practices of native Miwok or Ohlone cultures to present ag bizs loafing barns; cattle yards and feed lots; PVC single-calf enclosures; rutted unpassable trail erosions; fetid bovine-wasted coastal prairies and creeks; miles of restrictive barbed and electric wire fences; cattle-generated methane gas levels more concentrated and harmful than annual vehicle visitations; and all other private government-subsidized ranching and ag operations is either intentional cultural history fabrication, or fantastical delusion. Go ask the remnants of these native peoples what they think of the cultural heritage and ranching expansion actions past and present of the NPS and PRNS/GGNRA management plans as cultural or historical fact and truth - ask surviving Miwok and Ohlone peoples if they support absolute and total lands, waters, wildlife, and native flora desecration.

NO ON PLAN B - YES ON PLAN F!

Mark Walsh, One Persons Direct Substantive Experience - Point Reyes National Seashore and Golden Gate National Recreation Area - Plan B Would Even Further Damage of Wildlands, Wildwaters, Wildlife, and Wild Flora

" Estero Trail: trampled, muddied, rutted, seeping with cattle feces and urine; vast fenced-off inaccessible acreages; navigation through bovine herds, cleaning cattle excrement off boots in what is to be a wilderness experience; passing fetid cesspool-like algae-choked ponds and runoffs; filthy bridges; disease risk and exposure; unsafe/unhealthy family recreation; noxious smells; methane; non-native plants suffocating native plants; cattle not wildlife proliferation; little-to-no ground wildlife; crows, starlings, cow birds, and ravens. " Hearts Desire/Indian Beaches: massive manure-induced algae blooms/mats at supposed swimming beaches; disease risk and exposure; extensive cattle and ag development/byproduct waste runoff on beaches/cliffs and into bay/surf; disease risk and exposure; unsafe/unhealthy family recreation; private ranching, livestock, and ag business operations threaten endangered/marine species; crows, starlings, cow birds, and ravens. " Abbotts Lagoon, McClures, Kehoe Trails/Beaches: adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); fetid cesspool-like algae-choked ponds and runoffs; filthy bridges; extensive cattle and ag development/byproduct waste runoff on beaches and into lagoons/ponds/creeks/surf; cattle excrement accumulation in multiple runoffs to lagoon/ponds/beaches/ocean; disease risk and exposure; unsafe/unhealthy family recreation; noxious smells; methane; cattle not wildlife proliferation; non-native plants suffocating native plants; little-to-no ground/dune/aerial wildlife; private ranching, livestock, and ag business operations threaten endangered/marine species; crows, starlings, cow birds, and ravens. " Drakes Beach/Trail: trampled, muddied, rutted, seeping with cattle feces and urine; extensive fenced-off inaccessible acreages; adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); noxious smells; methane; cattle not wildlife proliferation; little-to-no ground wildlife; non-native plants suffocating native plants; extensive cattle and ag development/byproduct waste runoff on beaches and into bay/surf; disease risk and exposure; unsafe/unhealthy family recreation; private ranching, livestock, and ag business operations threaten endangered/marine species; crows, starlings, cow birds, and ravens. " Agate Beach/Duxbury Reef Beach/Palomin Beach: extensive cattle and ag development/byproduct waste runoff on beaches/cliffs and into surf; cattle excrement accumulation in multiple runoffs to beaches/ocean; disease risk and exposure; adjacent overgrazed and bare-earth coastal (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); extensive fenced-off inaccessible acreages; disease risk and exposure; unsafe/unhealthy family recreation; private ranching, livestock, and ag business operations threaten endangered/marine species; crows, starlings, cow birds, ravens. " Bull Point Trail: trampled, muddied, rutted, seeping with cattle feces and urine; extensive fenced-off inaccessible acreages; inclusive and adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); noxious smells; cattle not wildlife; little-to-no ground wildlife; non-native plants suffocating native plants; extensive cattle and ag development/byproduct waste runoff on beaches and into bays/estuaries/surf; navigation through bovine herds, cleaning cattle excrement off boots in what is to be a wilderness experience; noxious smells; methane; disease risk and exposure; unsafe/unhealthy family recreation; private ranching, livestock, and ag

business operations threaten endangered/marine species; crows, starlings, cow birds, and ravens. " Millerton Point/Beach: extensive cattle and ag development/byproduct waste runoff on beaches and into bay/surf; cattle excrement accumulation in multiple runoffs to beach/bay; disease risk and exposure; unsafe/unhealthy family recreation; adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); large adjacent fenced-off inaccessible acreages; private ranching, livestock, and ag business operations threaten endangered/marine species; little-to-no ground/dune wildlife; crows, starlings, cow birds, and ravens. " Jewell/ Bolinas Ridge Trails: trampled, muddied, rutted, seeping with cattle feces and urine; extensive fenced-off inaccessible acreages; adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); navigation through bovine herds, cleaning cattle excrement off boots in what is to be a wilderness experience; noxious odors; methane; cattle not wildlife proliferation; little-to-no ground wildlife; non-native plants suffocating native plants; extensive cattle and ag development/byproduct waste runoff on trails; noxious smells; methane; disease risk and exposure; unsafe/unhealthy family recreation; crows, starlings, cow birds, and ravens. " Bay (Tomales) Trail: trampled, muddied, rutted, seeping with cattle feces and urine; navigation through bovine herds, cleaning cattle excrement off boots in what is to be a wilderness experience; inclusive overgrazed and bare-earth coastal prairie and riparian habitat (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); extensive fenced-off inaccessible acreages; private ranching, livestock, and ag business operations cause threats to endangered species; non-native plants suffocating native plants; fetid cesspool-like algae-choked ponds/creeks/runoffs; filthy bridges; disease risk and exposure; unsafe/unhealthy family recreation; noxious smells; methane; non-native plants suffocating native plants; cattle not wildlife proliferation; little-to-no ground wildlife; crows, starlings, cow birds, ravens. " Great/North Beach: adjacent overgrazed and bare-earth coastal prairie and riparian habitat (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); extensive fenced-off inaccessible acreages; private ranching, livestock, and ag business operations cause threats to endangered species; extensive cattle and ag development/byproduct waste runoff on cliffs/dunes/beaches; non-native plants suffocating native plants; little-to-no ground/dune wildlife; cattle excrement accumulation in multiple runoffs to beach/ocean; disease risk and exposure; unsafe/unhealthy family recreation. " Overlooks and Vistas - Ranching Operations West of Inverness Ridge - from Mt. Vision, Pt. Reyes Hill, Sir Francis Drake Highway, and Pierce Point Road: huge private commercial/industrial-level beef/dairy businesses; concentrated central operations cattle/feed lots, complexes, and compounds occupying 2-20 acres; despoiled, rutted, muddied coastal prairie and riparian habitat (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); concentrated mega-buildings, cattle pens/paddocks, loafing barns, ranch/farm vehicles/equipment/implement/machinery; cleared/removed native and non-native foliage, brush, trees; extensive cattle and ag development/byproduct waste runoff; extensive fenced-off inaccessible acreages; vast overgrazed and bare-earth coastal prairie and riparian habitat (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); noxious smells; methane; cattle not wildlife proliferation; crows, starlings, cow birds, and ravens. " Etc. - Plan B Increases and Expands Existing Damages to Coastal Prairie, Woodlands, Trails, Creeks, Runoffs, Ponds, Lagoons, Estuaries, Bays, Beaches, Ocean, and Vast Fenced-Off Inaccessible Public Lands and Waters.

First, I strongly and unequivocally - once again and still now for over these 4 decades of my direct experiential witness and exposure within PRNS and GGNRA - object to the NPS, PRNS, and GGNRA officials comprehensive, derelict, and gross mismanagement of our public Seashores national park wildlands, wildwaters, wildlife, and wild flora.

Second, I strongly and unequivocally object to the completely misguided and unscientific Plan B promoted and preferred by NPS and PRNS management that serves special-interest commercial- and industrial-level private rancher, livestock, ag, and land development business owners, lawyers, and lobbyists. Such plans and implementations fall against significant laws, policies, and regulations of the Organic Act of 1916 establishing the NPS, as well as the enabling legislation establishing PRNS and GGNRA. I further object to Plans A, C, D, and E for similar or other legal, ethical, scientific, health, or safety reasons.

Third, I strongly and unequivocally oppose Plan B and support Plan F, to be considered as a starting point to incorporate exact specifics to once and for all, after 57 years since the Seashores creation: " completely remove from PRNS and GGNRA all ranching, cattle, large and small livestock, agriculture, or other development-type

business operations " cease planning and implementation of proposed private rancher business income diversifications; expanded acreage and numbers of dairy and beef cattle; allowance of row crops; introduction of small livestock operations (pigs, goats, sheep, chickens, ducks, turkeys, rabbits, etc.); allowance of retail overnight accommodations, hospitality venues, shops, and roadside stands " remove or cease planning and implementation of all similar, related, and attenuated private business development activities " and fully facilitate, encourage, and deliver restoration and protection of wildlands, wildwaters, wildlife, and wild flora, especially for free and open proliferation of iconic Tule elk In essence, to the most complete and thorough scope and degree, immediately and henceforth prioritize restoration and protection of PRNS and GGNRA for the health, well-being, education, research, experience, and enjoyment of present and future generations through the utmost science- and ethics-based sound wildlands, wildlife, wildwaters, and wild flora restoration and protection principles and practices.

Since the 1960s, the 24 rancher businesses negotiated for and were compensated fair-market value (appraised at over \$350M in today's dollars) for their properties. Lease-back arrangements to ranching operations over these 57 years have proven the disregard and actual contempt these coddled parties have for millions of their brethren and for the lands, waters, fauna, and flora abused by their reckless attitudes and actions. Of a total 71,000 PRNS acres, 28,000 acres (39.4%) are already in de facto control of publicly-subsidized private rancher, livestock, and related ag and land development business operations. The NPS and PRNS leadership are to hold accountable these current private rancher, livestock, ag, and land development business operations through legislative, administrative, and legal oversight, enforcement, and punishment&..and regularly and continuously opt to ignore or fail their official NPS and PRNS roles and responsibilities of service to the greater millions of the American people, all for 24 rancher businesses.

What dollar value can legitimately be placed on increasingly rare wild spaces?

Is \$350M an accurate current assessment for nearly 30,000 acres of California coastline, what ag and land developers consider (with dollar-signed eyes) prime real estate? Is \$700M? Is \$2B? \$5B? \$10B? How can the present privately-owned, publicly-subsidized, and tax-free ranch operations in PRNS and GGNRA - which either by owner or spouse death, or by 25-year life estate maximum extension - still be squatting on and insistently, even proudly, ravaging our publicly-owned and increasingly vulnerable PRNS and GGNRA national parks lands, waters, wildlife, and wild flora?

What explains the continued and adamant support of NPS and PRNS over 57 years for the worst options for environmental, ecological, scientific, even cultural restoration and protection for our Seashore and GGNRA?

The Point Reyes Seashore Ranchers Association website has one page, and its first sentence is: Our members are families who have owned and operated small ranches within the pristine landscape that is now the Point Reyes National Seashore.

Small? Blocking off and controlling nearly 40% of PRNS public national park land and waters? Nearly every view and vista overcome with commercial/industrial-sized dairy and beef ranching operations? Pristine? Cattle defecation, manure, urine, and ag waste that incubates as potential disease stew harmful to humans and wildlife, seeping and floating across soil, water, and air? Massive concentrated commercial/industrial-level private ranch compounds that look like nuclear sites?

NPS, PRNS, and GGNRA management already abrogates its legal and ethical responsibilities. And yet prefers even more super-sized wholesale destruction through Plan Bs woeful structure, mechanics, and non-science. As conditions are today, it will be a herculean undertaking just to restore the existing damage by ranching, livestock, and other ag biz operations over the past 57 years of ranching stewardship.

Have the Point Reyes Seashore Ranchers Association (PRSRA) and Resilient Agriculture Group (RAG) in the end - with rancher, ag, and land development proponents Kevin Lunny, Phyllis Faber, Sara Rolph, John Doolittle, Baker Botts, and other local and national private ag business operators, for-hire civil/criminal lawyers, and local and federal special interest lobbyists - deliberately compromised NPS or PRNS/GGNRA management at the

expense and value to all Americans safe and healthy access to experience and enjoy our Seashore national park? Has our U.S Representative Jared Huffman or U.S. Senator Dianne Feinstein ever gotten out of an SUV and walked along PRNS and GGNRA bovine-waste-infused lands and waters - where cattle manure and urine stagnates in mass irregular liquid puddles, floats in tangled gaseous algae mats in ponds and creeks, or runs off and spews loosely into Tomales Bay or the Pacific Ocean, visibly and viscerally fouling beaches and surf?

Will NPS and PRNS/GGNRA management ever act on behalf of this nations current generations and future generations - rather than for 24 private rancher businesses that generate little benefit and cause exponential harm to nearly 40% of our Seashore? What about our California leadership role in responsible climate action? Or will NPS and PRNS/GGNRA officials cave once more, and act as if they exist literally to cow-tow to 24 private rancher businesses at full-go-for-more concessions to steal from our national park?

If NPS and PRNS/GGNRA management officials so desire to work in the frameworks of the BLM, Forestry Service, or Department of Agriculture, they may consider transfer to those entities, leaving NPS, PRNS, GGNRA, and other national parks to be led by those who will follow U.S. laws pertaining to the NPS.

Dairy, beef, and related livestock and agriculture markets inexorably and deservedly are collapsing as humans strive for more healthy nutrition and lifestyles - just as scientifically-established exorbitant and deadly concentrations of methane gas from livestock ranching disastrously impacts our global climate. The NPS and PRNS/GGNRA management - in oddly quizzical, illogical, and even illegal actions - promote and support private rancher and ag businesses on our Seashore and other public national park lands. This not only continues but dangerously expands these management officials own devastating climate-impact effects that poison our soil, waters, and air - and our rights to coexist with our own and other species.

In closing, I strongly and unequivocally oppose Plan B and support Plan F, to be considered as a starting point to incorporate exact specifics to once and for all, after 57 years since the Seashores creation: " completely remove from PRNS and GGNRA all ranching, cattle, large and small livestock, agriculture, or other development-type business operations " cease planning and implementation of proposed private rancher business income diversifications; expanded acreage and numbers of dairy and beef cattle; allowance of row crops; introduction of small livestock operations (pigs, goats, sheep, chickens, ducks, turkeys, rabbits, etc.); allowance of retail overnight accommodations, hospitality venues, shops, and roadside stands " remove or cease planning and implementation of all similar, related, and attenuated private business development activities " and fully facilitate, encourage, and deliver restoration and protection of wildlands, wildwaters, wildlife, and wild flora, especially for free and open proliferation of iconic Tule elk In essence, to the most complete and thorough scope and degree, immediately and henceforth prioritize restoration and protection of PRNS and GGNRA for the health, well-being, education, research, experience, and enjoyment of present and future generations through the utmost science- and ethics-based sound wildlands, wildlife, wildwaters, and wild flora restoration and protection principles and practices.

Plan F Starting Points for Exact and Specific PRNS/GGNRA Priority, Planning, Policy, Action, and Enforcement

1. Phase out all ranch, livestock, agriculture, and other development as was originally intended by the establishing legislation for PRNS and GGNRA, or to otherwise restore and protect the Seashore
2. Prioritize and manage the Seashore for the natural landscapes, resources, and values it was created to preserve - wildlands, wildwaters, wildlife, and wild flora
3. Restore, encourage, and protect wildlands, wildwaters, wildlife, and wild flora - cease private rancher businesses, livestock operations, and expansion into small livestock, crops or row crops, harvesting, processing, storage, hospitality and accommodations, retail shops and stands, and all similar, related, and attenuated private business development activities.
4. Restore and protect the so-called Pastoral Zone and similar areas back into naturally healthy and sustainable coastal prairie, woodland, riparian, bay, ocean, wildlife, wild flora, and other natural habitat, emphasizing protection for appropriate education, research, recreation, and enjoyment.
5. Repurpose 3-or-less scaled-down ranches limited to 5 total acres each for cultural history purposes.
6. Investigate, plan, and implement with local native peoples cultural restoration and protection of ancestral Miwok and Ohlone sacred and community lands throughout the Seashore and GGNRA.

Signed, Mark A. Walsh

Name: Vickers, Jeffrey  
Correspondence: Hello,

I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands.

The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Thank you, Jeffrey Vickers

Subject: Review Comments on the Point Reyes National Seashore General Management Plan Amendment - Draft Environmental Impact Statement

Dear Superintendent Muldoon,

## Introduction

Thank you for this opportunity to provide comments on the Draft Environmental Impact Statement (DEIS) for the Point Reyes National Seashore and Golden Gate National Recreation Area North District (PRNS/GGNRA) General Management Plan Amendment (GMP Amendment). We are a multi-disciplinary (Animal Science, Agricultural Economics, Dairy Science, Epidemiology, Integrated Pest Management, Rangeland Ecology, Soil Science, Veterinary Medicine, Watershed Hydrology, and Wildlife Biology) group of UC Cooperative Extension Advisors, Specialists, and Faculty whose applied research and education programs focus on solution development to achieve integrated conservation objectives on working landscapes. As we did in our scoping comments (dated November 30, 2018). We prepared to be a resource and collaborator going forward in the development and implementation of the GMP amendment and offer the following comments to support the GMP Amendments goals, including the opportunity to successfully advance land conservation for multiple and integrated objectives.

## Specific Comments

The following comments are offered to improve the accuracy and adequacy of the DEIS and GMP Amendment, building upon our scoping comments submitted on November 30, 2019 for that same purpose and attached to complement these review comments.

## Diversification and Succession

DEIS agricultural diversification and ranch succession planning elements parallel similar efforts and programs, such as but not limited to Grown in Marin, Kitchen Table Advisors, and California Association of Family Farms. The aims of these efforts are to create pathways for farm and ranch viability and successful handoffs of operations to future farm generations. DEIS goals and its conservation strategies are similar to these aims and the following specific comments are provided to improve these elements within the DEIS so the GMP Amendment is successful.

" Row crop on 2.5 unirrigated acres (DEIS Ch.2, p. 37): Very few crops grown for commercial purposes lend themselves to exclusively dry-farming systems, and even those that do are successful through specialized variety selection, frequent tillage, and highly site-specific conditions such as rainfall and soil type. Some of the most common crops grown without irrigation are also high-acreage crops such as grains, vines and tree fruit - a clear mismatch with the 2.5-acre cap. And to limit this production to only the Ranch Core subzone precludes specific instances wherein Pasture subzone soil and site conditions are better suited for this type of diversification. The draft language suggests that even with available water, any diversification into row crop farming must be dry-farmed in the Ranch Core Zone. Revise language to read, Up to 2.5 acres of row crops would be allowed in previously disturbed areas in the Ranch Core and Pasture subzones.

" Tilling and Seeding (DEIS Ch.2, p. 37): Many commercially grown row crops are not direct sown but transplanted. And in both transplant and direct-sow systems, some measure of primary and secondary tillage throughout the season is typically required. This language suggests that only direct-sown crops are allowed within row crop diversification, and no tillage would be allowed. Revise language to read, Tillage minimization is encouraged, including use of no-till seed drills for direct-sown crops.

" Crop Protection and Wildlife Management (DEIS Ch.2, p. 37): This section suggests that the only form of acceptable protection for crops is fencing, a practice that is ineffective for gophers. This would inappropriately eliminate many common forms of management for row crop pests. Revise language to read, Management of wildlife associated with protection of row crops should adhere to IPM methodology, prioritizing non-lethal methods such as fencing and other forms of exclusion from cropping areas. Any lethal forms of wildlife management as protection for row crops must be identified and approved in the Ranch Operating Agreement (ROA)

" Sales of Local Agricultural Products: Repeated mention is made of sales of local agricultural products in DEIS Ch.2, p. 37, Ch.4, p. 118, 121, 150) and Appendices (Appendix K, p. 75) but explicit lists of Diversification activities and the subzones to which they have been assigned in Ch.2, p.37, Appendix K, p.15-16, Appendix L, p. 15 as well as Draft Sample Lease, Exhibit B, Ranch Operating Agreement make no mention of sales of local agricultural products. This creates confusion as to what the NPS envisions and evaluated when considering diversification on ranches as it relates to on-farm sales of products. The opportunity for members of the public to engage with agricultural operations directly as consumers of local products draws them closer to the regions long ranching history and yields both economic and cultural benefits. Visitors to the park benefit from the direct experience of what ranchers are producing and ranchers benefit from the opportunity to explain their practices and sell the fruits of their labor. Include in any enumerated lists of activities labeled Diversification, Ranch Core Subzone a bullet for Sales of local agricultural products. Also include in Draft Sample Lease Exhibit B and elsewhere throughout DEIS, Sales of Local Agricultural Products among other forms of Diversification to be allowed.

" Public-serving Ranch Activities (DEIS Ch.2, p. 38): Diversification activities authorized in the Ranch Core and Pasture subzones are: &Livestock species, & Public-serving ranch activities that support park goals for interpretation and education (i.e. farm stays, ranch tours) It is unclear whether fee-for-service events such as farm-to-table dinners, pumpkin patches, fundraisers or weddings would be allowed under Public-serving ranch activities. Some may assume that these activities fall under Draft Sample Lease section 4.13 Lessee may neither authorize nor host activities that require a National Park Service Special Use Permit, including organized events and filming activities, upon the Premises without Lessors prior approval and issuance of a Special Use Permit. The distinction between these two categories of public-serving programs needs to be made, including greater clarity around what kinds of events require a Special Use Permit. Revise language to read, Public-serving ranch activities that support park goals for interpretation and education (e.g. farm stays, ranch tours and other forms of agritourism as approved in Ranch Operating Agreement (ROA). Use this language to make consistent throughout Draft EIS and Appendices, Draft Sample Lease, etc. the activities allowed under diversification. Insert language outlining what kinds of organized events stand outside of the allowable forms of Diversification included in Alternative B.

" Livestock Diversification (DEIS Ch. 4, pp.133-134): Ranch Management - Diversification: &only ranches with an occupied residential complex would be authorized to diversify livestock. This statement does not fully agree with Appendix K, 3.2.12.2, p. 16 which restricts chickens in the Pastoral Subzone (up to 500 with up to 3 associated mobile huts) to ranches that have residential occupation but places no restrictions on sheep and goats beyond the caps on AU equivalents. Resolve the difference by allowing diversification of livestock species in the Pastoral Subzone of all ranches, maintaining for all the limitations on numbers based on AU equivalents. This would include the 500-chicken allowance for which the restriction to residentially occupied ranches is arbitrary and without clear cause.

" Succession: The draft and separate Succession Policy referenced in the DEIS uses the phrase immediate family member without a definition, leaving open the question of whether a niece, nephew, grandchild or cousin could join an operation and be added to the lease. In an era where succession for many farm families is unclear, preserving options for bringing in family members to take on leadership roles in the operation is essential. Modify language to read: &Named Lessees on an individual permit, with the agreement of all other current Lessees, may request to add additional family members to that lease/permit.

## Appendix D

DEIS Appendix D - Management Activity Standards & Mitigation Measures, in conjunction with the proposed Permit/Lease and ROA, provides clarity to the options available and the expectations required for NPS staff and leasing ranchers to manage and achieve resource conservation goals, including agricultural operations. The following specific comments, when addressed, will bring additional clarity to the Final EIS and GMP Amendment.

" Number of projects a year (p. D-3): The estimated number of individual projects to be implemented is up to 24 per year Is this the projected total across the entire park? What is the definition of project? Table D-1 delineates activities which, together, might make up a project. Many of these activities, however, are part of ongoing agricultural practices that would be defined in the Ranch Operating Agreement (ROA). It should be clearly understood that while any project may entail multiple activities, the use/implementation of one or more activities listed in Table D-1 would not necessarily constitute a project. In absence of such a distinction, it could be argued

that activities such as Mowing (p. D-4), Integrated Pest Management (p. D-4), Prescribed Grazing (p. D-5) and Forage Production (p. 6) which might be part of every ranch's ROA would count towards the 24-project cap. Insert definition of project to the effect of, Any establishment of a new agricultural practice, built structure or other form of land use not currently in effect on a given ranch.

" Nonlethal Wildlife Control (Table D-11, p. D-51): Use nonlethal wildlife control (i.e. scarecrows or decoys and control garden debris) because lethal control of wildlife is prohibited. Use of traps and raptor boxes are common forms of integrated pest management to control gophers, voles and other burrowing rodents that threaten row crops. Exclusion via underground fencing is not viable beyond a garden scale, but the wording in this section leaves few other options. Revise language to read: Prioritize whenever possible nonlethal wildlife control (i.e. scarecrows or decoys and control garden debris). Any lethal forms of wildlife management as protection for row crops must be identified and approved in the Ranch Operating Agreement (ROA)

" Cover Crop and Mulch (Table D-11, p. D-51): Plant cover crop or cover soils with straw mulch (until April 1) The exact timing of cover crop termination is a delicate balance between crop maturity, soil and air temperatures and soil moisture. Prescribing a date upon which cover crops must be terminated sets an unrealistic expectation and does not allow sufficient flexibility to respond to conditions. Additionally, many farms are using other forms of mulch besides straw to stop erosion and halt weed growth in fields during the rainy season. The prescription to use straw mulch is overly specific and closes the door to new methods. Revise language to read, Plant cover crop or cover soils with mulch and use at least 30% cover in fallow crop areas throughout the rainy season.

" Tilling Activities (Table D-11, p. D-51): For row crop diversification, conduct tilling activities row crop areas, as well as ripping, disking, or harrowing, after August 20 and before the first rains or November 1. Tillage associated with row crop production occurs at different moments during the season for different purposes. Primary tillage associated with preparing fields for planting in spring (disking, listing, rototilling, spading, etc.) would all take place outside of the August-November window; as would some secondary tillage associated with cultivating fields to control weeds and recycle planting areas. The dates listed here may be intended for field preparation for cover-cropping, but create an unworkable expectation for other forms of necessary tillage. Revise language to read, For row crop diversification, conclude tilling activities in row crop areas prior to first significant rains or November 1, whichever comes later.

#### Lease/Permit Template

The following table provides detailed questions and comments to clarify points in the draft PRNS and North District GGNRA Agricultural Lease/Permit and Ranch Operating Agreement. In addition to including this template formally within the Final EIS and GMP Amendment, the Lease/Permit and Ranch Operating Agreement will be improved to facilitate achieving the National Park Services goals and conservation strategies for the GMP Amendment.

#### Item/Section Text Implication Revision/Modification

1.9.2 (p.4) Hazardous Waste is defined as any material or substance that is or becomes defined as a "hazardous waste," "extremely hazardous waste," "restricted hazardous waste," "hazardous substance," "pollutant," "discharge," "waste," "contaminant," or "toxic contaminant" under any Environmental Requirement, or any above-ground or underground storage containers for the foregoing

The definition of Hazardous Waste would include manure and other dairy wastewater, but while 26.1.1 allows Lessee to bring, use, handle, generate, treat, keep or store [Hazardous Materials] in compliance with all Applicable Laws and as approved in writing by Lessor., 26.1.2 forbids Lessee to release, discharge or dispose of any Hazardous Materials. This sets up a conflict between the generation of waste and the discharge/disposal of it via manure spreading and/or sprinkling of water on pasture from manure lagoons.

This conflict could be resolved with the addition of the following to 26.1.2: &except where allowed in Applicable Law and as outlined in Ranch Operating Agreement (ROA)

Additionally, the TBD language in 15.1 regarding the Waiver of Waste discharge Requirements for CAFs should make clear that these waivers are a method of providing oversight and regulatory compliance for both the storage and discharge of waste.

4.1 (p.8) &For Leases where residential use is authorized, Lessee agrees to use the Premises as the principle residence (as defined by the Internal Revenue Service) of at least one of the undersigned Lessees throughout the entire Term of the Lease. This seems to preclude the possibility that a ranch could dedicate all housing to employee housing. It is unclear throughout Draft Lease and Draft Sample EIS as a whole whether employee housing is treated as a residential use and so fundamental to the terms of the lease or if the establishment of employee housing could be allowed through the ROA process alongside other Improvements or Alterations, bringing housing for agricultural workers to sites where none currently exists. Add language to Draft EIS and Draft Sample Lease clarifying:

1. Whether Section 4.1 of the Draft Sample Lease could be satisfied by the use of residential buildings as principle residence by employees of the Lessee
2. Whether employee housing units would be allowed beyond the 18 ranches for which residential occupation is currently authorized, perhaps by classifying the use of manufactured housing for employees as a form of Improvement or Alteration.

18.1 and 18.2 p.14 Lessee shall not provide any rancher worker housing on the Premises except as authorized in the ROA, including in manufactured housing units that are Lessees Personal Property. As Diversification activities are created/expanded, so, too, will the need for employee housing. Provisions in the Draft Sample Lease assert that manufactured housing would be treated as a personal property belonging to the Lessee but make no reference to how many and on what grounds new units would be allowed within a ranchs Ranch Core Subzone. Additionally, there is no mention of any evaluation of the impacts from necessary accompanying work of upgrading/installing septic systems and domestic water systems. Add language to Draft EIS and Draft Sample Lease clarifying:

1. By which means limits would be set on the number of housing units (or housed employees) that a ranch would be allowed.
2. By whom additional infrastructure to support rancher worker housing (septic, water) will be approved and paid.
3. Include language that these costs could potentially be paid via maintenance reserve accounts

4.13 p.9 Lessee may neither authorize nor host activities that require a National Park Service Special Use Permit, including organized events and filming activities, upon the Premises without Lessors prior approval and issuance of a Special Use Permit. Neither Draft EIS nor Draft Sample Lease indicate what circumstance/set of circumstances would trigger the need for an NPS Special Use Permit. Is this something acquired separate and outside of the once-annual ROA process? In absence of a definition of the Special Use Permit and the kind of organized event that necessitates one, confusion arises around some forms of Diversification described in Appendix K 3.2.12.1 such as ranch tours which are authorized through the ROA. Add language to Draft EIS and Draft Sample Lease clarifying when and how an NPS Special Use Permit must be acquired. Distinguish this process in substance, form and timing from the ROA negotiation process.

6.1 p.10 Regarding rent, Draft Sample Lease states:

Note: There is no draft lease language for rent at this time because the formula for determining fair market rent will be determined through an appraisal conducted under the Uniform Standards of Professional Appraisal Practice adopted by the Appraisal Foundation. NPS anticipates that lease rental rates will allow for annual adjustments so that rents remain consistent with market conditions. Lease rent rate is based on an appraisal of fair market rent - but market rates are notoriously inappropriate indicators of value on agricultural lands for which use is restricted to agricultural activity, from which extractable value is limited to agricultural enterprise. Additionally, it is not clear whether/how lease rates will be adjusted every year to reflect changes in ROA. This complicates a ranchs calculation to diversify their operation if they cannot know in advance whether/how their lease will change with the addition of new livestock, product processing, etc.

Additionally, Ch. 2, Alternatives, p.37, under the heading Appraisal Process, it is stated, Under alternative B, rather than individual appraisals, NPS anticipates development of a master appraisal process managed by the US Department of the Interior to determine FMV for park ranch operations. Because ROAs potentially change annually, independent of neighboring ranches, it is unclear how a master appraisal process would treat individual ranches that add diversification or make other changes to the operation.

Make explicit the relationship between appraisals, Ranch Operating Agreements and lease rent rate in terms of frequency and degree of change.

14.2 p. 13 Lessee acknowledges that wildlife may cause occasional damage to fences, ranching structures, livestock, forage and Lessee's personal property and agrees to seek no reimbursement or other compensation therefore. The establishment of a maintenance reserve account is mentioned in several places, but the purpose of these accounts is typically paired with maintenance of ranch buildings. No mention is made of how ranches will cover costs associated with damage to infrastructure, etc. caused by wildlife. Descriptions of maintenance reserve accounts should state explicitly that funds will be available to ranches to pay for damage to infrastructure and compensate for lost forage due to wildlife.

16.2 p.14

21.2 p.18 If Lessee desires to undertake any Diversification Activities, &or use any pesticides, Lessee shall notify NPS at least 30 days in advance of the annual ROA meeting referred to in Article 4 of this Lease and provide a brief, written description of the activity. Pesticide is, as defined in California state law is Any substance, or mixture of substances which is intended to be used for defoliating plants, regulating plant growth, or for preventing, destroying, repelling, or mitigating any pest & which may infest or be detrimental to vegetation, man, animals, or households, or be present in any agricultural or nonagricultural environment whatsoever.

The breadth of this definition means that many commonplace substances would qualify as a pesticide and, as such, require a rancher to report to NPS. Herbicides, both organic and conventional are only one example.

Having only one window in a year to gain approval of a pest-management practice is insufficient to allow a rancher to respond to changing conditions across the four seasons. As diversification on ranches increases to include row crops and small-scale processing, the complexity of managing pests increases. Language regarding pesticide use should be removed from references to ROA and 16.2 should be amended to read:

Lessee shall notify Lessor of any use of pesticides by the 10th day of the month following application. All uses of pesticides must comply with Applicable Laws including reporting and certification requirements.

Exhibit B, Ranch Operating Agreement

7.2, p. 36 Hay may only be produced for cattle owned by Lessee that are authorized under the terms of the Lease. On ranches that opt to diversify livestock to include sheep or goats or even horse boarding, the ability to grow hay for their feeding is both sensible and efficient. However, the use of the word cattle in 7.2 implies that this may not be allowed. Change the word cattle to livestock.

Exhibit B, Ranch Operating Agreement

11.2, p. 38 Pesticide application work must be supervised by a person licensed or certified in the use of the approved pesticides Under state law, no license or certification is required for a rancher to apply pesticides on their own land. These criteria are only required when applications are conducted by an employee of the operation. Revise the language to read, When required by Applicable Law, pesticide application must be supervised by a person suitably licensed or certified in the use of the approved pesticides.

Exhibit B, Ranch Operating Agreement

8, p. 37 Lessee is authorized to undertake the following types of Ground Disturbance& Absent a definition of Ground Disturbance, many basic activities associated with agriculture could be assumed to be Ground Disturbance and, as such, be hindered by the once-annual ROA negotiation process.

Use of keyline plow, subsoiler or other similar practice for improving soil health in pasture and rangeland could be mistaken for Ground Disturbance. Routine scraping of ranch roads to fill potholes and level bumps could be mistaken for Ground Disturbance. A formal definition for Ground Disturbance should be established. Marin County code established a threshold of 250 cubic yards for amount of soil moved as the trigger for its Grading Permits. Something like this would help ranchers distinguish between routine agricultural activity and things which must be delineated and approved in the ROA.

## Soils

The DEIS in preparing the Soils sections in Chapters 3 and 4 used the United States Department of Agriculture Natural Resource Conservation Service (USDA-NRCS) Soil Survey interpretations to restrict land use decisions rather than to guide management decisions. Soil Survey interpretations such as compaction resistance and erosion hazard rating are limited by the data that is collected by the soil survey. This data is not always the essential data that accurately explain a soils behavior. For example, while using the NRCS soil compaction resistance interpretation is convenient, it fails to capture the most important property that governs susceptibility to soil compaction, which is soil moisture. Soils are most prone to compaction when they are wet. Thus, careful

management of stocking rates, stocking density and timing of heavy traffic can avoid compaction. NRCS interpretation does not use soil moisture as an intrinsic property because soil survey does not monitor soil moisture. The compaction interpretation uses soil properties that have a secondary influence on compaction: texture, structure, rock fragment content, bulk density and organic matter content. Thus, it is a good indicator of relative differences in susceptibility to compaction among soils, but it is a poor indicator of the actual risk to compaction. Moreover, it does not link to any specific stocking rates or management goals.

A similar problem is associated with erosion hazard. The approach to risk or adverse impact on soil is faulty in the DEIS because it is based on the USDA-NRCS erosion hazard rating. This rating considers slope and K factor, but it does not use cover. Thus, erosion hazard is a relative interpretation of the intrinsic erodibility of bare soil on different slopes. It does not reflect the reality of anchored soil by vegetative cover. A recent study showed that grazing has minimal impact on soil erosion in California because plant cover is exceedingly high, even under high grazing scenarios (Salls et al., 2018). Moreover, soil survey in describing the erosion hazard rating states, The soil loss is caused by sheet or rill erosion in off-road or off-trail areas where 50 to 75 percent of the surface has been exposed by logging, grazing, mining, or other kinds of disturbance. The extent of this amount of bare-soil condition is limited to very few instances of high-use. The DEIS scales this up to reflect hundreds or even thousands of acres, which is not correct and in the instance of cattle trails is no different than that of human trails which the DEIS suggests are fine.

Similarly, the use of wind erodibility to livestock trails is also questionable given that the wind fetch is extremely low. Wind erodibility on agricultural fields must be judged relative to the timing of the unvegetated surface. If bare dry soil exists then wind erodibility is high, however, if bare soil is moist wind erodibility is exponentially lower. This again limits the applicability of soil survey interpretations as a risk assessment.

None of the USDA-NRCS erosion hazard ratings suggest that management should be removed as mitigating action. Rather it is suggested that careful management is needed on erodible land. One possible exception is the most restrictive instance of this interpretation very severe, described in soil survey to have the most conservative actions: loss of soil productivity and off-site damage are likely, and erosion-control measures are costly and generally impractical. Only 13% of the planning area is rated very severe with the high likelihood that this land is too steep for any management activity that would remove over 50% of the vegetative cover. Thus, any hypothetical change to land use within the planning area is likely to have no effect on soil erosion assuming ranchers use careful management such as prescribed grazing practices that meet residual dry matter targets. Unfortunately, the DEIS grouped severe and very severe classes into one class, a questionable decision given that severe ratings simply require careful management.

It is not clear how the acreage of high-intensity-use areas was determined. First paragraph on page 104 suggests 150 acres within grazing areas associated with trails, salt licks trough areas etc. This number may be smaller depending upon the inclusion or exclusion of animal concentration areas. It is difficult to quantify the spatial extent of these localized areas accurately. Moreover, the soil survey cannot be used at such a fine scale, thus we have no way of knowing how susceptible the soils are to compaction at these localized scales, making it difficult to use them to make statements and conjecture that suggest long-term adverse impacts on soils.

The DEIS assumes that there has been or will be soil degradation because of activities that are on what are perceived to be susceptible soils. There is no proof that many of these activities adversely affect these soils, with the exception of animal concentration facilities. The DEIS does not explain how soil survey data was aggregated. This is important because soil survey does not delineate individual soils but multiple soils that comprise a map unit. It appears in some cases that the DEIS pushes the limits of scale in terms of the questions soil survey can answer. Moreover, they do not explain how soil survey data was aggregated to report interpretations e.g. dominant soil component, dominant condition, spatially weighted average, most limiting condition etc. Soil Survey interpretations are not meant to restrict land activities. They are intended to guide careful management. In some instances, across the country highly erodible lands have been excluded from activities that could accelerate soil erosion. This is typically focused on removing land from cultivation. There is no evidence that careful grazing practices in California leads to adverse soil impacts, yet these statements persist in the DEIS. The result is a document that reads with an extremist view on the effects of management on soil.

The Final EIS and GMP Amendment will be improved and support achievement of the NPS goals and conservation strategies by revising its use of the USDA NRCS Soil Survey to the appropriate scale and to guide management practice decisions instead of restrict land use for the specific items mentioned and others where the DEIS relies upon the soil survey.

## Air Resources

The DEIS Executive Summary appropriately contextualizes the planning area air resources stating, While emissions of criteria pollutants and greenhouse gases would vary among alternatives, these emissions would continue to be a small contributor to overall impacts when compared to emission sources and transport of emission from outside the planning area (page ix). Additionally in Chapter 3 the DEIS explains &most deposition sources likely affecting the park come from sources outside park boundaries&(page 96). These points should be strengthened in the Final EIS by placing the planning area Greenhouse House Gas (GHG) emissions inventory within inventories for Marin County and California as requested in the attached scoping comments.

Adding to this context, the Final EIS will improve the context for the impacts and mitigation of air quality by accounting for carbon sequestration in agricultural soils relative to emissions estimates. The point here is to analyze and present the level of balance that currently exists in the planning area to inform the scale of mitigation that is even possible. Additionally, there have been modifications to the use of global warming potential of different GHGs referred to as GWP\* (Allen et al., 2016). Using these will improve the accuracy of analysis and management recommendations within the Final EIS based upon cumulative and short-lived climate pollutants. Lastly, the DEIS statement &NH<sub>3</sub> emissions can contribute to visibility impairment and to harmful ecosystem impacts from excess nitrogen deposition (page 93) is true and deserving of additional context. This occurs when a nitrate particulate is formed. It is important point that this is a reversible reaction. It is not clear if planning area conditions year-round would lead to this reaction. The resulting nitrate particulate is from gas engines, meaning both ammonia and car or engine exhaust are needed in the same place for the reaction to occur. The Final EIS must explain the potential for the reaction to occur instead of implying that all ammonia would form particulate nitrate and impact visibility.

## Appendix I

With the case study examples now available in the DEIS Appendix I, a complete peer-review of R Forage ( ) to Predict Rangeland Residual Dry Matter (RDM) is warranted to assure that the model and its outputs are addressing the intended objectives and contributing to achievement of the GMP Amendment conservation strategies. This could even provide a conceptual framework for the grazing use, overlap, and competition between livestock and elk that would the development and use of a forage model. It will provide NPS with technical support beyond assumption confirmation early in model development. It would also help bring clarity to the question or questions being asked as the impetus for creating the model. It would also be instrumental to facilitate the use of other existing data in the planning area including measured forage production and residual dry matter and authorized animal units. Lastly, it will help to resolve confusion in the application of terms and concepts applied in the model, including needed differentiation and definition of RDM, forage production, and consumption. For, example winter or spring estimates of RDM are contrary to the concept of RDM as a measure of material left at the end of a grazing year when it is dry and hot (typically measured in August or September). This is one example of where concepts are not clearly applied or described in Appendix I, giving rise to questions about the assumptions and the purpose of the model. Conducting a complete peer-review will improve the model and description in Appendix I by pointing out these questions and providing revisions to the model purpose and structure.

## Closing

Thank you again for the opportunity to support the NPS and community stakeholders with our scoping comments (attached) and now with our DEIS review comments. We will continue to be a resource for research-based information and a constructive partner for the development and implementation of the Final GMP Amendment.

Respectfully,

David J. Lewis

Subject: Point Reyes National Seashore General Management Plan Amendment - Draft Environmental Impact Statement Scoping Comments

Dear Superintendent Muldoon,

## Introduction

Ranching and dairy farming on the Point Reyes National Seashore (PRNS) and Golden Gate National Recreation Area (GGNRA) is the next opportunity to achieve the shared benefits and integration of working landscapes and land conservation. Conservation that increasingly is successful in protecting and improving soil, water, and habitat quality and simultaneously contributing to a stronger local food system and economy. This opportunity was made possible by decisions and agreements made nearly 50 years ago to establish PRNS and GGNRA. During that half a century, the science and practice of conservation has advanced. The following comments, organized by potential impact topics, are offered to convey this science for application in the Environmental Impact Statement (EIS) analysis of the General Management Plan Amendment (GMP Amendment) and during future implementation to assist the National Park Service (NPS) staff and PRNS and GGNRA ranchers and farmers to be successful in the protection of cultural and natural resources.

## Specific Comments

### Air Quality

" The EIS analysis should include the larger context of greenhouse gas (GHG) emissions for all activities within the planning area. This context and the methods used are important for apportioning individual sector contributions. For instance, well-defined and accepted methods for estimating emissions from livestock production and agriculture are under development by the United Nations Food and Agriculture Organization and in use, such as the National Air Quality Site Assessment Tool (NAQSAT, 2018). Additionally, estimates of livestock agriculture contribution to GHG emissions is 18% globally (FAO, 2006), less than 3% for the United States (EPA, 2009) and California (CEC, 2005; Pitesky et al., 2009), and 5% for Marin (ICF International, 2015). Using tools designed purposeful to estimate agricultural emission, presenting a comprehensive context for all

planning area GHG emissions, and reconciling the GMP amendment estimate with these other inventories will strengthen the EIS focus on the largest sources of GHG emissions and facilitate realistic goal setting for reductions and mitigation across all relevant sectors.

" The EIS should analyze agricultures potential as a formal and active partner in emission calculations, goal setting, and developing and implementing practices to obtain goals similar to Yolo County, California Climate Action Plan. This analysis should include the climate benefits already realized in dairy (Capper et al. 2009) and beef cattle (Capper 2011) production over the last five decades, and accounting for PRNS and GGNRA farms and ranches being pasture based and grass-fed operations with documented reductions in emissions relative to other systems (Obrien et al. 2014). Similarly, the EIS analysis will be improved by the inclusion of reductions in GHG emissions from nutrition and feed modifications (USDA, 2004), manure storage and handling (Mitleohner et al, 2009; Owen and Silver, 2014), and land management strategies (Lal 2007) among other options. Lastly, it will provide planning area NPS Staff and farmers and ranchers with the tools to increase their resiliency to climate change.

" Analysis in the EIS should include mitigation through carbon sequestration. The voluntary goal for emission reduction through methane capture technologies on Marin dairies is estimated at 4,638 (MTCO<sub>2</sub>e) countywide (ICF International, 2015). Currently, Marin farmers and ranchers are voluntarily implementing carbon farming programs and practices in collaboration with industry member associations and partners. This includes the Marin Carbon Project and carbon farm planning and the California Department of Food and Agricultures Climate Smart Agriculture and Alternatives for Methane Management Program, all of which should be considered and analyzed in the EIS. Conservative estimates of the amount of potential carbon sequestration from compost application, just one of 32 identified climate beneficial practices being implemented, are 10 to 100 times greater than methane capture and emission reduction goal (Ryals and Silver, 2013). Expanding the EIS to include sequestration is critical for a comprehensive plan that will make beneficial and lasting contributions to GMP Amendment goals.

## Rangeland Management and Ecosystem Services

" The EIS should analyze the contributions to ecosystem services that can be made through documented effective grazing and rangeland management. Californias annual grasslands are one of the worlds major biodiversity hotspots, supporting thousands of plant and animal species. These lands also provide a critical economic foundation for rangeland livestock production and cultural heritage in the state (Roche et al. 2015). An extensive body of scientific literature has demonstrated that through active stewardship and conservation, land managers can manage for agricultural production and a diversity of other ecosystem goods and services across these working landscapes. Managers can use prescribed grazing (the controlled implementation of timing, frequency, and intensity of grazing) as a tool to support and enhance multiple agricultural and conservation goals (Briske 2011a)-including biodiversity, wildlife habitat, and grassland health.

Large-scale weed invasion is a major threat to both conservation and agricultural goals on annual grasslands. Invasive weeds can significantly reduce rangeland health by inhibiting biodiversity, depressing forage productivity and quality for both wildlife and livestock, and depleting soil water resources. Proper grazing management can maintain or enhance grassland diversity and productivity (Gornish et al. In Press). Managed grazing can be used to target specific weeds, particularly as part of a long-term integrated pest management program. The most critical components of a prescribed grazing program for weed management are timing and intensity of grazing (Davy et al. 2015). Target weeds must be grazed during their most biologically susceptible stages. Using appropriate grazing timing and intensity can reduce undesirable weeds and increase desirable species and ecosystem productivity. Californias grasslands provide habitat connectivity, which is critical for annual migration of many wildlife species. These lands also support important foraging and nesting habitat for wild pollinator populations, which provide critical pollination services. Livestock grazing, via appropriate and sustainable management strategies, can be used to maintain or enhance herbaceous plant diversity. For example, grazing has been shown to enhance Californias unique vernal pool habitats by controlling exotic annual plants and enhancing herbaceous plant diversity, which can lead to longer pool inundation periods benefiting a diversity of aquatic species, including endangered species such as the California tiger salamander (Huntsinger and Oviedo 2014).

Grazing has also been shown to reduce accumulation of thatch. Excessive amounts of thatch cause shading and reduces near surface temperatures, which suppresses germination and emerging seedlings. This in turn reduces species richness (Bartolome et al., 2007; Eviner, 2016).

Including researched and confirmed grazing management methods and the resulting beneficial ecosystem services and goods that result in the EIS analysis will contribute to successfully achieving the GMP Amendment goals on range and pasture portions of the planning area.

#### Socio-economics

" In conducting the EIS analysis, careful consideration and attention is required in deciding the geographic area and the primary impact or direct effect inputs of any socio-economic analysis to accurately model the economic benefits of each alternative. The goal of socioeconomic analysis is to use a well-established methodology to quantify the benefits and costs borne by society under a given set of scenarios. While socioeconomic analysis encompasses several different types of analyses concepts, the most common concept applied when considering alternative situations like the General Management Plan Conceptual Alternatives is cost-benefit analysis. While the concept is simple - compare the net present value of expected future benefits to the present value of estimated future costs - the practitioner designing the economic modeling faces many complex decisions that will influence the results. To reduce some of the discretion and uncertainty associated with these decisions, many economists and consultants providing economic impact analysis use the widely-adopted, input-output modeling database IMPLAN (Impact Analysis for Planning Model).

The IMPLAN model is widely used in economics, planning, and engineering studies to account for interrelationships among sectors and institutions within regional economies and to ultimately ascertain full economic impacts of injections or withdrawals of regional economic activity. California and Federal agencies that have utilized the IMPLAN model include: California Department of Water Resources, State Water Resources Control Board, U.S. Army Corps of Engineers, U.S. Bureau of Economic Analysis, and U.S. Bureau of Land Management. IMPLAN constructs social accounting matrices for a given geographic area (usually a county, group of counties, or state) based upon actual business transactions in the area for a given sector (e.g., beef production, dairy production, etc.) that enable researchers to observe the full economic impact in the area. Thus, practitioner decisions of the geographic area included in the analysis will be a driver of the model outcomes.

The researcher also must determine the primary impact or direct effect of the scenario to input into the IMPLAN model. The primary impact is the monetary change that results from the policy implementation or scenario being analyzed. Based on the primary impact, IMPLAN generates secondary impacts of two types: Indirect impacts are determined by the amount of reduced spending, under each scenario, on supplies, services, labor, and taxes due to the primary impact. The induced impact of the project accounts for the reduction in spending in the area from the indirect impact, as some portion of that income would have been spent within the geographic region. The magnitude of both indirect and induced impacts are determined by the degree to which income leaks from the local economy by being spent outside its defined boundaries.

#### Soil Health

" Analyze as part of the EIS the soil quality drivers and the effectiveness of livestock management and conservation practices to improve soil quality and health in grazing livestock operations settings. Key soil processes that affect the sustainability of rangelands include compaction, runoff and erosion. Grazing management that improves soil health results in a series of interconnected positive outcomes, including: 1) soil bulk densities and soil structure that allows root and water penetration of the entire profile; 2) vigorous plants with capacity to develop and maintain extensive rooting systems; and 3) stable, resilient increases in primary productivity both above- and below- ground. These outcomes are of course strongly dependent upon site specific factors such as grazing intensity and timing, soil resilience to compaction, and precipitation. A recent comprehensive analysis found that reduced grazing intensity (e.g., moderate vs. heavy grazing intensities) improved soil health metrics; additionally, the analysis revealed that rotational grazing strategies reduce compaction and increase soil carbon relative to continuous grazing strategies, suggesting that rotational grazing could create climate change mitigation opportunities over continuous grazing (Byrnes et al. 2018). Additionally, a statewide study in California annual rangelands using the Revised Universal Soil Loss Equation (RUSLE) model suggested that erosion is low in most settings if recommended residual dry matter targets are obtained (Salls et al. 2018).

#### Water Quality

" Analyze as part of the EIS the water quality drivers and the effectiveness of livestock management and conservation practices to improve water quality in range livestock operations settings. The primary drivers of water quality degradation by range livestock are 1) excessive livestock numbers relative to site resiliency to negative livestock impacts to vegetation, soil, and hydrology; 2) livestock preference to inhabit critical hydrologic zones, thus disproportionately concentrating negative impacts and waste in these sensitive areas. Range management practices and strategies which directly and indirectly act to mitigate these drivers will lead to water quality improvements, a conclusion which is well supported within the research literature and by practice adoption by ranchers and range managers.

Briske (2011a) recently lead a comprehensive scientific review of the conservation effectiveness of all range management practices funded through United States Department of Agriculture (USDA) conservation initiative programs (e.g., Environmental Quality Incentive Program, EQIP). In this review, Briske et al. (2011b) and George et al. (2011a) conducted a research synthesis to address specific hypotheses about the effectiveness of stocking rate moderation, grazing system selection, management of timing of grazing and rest from grazing, as well as a suite of riparian management practices to improve hydrologic function and water quality. The authors determined that 1) setting site specific moderate stocking rates is an essential practice to sustain hydrologic functions and minimize soil erosion and pollutant transport; 2) simple seasonal-rotation grazing systems at moderate stocking rates result in improved upland soil hydrologic function compared to intensive rotational grazing systems at higher stocking rates or livestock densities; 3) management of timing and intensity of grazing and rest can improve riparian vegetation composition and structure, hydrologic function, and water quality; 4) livestock distribution practices, such as drinking water developments, supplement feed placement, and herding, are effective means of reducing livestock residence time and impact in riparian zones; 5) practices that reduce livestock densities, residence time, and waste loading in riparian areas and stream flow generation areas can reduce nutrient and pathogen pollution of surface waters; and 6) riparian vegetation can substantially filter waterborne pollutants from runoff, but the implementation of optimally efficient riparian buffers must incorporate site-specific biophysical factors such as flow regime and soil type.

Similar summaries on the factors and benefits of conservation approaches and practices to manage water borne pathogens in agricultural watersheds have been completed by the USDA Natural Resources Conservation Service (Atwill et al. 2012) and the World Health Organization (WHO 2012). These summaries present the considerable amount of research conducted on the efficacy of beneficial management practices (BMPs) for both extensive (i.e., cow-calf rangeland grazing) and intensive (i.e., dairy farms) livestock production systems to reduce microbial contamination from these facilities. These on-farm BMPs typically rely on several common strategies that endeavor to be practical, affordable, and adoptable, such as the strategic use of vegetative buffers between grazing sites and adjacent bodies of water, riparian exclusion to livestock grazing several months prior to and during the rainfall season, adequately storage time and drying of manure solids prior to land application, vegetating or use of straw to cover the surface of cattle loafing areas during the rainfall season, and appropriate setback distances between sites receiving manure solids and adjacent down slope bodies of water.

These international and national summaries are complemented by corresponding water quality management endeavors and evaluation in the Tomales Bay Watershed, including the GMP amendment planning area. Water quality results on working dairies and ranches confirmed that extensively grazed management units had indicator and nutrient concentrations similar to reference ambient conditions (Lewis et al. 2005). Building upon these findings, investigation of measures and practices to improve water quality in surface runoff from high use areas and pastures that receive manure confirmed that a suite of practices, including implementation of buffers, treating surfaces with mulch and seeding, applying manure in advance of runoff producing storms, and applying aged manure provide producers tools to successfully reduce pathogen loads (Lennox et al. 2007; Lewis et al. 2009; Lewis et al. 2010; Miller et al. 2007; Miller et al. 2008). In the Olema Creek Watershed, the NPS staff and PRNS/GGNRA ranchers have implemented livestock management methods and 48 conservation practices from 1998 to 2017, with implementation continuing beyond this period. Simultaneously, the NPS has monitored water quality in Olema Creek. Analysis of the water quality results confirms a significant reduction in indicator bacteria concentrations (Voeller et al. 2018).

" Include in the EIS analysis the progress and beneficial impacts made and to-be made through the planning and implementation of water quality improving conservation practices on dairies and grazing cattle ranches. PRNS and GGNRA ranchers and farmers and NPS staff have participated in and contributed to both the California Dairy Quality Assurance Program (Meyer et al. 2019) and the Californias Rangeland Water Quality Plan (Larson et

al. 2005; George et al. 2011b). These education and planning programs have led to the implementation of conservation practices through state and federal funding programs and in partnership with financial and technical assistance organizations including the Marin Resource Conservation District and the Natural Resources Conservation Service. Incorporating in the EIS analysis the momentum and progress made from these education and implementation program partnerships will facilitate the GMP Amendments future success to protect and improve water quality.

## Wildlife Interactions

" Include in the EIS analysis the increasing understanding of interactions and management solutions for livestock grazing and wildlife compatibility. Ranching and wildlife have coexisted for centuries. The key has always been proper stocking rate and grazing intensity to ensure that negative impacts from grazing do not occur to the grassland ecosystem. In fact, livestock grazing often provides valuable benefits to ecosystems and wildlife through their removal of dead and decadent forage. This vegetation removal stimulates new vegetative growth, opens up canopies for access to food resources previously inaccessible to many wildlife species, and helps to manage invasive weed species (Wolf et al. 2017).

" Include in the EIS the specific interactions and conflicts between elk and cattle, including the need for additional study and adaptive management to reduce or remove conflicts. Understanding the interactions between cattle and elk is essential in the assessment of impacts from allowing any co-habitation of the two species. Few studies have assessed compatibility of beef cattle and elk and none have evaluated those interactions between elk and dairy cattle. Elk and beef cattle diets show considerable overlap, with 42% overlap observed in Colorado (Hansen and Reid, 1975) and 46% in Nevada (Beck and Peek, 2005). While these results were not with tule elk and cattle diets they provide useful context. Additionally, tule elk home range is approximately 536 acres (Cobb 2010) to 1037 acres (Gogan 1986), small compared to other North American elk. An overlap of this home range and diet poses a significant constraint for PRNS dairymen, which are organic certified, requiring cows to meet 120-day, 30% dry matter intake minimum from pasture for organic certification (Rinehart and Bairer, 2011). Elk grazing during the same period that dairy cattle are required to meet nutritional regulations presents management conflicts from forage competition. Compensating dairy producers for loss of pasture forage does resolve the conflict of losing organic certification if dairies cannot meet the standards required of them.

Elk and beef cattle have been reported as socially compatible (Wallace and Krausman, 1987), potentially influencing the amount of time elk spend grazing cattle pasture. Beyond the impact this has on consuming important forage for cattle, it may also lead to dangerous interactions during the elk rutting season, where cattle may become involved in aggressive reproductive interactions leading to injury. While elk tend to use more aggressive threats than injury-resulting physical aggression on other elk (de Vos et al., 1967), no research has been conducted to determine how dairy cattle react to these situations and the associated risks. Injury, and potentially death of cattle, are economic losses to ranchers and farmers, both immediately from veterinary bills and long-term from loss of future production and income.

To reverse the severe decline and near extension in tule elk from the California Gold Rush and other impacts, twenty-one groups have been relocated from reserves to open lands resulting in a statewide population of 3800 (CDFW 2014a). By 1987, at least twelve of the states relocated elk groups had significantly damaged private property (CDFW 2014b). This includes frequent and routine damage to fences and other ranching infrastructure. Johnes positive cattle herds experience an economic loss of nearly \$100 per cow from production losses and increased cow replacement costs (Ott et al., 1999). Further, if cows are showing symptoms of Johnes disease at culling, this cost increased to nearly \$200 per cow. The free-ranging elk herd within PRNS is considered a Johnes positive herd and creates the risk to spread this disease to cattle, both dairy and beef that are considered Johnes free herds. If elk herds in the planning area continue to grow they will increase their ranging area and come into contact with cattle herds more frequently and with herds not yet intermingling with the elk. This presents a real economic concern, as some herds within PRNS are considered Johnes free through testing and may become Johnes positive through this mingling.

Recognizing the impacts presented by the interaction of elk and cattle, the gaps in knowledge about them, and being prepared to adapt management measures to relieve them in the EIS, will contribute to a GMP amendment that is better prepared to manage the conflicts between cattle and elk going forward.

## Closing

These comments have been developed by a multi-disciplinary (Animal Science, Agricultural Economics, Dairy Science, Epidemiology, Integrated Pest Management, Rangeland Ecology, Soil Science, Veterinary Medicine, Watershed Hydrology, and Wildlife Biology) group of UC Cooperative Extension Advisors, Specialists, and Faculty whose applied research and education programs focus on solution development to achieve integrated conservation objectives on working landscapes. The group is prepared to be a resource and collaborator going forward in the development and implementation of the GMP amendment and offers these recommendations and references to support the GMP Amendments goals, including the opportunity to successfully advance land conservation for multiple and integrated objectives.

Respectfully,

David J. Lewis

Name: Köneke, Jasmin

Correspondence: I'd like to urge you to adopt alternative F regarding the matter of tule elk at Point Reyes National Seashore in order to discontinue farming and ranching use of the land. The Preservation of endangered wild species and thereby taking care of the given unique ecosystem and, on a bigger scale, sustainability, must take precedence over farming and ranching opportunities, which would inevitably have negative effects the land as a common good. Grazing of productive livestock, especially in large numbers as given in case of the alternative B and intensive mass farming, is known and proven to contribute to water pollution, the spreading of invasive species and with them of diseases, all of which ultimately harm native species such as the tule elk. It is, however, vital for the given ecosystem, not to mention its symbolic cultural value. Now is the time to make decisions in favor of this endangered species and to put them first before other seemingly-profitable interests, whose benefits would be of very short wile.

#7227

Name: Tornatzky, Lynette

Correspondence: I was in high school 55 years ago when I first started writing letters to try to save the Tule Elk. It took years of letter writing by many of us, but it happened, we saved them. This proposal to cull elk in favor of grazing cattle is a disgrace to what National Parks should stand for. Converting grasslands to farms is the antitheses to the very idea of a "national park." Commerce is not "for the people" - well, not all of the people anyway, just some. This apparent favoritism should not be allowed. Cattle and farming can go elsewhere. Inconveniencing the few should not take precedence over the many people, now and in the future, who support National Parks to enjoy the few parts of the country not changed by ranching and farming.

#7228

Name: Woods, Lori

Correspondence: There are many alternatives to keeping ranching, both for meat and dairy on Point Reyes in order to keep a park and parklands there open. Considering using cows for meat and dairy is not only inhumane, it's totally environmentally unsound and this in the era of climate change means the Park Service has an opportunity here to the the right thing going forward.

Don't be on the wrong side of history here. You know the right alternative: phase out the ranching and dairy operations in the park.

#7229

Name: Stanton, Timothy

Correspondence: I understand the the mission of the NPS at Point Reyes is to maximize protection of the Park's natural resources while enabling visitor access and beef and dairy ranching that does conflict with this mission. The GMPA appears to conflict with that mission in its proposal to enable ranchers to expand into vegetable farming and tourist guest services, and enable boat camping in our one marine wilderness area, Drake's Estero. I understand as well that the GMPA does not include any environmental analysis of these measures and accompanying ones, which would include additional commercial traffic on Park roads.

I do not know the motives of those who wrote this plan and recommendation, but it would appear that one must be to enable ranchers to expand and perhaps better sustain their operations, certainly make them more profitable. I don't think this effort, while perhaps laudable from the ranchers' perspective, is included in the mission of the Park and NPS. I ask therefore that this plan go back to there drawing board for further consideration.

Thank you.

Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Dear Superintendent,

The General Management Plan Amendment Draft Environmental Impact Statement is so faulty it should be withdrawn. The document presents inaccurate information, relies on bad assumptions, and the analysis of the alternatives is entirely inadequate.

Former Seashore Superintendent Don Neubacher was once heard to say, What I wouldnt give for a park without ranches. Apparently nothing has changed. The DEIS is an apparent attempt to redefine Point Reyes National Seashore as a wildlife park and tourist attraction, rather than following its true mission of protecting this park unit based on its defining characteristics.

The DEIS deserves to be withdrawn if only because of its incorrect statement about the projects purpose and need. On page 4, the DEIS says, In 2013, at the direction of the Secretary of the Interior, the NPS Director issued a Delegation of Authority authorizing lease/permit terms for up to 20 years and directing NPS to initiate a National Environmental Policy Act (NEPA) process to evaluate the issuance of long-term leases. This is not true. There is no mention of NEPA in either then-Secretary Salazars November 29, 2012 decision memo or then-Director Jarviss January 13, 2013 delegation of authority. Instead of following these directives, the Seashore has initiated a NEPA process, apparently to validate the recent proliferation of elk on the ranch lands and to further restrict ranching activities. This is an abuse of the NEPA process.

Improper analysis of the Seashores tule elk

The DEIS uses an inexplicable hodgepodge of information about the tule elk in the Seashore to create the impression that this re-introduced species is a natural part of the environment on which impacts should be considered. By discussing the impacts on the elk, the Seashore neatly sidesteps the impacts by the elk. This is highly inappropriate, highly inaccurate, and has resulted in an inadequate analysis.

The DEIS omits all coverage of the elk depredations on ranches, even though the Seashore has been involved in discussions with the ranchers about this issue for years. There is even a published paper about these discussions (see Attachment A, The Continuously Managed Wild: Tule Elk at Point Reyes National Seashore, Journal of International Wildlife Law & Policy, 18:298-308, 2015). This paper provides abundant evidence that the statement

in the DEIS that the Seashore did not contemplate the expansion of the elk into the ranchlands is entirely inaccurate.

The DEIS uses the current elk range as its baseline for the elk analysis, and disregards, for purposes of the planning area, the 1998 Elk Management Plan and Environmental Assessment. Yet it says that the Seashore will continue to use the 1998 plan to manage the elk in the Tomales Point elk preserve. This arbitrary inconsistency is not supported by an information or analysis. The baseline for the current DEIS should be the range addressed by the 1998 EA. The Seashore has been remiss in not managing the elk according to plan. It should not be rewarded for that mismanagement, but should be held accountable to the 1998 plan. Any new elk-management planning must be considered within that framework.

The preferred alternative, Alternative B, is fatally flawed by its inaccurate analysis of the elk. The alternative as written would require ranchers to accept the grazing of the Seashores re-introduced elk on privately managed agricultural land, based on an arbitrary redefinition of the Seashores elk-management obligations. Any Final EIS must include an alternative that separates the elk from the ranches, in keeping with the 1998 EA.

The DEIS fails to include any analysis or discussion of the potential movement of the Limantour herd onto the ranch lands. The migration of this herd out of the designated elk range and onto ranch lands is already causing significant harm to ranchers. These impacts have increased over the last few years and are well-documented. The DEIS has not fully analyzed these impacts or considered the likely increase in elk migration onto ranch lands in the near future. Rather, it has been written in a way that ensures that expansion of the Limantour herd would be allowed. This is significant failure in the analysis of this impact topic. Any Final EIS must be corrected to include an analysis of all of the elk in the planning area, not just the Drakes Beach herd.

The issue of elk health has not been adequately analyzed. While the section of the DEIS on page 82 entitled Elk Health discusses only the two most common elk diseases, Johnes and CDW (the former is found in Point Reyes elk, the latter is not), on page 83, under Limits to Population Size, the DEIS states that Point Reyes elk are believed to be among the most inbred in California, and that copper and selenium deficiencies have been reported previously in the Tomales herd and more recently in the Drakes and Limantour herds, deficiencies that can negatively affect many aspects of the overall health of elk, including decreased resistance to disease, poor production, muscle damage, and developmental problems. This means that visitors to the Seashore may encounter the unpleasant sight of diseased or dying elk; the DEIS fails to take into account the impact of this on visitor use.

Officials at Point Reyes National Seashore appear to be prioritizing the value of the elk as a tourist attraction over the health of the animals. The Seashore should be required to create a biologically appropriate elk management plan that uses documented best practices to ensure the health of the animals. The Seashores current elk-management practices more closely resemble a wildlife experiment than a responsible wildlife-management plan.

Given the apparent failure of the Seashores elk-management efforts, any Final EIS should include an analysis of whether the elk population would be better managed by the California Department of Fish & Wildlife.

Alternative C, which purportedly provides an option for the necessary separation of the elk and the ranches, is fatally flawed by its lack of seriousness. The alternative is presented in a biased, skewed way.

For example, these statements on page 164: Lethally removing the Drakes Beach herd would result in an approximately 40% reduction of free-range elk in the planning area and a 2% reduction in the estimated California state-wide elk population (CDFW 2017) compared to existing conditions and would eliminate one of two free-range tule elk herds in the national park system. Impacts on the Drakes Beach herd would be significant because it would no longer exist. Overall viability of the tule elk population in Point Reyes or in California would not be affected; however, removal of a native species for ranching considerations would be unprecedented in the national park system and would be inconsistent with CDFW management of elk on ranchlands outside the park.

Most of this information is irrelevant. It does matter for purposes of the proposed action whether there is a reduction in the free-range elk in the planning area or a reduction in the estimated California state-wide elk population; the tule elk is not threatened or endangered, it is thriving. It is not relevant that this alternative would be inconsistent with CDFW management of elk on ranchlands outside the park; this DEIS is meant to address only actions inside the planning area. It is not appropriate to analyze the one alternative that removes the elk from the pastoral zone on the basis of its impact on the elk - it is the impact of the elk that this alternative should be analyzed to address. It is not accurate to describe the tule elk as a native species; it is a re-introduced species, which re-introduction was itself an NPS action under NEPA, and which requires management, as described in the 1998 EA and plan. Calling the removal of the elk unprecedented introduces an element of bias that is appalling in a formal planning document. Alternative C cannot be taken seriously, as the analysis itself is not serious.

The elk must be separated from the ranches, as indicated in the 1998 EA. The rational, science-based solution is to remove the so-called Drakes Beach herd back to the wilderness where it belongs, and place a fence in the appropriate spot to deter elk returning to the ranches.

This common-sense solution was inappropriately dismissed from consideration, based on an inaccurate analysis, even though relevant facts were presented in scoping. The following inaccuracies must be corrected in any Final EIS or ranch plan: " The necessary four-mile fence would cost far less than the proposed alternative; the DEIS analysis is inaccurate and inadequate because it does not compare the cost of this fence to the cost of current and proposed actions, such as ongoing hazing, repairing fences damaged by elk, and lethal control of elk to maintain populations. " Visitor experience would not be adversely affected. The fence as proposed by the ranchers, along the border of the wilderness, would be largely unnoticed. This park unit receives roughly three million visitors per year, almost all of whom arrive by car and drive around within the Seashore, from parking lot to parking lot. A fence at the border of the wilderness would not be noticed by most visitors. " The discussion of the fence in the DEIS is based on inaccurate assumptions about the nature of the terrain. There are ample opportunities for using natural barriers such as the forest and the ridge line to complement a partial fence at the border of the wilderness.

#### Inaccurate information about the environmental impacts of ranching

All of the alternatives presented are fatally flawed because of their reliance on inaccurate environmental analysis. The environmental analyses rely on a draft National Resource Condition Assessment that, by its own admission, is unsuitable for planning purposes, since (as stated on page xxviii of the NRCA) Information was insufficient to determine the trend for invasive plant and rare plant populations, the PORE range data set provides information about only one small part of the overall Point Reyes landscape, and further, that none of the indicator rankings were considered to have a high degree of certainty. Furthermore, the one factor that supposedly is of sufficient concern, total number of invasive species and number of introductions, is based on an inaccurate assumption-the reference condition is pre-European settlers (no invasive species) which is clearly an absurd standard for a national park unit.

The analysis of livestock impact on California red-legged frogs in the DEIS is downright embarrassing. It is quite clear from reading the document and supporting materials that the only reason Point Reyes is rich in red-legged frogs is that they are drawn to the stock ponds on the ranches. And yet the DEIS manages to find a likely adverse impact on the red-legged frog based on the notion that one of them might be trampled by a cow. No consideration is given to the possibility that a given frog might be trampled by an elk. Needless to say, the entire frog analysis is wildly inaccurate. This sort of thing would be laughable in a student paper. In a government document, it is grossly inappropriate.

Alternative F falsely implies that the elimination of ranching would benefit the environment. There is no valid information presented to support this assertion. The DEIS itself makes it clear that Over the long term, however, the cessation of ranching may not result in overall beneficial impacts, especially in grasslands, which constitute 48% of the planning area. Rates of shrub encroachment into grasslands, invasive perennial grasses, vegetative fuels (both herbaceous and woody), and the consequent risk of large, intense wildfires are all likely to increase, resulting in adverse impacts on vegetation."

These risks are being improperly discounted in the DEIS. Any final document must include a serious analysis of these risks, including the potential impact of large intense wildfires on property, human life, wildlife, and visitor use.

The purported impacts of agriculture on environmental factors such as soils, water quality, and air quality have been inadequately analyzed. Technical information provided by the ranchers in scoping has apparently been ignored, resulting in a shoddy analysis that is highly inaccurate. No valid evidence is provided for the negative environmental impact that is being claimed. Any Final EIS should include a scientific analysis of the environmental factors.

#### Inaccurate socioeconomic analysis

The socioeconomic analysis is based on inaccurate assumptions. Instead of discussing the economic impact of the proposed action alternatives in the planning area, the DEIS includes all of Marin County's production value - - and all of Sonoma County's production value, as well, including its large wine industry. This is highly misleading; one can only imagine that was the point. In a DEIS that considers the importance of the life of an individual frog, it is shocking to see the lives of the Point Reyes ranching families dismissed as 0.03% of total regional employment and 0.01% gross regional product in the study area.

The historic ranches within the planning area represent nearly 20% of the agricultural land in Marin County and the ranching families and their employees within the planning area produce nearly 20% of the agricultural product value in Marin County.

Not only does the DEIS use the wrong demographics for its economic analysis, it also fails to analyze one of the most important economic considerations: the viability of the ranches. Any Final EIS must take into account the impact of each alternative on the viability of the ranches.

The social and economic analyses in the DEIS are inaccurate and inadequate and must be reconsidered in any Final EIS.

#### Scoping gaps

A number of issues presented in scoping have not been accounted for. The Watt paper mentioned earlier, *The Continuously Managed Wild*, was presented in scoping and apparently ignored. Carbon farming is an important new aspect of rangeland management, and the Seashore knows that there is interest in carbon farming among Point Reyes ranchers, both from ongoing discussions and from the content of materials presented during scoping. Yet the DEIS mentions carbon farming only in the appendices.

These are just two examples of the Seashore's failure to address important issues that were brought up during scoping. This failure casts serious doubts on the integrity of the process.

#### Reasonable alternative

The DEIS presents no alternatives that are not fatally flawed by poor information, bad assumptions, and faulty analysis. The multiple serious failures of this document suggest that this process was not conducted in good faith. The Seashore should withdraw this fatally flawed DEIS and create a new plan that provides: " 20-year agreements for ranchers, as directed by then-Secretary Salazar in his November 29, 2012 decision memo, authorized by then-Director Jarvis in his January 13, 2013 delegation of authority, and promised by Superintendent Muldoon in her January 13, 2013 letter to the ranchers. " Consideration of the economic, aesthetic, and cultural value of ranching in Point Reyes National Seashore, including economic viability of the individual ranches as a management goal. " A socioeconomic analysis of the proposed action that includes only the proposed action area. " Science-based management of the natural resources in Point Reyes National Seashore, including an end to arbitrary limits on animal units. " Separation of the elk from the ranches, in accordance with the 1998 EA. The discussion in the DEIS

about fencing is highly inaccurate. The Drakes Beach herd should be re-located to the wilderness zone and secured with a fence. " Rangeland management authority to the ranchers. Only the proprietors of each individual ranch know the land well enough to manage it. Seashore officials, planners, and biologists should defer to or partner with ranchers on all matters relevant to rangeland management.

The scoping letter provided by the ranchers during the initial public scoping period, and the Community Alternative provided during the recent scoping process, provide abundant guidance for a reasonable alternative for properly managing the Seashores natural and cultural resources.

#### Summary

The purpose and need of the proposed action can be best accomplished in a way that meets the NPS mission and responsibility if the Seashore will work together in partnership with the Point Reyes ranchers and the West Marin agriculture community. The current DEIS should be withdrawn or very substantially revised. The Seashore should create a new environmental impact statement that draws on the best available science of rangeland management, working together with the ranchers and their partners in the local agricultural organizations.

Sincerely yours,

Sarah Rolph

Superintendent Cicely Muldoon Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Re: DEIS-GMP Public Comment Oppose Plan B - Support Plan F

My name is Mark A. Walsh. I have walked along the lands, beaches, forests, estuaries, bays, creeks, and ocean of Point Reyes National Seashore(PRNS, the Seashore) since 1978 - 16 years after President John F. Kennedy signed the 1962 U.S. Congressional enabling legislation into law , specifically to protect this rugged California coastal region from development for all Americans and for peoples of the world.

This law establishing our Seashore states it is not created to preserve ranches and ranchers, but to save and preserve, for the purposes of public recreation, benefit, and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped. Further, the Purpose Statement for our Point Reyes National Seashore states: Established for public benefit and inspiration, the Point Reyes National Seashore protects a rugged and wild coastal peninsula and surrounding waters, connecting native ecosystems, enduring human history, and recreational, scientific, and educational opportunities.

The National Park Service (NPS) and Department of the Interior (DOI) grievously, irresponsibly, and callously err and abdicate sound stewardship with their strenuous promotion of the current DEIS-GMP Plan B - an

asymmetrical near-militaristic assault on our national parks lands and waters. Past and current Seashore management leadership officials likewise actively deliver shameful and disingenuous words and actions, seemingly as pawns of or agents for special-interest commercial- and industrial-level private rancher, livestock, ag, and land development business owners, lawyers, and lobbyists . As often do our federal U.S. Representatives and Senators, who likely have never truly witnessed and experienced with boots-on-the-ground experiences the travesty wreaked upon lands, waters, wildlife, and flora of our national Seashore.

I have studied, learned, observed, and experienced myriad natural settings, fauna, and flora throughout the Seashore at all times of day, evening, and night. This has extended into similar experiences throughout the Golden Gate National Recreation Area (GGNRA).

My substantive public comments come from using the rightfully-purchased publicly-owned lands and waters of PRNS and GGNRA - witnessing and experiencing for over 4 decades the willful attacks and abuse on these national parks by 24 private, law-breaking, uncooperative, disruptive, and destructive dairy/beef rancher and related ag businesses who have controlled and expanded their influence and destruction for nearly 6 decades. The majority of these 24 erstwhile quaint family farms and ranches opposed the enabling 1962 PRNS legislation, and have metastasized into commercial- and industrial-level dairy/beef ranching, livestock, ag, and development operations - polluting public lands and waters, and traumatizing or killing wildlife and wild flora in their private business pursuit of profits with the help of government subsidies and tax schemes.

Rather than weight 5 of the 6 PRNS DEIS-GMP plans for private ranching, livestock, ag biz, and retail expansion, the NPS should adhere to all NPS laws and policies to restore and protect lands, waters, wildlife, and wild flora - as prioritized and required in its own founding legislation, and in the enabling PRNS and GGNRA legislation. The Interior Department, NPS, PRNS, and GGNRA should implement Plan Fs principles.

Time did not start with ranching on the Point Reyes peninsula - whether with 24 private rancher businesses in 1962, or during 1800s Americanos property takeovers, or with earlier Spanish mega-hacienda land-grants. This was an ancient open landscape with true native cultural icons and stewards of wildlife, wildlands, wildwaters, and wild flora. To compare respectful and honorable practices of native Miwok or Ohlone cultures to present ag bizs loafing barns; cattle yards and feed lots; PVC single-calf enclosures; rutted unpassable trail erosions; fetid bovine-wasted coastal prairies and creeks; miles of restrictive barbed and electric wire fences; cattle-generated methane gas levels more concentrated and harmful than annual vehicle visitations; and all other private government-subsidized ranching and ag operations is either intentional cultural history fabrication, or fantastical delusion. Go ask the remnants of these native peoples what they think of the cultural heritage and ranching expansion actions past and present of the NPS and PRNS/GGNRA management plans as cultural or historical fact and truth - ask surviving Miwok and Ohlone peoples if they support absolute and total lands, waters, wildlife, and native flora desecration.

**NO ON PLAN B - YES ON PLAN F!**

Mark Walsh, One Persons Direct Substantive Experience - Point Reyes National Seashore and Golden Gate National Recreation Area - Plan B Would Cause Even Further Damage of Wildlands, Wildwaters, Wildlife, and Wild Flora

" Estero Trail: trampled, muddied, rutted, seeping with cattle feces and urine; vast fenced-off inaccessible acreages; navigation through bovine herds, cleaning cattle excrement off boots in what is to be a wilderness experience; passing fetid cesspool-like algae-choked ponds and runoffs; filthy bridges; disease risk and exposure; unsafe/unhealthy family recreation; noxious smells; methane; non-native plants suffocating native plants; cattle not wildlife proliferation; little-to-no ground wildlife; crows, starlings, cow birds, and ravens. " Hearts Desire/Indian Beaches: massive manure-induced algae blooms/mats at supposed swimming beaches; disease risk and exposure; extensive cattle and ag development/byproduct waste runoff on beaches/cliffs and into bay/surf; disease risk and exposure; unsafe/unhealthy family recreation; private ranching, livestock, and ag business operations threaten endangered/marine species; crows, starlings, cow birds, and ravens.

" Abbotts Lagoon, McClures, Kehoe Trails/Beaches: adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); fetid cesspool-like algae-choked ponds and runoffs; filthy bridges; extensive cattle and ag development/byproduct waste runoff on beaches and into lagoons/ponds/creeks/surf; cattle excrement accumulation in multiple runoffs to lagoon/ponds/beaches/ocean; disease risk and exposure; unsafe/unhealthy family recreation; noxious smells; methane; cattle not wildlife proliferation; non-native plants suffocating native plants; little-to-no ground/dune/aerial wildlife; private ranching, livestock, and ag business operations threaten endangered/marine species; crows, starlings, cow birds, and ravens.

" Drakes Beach/Trail: trampled, muddied, rutted, seeping with cattle feces and urine; extensive fenced-off inaccessible acreages; adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); noxious smells; methane; cattle not wildlife proliferation; little-to-no ground wildlife; non-native plants suffocating native plants; extensive cattle and ag development/byproduct waste runoff on beaches and into bay/surf; disease risk and exposure; unsafe/unhealthy family recreation; private ranching, livestock, and ag business operations threaten endangered/marine species; crows, starlings, cow birds, and ravens.

" Agate Beach/Duxbury Reef Beach/Palomin Beach: extensive cattle and ag development/byproduct waste runoff on beaches/cliffs and into surf; cattle excrement accumulation in multiple runoffs to beaches/ocean; disease risk and exposure; adjacent overgrazed and bare-earth coastal (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); extensive fenced-off inaccessible acreages; disease risk and exposure; unsafe/unhealthy family recreation; private ranching, livestock, and ag business operations threaten endangered/marine species; crows, starlings, cow birds, ravens. " Bull Point Trail: trampled, muddied, rutted, seeping with cattle feces and urine; extensive fenced-off inaccessible acreages; inclusive and adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); noxious smells; cattle not wildlife; little-to-no ground wildlife; non-native plants suffocating native plants; extensive cattle and ag development/byproduct waste runoff on beaches and into bays/estuaries/surf; navigation through bovine herds, cleaning cattle excrement off boots in what is to be a wilderness experience; noxious smells; methane; disease risk and exposure; unsafe/unhealthy family recreation; private ranching, livestock, and ag business operations threaten endangered/marine species; crows, starlings, cow birds, and ravens.

" Millerton Point/Beach: extensive cattle and ag development/byproduct waste runoff on beaches and into bay/surf; cattle excrement accumulation in multiple runoffs to beach/bay; disease risk and exposure; unsafe/unhealthy family recreation; adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); large adjacent fenced-off inaccessible acreages; private ranching, livestock, and ag business operations threaten endangered/marine species; little-to-no ground/dune wildlife; crows, starlings, cow birds, and ravens.

" Jewell/ Bolinas Ridge Trails: trampled, muddied, rutted, seeping with cattle feces and urine; extensive fenced-off inaccessible acreages; adjacent overgrazed and bare-earth coastal prairie (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); navigation through bovine herds, cleaning cattle excrement off boots in what is to be a wilderness experience; noxious odors; methane; cattle not wildlife proliferation; little-to-no ground wildlife; non-native plants suffocating native plants; extensive cattle and ag development/byproduct waste runoff on trails; noxious smells; methane; disease risk and exposure; unsafe/unhealthy family recreation; crows, starlings, cow birds, and ravens. " Bay (Tomales) Trail: trampled, muddied, rutted, seeping with cattle feces and urine; navigation through bovine herds, cleaning cattle excrement off boots in what is to be a wilderness experience; inclusive overgrazed and bare-earth coastal prairie and riparian habitat (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); extensive fenced-off inaccessible acreages; private ranching, livestock, and ag business operations cause threats to endangered species; non-native plants suffocating native plants; fetid cesspool-like algae-choked ponds/creeks/runoffs; filthy bridges; disease risk and exposure; unsafe/unhealthy family recreation; noxious smells; methane; non-native plants suffocating native plants; cattle not wildlife proliferation; little-to-no ground wildlife; crows, starlings, cow birds, ravens. " Great/North Beach: adjacent overgrazed and bare-earth coastal prairie and riparian habitat (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); extensive fenced-off inaccessible acreages; private ranching, livestock, and ag business operations cause threats to endangered species; extensive cattle and ag development/byproduct waste runoff on

cliffs/dunes/beaches; non-native plants suffocating native plants; little-to-no ground/dune wildlife; cattle excrement accumulation in multiple runoffs to beach/ocean; disease risk and exposure; unsafe/unhealthy family recreation.

" Overlooks and Vistas - Ranching Operations West of Inverness Ridge - from Mt. Vision, Pt. Reyes Hill, Sir Francis Drake Highway, and Pierce Point Road: huge private commercial/industrial-level beef/dairy businesses; concentrated central operations cattle/feed lots, complexes, and compounds occupying 2-20 acres; despoiled, rutted, muddied coastal prairie and riparian habitat (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); concentrated mega-buildings, cattle pens/paddocks, loafing barns, ranch/farm vehicles/equipment/implement/machinery; cleared/removed native and non-native foliage, brush, trees; extensive cattle and ag development/byproduct waste runoff; extensive fenced-off inaccessible acreages; vast overgrazed and bare-earth coastal prairie and riparian habitat (so-called Pastoral Zone to be designated the more aggressive Ranch Zone); noxious smells; methane; cattle not wildlife proliferation; crows, starlings, cow birds, and ravens. " Etc. - Plan B Increases and Expands Existing Damages to Coastal Prairie, Woodlands, Trails, Creeks, Runoffs, Ponds, Lagoons, Estuaries, Bays, Beaches, Ocean, and Vast Fenced-Off Inaccessible Public Lands and Waters.

First, I strongly and unequivocally - once again and still now for over these 4 decades of my direct experiential witness and exposure within PRNS and GGNRA - object to the NPS, PRNS, and GGNRA officials comprehensive, derelict, and gross mismanagement of our public Seashores national park wildlands, wildwaters, wildlife, and wild flora.

Second, I strongly and unequivocally object to the completely misguided and unscientific Plan B promoted and preferred by NPS and PRNS management that serves special-interest commercial- and industrial-level private rancher, livestock, ag, and land development business owners, lawyers, and lobbyists. Such plans and implementations fall against significant laws, policies, and regulations of the Organic Act of 1916 establishing the NPS, as well as the enabling legislation establishing PRNS and GGNRA. I further object to Plans A, C, D, and E for similar or other legal, ethical, scientific, health, or safety reasons.

Third, I strongly and unequivocally oppose Plan B and support Plan F, to be considered as a starting point to incorporate exact specifics to once and for all, after 57 years since the Seashores creation: " completely remove from PRNS and GGNRA all ranching, cattle, large and small livestock, agriculture, or other development-type business operations " cease planning and implementation of proposed private rancher business income diversifications; expanded acreage and numbers of dairy and beef cattle; allowance of row crops; introduction of small livestock operations (pigs, goats, sheep, chickens, ducks, turkeys, rabbits, etc.); allowance of retail overnight accommodations, hospitality venues, shops, and roadside stands " remove or cease planning and implementation of all similar, related, and attenuated private business development activities " and fully facilitate, encourage, and deliver restoration and protection of wildlands, wildwaters, wildlife, and wild flora, especially for free and open proliferation of iconic Tule elk In essence, to the most complete and thorough scope and degree, immediately and henceforth prioritize restoration and protection of PRNS and GGNRA for the health, well-being, education, research, experience, and enjoyment of present and future generations through the utmost science- and ethics-based sound wildlands, wildlife, wildwaters, and wild flora restoration and protection principles and practices.

Since the 1960s, the 24 rancher businesses negotiated for and were compensated fair-market value (appraised at over \$350M in today's dollars) for their properties. Lease-back arrangements to ranching operations over these 57 years have proven the disregard and actual contempt these coddled parties have for millions of their brethren and for the lands, waters, fauna, and flora abused by their reckless attitudes and actions. Of a total 71,000 PRNS acres, 28,000 acres (39.4%) are already in de facto control of publicly-subsidized private rancher, livestock, and related ag and land development business operations. The NPS and PRNS leadership are to hold accountable these current private rancher, livestock, ag, and land development business operations through legislative, administrative, and legal oversight, enforcement, and punishment&..and regularly and continuously opt to ignore or fail their official NPS and PRNS roles and responsibilities of service to the greater millions of the American people, all for 24 rancher businesses.

What dollar value can legitimately be placed on increasingly rare wild spaces?

Is \$350M an accurate current assessment for nearly 30,000 acres of California coastline, what ag and land developers consider (with dollar-signed eyes) prime real estate? Is \$700M? Is \$2B? \$5B? \$10B? How can the present privately-owned, publicly-subsidized, and tax-free ranch operations in PRNS and GGNRA - which either by owner or spouse death, or by 25-year life estate maximum extension - still be squatting on and insistently, even proudly, ravaging our publicly-owned and increasingly vulnerable PRNS and GGNRA national parks lands, waters, wildlife, and wild flora?

What explains the continued and adamant support of NPS and PRNS over 57 years for the worst options for environmental, ecological, scientific, even cultural restoration and protection for our Seashore and GGNRA?

The Point Reyes Seashore Ranchers Association website has one page, and its first sentence is: Our members are families who have owned and operated small ranches within the pristine landscape that is now the Point Reyes National Seashore.

Small? Blocking off and controlling nearly 40% of PRNS public national park land and waters? Nearly every view and vista overcome with commercial/industrial-sized dairy and beef ranching operations? Pristine? Cattle defecation, manure, urine, and ag waste that incubates as potential disease stew harmful to humans and wildlife, seeping and floating across soil, water, and air? Massive concentrated commercial/industrial-level private ranch compounds that look like nuclear sites?

NPS, PRNS, and GGNRA management already abrogates its legal and ethical responsibilities. And yet prefers even more super-sized wholesale destruction through Plan Bs woeful structure, mechanics, and non-science. As conditions are today, it will be a herculean undertaking just to restore the existing damage by ranching, livestock, and other ag biz operations over the past 57 years of ranching stewardship.

Have the Point Reyes Seashore Ranchers Association (PRSRA) and Resilient Agriculture Group (RAG) in the end - with rancher, ag, and land development proponents Kevin Lunny, Phyllis Faber, Sara Rolph, John Doolittle, Baker Botts, and other local and national private ag business operators, for-hire civil/criminal lawyers, and local and federal special interest lobbyists - deliberately compromised NPS or PRNS/GGNRA management at the expense and value to all Americans safe and healthy access to experience and enjoy our Seashore national park? Has our U.S Representative Jared Huffman or U.S. Senator Dianne Feinstein ever gotten out of an SUV and walked along PRNS and GGNRA bovine-waste-infused lands and waters - where cattle manure and urine stagnates in mass irregular liquid puddles, floats in tangled gaseous algae mats in ponds and creeks, or runs off and spews loosely into Tomales Bay or the Pacific Ocean, visibly and viscerally fouling beaches and surf?

Will NPS and PRNS/GGNRA management ever act on behalf of this nations current generations and future generations - rather than for 24 private rancher businesses that generate little benefit and cause exponential harm to nearly 40% of our Seashore? What about our California leadership role in responsible climate action? Or will NPS and PRNS/GGNRA officials cave once more, and act as if they exist literally to cow-tow to 24 private rancher businesses at full-go-for-more concessions to steal from our national park?

If NPS and PRNS/GGNRA management officials so desire to work in the frameworks of the BLM, Forestry Service, or Department of Agriculture, they may consider transfer to those entities, leaving NPS, PRNS, GGNRA, and other national parks to be led by those who will follow U.S. laws pertaining to the NPS.

Dairy, beef, and related livestock and agriculture markets inexorably and deservedly are collapsing as humans strive for more healthy nutrition and lifestyles - just as scientifically-established exorbitant and deadly concentrations of methane gas from livestock ranching disastrously impacts our global climate. The NPS and PRNS/GGNRA management - in oddly quizzical, illogical, and even illegal actions - promote and support private rancher and ag businesses on our Seashore and other public national park lands. This not only continues but

dangerously expands these management officials own devastating climate-impact effects that poison our soil, waters, and air - and our rights to coexist with our own and other species.

In closing, I strongly and unequivocally oppose Plan B and support Plan F, to be considered as a starting point to incorporate exact specifics to once and for all, after 57 years since the Seashores creation: " completely remove from PRNS and GGNRA all ranching, cattle, large and small livestock, agriculture, or other development-type business operations " cease planning and implementation of proposed private rancher business income diversifications; expanded acreage and numbers of dairy and beef cattle; allowance of row crops; introduction of small livestock operations (pigs, goats, sheep, chickens, ducks, turkeys, rabbits, etc.); allowance of retail overnight accommodations, hospitality venues, shops, and roadside stands " remove or cease planning and implementation of all similar, related, and attenuated private business development activities " and fully facilitate, encourage, and deliver restoration and protection of wildlands, wildwaters, wildlife, and wild flora, especially for free and open proliferation of iconic Tule elk In essence, to the most complete and thorough scope and degree, immediately and henceforth prioritize restoration and protection of PRNS and GGNRA for the health, well-being, education, research, experience, and enjoyment of present and future generations through the utmost science- and ethics-based sound wildlands, wildlife, wildwaters, and wild flora restoration and protection principles and practices.

Plan F Starting Points for Exact and Specific PRNS/GGNRA Priority, Planning, Policy, Action, and Enforcement

1. Phase out all ranch, livestock, agriculture, and other development as was originally intended by the establishing legislation for PRNS and GGNRA, or to otherwise restore and protect the Seashore
2. Prioritize and manage the Seashore for the natural landscapes, resources, and values it was created to preserve - wildlands, wildwaters, wildlife, and wild flora
3. Restore, encourage, and protect wildlands, wildwaters, wildlife, and wild flora - cease private rancher businesses, livestock operations, and expansion into small livestock, crops or row crops, harvesting, processing, storage, hospitality and accommodations, retail shops and stands, and all similar, related, and attenuated private business development activities.
4. Restore and protect the so-called Pastoral Zone and similar areas back into naturally healthy and sustainable coastal prairie, woodland, riparian, bay, ocean, wildlife, wild flora, and other natural habitat, emphasizing protection for appropriate education, research, recreation, and enjoyment.
5. Repurpose 3-or-less scaled-down ranches limited to 5 total acres each for cultural history purposes.
6. Investigate, plan, and implement with local native peoples cultural restoration and protection of ancestral Miwok and Ohlone sacred and community lands and waters throughout the Seashore and GGNRA.

Signed, Mark A. Walsh

Correspondence:

The only reasonable and legal alternative in the National Park Service's Draft EIS for future management of Tule Elk and agricultural operations in Pt. Reyes National Seashore (NS) and Golden Gate National Recreation Area (NRA) is alternative F.

The termination of agricultural activities in both the NS and the NRA was the intent of the enabling legislation. Tens of Millions of federal tax dollars were expended to acquire private ranch inholdings over 45 years ago and the generous leasebacks of ranch and dairy lands after their purchase was intended to be ended after the lifetime of existing operators or after a fixed time period.

The Park Service must honor Congressional intent and choose and implement Alternative F from the Draft EIS. That choice is the only way to protect all the environmental elements and values of the NS and NRA that are unique to Pt. Reyes NS and Golden Gate NRA.

Please make sure to keep me on the emailing and mailing notification list for all future documents to be issued in this process, and thanks for the opportunity to comment.

Jon Marvel

Correspondence: Public lands and native wildlife on Point Reyes National Seashore and Golden Gate National Recreation Area need to be protected from cattle and commercial agricultural expansion. This is a serious back slide to allow, or allow to persist.

#7234

Name: kellogg, bonnie

Correspondence: The threat to Point Reyes National has me heart-sick. As one who has loved that area for a LONG time, it has seemed vastly unfair that this public land has become the private playground and source of wealth for a select few, who SOLD their land, received payment and are STiLL able to continue "business as usual" except with the protection of a few highly placed officials who, while elected to represent ALL the people clearly have in mind ONLY their own pocket books and self interest. (Alas I heard that the Sierra Club won't even touch this one because the people involved are on the "right side of politics").

There is a lot of land that these wealthy farmers/ranchers can BUY to further their self interests .. instead they have managed to create a plan that will further harm the environment at the expense of wildlife. As the world becomes more aware of the health and environmental benefits of whole food plant based diets, why is our government continuing to act as if adding more livestock to this area will be a benefit? To whom? Not to the atmosphere, not to the natural wildlife, not to the citizens who enjoy the area. No .. the only beneficiaries will be the 24 priviledged farmers/ranchers, who already underpay rent for the land they are using.

Please please please don't let this happen. Please stand firm for our revered and endangered Tule Elk. Please let this beautiful area remain open to photographers, campers, hikers ... to the public. If anything the current contracts should be curtailed, not enhanced.

Think about YOUR children and grandchildren.. where will they go? We need this area and more like it, and we don't need more rich farmers/ranchers. We don't need more wealthy politicians with their special interest friends. We need for our Public Lands to be protected.

Please help!

Name: Lowe, Margot

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

#7236

Name: Grayson, Letty

Correspondence: Please do not expand ranch grazing permits in this area. As a taxpayer, I wish the public land to remain as close to natural as possible and I enjoy photographing and seeing the elk. I do not want more domestic farm animals on this land.

#7237

Name: Kline, Susan

Correspondence: It is clear from the Draft Environmental Impact Statement that cattle ranching as it would happen in the ranching alternatives provided will have negative environmental impacts on water and air quality, vegetation, soils, and wildlife. Because of this, all these alternatives would violate the responsibilities given to the Park Service under several statutes. For this reason, the Park Service should not go forward with a Final EIS. Instead, a supplemental DEIS that includes ranching alternatives that protect natural resources must be prepared and circulated to the public.

Thank you, Susan Kline

Name: De Polo, Mokai

Correspondence: I comment today because the proposed General Management Plan amendment for Point Reyes National Seashore and Golden Gate National Recreation Area fails to protect and restore these vital public lands. The Point Reyes National Seashore legislation specifically mandates that this special coastline be "protected" and "restored."

I append my comments to those of Denise Boggs, Director of Conservation Congress, who wrote: "The National Park Service should be managing the National Seashore for the benefit of wildlife and the natural ecology. Emphasizing livestock ranching while subsidizing welfare ranchers is a takings of public land. Livestock don't belong on public lands in general and certainly not in a Seashore where fecal matter can get into the ocean."

Additionally, I append my comments to those of Laura Cunningham, California Director of Western Watersheds Project, whose testimony includes this statement: "I have seen coho salmon streams (within Point Reyes National Seashore) eroded from heavy trampling by the hooves of beef cattle, native bunchgrasses grazed out of existence..."

Managers for NPS, GGNRA, or Point Reyes National Seashore should not allow hazing elk out of cattle pastures or any action to lethally remove native elk. I add my voice to oppose any such plans or proposals.

Thank you for the timely consideration of these comments.

Correspondence: September 23, 2019

GMP Amendment c/o Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Subject: General Management Plan Amendment Draft Environmental Impact Statement

I appreciate the opportunity to submit comments for the Draft Environmental Impact Statement (DEIS) for a General Management Plan Amendment (GMP Amendment) addressing all lands currently under agricultural lease/permits within Point Reyes National Seashore and the north district of Golden Gate National Recreation Area in accordance with the National Environmental Policy Act and the public involvement requirement of the National Historic Preservation Act.

Background My name is Albert Straus. I was born in Marshall. Im an organic dairy farmer, who grew up on a family dairy farm in west Marin County. I converted our family dairy farm, which my father originally started in 1941, to a certified organic dairy in 1994, which is the first certified dairy west of the Mississippi River.

In 1994, I founded Straus Family Creamery, the first 100 % certified organic creamery in the United States. Straus Family Creamery has been in business for 25 years and has grown to buy certified organic milk from 12 dairies (six in Marin County) including two in the PRNS. The six Marin County organic dairies represent tens of millions of dollars in revenue and contribute heavily to the local rural economy.

The two organic dairy family farms in PRNS that supply certified organic milk to Straus Family Creamery include fourth-generation owner Jarrod Mendoza of Double M Dairy, which is located on 1,200 acres at the Historic B Ranch on the Point Reyes Peninsula. He has provided certified organic milk to Straus Family Creamery since 2014. In July 2019, Drakes View Dairy joined our group of suppliers. Fifth-generation William Nunes and Lianne Nunes-Taverna, the brother and sister team, operate the dairy farm on 866-acres at the Historic A Ranch in the Point Reyes National Seashore. William, Lianne, and their family are celebrating 100 years of dairy farming in the same location in the Point Reyes Seashore that their great-great-grandfather first started dairy farming in 1919.

My family was instrumental in the formation and the communitys vision of a park that preserved the environment at the same time sustaining the dairies and ranches. My mother Ellen Straus co-founded Marin Agricultural Land Trust which has preserved for eternity over 50,000 acres of farmland, The Environmental Action Committee of West Marin was co-created by my mother, to help facilitate a common vision of the future with environmentalists, farmers, community members, and government. I served on the board for many years.

Ranching in Point Reyes National Seashore is at a critical juncture in its existence. I believe the current DEIS for GMP Amendment intentionally fails to support the dairy farming and ranching in PRNS and fails to support ranching families and the surrounding communities.

I believe the DEIS for GMP Amendment and the preferred alternatives have inadequately analyzed and evaluated important issues and must be better designed to recognize the historical, cultural, social, educational, scenic, and environmental values and opportunities of the working dairies and ranches in the limited area of the PRNS and GGNRA recognized as the Point Reyes Peninsula Dairy Ranches Historic District and the Olema Valley Dairy Ranches Historic District.

According to the American Bar Association, an EIS is a government document that outlines the impact of a proposed project on its surrounding environment. In the United States, these statements are mandated by federal

law for certain projects. EISs are meant to inform the work and decisions of policymakers and community leaders. A typical EIS includes a section that analyzes the environmental impact of each of the Proposed Actions and Range of Alternatives. The analysis includes:

- o Impacts to threatened or endangered species
- o Air and water quality impacts
- o Impacts to historical and cultural sites, particularly sites of significance for indigenous peoples
- o Social and economic impacts to local communities, including housing stock, businesses, property values, and considerations of aesthetics and noise expected
- o Cost and schedule analysis for all of the actions and alternatives presented

From the perspective of farming and food-producing rural communities, comprised of families that work the land, I recommend these changes because its urgently necessary to enact sensible, practical and economic solutions to ensure that agriculture and the people who live here continue to have an essential role in our region for generations to come.

Please consider my recommendations below:

1. The risk of losing USDA organic certification of the dairy farms in PRNS was not considered in the DEIS. The organic farming model has a National law (USDA National Organic Program) which is based on care for the soil, environment, animals, farmers, and ranchers. This farming model has been essential to sustaining family farms, which contribute heavily to the local economy and communities. Six dairies in the PRNS are certified organic out of the approximately 23 organic dairies in Marin. This counts for more than 25% of Marin Countys organic milk production. According to the 2016 Marin County Livestock and Crop report, the dollar value of organic milk production is \$39,144,000. This almost \$40 million dollars is the highest value crop in the county and thus deserves to be protected as an important county resource. Organic dairy farming has created a proven stable price model and market for dairy farmers in this region.

Under the National Organic Program (NOP)s Pasture Rule, as established by USDA Organic Label requirements, certified organic farming operations must follow an extensive set of regulations around grazing and pasture management standards. The intent of the Pasture Rule is to ensure that organic ruminant operations are pasture-based and to increase pasture productivity and pasture quality over time. Organic producers should maximize the number of days their animals are on pasture. The length of the grazing season must be at least 120 days long within each one-year period. The NPS has a passive approach to land management and restricts and prohibits a pasture management system that includes maximizing pasture productivity with proactive ranchland practices such as carbon farming, compost application, mowing, and seeding.

Organic operations, which must compete with other species such as the Elk Herd that are crossing over into the ranchland zone, are at risk of losing their organic certification. The Elk Herd are eating the grass designated for the cows in the ranchland zone as outlined by the National Park Service (NPS). All the Elk Herds currently impacting ranching operations in PRNS were never authorized to be in the ranchland zone that they now occupy. With the Elk Herd eating the cows grass, they reduce pasture for livestock that is essential to meet federal law requirements. In addition, the cows animal welfare is being threatened by competing species. This undermines the organic standards and the viability and credibility of the ranchers organic business. Ironically, the elk herds consumption of leased pasture grass also puts the ranchers at risk of violating (through no fault of their own) the PRNS grazing standard of 1200lbs of residual dry matter left on pastures prior to the rainy season Source: Lane, Ethan. (2014). Ranching at Point Reyes: Two Centuries of History and Challenges.

The Elk are carriers of Johnes disease, which is transmittable to cattle. For this reason, ranchers are concerned about the elks presence in the pastoral zone. The elk population also competes with cattle for forage and water and have also been known to knock down cattle fences. One reason that this competition is problematic for the ranchers, is that when their pastures are grazed by elk, they need to bring in forage for their own cattle which puts them at risk in compliance with organic standards. This species doesnt currently have a predator in the park, causing their population to fluctuate. Since 1998, their population has ranged from 350 to 550 animals. Source: Ranching in Point Reyes National Seashore: Compromise and Coexistence, Spring 2017, page 27, University of Colorado, Boulder CU Scholar: Fiona Pettigrew.

The NPS has not taken any action to remove the Elk Herds from the ranchland zone. And the PRNS, by not following the 1998 Elk Management Plans intent, has intentionally driven out farmers. This is not an issue between the ranches and the Tule Elk population; it is an issue of management (or mismanagement) by the NPS. Free-ranging or not, these animals live in a cultivated landscape, and pretending that they will ever be free from human intervention only makes clear-headed management more difficult to implement Source: Watt, L. A. (2015). The Continuously Managed Wild: Tule Elk at Point Reyes National Seashore. *Journal of International Wildlife Law & Policy*, 18(4), 289-308. <https://doi.org/10.1080/13880292.2015.1096159>

Removal is necessary because their presence is in direct conflict with organic farming practices, making farming in this region less viable. The NPS has a passive land management approach. In addition to the mismanagement of the Elk Herd, the NPS is either restricting or prohibiting sustainable ranching practices (e.g. allowing methane digesters, carbon farming practices, etc.). Ranchers are active in wanting to implement sustainable agricultural practices. The NOP and its members are proactive, and the organic standards will continue to evolve, requiring more sustainable farming practices to mitigate climate change. All California dairy farmers - from the nations leading agricultural state - are already facing pressure to lower methane emissions under the states ambitious new greenhouse gas reduction laws, which include methane emission reduction targets of 40 percent below 2013 levels by 2030. The states Air Resources Board says that much of the reduction should come from converting methane from cow manure into energy. Dairy manure accounts for about a quarter of the states methane emissions.

Dairy farms in the PRNS are proactive in wanting to leverage agricultural practices such as carbon farming to combat climate change - an increasingly urgent global concern for many American consumers, businesses and agricultural communities. Carbon farming is recognized globally as a solution to fight climate change. The regenerative agricultural practice of carbon farming is helping move carbon from the atmosphere and put it back into the soil. The pasture grasslands of an organic dairy farm in the PRNS are an ideal environment to implement carbon farming practices.

A new study by UC Berkeley scientists published in *Science Advances* illustrates that the pace of climate change can be decelerated by pulling carbon out of the atmosphere and putting it into the ground, where it serves to improve soil quality and increase water retention. This science strengthens the growing body of research that substantiates carbon farming as a global solution to combat climate change.

UC Berkeley scientists reported when combined with aggressive carbon emission reductions - the best scenario for limiting warming from climate change - the study found that improved agricultural management could reduce global temperatures 0.26 degrees Celsius - nearly half a degree Fahrenheit - by 2100. Source: <https://news.berkeley.edu/2018/08/29/improving-soil-quality-can-slow-global-warming/>

Losing a total of 24 dairy farms and ranches in PRNS could prove detrimental in the states battle against climate change.

2. The preferred alternative (B) and alternatives A, C, D, E, F, should entirely exclude ALL Tule Elk from the Ranchland Zone. Elk should be allowed on the PRNS but the Drakes Beach herd and the Limantour herd should not be present on the limited area of the PRNS which have ranches. Over the last 30 years, NPS has not effectively separated the elk from the cows. The elk consumption of forage and grasslands threatens the organic certification of ranches and dairy farms; the safety of the families and animals living on the land and the property; elk damage ranch fences; elk consume forage that would otherwise be available to support cattle. Elk were not part of the Dairy Ranches Historic Districts.

3. The DEIS failed to include the economic impacts to local communities, including housing, long-term leases for ranches and farms and a succession plan for the next generation of farmers in the PRNS. This omission is misleading to the public.

Purpose & Need, page 4 - NPS states:

In 2013, at the direction of the Secretary of the Interior, the NPS Director issued a Delegation of Authority authorizing lease/permit terms for up to 20 years and directing NPS to initiate a National Environmental Policy Act (NEPA) process to evaluate the issuance of long-term leases.

There is no mention of a NEPA process in either the Salazar directive or the Jarvis delegation of authority. The reason that NPS decided to initiate a NEPA process following the directive to renew leases for the same use that has been ongoing for over 150 years is still unknown to the public. 20-year evergreen leases in the GMP Amendment process to help stabilize our rural communities.

Allowing 60-year leases or 20-year evergreen leases in the GMP Amendment helps stabilize our rural communities and create economic viability and longevity for the ranchers. These leases would result in the stabilization of historic rural communities, allowing them to thrive both as rural economic engines and as conservation stewards, encouraging best ranch-management practices and motivating the next generation to continue producing food for the region.

By investing in a stable infrastructure for farmers and ranchers and offering affordable housing for working families then we can fully maintain best agricultural management practices, retain a stable labor force and make farming a viable profession for the next generation.

A decrease of ranches would result in a decrease of children in West Marin Schools, which are already struggling for attendance. Without ranches and rancher families, the diversity of the area would lessen. Many of the ranchers working in PRNS are Hispanic. Most of their children attend local schools, in fact, 55.3% (63) of students at West Marin Elementary are Hispanic. Source: StartClass. (2016). Retrieved from <http://public-schools.startclass.com/l/14074/West-Marin-Elementary>

The PRNS has not lived up to, has not followed, and has, in fact, changed the intent of the 1980 General Management Plan without public input or permission. The Park management has managed by neglect and has intentionally made farming and living in the Park nearly impossible. The NPS management is uncollaborative and unresponsive to allow farms to be able to farm responsibly and address proactively the enormous issues of climate change.

Our community has been decimated by the actions of the Park staff in eliminating jobs and housing. In 1998 there were 7 dairies and 21 beef cattle ranches. Today there are 6 dairies and 18 beef cattle ranches with 6 less farming families and many vacant buildings.

Over the past 50 years, more than 130 homes where rural families live, raise their children, and work as an integral part of Marins local agricultural economy have been torn down or abandoned when PRNS leases are terminated. Working families have been evicted and have left our area permanently to seek stable housing. This lack of housing, the uprooting of workers and disruption of essential community resources is destroying our schools, medical facilities, and other public services that rural populations depend on to survive. The Bay Areas housing crisis is a severe impediment to economic and social stability. It makes no sense to destroy housing when working families already struggle to have a place to live.

Without workers, our local food economy cannot thrive because farming and ranching in PRNS and GGNRA contribute to the stability of our entire County of Marin farm system. PRNS ranches and dairies account for nearly 20% (\$20million) of all gross agricultural production in Marin County. These ranches and dairies play a critical role in maintaining the viability of Marin County agricultural infrastructure and economic viability. Application of an Economic Input-Output Model to NPS farms and ranches would have an economic multiplier impact of nearly four (4) times the gross production values, or \$80 million.

A leasing policy that permits affordable, stable housing for families will keep good workers on our farms and ranches and create resilience for our agricultural community.

4. The DEIS inadequately addresses the ecological and economic benefits of pasturelands used by livestock and doesn't recognize livestock agriculture as a solution to climate change. Scientists have published extensive studies in support of livestock farming as a primary solution to reversing climate change. Livestock grazing has been shown to benefit California's grasslands by reducing the risk of catastrophic wildfire and maintaining habitat for native plants and animals. Grazing promotes soil health by restoring its carbon content, captures carbon dioxide from the air through photosynthesis, and has been described as the most effective mechanism known to humankind in addressing global warming. (sources: Drawdown Solution #19: Managed Grazing/Rodale Institute) [<https://rodaleinstitute.org/wp-content/uploads/rodale-white-paper.pdf> and <http://cesonoma.ucanr.edu/files/225913.pdf>]

Furthermore, a recent study from the University of California, Davis, found that grasslands and rangelands are more resilient carbon sinks than forests in 21st century California. The study indicates that grasslands should be given opportunities in the state's cap-and-trade market, which is designed to reduce California's greenhouse gas emissions to 40 percent below 1990 levels by 2030. [<https://climatechange.ucdavis.edu/science/climate-change-definitions/>] In addition to reversing climate change, carbon farming practices also work to improve crop and pasture productivity. When soils have more organic matter and provide proper nutrition, they naturally increase the volume of pasture production; and with increased pasture production, cows have more nutritional-rich grasses, and farmers can reduce outside feed costs. [See example below of an expense sheet from a working dairy farm in Marin County.]

5. The beneficial impacts to soils from carbon farming was not considered. The DEIS only considers adverse impacts to soils as a result of dairy farming and ranching. The NPS should consider carbon farming and the ecological benefits of implementing a carbon farm plan that would improve soils, increase soil carbon, and increase organic matter to benefit water quality and air quality. The NPS should consult with the Marin Carbon Project, Carbon Cycle Institute, and Marin Resource Conservation District who have expertise in this area. There is no excuse to ignore the beneficial effects of carbon farming.

6. Effective best land-management practices weren't adequately evaluated, analyzed and included in the DEIS. The NPS takes a passive approach to land management. The current model has not been effective at balancing the needs of the agricultural community and natural resources. We need to create a successful and replicable educational model within the PRNS and GGNRA operations that teaches the environmental benefits of organic agricultural practices, preserves natural resources and builds a local, regional foodshed. Ranches and dairy farms are perfect examples to educate urban populations about farms where sustainable food production and good land management go hand in hand. Only one hour from major urban areas of San Francisco, the Oakland and the East Bay, generations of children could become more connected to sustainable food and farming, with a lifetime of impact on their relationship to the land.

We need to reduce climate change by working with dairy farms and ranches to implement organic farming sustainability practices such as carbon farming as actionable solutions. Encouraging best management practices for farms is urgent. U.S. government climate scientists issued a report [<https://nca2018.globalchange.gov/>] warning that climate change is a growing threat to human life, ecosystems and the economy, and that greenhouse gas emissions reduction would avoid hundreds of billions of dollars in future damage.

We need to implement intensive rotational grazing practices that have shown benefit to native plant and animal species, eliminating arbitrary stocking numbers. Native plants and animals thrive on these Point Reyes farms, including six plant species federally recognized [<https://ucanr.edu/sites/uccemarin/files/31000.pdf>] as threatened or endangered, including the Tiburon Paintbrush, and animals such as the California Red-Legged Frog. [[https://www.nps.gov/pore/learn/nature/upload/animalspecieslist\\_endangered.pdf](https://www.nps.gov/pore/learn/nature/upload/animalspecieslist_endangered.pdf)]

Sensitive species such as the California Red Legged Frog and native grasses thrive on ranches where good management practices are in place, proving that wildlife habitat and ranching can be highly compatible.

The NPS should be proactive in allowing diversification of sustainable farming practices. The regions economy needs small-scale farms to succeed, and diversification will enable farmers economic stability and contributes to the regions food security.

The NPS needs to commit to installing small-scale methane digesters on dairies needed to significantly reduce methane emissions and create renewable energy. These methane digesters would be a part of climate change solutions available to dairy ranches in the PRNS.

Ranchers and dairy farmers can partner with the local Resource Conservation District (RCD) that can assist with the technical infrastructure and economic support that is needed to develop and implement a carbon farm plan. This recommendation is omitted in the current DEIS. Compost application is a simple and affordable element of any carbon farm plan. This practice isnt currently allowed in the PRNS. This practice helps fight climate change. Scientists have shown that increasing organic matter in the soil allows for more water retention and increased pasture and plant growth. A statistic presented by the Marin Carbon Project states that if farmers spread a quarter-inch of compost on just 50% of Californias rangelands, 42 million metric tons of CO2e would be offset, equivalent to all the energy use for commercial and residential sectors in California. [<https://www.marincarbonproject.org/home>]

The San Francisco Chronicle reports that if compost were applied over 5% of the states grazing lands, the soil could capture a years worth of greenhouse gas emissions from Californias farm and forestry industries, or the equivalent of removing 6 million cars from the road. [<https://www.sfgate.com/science/article/A-sprinkle-of-compost-helps-rangeland-lock-up-5832244.php>]

Sincerely, Albert Straus Founder/CEO & Organic Dairy Farmer Straus Family Creamery Marshall and Petaluma, California

Name: Konietzny, Martina

Correspondence: Point Reyes National Seashore protects a rugged and wild coastal peninsula and surrounding waters, connecting native ecosystems, enduring human history and recreational, scientific, and educational opportunities.

This above sentence is the essence of what Pt Reyes is for myself and many others in my family and circle of friends. I have lived in the Bay area for over 30 years and have always wondered about the amount of livestock inside a National Seashore.

It is past time to remove domestic livestock operations from Point Reyes and dedicate the Point Reyes National Seashore to it's original mission: the preservation of native plants and wildlife. Livestock operations were supposed to have been removed over a 25 year grace period. I can understand why the farmers keep on holding on, getting paid off and subsidized, have their children become farmers and heirs of "our" property. This needs to stop.

Furthermore I just found out that even the organic milk is produced under the most cruelest circumstances. The white plastic bins you see everywhere in Pt Reyes are to house the baby cows, the baby cows are after birth taken away from their Mother's, so the Mother can only produce milk for commercial use. I always expected the farmers in Pt Reyes to be a step up from the rest of the industry because I thought, they were kind, and wholesome and loving to all animals.

The ever shrinking space of natural habitat in Pt Reyes, and the cruel practices along with their ground devastation they need to be phased out immediately. They had their "hay" day, now it will need to go back to the public. Particularly right now we are in a climate catastrophe and the movement will be toward NOT eating meat at all.

Meat production is the biggest polluter on earth (the reason why the Amazon is on fire), as it pollutes our earth and atmosphere.

The approximately 600 native subspecies of tule elk are much more important to me and many visitors to this park than the 5,000 head of cattle which cause erosion, invasive species and pollution of the water, not to mention exacerbating climate disruption. I do not visit Point Reyes to see cattle! The idea of killing some of the tule elk is beyond ridiculous when there are only about 4,000 elk remaining in California out of a historic population of half a million. The 24 ranches still at Point Reyes need to be phased out and the land restored for native species. I support the adoption of "Alternative F". Thank you for listening, Martina Konietzny

Correspondence: How have you managed to hide your actions for so long? I am guilty for living so close and being unaware, you but all are going to hell for your role in selling off this seashore to ranchers.

#7244

Name: James, Douglas

Correspondence: Updating the management plan last written in the 1980s had been a long and protracted process. In the meantime the population of the Bay Area has exploded. Point Reyes National Seashore was established along with other "urban" national parks to augment recreational opportunities for urban dwellers in centers nearby. It was never intended to be turned into wilderness. The release of tule elk first on the north point and then later in the pastoral zone in the main part of the park has not been a success. PRNS has not done a very good job of managing the herds. Several years ago ~34% of the herd on the north point starved to death due to lack of food. The concept that this is wilderness and these animals should fend for themselves is ludicrous. Due to the lack of top predators, wilderness at PRNS is just a human construct with no basis in reality. The Tule Elk experiment is more akin to a Wild Animal Park, similar to places in Southern California where visitors ride trams to view African wildlife. The difference here is visitors hike in to see the elk and the PRNS staff has had a hands off approach, which allows the herd to grow in size beyond the carrying capacity of the land. I have visited the north point from time to time. The plant life was/is in bad shape- over grazed. Also there were numerous places where concentrated animal use had led to loose soil and erosion.

What is more inhumane? Allowing these magnificent animals to decline in health and starve to death or periodically shooting a small percentage of the herd to maintain a healthy animal population appropriate to the carrying capacity of the land? Obviously, I am in favor of actually managing the elk herds so they remain healthy, with an appropriate ratio of males to females, and in such number that they have enough to eat without wreaking havoc on the plant life or hastening erosion by concentrated trampling.

THE OPTION I FAVOR MOST IS C. Remove the Drakes Beach Herd/ Keep the ranches.

I realize that this means killing animals, but this can be done humanely. The EIS offers "ALL or None" options because the public generally doesn't support killing animals (while they have no problem with hamburgers). This leads people to choose other options such as removing the ranches altogether. Fencing might be another option to keep elk away from ranches, but in the long run culling would still be necessary. There is also the recent discovery

of Johne's disease in the "wild" elk population. This highly infectious disease can easily be transferred to dairy or beef herds.

Treat the ranchers fairly and give them 20 year leases that were promised years ago under the Obama administration. A ranch operation cannot survive without access to capital. With the short leases and uncertainty of the last decade, ranchers have had a tough time getting loans to finance their operations. Plan and simple, a bank will not loan money on a 3 year horizon. This is the only fair option. This park would not exist if it were not for the 150 years of stewardship provided by the ranching families that occupied and worked these lands. Pt. Reyes without grazing animals wouldnt be Pt. Reyes. Ranchers have been innovative in managing their grazing lands, using techniques that foster sequestration of carbon in the soil. They have employed fencing to keep cows away from streams as well as other sensitive areas.

In closing I hope this almost 40 year process of deciding on how to manage PRNS comes to some final resolution. I have repeatedly been asked to comment on various plans and documents. Stop studying the problem and do something. Further delays are a waste of taxpayer money. This EIS alone cost us almost \$1M.

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

Name: Miller, Louise

Correspondence: thank you for accepting public comments.

I am totally against any culling of the elk population. The elk need to be protected and be able to roam freely, with adequate water sources.

We must protect our wildlife at Point Reyes by all means. The elk and other wildlife have the right to be protected and they are very special for the enjoyment of Point Reyes.

I don't know how successful relocating some of the elk herd to other locations. May harm the elk.

Also, I feel we need to restrict ranching at Point Reyes because of environmental concerns and climate warming. Our climate is getting destroyed and cattle are a part of this equation. The Park Service needs to get with the current thinking and restrict cattle use on public land.

I also am concerned with the 246 elk that were killed due to dehydration several years ago. This is not acceptable. The elk must be allowed to roam free so water sources do not dry up and cause another disaster. The Park Service is responsible for this horrendous loss.

I understand many many years ago, cattle ranching was important for

Correspondence: I was born and raised in the Bay Area and have always enjoyed going to Point Reyes National Seashore, which is a true gem in the Bay Area, the United States and among national parks. We managed to bring back the Tule elk from the brink of Extinction. Why would the Park Service even consider harming them in any way, including killing any of them and further degrading and contaminating the environment in which they live. There is ample evidence that the dairy industry has polluted the water, contaminated the soil and otherwise devastated the environment of Point Reyes National Seashore. As a taxpayer, I strongly encourage The NPS to approve alternative F, which would gradually phase out the dairy industry at Point Reyes National Seashore and allow the seashore to go back to its original pristine environment, in which plants and animals of so many species would thrive. Dairy is a dying industry - - look at all the alternatives to dairy milk on supermarket shelves - - and is a huge contributor to global warming and climate Injustice. I encourage The NPS to do the right thing to restore Point Reyes National Seashore which will allow the Tule elk and all the other species there to survive and thrive. Allowing the Dairy Ranches to remain and even worse, allowing even more animals to be raised on ranches at Pt. Reyes means continuing devastation on our National Seashore. Please do not let that happen.

Name: Jones, Annette

Correspondence: These remarks are in response to the NPS seeking input on the General Management Plan Amendment (GMP) Draft Environmental Impact Statement (EIS) for Point Reyes National Seashore and the north district of Golden Gate National Recreation Area prepared for the National Park Services (NPS) to update management guidance of national park system lands and all lands currently leased for beef and dairy ranching.

The California Department of Food and Agriculture (CDFA) Animal Health Branch is the States organized, professional veterinary medical unit that protects livestock populations, consumers, and Californias economy from catastrophic animal diseases and other health or agricultural problems. The Branch addresses disease and other problems that cannot be successfully controlled on an individual animal or herd basis but require state-wide coordinated resources.

1. CDFA supports the continued monitoring and testing of elk herds for Johnes disease and chronic wasting disease (CWD) as listed for all alternatives on the EIS. Both conditions are on the Departments List of Reportable Conditions for Animals and Animal Products.

a. Johnes disease is an incurable diarrheal wasting disease that can spread between livestock and wild ungulates caused by the bacterium Mycobacterium paratuberculosis (MAP). Studies indicate that infection is very prevalent in dairy herds (about 68% of U.S. dairy herds have at least one cow that tests positive for Johnes). Although infection seems less widely distributed in beef and goat herds and sheep flocks, Johnes is of critical signigance to all livestock producers.

b.CWD, a regulated reportable condition causing a fatal neurological disease that infects cervids such as deer, elk and moose, has not yet been detected in California. The Branch supports the continued surveillane for this disease in the NPS elk because of its potential spread to California.

2.CDFA encourages the dairy and beef ranchers impacted by this EIS to enhance biosecurity and participate in disease monitoring programs. If diversification activities are authorized for ranchers (Ranch core subzones) as defined on the EIS Alternative B - NPS Preferred Alternative, biosecurity and disease monitoring programs may be needed in other livestock species (pigs, chickens, sheep and goats).

3.CDFA is concerned about Johnes disease exposed elk being moved to sites where they may have direct contact with domestic ruminants or indirect contact through contamination of the environment and subsequent use by domestic ruminants.

Thanks for the opportunity to comment.

Name: Kitahara, Miya

Correspondence: I. Alternative F is the Most Appropriate Use of National Park Service Lands.

Although the EIS describes the enabling legislation that allowed ranching to persist to the present day and allows permit extensions, the NPS continues to have the responsibility to act in the best interest of the public and preservation of ecological function and native species (NPS Management Policies 2006).

The purpose of the NPS is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations, and it is the role of the Service to promote and regulate the use of Federal areas for these objectives (Organic Act, 1916).

Of the General Management Plan Amendment Alternatives, only Alternative F honors this responsibility. Specifically, Alternative F is the option which most responsibly conserves wildlife, provides for public enjoyment, and preserves the lands unimpaired for future generations.

## II. Alternative F is the Most Appropriate Alternative for Conserving Wildlife

The overpopulation of Tule Elk cited for the need for intervention is a result of prior human intervention in the ecosystem. To cull the herd while not preserving the other aspects of the ecosystem - contiguous land access and reintroduction of other ecosystem species - amounts to continued intervention that deteriorates the natural objects and wildlife habitat in the area. Alternative methods of population regulation should be explored. As ecosystem specialists, NPS experts should be directed to balance Tule Elk populations using ecological solutions (e.g. <https://www.nature.com/scitable/knowledge/library/dynamics-of-predation-13229468/>).

## III. Alternative F is the Most Appropriate Alternative for Providing Public Enjoyment and Unimpaired Enjoyment of Future Generations

Alternative F provides the most robust build out of infrastructure and services for public use and enjoyment, including additional planning above the scope provided for Alternatives B-E, and represents an improvement over Alternative A.

Any expansion or continuation of land- and ecosystem-degrading operations within NPS lands represents a failure to leave them unimpaired for the enjoyment of future generations. Alternative F will lead to the greatest chance of future generations to enjoy the park.

Furthermore, the greatest threat to future generations ability to enjoy NPS lands is climate change. The impacts of climate change are expected to deteriorate the quality and resilience of coastal areas, as well as cause sociopolitical instability which could undermine the ability for future generations to enjoy the benefits of national parks. In order to claim acting in accordance with not impairing enjoyment of future generations, all actions within NPS control must be taken to mitigate climate change. Alternative F is clearly the preferable alternative for reducing total GHG emissions, eliminating all 24,611 annual MTCO<sub>2e</sub>, which is equivalent to 20% of total agriculture emissions presented in the County of Marins 2017 GHG emissions inventory. Eliminating these emissions is the most responsible course of action.

To further augment its beneficial contribution to drawing down carbon from the atmosphere, Alternative F could consider inclusion of the mitigation strategy of Carbon Farming (EIS p.190) if determined undisruptive to ecosystem and wildlife habitat restoration. While some benefits are shown from livestock integration in carbon farming plans, many of the sequestration benefits can be gained without livestock, such as woody plantings,

herbaceous cover, and compost application (see comet-planner.com). Inclusion of livestock may be effective and appropriate on private lands, but it is not necessary on NPS lands.

#### IV. Ranching Facilities at PRNS Should Be Treated as Historical Objects

It is within the purview of NPS to conserve historical objects. The Historic Ranch Preservation subzone in Alternative F would serve this purpose. Ranching activities should be appropriately classified as historical activity, an artifact of decisions made prior to formal planning processes and without currently available data and science indicating the importance of ecosystem restoration and GHG reduction. Ranching activities should therefore not be continued on into the future. Furthermore, choosing to preserve and expand ranching based on historical significance demonstrates a culturally insensitive bias. The PNS land was actively managed prior to ranching by native populations, and yet evidence of their existence and relationship to the land is limited to a small display at Bear Valley Visitor Center. The historical objects dedicated to ranching should be appropriately proportional to the duration of time it represents, such as limiting it to Pierce Point Ranch.

#### V. The Interest of the Few Is Not More Important Than Public Interest and Conservation

There is no explanation in the EIS that identifies barriers to choosing Alternative F that cannot be overcome. The EIS identifies the potential loss of revenue and employment under Alternative F as representing only 0.01% of the study areas gross regional product, and 0.03% of regional employment, and does not undermine the visitation levels for public enjoyment. Choosing an alternative other than Alternative F would require a determination that advancing the interest of a few is a greater responsibility to NPS than protecting ecological resources and serving the public interest of current and future generations.

Correspondence: R & J McClelland Dairy Operating on the Historic L Ranch in Point Reyes National Seashore

September 21, 2019

Superintendent Cicely Muldoon Point Reyes National Seashore One Bear Valley Road Point Reyes Station, CA 94956

Dear Superintendent,

I appreciate the opportunity to comment on the Point Reyes National Seashore (PRNS) and North District of Golden Gate National Recreation Area (GGRNA) Draft Environmental Impact Statement (EIS) for the General Management Plan (GMP) Amendment dated August 2019. I am a fourth-generation rancher to operate on the lands of the Point Reyes Peninsula. My great-grandparents, JV and Zenia Mendoza, migrated here from the Azores in the early 1900s. They met while living on Point Reyes, were married, and started their families and businesses on the A and B Ranches. My grandparents, Joe and Scotty Mendoza, purchased the L Ranch in the 1950s and ran a dairy farm there until their passing. Since 2011, my husband and I have been milking

approximately 150 head of certified organic dairy cattle. We employ three full time employees who reside on the farm along with their families.

Before I begin, I would like to bring to your attention my endorsement of the Point Reyes Seashore Ranchers Association (PRSRA) letter that has been submitted during this comment period. I strongly urge you to consider and act upon all of the points raised in that letter. That letter represents the thoughts and needs of many of the dairy and beef cattle ranchers within the Seashore and GGNRA that the PRSRA represents-the historic L Ranch being one of those ranches.

I was encouraged to see the alternative that the Park chose as its Proposed Action included the ability for us to continue our historic ranching practices. With the recent designation by the Department of the Interior of the Point Reyes Peninsula Dairy Ranches Historic District and the Olema Valley Dairy Ranches Historic District on the National Register of Historic Places, I applaud the Park for aligning with this distinction. The historic ranches in the Seashore provide a longstanding cultural and historical resource.

In order to allow the ability for PRNS and GGNRA to honor the historical, cultural, social, educational and environmental benefits of our ranching heritage, I do want to take this opportunity to point out a couple of key topics that need more clarification or consideration. These are also important points of interest for the historic L Ranch:

1. Drakes Beach and Limantour Tule Elk herds- The number of Elk that have been suggested as a population threshold is not a number that aligns with the ability of the ranches to remain viable. For example, all of the dairies in the Seashore are certified organic, which means we have to feed our cows a certain amount of pasture in order to maintain our certification. The Elk compete for that pasture. We will have a difficult time continuing to provide the public with a historic visitor experience if we are not able to keep a certification that we depend on in order to stay in business. The idea of enticing the Elk out of key pastures with hay or hazing would not allow this majestic animal to exist in its most natural state. The agricultural properties in PRNS and GGNRA only represent 30% of the land that the Park oversees. These animals should be allowed and kept, with the help of fencing, in the other 70% of lands the Park manages in order to allow these animals to live as close to nature as possible. Furthermore, even with the Elk returning to the Wilderness Area, there needs to be a total population size within the Park established in this EIS in order to make future management decisions an easier process.
2. Diversification-More work needs to be done on the topic of allowing diversification. The impression has been given that what the ranchers have proposed are never before uses of these lands and that we want to make major large-scale changes. These points are far from the truth. There needs to be more research on the history of Point Reyes highlighting the diverse groups of animals and crops that were raised-historical uses that the ranchers would like the flexibility to return to. We are in an ever-changing climate and global market place. Some of our operations may cease to be viable in another five, ten years. Having the option of bringing in other species of livestock and/or crops would help us add to the visitor experience. Different species of animals would also allow us to be a partner with the Park by helping manage grasslands, brush and help alleviate the risk of wild fires.
3. Leases-there is concern with language in the lease addendum that would require lease holders to physically live on the property. To being with, not all of the ranches would be able to accommodate this due to there being no housing on the property. That is an unfair disadvantage to those lease holders. Many people all across America commute to their places of work every day, some spending hours in their cars. Ranching is a career that should not be looked at in a different way. There are numerous examples inside and outside of the Park that showcase a successful ranch can be run with the operator off-sight. Just because an operator lives off sight, does not mean that they are unable to be a responsible steward of their operation. Historically before and after Point Reyes became a National Seashore there are examples of operators who did not live on the land they managed. It would also add another burden to PRNS to have to monitor where lease holders reside.
4. Advisory Committee-An Agricultural Advisory Committee should be established that is made up of local agriculture and natural resource conservation groups in order to offer assistance to the Park when managing Agricultural topics.

The Point Reyes National Seashore is a unique example of government and ranchers working together to protect the land and continue to produce high quality food for a growing population. During the 1900s more and more

families left the farms and countryside to move into the suburbs. We are now meeting people who are three, four, five generations removed from the farm. PRNS can continue to be a place that not only protects the natural landscape, but highlights the cultural and historical landscape as well. PRNS can give visitors the opportunity to experience a way of life that is the backbone of American history and to learn where their food comes from. In order to keep this longstanding tradition going, the NPS has the opportunity right now to develop a plan that balances the needs of the natural landscapes, and of this vital historical and cultural resource.

Thank you for the opportunity to participate in this process,

Jolynn McClelland L Ranch

Name: Young, Stanley

Correspondence: When my family and I were recently camping nearby Pt. Reyes we visited a trail and saw all the elk. My son was thrilled. I just told him that there is a plan that would allow people to shoot and kill elk. He asked why and I said it was for people to kill and eat another animal a cow. He asked wasn't the amazon just on fire because of cattle ranchers and loggers? I said yes, and now instead of allowing wild elk to roam free, you might shoot them for people to kill and eat another animal?

Name: Lowe, Margot

Correspondence: The EIS makes it clear that under all the alternatives for continued cattle ranching, there will be detrimental environmental consequences on the Park's natural resources, including soils, water quality, vegetation, and wildlife, including tule elk.

The National Park Service governing laws prohibit actions that will impair natural resources.

Consequently, the Park Service should not adopt any ranching alternative and prepare a supplemental DEIS with ranching alternatives that comply with applicable laws prohibiting the impairment of natural resources.

#7254

Name: Merrill, Charles

Correspondence: Hello,

I am a life long Marin resident and avid cyclist residing in Fairfax.

I am writing in support of the improvements in public and bicycle access outlined under Alternatives B, C, D, E, and F.

I rarely ride in the Pt. Reyes area as I find the paved roads highly traveled, unsafe, very dangerous for cyclists and with limited connectivity and/or loop options. Dirt options are so limited that my friends that live in Pt Reyes Station and Inverness usually drive to Fairfax to ride.

Respectful public access to a few ranch roads during daylight hours would make a huge difference to me and the rest of the taxpayers that continue to be denied access.

Specifically I would like to see connections using existing ranch roads between: - Devil's Gulch and Platform Bridge Road. - Bolinas Ridge Trail and Five Brooks Stables. - Drakes Estero and Abbotts Lagoon Trail. - Marshall Beach Trailhead and Pierce Point Road. - Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail.

I would also like to see an Estero Trail loop using existing ranch roads.

I realize that this will take collaboration with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands. There are many fine local organizations ready to assist.

Best regards, Charles Merrill

#7255

Name: Maier, Jennifer

Correspondence: I oppose the DEIS as drafted as it relates to the removal of Tule Elk from Point Reyes. Tule Elk are ecologically critical part of the balance of the Point Reyes ecosystem. They live in harmony with other native species and are non-aggressive towards humans and other wildlife. Not only is the growing population of elk significant to the landscape of Western Marin, but also to the draw of tourists, hikers, and wildlife enthusiasts that frequent the trails, specifically the Tomales Point Trail that runs through the Elk Preserve. The free roaming populations of elk might exist in multiple groupings but are part of the same larger herd and should be protected as so. These tourists, hikers, and wildlife enthusiasts bring economic growth to the sleepy towns of Point Reyes, Nicasio, Inverness and Marshall that might not exist if that population is limited or capped as proposed by the DEIS.

Additionally, the Tule elk population is self-sustaining and only encroaches to areas outside the Preserve due not to the growth of the elk population, but to the growing presence of development, ranching and grazing in the area. It's these activities, not the population of elk that should be reduced and managed. Please allow the population to grow, exist and thrive freely in their naturally occurring habitat of Point Reyes. If their presence conflicts with extending the leases to commercial operations, then those leases should be modified to allow the elk population to not be killed off, capped or limited just to appease those commercial interests.

Thank you very much for considering these comments. The Tule Elk are a part of Western Marin heritage and should be protected, honored and respected as so. The public's interest in maintaining a growing and thriving elk population in Point Reyes should not be outweighed by the for-profit interests of local businesses, dairy farms, ranchers and commercial operations.

#7256

Name: Kupfer, David

Correspondence: I am a native of Marin County. I have lived and worked in Point Reyes, directing the Environmental Action Committee of West Marin. I have a keen understanding of the agricultural economy of West Marin as well as the history of PRNS. Let me be brief. The public lands and native wildlife on Point Reyes National Seashore and Golden Gate National Recreation Area need to be conserved - not replaced with cattle and commercial agricultural expansion. There is ample farmable land to be found outside of the National Park boundary's. The remains ranching families within the Park have been more than amply compensated for their land to the tune of hundreds of millions in today's dollars. The have been subsidized in recent years. I am all for rural regeneration of West Marin's agricultural economy. But i do not support this within the park boundaries. The long term environmental impacts are simply too great. The sanctity and character of the National Park concept is in danger. The PRNS' enabling legislation never granted ranchers access to federal land in perpetuity. Thank you for your consideration of my views.

GMP Amendment c/o Superintendent Cecily Muldoon Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Subject: Comments on the PRNS GMPA Draft Environmental Impact Statement

Thank you for the opportunity to provide comment on the Draft Environmental Impact Statement (EIS) for the National Park Service General Management Plan Amendment planning process. The Marin Resource Conservation District (Marin RCD) is supportive of agricultural activities and conservation actions that take place within the Point Reyes National Seashore and the north district of the Golden Gate National Recreation Area (NPS) and is pleased to provide suggestions for your consideration.

The Marin RCD was created in 1959 with a specific mission in mind: "to conserve and enhance our natural resources. It is our belief that the health of the county's natural landscape is dependent upon a robust agricultural economy and the active preservation of our agricultural heritage. In addition, it is our firm conviction that the agricultural productivity of the county is dependent upon the diligent application of practices which conserve and enhance our natural resources."

Over the last 50 years, we have supported NPS and the ranches in fostering a conservation-based land stewardship ethic. The Marin RCD has partnered with NPS and our sister agency, the USDA Natural Resources Conservation Service (USDA NRCS), in supporting this ethic. USDA NRCS is authorized to distribute USDA Farm Bill funding within our district based on these formal partnerships and collectively we have successfully partnered with many agencies and organizations over the years to match these funds by turning our local plans into meaningful conservation actions. It is our responsibility to establish a solid set of community values that will direct our future endeavors. It is for these reasons the Marin RCD believes the General Management Plan Amendment to be critical in developing a sustainable future for agriculture.

The Marin RCD supports NPS's preferred Alternative B and offers the following comments on the Environmental Impact Statement:

1. Twenty-Year Leases. The 20-year lease option (identified in Alternatives B-E) supports and encourages continuous environmental stewardship. In addition to zoning, this long-term support structure will improve environmental stewardship and should be stated within the EIS under all alternatives. Furthermore, while the Marin RCD supports Alternative B, we strongly recommend options for renewal at least five years in advance of lease termination dates for the reasons mentioned below.

NPS ranchers have demonstrated a strong interest in the implementation of stewardship practices that have been slowed by short-term leases conflicting with long-term maintenance/monitoring requirements in state funding programs. Furthermore, when a rancher nears the end of a long-term lease, they are left in the same noncommittal predicament that disqualifies ranchers from applications. Environmental programs offered through the State Water Resources Control Board and CA State Coastal Conservancy require 20-year commitments whereas the Marin RCD requires a 10-20-year commitment.

A 20-year lease, with an option to renew at year 15 would enable lessees to qualify for stewardship programs on a consistent basis, regardless of lease year, and fosters a stewardship ethic that spans multiple generations. This type of commitment strengthens relationships and promotes the cultural knowledge of the land that is passed through the generations and melded together with NPS ideals to inform adaptive management.

2. Conservation/Carbon Farm Planning. The Marin RCD is pleased to find an overview of carbon farming contained within the EIS and we offer our support to provide this program as requested by PRNS and the ranching community. Carbon farming provides benefits to soil, water, air, plants and animals and it is our recommendation that these benefits should be further elaborated under Alternative B. The list of practices, promoted and streamlined under Alternative B (shown in Appendix D), combined with long term lease options

will incentivize conservation action and increase environmental results. Air Quality, in particular, will be improved with these practices in play, however Alternative B describes no change to air quality.

Carbon farming is on the rise. County, state and federal partners have been engaged with local ranchers to complete individual carbon farm plans that support a regenerative and resilient agricultural landscapes. The effort has generated 20 plans thus far and considerable interest amongst the ranching community, inside and outside the Park. Plans identify family/agricultural/ environmental goals followed by an inventory of natural resources, identification of areas of concern, and prescription of regenerative management practices for implementation agreeable to all parties (See USDA NRCS Carbon Farm Plan Guidance document: [https://efotg.sc.egov.usda.gov/references/public/CA/CarbonPlanGuidance 3-18.pdf](https://efotg.sc.egov.usda.gov/references/public/CA/CarbonPlanGuidance%203-18.pdf)).

The plans, developed with landowners, lessees and local practitioners, consider a variety of USDA NRCS conservation practices (as identified in GMPA EIS Appendix D: Management Activity Standards and Mitigation Measures) in the planning process including Prescribed Grazing, Range Seeding, No-till/Reduced Tillage, Fencing, Weed Management, Riparian/Wetland Buffers and many more. All areas of the ranch are inventoried; including soil health associated with pasture management, grazing management and invasive weed management. These are concepts supported by the State of California's Healthy Soils Initiative, the USDA NRCS Environmental Quality Incentives Program, Marin County Climate Action Plan and more recently, Drawdown Marin to improve air quality.

Planned practices are proven to improve soil health: increase water infiltration, reduce evaporation, moderate soil temperature changes, increase rooting depth, increase nutrient uptake, and improve the water-holding capacity for most soils ([https://www.nrcs.usda.gov/wps/portal/nrcs/detailfull/soils/health/mgmt/?cid=s\\_telpdrdb1257753](https://www.nrcs.usda.gov/wps/portal/nrcs/detailfull/soils/health/mgmt/?cid=s_telpdrdb1257753)). Many of the practices support our farmers and ranchers in enhancing sensitive ecosystems by planting native trees, shrubs and grasses (windbreaks, buffer strips, grassed waterways, hedgerows, riparian forest buffers silvopastures). They are designed to improve water quality by increased infiltration rates and decrease runoff, thereby reducing sediment and nutrient loading to streams. Carbon farming practices, when managed well, offer exceptional greenhouse gas reduction and carbon sequestration benefits. The application of organic amendments to soils has the ability to sequester and increase soil carbon by 50 MT C per ha-1 in the top meter of soil (Ryals et al, 2015. Ecological Applications, 25(2): 531-545).

Furthermore, Alternative B provides a connection between the public and agriculture. The connection of greenhouse gas impacts from NPS visitors and potential offsets from agricultural carbon sequestration practices could be an incredible educational opportunity to the greater public in describing the co-benefits that agriculture can provide in a natural setting.

3. Appendix D: Management Activity Standards and Mitigation Measures. The Marin RCD is pleased to find the use of our Marin RCD Permit Coordination Program, along with the identification of additional management practices identified in the EIS. Considerable effort was devoted to the development of this program while working with local partners to identify management practices and environmental mitigation measures specific to our agricultural areas in Marin County.

In reviewing the practice list, we notice specific practices have been removed from consideration which, under certain circumstances, may offer additional environmental benefit. We recommend they are included also as a matter of consistency amongst programs and to provide the following environmental benefits:

Mulching (484) The application of a uniform layer of straw, wood fiber, or other acceptable materials over seeded areas or over bare areas if seeding is delayed to reduce erosion and stabilize areas while seeding is established.

Hedgerow Planting (422) A dense woody vegetation planted in a linear design to achieve a natural resource conservation purpose to protect water quality, wildlife, air, aesthetic value.

Silvopasture (381) An application establishing a combination of trees or shrubs and compatible forages on the same acreage to provide forage for livestock, increase carbon sequestration, improve water quality, reduce erosion, enhance wildlife, provide shade for livestock.

Conservation Cover (327) Conservation cover is establishing and maintaining perennial vegetative cover to protect soil and water resources on land retired from agricultural production or other lands needing permanent protective cover that will not be used for forage production.

4. Elk Management. While the Marin RCD supports the proposed elk management strategy, the EIS does not adequately represent farming losses associated with elk interaction on the ranches, damages associated with forage and silage in addition to fences and other infrastructure associated with their movement within the Range and Pasture Zones. The EIS should include a discussion of these impacts incurred by the ranches to adequately represent the economic loss associated with this option.

The Marin RCD strongly supports these ranchers and NPS in being national models of sustainable land stewardship and we offer our assistance whether in planning or project development. Thank you for the opportunity to provide comment.

Sincerely,

Nancy Scolari Executive Director

Name: Carey, Brenda

Correspondence: I do not support granting 20 year leases to cattle and dairy industry. Climate science has indicated we have less than 12 years to mitigate the worst of climate catastrophe. Allowing business that has been linked to water pollution, species extinction and in Point Reyes is the culprit of over 60% of the greenhouse gas emissions, it is not a good idea to give that same industry a 20-year lease to continue degrading our national park. Point Reyes is a refuge to thousands of plants and animals. Point Reyes can be a leader in the fight for climate justice, and it starts with phasing out Beef and Dairy operations and restoring the land to its natural state. The EIS has NO MENTION of the effects of climate change in it, and does not include any information of the cattle and dairy's impact on climate change within the park.

#7259

Correspondence: Pt. Reyes DEIS Comments by René Voss

1. All ranching alternatives proposed in the DEIS violate federal laws to protect National Parks, and only Alternative F or phasing out all ranching and dairy operations comply with the law.

Under its governing legislation-including the Point Reyes Enabling Legislation, the Point Reyes Act, the Park Service's Organic Act, and the National Park Service and Related Programs Act-the National Park Service is obligated to manage the Point Reyes National Seashore consistent with the overriding legal mandates that the National Seashore's wildlife and natural resources receive "maximum protection" and be left "unimpaired for the enjoyment of future generations." 16 U.S.C. § 459c-6(a); 54 U.S.C. § 100101(a) (previous version at 16 U.S.C. § 1). Only Alternative F, which phases out ranching, can comply with these legal mandates. Ranching within the National Seashore is not mandated by any law, and in fact was intended to be phased out under current law (see Pub. L. No. 95-625, § 318(b), 92 Stat. 3487 (1978) (codified as amended at 16 U.S.C. § 459c-5(a))), and so choosing any alternative that allows the continuation of ranching and other activities that hinder the legal mandate to provide maximum protection to wildlife and natural resources in Pt. Reyes National Seashore violates federal law.

2. Any ranching activities that continue polluting the designated Phillip Burton Wilderness, and especially Drakes Estero, violates federal laws.

The Park Service, in the DEIS, admits that cattle grazing and ranching operations have caused and are continuing to contribute to water quality degradation through manure and waste runoff, which includes polluted runoff into Drakes Estero and other portions of the Phillip Burton Wilderness. These discharges violate the Wilderness Act. Moreover, the Park Service has failed to analyze the adverse effects from the runoff/pollutants on the wilderness character or natural conditions in the Drakes Estero and other portions of the Phillip Burton Wilderness.

In 1976, Congress designated more than 33,000 acres, or nearly half of the National Seashore, as Wilderness and potential Wilderness. See Pub. L. No. 94-544, 90 Stat. 2515 (1976); Pub. L. No. 94-567 § 1(k), 90 Stat. 2692, 2693 (1976). This included Drakes Estero; and with the removal of the oyster racking the Estero became fully protected as wilderness.

The Wilderness Act defines Wilderness as an area that is "protected and managed so as to preserve its natural conditions ...." 16 U.S. Code § 1131(c). These natural conditions are being degraded by the continued discharge of nitrates, e-coli, and other pollutants from ranching operations. Moreover, these discharges adversely affect the wilderness character of Drakes Estero and other portions of the Wilderness, in violation of the Wilderness Act.

3. The DEIS has failed to conduct an adequate analysis on the effects of continued subsidies on other dairy and ranching operations outside Pt. Reyes, which violates NEPA.

Effects from continued subsidies in the form of reduced fees and favorable lease terms on the local operations of competing dairies and ranches has not received a proper analysis in the DEIS. In its environmental and economic analysis for a new general management plan, the National Park Service must consider the economic impacts of ranching on the dairy industry both locally and regionally. The current proposal and ongoing subsidies in the form of below-market rate grazing fees and leases force us-the owners of this National Park-to subsidize dairy operations on public lands, since ranchers are charged significantly lower grazing fees and receive favorable leases in Point Reyes as compared with nearby private land operations.

Dairies in Marin County and regionally, outside of Pt. Reyes, are struggling. Dairy farms in Marin, outside the park, may not survive the pressures on the organic-milk market. See <http://tinyurl.com/y8jlluea> (Sept. 7, 2018, North Bay Business Journal). And Marin's dairy price slump is dragging the farm sector down. See <http://tinyurl.com/y8me7lg3> (June 22, 2018, Marin IJ). The current subsidies in Pt. Reyes means we are propping up an industry in a National Park that dumps more milk into a slumping market to the detriment of nearby private dairy operations. The Park Service must consider and study these economic impacts as part of the analysis.

I urge the Park Service to ALTERNATIVE F: NO RANCHING AND EXPANSION OF TULE ELK IN THE PLANNING AREA. This is the only long-term sustainable alternative that protects our National Park as required by law and the original intent of creating Pt. Reyes National Seashore as a National Park.

Respectfully,

René Voss

Point Reyes GMP Amendment EIS Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

RE: Comments on General Management Plan Amendment EIS for Point Reyes National Seashore

Dear Superintendent,

WildCare is a nonprofit organization located in Marin County. Our programs include a licensed wildlife hospital, environmental education, advocacy and humane nonlethal wildlife conflict resolution. Our programs and services extend to all nine Bay Area counties. Every year we treat nearly 4,000 wild animals of more than 200 species in our wildlife hospital, and educate over 35,000 children and adults through our environmental education programs.

On behalf of WildCares 20,000 members and supporters, I am writing to provide comment on the General Management Plan (GMP) Amendment EIS for the Point Reyes National Seashore (PRNS).

The public lands of PRNS are hunting and feeding grounds for predatory birds and mammals, and many other species of wildlife including Tule elk. The Park Service's Amendment to the General Management Plan EIS must prioritize protecting these natural resources of PRNS.

Any cattle-ranching and other agricultural operations on these public lands must be managed to accommodate elk and other native wildlife, and should not harm wildlife habitat. We are opposed to the removal of any Tule Elk from PRNS. Commercial lease-holders should not be allowed to dictate removal or exclusion policies of wildlife on our public lands. Like any other property owner or tenant, when the lease holders activities carried out on the property attract unwanted attention from wildlife, the lease holder must bear the responsibility to mitigate those attractants and/or to restrict access.

We urge you to reject any conversion of National Park lands to row crops or expansion of commercial livestock farming to introduce sheep, goats, turkeys, chickens or pigs. Any conversion of these public lands to agriculture will only increase conflicts with wildlife, and further degrade wildlife habitat and water quality.

We appreciate the opportunity to provide our comments on the GMP EIS and encourage the National Park Service to protect and preserve wildlife, including the entire PRNS population of Tule elk, as well as to have the insight to implement a humane, long-term and sustainable plan which requires tenants to mitigate any conflicts with wildlife, including the growing population of Tule elk-wherever they may roam.

Sincerely,

Ellyn Weisel Executive Director

Correspondence: Comments on the alternatives to the Point Reyes National Seashore Draft General Management Plan EIS

The overarching question regarding the EIS alternatives to the PORE GMP are as follows

what was the original intent of the PRNS enabling legislation How was this affirmation altered to allow continued ROU for dairy and beef operations What is the highest use of this public land for the use and enjoyment of the public

Clearly, the intent of Congress was to preserve and protect for the use and enjoyment of the public of disappearing undeveloped coastlines of the United States. This is evident given that Congress authorizes set terms of ROU and SUP to ranchers of 25 years and in some cases 30 years or to be terminated upon the death of the the owner and/or spouse. While there have been amendments, to these terms over the years, that does not preclude further amendment of the legislation to insure the higher purpose of this public land

In addition to the amendments, there are questions regarding how the decision was made at the expiration of the ROUs in 1987 to extend them as leases.

Lastly, in this age of climate change, what is the highest and best use of this land. Cattle ranching at Point Reyes has contributed to the destabilization of major ecological and hydraulic systems within the seashore. Dairying contributes considerably to the discharge of methane, a gas more powerful than CO<sub>2</sub> in trapping heat in the atmosphere. Dairying requires continual migration daily to concentrated location that poses severe impact to soil and water resources. Supplemental feeding of dairy cattle has also contributed to the use of till/no-till production of forage crops that have introduced invasive plant species and contributed to soil erosion. The Seashore has dedicated considerable resources over the years combating invasive plant and animal species, restoring damaged streams, revegetating impacted areas and reintroducing threatened and endangered apex species extricated by ranching operations.

To state my concerns in a nutshell; the ranchers were paid substantial sums of money for the purchase of their land with the ability to continue their occupation for a time certain in exchange for the tax payer dollars they received. The overarching intent of Congress was to preserve and protect the Seashore for the use and enjoyment of future generations. Also, the original intent of the enabling legislation pertained to ranching and dairying, not the production of pigs, chicken, goats or other domestic species. It seems counter productive to perpetuate an activity that entails significant disruption to the native ecosystem while at the same time contributing to the destabilization of the climate.

Given all of these concerns, of all the alternatives presented in the Draft GMP EIS; Alternatives E and F are the most appropriate and inline with the NPS mission and would contribute, in a small but important way in leading toward a more sustainable future.

GMPA EIS C/o Superintendent Cecily Muldoon Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

RE: Point Reyes National Seashore General Management Plan Amendment - Draft Environmental Impact Statement Review Comments

Superintendent Muldoon:

Marin Agricultural Land Trust (MALT) was founded in 1980 to protect Marin's agricultural land for agricultural use. Over the past 39 years, MALT has invested over \$89 million to permanently preserve the agricultural utility and natural resources on 86 Marin farms and ranches totaling more than 54,000 acres. MALT works regionally with agricultural landowners and public and private partners to support and enhance agricultural viability and sustainability. One-third of Marin County's land is in productive agricultural use, including approximately 28,000 acres in Point Reyes National Seashore (PRNS) and the Golden Gate National Recreation Area (GGNRA). These family farms and ranches and the agricultural landscape they occupy are fundamental parts of the extraordinary and unique history, culture, environment, economy and character for which West Marin, Marin County and PRNS are known regionally and nationally. MALT Supports NPS's Preferred Alternative (Alternative B) Subject to the comments below, MALT supports the National Park Service (NPS) preferred alternative (Alternative B) identified in the Draft Environmental Impact Statement (DEIS).

1. Establishment of 20-year leases. Preferred Alternative B contemplates the establishment of 20-year leases for the existing agricultural operations within the planning area. MALT agrees with the establishment of 20-year leases because they will give the operators the certainty of tenure necessary to invest in the long-term success of their operations, including necessary ranch infrastructure improvements, improvement and diversification of agricultural operations and improvements to natural resource values. Assurance of tenancy through 20-year leases is critical to the ranchers' ability to secure financing, make necessary improvements, and implement beneficial stewardship practices. The Marin Resource Conservation District and the Natural Resources Conservation Service (NRCS) require 10-20 year maintenance and monitoring agreements to qualify for their programs. However, the DEIS does not address what happens to the leases established by the General Management Plan Amendment (GMPA) after the conclusion of the proposed 20 year lease period. The DEIS dismissed analysis of rolling leases because they have "no fixed termination date," are "... not consistent with ranching in a setting as complex as the planning area...", and "...the 2013 Secretarial delegation of authority to NPS and Congressional guidance directed NPS to consider issuing leases with 20-year terms." NPS has provided a copy of the Draft Agricultural Lease/Special Use Permit (draft lease) in response to prior public comments. The draft lease, on page 9, Section 5.3 contemplates an extension of the lease:

"5.3 Six months prior to the Expiration Date of the lease, NPS may offer this lease, or a similar lease, to Lessee. If Lessee fails to execute a subsequent lease prior to the Expiration Date, the Provisions of this Lease regarding Lessee's obligations to surrender and vacate the Premise shall apply. Lessor has no obligation to offer a subsequent lease to Lessee."

The DEIS does not address the conditions necessary for NPS to "offer this lease or a similar lease, to Lessee." Nor is it clear what the term of a subsequent lease may be. This will lead to uncertainty for the future of ranching operations in the planning area after the 20 year leases reach their term and could lead to unnecessary future litigation. The public should understand the conditions and terms of "this or similar lease" that may be offered to the lessee as well as the conditions that would lead NPS to not offer such lease to the operator(s). MALT strongly recommends that NPS address this issue in the final GMPA EIS. The MRCD and NRCS require 10-20 year maintenance and monitoring agreements to qualify for their programs. The preferred alternative should include 20-year rolling leases, which would enable lessees to qualify for these programs on a consistent basis and make them more eligible for bank loans to fund necessary improvements. MALT's recommendation is that NPS commit to rolling the leases over through a 20-year renewal process, with at least one year of advance notice, if the lessee meets all existing lease and ROA performance standards.

2. Lease appraisal process. Under the NPS preferred alternative (Alternative B) NPS proposes to implement a "master appraisal process managed by the US Department of Interior (DOI) to determine the FMV for park ranch operations." MALT staff could not find guidelines for such "master appraisal process" on the DOI's website or in the Uniform Standards of Professional Appraisal Practice (USPAP). Without a clear guide, the "master appraisal process" will likely lead to lease values that are fair for some leases but may not be economically viable for others and could make leases unaffordable for some operators. The final EIS should clearly explain the appraisal process for the proposed 20-year leases. MALT encourages NPS and DOI to design an appraisal process that is equitable to all of the lessees, given the significant mitigation measures that would be required for ranching activities authorized under the preferred alternative. The costs of implementing these measures should be considered for each lease when DOI appraises the value of the potential leases.

3. Stewardship of agricultural lands in the planning area. The NPS preferred alternative (Alternative B) identifies future authorized activities within the planning area, including modest agricultural intensification in the Ranch Core and Pasture planning subzones. The DEIS requires mitigation measures be incorporated into individual Ranch Operating Agreements (ROAs) for each activity. Further, many mitigation measures require consultation with NPS staff before activities can occur. Specific activities for each of the 31 leases will be authorized in the ROA for each lease and there seems to be no comprehensive planning effort designed to be completed for each ranch. MALT recommends that NPS make it clear through the GMPA and EIS that lessees in the planning area are allowed to work with qualified resource professionals, including the Marin Resource Conservation District, the Marin Carbon Project and/or USDA NRCS to complete conservation plans or carbon farms plans for their lease. MALT believes these plans will help NPS and the lessees to write ROAs that appropriately mitigate activities authorized in the planning area.

MALT also recommends the GMAP and final EIS specifically authorize "carbon farming," an important new planning process that identifies a collection of practices designed to maximize the land's ability to sequester carbon and reduce greenhouse gas emissions while making farmland more resilient to a changing climate. A Carbon Farm Plan outlines all of the practices that a particular ranch can use to sequester carbon and reduce greenhouse gas emissions. Some of these practices are big long-term goals, while others may be near-term priorities. A Carbon Farm Plan serves as a guide for a rancher to see the potential climate benefits on their property, the many other benefits these practices can have on their productivity and the environment, and potential funding partners to help implement these practices. Carbon farming practices also provide many co-benefits beyond sequestering carbon and reducing greenhouse gas emissions. Practices are designed to benefit the natural environment and the agricultural operation. Some examples include:

- Increasing carbon in the soil reduces soil erosion, promotes plant growth, and helps the soil hold on to more water. That means plants can grow longer into the dry summers, produce more forage for livestock and sequester even more CO<sub>2</sub>.
- Restoring creek vegetation increases wildlife habitat, stabilizes creek banks, improves water quality and helps slow down and soak up heavy water flow.
- Rotational grazing promotes vigorous grasslands with deep roots, encourages native grassland species and improves productivity.
- Planting diverse windbreaks and hedgerows provides shelter to livestock and reduces the drying effects of wind, allowing pastures to stay green longer into the summer. They also increase wildlife habitat and provide species for native pollinators.
- Using a methane digester for manure generates gas that can be burned for electricity and results in a more stable waste stream for applying back to the land.

Information on USDA NRCS conservation planning services can be found at:  
<https://www.nrcs.usda.gov/wps/portal/nrcs/main/national/technical/cp/>

4. Succession. Separate from the DEIS, NPS has provided a draft "Succession Policy for Ranch Operations within the Ranchland Zone for Point Reyes National Seashore and the North District of Golden Gate National Recreation Area" that would be used in the event "that named Lessees: (i) do not wish to enter into a lease/permit; (ii) cannot agree upon an arrangement among named lessees for continued operations under a new lease/permit, (iii) have not consistently met performance standards for the agricultural operation and other named Lessees are not willing to take on responsibility for improved operations;" MALT applauds the draft succession plan because it would help to ensure the succession from current to future agriculturalists in the planning area and puts a clear emphasis on selecting those producers that have a proven track record of operating pursuant to their ROAs. We recommend that the GMPA and final EIS specifically include this succession plan so the public can be aware of the terms and conditions of lease succession.

5. Management of Tule Elk. Management of Tule Elk has become an issue of concern for the public and the agricultural community, and rightly so. In prior planning and management documents, NPS did not contemplate or plan for expansion of the elk into the pastoral zone. Lack of funding for ranch improvements and the uncertainty caused by not having long-term leases helped lead to the unplanned establishment of these herds. Wilderness designated lands and leased ranchlands should be given equal protection corresponding to their intended use and purpose. Intended for nature preservation, wilderness areas are managed by NPS resource specialists. Conversely, leased ranches are intended to be managed for agricultural use by the lessee, with support from NPS staff. There should be little allowance for shared resource use and management styles between them. When livestock are found in Wilderness, they are removed. Likewise, when Elk are found on leased ranches, management methods should be used to control their population and remove their impacts.

6. Appendix D - Mitigation Measures. A partner in the long-term stewardship of Marin County's agricultural land, MALT appreciates the fifty-two pages of best management practices and mitigation measures included in Exhibit D. As these mitigation measures are "mandatory when implementing any of the activities" allowed in the planning area, the GMPA and final EIS should incorporate an "adaptive management" framework that would allow the practices and mitigation measures to be updated over time. Both NRCS and MRCD update their practices periodically to keep up with current science and industry standards.

7. Costs of implementing mitigation measures. The DEIS does not provide the lessees or the public with any guidance on how the implementation of mandatory mitigation measures will be funded. Many of the mitigation measures required in the Appendix D require a species level survey performed by a "qualified biologist." For example, regarding American badger, the document states in part, "conduct a preconstruction survey for the American badger prior to beginning work" (D-28). In addition, regarding Myrtle's silverspot butterfly, the documents states, "For all ranch activities, reconnaissance-level surveys would be performed by a project biologist to determine whether suitable habitat for Myrtle's silverspot butterflies is present in the project area" (D-30). MALT agrees that activities in the planning area should follow appropriate best management practices and mitigation measures but is concerned that lack of funding will prevent activities authorized by the DEIS. MALT recommends that the GMPA and final EIS identify sources of funding, including NPS funds, to assist the lessees with implementation of the mitigation measures.

8. Appendix D - Page D-4 Windbreak and Shelterbelt Establishment (380). Here, NPS identifies one of the many NRCS conservation practices that benefits soil and water retention, sequesters carbon and provides wildlife benefits. The practice as presented is modified to allow only "maintenance of historic windbreaks..." MALT suggests that NPS consider allowing the establishment of new windbreak or shelterbelts within the Pasture and Ranch Core subzones.

Thank you for considering MALT's comments to the GMPA Draft Environmental Impact Statement.

Sincerely, Jamison Watts Executive Director

Re: Comments to Point Reyes National Seashore GMPA/EIS

I have lived in San Francisco for 17 years and have spent many beautiful days in Point Reyes National Seashore (PRNS). Over the years, friends from all over the world have visited me and Point Reyes National Seashore is one of the places that I make sure to bring them so that they can see and experience the beauty of this area and all of the wonderful wildlife that we share our environment with. Without exception, they are amazed at the beauty of Point Reyes and are always confused as to why there are cattle grazing in the park.

I have read the Draft General Management Plan Amendment and EIS and am disappointed that the Park Service has selected Alternative B as the preferred plan. I believe that no real consideration has been given to the any of the plans that would result in a phase out of the ranches. Questions that came to my mind when reading the alternatives are:

Length of leases: It is stated in Alternative B that, "NPS would issue lease/permits with up to 20-year terms to the existing ranch families to continue beef and dairy operations on approximately 26,100 acres." How are the lengths of each lease determined? What are the parameters used to determine the lengths of each lease? This statement is vague and offers the public no way of knowing what is required of the ranch operators for them to qualify for a lease renewal and for how the length of the lease is determined. Expansion of Ranchland zone: If Alternative B is implemented, the Ranchland zone would be expanded. Why? How does expanding the area open to beef and dairy operations benefit the public? There is no explanation provided as to why this expansion is needed or justified. It is common knowledge that tourism brings in millions of dollars in revenue each year. If ranching was phased out, the NPS states in Alternative F that, "...there could be additional opportunities for use of some of the vacant ranch complexes to support a higher level of visitation such as a car-camping campground, larger trailhead, and other visitor facilities." This would bring even more revenue for the park, and if done correctly, without a high environmental burden.

Soil degradation: One does not need to be an expert to understand the affects that grazing and dairy farming are having on the land at PRNS. The impact of the weight of these non-native species, the amount of grass they

consume, and the amount of manure the produce is clearly noticeable in the muddy, sparse fields they inhabit. According to the NPS, "Under alternatives A, B, C, and D, activities associated with beef and dairy ranching would continue to affect soils because of erosion, compaction, and alteration of soil fertility, primarily from livestock grazing, forage production, high intensity use areas, and manure spreading." Conversely, "Under alternative F, cessation of ranching would eliminate all impacts on soils associated with ranching activities. Impacts from public use and enjoyment and elk management under all the alternatives would be minimal in intensity and limited in scale." With so few wild spaces left, why would the NPS choose the alternative that would allow the continued degradation of the land when there are so many positive alternatives for the land that would benefit the public, the wildlife at PRNS, and the quality of our environment?

Water Quality: The NPS admits that cattle grazing and dairy farming negatively affect the watersheds in the area. The high amounts of E coli present in the area as a result of cow manure has the potential to negatively affect the elephant seals and the Coho salmon, as other wildlife that call PRNS home. NPS states, "Under alternative F, impacts on water quality would be noticeable, long term, and beneficial because ranching activities would be phased out across the entire planning area. Under all alternatives, public use and enjoyment and elk management actions could have short-term, adverse impacts on water quality in localized areas in the planning area." Public use and enjoyment and elk management actions could have adverse impacts on water quality, but if foresight was used, this could be avoided. What we know definitively is that the current use of the land by beef and dairy farmers is having a tremendously negative impact on water quality. Why then does the NPS intend to not only continue these activities, but also to expand them? The NPS has not been able to adequately address the adverse effects the beef and dairy operations in NPRS currently have on the watershed, what is its plan to mitigate the increased impact the expansion of ranching will have?

Tule elk: The Tule elk is a species that is endemic to the PRNS. People from all over the world are in awe at the sight of these majestic animals. Because they are endemic, they add to the quality of the environment and help to balance an ecosystem. This cannot be said about the cows that inhabit PRNS. Alternative B calls for the lethal management of the Tule elk, and if implemented, would put the Drake Herd in immediate danger of culling. It is unclear to me who or what agency would be responsible for culling these animals. Would NPS employees be responsible, would hunting tags be provided to the public, or would an outside agency be contracted to conduct the culling? Additionally, it is unclear how the public or the ecosystem at PRNS would benefit for a reduction in the amount of Tule Elk and the expansion of ranching activities.

In addition to the points I have made above I am also concerned about the planting of non-native grasses in the park, the mowing of these grasses (which result in wildlife being killed), the treatment of the cattle, and the working conditions for ranch employees.

I am deeply disturbed that when I visited the public comment meeting in Sausalito there was an overall sense that the NPS has already made its decision and that the meeting was simply being held as a song and dance to make the public feel as if their voices were being heard. The manner in which the meeting was held did not allow for information to be clearly provided by the NPS as one had to queue up to speak to NPS employees. It was difficult to hear and crowded - these conditions did not allow for an adequate opportunity to discuss the matter nor to record comments the public had to offer. At no point in the Draft General Management Plan Amendment and EIS did the NPS adequately explain why they prefer Alternative B. I think the public has a right to this information.

In conclusion, I am formally voicing my opposition to the implementation of Alternative B and my support for Alternative F.

Thank you, Susan A. Larsen

Correspondence: I have been a frequent visitor to Pt. Reyes National Seashore for 20 years, and have seen

dramatic changes over the years due to ranching activities. The Pt Reyes ecosystem provides visitors with opportunities to see a multitude of bird species, bobcats, coyotes, Tule elk, seals, and even whales just offshore. I am angry when I see the cattle feed lots, with their lack of vegetation, that seem to be growing in size. There are plenty of places outside Pt. Reyes to see pastoral grazing of cattle - - Pt. Reyes National Seashore's draw is the pristine natural environment - - not cattle viewing.

Pt Reyes National Seashore is supposed to be managed under the Point Reyes Act for "maximum protection, restoration, and preservation of the natural environment." Not for the benefit of commercial agricultural activity.

I support Option F - - No Ranching - Ranches should be phased out, and until then, ranchers should be charged market rate use fees - they should not be subsidized by taxpayers. - No new agricultural activities should be permitted that will further disturb the natural environment. - Wildlife should take priority over ranching - providing park visitors the opportunities to experience this unique ecosystem in its natural state. - Wildlife habitat that's been destroyed by ranching should be restored to its natural condition to support a broad spectrum of wildlife. - Historic buildings can be utilized as facilities for park staff, research, and public education.

Name: Israel, Paula

Correspondence: I am opposed to the proposed destruction of the Tule Elk herd at Point Reyes. This is public land, intended to be wild, and allowing ranchers to lease the land and dictate the killing of competing grazing animals like the elk is indefensible. Just as the park service kicked out the oyster farmers (despite evidence that they actually improved the water quality) due to an expired lease, the cattle ranchers have over-stayed. Cattle ranching is known to be quite destructive for the environment and an exceedingly expensive source of protein. Additionally, a national park should belong to the citizens and resident wildlife to enjoy, and not be a private money making concern for a few agricultural concerns.

#7272

Name: M, S

Correspondence: This is such a terrible tragedy and an idea that is always destructive. Destroying native and natural species for private interests is short sighted and should not be tolerated.

Point Reyes National Seashore

One Bear Valley Road

Point Reyes Station, CA 94956

Re: Point Reyes National Seashore and North District of Golden Gate National Recreation Area General Management Plan Amendment, Public Scoping

Dear Superintendent Muldoon,

The draft environmental impact statement (EIS) for a general management plan amendment (GMP Amendment) for Point Reyes National Seashore (Point Reyes) and the north district of Golden Gate National Recreation Area

(north district of Golden Gate) proposes Alternative B, as the preferred alternative in the General Management Plan for Point Reyes National Seashore. In reviewing Alternative B, it contains several inaccurate statements and noticeably lacks the scientific basis for the implementation of new practices to better manage the natural resources at Point Reyes. Several points in Alternative B are not based on peer-reviewed science, it presents an unbalanced approach that will not sustainably support diverse resources and values, including historical agriculture, ranching, and natural resources. Concerns are listed in the following comments.

#### Appendix H: Subzone Definitions and Selection Criteria

The extent of the range subzones was determined by using existing landscapes attributes and buffering them by 35 feet; zones created to protect resources that include threatened and endangered species or critical components of their life cycle (e.g., California red-legged frog, Myrtles silverspot butterfly, etc.). There is no basis for the creation of these zones, there is no cited scientific research to support their creation nor the selection criteria. The creation of subzones, Range Subzones and Resource Protection Subzone, have been arbitrarily assigned and are not based on any resource determination. In fact, the removal of grazing in these zones could actually detrimentally impact the natural resources that Appendix H is supposed to protect. Removal of grazing will impact native biodiversity, including the listed special-status species. These special-status species are likely to decrease with removal or decrease of managed grazing. Research and experience have shown that grazing is strongly linked to maintaining habitat for some special-status species on PRNS lands, while results have been not been conclusive for others. In all cases though, managed grazing has proven compatible with preservation of the special-status species found at PRNS (Table 1).

Table 1. Special status plants that occur in grazed areas at PRNS (Federally listed plant species per USNPS 2001, and California Native Plant Society plant species per Bob Soost, 2004)  
Federally listed as threatened or endangered

#### Common Name Scientific Name

Sonoma alopecurus *Alopecurus aequalis* var. *sonomensis*

Sonoma spineflower *Chorizanthe valida*

Tiburon paintbrush *Castilleja affinis* ssp. *Neglecta*

Marin dwarf flax *Hesperolinon congestum*

beach layia *Layia carnosa*

Tidestroms lupine *Lupinus*

Tidestroms lupine *Lupinus tidestromii*

California Native Plant Society rare

Point Reyes horkelia *Horkelia marinensis*

Point Reyes meadowfoam *Limnanthes douglasii* ssp. *Sulphurea*

Sonoma alopecurus (*Alopecurus aequalis* var. *sonomensis*) is found in eight naturally occurring populations in Sonoma and Marin Counties; the four sites in Marin County all occur at PRNS and are all grazed by cattle. One historic colony that was located near Bolinas disappeared following the exclusion of cattle from the site (US Fish & Wildlife Service, (USFWS) 2002). The largest occurrence of Sonoma alopecurus at PRNS is on the former AT&T Ranch, which has been grazed for many decades.

Sonoma spineflower is found solely in a grazed pasture at PRNS. A masters thesis completed in 1992 on the ecology of Sonoma spineflower concluded that grazing of competitive, non-native plants had a positive influence on Sonoma spineflower survival (Davis 1992a and 1992b; USFWS 1998). Tiburon paintbrush and Marin dwarf flax occur on serpentine grasslands, with six occurrences of Marin dwarf flax on GGNRA grazing lands. PRNS staff concluded Marin dwarf flax may benefit from a moderate level of cattle grazing through the reduction of taller competing vegetation as the flax is subject to shading by competing grasses or may be suppressed by a buildup of thatch from previous years herbage if left ungrazed. (USNPS 2001). Beach layia and Tidestroms lupine are found in dune habitats. They do not appear to be dependent on grazing, though many of their occurrences are within grazed pastures (USNPS 2001). Point Reyes horkelia and Point Reyes meadowfoam are also found primarily within grazed areas (Bob Soost, 2004, personal communication).

UCCE highlighted the relationship of grazing to some threatened and endangered species in a report (Rilla and Bush, 2004). The report addressed Myrtles silverspot butterfly, which inhabits coastal dunes, prairie, and scrub.

Habitat suitability depends on numerous factors, but two critical components are the presence of its larval host plant, the native dog violet (*Viola adunca*), and adult nectar plants including numerous native wildflowers, as well as common weeds such as bull thistle (*Cirsium vulgare*) and Italian thistle (*Carduus pycnocephalus*). Most of the Myrtles silverspot butterflies documented at PRNS have been found in areas that are grazed either by cattle or tule elk. Butterfly surveys done by PRNS staff in 2003 showed occurrences of Myrtles silverspot on 13 ranches, all of which support livestock operations (Adams 2004). Recent research on Myrtles silverspot (Adams 2004; USNPS 2007) documents that Myrtles silverspot and cattle have co-existed for over a hundred years, and that the density of the nectar sources was higher in grazed areas. Biologists studying the Myrtles silverspot at PRNS recorded more butterflies in grazed dunes and grasslands than in ungrazed plant communities.

At PRNS, in managed grazing areas, numerous springs and ponds have been developed to capture runoff to water for livestock. The springs and ponds help to more evenly distribute the forage consumption by cattle across a pasture. The springs and ponds also provide drinking water for many wildlife species some of which, as discussed above, are rare species that coexist or are enhanced by grazing and the development and maintenance of ponds and springs. In riparian areas such as creeks, good range management may call for fencing to prevent heavy grazing of riparian vegetation, but exclusionary fencing may not always be the best solution.

Under Alternative B, there is no plan to exclude elk from resource protection subzones. At Yellowstone National Park, the lack of management of elk caused damaged to riparian areas. In order to manage the elk grazing, the Park introduced wolves into the ecosystem, resulting in the recovery of vegetation in riparian areas; photographs taken at a variety of locations showed considerable recovery of aspen in areas where it had become overgrazed in the years when elk were abundant (Ripple and Beschta, 2012, Ripple and Beschta, 2007). Although these riparian areas cover only a small area of the ecosystem (<2%), the park witnessed the first significant growth of aspen for over half a century. More recent data suggest that similar recoveries are being seen in cottonwoods and willows (Ripple and Beschta, 2012); this in turn has led to an increase in the abundance and diversity of riparian bird species (Hollenbeck and Ripple, 2008).

Rangelands have evolved from disturbances, such as grazing, and the removal of managed grazing by cattle can result in the loss of several threatened and endangered species. The removal of grazing in the 1980s and 1990s and into the early 2000s, was deemed detrimental to certain species (US Fish & Wildlife Service, (USFWS) 2002) and done in an effort to conserve threatened and endangered populations (special status species). Livestock grazing was reintroduced to protect the species that were supposed to be saved by removing grazing. Point Reyes is home to 20,000 acres of coastal grasslands made up of native and non-native species. The creation of these subzones will not protect the special status species that Appendix H claims to protect.

In addition, the reduction of cattle grazing lands through the resource protection subzone will result in increased brush lands at PRNS, with coyote brush likely becoming more abundant species. Coyote brush, *Baccharis pilularis* DC., although a native species, can over take areas resulting in the loss of other native species. It can be a problem in range or pastures (Robbins et al., 1970) and will displace other desirable vegetation if not properly managed. This occurs through managed grazing, not grazing from unmanaged wildlife.

Coyote brush's successional status varies with habitat type (Williams and Hobbs, 1989). It invades and colonizes grassland replacing annual grasses (da Silva and Bartolome, 1984; Steinberg, 2002). This is correlated with the absence of managed grazing and the rate of invasion increases with precipitation, because wet springs maximize early root growth. Range management practices are known to be effective for improving forage quality and quantity; management using tools including fire, mowing, grazing and planting rangeland forages have resulted in preserving the lush, productive, and biodiverse grasslands. Both native and non-native brush species require management in coastal prairie grasslands. Without brush control, the grasslands will likely become lost to brush invasion. This loss of native habitat due to brush invasion has already been demonstrated at PRNS in areas where NPS has removed ranching. In these subzones, PRNS proposes to remove even more grazing from currently managed grazing lands.

As climate change continues to affect California, creating drier conditions and prolonging the fire season, employing the best land and natural resource management practices for reducing invasive species and fire fuel loads will be critical to decreasing the risk and impacts of wildfires at Point Reyes and the surrounding communities. Rangeland ecologists and watershed managers understand that nutrients and sediments are better controlled and better treated by grass-covered soil than brush covered soil. The bare soils often found in the shade of the invasive brush allow water to travel more quickly and with less soil absorption and less plant nutrient uptake. At Point Reyes, coyote brush encroachment is overtaking natural resource areas and will lead to reduction of special status species.

Alternative B does not consider the importance of managed grazing by cattle in the newly created subzones; it conversely seeks to reduce the amount of areas that are currently grazed. Regenerative ranching, which promotes biological diversity in these lands, can provide a balanced habitat. Just as a system needs a diverse group of grasses, a diverse group of trees and shrubs can contribute to the diversity in soil microbes possibly raising our levels of carbon sequestration. Within PRNS, coyote brush has invaded much of the grassland area, and should be an important management goal for Point Reyes. Using managed grazing, with ranchers, will achieve this goal. Ungrazed areas over time can result in a buildup of dead grass on the other side of the fence where grazing is excluded, and a thick mass of dead grass forms that prevents native plants from germinating and growing. The mass of dead grass can be overcome by invasive species such as coyote brush and Himalayan blackberry. The buildup of dead grass results in a less than healthy system, which could lead to increased erosion, reduced nutrient and water cycling and increased fire hazards. On managed grazing lands, ranchers have implemented practices that are beneficial to water quality, soil health and biodiversity. Ranchers have spent their own money to maintain and improve rangeland and watershed conditions in cooperation with the U.C. Extension Service, U.S.D.A. Natural Resource Conservation Service, and the National Park Service.

## Elk Management

In 1978, PRNS reintroduced tule elk (*Cervus canadensis nannodes*), the only National Park unit where tule elk can be found. The State of California provided the initial elk re-introduced to Tomales Point; state wildlife biologists were integral members of the team that managed the re-introduction and subsequent monitoring. The plan stated that forage is unaffected by the number of elk occupying the range and elk do not have a strictly negative effect on vegetation. However, in 1999, PRNS moved a free-range herd of 28 elk from Tomales Point to the wilderness area near Limantour Beach. Within weeks, a few elk unexpectedly migrated to ranches in the designated pastoral zone.

Point Reyes National Seashore has attempted to manage elk habitat and their movements in the pastoral zone, but only by hazing. PRNS conducts elk hazing on a daily basis, but the elk have habituated to certain locations and return after the hazer leaves. This is not a natural way to manage elk, which are in the pastoral zone because they prefer the grass as opposed to brush encroached habitat of the Wilderness areas. Efforts to encourage better elk distribution in their designated areas would not only benefit them, but also the livestock and dairy producers along with sensitive natural resources areas at PRNS. Herds at Limantour and Drakes Beach are much less natural, inasmuch as they are being artificially supported by the ranchers fertilized fields and managed water supplies (Fimrite, 2015). As biologist Dale McCullough stated, there is nothing to stop the expansion of these southern herds except human interface&If ranchers are improving the range that will be even more attractive to the elk than the natural vegetation, especially during the dry season (Watt, 2015).

Elk migration and feeding behaviors have been studied extensively in Idaho (Dalke et al., 1965; Unsworth et al., 1998), Washington (Schwartz and Mitchell, 1945; McCorquodale, 1993), Montana (Edge et al., 1987), Yellowstone National Park (Boyce et al., 2003; Mao et al., 2005), and Rocky Mountain National Park (Green and Bear, 1990). Elk feeding behavior is largely influenced by forage quality. Low quality forage reduces daily feeding time and high-quality increases feeding time (Green and Bear, 1990). PRNS experiences different seasonal variations in forage quality due to a rainy winter and spring seasons and drier summer season, producing higher quality forages during spring, potentially inverting the expected feeding behavior in elk. The winter period also accounts for the time dairymen pasture their cows to meet the 120-day, 30% dry matter intake requirement from pasture for organic certification (Rinehart and Baier, 2011). Increased elk grazing during the same period that cattle are expected to graze presents management concerns for forage competition. Elk and beef cattle summer diets overlapped by 42% in Colorado (Hansen and Reid, 1975) and 46% in Nevada (Beck and Peek, 2005). They have also been reported as socially compatible (Wallace and Krausman, 1987), potentially influencing the amount of time elk spend grazing cattle pasture. Elk habitat selection was primarily driven by cattle use, distance from the nearest visible road, forage biomass, and distance to cover (Grover and Thompson, 1986). Cattle use and the greater available biomass on cattle pasture likely increase use of the pastoral zone.

Road usage and tourism should decrease elk pastoral zone use; however, as PRNS is a public destination, familiarization with park guests and ranch activity may reduce the behavioral necessity for elk to avoid trafficked areas. Increased habituation may result from food conditioning, natural tolerance, predator refuge, and habitat occupancy by humans (Found and St. Clair, 2016). Habituation of wildlife to people, while a benefit for wildlife viewing in tourist trafficked areas, can lead to ecosystem damage, result in human-wildlife conflict (Walter et al.,

2010), and increased elk habitation on ranching lands. Alternative B recommends increased public access on permitted, grazing lands. While ranchers are open to educating the public about their operations and agriculture in Marin County, this will be yet another challenge to their already limited ability to maintain a viable agriculture operation.

Increased use of ranching lands may also be encouraged by preference of elk to graze and rest on open meadow compared with forest (Collins and Urness, 1983), improvements to forage quality on lands grazed by cattle (Anderson and Scherzinger, 1975; Grover and Thompson, 1986), and the increased forage management on intensively managed cattle pasture. Typically, the negative impacts of elk cohabitation with cattle are offset through revenue generation with hunting (which is proposed in Alternative B but only at 10%). Elimination of potential benefits of co-grazing for ranchers creates a need to improve elk habitat outside of the pastoral zone. Unmanaged grazing, results of a free-ranging elk herd has shown to result in over grazed and under grazed areas. Alternative B has not taken into account the value of ranchers management, and instead has reduced the grazing land that ranchers managed. This is a similar management strategy, and as with the wild horse management strategy, excessive populations have depleted scarce food and water resources on rangelands, leading to starvation and dehydration of the horses and burros. A similar situation occurred at PRNS; one that will occur again with the elk management plan outlined in Alternative B.

In 1998, Point Reyes National Seashore adopted their Elk Management Plan; in that plan the Park states there will be careful monitoring of both elk and threatened and endangered species is important to ensure that the Seashore's management of elk is not harming T&E species. There has been no monitoring of the elk's impact to these species as they expand past their 1998 borders. In the Rocky Mountain National Park elk management plan, it pays special attention to the importance of monitoring elk grazing to ensure they don't adversely affect special status species. In the PRNS Alternative B, there is no management plan to ensure the protection of special status species. The lack of management will result in negative impacts to special status species that the PRNS has stated they want to protect. Elk should be removed from the pastoral zone where these special status species exist currently because:

" The elk can damage the ecosystem because they are not managed grazers;

" They have grazing areas at Limantour and Tomales Point;

" Current grazing by ranchers in the pastoral zone should remain, as their management has resulted in desired species habitat.

## Economics of Animal Agriculture

Point Reyes National Seashore (PRNS) lands provide a direct link between urban consumers and local food producers, a powerful conduit for educating the public about the importance of local food production and security. Marin County continually demonstrates how preserving family farms can contribute to social, economic and ecological sustainability at local, regional and even national levels. Ranching and farming have positive health impacts including increased food access and food security, food to local business and schools, improved health literacy and general well-being. Ranching in Marin County, which includes PRNS, remains a local industry which provides job creation, training and business succession, and market expansion for many other ranchers and farmers.

Dairy cattle at PRNS are organically raised. Organic food markets have shown considerable economic value within the US, accounting for an estimated \$28.4 billion in 2012 (Greene, 2017). While produce accounted for 43% of the organic food market value, dairy products ranked second, consisting of 15% of the total (Greene, 2017). Increased demand for organic fluid milk caused organic milk volume sales to increase from 1.9% in 2006 to 4.4% in 2013 of total fluid milk volume sales (USDA-ERS, 2014) and supported the growth of organic dairy farms throughout the US (1.7 vs. 7.4% of total dairy operations from 2007 to 2013, respectively; USDA, 2007, 2016). This growth has been particularly pronounced in small and medium sized herds with fewer than 500 cows (USDA, 2007, 2016). While organic producers typically earn more money per hundredweight of milk, the cost of sourcing organic feeds and resources meant a cost of \$7.65 per hundredweight higher than conventional farms, or nearly \$1 more than the average price premium for organic milk (McBride and Greene, 2009). This higher cost may influence producers to use grazing more, as pasture for feed costs less than other high-energy sources (McBride and Greene, 2009).

While much of the wildlife is not likely negatively affected the management of organic dairy production, co-existence with large herbivores, such as elk, does represent a challenge, as there is likely competition for forages

on grazing lands. In Colorado during summer months, elk and beef cattle diets overlapped by 42% (Hansen and Reid, 1975). Beef cattle and elk have been reported as socially compatible (Wallace and Krausman, 1987), potentially influencing the amount of time elk spend grazing cattle pasture. This may also be encouraged by improvements to forage quality on lands grazed by cattle (Anderson and Scherzinger, 1975).

Alternative B recommends 20-year lease terms for existing ranch families to continue their beef and dairy operations. These long term leases are needed to allow ranchers to make economic and ecological investments on the land. However, given that lease will now need to include elk grazing, and with increased elk pressure, the number of animals that can be grazed on individual leases will decrease. Ranchers will not be able to remain in business if their grazing allotments are reduced below a viable threshold since allotments will be shared with elk. The amount of land grazed by managed grazing animals will be arbitrarily reduced. This will greatly impact permitted beef and dairy producers livelihoods.

Alternative B provides for diversification activities would be authorized in specific subzones in a manner consistent with the EIS. The specific subzones were not determined based on soil type, locations, or other landscape attributes. The diversification area is limited to 2.5 acres, an amount not based on any economic analysis. These same acreage is not an economic viable scale for ranchers to get a return on their diversification investment.

#### Appendix I: RDM Model

Residual dry matter (RDM) is the herbaceous plant material -living or dead- left standing or on the ground at the end of the grazing season, typically considered the beginning of October, or the start of the new water year, (Bartolome et al., 2006). RDM measurement is commonly used to assess the years grazing use on annual rangeland, whether moderate, excessive or light. The recommended standards are based on the observation that the amount of RDM remaining in the fall interacts with site conditions and weather to influence rangeland vegetation species composition and forage production in the coming year. RDM standards are guidelines and it is recommended that local guides be developed for the very reason that production varies on the same mapping unit and ecological site due to differences in weather, soil type and growing season length at a given location. Because production is so closely linked to prevailing weather, other locations in the same ecological site can vary greatly in production.

In Appendix I, a model that simulates rangeland forage production and consumption by cattle (and if desired, by elk), predicts the residual dry matter on a specified rangelands at the end of the grazing season. Residual dry matter is based upon a percentage of total annual above ground production at the end of the grazing season. This prediction tool claims to provide a rapid estimation tool for managers, assessing the ability of a land parcel to support variation in stocking rates, forage decomposition, etc.; however, this tool is flawed. It cannot predict the elk population and residence times and their grazing amount since elk are not a managed species. Appendix I indicates the model is a supplementary tool to combine with on the ground range management, rancher expertise and other relevant data/observations. This model cannot predict long term simulation of average RDM by a free ranging animals, unmanaged elk. It is not consistent with using the rangeland manager and the ranchers experience.

The model is not based on scientific literature; and because of the limited amount of site-specific research information, RDM standards normally must be developed using local experience and general guidelines, particularly on perennial pastures. This has been used efficiently by the Point Reyes ranchers knowledge of the lands carrying capacity, annual precipitation along with the implementation of good grazing management practices. Park staff and ranchers have worked together for several years to better understand and managed RDM for the long term benefit of grazing lands at Point Reyes. The creation of this model serves no purpose other than to justify the need to reduce the amount of managed grazing animals carried by ranchers. Finally, listed researchers on Appendix I, provided input and advice to NPS staff during the development of Appendix I. They did not provide peer review for either Appendix H or I; to state otherwise is inaccurate and misleading. The preferred alternative, Alternative B, does not provide a balance to ensure the protection of the Parks natural resources while maintaining the historical, sustainable ranching that has occurred at PRNS for over 200 years. Beef and dairy producers implement best management practices including brush control, invasive species removal, and special status species management, while increasing water quantity and quality and the sequestering of atmospheric carbon in rangelands soils. A solution that specifically addresses elk management, completely excluding them out of the pastoral zone, will guarantee the continued existence of the unique natural resources and history at Point Reyes National Seashore.

Sincerely,

Stephanie Larson, PhD

Correspondence: I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

#7276

Name: Lango, John

Correspondence: A main reason why I visit the Point Reyes National Seashore is to view the wildlife. Our national parks have the mission of protecting native plants and animals. According to the recent Environmental Impact Statement, the land, water, and wildlife of the Point Reyes National Seashore are being harmed by the cattle owned by the ranches that are allowed to use land there. Therefore, ranching operations should be promptly and expeditiously discontinued. There is an abundance of ranch land outside the Point Reyes National Seashore where these ranches could relocate their cattle. There should not be a Historic Ranch Preservation subzone. Glorifying the genocidal practices of ranches is akin to glorifying Confederate generals by honorific statues.

Re: Comments for DEIS on GMP Amendment for Point Reyes National Seashore and GGNRA Planning Area

The Turtle Island Restoration Network is a national conservation organization with over 160,000 supporters and members throughout the US with a high concentration of supporters in the Bay Area.

We submit these comments on the Environmental Impact Statement (EIS) for the General Management Plan (GMP) amendment for lease lands at Point Reyes National Seashore (PRNS) and the north district of the Golden Gate National Recreation Area (GGNRA).

We believe the reintroduction of Tule Elk to the Point Reyes peninsula has so far been a success story for the conservation of native species and restoring ecosystems, in keeping with the mission of the National Park Service.

Resource protection is the highest value for the Seashore as intended by Congress in requiring the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area" 16 USC Sec. 459c (6)(a).

Turtle Island Restoration Network believes that the priority for the GMP should be to improve native wildlife preservation, ecosystem health and function, and ecological integrity.

For this reason, we oppose the NPS preferred alternative B that would allow native Tule Elk to be killed in favor of cattle grazing. Instead, we support alternative E with the following suggested modifications:

Suggestion editions to Alternative E

- The DEIS should provide more detail on managing invasive vegetation that is consistent with promoting native wildlife biodiversity and ecological processes.
- Areas of heavy cattle traffic in sensitive areas, along streams and adjacent to water bodies should be fenced and revegetated with native plants
- Cattle should be managed to mimic natural herbivores with rapid rotational grazing in order to disperse cattle out across the landscape and prevent the confinement of trails, especially in sensitive areas.
- Locations of needed habitat restoration should be identified where impacts from cattle grazing and dairy ranching have resulted in degraded environments, especially along streams and water bodies where impacts from erosion, nutrients, and manure have impacted adjacent habitats.

Turtle Island Restoration Network believes that the Draft Environmental Impact Statement (DEIS) overlooks areas of important consideration necessary for determining impacts from the proposed management alternatives. These are discussed below.

- 1) DEIS does not evaluate cumulative, direct or indirect impacts, connected actions, or reasonably foreseeable outcomes of agricultural diversification. Such impacts overlooked are conflicts between native wildlife predators and chickens, goats, pigs, and sheep. Other impacts of diversification not analyzed in the DEIS are impacts to visitor experiences and development of new trails and visitor uses by the introduction of diversification and impacts to the scenic and historic values of the Seashore.
- 2) The DEIS needs to consider future impacts from climate change. To protect park resources from impacts of climate change, protections should be identified and prioritized over ranching activities. Additional maps for the public should be developed that identify current restoration projects and sensitive water resources that are outside the Planning Area but are impacted by development within the Planning Area. Previous Seashore planning documents have analyzed climate change as a cumulative impact, this DEIS does not consider climate change impacts at all.
- 3) The DEIS also excludes analysis of federally listed wildlife that utilize the unique habitat of Drakes Estero stating, "Listed marine mammals (e.g. whales, seals, sea lions, sea turtles, and abalones) may use beaches adjacent to the planning area but are not included in this analysis because ranch activities would not affect these species in the planning area...elephant seals are found immediately adjacent to ranch lands...however, ranch operations do not affect them."
- 4) Finally, this analysis fails to consider the cumulative and connected impacts of ranching activities that includes trampling, erosion, and nutrient deposits from storage and distribution of manure that flows into the creeks that drain to beaches, wetlands, and wilderness areas that are not in the planning area but are adjacent and connected by ecological functions or species movement to new areas.

We appreciate the opportunity to provide comment on the GMP DEIS. Our intention is to request the DEIS evaluate impacts to the GMP that have so far been overlooked and investigate the scientific impacts of grazing and dairy operations in their entirety on the native wildlife and ecosystems functions of the landscape within PRSN and GGNRA.

Sincerely,

Todd Steiner and Preston Brown

Correspondence: We live in San Rafael, CA and Rep. Huffman is our representative.

The plan to shoot Tule Elk at Point Reyes is ill-conceived and just plain wrong.

As you can imagine, living less than 20 miles from Pt. Reyes, our family are frequent visitors to the area. One of the reasons we go to this spectacular place is to see the Tule Elk.

We don't go to see the cows (and even if we did, as a rule, cow ranches do not welcome visitors).

A second point I would like to make is that the presence of the cows there is ALREADY having very detrimental effect on the environment, as every year, hundreds of millions of pounds of cow dung is deposited into the Pacific Ocean.

(Earning Pt. Reyes National Seashore the lovely nickname of the "crappiest" beach in the U.S.)

I understand that approximately 100 years ago, the farmers were promised they could stay.

No one is kicking them out.

If they are having a hard time making a living from farming cows in that location because the NATIVE Tule Elk (whose numbers are an infinitesimal fraction of what they were 100 years ago) eat the same forage as the the cows, that is not the responsibility of the Park Service.

The Park Service said they could stay. The Park Service did NOT say "We will do whatever we need to do, up to and including killing native species, to make sure that your farms are economically viable."

As you might also imagine, we spend a good bit of money in Pt. Reyes and surrounding West Marin.

If you go ahead with this elk killing plan, Pt. Reyes will forever tainted for us and thousands of other nature lovers (the exact kind of people that Pt. Reyes attracts).

Economically, this is not a good idea.

In terms of public relations, it is a disaster and in terms of the elk who live there (and were there first), it's cruel and unnecessary.

You will please some farmers who farm cows in the Pt. Reyes area.

You will strongly upset the many environmentalists, animal advocates and families who love to see the Tule Elk- and all of that is just local.

Pt. Reyes is, obviously, a worldwide attraction.

Killing the elk will not endear potential visitors from anywhere and by killing Tule Elks, you would be reducing one of the natural attractions that draws tourists to Pt. Reyes in the first place.

In summary, this plan is cruel, very bad ecologically and likely to result in Pt. Reyes generating diminished economic returns.

Please, do not shoot the Tule Elk.

Thank you for your consideration.

Sincerely,

William and Stephanie Falcone

Correspondence: I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands.

The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Name: Brookover, Cicely

Correspondence: I am so concerned about the potential for increased grazing of cattle and the culling of Tule Elk in Point Reyes.

I understand that Point Reyes Seashore is the only national park where these rare native elk exist. Cows outnumber elk 10 to 1. The NPS plan the elk calls for culling 10-15 elk annually to maintain a population 120. Any free-roaming elk that forage on land leased for cattle will be shot.

This is SO WRONG. Ranchers SOLD this land to the park many years ago. Please don't let cows and greed overcome the need for native wild animals.

Thank you

Cicely Brookover

Correspondence: Cattle Farming is destructive to the environment for many reasons, including carbon emissions, desertification, and habitat loss for wild species. It is short sighted and economically foolhardy to propose killing wild elk and replacing them with cattle. Tourists are not uninformed, and they understand the need for us to protect and preserve wildlife in our parks. Please do not mislead the public into thinking it is environmentally advantageous to have an unnatural domesticated animal farm instead of allowing the animals to be. It could not be more clear that cattle ranching interests are influencing government policy simply due to their economic clout. This is the wrong way to bring money into our park system.

#7282

Name: Shaman, Cory

Correspondence: You ask that my comment be substantive, and so I base my comment on one criterion you identify: that it questions with reasonable basis the assumptions used for the environmental analysis.

And so, any assumption that animal agriculture is a sustainable practice is patently absurd. I refer you to the IPCC reports on climate change and associated international documents that directly challenge such a position on a mountain of evidence. Dairy and beef operations should receive absolutely no public money as those operations are destructive of animals, the environment, and people.

The grossly unexamined assumption that animals do not deserve moral consideration - - by treating them as mere fungible objects in the economy of current, normative agricultural practices and environmental management practices - - is an affront to all reason. We should learn to live with animals in nonviolence, and we are perfectly capable of doing so in ways that do not diminish our ability to thrive. In fact, living with animals in caring relationships creates more beneficial human social arrangements.

Environmental policies and projects should not and must not be used as instruments to unnecessarily (and I use that term very carefully in a specific framework that I am willing to describe further) harm and kill animals. Dairy results in the extreme suffering of cows and their killing, ranching results in many forms of violence and killing of cattle, and killing Tule elk is a wrong with no reasonable basis.

I vehemently object to any policies that perpetuate violence against and killing of animals.

Thank you.

Correspondence: It is time to move away from animal agriculture. The industry destroys ecosystems, wildlife and the farmed animals it exploits. Say no to animal agribusinesses' on public lands.

#7284

Name: Monroe, Jim

Correspondence: Honestly, I took this long to comment because the whole affair is so disappointing. The answers are clearly for the farms to leave at some point and be reduced now. It just is so wrong to let lawyers strategize about the "cultural" history of the park and run with that euphemistic, irrelevant word as the main concern here. It just isn't. I'm sincerely embarrassed that this is happening in our state and it's another example of why politicians are so shameful and disrespected.

Move the farms out of public land. The labor pool and economy it hits is negligible. Especially, only in defense of a dying, elastic industry that brings no true value to the area.

#7285

Name: N/A, N/A

Correspondence: The public lands and native wildlife on Point Reyes National Seashore and Golden Gate National Recreation Area need to be conserved - not replaced with cattle and commercial agricultural expansion. This decision can lead in the right direction or bring shame. Please conserve the nature we all rely on and produce less of the food that the population is shifting away from.

#7286

Name: Deutsch, Barbara

Correspondence: I am an advocate of restoring Point Reyes as a wilderness, in keeping with the National Parks original mission and also the original agreement in which the ranchers were compensated for their land by the U.S. government. I disagree with my tax dollars being spent to support private businesses that have already been paid for their property and now receive drastically below-market leases and publicly supported maintenance services.

But my greatest concern is the degradation of the water, land and wildlife habitat of the Seashore. I visit many times a year to hike and enjoy the magnificent natural environment. I always arrive so my visit coincides with sunset when the elk begin stirring and moving across the landscape. It is one of life's greatest pleasures. And now, I understand that these creatures will be allowed to be killed because they interfere with dairy ranching! How arrogant are we humans that we first decide to reintroduce the Tule elk the Seashore to save them from extinction, then decide to kill them off when it becomes inconvenient for our businesses.

Please, please play a leadership role for our country by turning around the terrible direction being taken by the U.S. Park Service in Utah, Alaska and California.

Stand up for the unique wildlife and habitat you were hired to protect, not for ranchers who can raise cattle anywhere.

Thank you.

Correspondence: Please do NOT allow local elk to be shot to make room for cows. Let these elk be. Cattle ranching is contributing massively to the destruction of natural habitats around the world.

It is beautiful to see elk in Pt. Reyes in their natural environment. Livestock does NOT belong on public land. Protect natural resources.

#7293

Name: Haworth, Elia

Correspondence: We want visitors to come to coastal Marin and cherish open land and small towns, but not at the price of our communities, historic ranches, food production and the people who have invested their lives in this region.

I am haunted by comments at a crowded meeting about the impact of tourism that was held at the Dance Palace. John Dell'Osso, of Point Reyes National Seashore, reported on the TONS and TONS of visitor's trash and human waste that the park service has to haul out from campsites, trails and visitor areas. Why is that not the major issue of our discussions?

(That meeting was attended by our senator and supervisor, leaders of the sheriff's department, CHP, Coastal Commission, Point Reyes National Seashore and the head of Caltrans for the Bay Area were on the panel listening to public comment. People spoke of the shared frustrations with overwhelming traffic, crowding, and the emphasis on expanding tourism instead preserving our unique communities and landscape.)

Point Reyes has been grazed by cattle since the Spanish colonists gained Mexican land grants. And there was once more than 800 acres of peas and artichokes growing by Drake's Bay.

Now there are ranching families that have been on the land more than one hundred years, and remain passionate about food production. History of place IS important! The ranches are a living part of our shared history, they should be protected and celebrated.

The ranches are also hope for our future. Global warming will impact American agriculture, but here in the cool clean landscape, food production will remain viable, with small scale production of high quality and mostly organic food, by ranchers who are evolving their sustainable practices.

Regarding our handsome elk: no specie should reproduce unchecked, but we have removed the natural predators of elk. Since we manage their lives, it is also our responsibility to limit the size of herds and not let them intrude on ranches or private property. There is a lot of space for co-existence.

#7294

Name: Stewart, Gordon

Correspondence: I strongly support the idea of opening the trails in the Pt Reyes area to bicycles.

This is a multi-use area and bicycle access in the Park should be opened on roads and trails that are vehicle accessible. Single-track trails preferred by hikers should be reserved for hikers (an possibly for equestrians ??).

Pt Reyes National Seashore is a wonderful resource that I have enjoyed many times as a cyclist. The opportunity to get off the paved roads and enjoy some of the farm roads would be a welcome gift.

#7295

Name: Hemphill, Rhonda

Correspondence: There are several reasons that they should not kill these elk. I am not opposed to hunting so It isn't for those reasons that I object to killing these elk. For one reason there is very little room for these elk and to have a niche for them seems well worth saving. It is also a draw to people to get a chance to see them, they are not that predominant in the wild. We shrink the habitat of all our wildlife until they have nothing left. Why do we kill animals off only to wait till they are almost gone to try to save them. This is a small herd, they should not be sacrificed to appease cattlemen. The amount of feed, that the 4 that they propose to kill, eat is hardly work killing for. Cattle are on every piece of ground available and it seems only right to allow some other creature the right to some of that ground. Politics get involved and the cattlemen always seem to win, it's time that the little guy gets to win.

Some one needs to fight for the rights of someone other than the cattlemen, they seem to control what we do with public lands.

It is public lands, people need to see and enjoy these magnificent animals.... we as Americans owe it to ourselves and the generations that come after us to preserve them and allow them to continue to thrive there.

We should want to preserve them and we should be proud that we stood up for them.

#7296

Re: Point Reyes National Seashore Draft Environmental Impact Statement for the General Management Plan Amendment

September 23, 2019

## Introduction

A grossly over-simplified narrative runs through much of the environmental advocacy surrounding the Point Reyes Seashore National Park (Seashore), and specifically the management plan currently under consideration. It goes something like this: A unique, vibrant ecology is threatened by farming and ranching and can be restored only by agriculture's removal. This idea, which has permeated much of the litigation and activism about the Seashore for years, is not only false it is dangerous. If accepted, it would lead to a far less beautiful, less ecologically vibrant park and region.

Much has been said and written by others about the history of the Seashore, so we will not restate it here. Simply put, agriculture has existed since long before the creation of this park and was always meant to continue as part of it. Largely because of the farms and ranches, as well as its geographic location, the Seashore is especially positioned to connect people not just with nature but also with working landscapes, farming, and their food. In fact, the Seashore may be the only park in the United States that makes up such an essential piece of a functioning and cherished local foodshed. No other park has both plentiful agriculture and a close proximity to a major metropolitan area world famous for farm to table cuisine. Just in this small geographic area, at least four nationally known brands of high quality foods - Niman Ranch, Straus Dairy, Marin Sun Farms, and Point Reyes Farmstead Cheese - all had their origins and continue to operate. These facts alone make a strong case for keeping agriculture as part of the Seashore. But there is a lot more to consider.

## Who We Are

We are a husband and wife ranching team who, together with our two sons, raise grassfed cattle and heritage breed turkeys on a ranch in the Seashore. We sell our meat locally throughout the Bay Area, and advocate nationally and internationally for regenerative farming practices, especially for well-managed grazing, and for the importance of animal-derived foods in the human diet. Bill is the founder of the sustainable meat company Niman Ranch, and co-founder of BN Ranch, a grassfed meat company. He is co-author of *The Niman Ranch Cookbook*. Nicolette worked previously as the Senior Attorney for the environmental organization Waterkeeper Alliance, where she led the group's campaign to reform the livestock industry. She is co-founder of BN Ranch and author of two books about sustainable meat production, *Righteous Porkchop: Finding a Life and Good Food Beyond Factory Farms*, and *Defending Beef: The Case for Sustainable Meat Production*, as well as numerous articles and op-eds about ecological food production in *The New York Times*, *The Wall Street Journal*, *The Atlantic*, *The Los*

Angeles Times, The Earth Island Journal, and many other publications.

### Regenerative Agriculture is the Future

Much of the criticism launched at the National Park Service for allowing ranching to continue in the Seashore has suggested that agriculture, especially of animals, is inherently destructive and extractive, often also suggesting that we all know we should be eating less dairy and meat. Implicitly these people argue that the world, in general, as well as the Seashore, specifically, would be a better place if there were fewer people raising livestock. We vigorously refute every aspect of these claims. They vastly oversimplify complex questions of diet, health, and the environment and ignore the vital role local farm people play in communities. In truth, farmers and ranchers can and must be essential allies in the burgeoning movement to re-make our food system into one that produces healthy, nutrient rich food and is ecologically regenerative. And while there are people whose health might benefit from reducing their meat consumption there are others whose health would improve if they ate more meat.

These critics dismiss regenerative agriculture as impractical, unfeasible, or even impossible. Animal rights activists, and conventional agriculture and its allies - fossil fuel and chemical companies, big food companies, and the pharmaceutical industry - all want people to believe this. But ranchers in the Seashore and elsewhere are demonstrating that regenerative agriculture is not only real it is also the most financially viable and ecologically sound option for the food system. Successful real world examples of regenerative agriculture with livestock have been set forth in great detail by Gabe Brown in *Dirt to Soil* (2018), David Montgomery in *Growing a Revolution* (2017), Charles Massy in *Call of the Reed Warbler* (2018), among many others, which powerfully demonstrate the potential for widespread adoption of regenerative practices.

The best regenerative agriculture models, including many of the ranches in the Seashore, have strong connections to surrounding communities. In her several books and her film, *The Economics of Happiness*, Helena Norberg-Hodge urges that the most important thing people can do to protect the earth is to re-localize our economies, including with respect to food and farming. It is our very disconnectedness from our surrounding landscapes, our alienation from the people around us, and from the sources of our food and fiber that causes so many modern ills, Norberg-Hodge contends. Vibrant health - both mental and physical - is closely related to our connectedness to the people, community, and nature surrounding us. Keeping agriculture in the Seashore maintains a longstanding intricately woven community fabric in West Marin between humans, animals, nature, and our food. The people who live and work on these ranches not only generate our food they are members of our churches and civic clubs, have children at our schools and on our soccer teams, and frequent our local businesses. They are vital to our community cohesion.

Ranches are equally important to this regions environment; animal impact is essential to ecosystem function. According to an ecology textbook used at UC Berkeley, *California Grasslands: Ecology and Management*, 6,000 years ago California was home to some 19 species of browsing and grazing creatures. They, together with other large beasts who preyed on them, created and maintained Californias vast open areas and diverse, biologically active soils. Without the once-abundant large predators, (which included grizzlies, wolves, lions, and tigers), it is no longer feasible for this urban-fringe area to maintain significant populations of large wild grazing animals. Domesticated grazing animals, however, can serve as the proxies for those disappeared wild grazers and browsers. Indeed, for this ecosystem to function at its best, large populations of grazing animals are necessary.

A large body of scientific evidence shows that grazing, including by cattle, enhances biodiversity, from soil microorganisms to megafauna. Grazing animals hooves help press seeds into the soil, their mouths clip vegetation, stimulating plant growth and helping later-sprouting species of plants to germinate, and their manure and urine provide nutrients, moisture, and organic matter that help soil biology. For example, a long-term study by University of Nebraska researchers published in 2004 found more plant diversity in areas with grazing than in areas where grazing had been excluded. The 2016 textbook by Stanford biology professor Harold Mooney, *Ecosystems of California* states: A growing body of research shows that livestock grazing can enhance biodiversity. To a surprising degree, this research comes from cases in which, as part of conservation efforts, livestock grazing was removed, and subsequently, species or habitats of interest disappeared.

Grassland birds are among the most rapidly disappearing of all types of wildlife, largely because of losses of farming and ranching land and conversion of grazing areas to croplands. Work by Audubon Society, Point Blue and others have shown that well-managed ranches are essential partners in stemming the decline of bird populations. For example, recent analyses show how grazing benefits bird populations. See, e.g. What's good for the herd is good for the bird, Beef Magazine in 2019.

Some have urged that the greenhouse impact of livestock alone warrants getting rid of the Seashores ranches. But livestock's connection to climate change has been wildly mis-stated by various interest groups who are using climate change to advance their own agendas. Animal rights groups and some environmental groups have claimed that changing your diet (by reducing or eliminating beef) is the single most important thing you can do to help the climate. In the particularly ridiculous film *Cowspiracy*, the utterly specious claim was even made that more than half of greenhouse gases come from cattle. According to the U.S. Environmental Protection Agency, however, the real number is around 2 - 3% for all grazing animals (including cattle, sheep, goats, bison, and yaks).

While it is both admirable and valuable for Americans to make wise personal daily choices, those decisions have far less impact on the climate than does US policy. This point has been made repeatedly by climate leaders like Bill McKibben, and is explained by David Wallace-Wells in his recent book, *The Uninhabitable Earth: Life After Warming* (2019). Wallace-Wells calls personal dietary choices a drop in the bucket. (See interview with William Branghan, PBS, March 1, 2019).

The true impact of beef related to climate is much more accurately understood when compared with other foods. The work of Dr. Michael Lee (Head of Sustainable Agriculture Sciences, Rothamsted Research, UK) shows that when the nutritional value of food is considered, beef has a comparatively small climate impact.

Most important, recent peer-reviewed research strongly supports the case made in *Defending Beef* that well-managed grazing provides myriad ecosystem services, even including a net benefit to the climate by sequestering large amounts of atmospheric carbon. This research includes the following:

\*Journal of Soil and Water Conservation, April 2016: A collection of well-known rangeland experts, sustainable agriculture experts, and soil scientists assemble to argue that good grazing builds soil carbon, removes substantial carbon from the atmosphere, and is better for the climate than crop production. They estimate 1.2 tons of carbon per acre per year (1.2 tC/ac/yr) drawdown via properly-managed grazing, and that the drawdown potential of North American rangelands and pasturelands is 800 million tons (megatonnes) of carbon per year (800 MtC/yr). Most interestingly, the authors show that if crop production were replaced with well-managed grazing the greenhouse gas emissions of agriculture would actually decline. Teague, W. R., Apfelbaum, S., Lal, R., Kreuter, U. P., Rowntree, J., Davies, C. A., R. Conser, M. Rasmussen, J. Hatfield, T. Wang, F. Wang, Byck, P. (2016). The role of ruminants in reducing agriculture's carbon footprint in North America. *Journal of Soil and Water Conservation*, 71(2), 156-164. doi:10.2489/jswc.71.2.156 <http://www.jswconline.org/content/71/2/156.full.pdf.html>

\*University of Georgia study, May 2015: Finds 3.6 tons of carbon per acre per year (3.6 tC/ac/yr) drawdown following a conversion from row cropping to regenerative grazing. <https://news.uga.edu/farmland-management-changes-boost-carbon-sequestration-rates-0515/>

\*May 2019, study of Georgia farm (White Oak Pastures in Blufton, GA) shows well-managed beef operation having negative carbon footprint: <https://www.prnewswire.com/news-releases/study-white-oak-pastures-beef-reduces-atmospheric-carbon-300841416.html>

\* Nature article, April 2015, summarizing studies showing carbon sequestration in ag soils from good management, including management-intensive grazing. Machmuller, M. B., Kramer, M. G., Cyle, T. K., Hill, N., Hancock, D., & Thompson, A. (2015). Emerging land use practices rapidly increase soil organic matter. *Nature Communications*, 6, 6995. doi:10.1038/ncomms7995 <https://www.nature.com/articles/ncomms7995>

\* 2018 study by Michigan State University finds that well-managed grassfed cattle sequester enough carbon in soils

to offset all of their GHG emissions (including methane), i.e. 1.5 tons of carbon per acre per year (1.5 tC/ac/yr) drawdown. Stanley, P. L., Rowntree, J. E., Beede, D. K., DeLonge, M. S., & Hamm, M. W. (2018). Impacts of soil carbon sequestration on life cycle greenhouse gas emissions in Midwestern USA beef finishing systems. *Agricultural Systems*, 162, 249-258. doi:<https://doi.org/10.1016/j.agsy.2018.02.003>

Finally, while we recognize its not central to the National Park Services decision-making process, it should be noted that Seashore ranches are providing exceptionally wholesome, nutrient rich foods at a moment in history when they are desperately needed. Our nations healthcare system is literally collapsing under the strain of a population that is plagued with diet-related diseases. Meat, milk, yogurt, cheese and eggs are among the most nutritionally valuable foods. Almost a century ago, in his seminal work, *Nutrition and Physical Degeneration* (originally published in 1939, 23d printing, 2009), Dr. Weston Price, meticulously documented how humanitys adoption of processed foods and abandonment of traditional foods - especially those from animals - was leading to widespread declines in human health. Modern Americans increasingly depend on pills, powders and potions for their nutrients. In contrast, beef, (especially organ meats), butter, milk, yogurt, and cheese are exceptionally nutrient rich foods that support vibrant health.

More specifically, all of the dairies in the Seashore are organic and grass-based; many of the meat and egg operations are grassfed. Grass-based meat, dairy, and eggs, such as those produced in the Seashore, are rich in vitamin K2, a nutrient found only in animal-based foods where animals are raised on grass. Today, K2 is extremely scarce in foods due to our nation moving animals off pastures into confinement systems. The absence of K2 in our diets has contributed to high levels of many serious health problems in our population, including heart disease and osteoporosis. (For more on this topic, see: Dr. Kate Rheaume-Bleues groundbreaking book *Vitamin K2 and the Calcium Paradox* (2013), and Dr. Cate Shanahans *Deep Nutrition* (2016)).

## Conclusion

For these and many other reasons, we urge that the General Management Plan Amendment reflect a National Park Service commitment to the long-term continuation and support of the Seashores ranches. Remember, Its not the COW, its the HOW.

RE: Comments Regarding the Draft EIS for a GMP Amendment for Point Reyes National Seashore and the Golden Gate National Recreation Area

The Animal Legal Defense Fund (ALDF) provides the following comments regarding the draft Environmental Impact Statement (EIS) for a General Management Plan (GMP) Amendment for Point Reyes National Seashore and the Golden Gate National Recreation Area. We appreciate the National Park Services (NPS) efforts to prepare an EIS and to consider alternatives that include reducing or eliminating ranching. However, there are several environmental considerations lacking in the draft EIS that need to be adequately addressed in the final EIS. Further, given all the available information and science, the only reasonable action is Alternative F and all other Alternatives would violate the NPS Organic Act, the Point Reyes National Seashore Enabling Act, the National Environmental Protection Act, and the Administrative Procedures Act.

I. Alternatives A Through E Violate the NPS Organic Act.

The draft EIS fails to prioritize the fundamental purpose established in the NPS Organic Act to conserve the scenery, natural and historic objects, and wild life in the System units and to provide for the enjoyment of the scenery, natural and historic objects, and wild life in such manner and by such means as will leave them unimpaired for the enjoyment of future generations. 54 U.S.C. 100101(a). The Settlement Agreement specifically states that [i]n preparing the GMP Amendment and the EIS, NPS will follow all applicable law and policies, including, but not limited, [the above referenced statute.]

Point Reyes National Seashore is one of the 10 most feces-contaminated locations monitored in California. Further, California's highest reported E. coli level was on a Point Reyes cattle ranch. Runoff from ranches can not only include manure, but also antibiotics and hormones given to the animals, as well as fertilizers and pesticides. National Geographic: Ranching, <https://www.nationalgeographic.org/encyclopedia/ranching/> (last viewed Nov. 28, 2018). Allowing these impacts in an area of unique aquatic value-which is federally protected specifically because of that value-without adequately assessing and mitigating them is antithetical to the NPS's mandate and would therefore violate the NPS Organic Act.

Alternatives A through E prioritize the commercial benefits of ranching and dairy operations by expanding these industries at the expense of the scenery, natural objects, and wild life of Point Reyes National Seashore and therefore violate the NPS Organic Act. Details regarding the significant negative impacts on the environment resulting from Alternatives A through E may be found in Section III below.

## II. Alternatives A Through E Violate the Point Reyes National Seashore Enabling Act.

The Point Reyes National Seashore Enabling Act requires that these areas be afforded maximum protection, restoration, and preservation of the natural environment[.] 16 U.S.C. 495c-6(a).

Alternatives A through E pose significant negative impacts on the natural environment and therefore violate the Point Reyes National Seashore Enabling Act. Details regarding the significant negative impacts on the environment resulting from Alternatives A through E may be found in Section III below.

## III. NPS's Current Assessment of Impacts From Alternatives A Through E Violate the National Environmental Policy Act.

According to the National Environmental Policy Act (NEPA), the EIS shall provide full and fair discussion of significant environmental impacts and shall inform decisionmakers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment. 40 C.F.R. 1502.1. Further, NEPA requires that the agency [r]igorously explore and objectively evaluate all reasonable alternatives. Id. at 1502.14.

The draft EIS fails to adequately discuss current scientific evidence regarding the environmental effects, both positive and negative, of all the alternatives and therefore violates NEPA.

### A. The Draft EIS Does Not Adequately Evaluate the Environmental Impacts of Ranching.

Alternatives A through E include ranching and dairy operations. Yet the draft EIS does not provide current scientific evidence regarding all the negative environmental impacts due to current ranching operations and how any continued ranching operations or diversified ranching operations will negatively impact the environment.

#### 1. Water Quality

Though the draft EIS includes Water Quality analysis, this section fails to adequately discuss a wide range of environmental impacts from ranching such as how manure, antibiotics, hormones, fertilizers, and pesticides from

ranching operations impact the water quality and therefore the surrounding wildlife and human populations.

For example, runoff from farmland can carry contaminants from animal manure and urine into lakes and rivers. One Green Planet: The Gross Way Water Pollution From Livestock Affects You, <https://www.onegreenplanet.org/animalsandnature/the-gross-way-water-pollution-from-livestock-effects-you/> (last viewed Sept. 22, 2019). These contaminants, such as manure and farming fertilizers, bring nutrients such as nitrogen, phosphorus, and potassium to the water sources and these excess levels of nutrients cause algal blooms which kill fish and can cause methemoglobinemia which is fatal to human babies. Id. Manure can also contain antibiotics and hormones which have affected the reproductive system of fish in some cases. Id. Further, animal manure and urine has the ability to spread over 40 diseases to humans and can cause kidney issues and nervous system disorders. Id.

For these reasons, the only Alternative that will not have a significant negative impact on the water quality, and therefore surrounding wildlife and human populations, is Alternative F which eliminates all ranching and dairy operations.

## 2. Air Quality

In addition to threatened water quality, ranching also significantly contributes to global warming. Though the draft EIS attempts to deemphasize the environmental effects of farming by claiming that most deposition sources likely affecting the park come from sources outside park boundaries, including mobile sources, power plant and industrial sources, and regional farming operations[,] this comparison is misleading. The agency needs to consider how its actions affect global warming. *Ctr. for Biological Diversity v. Nat'l Highway Traffic Safety Admin.*, 538 F.3d 1172, 1217 (9th Cir. 2008).

For example, the draft EIS makes a point to show that NH<sub>3</sub> emissions from Point Reyes ranching only account for 11.16% of Marin Countys NH<sub>3</sub> emissions and VOC emissions from Point Reyes ranching only account for 1.34% of Marin Countrys VOC emissions. However, the draft EIS must present the data in a fair and accurate way that instead shows how Alternative F would eliminate 105.9 tons/year of NH<sub>3</sub> emissions and 46.9 tons/year of VOC emissions whereas all other alternatives would still contribute to the parks NH<sub>3</sub> and VOC emissions.

## 3. Diversification Activities

The NPS proposed action, Alternative B, as well as Alternatives C and D, allow for [a]dditional diversification activities[.] The final EIS must list every possible diversification use that would be permitted and then, using scientific evidence, analyze all potential environmental impacts of those uses and how those environmental impacts would be minimized. For example, Alternatives B, C, and D could authorize the addition of pigs, chickens, sheep, and goats to the park. Environmental analysis regarding the impacts of the addition of these species needs to be included in the final EIS and fairly analyzed against Alternative F which does not allow for diversification activities.

### B. The Draft EIS Does Not Adequately Evaluate the Environmental Impacts of Elk Herd Management.

The draft EIS does not adequately evaluate the positive impacts of tule elk to the environment and the negative impacts of the proposed lethal management practices. The proposed management practices of the free-range tule elk include: lethal removal, translocation, fencing, elk crossings, habitat enhancements, hazing, water development, and other measures as appropriate. The final EIS needs to clarify the specific actions allowed under each proposed management practice, when those specific actions may be utilized, how those specific actions will impact the environment, and whether or not those actions leave [the wildlife] unimpaired for the enjoyment of future generations. 54 U.S.C. 100101(a).

ALDF continues to strongly encourage NPS to remove lethal methods from the NPS proposed action and all alternatives. The lethal removal of the tule elk is the complete opposite of ensuring the herd is left unimpaired for

the enjoyment of future generations. 54 U.S.C. 100101(a). Additionally, as is true for many wildlife species, the indiscriminate killing of individual animals is ineffective and likely leads to increases in population due to the disruption of social structure. See J. M. Goodrich and S. W. Buskirk, Control of Abundant Native Vertebrates for Conservation of Endangered Species, *Conservation Biology* 9, no. 6 (1995).

In addition to being ecologically destructive, most lethal methods are cruel and pose a danger to both people and other animals. Devices such as Conibear traps, leghold traps, and snares often result in injury, pain, suffering or death of target and non-target animals-including companion animals, livestock, and threatened and endangered wildlife. Nationwide, these traps and other similarly non-selective lethal control devices have unintentionally killed many pets, vertebrates of 150 species, and thousands of mammals of at least 20 different taxa that are listed as threatened or endangered federally or in certain states. See Knudson, T. The killing agency: Wildlife Services brutal methods leave a trail of animal death-wildlife investigation. *The Sacramento Bee*, April 29, 2012; see also Bergstrom, B.J., L.C. Arias, A.D. Davidson, A.W. Ferguson, L.A. Randa, and S.R. Sheffield. 2014. License to kill: reforming federal wildlife control to restore biodiversity and ecosystem function. *Conservation Letters* 7: 131-142. The EIS must recognize these drawbacks when describing the proposed action and any alternatives that allow lethal removal methods.

ALDF further reminds NPS that non-lethal alternatives are a more cost effective means of wildlife management. The economics of spending public funds to kill tule elk rather than using that public money to introduce effective alternative methods of controlling alleged harm to farmed animals is unreasonable. Indeed, lethal management actions actually harm, rather than protect, Point Reyes National Seashores valuable natural resources and environment. The EIS must recognize the relative cost effectiveness of the non-lethal alternatives compared to the proposed lethal methods.

#### C. The Draft EIS Does Not Provide a Fair Discussion of Socioeconomic Impacts.

The draft EIS does not accurately and fairly discuss the possible socioeconomic impacts from the range of Alternatives. Though the draft EIS evaluates socioeconomic impacts, it fails to accurately discuss all the possible impacts. For example, though the draft EIS provides data for the loss of revenue and jobs under the Alternatives that reduce or eliminate ranching, the EIS fails to provide data on the socioeconomic benefits of replacing ranching operations with other opportunities such as visitor activities.

In addition, the draft EIS fails to fairly discuss the socioeconomic impacts of the different Alternatives. Currently, ranching in the planning area only accounts for 0.01% of the gross regional product and 0.03% of the total regional employment. The draft EIS should allow for and discuss the opportunities that could be opened up for current ranching families if NPS provided resources for them to convert their current ranching operations into more environmentally-friendly and lucrative operations.

The final EIS must [r]igorously explore and objectively evaluate all reasonable alternatives and this includes the socioeconomic impacts of those alternatives. 40 C.F.R. 1502.1.

#### D. The Draft EIS Does Not Consider the Negative Impacts on Individual Animals.

NEPAs mandate to consider direct, indirect, and cumulative effects to the human environment is broad, and encompasses ecological, aesthetic, historical, cultural, economic, social, and health effects that flow from a primary impact on the physical environment. See 40 C.F.R. 1508.8. Animals, both wild and domestic, are indisputably part of the physical environment, as is farmland and manmade environments. See *Sierra Club v. U.S. Army Corps of Engrs*, 701 F.2d 1011 (2d. Cir. 1983) (finding that fish are animals, and animals are a part of the environment); Worksheet, Determination of NEPA Adequacy, U.S. Department of the Interior, Bureau of Land Management, Horse Lake Sage-Grouse Habitat Restoration Project, p. 1 (Nevada, 2013) (including benefits to wildlife and domestic animals in a NEPA worksheet); see also *Middle Rio Grande Conservancy Dist. v. Norton*, 294 F.3d 1220, 1223-24 (10th Cir. 2002).

A sufficient NEPA analysis must include consideration of the direct and indirect injury or harassment to animals. See *Nat. Resource Def. Council v. Winter*, 645 F. Supp. 2d 841, 849-51 (C.D. Cal. 2007) (NEPA requires analysis of the effects of sonar on whales, to avoid harassment and injury); *Greenpeace U.S.A. v. Evans*, 688 F. Supp. 579, 582-83 (W.D. Wash. 1987) (including harassment to whales social structure as an effect that the National Marine Fisheries Service must consider in NEPA analysis); see also *Fund for Animals v. Norton*, 281 F. Supp. 2d 209 (D.D.C. 2003) (requiring agency to study environmental impacts of killing an invasive species); *Stauber v. Shalala*, 895 F. Supp. 1178 (W.D. Wis. 1995) (noting in dicta that NEPA would have required an analysis of the effects on human and bovine health and safety had that not already been completed by FDA); see also *Animal Legal Def. Fund v. Glickman*, 154 F.3d 426 (D.C. Cir. 1998); George Skelly, *Psychological Effects at NEPAs Threshold*, 83 COLUM. L. REV. 336 (1983).

Here, the draft EIS fails to consider the impacts to individual wild and domestic animals if ranching and dairy operations are allowed to continue under Alternatives A through E. As detailed above, lethal management methods have the potential to cause considerable harm and suffering to individual animals who are killed by these means. Yet the draft EIS does not assess impacts to wild animals beyond species-level impacts, nor does it consider dairy cows as part of the human environment that requires consideration. Other federal management agencies have considered these impacts in Environmental Assessments, as the NPS must do here. See, e.g., *DRAFT ENVIRONMENTAL ASSESSMENT FOR REDUCING BIRD CONFLICT IN IDAHO, UNITED STATES DEPARTMENT OF AGRICULTURE ANIMAL AND PLANT HEALTH INSPECTION SERVICE* (Oct. 2017). This is especially important here, where the draft EIS compares several alternatives that would eliminate specific numbers of individual elk, rather than entire herds. The final EIS needs to discuss the impacts to the individual animals killed under all the Alternatives.

#### IV. NPS Must Comply With the Administrative Procedures Act.

Finally, the Administrative Procedures Act (APA) requires that reviewing courts hold unlawful and set aside agency action, findings, and conclusions found to be arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with the law[.] 5 U.S.C 706(2)(A). If the agency adopts Alternatives A-E without adequately correcting the deficiencies detailed herein, and justifying its decision in light of these considerations, the agency will be acting arbitrarily, capriciously, and not in accordance with the NPS Organic Act, the Point Reyes National Seashore Enabling Act, and NEPA.

\*\*\*

In conclusion, we appreciate the opportunity to provide comments and urge the NPS to consider these comments and the scientific evidence when preparing the final EIS. Please contact us with any questions or concerns.

Sincerely,

/s/ Alexandra Monson

Sept. 23, 2019

Dear Park Superintendent,

Thank you for accepting public comment on the Draft Environmental Impact Statement (EIS) for the Point Reyes National Seashore General Management Plan Amendment.

CCOF is a nonprofit organization governed by the people who grow and make our food. We are supported by an organic family of farmers, ranchers, processors, retailers, consumers, and policymakers. Together, we work to advance organic agriculture for a healthy world.

CCOF supports organic dairy and beef producers and believes that they are excellent stewards of the park's land, animals, and other natural resources. As the draft EIS points out, organic dairies on Point Reyes National Seashore are a significant source of milk to nearby dairy processors and creameries, and constricting or ending this supply would have negative impacts on the economic viability of these local businesses.

We are disappointed that the draft EIS does not include an alternative that combines continued agricultural production with non-lethal management of Tule elk. We reiterate CCOF's support for organic ranching and dairy farming on the Seashore \*and\* humane management of the resident elk herds. The National Park Service has an obligation to carefully balance the historical commitment to ranching and dairy production on the National Seashore with the need to responsibly manage the introduced elk populations.

Thank you for consideration of our comments.

Sincerely,

Jane Sooby  
CCOF Senior Policy Specialist

Correspondence: Pt. Reyes National Seashore

I am not a lawyer, but a U.S. citizen who believes in our laws, governing rules and principals such as established by the U.S. Constitution. We enter into and document our contracts so they can be examined for their faithful execution and compliance to upholding agreements as recorded. Such an agreement was made and entered into by the citizens of the U.S. with the farmers and ranchers within the enabling legislation that would create the Pt. Reyes National Seashore and Golden Gate National Recreation Area (Public Law 87-657, September 13, 1962). Review of these agreements and examination of the written legislation provided for a very clear path for the seashore. This path was agreed to by all parties concerned, ranch owners, cattle ranchers, dairy ranchers and the congress of the U.S. Provisions of that agreement, documented in the enabling legislation, provided for agreed to

compensation for acquisition of the land involved PLUS a very generous allowance for the leaseback of these lands to the sellers for their remaining lifetime or 25 years, whichever came first. These leasebacks have proven even more generous in that they were at sub-par rates when compared with non-park surrounding areas. It must be further noted that in many cases the ranchers and farmers took the proceeds and used these to acquire additional land adjacent to or outside of the park area thus increasing their holdings while taking advantage of not being displaced from the land they had sold. For various reasons over the years these leases have been extended, further delaying the transition back to the wild habitat the legislation, and purchase compensation was intended to accomplish. Enough is enough! I have carefully examined the 6 proposed alternatives generated by the National Park Service along with thoroughly reading the Environmental Impact Study of the existing park and the relation to each proposed alternative. This latter EIS I find very troubling in that much of each proposal contained in alternatives "B", "C", "D" and E are not considered. As an example; proposed "diversification" that would allow expansion of the raised animals to include pigs, goats, sheep, and chickens, plus expansion of row crops. Not only should there have been consideration of these proposals within the EIS, what about the requisite infrastructure that would be required? Would we see additional animal fencing, chicken coops, etc.? Certainly any of these kinds of additions do nothing to enhance the National Park visitor experience, they are detractors and have no place in any alternatives. These can only have been included to augment the bottom-line of the already subsidized ranchers and dairymen. No thought was given or presented to what the additional inclusion of these animals would mean in a wild predatory environment. Would a rancher be out shooting at a raptor taking on of his chickens, while visitors walk through the park? There really is only one alternative that lives up to the original enabling legislation, Alternative "F." I could site the facts presented in the General Management Plan and the Environmental Impact Statement produced along with the plan relating the various endangered plant and animal species that occur to one extent or another within each ranch, each of which will be further threatened by any alternative other than alternative "F." Certainly none of which are at all improved by any manner or form of continued ranching or dairying. I could site the results of the EIS water quality report from within the park, the surrounding area and the seashore itself. The EIS evidencing that with ranching and dairying even as they currently exist produce some of the most polluted waters in the state, a state that holds environmental standards to a very high level. I could site the current spring mowing of the silage areas that completely disregard the nesting birds and other wildlife in these areas, none of which would happen if ranching and dairying ended as was the original intent in forming the park. I could site the hundreds of native Tule elk that found home in this area long before cattle ranching and dairying who were made to die by isolating them from needed food and water during our recent severe drought. This all the while that cattle had food and water trucked in. I could site the huge amounts of manure produced by the ranching and dairying that is such a disposal problem that ranchers seem to find the only way to dispose of it by diluting it with water and spraying it on our parkland enabling legislation had intended to be returned to the wild coastal environment it began as. I could site the unauthorized (illegal) signage posted by ranchers and fencing erected denying public access to parkland they paid for under terms accepted by the ranchers and dairymen. I could site what was said in Senate testimony by the then rancher Boyd Stewart, on behalf of his fellow ranchers that "dairying with the necessity of confining large herds of cattle tightly into pasture is NOT compatible with the public ownership of land." But, I shall not site these things. Instead, I must return to the initial enabling legislation and agreement between congress and ranchers; 1) get paid for your land, 2) have plenty of time to transition out of ranching/dairying in the park altogether or into land acquired with the proceeds outside the park, 3) wind down and eliminate ranching/dairying activities with a possible exception of establishing a small demonstration ranch for educational purposes such as at Pierce Point. I find it interesting that our National Park Service has embraced a "preferred alternative, alternative "B"." Not only does this "alternative" show a favoritism in what should have been an unbiased solicitation for public comment but this "alternative" flies in the face of the original intent of the establishment of the park by blatantly advocating for the ranchers/dairymen by advocating for the expansion of operation to include other farm animals (pigs, goats, sheep, chickens, etc.) and the planting of various row crops totally inconsistent with the nature of this park area. There is even avocation within these alternatives (except "A" and "F") to build Bed and Breakfast lodging and farm stands. This to augment the bottom-line of the ranchers/dairies. The 1962 Pt. Reyes National Seashore Act specifically says "to save and preserve, for purposes of public recreation, benefit and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped." This certainly does not mean expanding ranching and dairying's scope to include infrastructure that would be added to accommodate provisions not only in alternative "B" but "C", "D" and "E" as well. We as taxpayers have subsidized these ranchers and dairymen long enough. There is no obligation within any of these alternatives to further subsidize them. If their ranching and dairying are not viable

businesses while even leasing land at a sub-par rate, they should not be in these businesses and certainly not within our national Park. Alternative "F" is the only alternative that lives up to the reason for the part, to the enabling legislation and to the expectation visitors have when visiting a National Park.

Regards, Jeff Jorgensen

Cicely Muldoon, Superintendent

Point Reyes National Seashore

1 Bear Valley Road

Point Reyes Station, CA 9495 September 22, 2019 Sept 20, 2019

Re: Comments on PRNS General Management Plan Amendment

Dear Cicely Muldoon,

I want to weigh in on the future of Point Reyes National Seashore as a private citizen, someone who watched as a boy - a fly on the wall - as the park was established and have followed its history, and all its trails and shorelines, through all 57 years since.

Below is an Oval Office group portrait by White House photographer Abbie Rowe. It is September 13, 1962 in the photograph, and President Kennedy is signing the enabling legislation for Point Reyes National Seashore. The tall, white-haired man on the far right is my father, David Brower, the first executive director of the Sierra Club. He represents the environmental movement at this gathering. [I find I can't attach a photo to this form. I'll follow this with a print version with the photo included}.

In the late 1950s and early 1960s, my father threw the resources of the Sierra Club into the campaign to make Point Reyes a national park and he lobbied for that designation on both coasts. He edited, designed, and published a Sierra Club book, *Island In Time: The Point Reyes Peninsula*, by the great environmental reporter Harold Gilliam, whom he persuaded ("relentlessly needled," in Gilliam's words) to write the text. He wangled a foreword from Interior Secretary Stewart Udall. He ran the text and layout by me, his teenage son.

That book is everywhere in this photograph. Congressman Clem Miller of California, author of the Point Reyes legislation and the point man in the campaign for the park, stands at JFK's left shoulder, holding *Island in Time* under his arm. Secretary Udall, third from the left, holds his copy in hand. Congressman Wayne Aspinall of Colorado, farthest left, wants nothing to do with the book. He has set his copy down on the Resolute Desk. (Aspinall, the scourge of the nascent environmental movement, has stalled passage of the Wilderness Bill for four years and will block it for two years more. "We have seen dream after dream dashed on the stony countenance of Wayne Aspinall," my father has complained to the *Wall Street Journal*. The congressman has countered that my father and his preservationist ilk are "aristocrats" and "over-indulged zealots.") Lucky that these two stand at opposite ends of the room.

None of the thirteen men pictured here is alive. The John Kennedy of this photo has a year and nine days left before his assassination. Congressman Miller, who regarded this moment - creation of PRNS - as the highpoint of his career, has just twenty-eight days left before the plane crash that kills him. Old age has claimed all the rest. We can no longer quiz any of these men about their feelings that day in the Oval Office, or their intent in framing this legislation, or their hopes for Point Reyes National Seashore. This is unfortunate, for these are questions being debated today as the fate of the park is decided.

As that fly on the wall during the gestation of park, and as relative or acquaintance of several of those in the Oval Office photo, and as acquaintance of other PRNS founding fathers and mothers not present at the White House that day, I'll presume to testify on their behalf.

I have read Paul Sadin's excellent, NPS-sponsored administrative history of the park, and the relevant Congressional testimony. When Secretary Udall came out for the park's 40th anniversary, I compared notes on the history with him. It is an historical falsehood- -despite the widespread myth otherwise- -that the park's founders ever intended that ranching be permanent. As Paul Sadin points out in his study, preservation of ranching was never featured in the arguments for establishment of the park. Clem Miller, in persuading his colleagues to vote for his bill, never suggested that "historical" ranching was integral to the national seashore, nor did he advertise ranching as a selling point. Rather the opposite, as his fellow congressmen were uneasy, justifiably, at the prospect of a national park with commercial ranching inside.

The idea, and the deal, was that ranching would continue on leases while the government raised the funds to acquire the private rangeland needed to expand the park. This would make for a transition period easing the ranchers' separation anxiety and the county's loss of tax base. Congress allowed owners of agricultural property to reserve a right of use and occupancy for twenty-five years or the life of the owner or her spouse as a condition to acquisition. A sunset clause, on which the sun has long since set.

Alternative F of the GMP amendment- -an end to ranching at the seashore- -was the founders' intent from the start.

Alternative B, the "preferred" alternative of the NPS- -new 20-year leases, diversification of agriculture to include goats, sheep, pigs, chickens, and row crops, Bed & Breakfasts, retail farm stands, and the shooting of native tule elk to make room for all this livestock and other enterprise- -would have been the founders' nightmare, had they been capable of dreaming that such proposals would someday be made.

Before me now, as I write, I have laid a pen from the Resolute Desk, the one John Kennedy gave my father after signing Point Reyes National Seashore into law.

The act that this pen legalized specifies that the park's first priority be the natural environment. Property acquired for the park by the Secretary of the Interior, "shall be administered by the Secretary without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area."

The italics are, or would have been, my father's. The question he would ask, if he could, is this: can commercial ranching operations ever be consistent with maximum protection, restoration, and preservation of the natural environment?

The NPS, in its 2013 Coastal Watershed Assessment for Point Reyes National Seashore, noted that among the principal threats to water quality on Point Reyes was bacterial and nutrient pollution from with ranches and dairies. "Extremely high fecal coliform concentrations have been documented in streams adjacent to existing dairy operations." The Drakes Bay, Limantour, Kehoe, and Abbots Lagoon areas were particularly polluted. "Extremely high fecal coliform concentrations have been documented in streams adjacent to existing dairy operations," and that areas where dairies spread manure "are correlated with the increased presence of invasive and noxious weed species."

A commandment of Management Policies ("the primary source and foremost authority in the Park Service's directives system," according to the NPS) decrees that commercial grazing will be allowed only where it "does not cause unacceptable impacts on park resources and values." Are heavy fecal coliform concentrations in waterways, eutrophication of creeks and ponds from nutrient run-off, and the spread of invasive and noxious weeds all acceptable impacts?

Cattle are responsible locally for "the vast preponderance" of greenhouse gas emissions at Point Reyes, according to another NPS study. Are these proper atmospheric conditions for a national park? Is outgassing on this scale what we want at Point Reyes National Seashore?

A further directive of Management Policies is that the NPS "will phase out the commercial grazing of livestock whenever possible." What makes phase-out impossible at Point Reyes?

A large part of this national seashore is in the hands of commerce, and the remainder is in the hands of an agency created, a century ago, to protect American landscapes from commerce. PRNS has a split personality. For the entire history of the park, two disparate ideals of land stewardship, protection vs. production, have been at odds. The park is a house divided. Alternative F of the GMP ends the civil war that has raged since the 1978 reintroduction of elk and intensified during the Drakes Bay Oyster Company controversy early this century. These wars have left both sides weary.

Alternative B perpetuates a divided house forever.

My father, in his publisher's note for *Island in Time: the Point Reyes Peninsula*, opens with an account of a trip our family took to Point Reyes at the height of the battle to establish the national seashore, a drive out to the beach at Limantour. We, his four kids, were anxious to get down to the sand, but we never made it. "You can't park there. That's private property," a man with a hammer, a carpenter, shouted when we reached shore.

"Where then?" asked my father.

"This is all private property, down to the tide line. If you want to get to this beach, go down to Bolinas and walk up along shore." Some walk. That hike from Bolinas would have been a fourteen-mile death march along the foot of steep cliffs pounded by surf.

The carpenter was part of a land rush. As creation of a national seashore grew ever more likely, developers hurried to fabricate a fait accompli that would defeat the park. Big signs went up along the shore. "Here soon. Drakes Paradise Estates," read one. "Drakes Bay Estates. Beach Development," read another. A new asphalt road ran along the Limantour dunes, marked off at intervals by red fire hydrants, with street numbers posted and some lots marked "sold." East of Limantour Spit, on the mainland shore of Limantour Estero, the bulldozers had gouged out a grid of subdivision streets, and several houses had gone up. The carpenter was nailing the frame of a new one.

But he miscalculated. No trace of his carpentry remains. You can still find a few house foundations in the brush at Limantour, but the walls are long gone. The shore that the carpenter declared private property is now public, part of the Phillip Burton Wilderness. As such it is the property of the ospreys that overfly it, the snowy plover that nest in its dunes, the harbor seals that haul out at the tip of the spit, and the humans who come just to see. It is a national seashore owned equally by all Americans and open to all peoples of the world.

"The peninsula is what we have and there is no more where it came from," my father concludes his note in the book. "It is part of a shore that must serve uncountable millions in the more crowded time to come. We need to have what it takes to act boldly in their behalf-to save enough in the first place, and to remember, ever after, that the important things are not those we put on that shore, but those we find have always belonged there."

The Park Service needs to act boldly, once again, on behalf of those uncountable millions in the more crowded time to come. The Park Service needs to remember, ever after, that the important things are not those we put on that shore, like cattle, sheep, goats, and hogs, but those native creatures that have always belonged there.

Sincerely,

Ken Brower

It is time that we choose to be an example of humanity, not cruelty.

I would like to begin by recalling what Mahatma Gandhi once stated: "the greatness of a nation and its moral progress can be judged by the way its animals are treated."

This includes ALL animals, both wild and domestic. In terms of preserving the ecosystem and maintaining the proper balance to sustain it, it is critical to preserve native wild species. Changing that balance has consequences, some of which we cannot foresee and will not know until it is too late to correct. That doesn't mean any domestic species need to be harmed in any way. That would be just as wrong and inhumane. It is about finding a healthy balance for ALL involved, WITH HARM TO NONE.

We now have an opportunity to be a leader in the world by demonstrating that all living things matter and that all deserve to be treated with dignity. We do not have the right to be cruel or exploit other living beings simply for our convenience. An atrocity is no less so just because a license is granted or a law is written. All animals have complex needs, feelings, and behaviors; and unfortunately, many people have downplayed that in order to justify their own actions. Human beings are capable of greatness - great humanity and great cruelty. On which side will we be remembered?

Human nature - at its best - requires us to recognize and honor the rights of all living creatures.

I thank you for considering my comments.

"To conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

Organic Act of 1916 establishing the National Park Service

As a member of the public, I see no need to buttress my statement of concern with footnotes or references to past or ongoing studies and I would sincerely object to your terming my submitted comment non-substantive, which would limit the input of ordinary citizens.

Therefore I state that by my own fieldwork over the course of years, I believe the NPS is failing to comply with its stated mission, see above, by continuing to extend the lease of dairy ranchers at Pt. Reyes, especially to the detriment of the Tule elk, who may be "culled" at the exhortation of the ranchers.

Alternative F is the best of the stated alternatives. If not that, restrictive grazing options should be developed in a supplemental EIS, like an alternative that phases in a 50 percent cow stocking rate reduction over 5 years, or 75 percent over 10 years.

Dian Hardy

Correspondence: The last thing anyone needs, aside from ranchers themselves, is more ranches. Ranches are a major source of pollution, and scientists have beckoned the world to move away from eating meat. Furthermore, with rising sea levels, we would be grossly negligent to allow the endangerment of cattle and other animals being raised, and economically speaking, ranches by the ocean would prove a major liability. How about preserving the open space? How about keeping these ranchers from killing more elk, and trees, just for short-term profit?

#7309

Name: Bennett, Sharon

Correspondence: I am writing to oppose the latest proposal by the NPS regarding the Tule elk in Point Reyes National Seashore. I visited California recently and made a point to get up to Point Reyes as it is one of the prettiest spots in Northern California. My husband and I hiked the Tomales Point trail all the way out to the very end. Along the way we had the absolute pleasure of seeing and hearing the elk in their reserve. Seeing the elk was definitely one of the highlights of that hike and removing them from their protected area is unimaginable to me. They belong in Point Reyes, where the public can see them. As a taxpayer, whose taxes go towards funding the national parks, I urge you to keep the elk where they are in Point Reyes. They should not be removed just to appease some ranchers. Please keep our national park what it is, a sanctuary for Tule elk and a haven for those of us looking to escape the frenetic pace of life and enjoy some time surrounded by nature's beauty.

#7310

Name: Williams, Diana

Correspondence: Gentlemen: For years, we have visited this area on our vacations in your state. We especially enjoy seeing the Elk and know their numbers are only around 600. It took years of planning and habitat restoration to get the herd to its current level. We know that in 2017, you, the NPS were required according to a court order to submit a plan making it clear what amount of destruction thousands of beef and dairy animals would impose on this limited area. From what we have read, no such plan has been provided. That is an awful lot of animals and the impact on land of their feeding, drinking and eliminating will be substantial and could cause a crisis on this land - which is public land - let's remember.

California in the last several years has suffered serious droughts, all consuming fires and other devastation.

This is recreational land, not farm land. It is not to be used to grow crops. The wildlife now are not in conflict with new encroaching animals. Let us keep it that way.

You are supposed to be the guardians of our land, you as NPS have been designated that honor and responsibility. I hope to hear that you have taken this responsibility seriously and will do the right thing. Thanks.

#7311

Name: Burriss, Connie

Correspondence: I am contacting you I do not agree with your plan to kill elk every year to appease private livestock owners who enjoy and appear to be privileged subsidized grazing of their cows on this public land. We should not be helping ranchers graze cattle, goats, sheep, chickens, or pigs which only damages wild lands which pollutes water-degrades wild lands and makes soil erosion. Nor should crops be able to be planted which in turn destruction of our Wildlife and Wild lands

These plans are A recipe for more destruction and conflict with rare native Wildlife

Please No killing wildlife

No grazing on Point Reyes National Seashore

Please drop plans of destruction to these wildlife habitat

Thank you

#7312

Name: Marckesano-Jones, Paula

Correspondence: We must not sacrifice existing wildlife habitats to the cattle industry. Cattle ranching is an imbalanced use of resources that contributes to climate crisis, and from its inception has resulted in the destruction of indigenous people, plants, and animals.

#7313

Name: Malberg, Jennifer

Correspondence: I strongly oppose the use of the public lands of Point Reyes for cattle grazing and ranching and am voicing my support for Alternative F. The rare and beautiful space that is Point Reyes National Seashore (not Point Reyes cattle ranch!) should be set aside for "public enjoyment and inspiration", in keeping with the stated purpose when first established by Congress.

As someone who grew up in a rural setting and personally raised cattle, I know first hand the destructive nature of cattle grazing on land. As any biologist or naturalist could attest, the existence of 6,000 cattle given the damage they cause to the landscape and massive amounts of waste they create, is absolutely incompatible with the opportunity for Native Tule elk and hundreds of native plants to flourish. The simple ratio of cows to elk of 10:1 illustrates how far things have strayed from the original stated purpose for the Point Reyes National Seashore. This land belongs to all the people of the United States, not the special interests of the local ranchers. Subzoning or fencing the Seashore and killing Tule Elk each year to limit their population in favor of ranching interests is an unacceptable use of the land.

In 2019, with the destruction of climate change upon us, we MUST do all we can to preserve and preserve open space where oxygen-producing vegetation can proliferate over methane-gas producing, environmentally destructive livestock. Implementing Alternative F is a perfect opportunity to do so in a meaningful way for the longterm benefit of the citizens of the area and the region.

It has been well-established that the enjoyment of wide open spaces in nature is beneficial for human health and well-being. In 2019, children (and their parents!) are more stressed than ever with fear of school shootings, the impending threat of climate change, and "noise" of urban living. Spending time in nature is a cure for just about anything that ails a person. To quote the great John Muir, "Thousands of tire, nerve-shaken, over-civilized people are beginning to find out that going to the mountains is going home; that wildness is a necessity" The same holds true for the precious and wild Point Reyes National Seashore and for certain, has NEVER been said of cattle ranching!

Please consider the long-term benefits of FULL protection of this national treasure and uphold the original, stated purpose of setting aside Point Reyes for the enjoyment and inspiration of ALL the people of the United States.

#7314

Name: Cobb, McCrea

Correspondence: Alternative B states: NPS would actively manage the Drakes Beach herd. Based on estimated forage consumption by elk, forage productivity on ranches, and time that elk spend on ranches, as well as NPSs capacity to manage elk, NPS has set a population threshold of 120 adult elk for this alternative. NPS would manage to the population threshold using lethal removal methods. Elk from the Limantour herd would be monitored closely and managed in consideration of ranch operations.

Comments:

-A population threshold of 120 elk for the Drakes Beach herd seems unrealistically low. Elk productivity, survival and associated herd growth vary inter-annually as a function of annual and decadal (El Nino) fluctuations in rainfall and its interaction with herd density. Therefore, one produce a single estimate of herd carrying capacity at Pt. Reyes; it varies in response to weather and other factors. By 2017, the Drakes herd already numbered at least 112 elk and herd growth showed little density dependence (i.e., exponential growth). It is unclear how changes in range conditions have changed with this associated increase in elk abundance, but it is likely minimal at this point. Together these provide evidence that the herd is not approaching carrying capacity at Drakes and could be closer to carrying capacity (maximum sustained yield). Limiting herd sizes to 120 elk will therefore a great effort and involve many annual lethal removals. I strongly recommend reevaluating elk carrying capacity at Drakes, which will likely result in increasing the 120 elk limit.

-Yearling elk are smaller than adults, and their forage consumption is lower than adults. If the forage consumption model considers yearlings as adults then the model would have produced inflated estimates of elk forage consumption and deflated estimates of carrying capacity.

- The forage consumption model assumes 100% overlap between elk and cattle, which is not realistic or backed by empirical evidence. In fact, most studies find niche partitioning between these species, and in some areas, competition between cattle and elk is negligible. See: Halbritter, H. and L Bender. 2015. Herbivory of sympatric elk and cattle on Lincoln National Forest, south-central New Mexico. *Forest Ecosystems* 25: 2. Unless local elk diets were empirically compared to cattle at Pt. Reyes, this is a big assumption that could substantially increase carrying capacity estimates of elk.

Alternative B states: No new elk herds would be allowed to establish in the planning area.

Comment: It is unclear how this could be realistically achieved. Bull elk from the Home Ranch region have historically moved between the Drakes and Limantour herds, especially during the rut. Will these bulls be considered? In addition, as Cobb (2012) shows, elk herd dynamics at Pt. Reyes (Tomales Point) can be fluid. If the Drakes herd splinters into multiple sub-herds, will these be considered new herds? How would the 120 elk threshold then be applied?

Name: Flores, Johnathon

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle

ranching, not add more crops or animals to increase ranching profits. I am sure that you can agree that this is no way to celebrate the biodiversity found in the United States of America. Currently, there is one National Park that these Tule elk call home. Also,

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

Thank you for your consideration,

Johnathon Flores

Correspondence: Really upsetting to hear that the public land might not be protected. The native elk belong on those lands, not commercial ranchers.

#7317

Name: Bartlett, Scott

Correspondence: Do not let this happen. Wildlife has already been forced out of too much of their habitat, and cattle are one of main reasons for our methane problem. It's all for greed and profit. Enough is enough!

#7318

Name: Hinz, Robert

Correspondence: The correct preferred alternative is obvious: Ranching Should Be Ended.

The National Park Service's purpose is to preserve and protect the natural landscapes of the United States for the benefit and enjoyment of the public. The NPS should be preserving and protecting the increasingly endangered coastal habitat such as that found at Point Reyes. Where is the effort to restore any of the habitat degraded by ranching?

The short grass habitat could apparently be provided by the elk since the ranchers 'know' that the elk are eating too much of their cattle's grass. Where are the ground squirrels that should be living at Point Reyes? Where are the burrowing owls that live in the squirrel burrows?

It is not the purpose of the NPS to make ranching on Point Reyes a profitable or more profitable business. It would not be a beneficial precedent for managing our other national parks.

The USA has a surplus of dairy products and consumption of milk has been in decline for decades. Point Reyes does not need diversification. There is nothing historic or culturally significant about hog farming, raising sheep or goats, planting row crops or adding chickens to the landscape. There are many places for the public to see those things. As for chickens, ten for each ranch would be enough to provide fresh eggs.

The ranches of Point Reyes are public property that now do not fulfill that purpose. The ranches are not in-holdings; ranchers sold them and we, the public own them. The NPS did not buy those lands because the NPS wanted to be a landlord, especially not a toothless landlord without real authority to manage ranch lands in an environmentally sound fashion. The water quality does not meet state standards. Some areas are overgrazed. The

number of cattle exceeds the 'allowed' number. Sounds to me like there should be some culling of cattle, not elk.

The NPS bought those ranches because NPS expected ranching to end, not necessarily in one year or five, but to end before ranchers' great-grandchildren would be the new ranchers.

Things you will never hear as attractions of Point Reyes: "Hey, kids, let's gather some dry cow dung, build a fire and roast some marshmallows or make s'mores." or "Dear, It's a nice warm day. Let's go to Point Reyes and smell the hog farm."

The general public does not generally know that they are entitled to hike all through the ranches, and the ranchers do not want people hiking in the pastures. The public can see cattle elsewhere in Marin County. They could even go to a petting zoo for an up-close experience. Hog farmers do not want people bringing swine fever (hog cholera) or African swine fever or porcine epidemic diarrhea to their operations. Public, keep out!

Adding more farm animal species will bring more management problems that the NPS does not need. Ranchers do not want their lambs or kids to be feeding coyotes or mountain lions. How would that predation be stopped? Shoot the wildlife? Poison the coyotes? That doesn't sound like something the NPS should be doing on its lands.

Shut down ranching and relieve the poor ranchers from their struggles to make a living. In the meantime, charge the ranchers enough to pay for overseeing their businesses and correcting environmental problems that arose from improper ranching operations. Convert a few ranch buildings to facilities where the public could be informed about the human history and natural history of Point Reyes. Restore the degraded ranch land. Then, at last, there would be a benefit to the public who owns these lands.

#7319

Name: N/A, N/A

Correspondence: Utilization of NPS land should be centered on protecting natural resources within the property. Continued use of the property for private agricultural uses undermines the mission of the NPS and serves to benefit few citizens at the expense of taxpayers. Restoration and management of native wildlife (Tule Elk) should take complete precedence over agriculture.

Point Reyes GMP Amendment c/o Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Re: Pt. Reyes GMP Amendment EIS

To Whom It May Concern:

We write on behalf of members of our conservation nonprofit organization, Madrone Audubon Society (Madrone Audubon). Madrone Audubon is the Sonoma County Chapter of National Audubon. We serve approximately 3000 members. All of us regularly visit Pt. Reyes National Seashore for the incredible natural environment, wildlife and birds, and the exceptional public amenity Pt. Reyes National Seashore as a national park represents - for residents and visitors from around the country and international origins.

In review of the EIS and proposed GMP Amendment, we support Alternative F - No Ranching. This alternative would end ranching within the national park and land would be repurposed for 'visitor opportunities.' The Tule Elk would be allowed to expand their range in the park.

As we consider protection and sustaining of PRNS' revered natural features, now and for future generations, we must address global warming and climate change impacts as a priority in any such consideration. Action and a plan to conserve and sustain Pt. Reyes National Seashore, a most precious national park with exceptional landscapes, wildlife and birds, should be the #1 priority. We must consider water quality and impacts of cattle on fresh water streams and creeks, along with the fact cattle are the leading source of greenhouse gases at the Seashore. We do not support any discussion of ranchers being able to diversify into additional areas of ranching and growing. Introducing such practices would inevitably create wildlife conflicts related to predator-prey, further impacts to grassland, and negatively impact what should be a natural environment by introducing different ranching practices, using the same land.

Among the laws that govern how the National Park Services manages Pt. Reyes National Seashore is the 1916 NPS Organic Act. § 100101 (a) In General - includes use of the National Park System by means and measures that conform to the fundamental purpose of the System units, which purpose is "to conserve the scenery, natural and historic objects, and wild life in the System units and to provide for the enjoyment of the scenery, natural and historic objects, and wild life in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

In addition, the PRNS statute seems to clearly indicate in § 459c-6. Administration of property, "(a) Protection, restoration, and preservation of natural environment."

In 2019-2020, as the Amendment to the Management Plan and alternatives are considered, the alternative that supports your governing laws and statutes, including prioritizing the natural environment and exceptional natural features of Pt. Reyes National Seashore, is Alternative F. The Tule elk population at PRNS should not be shot or fenced off in support of ranching operations, and diversifying ranching operations would only contribute to more negative impacts and imbalance with the natural environment.

We urge the decision in favor of your enabling legislation and statutes governing Pt. Reyes National Seashore, and Alternative F is the most appropriate and relevant choice.

Sincerely,  
Susan Kirks, President Madrone Audubon Society

#7322

Name: Ryce-Paul, Roxanne

Correspondence: I urge the NPS to adopt Alternative F, which would discontinue farming and ranching opportunities in the park and expand visitor opportunities.

Preservation of native wild species must take precedence over farming and ranching activities. Grazing negatively affects ecosystems, causing water pollution and soil erosion, spreading invasive species and disease, and harming endangered species.

In fact recent trends show American are eating less and less meat - choosing instead plant based meat alternatives. The market for cattle and pigs is dying we don't need 5500 more cows, we need to restore America's wild lands and that happens when the NPS preserves a natural balance. The Drakes Beach elk herd and the and the Limantour herd are native to California belong to Point Reyes National Seashore.

#7323

Name: N/A, Mario

Correspondence: There are a few areas of the analysis which I feel are lacking or are contradictory.

1. The benefit vs cost of cattle vs Tule Elk grazing:

The EIR states that uncontrolled Tule Elk population would have an adverse impact on ranching and dairying operations due to the competition for forage, and that alternative B would require control of the Tule Elk population. The EIR then states that the loss of cattle under alternative F would likely have an adverse environmental impact due to a loss of grazing yet does not properly analyze how increased grazing from a growing Tule Elk population could mitigate those adverse impacts. The EIR seems to take the contradictory position that an uncontrolled elk population would consume too much forage, but that an even faster growing population (under alternative F) would have no impact on the control of invasive species or the maintenance of coastal prairie land.

The EIR makes use of detailed modeling to calculate the residual dry matter in the grazing areas with various combinations of elk and cattle in order to explore how cattle and elk can be managed together (Appendix I). With this foraging computation toolset the predicted foraging of an increased elk population under Alternative F could have been used to make more substantive prediction of the environmental impacts. The current analysis is incomplete in this regard.

2. The emphasis of cattle ranching/dairying over all other cultural resources:

The EIR states that the desired conditions for preservation of cultural resources include Register of Historic Places (National Register), and historic and prehistoric archeological sites and ethnographic resources. The EIR makes very little effort to explore any other cultural resources outside of ranching and ranch buildings. The area has been host to many eras including indigenous peoples, the Spanish occupation, and even a bit of whaling. The emphasis of ranching over all other cultural history is unexplainable and lacking.

3. No discussion or analysis of the preservation of historic or "traditional ranching and dairying":

In the enabling legislation and purpose statement for the PRNS historic preservation is listed in both documents, and further legislation has further emphasized that agricultural leases should be issued for "traditional ranching and dairying". Given those facts, the EIR's emphasis on modern ranching and dairying is puzzling as there is no discussion of the preservation of historic practices, tools, and methods anywhere in the EIR. The PRNS was not established to preserve commercial agriculture, it was established to preserve the history of commercial agriculture at the time of it's establishment.

Currently there is no preservation of historic ranching/dairying outside of some of the old structures themselves. There is no public outreach and no way of the public to experience or view historic dairying or ranching using traditional methods and tools. Furthermore the inclusion of diversification on the ranches seems counter to the stated goals in both the enabling legislation and the draft purpose statement.

4. Lack of any basis for the diversification of agricultural use:

The preferred alternative B includes allowing ranch lease holders to get permits for alternative uses of historic cattle ranches. There is no stated basis for this inclusion and limited analysis of its impacts. The diversification of the lease uses appears to be counter to the enabling legislation and the further legislation that states that leases should be used for "traditional ranching and dairying".

Besides diversification of crops and animals, alternative B includes the suggestion that lease holders could create destination experiences on the leased land for sales, experiences, or overnight stays. The lease holders have already been given years of economic benefit through below market rate leases for grazing and housing, while

making no efforts at all to share their historic operations with the public. The EIR also states that diversification could result in modification to historic structures which is clearly a negative impact.

If anything, under the current system the public feels unwelcome to use the leased land even though it is their statutory right. There is no analysis of any sort of revenue sharing between lease holders and the NPS for further economic use of public land. Charging the public money to experience land they already paid for in 1978 should be justified and the lack of competition for these services should be explained under the statutory framework.

#### 5. Lack of substantive analysis of visitor numbers under alternative F vs alternatives A&B:

The EIR states that under Alternatives A, B, and F that there is unlikely to be any increase in park visitors. This analysis is not supported by any data or modeling and appears incomplete. The number and variety of park user experiences will likely be much greater under alternatives B and F vs alternative A, but the EIR simply states "annual visitation is unexpected to change".

The analysis seems especially lacking when analyzing alternative F. The EIR states that alternative F would have the most beneficial impacts for visitor opportunities and experiences of all the other alternatives yet, without any explanation of methodology, states that there is no expected change in visitor numbers. This determination not only has bearing on the Public Use and Enjoyment analysis, but it also appears in the Socioeconomic analysis. In the socioeconomic analysis of alternative F it is stated that the loss of residents and workers would negatively impact the environment, yet the increase of public use and enjoyment is not expected to offset that through increased visitors.

#7324

Name: Irish, Jeffrey

Correspondence: I oppose the proposed Ranch Core subzone on 180 acres, where row crops could be grown, new buildings constructed, and onsite farm processing plants built. In addition, pigs, sheep, goats, chickens, horse boarding, yurts, lodging, ranch stays, and other commercial activities would be allowed to occur on park land, apparently for the profit of the 24 ranchers. These are not concessions, as is usual in National park units. This is not in the best interest of our community, our state, our country, or our planet. This is a myopic and selfish decision that appears to not take into consideration our wildlife and specifically our unique indigenous and endangered tule elk.

Alternative F would discontinue ranching operations and cattle grazing, and allow tule elk to establish new herds in the pastoral zone of Point Reyes National Seashore. I support this planning alternative because it has a true vision of our future and will demonstrate the integrity of the National Park Service, in service to all not to a few for profit businesses.

#7325

Name: A, Christina

Correspondence: We need less meat and dairy production if we are going to stop global warming. Not only is this plan cruel to native Elk, but it is also unsustainable.

#7326

Name: Syed, Adam

Correspondence: The NPS should not be shooting elk to serve the bottom line of ranchers.

#7327

Name: Sorensen, Dale

Correspondence: We are in a state of climate emergency and Pt.Reyes National Seashore should not be contributing to that condition. The world is losing wildlife habitat at an alarming rate and animal agriculture is one reason. The National Park was created to protect wildlife and provide opportunities for the general public to enjoy nature. The ranches have been documented as being the largest emitter of greenhouse gases, primarily methane. They also produce millions of pounds of manure annually that pollutes the creeks, the bay, eventually the ocean, it seeps into sensitive habitats contributing to lose of threatened species. And the demand for water by the dairies is unsustainable.

I know the history of how the Park was created and I know that the ranches were already paid millions for their land with the understanding that they would be phased out over a period of 25 years but somehow the ranches have remained via leases granted by the Park. Most of these leases should have expired in the 90s, they were never meant to continue indefinitely. The Parks preferred plan seems to favor the private commercial endeavors of the ranchers. This is inappropriate and violates the mandate of the National Park Service to protect and preserve the environment for future generations.

I am absolutely opposed to any culling of the Tule Elk, who were here before the ranches, the Park was right to reintroduce them. The Elk should be protected from the ranchers as the Park is the best "steward of the land."

Fencing should be erected only with Park approval, all ranching activities should be monitored closely.

The idea that ranchers would be allowed to further commercialize Pt. Reyes National Park is an abomination.

Like cows, other livestock would further degrade the land. The public has no obligation to help the ranchers make a living! Therefore I support Measure F, phasing out the ranches as was originally intended and restoring as much as possible wildlife communities and native plants particularly in the pastoral zone.

Correspondence: Please stop changing the standards and regulations and to benefit the cattle and mining industries. Leave the wilderness and wildlife to live for our future and our children, not culled for industrial profit.

#7332

Name: Berger, Jay

Correspondence: Under no circumstance shall the park kill any Tule Elk.

The park should prioritize Tule Elk habitat.

The park should refuse to grant 20-year permits and leases to cattle and dairy ranchers. Ranchers have overstayed their original permit limits already. Long-term leases will set a terrible precedent in favor of private, commercial industry and jeopardize the future of our parks and the health of the ecosystem.

Absolutely no diversification of ranch operations. Any diversification (such as chicken coops, pigs, sheep, row crops, etc) will only serve to attract more predators like coyotes, foxes, bobcats that will be in conflict with ranch operations and have to be "managed" as well.

The park should revoke permits for all cattle and dairy operations and restore the leased land to its original, pre-industry state. The park should prioritize wildlife NOT commercial interests! Do you agree? Sign our online petition!! Go [HERE](#).

We would like the park to update their education and visuals throughout the park to reflect their mission- wildlife preservation. We would like to see the information tablets that currently highlight dairy and ranching history to be replaced with ones that showcase the park's biodiversity and their work in wildlife protection and restoration.

We would like the fence at the Pierce Point Elk Reserve to be ultimately be taken down so a migration corridor can be created for that Tule Elk herd.

#7333

Name: Good, Karen

Correspondence: Please do not cull the tule elk. I love seeing these wonderful creatures in their homeland. The park service should consider what is natural and healthy for the ecology and not what is profitable for ranchers. These lands are owned by the public now. We want nature in as pristine a form as possible! Thank you, Karen Good

#7334

Correspondence: Please do not open up this park further to ranchers and commercial activities, or authorize shooting elk. The point of national parks is to preserve the land and natural habitat of plants and animals in this unique area.

#7335

Name: Kehoe, Tim and Janice

Correspondence: Dear Superintendent Muldoon,

Thank you for giving us the opportunity to give public input regarding the draft Environmental Impact Statement (EIS) for the General Management Plan (GMP).

Our ranch, along with all the other ranches have a long history here in the park. The Kehoe Family has operated a dairy on the Point Reyes Peninsula for over ninety years. We established our dairy on the J Ranch and continue current operations solely on the J Ranch. We have leased from the Point Reyes National Seashore (PRNS) since its inception in 1970. My Father had taken the longest lease offered back then of 30 years as it was his dream and goal to be here to pass this business on too many generations. We have enjoyed a good business and personal relationship with the PRNS and its administration over these years.

We are working on four generations of our family making a living and raising a family on this beautiful property. At the present time we are operating as a certified organic Holstein dairy. We received our organic certification in 2006. The milk we produce is distributed to a local dairy processing facility in Petaluma. This facility which prides itself on being a small, family-oriented business that produces a high-quality local product is why we chose to be associated with this company.

While our family supports the Preferred Alternative B, the continued ranching alternative presented in the draft

EIS, there are a few issues of concern that we would like to give input on. The first is the amount of Elk on the existing ranch land and the relocation of such Elk. The amount of 120 Elk in the Drakes beach herd needs to be reduced or moved back to the Pierce Point Range, where they can be free to roam within the confines of that range and not have conflicts in the pastural zone. If the only option is reducing the herd, it should be no more than 50 head. 120 Elk is unsustainable for an organic dairy herd to compete for the pasture that is required to meet the 120 days at 30 percent dry matter for the organic pasture usage requirement as set forth by the National Organic Program. There also needs to be some specific details on handling of the Limantour Herd if it becomes an issue in the pastural zone.

The succession issue that was documented, we feel was a fair resolution, but there was no mention of what will happen after the 20-year lease expiration. Will there be extensions beyond that or will ranching be phased out? Having lived on Pierce Point my entire life, the next generation would be in the same position that my family has been in since our original 30-year lease expired in 2001. We would like to know what the plan and process would be going forward and how that issue will be handled, so that we will know how to plan our future and hopefully not have to go through this process of uncertainty again.

In the lease addendum there is a part that requires the lease holder to live on the premises of the ranches. We believe that this is not a priority as long as the lease holder is actively involved in the day to day operations of their business. Also, with the shortage of employee housing and the restrictions put forth on our operations to expand housing, owners will need to have more creative ways of housing their employees, working within the confines of the housing units already put in place.

In closing we want thank you for the opportunity to comment on the Point Reyes National Seashore EIS. With the historical significance that the ranches and ranching families bring to the PRNS, it would be a devastating loss to the cultural heritage of this area, a heritage that cannot be replicated or replaced.

Tim and Janice Kehoe Family

Correspondence: I'm writing in opposition to the National Park Service's (NPS) preferred alternative plan to shoot native tule elk in the Point Reyes National Seashore, the only national park in which tule elk survive.

Several aspects of the NPS's preferred plan for the park are inconsistent with the NPS's mission to preserve and protect natural values, native wildlife, and public access. When the Point Reyes National Seashore was created, the historic cattle ranches were granted limited leases to continue operating within the boundaries of the park. The owners of the ranches have had plenty of time to adjust their operations to accommodate the tule elk and prepare for the expiration of these leases. Instead, the ranching operations continue to enjoy large public subsidies for their operations.

If cattle ranching within the Point Reyes National Seashore does continue, the NPS should give priority to protecting the tule elk and natural values for which the park was created. The successful re-introduction of tule elk to Point Reyes, at significant public expense, should not be undermined in favor of the private, commercial interests of cattle ranchers.

The existing threats to the elk herds include restrictions on their movements from barbed-wire fencing, access to water, climate change, and infectious disease spread from cattle to elk. Over a two-year period from 2012 to 2014, the Pierce Point elk herd declined 47 percent from 540 to 286 elk because of drought and lack of access to fresh water. During the same period of drought, free-ranging herds of elk were able to increase in number because they had access to water. The NPS should be acting to improve the elk's chances of survival, not shooting them to appease private cattle ranchers' interests.

The cattle ranches already receive enormous public benefits, including subsidized grazing fees, infrastructure, and road improvements. Cattle ranching should only be allowed to continue if it can accommodate the NPS mission and goals of preserving and enhancing the natural environment. The cattle are a significant source of greenhouse

gases. The NPS's preferred management plan should be rejected because it is inconsistent with its own "Climate Friendly Parks" plan.

Name: N/A, Kathleen

Correspondence: I do not support granting 20 year leases to cattle and dairy industry. Climate science has indicated we have less than 12 years to mitigate the worst of climate catastrophe. Allowing business that has been linked to water pollution, species extinction and in Point Reyes is the culprit of over 60% of the greenhouse gas emissions, it is not a good idea to give that same industry a 20-year lease to continue degrading our national park. Point Reyes is a refuge to thousands of plants and animals. Point Reyes can be a leader in the fight for climate justice, and it starts with phasing out Beef and Dairy operations and restoring the land to its natural state. The EIS has NO MENTION of the effects of climate change in it, and does not include any information of the cattle and dairy's impact on climate change within the park.

This is the public's land, not the dairy industry. They should be completely and permanently removed from this land.

Name: Rodoni , Fred

Correspondence: There are two areas I feel were not adequately considered by the Park Service:

- Public Hunting: Since culling is an option, public hunting should be studied for both safety and the significant economic benefit that could be used for other park purposes. Just for example, Drake's Beach Road is very easy to close on November mornings for a few hours for 3 or 4 hunters escorted by skilled personnel with almost no impact on visitors.

- An Economic Study of organic dairies in the Park: Since some are claiming financial hardship from sharing grass with elk, why don't we find out if it's true. Much of the information is public record or very easy to find. Surprisingly, you can get a pretty good idea of income in less than an hour. The need for culling is at least partially the result of this possibly inaccurate information.

Correspondence:

I am writing to voice my strong opposition of any proposal that would be fatal to Tule Elk and other wildlife and that would benefit ranching operations in the Point Reyes area.

Please discontinue grazing and please allow us citizens to enjoy this beautiful park and to be enriched with opportunities

to visit and appreciate this special place.

Please make the most ethically correct choice and adopt Option F.

Thank you,

Maureen Morrison, R.N.

Point Reyes GMP Amendment  
c/o Superintendent  
Point Reyes National Seashore  
1 Bear Valley Road  
Point Reyes Station, CA 94956

Re: Pt. Reyes GMP Amendment EIS

To Whom It May Concern:

We write on behalf of members of Paula Lane Action Network, or P.L.A.N., a nonprofit conservation organization based in Petaluma, CA. P.L.A.N. advocates for and works to preserve open space, habitat and wildlife corridors, and has in-depth experience in American Badger (*Taxidea taxus*) conservation and education. Susan Kirks, Naturalist, has monitored the American Badger population at Pt. Reyes National Seashore (PRNS) for approximately 15 years. PRNS is one of the few locations in the San Francisco Bay Area where the protected national park and habitat areas are able to support 1-2 adult reproducing female badgers with an estimated 8-9 adult male badgers. Corridors for both movement and dispersal that connect to PRNS include Bolinas, Tomales/Marshall, Valley Ford, and east-west to Petaluma.

A significant increased level of visitor population to one formerly populated area of the park by American Badger has resulted in displacement to other grassland areas of the park. There is a delicate balance of available habitat, sufficient prey with fresh water, and area to range for badgers at PRNS. Contrary to popular myths, badgers, reclusive, are people avoidant and are not vicious predators, but rather positive contributors to managing gopher and vole populations and soil aeration in grassland at PRNS.

PLAN supports Alternative F of the document available for review. We have reached a point in our society and culture, with this proposed amendment, where the NPS must abide by your governing statutes and relevant laws, to protect, restore and preserve the natural environment. Second to this will be the interface without too significant encroachment by members of the public, visitors, as well as reseachers and conservationists to support your ongoing prioritized efforts.

The discussion regarding diversifying ranching operations is a slippery slope and wholly contraindicated in terms of introducing proposed diversified ranching practices into PRNS. This would inevitably result in taking of more grassland habitat, negatively impacting the small American Badger population currently able to sustain and reproduce, and also create predator-prey conflicts, a reflection of the inappropriate proposal to introduce such diversifying practices into PRNS.

We do not support the recent legislation that was crafted to extend the lease periods of existing ranchers at PRNS. This was an action out of sequence and contrary to the current review process where the most appropriate decisions for the future of PRNS are to occur. We also support the Tule Elk presence and continued natural existence at PRNS. An examination of the presence of Black Bear as a native species with a potential natural predator relationship should also be examined. Fencing off the Tule Elk in favor of the ranching community is not consistent with your governing statue(s) and laws.

There will not be another present or another future into which we are moving.

We urge decision makers to embrace the exceptional national park, Pt. Reyes National Seashore, and direct it into prioritizing protecting, restoring and preserving the natural environment. This is not a time to succumb to the ranching lobby or the claims that ranching was always intended to be integral to PRNS - clearly, it was not. You must make decisions that are in the best interest, also, of the members of the public and visitors to PRNS and their health and appreciation of this national treasure.

By making the right decision and selecting Alternative F, then moving forward with a creation and review process for an implementation and management plan, the American Badger population at PRNS will be more likely able to survive and sustain, contributing to biodiversity of the species in one of the few areas where adult female badgers are able to claim and occupy selected natal territories.

Sincerely,  
Susan Kirks, Naturalist

Name: Speraw, Andrea  
Correspondence: Dear National Park Service Administrators:

I am a long-time visitor of Point Reyes National Seashore having begun in the 1960's as a young child. What a joy to have the protections added when it became a National Seashore meaning that all native flora and fauna would be protected, as well as the public to be able to enjoy a natural, peaceful and spectacular environment for many generations to come.

So why are we so determined to protect the private industry that remain in the Park? Is this not simple sentimentality for "family farmers?" This move is in direct contrast to the mission of the Park. We should be working to strengthen the protections of natural values, native wildlife, public access and enjoyment, not weaken them by allowing private enterprise to remain. Protections should take priority over commercial activities at Point Reyes. Right now the Point Reyes ranches enjoy not only subsidized grazing fees and housing, but also taxpayer-funded infrastructure and road improvements, and publicly funded projects. Commercial activities at Point Reyes should be required to accommodate native wildlife - not the other way around.

Tule elk are an important part of the landscape at Point Reyes. Their recovery is a result of successful native ecosystem restoration, which is a key element of the Park Service's mission. It's taken a lot of time, money and effort to restore tule elk to Point Reyes, the only national park where they live. Tule elk should be allowed to roam free and forage in the park - not shot, removed, fenced or treated as problem animals.

I strongly urge you to not allow the culling of the Tule Elk. Please consider other options that are not so destructive to the wildlife that currently thrives there. We owe it to the land, its inhabitants and the public to full protect the Park, not private industry.

Thank you,  
Andrea Speraw

Correspondence: I do not support granting 20 year leases to cattle and dairy industry. We are already on the brink of a climate catastrophe, so allowing businesses linked to air pollution, water pollution, soil erosion, desertification, ocean dead zones, and species extinction a lease to continue to degrade our national park would be incredibly irresponsible. Furthermore, the national park should be protecting the tule elk who inhabit Point Reyes, as they have already faced extinction before, coming back from merely 20 individuals.

#7343

Name: Wantz, Dana

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

#7344

Correspondence: Please do not expand ranching access or allow more human commercial use of or reyes national park. in fact restrict commercial use of this critically sensitive ecological wonder. consider these points: All the ranching alternatives in the Draft Environmental Impact Statement involve the impairment of natural resources.

Three National Park Service laws prohibit actions that will impair natural resources (the 1916 NPS Organic Act, Point Reyes National Seashore legislation Section 459c-6, and Golden Gate National Recreation Area legislation Section 460bb).

Consequently, the Park Service should prepare a supplemental DEIS with ranching alternatives that comply with applicable laws requiring the protection of natural resources. The Park Service should then circulate that supplemental DEIS for public comment.

Thank you.

Correspondence: To who it may concern

National seashores and lakeshores are defined as coastal areas federally designated by Congress as being of natural and recreational significance as a preserved area.

**NATURAL AND RECREATIONAL SIGNIFICANCE**

Where does it say that cattle are natural and significant to a healthy ecosystem in a national Seashore?

Point Reyes is the home to over 1,000 species of animals and plants, tall cliffs, and sandy beaches. This National Seashore has important historical significance. Most experts agree that Sir Francis Drake landed in a cove within the property of Point Reyes in 1579, making Drake the first European to come ashore in California. That is the historical significance not coastal prairie ranching.

I spent many hours hiking along the beaches and trails of the national Seashore. The first time I traveled to Point Reyes, I was quite disturbed by the number of cow patties I found and I was unable to find a spot to sit and picnic amongst the cliffs. That shouldn't be the case, I don't visit to see cattle and veal crates. I visit for the wildlife and the sweeping landscapes.

The adverse impacts of ranching on soils, water quality, vegetation, wildlife and the ecosystem are undeniable:

piles of manure, muddy trails, accelerated erosion, weed-infested pastures. Is a scientific fact.

The leases should not be renewed, coastal prairie, as well as the plants and wildlife it supports, is rare and deserves full protection and restoration and must take precedence over non native cattle.

The Tule elk are unique and deserve protection. Today, around 6,000 cattle live on the land while native elk populations have dropped to 600.

450 of which are trapped in a zoo-like enclosure preventing them from roaming or ever even potentially bothering ranch lands.

Nothing was done to prevent the elk from dying, trapped unable to access fresh water the Park Service is guilty of not protecting them and played a part in their deaths.

I don't support management of the tule elk herd animals that have been hunted to near extinction have the challenge of their genetic diversity being depleted, therefore their long term survival and ability to adapt with changes the world throws at them are diminished. Small numbers, especially in enclosed areas, means inbreeding, which is generally not good or natural."

In closing I support Alternative F let the seashore rewild itself, let the elk increase their population and native species will come back to the seashore they called home.

Regards.

Heather M

#7347

Name: Blum, Michael

Correspondence: I would like to comment on the Park service plan to allow ranching to continue in Point Reyes National Seashore for the next 20 years. I think this is a big mistake. We need wild areas that resemble what our country looked like before it was settled and developed. The park should be allowed to heal itself from the intensive cattle ranching that has occurred for the last 100 years. Those ranches were bought and paid for fair and square along time ago. If I want to see a dairy ranch I can drive out Chileno Valley road in Sonoma county. Let native species have a safe area to survive without having to compete with cows or all the animals associated with a farms (cats, dogs, crows, etc). I know there is political pressure to let them stay and even expand. However, how can we as a country try to preserve our planet and stave off global warming if we cant even protect a national park from dairy farming. Right now in the Brazil the rain forest is being destroyed to create more ranching. We need less ranching and more pristine areas where nature and native species can thrive and we can go out and explore and discover them. Please do not succumb to the political pressure and do the right thing. Its time to put a final sunset on the Dairy farms and return the area to its beautiful original state. Thank you, Michael Blum

#7348

Name: Shannon, Peggy

Correspondence: I have several substantive comments that I expect to see addressed in both the FEIS and FMP. **TO BE CLEAR: I SUPPORT THE NO PLAN ALTERNATIVE. ONLY THE "NO PLAN ALTERNATIVE" T WILL NOT RESULT IN INCREASED NEGATIVE IMPACTS TO BIOLOGICAL AND CULTURAL RESOURCES.** All other alternatives would result in varying degress in significant impacts to water, soil, wetlands, archaeological sites and elk exclusion allong with increaseed **SOIL DEGRADATION WHILE INCREASING LIVESTOCK/WILDLIFE/CAR IMPACTS.** At a time of climate crisis and species loss it is appalling that the NPS

has strayed so far from meeting its mandate originally proscribed and funded by local tax payers. How dare you cater to the few at the expense of the many!

The "no plan alternative" is the only alternative that has been presented to the public that protects the natural and cultural resources that visitors come to enjoy. Increase tule elk herds, get rid of the cattle, do not add other agricultural activities in a NATIONAL SEASHORE. Cattle cause much greater impacts to the soil, plants, habitats, archaeological resources, wetlands, streams, etc. The ranchers were paid off generations ago and it is unfair that they can continue to operate: What a privileged status! How do I join? I would protect the historic structures and the natural and cultural landscapes, habitats and species. What do the ranchers contribute other than of course increased money and horrid environmental impacts.

I hope to address these issues item by item but have limited time. I expect to see you in court!

Blessings

Correspondence: To whom it may concern,

I am writing because I am concerned about the preservation of the wild lands of Point Reyes National Seashore. I grew up in the bay area and have spent endless happy hours exploring the beauty of Pt. Reyes. I am hearing talk of expanding the use of protected land for use in the farming industry.

The topic of whether or not the rolling green slopes of the farming land in the park are appropriate or not and whether farming in the park should be abolished may be for another day. But the thought of expanding farming into the protected lands of the park is unthinkable. This is a National Seashore and a protected national park land, is it not?

I urge you to look at adopting option F of the various proposals for land use. Thank you

#7350

Name: Petersen, Kelli

Correspondence: This comment is submitted by Kelli Petersen, a California native, and Marin County property owner and the comment pertains to the Draft Environmental Impact Statement (DEIS) for the General Management Plan Amendment (GMPA) for the Point Reyes National Seashore (PRNS). My husband, family and friends visit the PRNS regularly to view and enjoy wildlife, and walk the trails and beaches. Upon review of the DEIS, it was found to be substantially inadequate and unbalanced as five (5) of the six (6) Alternatives presented are biased with the continuation, and even expansion, of the ranching and dairy operations within PRNS. None of these 5 Alternatives are aligned to the legislation implemented in the 1960's and 1970's, which notes: • 1962 Enabling Legislation: the NPS was required to "preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area" • 1972 Legislation: the NPS was to "administer Point Reyes without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, and based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area." • In addition, the 1962 Enabling Legislation states, "Except for property which the Secretary specifically determines is needed for interpretive or resources management purposes of the seashore, the owner of improved property or of agricultural property ... may, as a condition of such acquisition, retain for himself and his or her heirs and assigns a right of use and occupancy for a definite term of not more than twenty-five years, or, in lieu thereof, for a term ending at the death of the owner or the death of his or her spouse, whichever is later." Therefore it is unclear why in 2019, and per the 1960-1970 legislation noted above, the NPS would allow the continuation of ranching and dairy activities in PRNS

based on its documented support of Alternative B. Alternative B in the DEIS allows: - The continuation of cattle ranching and dairy farming in the PRNS - An expansion of cattle ranching and dairy farming in the PRNS with the addition of pigs, sheep, goats, etc - Lethal removal of the reintroduced native tule elk that trespass on to ranching/farming lands in PRNS, also known as public lands

The domesticated cattle, the ranchers and dairy farmers, have negatively impacted what should be a pristine and natural environment. PRNS visitors are exposed to large areas of erosion caused by dairy cattle, mounds of manure, horrendous odors from the manure, and dilapidated ranch and dairy buildings. I have visited numerous National Parks in the United States and the world and I have never seen such unsightly situations as I have seen in my local National Park, PRNS. Why do my tax dollars continue to subsidize cattle ranchers and dairy farmers in PRNS, who were already paid for the land decades ago, and who have proven to have minimal concern on the negative impact of the public land in this national park? I support Alternative F in the DEIS, which requires the cessation of cattle ranching and dairy farming within a 5-year period. In addition, Alternative F, per the DEIS Environmental Consequences section, will also provide the following local and global environmental benefits: • Soils - "... cessation of ranching would eliminate all impacts on soils associated with ranching activities." • Water Quality - "... impacts on water quality would be noticeable, long term, and beneficial because ranching activities would be phased out across the entire planning area." • Vegetation - "... vegetation composition would likely change in areas where ranching is removed. In these areas, while the cessation of grazing would eliminate adverse impacts such as high-intensity-use areas... impacts on other federally listed plants that occur in certain habitat, such as dune or serpentine habitat, may be beneficial because the potential for cattle to trample individual plants would be reduced... Elk management actions under alternatives B, C, and D could result in highly localized impacts because of trampling." And although this section indicates that "Eliminating livestock grazing could also adversely affect several federally listed plants that occur in coastal grassland because grazing is the most effective tool for promoting their persistence with respect to competition with other non-native grassland species," it does so without recognizing the role grazing plays in spreading the invasive species in the first place. • Wildlife - "Where cessation of grazing occurs on lands under alternatives D and F, impacts on wildlife related to dairy and beef ranching would cease, including disturbance, trampling, erosion, and nutrient inputs... Alternatives E and F would eliminate impacts of forage production, manure spreading, and diversification and would reduce high-intensity-use areas compared to existing conditions." • Tule Elk - "... would eliminate impacts on elk related to hazing and fencing and would allow for the free-range population to expand across the planning area." [And would not call for the lethal removal of any elk.] • Air Quality - "... would phase out ranching, ending ranching-related emissions of criteria pollutants." Therefore, not only is Alternative F aligned with the 1960-1970 Legislation, but it is the ethical and responsible step to take based on the global climate crisis and well as the appropriate utilization of tax payers money.

It is requested the NPS update the DEIS to include rationale and justification of each Alternative, including rationale why the NPS supports Alternative B. The updates to the DEIS should involve appropriate committee members to ensure a balanced representation of Alternatives, as 5 of the 6 Alternatives are clearly pro-ranching. The updated DEIS will need to be released for public review and comment. In summary, I support Alternative F as it aligns with the prior legislation that was agreed upon by the ranching and dairy farming families who financially benefited from the purchase of the land years past. Alternative F will help address a global climate crisis, as PRNS would return to a natural, and healthy landscape to be enjoyed by people of all ages, including our native wildlife.

Sincerely, Kelli Petersen

Correspondence: This is so wrong! Dont do it

#7352

Name: Prabandham, Manu

Correspondence: Hi, I am Manu Prabandham, a student at the College Preparatory School in Oakland. As it is for many other young people, Pt. Reyes is a special place for me. From family picnics on Limantour Beach to a more intense wilderness experience in the Phillip Burton Wilderness, I've fallen in love with Pt. Reyes, a well-preserved Marin Coastal environment. I have utmost faith in the National Park Service to continue to protect the Pt. Reyes Seashore for generations to come. However, I'm not sure if ranching should be a part of this future. It certainly wasn't a part of Pt. Reyes's past, before Spanish colonization. Elk herds roamed, and Native Americans used land sustainably without harming waterways and soils.

I prefer Alternative D as a plan going forward compared to the currently favored Alternative B and Alternative A. Although the ranchers are doing their best to prevent environmental impact on the ecosystem within the ranching zone, I believe their impact will always be too significant for the park to continue allowing ranching in the long-term. Alternative D is a good compromise similar to what the park has been doing over the last few decades. Ranches once occupied a far larger portion of the Pt. Reyes Peninsula, but much of the land has been bought back by the park. Ranching still continues, but in a smaller scale than before. Alternative D would continue this trend, opening up more land for the park to restore and protect (as it has with many other former ranches), while protecting ranchers and their livelihoods for at least the next 20-30 years.

The Environmental Impact Statement states that Alternative D would decrease emissions associated with ranching in the area by 8.05% year-on-year. While this doesn't seem like much, any restoration of pollution to its original state is beneficial. Alternative D is the first step in a gradual reduction of pollution in the region as ranching is phased out. The Federated Tribe of Graton Rancheria, an underrepresented group in the wilderness conversation, prefers that the land be returned to its original state. The Native Americans of the area, through living on and with the land for millenia, developed land-management strategies which conserved resources. Ranching interferes with traditional land-management. In essence, the true tradition of the land is the Native American way of periodical burning, not the "tradition" of ranching.

Dewey Livingston spoke to me about the influence of climate change on park lands. He talked about the land, especially the grasses, of the region becoming less suitable for ranching. The warming climate reduces the number of foggy days long-term, he said. We have to work to preserve the state of the land we have. Instead of continuing intensive ranching on land already burdened by climate change, we have to protect what we have, and the gradual shrinkage of the Ranching Zone, initiated by Alternative D, will start this process. Offering too many concessions to the ranchers threatens the landscape even further. But we have to take into account the rancher's perspective as well. They've been living on this land for decades, and it's important to take into account their livelihood as well. However, Point Reyes is a National Seashore, owned by the public as a whole, not just the ranchers. One original mission of the park was to protect the area from suburban development. Now, with increasing urbanization, it's the park's responsibility to protect the land for a new generation of people further separated from the wild.

#7353

Name: Rambo, Vicki

Correspondence: Point Reyes National Seashore is for wildlife and deserves restoration and protection. The "agricultural" leases and permits need to end at this location.

Numerous conservation groups, including Western Watersheds Project, Resource Renewal Institute, For Elk, Conservation Congress, Wilderness Watch, Sequoia Forest Keeper, White Shark Video/Shame of Point Reyes, John Muir Project, and Ban Single Use Plastics, as well as many concerned former National Park Service employees and individuals, are opposing the Park's current preferred alternative, which would extend Ranchers' lease-permits for decades is not the best choice for this national park.

Barbara Moritsch, ecologist, author, and former botanist for the National Park Service at Point Reyes National Seashore, makes the point "The ranches were purchased by the government and the ranchers were given more than adequate time to move elsewhere. The National Park Service now has an unprecedented opportunity to end ranching on our public lands in this parks-doing anything else would be a grave disservice to the American people,

as well as to the incredible diversity of native plants and wildlife that actually belong on these lands." Grazing has adverse impacts on coastal prairie, riparian systems, springs, wetlands, and coastal dune vegetation.

The national seashore has been degraded by ceaseless cattle grazing since this national park was established nearly 60 years ago and a grand opportunity presents says Laura Cunningham, California Director of Western Watersheds Project. "This could be the Yellowstone of the Pacific Coast with elk and wildlife roaming freely, instead of more beef and dairy cattle."

In contrast to the herds of cattle, there are only 124 free-roaming native tule elk in the Drake's Beach herd. "It's shocking to me that the park would kill or remove elk, for cows, or pigs, or chicken, or special interest profiteers on national park land.

Conservation values must be placed first. The proposed General Management Plan amendment being analyzed fails to protect and restore Point Reyes National Seashore AND Golden Gate National Recreation Area.

The 1916 Organic Act that formed the National Park Service mandated that natural resources on park lands shall not be impaired. The Point Reyes National Seashore legislation specifically mandates that this special coastline be "protected" and "restored."

It is my understanding that it is the job of the National Park Service to protect the National Seashore for the benefit of wildlife and the natural ecology.

Superintendent Cecily Muldoon Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Subject: Review Comments on the Point Reyes National Seashore General Management Plan Amendment - Draft Environmental Impact Statement

Dear Superintendent Muldoon:

Thank you for this opportunity to provide comments on the Draft Environmental Impact Statement (DEIS) for the Point Reyes National Seashore and Golden Gate National Recreation Area North District (PRNS/GGNRA) General Management Plan Amendment (GMPA). I am a wildlife biologist with over 30 years of professional experience in Marin County.

Mandates

NPS is constituted to primarily to protect the natural resources, according to the following statutes: • The 1916 NPS Organic Act mandates that the Secretary "shall promote and regulate the use of the National Park System by means and measures that conform to the fundamental purpose of the System units, which purpose is to conserve the scenery, natural and historic objects, and wildlife in the System units and to provide for the enjoyment of the scenery, natural and historic objects, and wildlife in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." In regard to this mandate, the Ninth Circuit Court of Appeals has held that the language quoted above means that "resource protection [is] the overarching concern' in the management of national park system units." • The PRNS legislation provides for administration of the public land "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with . . . the maximum protection, restoration, and preservation of the natural environment within the area." • The GGNRA legislation

provides as follows: “In order to preserve for public use and enjoyment certain areas of Marin and San Francisco Counties, California, possessing outstanding natural, historic, scenic, and recreational values, and in order to provide for the maintenance of needed recreational open space necessary to urban environment and planning, the Golden Gate National Recreation Area... hereby established. In the management of the recreation area, the Secretary ... shall utilize the resources in a manner which will provide for recreation and educational opportunities consistent with sound principles of land use planning and management. In carrying out the provisions of this subchapter, the Secretary shall preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area.” The DEIS documents that all ranching alternatives will have unmitigated detrimental impacts - particularly cumulative effects - - to natural lands and conflict with the above mandates.

#### NPS's Preferred Alternative (Alternative B) Contrary to NPS Mandates

I most concerned that this alternative prioritizes the economic viability of private agricultural enterprises on the public land over the NPS's mission to preserve “unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations.”

By, in effect, assuming a responsibility of maintaining the economic profitability of the ranching operations, the NPS will find itself in conflict with its own mandates. The term “sustainability” in practice entails a commitment to maintain profitability, which is out of the acceptable scope of NPS mandates.

Of particular concern are conflicts between agricultural operations and natural land values:

- Carbon sequestration results in increased soil fertility which in turn encourages invasive exotic plants replacing native flora.
- Farm operations inadvertently encourage expanding populations of American crows and common ravens, which predate on native fauna including the federally listed snowy plover. This spring the first instance of a raven taking baby pileated woodpeckers from a nest cavity was photo documented on the PRNS.
- Native coyotes and mountain lions naturally take domestic livestock, generating practices by either the NPS or the ranchers to control these native species. Coyote populations had been drastically reduced in Marin County in the past by lethal means. It can be anticipated that coyote populations on the PRNS and GGNRA will continue to increase and so will conflicts with ranching. A similar pattern may be the case with mountain lions as their populations naturally increase.
- Due to past ranching practices, California ground squirrels have been largely exterminated in the current ranchland. But it is likely that over the 20-year initial lease period, these range rodents will return. The ground squirrels will likely be even greater competition for range forage than the tule elk. In addition, the ground squirrel burrows are perceived as a hazard for cattle and horses. In short, the NPS will find itself in the position of having to control for yet another native species given the precedent established by the control of the elk. Ground squirrels are a native species and provide valuable ecosystem functions such as supplying burrows for burrowing owls and other native wildlife and recirculating soil compacted by cattle and other introduced livestock.
- The ranches will have outdoor domestic cats. It is now well documented that outdoor cats take a heavy toll on native rodents, reptiles, and birds.
- The ranches may have unleashed dogs, either as working animals or as pets, which is contrary to NPS policy. For all of the above, the DEIS does not provide adequate mitigation measures. Further, the NPS does not have adequate enforcement mechanisms even where the mitigation measures are in place. The DEIS should conclude that for all of the above impacts, the mitigation fails to achieve full mitigation. That is, Alternative B is partly unmitigated.

#### NPS's Other Ranching Alternatives (Alternatives A, C, D, and E) Contrary to NPS Mandates

While I recognize that the NPS has a mandate to preserve the historical heritage of ranching on the public land, the DEIS fails to demonstrate why that necessitates a change in the policy of the PRNS from temporary leases that would could expire and not be renewed to having commercial ranching in the entirety of the pastoral zone in perpetuity.

For instance, the NPS administers Civil War battlegrounds, but does not insist that part of the visitor experience include being subjected to live ammunition. This is, of course, an extreme example. But the DEIS does not

adequately examine and provide alternatives to active agriculture that would still conserve historical cultural values.

In a recent letter to the Marin Independent Journal, Elizabeth E. Dodge commented: “Even in cases when a ranch’s lease is relinquished, the National Park Service offers it to other ranchers rather than either retire it or, if we are to be historically sincere, return it to the Coast Miwok people who were driven off the land by the ancestors of those who currently occupy it.”

#### Alternative F Achieves Resource Protection

Alternative F most closely achieves an environmentally superior desired outcome of allowing ranching to expire. The DEIS provides sufficient evidence that continued ranching as proposed in Alternatives A-E result in unmitigated detrimental environmental effects on soils, water quality, air quality, vegetation, wildlife, and other natural resources. These alternatives are not consistent with the NPS’s statutes.

The DEIS’s proposed policy for ranch succession should be modified to allow ranching operations to expire on a given ranch if a named lessee does not wish to enter into a lease/permit. Likewise, if a current lessee consistently fails to meet performance standards, the lease should be terminated. No other effort should be made to seek leases from insider or outside the park. An alternative allowing ranching to attrite over time is the most in keeping with the NPS’s natural resource protection mandate.

#### Conclusions

- The NEPA document is insufficient in failing to fully explore restoration of public lands from the impacts of ranching. This should be more fully developed.
- The discussion of the NPS’s monitoring and enforcement program is insufficient and needs to be expanded. In particular, the issue of insufficiently funded and unfunded programs should be considered the same as having no program at all.
- The cumulative impact analysis is incomplete and insufficient to explain the overall impacts of grazing compared to benefits of the removing it.
- The DEIS does not clearly link the impact assessment with specific mitigation measures. This needs to be done. Unless BMPs and other mitigation measures are required and specifically linked to impacts, they are really intentions and not concrete mitigation.

If the NPS would recirculate a supplemental DEIS for public comment, the source of funds to fully implement the alternatives and the effects of any reduction in funding on any other existing programs should be described. The FEIS should assume no increase in overall funding to pay for the implementation of the selected alternative, because funding has been declining.

Respectfully,

Roger D. Harris, Certified Wildlife Biologist

Name: Heimberg, Erica

Correspondence: To Whom it May Concern,

I am extremely concerned with Alternatives A-E outlined in the proposed General Management Plan Amendment. I have worked to protect national parkland throughout my career as a nonprofit funding development professional with the Golden Gate National Parks Conservancy, Turtle Island Restoration Network and other environmental organizations in Marin County. I am also an outdoor enthusiast and visit the Point Reyes National Seashore regularly to enjoy the remaining natural ecosystems and view wildlife.

The National Park Service mission is to "preserve unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations. The Park Service cooperates with partners to extend the benefits of natural and cultural resource conservation and outdoor recreation throughout this country and the world."

Allowing ranching to continue or to expand within the park is counter to this mission in three key ways:

1) Ranching impacts wildlife habitat, increases erosion, fouls water and increases greenhouse gas emissions. While the EIS notes these impacts, the preferred alternative would allow them to increase. No estimate of the costs to mitigate or restore these ecosystem services are included. North America has lost 3 billion birds since 1970 due to habitat loss. 86% of land mammals are now livestock or humans. The impacts on elk are outlined, but no other species impacts are detailed. As we lose species, the web of life is fraying. What are the costs to mitigate these impacts, which would be allowed in conflict with the NPS mission? How will those mitigations be funded in order to protect the parkland.

2) Dairy and beef consumption are leading causes of climate change. With the UN IPCC October 2018 report stated that we have less than 12 years to avert the worst impacts of climate change. Marin County has committed to "Drawdown Marin" which includes best practices to reduce carbon, including reducing meat and dairy consumption. Livestock accounts for 14.5% of greenhouse gas emissions worldwide. Grassfed beef is not significantly better for the environment, and the benefits of rotational grazing have been debunked. How will the National Park Service mitigate the continued or increased greenhouse gasses produced by options A-E?

3) The diminished impact on the enjoyment of national parkland by people who don't eat meat or dairy of viewing these activities. I personally have viewed separated plastic crates with tiny outdoor yards used to separate calves from dairy cattle. I have seen cows with painfully swollen udders covered in mud and excrement. I have seen eroded pathways where mud and excrement are flowing into water ways and estuaries. I was extremely disturbed to realize that my tax dollars are subsidizing these activities on parklands. Many US citizens do not eat meat or dairy due to religious reasons. We all have a right to visit our national parks and not view harmful, cruel activities.

Do not use my tax dollars or anyone else's to subsidize the ranchers further through allowing succession or additional agricultural activities.

I do support funding to help the ranching families develop alternative ways to make a living. Have potential training opportunities in alternative livelihoods in the community been developed?

I urge the National Park Service to select option F and end ranching in the Point Reyes National Seashore. The science in the EIS does not support continued ranching within the mission of the National Park Service.

Sincerely,

Erica Heimberg

Point Reyes National Seashore

Re: Comments to Point Reyes National Seashore GMPA/EIS

I have lived in the Bay Area most of my 64 years, and in Marin County for over 20 years. As a frequent visitor Pt. Reyes National Seashore partaking of its many recreational opportunities to hike, bike, camp and kayak, I feel blessed to experience the Seashores incredible beauty and natural diversity through the seasons.

That said, I am deeply troubled by the ongoing degradation inflicted on the Seashore by pervasive dairy and beef ranching on nearly on third of the park. Inevitable encounters with cow manure and muddy pastures; rutted trails, tracked hillsides, polluted ponds, industrial-looking buildings, machinery and trash, barbwire fences and private property signs diminish the visitor experience, violate the public trust and give the impression of blatant disregard for National park values.

This ongoing occupation by ranchers flies in the face of the promise and purpose of the Seashore. Pt. Reyes is the only National Seashore on the West Coast which was envisioned as an unimpaired natural oasis in rapidly developing coastline. Located within an hours drive for millions of Bay Area residents, the establishment of the park offered an important opportunity for urban residents to connect with nature. The lands were purchased with public funds and all parties, including well-compensated ranchers, agreed that ranching would reasonably come to end. Now, sixty years later, taxpayers continue to bear the burden of detrimental ranching on 28,000 acres our National Seashore. And, when the ranchers finally depart (Alternative F), will the public have to cover the financial cost of repairs and restoration, as they did with the Oyster Farm in Drakes Estero?

My professional and educational background is in public health, so I my my comments are narrowly focused on the threat that nearly 6000 cattle pose to health and welfare of the Seashore's wildlife and visitors. It seems as though these concerns were not addressed or dismissed as unimportant by Preferred Alternative B. For instance, cattle are the single largest source of greenhouse gases in the park and thus the largest contributor to the Climate Crisis yet this impact is largely unaddressed by the EIS. The hundreds of tons of cow manure that pollute watersheds and coastal waters, harms rare coastal ecosystems that are home to over 100 endangered or threatened plant and animal species is also overlooked in B. Runoff from cattle operations also harbors bacteria, such as e-coli, that drains into water bodies where people swim, fish and cultivate oysters. Notably, signs posted at Chicken Shack beach warn swimmers of the biohazard. Wildlife, human and ecosystem health should be prioritized and protected, not trampled and poisoned by commercial cattle operations.

#### Johnes Disease

Most certainly, Johnes disease in Pt. Reyes National Seashore poses an intolerable threat to wildlife that must be eliminated. Last year the Park Service culled 20 Tule elk to test for Johnes, but simply trying to estimate infection rates in wildlife ignores the most likely source of ongoing infection-the 6,000 resident cattle. Yet, the public has little information regarding current testing requirements or results for cattle at Pt. Reyes.

Previous studies indicated that 50 percent of Pt. Reyes herds were infected, but the number could be much higher today. According to national experts at Johnes.org, Johnes disease is nearly ubiquitous in U.S. dairy cattle with an estimated true herd-level prevalence of over 90% (when accounting for herds with false-negative culture results; Lombard, Prev.Vet. Med. 108:234-238, 2013). and is also present in 18% of US beef cattle herds.

Meanwhile, MAP bacteria, which causes Johnes's disease can persist in water, silage and soil for a year or longer, infecting other animals that come into contact. Currently, dangerous ranching practices contaminate grasslands and watersheds, and expose wildlife and humans to disease. These include allowing cows to enter creeks and ponds, allowing cows to graze on hillsides that drain into streams and watersheds, overgrazing pasturelands by confined dairy herds, allowing ranchers to spread manure slurry onto grasslands and the failure by NPS to regularly monitor number of cattle and conditions on leased lands. Sheep and goats also contract and transmit Johnes,

Cattle are proven to have infected native Pt. Reyes Tule elk, the only population of Tule elk that reside within a National Park. Tragically, the Tule elk problem may be the tip of the disease-transmission iceberg. Johnes Disease

can infect a wide range of wild and domestic species including sheep, goats, deer, antelope, fox, rabbits and birds that come into contact with infectious cow manure, according to [Johnes.org](http://Johnes.org).

Should the NPS wish to eliminate Johnes disease from Pt. Reyes cattle herds, comprehensive testing and culling, along with strict calf and manure management protocols would be necessary. Without comprehensive testing, diagnosis of Johnes is difficult. Johnes is silent in the early stages-animals typically appear healthy for three or more years while shedding the infectious MAP bacteria in manure and milk. The hallmark signs of chronic diarrhea and wasting do not present until later stages. Dairy cattle are taken to slaughter once their milk production wanes, typically end up as hamburger meat before the disease becomes evident.

Prevention of the disease in cattle is even more challenging now the single vaccine, Mycopar, used by many U.S. Veterinarians and producers to prevent infection is no longer being produced.

The Hoards Dairyman article is based on this Livestock Health Alert issued by the Wisconsin Department of Agriculture Trade and Consumer Protection (DATCP).

#### Chronic Wasting Disease VS Johnes Disease MAP (paratuberculosis)

Alarming, from a public health standpoint, is the risk that the Johnes-causing bacteria, *Mycobacterium avium paratuberculosis* (MAP), may play a role in a spectrum of human diseases, most notably, Crohns Disease. Like Johnes, Crohns is a chronic and painful inflammatory disease of the intestines. Evidence linking the two diseases includes the finding that MAP bacteria are present in Crohns patients at rate of 7:1. For the dairy and beef industry, MAP is the elephant in the room since live MAP bacteria have been found in raw and even, pasteurized milk, cheese, dehydrated infant formulas and beef.

Elimination of Johnes disease from cattle should be a priority for the industry. Michael Collins, DMV, international Johnes expert at University of Wisconsin Veterinary Department and Johnes Information Center cites the following article about CWD, a cattle disease that may also threaten human health. Chronic Wasting Disease in Cervids: Implications for Prion Transmission to Humans and Other Animal Species. The authors of the article conclude: Available data indicate that the incidence of CWD in cervids is increasing and that the potential exists for transmission to humans and subsequent human disease. Given the long incubation period of prion-associated conditions, improving public health measures now to prevent human exposure to CWD prions and to further understand the potential risk to humans may reduce the likelihood of a BSE-like event in the years to come.

Dr. Collins contrasts CWD with Johnes (JD), which is a more common disease in cattle. His comparison of the two diseases underscores the relative importance of JD to society and urges science-based decisions on animal disease control investments. The evidence in the table below and the references that follow illustrate the highlight the relative risks to humans.

#### Contrasting Two Wasting Diseases

CWD MAP (Johnes's Disease causing bacteria)

RARE and only found in cervids primarily in Common-90% of US Dairy herds  
North America

Limited transmissibility to nonhuman Documented cases of naturally occurring MAP infection in non primates by experimental challenge human primates

No evidence CWD causes human disease MAP found in 50% of of people with CD

Anti-MAP antibiotics can cure CD

MAP fulfills 8/10 Hills Criteria for causality of CD

MAP linked to T1DM and other so-called autoimmune diseases

Risk factors for humans known and controllable Multiple ongoing exposure risks for humans:

MAP found alive in pasteurized milk and raw meat

#### Footnotes:

" 1 Crohns disease affects more than 1 in 800 people in North America, and while the incidence has plateaued in more industrialized countries, since 1990 the incidence has been rising in newly industrialized countries in Africa, Asia, and South America, including Brazil.

" 2 Type 1 Diabetes Mellitus affects roughly 1 in 550 youth (<20 years old) in the U.S. and Canada, and the incidence is rising.

" 3 Multiple Sclerosis affects roughly 1 in 700 in the U.S., and the incidence is rising.

To ignore the threat of Johnes disease risks the health of wildlife and potentially humans in the park. The unknown risk is whether MAP infection is also transmissible to humans via contaminated water, soil or grass (as it is to elk and other animals). The Precautionary Principle states that that unless a risk can be eliminated, it must be considered.

#### Evaluation of the Alternatives

##### Alternative A: No Action

This alternative, required by the National Environmental Policy Act, would allow ranching to continue under 5-10 year leases. The NPS would capture and move, or kill Tule elk that encroach on lands leased for cattle.

Comment: Alternative A does not address the harmful impacts of ranching including pollution and Johnes disease. It is uncertain that Tule elk that test positive for Johnes could be moved to other lands, where they may infect other herds.

##### Alternative B: NPS's preferred alternative

Issue 20-year leases; establish a "Ranchland Zone" with 3 sub-zones. This would concentrate cattle in one subzone designated for that purpose; and convert some cattle grazing land for diversification (raising pigs, goats, sheep, chickens, and row crops). B&Bs and retail farm stands would constitute another subzone. This alternative would remove (aka shoot) 10-15 Tule elk annually in order to maintain a herd of 120 elk at Drakes Bay, as well as any elk that graze on grass leased to ranchers.

Comment: Alternative B does not address/reduce/eliminate the harmful impacts of ranching, including pollution and Johnes disease. Also, allowing ranchers to diversify by raising sheep and goats would likely contribute to disease spread since these animals also acquire and transmit Johnes disease.

##### Alternative C: Lethal removal of all Drakes Bay Tule Elk

Comment: Alternative C does not address/reduce/eliminate the harmful impacts of ranching, including pollution and Johnes disease and would likely contribute to disease spread through diversification with sheep and goats.

It is unconscionable that rare Tule elk would be extirpated from their native habitat in favor of livestock.

##### Alternative D: Reduced ranching

Same as B; would grant 20-year leases and phase out those ranches with minimal infrastructure on 7,500 acres over one year.

Comment: Alternative D does not address/reduce/eliminate the harmful impacts of ranching, including pollution and Johnes disease and would likely contribute to disease spread through diversification with sheep and goats.

##### Alternative E: Phase out dairy ranches

Dairy farms have more impacts to the park than beef ranches. The six dairy farms would be phased out over 5 years and allowed to convert to beef ranching, eligible for 20-year leases. The Drakes Bay elk herd would be managed at a threshold population of 120.

Comment: Alternative E would reduce but not eliminate the harmful impacts of ranching, including pollution and Johnes disease and would likely contribute to disease spread through diversification with sheep and goats.

Alternative F: No ranching.

Under Alternative F, land dedicated to ranching would be repurposed for "visitor opportunities. The Tule elk would be allowed to expand their range in the park.

Comment: I support Alternative F, the only that option that would finally accomplish the intended purpose of the park and can restore the Seashore to a healthy environment for wildlife and people.

Thank you for the opportunity to provide comments.

Sincerely,  
Deborah Moskowitz, MPH

Correspondence: I am encouraged by NPS' ongoing evaluation of expanding cycling opportunities in the Point Reyes area. Though I currently restrict my cycling visits there out of concern for safety, increased connectivity through the use of existing ranch roads would be most welcome and greatly increase my visitation to this gem of the GGNRA. Specific connections I would like to see are as follows:

Marshall Beach Trailhead to Pierce Pt. Rd. via existing ranch roads; Abbotts Lagoon to Drakes Estero via existing ranch roads; Platform Bridge to Devil's Gulch via existing ranch roads; Bolinas Ridge at Olema Hill to Point Reyes Station via existing ranch roads; Bolinas Ridge to Five Brooks via existing ranch roads; and an Estero Trail loop using existing ranch roads.

Thanks for your consideration! John C. Sweeney

Name: N/A, N/A

Correspondence: Dear Point Reyes National Seashore Superintendent,

Marin County Farm Bureau appreciates the time and effort that has gone into researching all options for the draft EIS. Marin County Farm Bureau (MCFB) is a grassroots, voluntary membership-based organization whose purpose is to represent the interest of agriculture in Marin County. MCFB works to secure the future of agriculture and aims to find solutions to the problems of the farm and rural community. Farm Bureau strives to protect and improve the ability of farmers and ranchers engaged in production agriculture to sustainably and viably provide a reliable supply of food. MCFB is affiliated with the California Farm Bureau Federation; MCFB supports the September 23, 2019 California Farm Bureau Federation comment submitted.

Please select the preferred alternative, "Alternative B" for the future of ranching in the Point Reyes National Seashore. MCFB supports agriculture in the Seashore because it is a vital part of the region's history, culture, and current economy.

Marin County Farm Bureau appreciates the time and effort that has gone into researching all options for the draft EIS. Twenty year leases, succession planning, and diversification allowances enable the farms and ranches to sustainably adapt to changes facing their family farms and allows the next generation the opportunity to contribute to the local food shed. However, diversification seems limited in scope and size, 2.5 acres around structures in ranch core with no irrigation and other restrictions is cumbersome. In addition, the draft EIS would

have been more complete if research was done on an option that includes an Elk Fence between the agriculture and wilderness area or Elk relocation options. Agriculture is a partner in natural resource conservation and preserving open spaces. Many of the natural landscapes in the US near large urban areas are preserved because agriculture was there first to curb development. Agriculture and nature do co-exist, we support the farmers and ranchers in the Seashore for their part in providing for the local food shed in a sustainable way. Agriculture plays an important role in combating Climate Change by providing local food and carbon and greenhouse gas drawdown.

Agriculture, and the continuation of workable farming in the Seashore, is important to Marin County Farm Bureau because it is a cornerstone in West Marin's history, economy, culture, resource conservation, and carbon drawdown. In its mission statement, the National Park Service's goal is to preserve unimpaired the natural and cultural resources and values of the National Park System for the enjoyment, education, and inspiration of this and future generations. Agriculture in the Seashore is a part of the history that led to its creation and has been a part of the working landscape that has existed since inception of the Point Reyes National Seashore. Historic preservation and cultural landscapes are priorities for the National Park Service. Farms and ranches in the Seashore are part of these cultural landscapes and are important to preserve, viably, for this and future generations.

Agriculture is important to me in the Point Reyes National Seashore, the preferred Alternative B is the best option from the draft EIS for reasons stated above. Please consider the changes above and those mentioned in the California Farm Bureau Federation's September 23, 2019 comment in the final EIS and GMPA. Thank you for taking the time to review these comments.

Respectfully Submitted, Brian Dolcini President, Marin County Farm Bureau

Correspondence: I am entirely opposed to the killing of elk at Point Reyes...

It is THEIR habitat and they have EVERY RIGHT to be there!!

They are an important part of the eco-system and should be left alone!!!

RESPECT wildlife - DON'T kill it!!!

Do you think tourists will want to come there to see an empty desolate wasteland??!

Please leave the elk and other wild creatures ALONE!!!!

Thank you.

#7361

Name: CATALDO, BETH

Correspondence: To Whom It May Concern,

I am writing to support Alternative F of the General Management Plan Amendment Draft Environmental Impact Statement. I do this in the spirit of Theodore Roosevelt, who said:

"The 'greatest good for the greatest number' applies to the number within the womb of time, compared to which those now alive form but an insignificant fraction. Our duty to the whole, including the unborn generations, bids us restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The

movement for the conservation of wildlife and the larger movement for the conservation of all our natural resources are essentially democratic in spirit, purpose, and method."

My experience as a volunteer in two capacities at Point Reyes National Seashore has provided me with insight into the detrimental short- and long-term effects that the ranches have on our public lands and oceans. I will describe what I have seen during more than 500 visits to Point Reyes over the last 20 years.

Winter Wildlife Experience: I have been a Winter Wildlife volunteer for the past 10 seasons, spending time from January until April each year talking to visitors about elephant seals, whales and other wildlife that visit the park. During this time, I have seen raw sewage from the cattle flow directly into the ocean at Drakes Beach.

One time in particular stands out, this year (2019) after a heavy rain. I was talking to visitors at the north end of the beach and we were discussing the strong smell of cow manure when we looked down at the stream, which runs into the ocean here, and saw the brown sewage, which was emanating the stench. This continued all day as we watched the ocean turn brown.

There aren't any signs alerting the public of this sewage. Children and adults walk through and play in this stream. I have also seen wildlife, including elephant seals, river otters and migrating birds, using this waterway.

I took a video that day so that I could have evidence of what was going on.

When I alerted the park staff via email about the pollution and stench, they wrote me back, stating that: "Facilities looked at the pipe for the Drakes VC sewage system and did not detect any leaks. Range staff checked from the parking lot upstream to the pond for signs/scents of manure - didn't detect anything unusual. I also talked to the ranch operator and it sounds like they were spreading manure on the flat areas of the D Ranch field along Drakes Beach Road during that time, so that may have been the source of the smell."

This tells me that the ranch's everyday operations cause pollution in our oceans. There is nothing that the Park can do to mitigate this. The employees could only shrug since the Park Service allows dairy ranches to spread liquid cattle manure on grasslands throughout the park.

Beach Watch Experience: For more than 15 years, I have walked the Great Beach (North Beach to Abbotts Lagoon) each month for the Beach Watch program, counting the live and dead animals on the beach and in the water. This information from this program adds to a database of information NOAA uses to assess ocean and beach health.

During this time, I have seen Abbotts Lagoon turn brown, clearly from the runoff of the cattle. This area also lacks signage about the possible pollution for those who are fishing and playing in this area.

Many birds - both migratory and residential - and mammals find their food in Abbotts Lagoon. I can't help but wonder what eating fish from this area with these levels of pollutants do to them.

Before I wrote this feedback, I wanted to make sure that I wasn't exaggerating my experiences. I researched to see if anyone had tested the water there and found a report (the link is below).

The data referenced in the report, which was collected throughout the country, show that "The livestock-polluted waters of Point Reyes National Seashore rank in the top 10 percent of U.S. locations most contaminated by feces indicated by E. coli bacteria."

The report also discloses that "Point Reyes National Seashore has been one of the 10 most feces-contaminated locations monitored in California since 2012 and that the state's highest reported E. coli level was on a Point Reyes cattle ranch."

The report goes on to state that "The Park Service's assessment determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbotts Lagoon areas with high concentrations of fecal coliform. Other studies show that cattle ranches are one of the major contributors of fecal coliform and E. coli to Tomales Bay."

This report and references to the data can be found online: <https://therevelator.org/wasted-water-crappiest-places/>

Given these findings, I find it hard to understand why the National Park Service recommends continuing and extending ranching in this beautiful area that future generations of humans and animals would like to enjoy. Let's be clear: the e. coli from the cattle are affecting the public enjoyment and use of Point Reyes National Seashore. I witnessed this firsthand.

The National Park Service is supposed to manage these public lands for "the greatest good for the greatest number." With the many challenges this country faces in light of the changes in climate, protection of natural resources should be our priority out of respect for future generations.

Politicians of diverging opinions come together on the importance of our parks.

George W. Bush stated: "Our National Parks belong to each of us, and they are natural places to learn, exercise, volunteer, spend time with family and friends, and enjoy the magnificent beauty of our great land."

President Roosevelt said: "There is nothing so American as our national parks.... The fundamental idea behind the parks...is that the country belongs to the people, that it is in process of making for the enrichment of the lives of all of us."

I am in full support of honoring the original spirit of our national parks. The best solution would be to: • Phase out ranches • Remove commercial livestock • Prioritizes wildlife over cattle • Restore wildlife habitat to native plants

Alternative F is the only option for the future of Point Reyes National Seashore.

Beth Cataldo

#7362

Name: Price, Bart

Correspondence: I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands.

The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Name: Heagerty, Elise

Correspondence: I remember when the GGNRA was formed. I am a long term resident of Marin County. Also have been involved with the equestrian community for over 45 years in Marin. It has been punishing at best attempting to work with the Park Service in meeting expensive and very limiting goals in terms of horses, their environment, etc.. So I am shocked and saddened by what appears to be a cozy relationship with ranchers and the Park Service which seems to favor ranchers with growth and seems to by-pass community, environmentalists, and puts in place contracts long term. To think that the Tule Elk could be hunted to ensure that cattle, now chickens, etc., and B&Bs could be introduced into this amazing territory. We know what the impact has been on water. When I go out to Pt Reyes I am always in awe of the beauty and, of course, the Tule Elk. We all love Pt Reyes so please open up this decision making proces to time and data from the community. Elie Heagerty

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

Correspondence: I believe that ranching must come to a natural end in point Reyes national seashore. Ranching has a history that predates the park, but this does not mean that it should exist in the park in perpetuity. Indeed, this is why the leases were limited in duration from conception of the park. ranchers should not be permitted to expand their operations and reap commercial benefit using the land supported by taxpayer dollars. Further, ranchers argue that the rule elk are competing with cattle for their land and destroying fences etc. the elk seek to roam and forage. They should be permitted to do so.

#7366

Correspondence: I respectfully submit my comments on the draft Environmental Impact Statement to guide the NPS Point Reyes National Seashore management plan.

#### Alternatives A-E

The essential message in the EIS is that the land, water, and wildlife inside the boundaries of the Pt. Reyes National Seashore would benefit if the two dozen or so ranches were to stop operations. Only one of the alternatives of the EIS addresses the issue of ending ranching in the PRNS over a 5-year period, Alternative F. This is not new. It was the agreement made through compromise back in 1975, to phase out private ranching on Point Reyes parklands within 25 years or with the death or retirement of those ranchers who took part in the plan, signed it, and were rightly and well compensated.

The NPS should adhere to the goals it set out for all of the parks it manages, including the Pt. Reyes National Seashore, which includes protecting the park for the benefit of the natural environment and its wildlife, and for public enjoyment. The friction inherent between these two missions has been real since the agency was established and yet there have been many successes in mitigation over its long history. Yet, in none of Alternatives A-E is there an alternative offered for avoiding wildlife conflicts other than terminating the "excess" elk. These elk were returned to that environment in 1978 in order to thrive. Yet, the ranchers' benefits have been considered above the elks, and all others.

As a member of a multi-sector committee in Marin in 1987 reviewing how soils were managed on all public land in the County, the worst degradation I saw by far was in the Pt. Reyes National Seashore. We saw that it was due to cattle grazing on the alluvial soils and the hillsides, exacerbated by the wind and fog. Thirty years later, it is still happening. And now there is the added issue of the effects of climate change, including sea rise.

#### National Park Service Climate Plan

The preferred Alternative B and all others except F are counter to the goals and actions of the NPS climate plan, and that of Marin County and the state.

I applaud the work on the NPS climate action plan, and its Climate Friendly Parks Program. This is expensive. The NPS literally cannot afford to continue to support grazing in the PRNS or any parks while also "assisting parks in developing strategies and specific actions to address sustainability challenges, reduce GHG emissions, and anticipate the impacts of climate change on park resources." Methane, a GHG produced by cattle is at least 25x worse than carbon dioxide. There is no mention of mitigating the cattle's impacts in the Alternatives.

PRNS is one of the few undeveloped seashores in the US. Due to the effects of climate change including sea rise, the protection of the waters, land, air, and wildlife is the priority of the NPS for PRNS. Alternative F is the best and ultimately the only choice for the NPS.

Correspondence: Dear Point Reyes National Seashore Superintendent,

The Sonoma-Marín Cattlemen's Association thanks the National Park Service for the opportunity to comment on the draft EIS. The Sonoma-Marín Cattlemen's Association (SMCA) is affiliated with California Cattlemen's Association and the National Cattlemen's Beef Association and supports the comments that these groups submitted to the National Park Service regarding the Point Reyes National Seashore on September 23, 2019. The Sonoma-Marín Cattlemen's Association is a local, grassroots organization comprised of ranchers in Sonoma and Marin Counties.

Sonoma-Marin Cattlemen find Alternative B to be the best option in the draft EIS. Twenty-year leases, succession planning, and diversification are factors that will enable ranchers to be sustainable and viable. The producers in the park are a significant part of ranching in Marin County and contribute to the critical mass that supports local agricultural infrastructure and economy. The draft EIS would have been more complete if research was done on an option that includes an Elk Fence between the agriculture and wilderness area or Elk relocation options.

Agriculture and wildlife can and do co-exist. Agriculture inherently conserves natural resources and preserves natural landscapes and vistas. Sonoma-Marin Cattlemen support the farmers and ranchers in the Seashore for their part in providing for the local food shed in a sustainable way. Agriculture plays an important role in combating Climate Change by providing local food and carbon and greenhouse gas drawdown. Livestock grazing is an essential land management tool that is a cost effective tool for wildfire prevention and is a win for the environment. Grazing livestock captures carbon and increased the rate of sequestration, and grazing drives rural economic development and local food sources.

Thank you for taking the time to review these comments. Sonoma-Marin Cattlemen's Association supports the comments submitted by California Cattlemen's Association and the National Cattlemen's Beef Association. Sonoma-Marin Cattlemen's Association favors Alternative B and the changes mentioned above for the final EIS/GMPA.

Respectfully Submitted, Michael Furlong President Sonoma-Marin Cattlemen's Association

Correspondence: Take the cattle off our public lands!

#7370

Name: Mason, R

Correspondence: I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands.

The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Correspondence: Dear National Park Service,

Facts- 1. Pt Reyes National Seashore is a National Park, not private land to be used for Ranching, farming, or other domestic animal raising. Leases for Ranching were to have expired decades ago, as agreed by the Ranchers who

sold their land to be used as a National Park. 2. Current proposals of culling, expanded ranching, and row crops do not add to the National Park, only the degradation of it and it's specialty Wildlife such as the Tule Elk and Blue eyed Coyotes. 3. The visiting Public in general does not come to see veal contained along side the road, Wildlife fenced in, or hillsides covered with crops. While the Ranching history should be recognized and preserved, the days of large operations inside the Park were to be phased out, not made larger and especially at the expense of what makes this National Park so unique. 4. The Public is being robbed of this Park by special interests. I come here, as many do, to see unique Wildlife and untouched coastal lands, not cows being herded for daily milking by ATVs. 5. No for profit, private operation should be allowed to damage/control a National Park. If they are to exist within, they should be made to co-exist and be a benefit to the land. No Wildlife should die as a result of their use of the land, as will certainly happen under the current preferred proposal. What can any member of the general public say to effect change in the mission of the NPS to return this Park to the Wildlife and Public who come here to see it? You are to be the protectors of this Park. Under the current preferred proposal, this National Park will cease to be as it was meant to. If every member of the public that visited the Park was aware of what is happening, the outcry would be something that could not be ignored. I implore the NPS to stop going down this path of catering to special interests and protect this very special place for generations to come. There are few animals that will remain untouched and unaffected by the NPS preferred proposal. A Blue eyed Coyote has no price tag over a goat or cow. No cattle alive can hold a candle to the majestic sight of a Tule Elk standing on a hill with an ocean backdrop. THIS is what Pt Reyes National Seashore is and should always be. Please do not expand ranching/row crop raising. Please do not cull Elk, they have far more a right to eat the grasses than a cow for profit. Keep Pt Reyes the National Park it should be.

Correspondence: Adopt Alternative F the maximum protection, restoration and preservation of the natural environment within the area. Don't shoot Point Reyes Tule Elk. <https://restoreptreyesseashore.org> a best friend told me of this effort.

#7373

Name: Locke, Janet

Correspondence: I absolutely do not want our wonderful Tule elk slaughtered so ranchers can use our national park to graze their cattle. Cattle are destructive to the environment because their heavy weight and destructive hooves tear up the soil and the gas they pass contributes more to greenhouse gases than automobile emissions. To have Tule elk who were once thought extinct exterminated is a horrible idea. I love seeing wild animals in National Parks, and I hate the idea of letting cattle graze in our national treasures.

#7374

Name: Lee, Anthony

Correspondence: I currently hike and run at Pt. Reyes national park. I would love to mountain bike there as well but the number of trails available for biking on are very limited. It would be great if more trails and dirt roads were accessible, particularly as loops.

Thank you, Tony

Correspondence: Writing in opposition to any plans to sacrifice wildlife (Elk) for cattle ranching in Marin County. For the health of the environment, and the natural ecosystem, not to mention human health (which will not benefit more consumption of animal products), please protect the elk population at Point Reyes.

#7376

Name: Axelrod, Lynn

Correspondence: I'm in favor of doing all possible to maintain healthy elk populations in Point Reyes Ntl Seashore. The return of an elk population in Coastal West Marin, where they historically existed, is an ecological success story. They are historic, indigenous.

"Tule elk, the smallest of the four surviving elk subspecies in North America (compared to Roosevelt elk, Rocky Mountain elk, and Manitoba elk), are endemic to California. A dominant grazer wherever they set foot, tule elk once numbered 500,000 across the coastal regions and inland basins of California, with a thousand alone on the Point Reyes Peninsula. [...]" This is from Bay Nature Magazine, which I'm citing for the information about their history: <https://baynature.org/article/on-the-fence/>. I'm also citing to the Center for Biological Diversity: [https://www.biologicaldiversity.org/campaigns/protecting\\_Point\\_Reyes\\_elk/pdfs/TuleElkBrochure.pdf](https://www.biologicaldiversity.org/campaigns/protecting_Point_Reyes_elk/pdfs/TuleElkBrochure.pdf)

The Park Service is obligated to maintain the elk, per the Tule Elk Preservation Act (16 USC 673d) - - P.L. 94-389, approved August 14, 1976, (90 Stat. 1189).

#7377

Name: Burger, Richard

Correspondence: I would like to add encourage all of the ideas listed under Alternatives B, C, D, E, and F. I especially like the alternatives that allow for bicycling on trails, ranch roads, and paths in the area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads.

These are the kinds of improvements that would allow me, living in Petaluma, to visit the area more regularly-and by bicycle, rather than in my automobile. It would be safer riding on trails, pathways, and ranch roads, rather than on the public roads that are used by autos and trucks. (I think the autos and trucks would like it better, as well.) Bicycling infrastructure is quite fragmented, so any improvements would enable many people to more of the area by bicycle.

Correspondence: DEIS Policy Recommendations for Pt. Reyes National Seashore (PRNS) Ranches Comments By the Watershed Alliance of Marin

The Watershed Alliance is grateful for opportunity to comment on the General Management Plan Amendment Draft of the Environmental Impact Statement (DEIS) for a General Management Plan regarding areas of Point Reyes National Seashore (PRNS) and Golden Gate National Recreation Area(GGNRA).

We are very concerned that the DEIS recommendations do not follow the applicable laws of the federal government and believe that the DEIS alternatives violate the laws quoted below. We also address scientific reasons for our conclusions below.

Because of the below listed concerns we can only recommend Alternative F. No Ranching Alternative The DEIS is inadequate and the NPS should re-examine and circulate another set of alternatives that includes restoration of the Point Reyes Peninsula and Olema Valley.

We endorse the letters of the Natural Heritage Institute, Susan Ives, Jim Coda, Audubon Society, Sierra Club, Judy Schriebman and Restore Pt. Reyes National Seashore.

Continued cattle ranching and dairying as proposed in the current DEIS ranching alternatives indicate that there will be continued adverse environmental impacts to natural resources, tule elk, salmonids, birds, amphibians, soil, air and water quality, coast chaparral, soils, water and air quality.

We must quantify and correct immediately, the loss of ecosystem services, critical habitat and sequestration of carbon from once intact ecosystems of native coastal scrub and grasslands. Culling and taking of tule elk for scientific purposes or herd management must cease immediately.

Consequently, all the ranching alternatives (except F) provided violate the Park Services duties under the three statutes and are therefore unlawful.

Protecting the National Parks natural resources is the first imperative. Over the course of the leases, we have not seen this occurring. The mitigation plans seem infeasible.

In this regard there are three relevant laws to consider:

The 1916 NPS Organic Act applies to all units of the national park system, including PRNS and GGNRA. The Organic Act provides as follows:

100101 (a) In General-

The Secretary . . . shall promote and regulate the use of the National Park System by means and measures that conform to the fundamental purpose of the System units, which purpose is to conserve the scenery, natural and historic objects, and wild life in the System units and to provide for the enjoyment of the scenery, natural and historic objects, and wild life in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.

54 U.S.C. § 100101(a). (Emphasis added.)

With respect to the Organic Act, the Ninth Circuit Court of Appeals has held (in a case in which the Sierra Club was an intervening defendant, alongside NPS) that the language quoted above means that resource protection [is] the overarching concern in the management of national park system units. *Bicycle Trails Council of Marin v. Babbitt*, 82 F.3d 1445, 1453 (9th Cir. 1996).

The other two laws are the PRNS and GGNRA statutes.

The PRNS legislation provides, in pertinent part, as follows:

§ 459c-6. Administration of property (a) Protection, restoration, and preservation of natural environment

Except as otherwise provided in sections 459c to 459c-7 . . . the property . . . shall be administered by the Secretary without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with . . . the maximum protection, restoration, and preservation of the natural environment within the area . . .

16 U.S.C. § 459c-6. (Emphasis added.) GGNRA legislation provides: §460bb - Establishment

In order to preserve for public use and enjoyment certain areas of Marin and San Francisco Counties, California, possessing outstanding natural, historic, scenic, and recreational values, and in order to provide for the

maintenance of needed recreational open space necessary to urban environment and planning, the Golden Gate National Recreation Area (hereinafter referred to as the recreational area is hereby established. In the management of the recreation area, the Secretary shall utilize the resources in a manner which will provide for recreation and educational opportunities consistent with sound principles of land use planning and management. In carrying out the provisions of this subchapter, the Secretary shall preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area.

16 U.S.C. § 460bb. Our government has spent billions and untold amounts of volunteer and non-profit efforts on federal recovery plans for endangered and threatened species.

#### Natural Resource Protections

For context, the number of cattle/cows in the world is approximately 1.4 billion. The entire tule elk population in the world is estimated to be around 5700, under California Dept. of Fish and Wildlife Management and where there used to be over 500,000 in California - 1.15 percent of their original numbers. This exceeds the threshold for Endangered Species Act (ESA) listing. Predation is occurring from the NPS, ranchers and hunters. Recent scientific killing and culling has occurred. The tule elk chosen to be culled by humans may carry a genetic superiority that would protect the species going forward. Any intercession of this species is antithetical to tule elk biology. Culling a genetically superior animal (where one bull will retain the right to mate with his harem of as many as 30 cows) could put the population in jeopardy. The Parks alternatives that will affect wildlife and tule elk ignore the ESA and put the entire population of tule elk and other wildlife at risk with their plans. This genetic bottleneck created by humans and now given the fact of climate change stressors on ungulates, may be our last efforts to save this magnificent and important species, once indigenous to the PORE. To be considered for listing, the species must meet one of five criteria (section 4(a)(1)): 1. There is the present or threatened destruction, modification, or curtailment of its habitat or range. 2. An over utilization for commercial, recreational, scientific, or educational purposes. 3. The species is declining due to disease or predation. 4. There is an inadequacy of existing regulatory mechanisms. 5. There are other natural or manmade factors affecting its continued existence.

Best management practices (BMP) information provided to ranchers for decades has been ignored and habitat restoration for the "at risk" tule elk and other species has not occurred. Water quality monitoring reports from the scores of creeks of PORE affected by ranching are spotty, unavailable or non-existent. Salmonids are not recovering in Olema Creek or other watercourses on the Peninsula. The monitoring of creeks and BMP application because of staff, budgets and focus are also non-existent.

However, for profit solely, the tule elk, who are endangered and threatened are being limited, hazed, culled (killed) and by ranchers and their advocates to promote commercial interests alone. That this is occurring on our public parklands violates the trust of the NPS purpose. The facts are clear - continued public support of ranches and dairies, homes, modern dairy barns, lack of BMP needs to end. The ranchers were paid handsomely for their land and have been subsidized for decades. The chart on the number of cattle on beef cattle ranches appears to be missing or is confusing on pages 9-12. Restoring the PORE and its wildlife would be a gift to future generations and fulfill the guiding principles of the NPS.

Our first choice is to see the ranches gone and the lands returned to wilderness. The baseline for restoration should extend far past European ranchers to the legacy of the Coast Miwok.

Barring that from happening, and should ranching continue and in the hopefully short interim, ranchers have a stewardship responsibility to improve conditions on their property that is essentially public land. They should be assessed on a watershed-by-watershed and ranch-by-ranch basis. Of primary concern is adherence to all relevant federal and state laws protecting critical habitat, recommendations and mandates regarding climate impacts, land use, water quality, species protections, BMP stormwater and ranching practices.

Lacking funding, we have not seen the NPS able to monitor or assess the destructive conditions that are occurring from ranch practices so the idea of BMPs going forward is highly questionable.

#### Tule Elk numbers vs. cattle

Number of elk in the world - 5700 approx. There are approximately 500 in the PORE and 224 died a few years ago presumably from drought, most all at Tomales Point where they were essentially trapped behind a 12 foot fence. There has been some recovery with excellent subsequent rain seasons. However, the free ranging southern herds are in jeopardy of being culled through the EIS recommendations. We are abjectly opposed to this.

It has been determined by park biologists that the Southern free-ranging herds are healthier. So why would the NPS irresponsibly jeopardize an already extremely genetically vulnerable species by making a decision to cull them in favor of cattle or cows. The ecologic land and economic benefit derived from the elk should be established. Genetic diversity from the 1875 descendants of only 10 remaining tule elk is extremely limited and therefore any culling or losses should be considered a threat to the species survival. Johnes disease was originally contracted by elk from cattle at Tomales Point. Disease transmission between cattle and elk is more likely to occur from cattle crowding and unclean conditions.

#### Other issues

Allowing bicycles additional access into the PORE will further impact water quality, plant communities and further human harm to natural resources. Increased liability and safety concerns to other park uses will also occur from increased bicycle use on trails. For those reasons we are opposed to any increase or introduction of bicycles on trails.

We remember the Mt. Vision fire and the mass of devastation to ever increasing visitor numbers that puts the entire PORE at greater risk of this kind of disaster. Tule elk should be expanded throughout the park in order to restore the biological functions of the coastal prairie. That may include fire.

Should the above requests fail to be implemented and/or a new SEIR circulated as recommended by some:

#### Review and Make Public all leases

1. When a legacy ranching family retires a ranch, that ranch will be returned to the PRNS as wilderness and left open to elk. 2. Verification of all leases and lease language needs to be made public immediately. 3. Conduct a full count of all cattle and cows. 4. Make available all financial records and costs to the public regarding buildings and maintenance.

Land use recommendations - 1. Present practices allow non-native annual grasses to be planted and invade the coastal prairies. These grasses should be replaced with native bunch grasses, improving carbon sequestration. 2. Cattle herds need to be rotated more frequently to lessen impacts to water, soil quality, plant succession, carbon losses and erosion. 3. Regulation for completely non toxic and organic certification will be a first step on improving the land damages of the past 150 years. 4. Less intense use of current ranch practices should be happening in the face of climate change. 5. All ranches should be fenced accordingly but the tule elk should be allowed to remain outside those fences. 6. No fences should be constructed that have an adverse affect on wildlife. 7. No row crops or other farm animals allowed for production. 8. All lands impacted by grazing must be restored and protected first, i.e. red legged frogs, salmonids and snowy plovers 9. Cessation of manure spread during wet season. 10. Outlaw the inhumane practice of veal farming.

Water Quality degradation from the cattle is well established.

1. Reduced water quality impacts public lands off the ranches. Ban the use of rodenticides, glyphosates and all non-organic, toxic fertilizers and non-organic, toxic land management practices. 2. Any extension of leases

should prevail upon the lessee to the greatest extent possible with BMP restoration guidelines to fence out cattle while restoring all riparian corridors on intermittent, perennial, ephemeral streams to Clean Water Act standards and standards for the return of salmonids, western pond turtles, red legged frogs and other amphibians. 3. Setback minimums on streams will be predicated on the NOAA 2012 NMFS, Evolutionarily Significant California Central Coast Coho Recovery and Steelhead Recovery Plans and Clean Water Act/ Regional Water Board recommendations and scientific recommendations. 4. Insure that species like the elk, western pond turtle, red legged frogs and all other dependent species benefit from habitat recovery across species. (Monitor biennially) 5. If a ranch cannot improve water conditions within a 5 year period to an agreed upon standard that is the law, they will violate the terms of their lease and lose the right to ranch or stay. (Applicable laws include the Clean Water Act and the Regional Water Quality Control Board current standards.)

#### Reduction of Green House Gas Emissions

1. Climate change caused by loss of carbon into the atmosphere from land use practices and cattle must be reduced as per scientific recommendations (Marin Carbon Project) and government mandates. Many different management practices can improve a livestock operations production efficiency and reduce greenhouse gas emissions. Some of the most effective practices include but they must all be organic: Improving grazing management and quality of native grasslands. Soil testing, followed by the addition of proper amendments and organic fertilizers Supplementing cattle diets with needed organic nutrients Developing a preventive herd health program managing herd crowding. Providing appropriate water sources and protect water quality through riparian buffers and fencing. 2. No excess of allowable number cows or cattle on a ranch - Strict numbers maintained. 3. Eliminate Dairy operations and concentrated pollution. 4. Cattle produced methane that is contributing to Climate Change from the EPA -<http://www.epa.gov/rlep/faq.html> - "Globally, ruminant livestock produce about 80 million metric tons of methane annually, accounting for about 28% of global methane emissions from human-related activities. In the U.S., cattle emit about 5.5 million metric tons of methane per year into the atmosphere, accounting for 20% of U.S. methane emissions."

#### Health of the tule elk herd

1. Johnes disease is transmitted from degraded dense conditions. The cattle can easily transmit Johnes to the elk. 2. Test the ranch herds bi-annually for Johnes paid by the ranchers. 3. All ranches in the lessee program need to convert to certified organic and sustainable within a three year period. 4. Culling and taking for scientific purposes must cease immediately. 5. By not spraying and using toxins in production, the ecosystem improves, needs less intervention in the future. 6. Riparian restoration, slows erosion, improves water quality and prevents issues from exploding into financially prohibitive restoration fixes.

#### Eco-psychological argument.

1. This land is public. Its purpose is to restore our mind, body and spirit. The economic benefit derived by the ranchers is not an unrestricted entitlement. It has responsibilities to the public that underwrites their ability to remain in their businesses and lifestyle. Restoration education would be a better use of the resources of the park. 2. The healing, restorative, beauty filled allure of nature filled with wildlife is a growing economic benefit to human health and nearby communities. 3. Seeing the land ravaged by cattle is not restorative or recreationally satisfying for many who subsidize the ranches and the existence of the park through their taxes. Some prefer to think of it as bucolic and pastoral without the associative degradation of the land and surrounding wildlife caused by ranching. 4. The public believes that the NPS is caring for our parklands, the natural resources including the wildlife that inhabit them. Without assurance that that is exactly what is occurring, a direct loss of confidence in the NPS is and will continue to occur.

Sincerely,

Laura Chariton, President, Watershed Alliance of Marin.

#7379

Name: Wagner, Leilani

Correspondence: I prefer alternative F. Parks should be set aside for the preservation of diminished natural world - needed for humans to survive. Taxpayers shouldn't be subsidizing cattle operations that harm biodiversity as well as air quality, soil quality, and so much more. If we move forward with the original plan, we are killing nature, natural biodiversity and in turn will be killing our planet and in turn, humanity. Plants will die, animals will die, and humans will die off, the planet will live on & heal herself.

#7380

Name: N/A, N/A

Correspondence: The Tule Elk should not be killed for any private industry. The 5,000 cattle that are being exploited shouldn't be grazing on public lands if the public is not going to be able to benefit from the cattle owners benefiting from our public lands. The cattle owners lease should be extended but to the lands furthest away from with the least amount of damage to the environment. Also, charge them more so we can protect our environment and animals.

#7381

Name: Barrett, MD, James

Correspondence: Dear Gentlepersons:

As a retired family physician and owner of farmland (I'm generally supportive of family farms and ranches in most cases) I write to argue against expansion of cattle operations and reduction of Elk herds at Pt. Reyes National Park. My reasons are:

1. The American diet already consists of too much red meat leading to increased atherosclerotic vascular disease. Increasing cattle production only worsens the situation. Also, there is no need for an adult to have a daily glass of milk. We do not need more dairy production.
2. Mental Health. As we force cities and towns to increase their population density to avoid reckless building on farm land and natural habitat we must provide and maintain natural habitat so city folks can visit and enjoy natural habitat settings. We know that visiting habitat and viewing wild animals in their natural setting can restore mental health in many people. The Park, paid for with taxpayers dollars, is well equipped to meet this need as long as it is not destroyed or compromised.
3. Economic. The Park as a wild animal habitat is a magnet for tourists. Tourists will spend money in the surrounding communities therefore boosting the economy for many rather than a select few who profit from cattle raising on public land.

Thank you for your time

#7382

Name: Stockmann, Kevin

Correspondence: Dear National Park Service,

Please do not expand commercial agriculture in the Point Reyes National Seashore. Please honor the original agreement - allow the ranchers to operate their dairy or cattle ranches until the family members no longer wish to operate. Please do not allow any increase in ranching or new agricultural activity. Please absolutely do not allow the introduction of sheep, goats, chickens or pigs, or row crops. These activities invariably create wildlife conflict

and degrade the our National Seashore. The goal of the original agreement was that ranching would eventually be phased out.

Your preferred alternative benefits the very few ranchers at the expense of nature, wildlife and the American public. The public wants places left wild, space for nature, place where Americans can witness the beauty of the natural world not more agriculture.

Regarding the Elk, the long-term goal should be to increase the Elk's area as the ranches are phased out over time. The ranches should not be staying permanently. When the families sold their land, they got a very good deal, current ranching activities may continue until the original family members move on. Whenever a ranching family is ready to leave, please return that land to the people of the United States. Ranches should not be transferable to new owners, and ranching activity should not expand.

Please manage the National Seashore for the greater good of the American People, and our natural resources, and not for the few wealthy ranching families. There is plenty of other ranching in Marin County.

Please reconsider the alternatives and choose one that does not expand commercial agriculture and re-affirms the long term commitment to removing the ranches one by one as the time comes.

Thank you.

-Kevin

Correspondence: In my opinion it is more important to protect our wildlife than the farming business. Please protect the elk. Thanks, Claudia Bruckert

#7385

Name: Dinah, Dinah

Correspondence: The elk need protection. The cattle ranching is destroying life on earth, don't you guys read the news. We are living through a time of mass extinction. This is NOT the time to worry about ranchers making a living. This is a moment we must seize to save everything we are otherwise about to lose. The elk deserve every protection. In the words of Greta Thunberg, "How dare you" We will not forgive you.

#7386

Name: Maniar, Jennifer

Correspondence: Elk to stay, ranchers out, it's simple. This is our parkland, so it is now finally time for the ranchers to go.

#7387

Name: Hein, Patricia

Correspondence: I vehemently oppose the National Park Service's plan to kill native tule elk and expand

commercial agriculture in Point Reyes National Seashore and Golden Gate National Recreation Area. I care deeply about protecting California's wildlife. Our government should act in the best interests of the public at large and not in the best interests of a small group of ranchers who are motivated by profits. I urge the National Park Service to stop the destruction of our lands and instead, restore and preserve the lands for wild animal habitat.

This land belongs to the public, not private ranchers whose main goal is to profit from our public land. And profiteering comes at the expense of our unique natural resources. The ranching activities destroy the beauty of this public space, pollute the lands with millions of pounds of manure each year, result in the destruction of native plants, and cause the brutal killing of the beautiful tule elk.

These public lands that are home to native plants and wildlife should be available for the enjoyment of many, and not taken away to satisfy the financial interests of a few. This precious space should be preserved for the enjoyment of members of the public and left as our legacy to our children and grandchildren.

Our government is of the people, by the people, and for the people. I urge the National Park Service to act in the best interest of the people rather than in the interests of a few ranchers. Please restore, preserve and protect the Point Reyes National Seashore and Golden Gate National Recreation Area. Our children deserve nothing less.

Thank you.

Patricia Hein

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

Correspondence: PUBLIC INTEREST COALITION \_\_\_\_\_ September 23, 2019 GMP Amendment c/o Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956  
RE: Pt Reyes Nat'l Seashore- -General Management Plan Amendment Draft Environmental Impact Statement-  
Public Comment Although guidelines to submit substantive comments are always appreciated, when aspects of a proposed project or management plan are strongly unacceptable, it puts the public in a non-trusting mode. In turn, that sets the stage for public comments to criticize the process and/or those who have authored or pushed it forward. The National Park Service (NPS) needs to consider those perceptions and not be dismissive of concerned citizen comments. No management plan should allow ranching to continue, or other "farming" type activities to expand, at or on Pt Reyes National Seashore or its environs. This is due to eco-system negative impacts that are well known with (1) livestock operations (animal waste, soil contaminates, antibiotics residue, water quality, and other serious "pollution" aspects) and (2) farming activities (herbicides, pesticides). We urge that only a "No Ranching" or other "No Private use" of Pt Reyes land alternatives be adopted. Ranching, with all its well-established negative environmental impacts, does not belong on any public lands- -especially near coastal or scenic areas. Whether there be fragile, sensitive species or iconic wildlife, such as tule elk, is a moot point. Public, federally owned land, such as Pt Reyes, must be devoid of private enterprise operation intrusions and barriers. Once leases are cancelled/expired or otherwise legally terminated, then all private parties must be ordered to move off/vacate Pt Reyes lands entirely. The management plan must make the parties (leaseholders or other occupancy arrangements) be responsible for removal and clean-up of all private property. Posting a bond to cover clean up should always be included. Taxpayers should not fund clean-up, toxic or otherwise, of current leaseholders or their subsidiaries, and there should be no exceptions. When Pt Reyes reverts back to public lands, National Seashore and National Park Service need to fully manage for landscape and ecosystem benefits, including but not limited to preservation of resources, limited/specific hiking/equestrian only trails, shuttles, parking, and other passive activities that create no significant impacts. There are enough areas in Marin and Sonoma Counties to accommodate those who desire longer stays. Therefore, no camping or overnight accommodations should be considered. Strictly limited, reservation-only backpacking may be allowed in a few Pt Reyes areas but only if there is full enforcement capacity and no impairment of natural resources. Thank you for considering our views, Marilyn Jasper, Chair

Correspondence: Thank you for the opportunity to submit comments on the current PRNS General Management Plan Amendment Draft EIS.

Page 32 of the DEIS states in part:

Development to Support Day Use and Overnight Accommodations

NPS would look for opportunities to expand day use and overnight accommodations in the planning area.

- Drive-in, hike-in, and boat-in camping sites with limited services and amenities (several locations offer possibilities to consider for expanding overnight camping, such as Schooner Bay near Drakes Estero or Home Ranch)

In light of the current condition of the boat-in camping sites on the West shore of Tomales Bay are frequently found in (various trash items including human and canine feces and toilet paper), I would ask the NPS to delay adding more boat-in camping until such time that current boat-in camping locations are managed in such a way that maintains the natural habitat and prevents human and canine waste from being deposited.

More frequent and regular patrolling of the Tomales Bay boat-in sites is suggested as well as better signage at campsites and at all likely boat put-in locations (Marconi, Miller Park, Lawson's Landing).

Requiring all boat-in campers to possess and use their own toilet facilities, packing out all waste is also strongly suggested.

One of the great joys of living here is the beauty of West Marin and all the creatures who live there, not least of all, the Tule Elk. Their removal would be a shame and a sad story to tell my children. PLEASE do not make them disappear, it would be heartbreaking to me, my family and all of those like us, who grew up here and have fallen in love with these magnificent creatures.

#7400

Name: Reule, Linda

Correspondence: I have been lucky enough to discover Point Reyes National Seashore on my recent visits to California. I am considering relocating to California from Illinois and would like to consider Point Reyes Seashore to be the backyard in which I could truly frolic. I have also brought my elderly mother with me and we both truly enjoyed traveling through the park, seeing the ocean, Drakes Bay, Tomales Point, and the Pierce Point Ranch where the Tule Elk call home (protected pend in area). I am saddened to hear about the plans to expand ranching (by allowing additional farm animals and growing commercial crops) on the national seashore while NOT advocating to protect the native Tule Elk, but rather, to eliminate or relocate them. I was shocked to see that the planning documents talked so highly about preserving the current ranches because the only ranch I could connect with, explore and enjoy was the ranch that no longer has cattle. I would like the Park Service to adopt Alternative F. - -Phase out all ranching, as was originally intended. - -Manage the Seashore for the natural values it was created to PRESERVE - its land, water, and wildlife. - - Protect wildlife over livestock. - -Restore the pastoral zone for wildlife habitat, native plant communities, scientific Research and Education. - -Repurpose the historic ranch buildings for research, interpretation and education. The public would benefit from an expanded vision of Alternative F, to restore Point Reyes.

GMP Amendment c/o Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Re: Safari Club International Comments on the National Park Services Draft Environmental Impact Statement for the Point Reyes National Seashore General Management Plan Amendment

Dear Sir or Madam:

Safari Club International (SCI) appreciates the opportunity to comment on the Draft Environmental Impact Statement for the Point Reyes National Seashore General Management Plan Amendment (Draft EIS). SCI disagrees with the National Park Services (NPS) preferred alternative and with the scientific analysis upon which it is based. SCI respectfully recommends that the NPS adopt a new alternative that would direct the units managers to take the necessary steps, in coordination with California state game and fish management authorities, to initiate a regulated harvest designed to reduce and maintain the tule elk population on the National Seashore.

Safari Club International

Safari Club International, a nonprofit IRC § 501(c)(4) corporation, has approximately 45,000 members worldwide. SCIs missions include the conservation of wildlife, protection of the hunter, and education of the public concerning hunting and its use as a conservation tool. SCI has many members who live and hunt in California, some of whom would like to participate in tule elk hunting on Point Reyes National Seashore lands.

Hunting May and Should Be Authorized on the Point Reyes National Seashore The Draft EIS correctly concludes that the NPS could authorize hunting on Point Reyes National Seashore due to the language Congress used in the National Seashores enabling legislation (16 U.S.C. § 459c-6(b)). SCI disagrees with the NPSs conclusion that a managed hunt on National Seashore lands should be rejected due to efficiency, expense, and safety concerns.

The Draft EIS correctly notes that managed hunting differs from culling programs in which the NPS utilizes volunteers to reduce game populations on National Park units where legal hunting may not occur. The NPS should also recognize that state and federal wildlife managers frequently use hunting as a management tool to reduce and maintain wildlife populations. In such hunts, state wildlife managers target certain numbers, age class, and sex of the population to be hunted by regulating the harvest conditions. With the assistance of the California fish and game management authority, the NPS could conduct a hunt on Point Reyes National Seashore lands that would appropriately reduce and manage its tule elk population.

Ironically, the Draft EIS relies on the same arguments to justify the impossibility of a regulated hunt that the NPS has routinely used to avoid instituting skilled volunteer programs for ungulate population reduction on National Park units. The Draft EIS, just like the EISs the NPS has drafted for numerous ungulate reductions on National Park Service units where hunting has not been allowed, rejects hunting and skilled volunteer programs due to efficiency, expense, and safety concerns. The Draft EIS appears to set up a Catch-22 scenario in which the NPS suggests it is unable to use a skilled volunteer program due to the fact that the NPS has the authority to establish a regulated hunt but then rejects a hunt due to these same efficiency, expense, and safety excuses. SCI seriously questions the following, unsupported statement from the Draft EIS:

Sharpshooting offers safety features that a typical managed hunt does not. Although it is not suggested that hunts cannot be done in a safe manner, the extensive planning and oversight that would be required to ensure a level of safety comparable to wildlife professionals engaged in sharpshooting activities make a managed hunt less feasible.

Draft EIS at 63. After years of making similar excuses to defend its decisions to choose sharpshooters over skilled volunteers, the NPS itself proved the fallacy of its safety and expense protestations. In 2016, the NPS published a National Resources Report that evaluated its own skilled volunteer programs. In that report, the NPS acknowledged that such programs have not proven to be exceedingly costly to run and have not posed unnecessary safety hazards. Elk Management in the National Park Service - Two Case Studies in the Use of Public Volunteers (Natural Resource Report NPS/NRSS/BRD/NRR - 2016/1119). Based on these findings, the report also concluded that the NPS could utilize skilled volunteer programs for white-tailed deer management in the mid-west and eastern U.S.-areas with higher human population densities than the NPS previously considered appropriate for such management strategies. Id. at 18. It appears that being disproven in applying these arguments against skilled volunteer programs, the NPS has refocused these arguments for use against hunting programs.

SCI also questions the NPSs conclusion that it may only authorize a hunt that would be more efficient or less expensive than the use of paid sharpshooters or NPS personnel to reduce the Point Reyes National Seashores tule elk population. Draft EIS at 63. SCI challenges the source of such a pre-condition to opening hunts on NPS units where hunting is authorized. Moreover, in assessing the value of a regulated hunt, the NPS should evaluate more than the limited factors of efficiency and expense. The NPS should not ignore the other important rewards hunting would offer. In addition to adding a new NPS outdoor recreational experience, participation in tule elk population reduction would benefit hunters by enabling them to play a contributing role in National Park wildlife management.

#### The NPSs Assessment of Cost Is Based on Inaccurate Calculations of Elk Population Numbers

Presumably, the NPSs determination that a regulated hunt would be exceedingly costly relies at least to some extent on an underestimation of the harvest numbers necessary to maintain the population size at 120 elk. The preferred alternative incorrectly proposes the culling of only 12-15 elk per year. However, based on Spatial Ecology and Population Dynamics of Tule Elk (*Cervus elaphus nannodes*) at Point Reyes National Seashore, California, by McCrea Andrea Cobb at UC Berkeley in 2010, the average annual growth rate of the herd has been between 18-20%, which would mean that the annual cull numbers should be 22-27 elk per year. Consequently, if the NPSs concern about the costs associated with a hunt vs. the use of skilled sharpshooters for only 12-15 elk, the drafters should re-examine their cost estimates, using the correct harvest numbers.

In summary, SCI strongly recommends that the NPS reject the proposed alternative and instead take the steps necessary to open a hunt on the National Seashore. SCI also recommends that the NPS should delete the inaccurate and inflammatory description of the efficiency, costs and safety issues related to managed hunting included in the Draft EIS.

Thank you for the opportunity to provide this input. If you have any questions about these comments, please contact Anna Seidman, Director of Legal Advocacy and International Affairs, at [aseidman@safariclub.org](mailto:aseidman@safariclub.org).

Thank you.

Sincerely, Steve Skold President Safari Club International

Correspondence: There is plenty of land for both. I hike out in Point Reyes National seashore alot. At lease a few times a week. For the most part the elk are not even Close to cows. Farmers want more land for there cows to destroy.

#7406

Name: Arndt, Laura

Correspondence: I am a long time resident and property owner in pt Reyes 40 years. I have opposed these decisions based on incomplete data, as this is. For instance those against ranching in the point say that the red legged frog is threatened. But the data shows that the only reason pt Reyes is full of these frogs is because they thrive in the stock ponds. The population of elk need to be culled, they are multiplying at a rate that is unsustainable, for the environment and the health of the herd. The benefits of livestock grazing on grasslands is so important that if ranching were reduced or eliminated The park would have to hire its own herd to control the grasslands or do extensive mowing. There are several other valid arguments and issues to be raised with this proposal and they need to be answered The park has done some great work here and they have many challenges but these ideas that come from the park being a wilderness ( where millions of people travel through and ranchers need to go Are from people overreacting Problems need to be solved without making things worse The elk herd is too large for the point, They need to be contained out of the pastoral zone

Thank you

Correspondence: I support alternative F.

I think maintaining the environment for tule elk is very important. Converting it to grazing lands is short sighted.

thank you.

#7409

Name: Wallace , Norma

Correspondence: I protest completely and 1000% this appalling plan to decimate a recovered native species and replace it with animal agriculture. This plan flies in the face of the definition of National Park. The country decided years ago to protect the land from animal agriculture. This is against the will of the people, it is anti science, anti common sense, will cause environmental devastation and toxic conditions. I assuming will pollute groundwater.

The elk did nothing wrong, They did what we humans wanted, they reproduced. Now you want to kill them. What happened to the sanctity of life?

It simply makes no sense. I protest!

#7410

Name: Harrar, Paul

Correspondence: I grew up in the Bay Area and have appreciated the wildness of the Point Reyes National Seashore area since the 1970s. I currently visit the area 3-4 times a year, usually staying several days. I am primarily a hiker and kayaker.

My arguments FOR elk and AGAINST cows in GGNRA are: 1. Cows are a non-native species that pollute and degrade the environment and add no significant scenic, cultural or historical value for visitors, or most West Marin residents. 2. Elk have a limited environmental range for biological success; cows can be raised in many places elsewhere. This is an important habitat for elk. 3. As was done with Drakes Estero, an opportunity to successfully restore an area to wilderness (in a park boundary) should be undertaken, if feasible. Wilderness is more valuable longterm than dairy businesses. 4. Historic ranches can be retired as dairy businesses and transitioned to other uses, including visitor lodging, cultural/historical education (museums) and environmental science labs. 5. I'm fine with dairy ranching continuing to operate east of Tomales Bay.

Thank you for listening.

Paul Harrar

Name: N/A, N/A

Correspondence: These comments are submitted in response to the National Park Service's Draft Environmental Impact Statement concerning the General Management Plan Amendment for the Point Reyes National Seashore and north part of the Golden Gate National Recreation Area (Seashore). The comment period is August 8, 2019 through September 23, 2019.

Preliminarily, the report fails to address the limitless recreational opportunities already available at the Seashore, making option F, ceasing ranching at the Seashore, completely unjustifiable. After all, only 28,000 acres of more than 78,000 acres at the Seashore are used for ranching and dairying. Meanwhile, thousands of acres are available for camping, hiking, biking, and other recreational activities. Of great importance, the Draft General Management Plan Amendment (DGMPA) fails to adequately address the adverse economic impact ceasing ranching and/or dairying at the Seashore would have on food quality, organic agriculture and the agricultural sector in Marin County and indeed California and the nation as a whole.

Agriculture in Marin contributes over \$94 million annually to the local economy, with milk production dominating. In 2018, organic milk was the No. 1 agricultural commodity produced by Marin County farmers and ranchers with a gross value of \$28,035,000. Over 15 percent of Marin's agriculture is on the Seashore and 100 percent of it is organic. This is significant because Marin County's agriculture makes an important contribution to California's overall output of organic beef and dairy production allowing California to enjoy the reputation of having the highest volume of organic production in the country.

No where does the DGMPA address the distinction between organic and conventional agriculture in land stewardship, environmental benefits and food quality. Organic agriculture excludes, among other things, toxic or synthetic fertilizers, genetically modified organisms (GMOs), synthetic hormones, antibiotics, artificial preservatives, flavors or colors.

At the heart of organic agriculture is developing healthy soils which provide many benefits such as holding more water, reducing erosion, fertilizing grasslands and sequestering carbon. To forego these benefits for the environment, food security, and the economy so that additional Tule Elk can freely roam is misguided public policy.

Correspondence: General Management Plan amendment (GMP Amendment) for Point Reyes National Seashore and the North District of Golden Gate National Recreation Area

The General Plan provides six options addressing the future of ranching on the Point Reyes National Seashore. Alternatives include maintaining ranching as is, various reduced ranching operations to elimination of ranching under Option F. Option F provides the most benefits to Tule elk by removing ranches and enabling elk to expand to sufficient numbers to presumably support a more varied genetic pool.

Comments are based on, and generally in support of, the NPS's Option B proposing 20-year Lease Agreements and providing some flexibility in ranch operations. Option B allows NPS time to recognize changing park service needs and as leases expire or successor issues arise, termination of ranch ownership to expand recreation or Tule elk populations.

1. The employment and labor income section discusses the number of jobs but not the quality and type of jobs or the ramifications of those jobs. Ranchers are generally members of and leaders in their communities including conservation districts (CD) where issues such as water quality, soils, and invasive species etc. are addressed. Phasing out ranching separates NPS from CD (Marin Conservation District?) and other soil and water initiatives. NPS staff who are generally transitory and not necessarily knowledgeable about soils or water management will ideally work with ranchers. NPS and the ranchers can be leaders in water and landscape management.
2. Twenty year leases with an option to renew are desirable to encourage rancher investments and maintenance of the properties. Twenty years also gives NPS time to conduct its own planning including removal of a ranch property to meet public or natural resource priorities. Existence of these leases may have forestalled more recreation development along the road with parking lots, restrooms, another visitor center etc.
3. The discussion on organic food, local markets, and income production could be highlighted more. Locally grown organic food has been growing in popularity in recent years; the Point Reyes ranches, should they continue, may provide the only locally raised products as urbanization sucks up ranch land from San Francisco to Point Reyes.
4. Since Point Reyes was founded, the National Park Service has been expanding its definition of lands and values to be preserved. According to the Wilderness Society, National Parks has added 13 Parks, Monuments, and Historical sites celebrating Black History <https://www.wilderness.org/articles/article/13-parks-and-monuments-celebrate-black-history>. At Point Reyes there is a living history. By contrast Pierce Ranch, lovely in its isolated splendor cannot portray a real scenario of a working ranch. The proposals to expand the definition of ranch via sheep, poultry crops, events, can expose an increasing urbanized public to domestic animals and use of those animals. The ranches, as examples of a 100 year old history, have increased in historical value as examples of our past as NPS preservation goals expand. However, boarding horses seems removed from ranch operations. Hauling horses will increase burden on road system; presumably horse owners will want to use trails. What is the policy on a private vendor using public trails? Chickens might be housed in movable coops as part of producing healthy eggs and meat.

5. NPS cannot possibly design plans, let alone implement plans, given the scarcity of funding, should ranching at this point be terminated within 5 years or even 10. The lease income on the ranches may primarily cover NPS time working with the ranchers, but ranchers not NPS funds cover any improvements. Maintenance or removal of historical buildings will require years to determine via a planning process. Terminating a lease even 5 years from now will discourage maintenance of buildings, fences, etc.

6. The ranch existence may have forestalled more recreation opportunities. There will surely be pressure to increase the number of visitors from the current 2.5 million. I can personally vouch for turning around when I encountered heavy traffic. Impacts on wildlife from recreationists especially on the beach and waterways must be addressed before a lease is terminated to make way for more recreation. I assume a plan for the proposed recreation will be presented for public review. Recreation also impacts wildlife and natural resources especially on beaches and around waterways.

7. How will NPS address noxious weeds or other undesirable plants or maintain pasture land should NPS desire to do so on former ranch lands? Shrubs will invade; elk apparently will not forestall shrubs. Perhaps I missed the discussion but which species of wildlife and pollinators prefer pasture to shrub lands? Removing invasive plants is difficult. Does grazing via cattle or elk at least limit exotic expansion? 8. What is the current and projected fire management regime with or without ranchers? Ranchers presumably do some irrigation to maintain pastureland. Ranch employees are available to fight fires. Once pastures are emptied and shrubs invade, what is the likelihood of fire?

9. While the period of honoring the conditions of the original purchase are at an end, both conservationists and the park service should continue to recognize how the park was acquired and how treatment of landowners is a model for other potential acquisition opportunities.

10. There is a section of "savings in gas and air pollution if ranches are removed." If ranch use is expanded to include room rentals, workshops, horse riding or other new uses of the ranches are proposed etc., increases in transportation also must be considered. Presumably ranch transportation will not exceed tourist impacts. Increasing tourists will also result in increased transportation costs.

I do not live in California but have visited Point Reyes over the years. I attended one of the Sierra Club's invasive weed removal service trips at Point Reyes. (Weeds are not just caused by livestock.) I serve or have served on boards of land trusts where working with landowners to acquire property or development rights on property is necessary and long-term relationships are desirable.

Correspondence:

Dear Superintendent,

Thank you for the opportunity to comment on the Draft Environmental Impact Statement(DEIS).

As a background, I have lived in West Marin for almost forty years. In most of those years I have worked as a naturalist for many organizations and have taught hundreds of natural history classes in Point Reyes National Seashore. As an ornithologist, I have conducted numerous studies on wetland species and other birds in West Marin. I have served on the board of two organizations that are concerned with natural resource protection in the seashore and other parts of West Marin. In short, I have a detailed knowledge of wildlife in area and the diverse natural history at Point Reyes National Seashore.

The enabling legislation that created Point Reyes National Seashore in 1962 indicated that ranching would continue in the national seashore indefinitely as long as those original families/leaseholders continue their

operations in the area. Unfortunately, the enabling legislation did not specify what is an acceptable amount of livestock in the national seashore. Nor did it make clear that the natural resources in the park should be protected fully and have precedence over domestic animals and agricultural operations.

Since 1962, there seems to have been a compromise in the national seashore; there has been ranching in the pastoral zone, but there has also been a fair amount of protection of the natural resources. I accept that ranching can continue at the national seashore, but I would like to know what impacts the beef and dairy cows have on various habitats and wildlife in the park. I strongly feel there should be scientific studies to document these exact impacts. If there are documented negative impacts than clearly the number of cows should be reduced to an acceptable number.

Specifically, I am concerned about three management issues; diversification, succession and the culling of elk.

## DIVERSIFICATION

I have read that "Diversification activities identified through the scoping process and ongoing discussions include the addition of new types of livestock, row crops, stabling horses, paid ranch tours and farm stays, small-scale processing of dairy products and sales of local agricultural products..."

In my opinion, it is extremely difficult to quantify not just the physical impacts those activities will bring to the pastoral zone, but the aesthetic ones as well.

I am greatly concerned about the level of these potential impacts therefore I feel that authorized ranching operations should be limited to dairy and cattle ranching, as intended by the enabling legislation.

I feel that limiting the commercial uses of the area is necessary to preserve the natural and cultural resources of the Seashore.

The preeminent mission of the National Park Service is to conserve natural resources. The Seashore's enabling legislation provided for a limited exception for beef and dairy ranching consistent with the maximum protection, restoration, and preservation of the natural environment.

Unfortunately, the DEIS allows for diversification in the national seashore. Diversification, or increased agricultural activities, would be contrary to the Park's mission.

The DEIS exceeds its authority in proposing diversification. And the DEIS has not analyzed many connected and cumulative effects of diversification on environmental resources. All the biologists and others with wildlife expertise I have talked agree with me. Diversification would have negative impacts on predators such as bobcat, coyote, fox, hawks and owls. The negative impacts would not be limited to predators, but would be seen on all levels of the food chain.

The DEIS ignores that diversification could bring a dramatic shift of commercial land use within the Seashore.

I feel that limiting the commercial uses of the area is necessary to preserve the natural and cultural resources of the Seashore.

## SUCCESSION

To be consistent with the park's purpose, the Seashore must focus continuation of ranching on cultural and historical significance of multi-generational beef and dairy ranching.

The DEIS would open ranching operations through competitive bidding process to the general public. I am strongly opposed to this change in the management philosophy at Point Reyes.

Opening the Seashore to outside operators would have significant impacts on the park's cultural and historic values. The DEIS fails to analyze these impacts, and even fails to provide enough detail about the RFP process to say what the impacts may entail, or when they may occur.

#### CULLING OF ELK

I understand that grazing elk can compete with cows for available forage in the national seashore. Has the park explored all possible solutions to this conflict? The construction of fences, while costly, might be one solution to allowing the number of elk to expand in the pastoral zone.

When the family occupying the "D" Ranch left the national seashore their lease expired. This would have been a logical time to create a reserve just for elk and not cows in that area. That did not happen. That is an example to me of the park choosing ranching over protection of the natural resources.

The DEIS calls for culling of tule elk. I am opposed to culling.

Consistent with the Park's management goals and directives, NPS management of Tule elk would occur only to support other resource protection needs and management goals. New herds would be allowed to continue, regardless of geographic location if they do not move outside Point Reyes.

Authorized animal units for each ranch would be adjusted as needed to meet residual dry matter goals. Resource protection is the highest value for the Seashore as intended by Congress in requiring the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area,..." 16 USC Sec. 459c (6)(a) (emphasis added).

#### CONCLUSION

I urge the NPS to adopt alternative B with modifications, including the complete removal of all diversification. The Seashore's highest values are the protection of Wilderness, Scenic and Coastal Landscapes, Marine, Estuarine, and Freshwater Environments, Diversity of Habitats and Native Species, Maritime Cultural Landscapes, Continuum of Human Use, and Opportunities for Inspiration and Recreation.

Resource protection is the highest value for the Seashore as intended by the 16 USC Sec. 459c (6)(a) where Congress elaborated on this statement by requiring the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area,..." "16 USC Sec. 459c (6)(a) (emphasis added).

The DEIS should reflect these values and consider the cumulative and connected actions of the proposed plan within the planning area and to sensitive habitats adjacent to the planning area.

Thank you for the opportunity to comment on the DEIS.

Sincerely,

David Wimpfheimer

Correspondence: Comments on the DEIS regarding management of Pt Reyes National Seashore and a section of northern GGNRA.

1. The 1962 enabling legislation for Pt Reyes National Seashore stated that the purpose was "to save and preserve, for purposes of public recreation, benefit, and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped". The underlined portion of the statement of purpose is not included in the DEIS. Since it makes it clear that public recreation was a primary goal of setting aside the area, why has that language not been retained. The original measures for phasing out dairy and grazing operations were consistent with that purpose. My recollection of the public perception in the late 1960s and beyond is that the ranches and dairies would be phased out as the 20-year leases, or life estate exemptions expired. However, the dairy and ranching lands remain inaccessible to the recreating public. And the bulk of the alternatives presented do nothing to rectify that situation, as the total ranchland zone remains basically consistent with the current acreage removed from public use (Alternatives A -E). Although a few of the dairy buildings appear to be historic, there are many buildings that appear to have been built since the enabling legislation was past. Those buildings are not historic.

2. The Bay Area has increased greatly in size and population over the last 50-plus years. The increased population has resulted in jammed freeways as residents travel to places as far away as the Sierra Nevada to recreate. There is a crying need for more recreation opportunities closer to the population centers of the San Francisco Bay area and the western portions of the inland valleys. Pt Reyes is heavily used by hiking groups and additional trails would be a major boon to recreation in the area. My experience is that the ranching and dairy areas are closed to public access and do not represent a National Reserve environment. In addition, in a heavily populated region, with demonstrated need for more accessible outdoor recreation, it appears that over 1/5 of the Pt Reyes and northern GGNRA acreage is being reserved for exclusive use for dairy and ranching.

3. My experience, from surveying for native species in the vicinity of dairy farms in the eastern central valley is that dairy operations, with concentrated holding of cows, is very detrimental to water quality and soil conditions. The operations that are listed as being attendant upon these operations, such as fertilization and manure spreading, etc., are similarly inconsistent with an area reserved for its natural and recreational values.

4. Alternatives B through E show no real range of consideration in the area available to ranching. Although treatment of tule elk varies in several alternatives, only in Alternatives E and F are elk herds allowed to increase.

5. Alternative F is the alternative most consistent with the original intent of reserving these lands. Only in alternative F is there any real consideration of increasing visitor (and recreation) opportunities within the planning area.. This is a change that is sorely needed within the region, and is the most consistent with the enabling legislation.

6. The ability to allow prescribed grazing for vegetation management and has been used successfully for specific purposes, and has been used successfully in various national wildlife refuges within the Central Valley. In addition, the elk populations are allowed to expand within this alternative. Such expansion into other suitable habitat within the planning areas is appropriate.

7. I am surprised that the DEIS does not include any assessment of effects of the alternatives related to climate change. I would propose that Alternative F would also be most consistent with objectives for reducing climate change because it would 1) reduce the number of cattle on site, and 2) provide additional recreation opportunities proximate to a population center, thereby reducing long-distance travel to the Sierra Nevada.

Sincerely, Karen E. Leye, Ph.D.

Correspondence: Since we are only allowed to pick from the different official alternatives, my choice is Alternative A. While I did like some of the ideas for the elk and the general public offered in Alternative F, getting rid of the ranchers is too extreme.

#7419

Name: Kelly, Gina

Correspondence: Dear NPS and melanie\_gunn@nps.gov,

I support Alternative F, phasing out cattle and dairy industry and returning the land to its natural state. The enabling legislation of the National Seashore supports wildlife protection and does not mention upholding private industry. The original leases to ranchers were to be 25 years. Ranchers have already been paid handsomely for their land, so it is long overdue to phase out the ranches. "Cultural Resource" and "Historic" does not mean industry needs to be currently in operation. Private business has no place on public land. Allowing industry and ranches to diversify their business is a bad idea. Already these ranches have been negatively impacting the land, mismanaged to allow soil erosion, scarring in the landscape, e.coli contamination in waterways and more. If you allow EVEN MORE agricultural practices on the seashore, there is no way to know the impact and there is no historical evidence you will be able to manage any negative impacts on the environment. Tule Elk should be protected for the survival of their species. They have already gone through a huge genetic bottle neck when they were almost completely wiped out except for 20 individuals. Every gene allele is important for the long term sustainability of the herd. The National Park should be protecting all Tule Elk, and allowing new herds to form and to TAKE DOWN THE FENCE at Pierce Point and allow all Tule Elk to roam free. I do not support granting 20 year leases to cattle and dairy industry. Climate science has indicated we have less than 12 years to mitigate the worst of climate catastrophe. Allowing business that has been linked to water pollution, species extinction and in Point Reyes is the culprit of over 60% of the greenhouse gas emissions, it is not a good idea to give that same industry a 20-year lease to continue degrading our national park. Point Reyes is a refuge to thousands of plants and animals. Point Reyes can be a leader in the fight for climate justice, and it starts with phasing out Beef and Dairy operations and restoring the land to its natural state. The EIS has NO MENTION of the effects of climate change in it, and does not include any information of the cattle and dairy's impact on climate change within the park. Please include my comment in the draft plan.

Thank you,

Mrs. Gina Kelly

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

Correspondence: I am writing to urge you to fulfill the National Park Service's mission of preserving the habitats and wildlife of the Point Reyes National Seashore and to end the destructive ranching which is currently degrading our public land. PRNS badly needs improvement of its streams, grasslands, and other habitats. Natural resources are suffering because of the presence of ranching at PRNS.

Tule elk belong here. As natural inhabitants of the PRNS they require our protection. They do not deserve to be penned, nor to die agonizing deaths because we deprive them of water, and they certainly do not deserve to be shot. Our public lands are created to preserve and protect the land and its wildlife, not to ensure the financial interests of ranchers.

We had a deal. The heroes of our community, the group of local citizens who joined efforts with their allies in Washington, worked hard to designate the PRNS and to preserve this Seashore from ruin.

They understood that cows and cattle are not compatible with the mission of protecting our national parks and they made a generous deal. The ranchers were given decades to cease operation and to hopefully clean up the destruction they've created. Instead, the expired lease holders want to renege on the deal.

Visitors come here to see elk. No one travels here to see the ranches' junked cars, pollution, erosion, veal factories, or to witness the suffering and misery they inflict on the farm animals.

We don't create public lands so that a small group can profit from its misuse, steal our precious water, introduce weeds, crumble roads, and decimate wildlife. Ranches don't belong at PRNS. Their legacy of is one of degradation and destruction which they expect taxpayers to mitigate.

We had a deal when PRNS was created, to protect this precious land and the wildlife who inhabit it and to end destructive ranching. Let's muster integrity, stick to our deal, and fulfill the Park Service's mission.

Correspondence: Cattle grazing destroys the land & pollutes the water. The law requires Pt. Reyes National Seashore be protected from the impacts of cattle grazing. Time for NPS to follow the law!

#7423

Name: Stanziano, Lisa

Correspondence: The NPS EIS study, "Pt. Reyes and North District of Golden Gate GMP Amendment Draft EIS" clearly indicates that phasing out ranching is the best way forward for the environment (addressing soil, water, vegetation, wildlife, and air). The only responsible plan option must be Alternative F.

-Alternative F is the only plan does not allow dairy and ranching leases to be subsidized by tax-payer funds. If these leases are allowed, the subjectivity of management activity standards and the feasibility of oversight is in reasonable question. Questions about specific objectives arise related to the following points from APPENDIX D: MANAGEMENT ACTIVITY STANDARDS AND MITIGATION MEASURES: "When developing and implementing projects, NPS would follow these principles to avoid or minimize the potential for adverse impacts: -Ground and vegetation disturbance would not exceed the minimum area necessary to complete the project. Removal of native trees and shrubs would be minimized and only occur when necessary to meet project objectives. [SUBJECTIVE: who will determine definitions of "minimum area necessary" and "necessary to meet project objectives"?)

-Site-specific design plans would show the maximum extent of grading and would include requirements to protect sensitive environmental resources during construction and maintenance activities, including sediment control measures. [QUESTION: Who will develop these plans?]

-Planning would consider methods available to achieve objectives and use the method(s) least disruptive to the habitat of endangered or sensitive species. If sensitive habitats or species near to proposed work must be avoided, the area would be flagged and/or an NPS representative would be present onsite to denote sensitive resources. The parties implementing the project would avoid all NPS-delineated sensitive resources. [COMMENT: The logic of Plan B to cull elk from the Drakes Bay herd is counter to "least disruptive to sensitive species" The notion that 120 elk will do less "damage" to ranching resources than 124 elk, and that killing 4 elk as a productive measure is ludicrous and not based in science.]

-As needed, ranchers would seek technical assistance from the local USDA, NRCS, or Resource Conservation District offices because the relevant practices needed at a given ranch depend on project layout, topography, soil types, and other factors. [QUESTION: Who defines "as needed"?

-The NPS had set a goal of a 25 percent reduction of 2008 GHG levels from agriculture by 2016. There have not been updates since 2010 to determine if they reached this goal. The EIS Executive Summary states that "While emissions of criteria pollutants and greenhouse gasses would vary among the alternatives, these emissions would continue to be a small contributor to overall impacts when compared to emission sources and transport of emissions from outside the planning area." This statement does not reflect the fact that in 2008, Greenhouse gas (GHG) emissions within Point Reyes National Seashore totaled 20,239 metric tons of carbon dioxide equivalent ("MTCO<sub>2</sub>E"). Of this, 12,533 MTCO<sub>2</sub>E was budgeted to agricultural operations in the seashore-62 percent of the Point Reyes greenhouse gas budget in 2008. As the planning for the future of the National Seashore continues, an updated assessment of GHG and current mitigation measures is needed to determine how cattle operations can best achieve reductions; whether they are achieving reductions and to what extent the ranches in the Point Reyes, and beyond, are able to achieve carbon neutral or carbon negative operations. One way to ensure a decrease in carbon emissions-without the expense of updated assessments of GHG is to remove cattle from these open spaces and focus on restoration to native, perennial prairies and woody vegetation, which studies show sequester more carbon than the European grasses that have replaced native grasses in the Point Reyes National Seashore's Pastoral Zone. [Sources: Kane, D. (2015). "Carbon Sequestration Potential on Agricultural Lands: A Review of Current Science and Available Practices." National Sustainable Agriculture Coalition (NSAC) and Breakthrough

Strategies and Solutions, LLC. Washington, D.C. Accessed:

[http://sustainableagriculture.net/wpcontent/uploads/2015/12/Soil\\_C\\_review\\_Kane\\_Dec\\_4-final-v4.pdf](http://sustainableagriculture.net/wpcontent/uploads/2015/12/Soil_C_review_Kane_Dec_4-final-v4.pdf) National Park Service. (2010). CLIMATEfriendly PARKS, Point Reyes National Seashore Action Plan. Point Reyes National Seashore, Point Reyes, California. <http://cesanluisobispo.ucanr.edu/files/136179.pdf>] The only acceptable alternative that addresses the elimination of greenhouse gases is phasing out cattle and dairy ranches.

-By allowing ranches to expand the damaging commercial use of the park lands - the NPS preferred alternative plan (B) is in direct contradiction to its charter. Alternative B calls for the introduction of chickens, pigs, sheep and goats. Plan B states “no predator management would be allowed,” but it is naive to think there won’t be conflict between these livestock and the wild predators in the park. The history of livestock agriculture in California and the West in general is that of devastation of wolves, mountain lions and other species via depredation permits (not to mention the toll of poisons and traps and non-agency, vigilante predator removal.) The science regarding the disruptive consequences of predator removal to ecosystems’ health is clear and the park is sliding down the slippery slope of killing wildlife to protect private profit.

Alternative F is the ONLY environmentally responsible, just alternative for the management of Pt. Reyes National Seashore (for all of us) because...

1. Alternative F is the only plan that reduces documented harmful environmental effects of animal grazing and dairy farming. Alternative F is the obvious choice for the NPS to uphold its duty Animal grazing damages grasslands, birds, native plants and wildlife; grazing pollution affects freshwater and marine habitats; and produces methane and other greenhouse gas emissions that contribute to the climate crisis. The 2019 United Nations report on climate change points to dangerously high temperatures, drought, and extreme weather events and calls for reforming agricultural practices, specifically reducing cattle. (NOTE: exceptions could be considered for the two reserved-life-estates: Percy and Commonweal/Niman, which are located outside the range of the Drake’s Bay elk herd.)

2. Alternative F is the only alternative that does not subsidize private commercial interests at tax-payer expense AND is the best alternative for preserving the environment for future generations. The proposed zoning framework-the “Ranchland Zone”-would allow one-third of the parkland in question, which is public land, to be used for private enterprise and subsidized at public expense. The NPS granted the right to continue living and working on formerly owned, now NPS property for 25 years. The time to return those public lands to the park is long overdue. I question how the NPS can prefer a plan (B) that allows ranching to continue past 50 years at tax-payer expense (through subsidies) without a public vote to do so when the EIS (study) indicates that phasing out ranching is the best way to preserve every aspect of the environment (land and wildlife) for the enjoyment by visitors of the park.

3. Alternative F is the only plan that fulfills the mission of the NPS to conserve native species and restore ecosystems. To limit to an arbitrary number of 120 and kill those beyond that number is counter to that mission. Letting elk roam free is critical to their survival. More than half the elk in the Tomales Point herd, which is fenced in on a peninsula to appease ranchers, died during a recent drought because of a lack of water and food. That is a failure to uphold the NPS mission and to adopt a plan to systematically kill even one elk to satisfy private interests that sold their land decades ago is preposterous. Rancher and dairy farmers sold their land to the NPS years ago with the understanding that they would have limited leases. The time to stop renewing public lands in the park is long overdue.

In conclusion, you must not ignore that the NPS Act and the Point Reyes Act direct the NPS to support the maximum protection, restoration, and preservation of the natural environment within Point Reyes National Seashore. But under all the alternative management plans except for Plan F, cattle, not wildlife, are given priority status at the Seashore. Point Reyes National Seashore is the only national park where Tule elk live. To ensure forage for private cattle, most of the elk are confined behind at fence at Tomales Point. Native to California, the elk were reintroduced to the park in 1978. Once numerous on Point Reyes peninsula, they had been extirpated by early settlers and were believed to be extinct. Point Reyes Seashore is a success story in wildlife recovery. All of the

Alternative plans in the EIS except for Alternative F are in direct opposition to that success, the purpose of the NPS, the NPS Act, and the Point Reyes Act.

I urge the decision makers for this management plan to choose Alternative F: stand up for the preservation of park land that all citizens can enjoy, not for the profit of a few private enterprises that have been well compensated over many years. To choose any other plan is egregiously irresponsible to the legacy of the NPS and the true historic value of Pt. Reyes National Seashore.

Yours sincerely, Lisa Stanziano

Correspondence: It is essential to keep NPS lands true to their natural environment. Any plan to disturb or detract from that is unacceptable. In this case, the elk that live in the NPS lands should be protected rather than eradicated simply to expand land for farmers. There is much land in the north bay (e.g. Marin Land Trust) which allows for cattle farmers to utilize the space for grazing.

Please do not destroy our precious natural habitat and it's resident species!

#7425

Name: Jones, Gwen

Correspondence: Hi, I grew up in West Marin and visit the PRNS frequently, still. I do not want to see a native species destroyed in order to provide cheaper, more plentiful feed for ranchers to make money off of. To even consider this, in Marin county fo all places, is absurd. Cows destroy the environment through corrosion and pollution. Please, do not kill the rule elk in PRNS in favor of rancher's profits!

#7426

Name: Morrison, Sarah

Correspondence: Please phase out ranching and give the land to the public and the animals.

#7427

Name: Pandapas, Laura

Correspondence: The only alternative that honors the intent and letter of the enabling legislation is Alternwrtive F. These lands belong to the public. We paid fair market value for all the ranches in the pastoral zone, and leases were extended that were ALWAYS intended to be finite. The ranchers were allowed to continue ranching for their lifetimes while giving their children the chance to continue in the case of some of the older ranchers. That's why the leases were capped. It was never intended that they could sell their businesses to other parties, nor was it intended that they could have an unlimited number of cattle. Any alternative that changes the management priorities of the PRNS to put cattle before elk and before the public is unacceptable. Fifteen ranching families should not be allowed to dictate what happens on national parkland that is supposed to be governed by the Organic Act. Expensive lawyers and compromised politicians shouldn't be able to change the enabling legislation to somehow assert that cattle ranching is now a "value" to be protected. It was ALWAYS intended to be phased out and that the Seashore would be restored once the ranching faded. It's too bad Jared Huffman wouldn't actually provide some leadership to get an alternative that honors the mandate to protect the PRNS and its wildlife to leave both unimpaired for future generations. This one is going to be Jared's shame for the rest of his career. The ranching, if allowed to continue at all, should be modified to fit within the special setting that is the PRNS, not the other way around.

#7428

Name: Spear, Jonathan

Correspondence: In the EIS, you fail to address just how foul the odor of cow manure is at the Pt. Reyes National Seashore.

In my own trips through the park, I have observed that dairy and beef ranching operations contaminate the air with badly smelling gases and particulates. Allowing this pollution, due to an excessive number of cows (who are not naturally suited to the ecosystem of the park) is negligent. The NPS is supposed to safeguard the ecosystem of the park.

While my own statement, that "the air in the park stinks of cow manure," is not quantitative, it is a valid bit of evidence. Humans evolved with a keen sense of smell, and odors that we qualitatively perceive as being offensive (such as bovine feces) usually are harmful to both human and other wild life. Cow manure emits harmful gases such as hydrogen sulfide, methane, and ammonia, and it also festers dangerous pathogens such as e. coli, listeria, and salmonella.

Dairy and beef ranching industries within the park already operate at an unreasonable and unsustainable level. Tons of feed are brought into the park for the cows, and many tons of excess manure exceed the capacity of the ranches for sustainable composting. The excess cow manure contaminates the ground water in the park, and runoff of sprayed manure also poisons the seashore.

The only sensible proposed plan is Alternative F, which ends the commercial ranching operations. It is your duty to restore and safeguard life within the park.

#7431

Name: N/A, Nuala

Correspondence: I am 15 years-old and have lived in the Point Reyes area my whole life. I grew up hiking, going to the beaches, and looking at Point Reyes's wildlife. I love all the animals here, but the elk are one of my favorites. Many other people agree. Elk are a huge tourist attraction in Point Reyes. People come from all over to look at them. Numerous times while hiking, I've seen groups of tourists exclaiming over elk herds and pulling over to take pictures.

If the Park allows the ranchers to kill the elk, open their ranches to other farm animals, and bring in crops, Point Reyes will lose most of what is special about it. Places like Sonoma are covered in vineyards and farms with cattle, chickens, and other animals. Opening the Point Reyes ranches to this kind of stuff will not only permanently harm the National Park land, but it will make Point Reyes into Sonoma County. Point Reyes is too special to allow private ranches to change it. Point Reyes will probably lose much of the respect for its beauty and remarkable landscape if that mistake is made.

Thank you.

#7432

Name: Johnson, Roberta

Correspondence: Public lands are for the public, not for privately owned ranches. They destroy wilderness areas. Please keep cattle off off our public lands.

#7433

Name: Likover, Laura

Correspondence: I feel that we should have native animals in our parks, not cattle for ranchers. I believe this is a substantive comments as before the advent of cattle, the elk were the only large grazing animals utilizing the park area. To kill the native animals so that private ranchers can make more money is crazy.

#7434

Name: garcia, erin

Correspondence: Hello,

I am writing to urge the National Park Service to discontinue the grazing of beef and dairy cattle at Point Reyes National Seashore. This precious area has been damaged by livestock grazing which poses a threat to the environment and local wildlife and it should be protected and used to serve the public good, and not for the benefit of the livestock industry.

I strongly oppose Option B and any other proposal that would be fatal to Tule Elk or other wildlife to the benefit of ranching operations, and encourage the agency to adopt Option F to discontinue grazing and allow members of the public to enjoy this beautiful park and to be enriched with opportunities to visit and appreciate this special place.

#7435

Name: Gogan, Peter

Correspondence: I read with astonishment that the National Park Service (NPS) preferred alternative for management of Point Reyes National Seashores pastoral zone includes limiting the Drakes Beach herd of tule elk to 120 adults by direct lethal removal for the following reasons: 1. ELK IMPACT ON PASTORAL LANDS - The Management Plan Draft EIS states on page 82 that, Competition for forage between elk and cattle is possible if they occur together in the same space and time and limited forage is available. However, no evidence of competition between tule elk and livestock is presented to support this statement. In fact, the Draft EIS uses the lack of competition for forage between elk and livestock to justify allowing additional types of livestock in the pastoral zone. The Draft EIS goes on to cite on page 83 ongoing data analyses indicating that, density-dependence had a measurable effect on herd growth at Drakes Beach despite the herd not being confined in any way. Why does the NPS propose to expend valuable time and resources initiating a continuous long-term effort to control a population of elk that is showing signs of density-dependent self-regulation? The Management Plan Draft EIS states that most of the issues resulting from the presence of elk in the pastoral zone involve damage to fencing and possibly water pipes. These issues can be resolved on a long-term basis with various alternate fencing designs and construction. 2. GENETIC CONSERVATION - The Management Plan Draft EIS also states on page 83 that, Point Reyes elk are believed to be among the most inbred in California, having lost an estimated 80% of their retained genetic variability. A recent study not cited in the Management Plan Draft EIS reported an inbreeding coefficient of 0.19 for elk at Point Reyes (Meredith et al. 2007:Table 2). A more recent paper by a researcher at the Smithsonian Institute and others states (Ralls et al. 2018:4) that,

If an isolated population has a known or inferred inbreeding coefficient of 0.1 or has lost 10% or more of its genetic diversity (both readily estimated from genetic marker data sets such as microsatellites, or increasingly, genomewide DNA sequence-based analyses), it should be assumed to have genetic problems requiring management. An inbreeding level of 10% may sound like a low threshold for intervention, but in fact it represents a very considerable loss of fitness. Assuming an average of 6 diploid lethal equivalents per genome (likely an underestimate of the genetic load of an average naturally outbreeding species [Hedrick & Garcia-Dorado 2016]), an inbreeding level of 10% leads to a fitness reduction of 45% compared to a large population. For example, an inbreeding coefficient of 0.125 in wild red deer (*Cervus elaphus*) reduced lifetime breeding success (the gold standard of fitness measurement) by 82% in inbred females and 95% in inbred males compared to those with no inbreeding (Huisman et al. 2016). Further, as the rate of response to selection is proportional to additive genetic variation and approximately proportional to heterozygosity, a 10% increase in inbreeding will also result in an approximately 10% slower rate of adaptation to new selective pressures (Frankham 2015). This is not desirable because given the rapid rate of anthropogenic environmental change, species will need more, not less, ability to adapt.

Note that the inbreeding depression among elk at Point Reyes (0.19) is almost twice that of the level identified by the authors of having genetic problems (0.1) and greater than the example for red deer (the same species as elk) cited above (0.125). Given the potential severity of inbreeding in tule elk, the NPS should be making every effort to reduce the likelihood of inbreeding depression in the Drakes Beach herd rather than proposing to limit it to a relatively small number of breeding adults (120) where inbreeding depression is likely to be increased rather than reversed. The Management Plan Draft EIS inappropriately cites the California Department of Fish and Wildlife Elk Conservation and Management Plan (2018) statement that 100 is an acceptable minimal number for a tule elk herd. This statement is conditional of regular movement of tule elk between herds. Since the elk at Point Reyes are isolated from other elk herds, any movement of animals is dependent upon active management. The Management Plan Draft EIS identifies translocation of tule elk from other herds as a possible management alternative. Any such translocations should be completed prior to any reduction of numbers of elk in the Drakes Beach herd and only after confirmation that the translocation efforts have successfully reduced the level of inbreeding in the Drakes Beach herd. However, it is worth noting that the National Park Service has not initiated translocations to tule elk from elsewhere to Point Reyes in the 50-year existence of elk at Tomales Point.

Correspondence: I'd like people to say they support alternative F, the only alternative that phases out ranches and restores the land to what it was bought and paid to be - a national park dedicated to wildlife protection. Cattle grazing is harmful to the environment in so many ways, and this space is for the native residents, the Tule Elk. We hike extensively in Pt Reyes and I appreciate being able to observe the native animals. We have plenty of cattle ranches across Marin County.

Name: Homenko, Deborah

Correspondence: I grew up in m Marin and still visit often. The national parks should be for preserving the natural world, not maintaining cattle, which bring nothing positive to anyone but the ranchers.

#7441

Name: Manviller, Jason

Correspondence: I care about protecting California's wildlife. I oppose the National Park Service's plan to kill native tule elk and expand commercial agriculture in Point Reyes National Seashore and Golden Gate National Recreation Area. I urge the National Park Service to instead restore the lands for wild animal habitat.

We should prioritize the preservation of our public lands and wildlife, not the economic interests of private ranchers. These commercial cattle ranches have serious negative environmental impacts on the park - polluting waterways, causing soil erosion, and harming the many endangered and threatened animals who live on Point Reyes. National parks exist to protect our natural resources and native wildlife. This park should be managed accordingly.

#7442

Name: Anderson, Dante

Correspondence: Please do not remove the elk. Thank you. Dante Anderson

#7443

Name: Carder, Stacey

Correspondence: Save the tule elk-do not expand cattle ranching.

#7444

Name: N/A, N/A

Correspondence: Public land should not be used for private industry. The National Seashore supports wildlife protection. The land should be used to protect the Tule Elk and their survival, and returning the land to its natural state, NOT to support private cattle and dairy ranching that negatively impacts the environment.

Name: Burnham, Douglas

Correspondence: Dear National Park Service,

I am writing today to express my strong support for "Alternative F" as outlined within the General Management Plan Amendment Draft Environmental Impact Statement for Point Reyes National Seashore and the North District of Golden Gate National Recreation Area. Barring "Alternative F", my secondary preference is for "Alternative E".

I am deeply opposed to any and all of the alternatives that contemplate reduction, lethal management, or removal of any existing or new Tule Elk herds within the area under consideration.

The reason for my position is simple: I am approaching the questions under consideration in the current EIS within the broader land use and ecological context of the greater Bay Area.

It is undeniable that:

A) There currently exist, elsewhere in California, many ranch lands of comparable quality and character to those found within the NPS-controlled lands under discussion within this EIS; B) The amount of ranching activity occurring on the NPS-controlled lands under consideration is fairly modest (i.e. impacts to ranching on these lands do not negatively impact the people or economy of the region as a whole); C) That the current Tule Elk population is at roughly 1% of its pre-colonial levels; that therefore D) Opportunities for Californians to observe Tule Elk are extremely limited; and most importantly that E) Tule Elk are a significant missing link in the deeply damaged ecology of California's coastal ecosystems

Given the above, it seems unconscionable that Tule Elk populations should be either numerically reduced, or made more difficult to observe, within the approximately 30,000 acres of NPS-controlled land under discussion on behalf of a land use (ranching) which by most estimates occupies almost 40,000,000 acres of land in the state of California.

While I applaud the National Park Service's ethos of historical preservation, and their efforts to model the harmonious integration of human and natural use, it seems clear that in this case the needs of the very fragile Tule Elk population should be put before the needs of any individual or particular members of a group (ranchers) that is, on the whole, over-dominant within the larger framework of Californian land use.

Instead, the NPS should take this opportunity to send a clear message that it prioritizes the re-wilding of the public lands under its control, and the rehabilitation of species and ecosystems damaged by human activities.

The Alternatives that serve the broad public interest to the greatest degree are in this case those which expand access to (and the health of) a scant natural resource (Tule Elk) - that is to say Alternative F, or less-so, Alternative E - though this may cause some amount of economic distress to the particular ranchers whose operations occur within the EIS area.

Thank you for your attention to this matter; I sincerely hope that your group will take action to protect the continued re-habilitation of one of California's many unique native species.

Sincerely,

Douglas Burnham CA Architect #C25383

Correspondence: Native Tule elk are the true historic occupants of the Point Reyes peninsula. Cattle are not. Ranchers were paid well for their land in the 1960s and it was agreed that they would leave within 25 years, and yet, they are still there. Now, with the proposed General Management Plan Amendment, the NPS has proposed six alternatives, five of which include continued ranching activities. Alternative B, the NPS's "preferred alternative", not only allows for continued ranching activities, but it also promotes new agricultural activities such as planting artichokes or other row crops, and expanded ranching activities such as introducing sheep, goats, pigs or chickens. New row crops will attract birds and expanded ranching will attract native predators. This is a recipe for more conflicts with native wildlife. And to top it all off, Alternative B includes the lethal removal of Tule Elk in order to limit the Drakes Bay herd to 120 adults. Your preferred alternative allows for more than 5,000 cattle to graze, and even provides for expanded ranching activities, and yet you have determined that the same land can only sustain 120 Elk. It's hard to look at these proposals and see the NPS as impartial in these matters. You appear to be kowtowing to the ranchers and have lost sight of your mission under the Point Reyes Act: to manage the Point Reyes National Seashore for "maximum protection, restoration, and preservation of the natural environment." There is no mandate for prioritizing commercial agricultural leases on these public lands. Cattle ranching should only be allowed if it's consistent with preserving the natural environment and should be required to accommodate native wildlife - not the other way around.

Correspondence: Dear Superintendent Muldoon,

Our family appreciates the opportunity to comment on the General Management Plan Amendment Draft Environmental Impact Statement (DEIS).

We would like to show support for the comment letter submitted by the Point Reyes Seashore Ranchers Association (PRSRA) and the comment letter written together by the the Lunny, Grossi, McIssac, Rogers, and Percy ranching families. These two letters cover our concerns with the DEIS. The purpose of our comment letter is to provide a history of our family farm and the impact from the growing Tule elk herd at Drakes beach.

We appreciate the work which has gone into creating the DEIS; however, we feel our family's concerns and expertise were not considered in the DEIS. We have been communicating our concerns directly with NPS staff for almost 20 years when the first two elk showed up on our ranch. In the year 2000, we were utilizing best management practices for our soil, pasture, and herd health. The farm was running very smoothly and we were enjoying our partnership with NPS. This same year two elk showed up on our farm. They were collared and appeared very nervous. We knew from our experience with large animals, something was off. We reached out to local NPS staff and they said the two elk (both female) must have swam across the Limantour Estero. This seemed quite odd since our farm is not directly across Limantour. It also seemed a bit coincidental since years before, the park discontinued the lease to our neighbors at D ranch and left a large part of the land fallow. We were told to not worry and that the two elk cows would most likely swim back. In the late spring/early summer, one of the

cows calved and then in the fall a bull showed up with a third cow. During this time we were not aware of the 1998 Tule Elk Management Plan which stated that those animals which were collared were part of an experimental relocation herd and if they caused harm or damage they would be relocated.

The following year we expressed our concern regarding the increase of the herd size and were told not to worry since the cows were sterilized. The cows ended up being very fertile because they each calved growing the original 2 to a herd of 5. The following year, the new herd size grew to 7 elk. Our concerns began to grow and we asked if they had a plan for the herd and were told there wasn't anything they could do at the time. We were told that the herd would most likely swim back to Limantour and were reassured the herd size would not grow because they were going to sterilize the females.

In 2004, we started to experience negative impacts to our farm. The herd size was only 15, but we were unable to utilize best management practices for our pasture due to the elk herd destroying our temporary and permanent fencing. Fencing allows the pasture to rest preventing erosion, expansion of obnoxious weeds, and encourages a healthy ecosystem. Our irrigation system started experiencing damages from elk including broken aluminum pipes and our sprinkler. The system cleans out the winter holding ponds and pumps water and fertilizer onto the pasture. This helps promote the growth of perennial grasses and wild flowers. We approached the PRNS staff regarding elk fencing to keep the herd off the pasture land and prevent any further damages. The staff told us they would look into it.

The following year, the herd size grew to 21 and we were beginning to see the negative impact on the pasture land. The pasture was beginning to deteriorate due to the inability to keep the elk herd off the pasture when it needed to be rested. We started to notice bald spots in the field when we did not have cattle in the pasture at the time. The bald spots were turning into obnoxious weeds instead of perennial grasses. We then observed bull elk rooting up the soil and discovered this was the cause of the bald spots. The damages to the fencing, irrigation system, and pasture began to increase.

In 2007 we were told the PRNS was seeking funding for an elk fence and in 2008 we were shown an actual proposal. Please see attached. We were told the fence would be installed by 2010 and to be patient.

In 2010, the herd size grew to 57 from the original 2 and there still wasn't an erected elk fence. Our original superintendent Don Neubacher left the seashore and was replaced with Ms. Cicely Muldoon. Before Superintendent Neubacher departed, he assured us the problems we had been having with the growing elk herd would be fixed. Upon our first meeting with Superintendent Muldoon, we presented her with our concerns and an itemized list of damages and costs from the current year. At this time, the damages expanded to our cattle and loss of actual hay. The bull elk were now goring our cattle with their massive horns. The elk herd was now not only competing with our cattle for pasture (forage), they were competing with our cattle for hay. The result was purchasing additional feed to supplement for the loss of both pasture and hay.

We were told to be patient while Superintendent Muldoon became settled in her new position at PRNS and up to speed with our issues. PRNS staff didn't believe the elk were causing such damages and told us to continue to document the damages.

Since 2010, the damages have gotten much worse. The costs have increased greatly. For example, in 2010 the average cost of hay was \$150/ton. Today the cost is \$400/ton. We have had to reduce our herd size due to limits on milk production contracts with our milk buyer. Even though we have reduced the herd size, we are purchasing more hay. The increase in hay purchases is due not only to the loss of forage from the growing elk population on our farm; the elk are actually eating the hay. In most cases, the elk are pushing the cattle away from the hay during feeding. The DEIS is inaccurate stating this incident happens only on occasion (page 82). Most recently elk have gotten into our horse pen to feed on horse hay. Our baby colt was injured and needed stitches.

The DEIS estimating a maximum herd size of 120 elk as a healthy herd based on simulations of 1200 RDM is inaccurate and contradicts the 1998 Tule Elk Management Plan of 1400 RDM. The RDM requirements do not

have any actual field data and does not consider seasonality, changes in grazing practices and diversification. It is almost impossible to prevent the overgrazing of elk on pasture without proper fencing. During a few of our Organic inspections, our inspector mentioned the property looked overgrazed. They were shocked to know the pasture was not being used by cattle and that the damage to the top soil was from elk.

The NPS staff initiated hazing as a solution to prevent elk from foraging on permitted pasture land. Hazing is extremely ineffective and costly. The DEIS is inaccurate in stating it has been moderately successful. The elk are most active starting early evening through the early morning. They travel throughout the night, crossing over several fences to forage and drink water. The NPS staff haze the elk after they have bedded down in the morning while the elk are chewing their cud on weekdays (during normal business hours). The staff chase the elk around in circles resulting in the herd crashing through barbed wire fences resulting in unwanted stress to the elk and to the surrounding cattle. After the staff leave, the elk return the same evening to begin the same cycle. The hazing process is contradictory to NPS's mission of a free-ranging herd. The most cost effective and humane solution is an elk fence.

Since the Drake Beach Elk Herd first appeared, we have never requested the NPS to cull the elk. We have always requested the elk to be relocated to protect not only our farm, but our neighbors. We have one of the smallest operations in the PRNS and have the greatest impact of elk damages. We greatly depend on our pasture for grazing and fences to keep our cattle in specific areas. The fences are necessary to keep the cattle & public safe; they help prevent erosion and encourage a healthy ecosystem.

Our family farm not only supports four generations of families, we have employees and their families which depend on us. It is necessary to keep the farm viable and sustainable. We have always been proud of our operation and have strived to be excellent stewards of the land. It is our mission to continue the family legacy and pass down the traditions of farming to the next generation.

We ask the NPS to consider a fencing solution which would ensure the separation of the free-range elk and the permitted lands in the PRNS. This is the only feasible solution for our family farm to continue.

Sincerely,

Ernie, Nichola, & Ernest Spaletta Rebecca Spaletta-Ahlers

Correspondence: I remember visiting Point Reyes as a child and very much enjoying the ranching and farming experiences there. They are part of the park. A promise was made when the park was founded that agriculture would remain part of the experience. Incompetent park managers have failed to keep the elk in their controlled areas and have caused large numbers to die. The numbers must be managed and their range controlled. They can coexist. It's clear that park management has created this situation to influence public opinion. Agriculture should be close to populated areas so that the public can know and understand how the food is produced. It's a wonderful education for the children and adults.

Correspondence: Cicely Muldoon Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956 Re: Draft Environmental Impact Statement for Point Reyes National Seashore General Management Plan Amendment

Dear Superintendent Muldoon: Please select the preferred alternative, "Alternative B" for the future of ranching in the Point Reyes National Seashore. I support agriculture in the Seashore and think it is a vital part of the region's history, culture, and current economy. I appreciate the time and effort that has gone into researching all options for the draft EIS. I support 20-year leases, the ability for farmers and ranchers to succession plan, and the opportunity for farms and ranches to diversify their operations to viability and sustainability adapt their operations for generations to come. I wish that the diversification was not so limited in scope or size, 2.5 acres around structures in ranch core with no irrigation and other restrictions is cumbersome. In addition, the draft EIS would have been more complete if research was done on an option that includes an Elk Fence between the agriculture and wilderness area or Elk relocation to the wilderness area. Agriculture is a partner in natural resource conservation and preserving open spaces. Many of the beautiful natural landscapes in the US near large urban areas are preserved because agriculture was there first to curb development. Agriculture and nature do co-exist, I support the farmers and ranchers in the Seashore for their part in providing for the local food shed in a sustainable way. Agriculture plays an important role in combating Climate Change by providing local food and carbon and greenhouse gas drawdown. Agriculture is important to me in the Point Reyes National Seashore, the preferred alternative B is the best option from the draft EIS Thank you Dominic Grossi

To Whom It May Concern:

Herein we submit a letter of comment from Point Blue Conservation Science on the draft Environmental Impact Statement for the General Management Plan Amendment and associated summary.

Point Blue Conservation Science (Point Blue; [www.pointblue.org](http://www.pointblue.org)) works to conserve birds, other wildlife and ecosystems through science, partnership, and outreach. With a staff of 150 scientists, we partner with public and private natural resource managers on land and at-sea in California, across the Americas, and in Antarctica. In addition to our extensive work on public lands, we collaborate with more than 1,000 ranchers, farmers and others who manage over 400,000 hectares of working lands across California. Founded in 1965 as Point Reyes Bird Observatory, our organization's beginning was made possible through a partnership with Point Reyes National Seashore, who we continue to partner with today. Then and now, we are grateful to the park for their continued commitment to the study and conservation of natural resources.

We read with interest the draft Environmental Impact Statement (EIS) for the General Management Plan Amendment (GMPA) for the Point Reyes National Seashore and North District of the Golden Gate National Recreation Area (hereafter collectively "the park"). We appreciate the tremendous amount of effort that has gone into producing and evaluating the six alternatives. Given the strong public opinion on the issues at hand, we recognize the challenges the National Park Service faces in meeting multiple objectives and balancing multiple resource concerns, and we express support of the effort to address these complex issues. In this letter, we do not advocate for any one of the six individual alternatives, and we recognize that the park may select a final amendment that combines elements from multiple alternatives. With Point Blue's long history of collecting data within the park, and in California rangelands and coastal ecosystems more broadly, we instead offer considerations and recommendations on some of the specific elements of the six alternatives:

- **Habitat disturbance, biodiversity, and resilience.** In the absence of fire or other major disturbances to the landscape, grazing by livestock and/or by elk plays an important role in keeping grassland and coastal prairie habitats abundant in the park. If the grazing intensity and/or spatial distribution is reduced in the park, we recommend the park consider the long-term effects of the conversion of grassland and coastal prairie habitats to dense coastal scrub and/or forest, a process the park mentions is likely to occur and would have ecological winners and losers. We have conducted long-term monitoring of the effects of such a conversion at the Palomarin Field Station at the south end of the park, in an area that was partially in agriculture and grazing prior to becoming part of the park. We have documented extensive conversion of that area from open coastal scrub to Douglas-fir forest, resulting in considerable changes to the composition of the local bird community, including the local decline or loss of species associated with coastal scrub and prairies (Porzig et al. 2014). Regardless of the alternative that is selected, maintaining a heterogeneous landscape with a diversity of vegetation types is likely to maintain the greatest biodiversity, ecological function, and resilience to climate change and other threats (Folke et al. 2004).
- **Grazing as a tool for targeted ecological management.** Managed or prescribed grazing can be used to achieve specific resource-management objectives such as creating and maintaining habitat for sensitive species and maintaining desirable plant assemblages. A 2010 study Point Blue conducted on grassland birds in coastal prairies in Sonoma County found that sites that were continuously grazed by cattle supported a greater diversity and abundance of grassland bird species than sites where livestock grazing had ceased (DiGaudio 2010). Hayes and

Holl (2003) found that grazed coastal prairies supported higher native annual-forb species richness than ungrazed coastal prairies; and Henneman et al. (2014) found that native bunchgrass presence increased following prescribed rotational grazing. Within the park, grazing has been demonstrated to maintain native grasses and forbs in the presence of introduced plant species (Arceo et al. 2017). Under all ranching scenarios, we encourage the park to work with agricultural producers to establish biodiversity goals and have a shared understanding of the appropriate management actions for these areas, and manage for these goals in an adaptive framework.

- Application of subzones within the Ranchlands zone. We appreciate the inclusion of nuanced management subzones in Alternatives B-E. Poorly planned grazing in sensitive areas such as wetlands and riparian areas can negatively impact vegetation, erosion, and water quality, with subsequent impacts to bird abundance and diversity (RHJV 2004). Fencing riparian areas allows the park and its lessees to limit grazing access and control the timing, intensity, and duration of grazing within the riparian zone; and monitoring and adaptive management of the riparian zone can support this decision-making process. Additionally, active restoration of riparian-zone vegetation would provide multiple benefits to ecological function, including water quality improvement, erosion prevention, carbon sequestration, and habitat for wildlife (Dybala et al. 2019, Naiman et al. 2010).

- Nesting landbirds in silage. As cited in the draft EIS, Point Blue conducted a study in 2015-16 with the support of the park on the impacts of silage on breeding birds within the Point Reyes National Seashore. The study found that 7 bird species were either confirmed or likely nesting within the silage fields prior to when the fields were mowed, including 3 bird species of special concern (DiGaudio et al. 2016). This study also offered a number of management considerations for the park to review and weigh, although it was beyond the scope of the project or report to determine whether each consideration was compatible with park goals and ranching operations. If the park has not already done so, we recommend the park evaluate the efficacy of the management considerations summarized in the report from that study to determine if there are any appropriate actions that can be taken to reduce the impacts of silage harvesting on nesting birds.

- Modifying ranching practices to minimize food subsidies for Common Ravens. The park works on many levels to protect the federally-threatened Snowy Plover during the nesting season (e.g., seasonal closures, pet restrictions, public outreach, and practices to reduce impacts from ravens). Common Ravens remain the primary threat to Snowy Plovers within Point Reyes; they are also known to prey upon Common Murre nests. As mentioned in the draft EIS, the large Point Reyes raven population is supported by the abundant food resources accessible at some park ranches. Management actions that control ravens' access to these resources may lead to a smaller raven population size, thereby reducing their impact on vulnerable avian species like the Snowy Plover (Roth et al. 1999). Under any ranching scenario, we recommend the park consider actions, many of which are outlined by the park in the draft EIS, that would reduce the subsidization of Common Ravens, resulting in benefits to plovers and other species upon which ravens prey.

- Long-term perspective on Tule elk management. We appreciate the park's efforts to reintroduce and maintain a population of a large California endemic species that had been extirpated. Tule elk play an important role in the ecology of the Point Reyes National Seashore, and the opportunity for users of the park to observe and appreciate these animals in the wild is valuable. We recognize that managing a wildlife population is complex, and that under any of the alternatives, including alternative F over the long-term, the park may be required to actively manage the elk population size. In the absence of a large population of predators, the elk population is likely to continue growing, increasing the potential for dangerous interactions with park visitors and on roads (both within and beyond the park), in addition to potential conflicts with other park resources. Given the strong public opinion on population management, we encourage the park to communicate frequently and openly about population management decisions.

- Climate change. We recommend the park's decisions on any of the alternatives, or individual elements of the alternatives, are made in the context of climate change. Climate change is already affecting, and will continue to affect, the ecology of Point Reyes over the long-term. For instance, bird populations are already impacted by mismatches in phenology and impacts on reproductive success and survival during critical life stages (Dybala et al. 2013, Nur et al. 2018). In addition, range managers will be increasingly challenged by extreme and variable

weather conditions. The park can take actions now to help ensure wildlife and human communities are equipped to contend with these challenges, such as by undertaking restoration projects and other management activities that will improve ecological function, minimize the impacts of other ecological stressors, and maximize resilience.

In summary, we recommend the park consider management actions that are data-driven, incorporate pre-existing and future long-term monitoring, are adaptive in nature, and reflect a long-term perspective that allows a diversity of habitats, native wildlife, and the human communities who rely on and appreciate the park to thrive. We recognize there are many different stakeholders that bring unique perspectives to the park's history and future, including Coast Miwok, and we encourage inclusive and collaborative management with those groups. We acknowledge the complexity of the management decisions at hand, and the value of producing a management plan amendment that aims to achieve multiple benefits for both ecological systems and human communities in a changing world. We thank the park for the opportunity to comment, and we look forward to our continued partnership.

Sincerely,

Elizabeth Porzig, PhD Working Lands Group Director Point Blue Conservation Science 3820 Cypress Drive #11  
Petaluma CA, 94954

Name: Stalker, Julia

Correspondence: According to section 1.4.7 of the NPS Management Policies, 2006 (Decision-making requirements to Identify and avoid Impairments), the decision on a proposed action that could lead to an impairment of park resources and values must consider the impacts of the proposed action and determine that they will not lead to an impairment of the park resources and values. The action MUST NOT be approved if there would be an impairment.

I believe that the current DEIS is incomplete and not an adequate document to rely on to make such a decision without more research on the impacts to the natural resources and aesthetics caused by the agricultural activities and live stock within the Park.

The Park management is mandated to ensure the preservation and improvement of natural resources, processes, systems and values of units of the national park system in an unimpaired condition within the Park (now and into the future) and to identify and prevent unacceptable impacts and impairments to these resources.

I fully agree with and support the following comments on the General Management Plan Amendment Draft Environmental Impact Statement:

IMPACTS of diversification:

Remove all types of diversification from DEIS consideration and programmatic planning as the DEIS does not evaluate cumulative, direct or indirect impacts, connected actions, or reasonably foreseeable outcomes of diversification.

Impacts and conflicts with wildlife predation and interference with wildlife habitat by the introduction of sheep, goats, chickens, and pigs were not analyzed.

Impacts on roads and park infrastructure with increases in commercial traffic for farm-stays, processing centers, and retail sales, were not analyzed.

Impacts to visitor experiences and development of new trails and visitor uses by the introduction of immediate allowances for diversification were not analyzed.

Impacts to the scenic and historic values of the Seashore, as the ranch cores and historic pastures will be changed to support new uses, were not analyzed.

#### IMPACTS TO NATURAL RESOURCES:

Revise development of Ranchland Zoning so that it prioritizes holistic planning areas and resource protection buffers that are connected to sensitive resources, watersheds, and wilderness areas that are within and outside of the Planning Area.

The Ranchland Zoning also needs to consider future impacts from climate change including rising sea levels. To protect park resources these protections should be prioritized over ranching activities. Additional maps for the public should be developed that identify current restoration projects and sensitive water resources that are outside the Planning Area but are impacted by development within the Planning Area. Previous Seashore planning documents have analyzed climate change as a cumulative impact, this DEIS does not consider climate change impacts at all.

Require development of Ranch Operating Agreements (ROAs) to be evaluated as Resource Management Plans that consider all the foreseeable impacts on park resources before the issuance of the Final EIS. This may be accomplished with a supplemental update of the DEIS so that the current impacts of specific operations of beef and dairy ranching are analyzed and to the extent that current ranching operations impair park resources, those impairments should be cured.

Add a requirement for water quality testing for wilderness and all recreational bodies of water. The best available science on water quality in many areas of the DEIS are outdated by as much as 20 years. While NEPA does not require the Seashore to collect data prior to issuing a DEIS, the Seashore cannot adequately monitor mitigation measures and enforce ROA terms with seriously outdated data. Consequently, the NPS must test water quality both now, and on an ongoing basis in the future. Otherwise, the DEIS mitigation terms regarding water quality are empty promises to protect public resources.

Update maps to include locations of NPS and rancher restoration plans for water quality, special status species, and other important plant and animal communities. These maps need to be generated for the Seashore and should inform the development of the individual maps for Ranchland Zones to inform placement of Resource Protection Zones and Pasture Zones.

#### Succession Impacts:

To keep within the delegated authority and be consistent with the park's purpose, the Seashore must focus continuation of ranching on cultural and historical significance of multi-generational beef and dairy ranching and should not open ranching operations through competitive bidding process to the general public.

Opening the Seashore to outside operators would have significant impacts on the park's cultural and historic values. The DEIS fails to analyze these impacts, and even fails to provide enough detail about the RFP process to say what the impacts may entail, or when they may occur.

#### IMPACTS TO WILDERNESS

The DEIS excludes analysis of federally listed wildlife that utilize the unique habitat of Drakes Estero stating,

"Listed marine mammals (e.g. whales, seals, sea lions, sea turtles, and abalones) may use beaches adjacent to the planning area but are not included in this analysis because ranch activities would not affect these species in the planning area...elephant seals are found immediately adjacent to ranch lands...however, ranch operations do not affect them." (emphasis added)

This analysis fails to consider the cumulative and connected impacts of ranching activities that includes trampling, erosion, and nutrient deposits from storage and distribution of manure that flows into the creeks that drain to beaches, wetlands, and wilderness areas that are not in the planning area but are adjacent and connected by ecological functions or species movement to new areas.

The shoreline of Drakes Estero should have a 100-foot buffer from development and grazing activities, to protect sensitive resources and preserve wilderness values. The impacts of boat-in camping sites along the shores of Drakes Estero are not analyzed in the DEIS. Based on the 2012 Wilderness Designation of the estero marine system, camping site designations should be removed.

financial planning:

Provide the financial budget for implementation of the GMPA so that public can understand how the Seashore will implement the GMPA and ensure the plan is fully informed and well considered.

Tule Elk:

Eliminate culling of tule elk: Consistent with the Park's management goals and directives, NPS management of tule elk would occur only to support other resource protection needs and management goals. New herds would be allowed to continue, regardless of geographic location if they do not move outside Point Reyes. Authorized animal units for each ranch would be adjusted as needed to meet residual dry matter goals. Resource protection is the highest value for the Seashore as intended by Congress in requiring the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area,..." 16 USC Sec. 459c (6)(a) (emphasis added).

Thank you for the opportunity to comment.

Correspondence: As a concerned citizen of Marin, I urge you to consider all impacts the proposed changes would have on Point Reyes and its visitors. There are many reasons to believe the reporting was not thorough or served with unbiased intent.

In light of the thorough reporting done by the EAC committee, I have included the concerns I share with them.

- The DEIS exceeds NPS' discretionary authority by allowing for new agricultural uses to be developed.
- Opening the Seashore to outside operators would have significant impacts on the park's cultural and historic values. The DEIS fails to analyze these impacts, and even fails to provide enough detail about the RFP process to say what the impacts may entail, or when they may occur.
- It is impossible for the public to understand the complexity of NPS' decision-making process and NPS' responsibility to properly evaluate the cumulative impacts and connected actions of the ROAs and how the outcomes of mitigation measures on one property may be denigrated on another without updating the DEIS to include mapping and other information, as well as an appropriate evaluation of cumulative environmental impacts of all of these ROAs at this time in the EIS process.

In summary, a comprehensive analysis of connected and cumulative actions is required at this stage of the DEIS. If NPS is unable to satisfy this requirement, then considerations for diversified operations should be removed before the Final EIS is issued.

- The introduction of sheep, goats, and chickens into a proposed Pastural Zone and pigs into the Ranch Core Zone will create conflicts with wildlife that are not analyzed in the DEIS.
- In addition, the DEIS fails to analyze impacts of diversification on native wildlife, including fragmentation of habitat, potentially detrimental changes to movement patterns, loss of forage areas, and reductions in available range. Cattle, sheep, goats, chickens, and pigs require different confinement and management methods that create impacts to resources. A field used to graze cattle is still available to coyotes, bobcats and raptors as territory to hunt gophers and voles; the same is not true of an area used for row crops or raising chickens. Eliminating territory for predators and raptors will have a negative consequence on those populations - populations NPS managers are tasked with protecting.
- The DEIS fails to clearly outline impacts from increased types of commercial traffic on the Seashore's infrastructure and visitor serving uses. In particular, an increase in truck traffic is reasonably foreseeable for commercial operators to distribute and conduct on-site sales. Diversified activities will add commercial trucking to export crops and livestock (sheep, goats, pigs, and chickens) for processing outside of the planning area. In addition, the DEIS allows for ranchers to import crops and livestock into the planning area for small-scale processing or retail sales at farm-stands that will also increase commercial trucking.
- The DEIS fails to analyze or propose any mitigation of impacts for boat-in camping along the shores of Drakes Estero. Proposals for camping and visitor development in areas that could impact wilderness areas must consider cumulative impacts of visitor overnight camping near marine wilderness. High visitation and overnight camping means increases in frequency and number of visitors accessing Drakes Estero, the need for installation of toilets or a program that educates and enforces appropriate human waste disposal, education and enforcement of camp fires, and establishment of trash facilities or education and enforcement for visitors to pack trash out.

The Seashore has had to close other remote boat-in camp facilities in the past along Tomales Bay, like Jack's Beach, due to negative cumulative impacts resulting from human waste and excessive trash that littered the Tomales Bay shoreline and impaired water quality and created public health issues. In addition, the lack of enforcement at remote sites also contributed to the damage of significant cultural resources of the Coast Miwok, federally recognized as the Federated Indians of Graton Rancheria.

- The Seashore is the only national park with a native population of tule elk. The elk have been prevalent in the Bay Area and Marin for thousands of years, long before their extirpation in the 19th century. Tule elk are considered natural resources and constitute an important part of the Seashore's ecosystem. Although tule elk are not a listed species, they are an important economic and natural resource for the Seashore that should be considered in addition to the lease/permit obligations that the Seashore holds. Removal of the Drakes Beach herd will have negative impacts to visitor experiences within the Seashore.

Any strategies to manage the elk populations should be in the context of managing resources like other natural resources within the Seashore and not for the benefit of commercial lease holders. The GMPA should protect and manage natural resources, including tule elk, with conservation of these resources as the highest priority, as mandated by the Seashore's mission and current NPS management policies. Long-term leases and overall management strategies should strive to reduce conflicts and find non-lethal management strategies to balance and accommodate the presence of elk and cattle.

As for proposed action, I continue to urge you to reference the reporting done by the West Marin Environmental Action Committee.

Thank you for this opportunity to share our comments, please take them to heart.

Name: Harris, Kim

Correspondence: Point Reyes National Seashore in California was established as a national park in 1962!

The government paid \$50 million to purchase the land from farming and ranching families for 'native wild species!'

The Elk must take precedence over farming and ranching activities. Grazing negatively affects ecosystems, causing water pollution and soil erosion, spreading invasive species and disease, and harming endangered species.

PLEASE stop allowing farm cattle in this NATIONAL PARK! Thank you - Blessings ~

Ask yourself, would God, the creator of these animals, approve of any abuse to his creations?! karma to all animal abusers

"Compassion for animals is intimately connected with goodness of character; and it may be confidently asserted that he who is cruel to animals cannot be a good man." -Schopenhauer

"The greatness of a nation and its moral progress can be judged by the way its animals are treated. I hold that the more helpless a creature, the more entitled it is to protection by man from the cruelty of man." - Mahatma Gandhi, Indian spiritual/political leader

"The question is not, can they reason? nor, Can they talk? But rather, Can they suffer?" - Jeremy Bentham, 19th century Philosopher, Oxford University

"I regard animals and humans in the same light. All of them suffer pain, and all of them deserve compassion." - Mohammad Alaa Aljaleel

Correspondence: I support alternative F, phase out ranches and restore the land to what it was bought and paid to be - a national park dedicated to wildlife protection. Cattle grazing is harmful to the environment and this space is for the native species, the Tule Elk. We have an over abundance of cattle and it is wreaking havoc on native habitats in the US, from wild horses to elk to many other species. Please leave national parks unspoiled by the harmful destruction that cattle leave in their wake. thank you

Correspondence: This is a place of sanctuary not only for the wildlife, but for my mental health. I've been visiting this space for years and it breaks my heart to think this place of life for wild animals will be destroyed for ranching on land that is supposed to be used for public use - not private profit. No Ranching - Plan F.

#7461

Name: Turcza, John

Correspondence: I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands. The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Correspondence: I am disgusted and disappointed that the park service would put private interests over the wellbeing of our public lands and wildlife. I am utterly appalled and strongly urge the reconsideration of this proposition. Put our native wildlife first, not private agricultural entities that harm our land and water.

#7464

Name: De leon, Alma

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

#7465

Name: Drosten, Fritz

Correspondence: Point Reyes National Seashore is a "Restricted Use Land" and when established in 1962, ranching was never intended to be a part of the seashore forever. It was planned that ranching would be phased out.

I am a volunteer at another national park, and along with the thousands of visitors, I want to see what they want to see: wildlife, wildflowers, and in the case of Pt Reyes, the seashore. They want to hike in the area, and they want healthy wildlife. They want access to the area, more camping areas (there are no car camping areas in the park currently). That's what I want, too. Per the national park service, "Preserving shoreline areas and offshore islands, the national lakeshores and national seashores focus on the preservation of natural values while at the same time providing water-oriented recreation". That doesn't include preserving ranches with cows that overgraze the terrain, pollute the water and destroy native plants. Those buildings can be repurposed for education, interpretation and research. The financial benefits or losses from discontinuing ranching listed in the report are not significant.

Ranchers received money for the sale of their lands to the park service, and were allowed a 25 year lease. That ended long ago. They did not use their money to move their operations. They don't pay taxes now! They pay far less than other ranchers pay to graze on public lands. Now that farms have historic designation, their buildings are historic. Their cows are not, and the public has access to one historic farm, a non-working one at Pierce Point. The other existing ranch operations do not add to the National Seashore. Currently here is no cultural or interpretive value to their farms, and the public sees only many no trespassing signs and fenced off areas.

Environmental impacts: Cattle are the leading cause of greenhouse gasses at the seashore. Methane gas is more damaging to the environment than CO2. Where are the mitigation plans were the ranches to continue? There is no discussion of the impacts of diversification of the existing ranches on the environment and wildlife making it an incomplete EIR. Except that option F would not include it.

Presence of cows in this national seashore has tremendous environmental impacts that do not seem to be mitigated in anything but the alternative F. Alternative F "would eliminate all impacts on soils associated with ranching activities." Water quality would improve. Native coastal prairies could be returned instead of the presence of land with non-native grasses dominating their pastures. The pastoral zone should be restored to native wildlife habitat, native plant communities, and should allow scientific research and education. Visitors could see Tule elk, an original California native species, a type of animal far less destructive to the hillsides than cows. They could see normal birds, not just the crows that follow cattle. Birds have been shown to be declining such that one on four have vanished (Cornell lab of Ornithology). The Snowy Plover has nesting areas down-hill from the drainage of the contaminated water. Land and sea life would benefit from cleaner water. Why would the park service choose an environmentally unfriendly choice as their preferred choice? In today's world with current climate concerns?

Ranches do not belong on Point Reyes National Seashore, and I urge consideration of and choosing option F: Ranching operations to be discontinued. All areas of soil, water vegetation, wildlife and air are negatively impacted by ranching in the Point Reyes National Seashore.

Correspondence: GMP Amendment c/o Superintendent Cicely Muldoon Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956 Via Online Portal

RE: General Management Plan Amendment Draft Environmental Impact Statement

Dear Superintendent Muldoon:

I appreciate the opportunity to provide comments on the National Park Service (NPS) Point Reyes National Seashore's General Management Plan Amendment (GMPA) Draft Environmental Impact Statement (DEIS).

Point Reyes National Seashore is a special place. The purpose statement for the Park states, "Established for the public benefit and inspiration, the Point Reyes National Seashore protects a rugged and wild coastal peninsula and surrounding waters, connecting native ecosystems, enduring human history, and recreational, scientific, and educational opportunities."

The Draft Environmental Impact Report fails to consider or analyze a number of foreseeable consequences of the Preferred Alternative (Alternative B). Specifically, the DEIS for Alternative B fails to consider foreseeable impacts from diversification and the proposed succession policy. Additionally, in Alternative B, the tule elk management improperly prioritizes commercial operators in the Park over a native species, which should be protected.

First, there does not appear to be any authority for the NPS to allow diversification in the GMPA. No legal authority for diversification has ever been provided to the public in the GMPA process.

Second, diversification will lead to the following foreseeable problems, none of which are addressed meaningfully in the DEIS:

- 1) Increased conflicts with wildlife: The increased conflicts with wildlife arising from chickens, sheep and pigs could result in loss of animals for the ranchers and/or degradation contracts which result in wildlife deaths. The DEIS does not include an analysis of this conflict.
- 2) Loss of wildlife habitat: Areas enclosed for chickens or cultivated row crops will no longer be available to bobcats, badgers, coyotes and birds of prey for hunting gophers and voles the way the pastures are currently available to these animals. The fragmentation and loss of habitat/territory for native predators and raptors was not analyzed in the DEIS, nor was the potential impact on those wildlife populations.
- 3) Decline in water quality: The NPS lacks adequate data about current water quality, and the studies cited (which do in fact note contaminated waterways near ranches) are quite dated. Additional fertilizers for crops, and the introduction of additional livestock such as pigs, will likely cause further decline in water quality. These impacts have not been properly evaluated.
- 4) Decline in air quality: Additional trucks and traffic, as well as additional animals will likely cause a decline in air quality, but no analysis of this issue is included in the DEIS.
- 5) Loss of scenic value: The Park's wild, scenic beauty is negatively impacted by modern agricultural buildings and adding row crops, greenhouses, chicken coops and other buildings to support diversification. The DEIS does not address the impact of diversification on scenic value.
- 6) Inconsistency with historic designation: The proposed diversification activities could be inconsistent with the historic designation areas, but this issue is not addressed in the DEIS.
- 7) Impediment to visitor uses: By immediately negotiating Ranch Operating Agreements, while implementation of improved visitor experiences through new trails and educational facilities will take substantial time and resources, the result will be prioritization of commercial activities over visitor experiences; this is not addressed in the DEIS.
- 8) Damage to Park infrastructure from increased truck traffic: As someone who drives in the Park regularly, I see that the roads in the PRNS are literally falling apart. The potholes and cracks in the roads are everywhere. The repairs have been delayed and I understand the bids to do the current repairs exceed the projected budget. There is a wealth of data available regarding the damage trucks do to roadways; the milk, hay and gas trucks cause daily damage to the roads in the Park, at taxpayer expense. Diversification will require additional trucks for fertilizer, transport of animals, and transport of crops. And if ranchers are allowed to bring in outside goods for sale in the Park, those trucks will add to the road damage as well. The DEIS does not contain any analysis of the increased

damage to Park infrastructure from diversification (nor does it address other foreseeable damage like visitor cars parking along the roadside). The money spent repairing additional road damage from diversification could be better spent building educational facilities or maintaining and improving trails.

Third, the succession policy includes an option for outside operators to bid on ranch leases; this is inconsistent with the historic and cultural values of multi-generational ranching, and could lead to large commercial operations on ranches in the Park. Once the door is opened to diversification and outside operators, it is reasonably foreseeable that sometime in the future the historic dairy and ranching operations will be replaced by commercial chicken operations or other, more lucrative options. That is a far cry from protecting the historic California dairies and extending leases to current ranching families. The ranch leases should be limited to existing ranching families (operating in a manner that does not negatively impact Park resources) as the DEIS does not properly evaluate the foreseeable consequences of third party operators.

Fourth, Alternative B includes a reference to possible boat-in camping in Drake's Estero. The DEIS does not include any analysis of the impact on waterbirds, nor the problems with human waste and trash that boat-in camping will create.

Fifth, the DEIS Alternative B includes culling of the native tule elk. The tule elk are one of the highlights of visitor experiences in the Park, and the Drakes Beach herd is an easily and regularly visited herd of tule elk. The preservation of resources in the PRNS should be the highest priority, and tule elk should be protected. The DEIS does not include a thorough analysis of alternatives to lethal methods, and prioritizes commercial operations over protection of an important Park resource.

Finally, the DEIS fails to address the elephant in the living room: the lack of resources to implement many aspects of Alternative B, including but not limited to enforcement, monitoring mitigation measures, creation of new trails, or reclaiming historic buildings for educational purposes. It is my understanding that the PRNS is currently under-funded. Many aspects of Alternative B require extensive resources to create, maintain, monitor, mitigate or repair. The DEIS does not include a proposed budget for any of these things, nor any specifics about where funding will come from. The current state of the Park is failing roads, dilapidated abandoned houses and ranch buildings, inadequate resources for trail maintenance, no consistent, current water quality testing, and inadequate staffing to enforce existing PRNS rules. The Preferred Alternative should include specifics about cost, staffing and funding sources.

In summary, the DEIS highlights a number of problems with the preferred Alternative, Alternative B. As someone who loves PRNS, I ask that you go back to the drawing board and create a preferred Alternative consistent with the Park's highest priority: resource protection. Congress required the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area,..." 16 U.S.C. Sec. 459c (6)(a).

Please eliminate any type of diversification, culling of the elk, boat-in camping and the option for third-party operators to bid on ranch leases. In addition, I implore you to add a provision for ongoing, consistent water quality testing in places like Kehoe Creek, Abbotts Lagoon and other like surface waters in the Park, to ensure our resources are protected.

Thank you, Sarah Killingsworth

Correspondence: 23 Sept 2019

Dear Point Reyes National Seashore,

Herein are comments regarding the proposed Pt Reyes Seashore General Management Plan Amendment (GMPA) for all lands currently under agricultural lease/permits within PRNS and the north district of Golden Gate National Recreation Area. I have been fortunate to enjoy Point Reyes National Seashore (PRNS) since I was six years of age, which is prior to the creation of the park, and I spend many weekends at PRNS hiking, birdwatching, and enjoying nature.

I am disappointed in the Management Plan for Point Reyes National Seashore. It is a document deficient in alternatives, deficient in details about some of the proposed actions, and neglects to remember that the park's mandate is to preserve and protect. The legislation that enacted establishment of the park put it best: "To preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area". During the oyster controversy, the Park Service/federal staff (mostly) provided science-based leadership with a vision to protect a wild and natural park. This document fails to do so.

I remember the fight to save Limantour from becoming a housing development. Establishment of the park saved the ranchers. If it were not for the park, ranchers would have sold out long ago to developers and their lifestyle would have terminated. It is not the job of a national park to preserve and protect ranchers. It is, instead, the mandate of the parks to preserve and protect natural resources/wildlife.

A beneficial byproduct of the Point Reyes ranches is provision of habitat for tricolored blackbirds, a state-threatened species. I am not advocating that the ranches be abolished. The severe degradation from massive overgrazing must be addressed. There are too many cattle at PRNS. Ranchers have not done a good job maintaining fences. The management plan should include provisions to fine or penalize ranchers that allow livestock to enter protected areas. I frequently seen cattle - or their flops - at Abbott's Lagoon. The management plan must include more grazing exposures and present a detailed monitoring measurement. Why are some grazing exclosures in disrepair (e.g. Bull Point)?

The supplemental ag proposals-pigs, row crops, retail facilities, etc. -are not ok. All ranchers realize they are participating in a risk-filled business. It is not the duty of the public to be obliged to clutter our public lands with artichoke fields and farm stands. There are rumors that federal tax dollars are used to bring hay onto the ranchers during dry years. Unfair. In the US, some ranches survive, some go under. Beef and dairy (and oysters) may represent food but they are not critical to the survival of humans. As it is, we already subsidize the ranchers too much. According to Center for Biological Diversity (using 2009 data) The cost per animal unit for ranchers leasing back public lands at Point Reyes is \$7. The cost per animal unit for non-federal grazing lands in Marin county is \$15-20 (see [https://www.biologicaldiversity.org/campaigns/protecting\\_Point\\_Reyes\\_elk/pdfs/CowsAndElkByTheNumbers.pdf](https://www.biologicaldiversity.org/campaigns/protecting_Point_Reyes_elk/pdfs/CowsAndElkByTheNumbers.pdf)).

The GMPA is deficient because it does not provide any details about the supplemental ag proposals. What is the impact? How many acres dedicated to each type of alternative ag? Where would they get the water? What would be the damage to instream uses/fisheries, and the impact from toxic herbicide and pesticide laden runoff? All water should go to maximize salmonids and other wildlife. Regardless of data, ag alternatives would NOT preserve the natural character of the area.

I lead Audubon field trips to PRNS. My "clients" make the trek to enjoy a wild experience, see quail and peregrines, guillemots and tricolored blackbirds. They are delighted by coyotes and elk and ecstatic if I can show them a gray fox or a bobcat. And they enjoy the Sidalcea, chocolate lillies, lupines, gumplant, Brodiaeas. The vista of sky and sea without recent development. As do I. Retail operations, row crops, etc. are not appropriate.

Boat-in camping at Drakes Estero? Outrageous. People building fires, disturbing harbor seals and birds, garbage, more ravens. I have never seen a law enforcement staff person on the trails. How would any regs be enforced? Regardless, it is just not appropriate.

Additionally, the document does not address that the ranches provide a historic cultural resource-birdwatching. Options that preserve ranching must include a guarantee of continued public access. I have been birdwatching the Point Reyes ranchlands for 30 years. During this time, we have lost "birders habitat" as visitation has increased. My general understanding is that PRNS lands are public. Birders realize that we are allowed access for birding if we do not disturb livestock or come too close to ranch residences, and of course conform to any other regulations about safety, snowy plover protection, areas closed for marine mammal rookeries, etc.

In short, the document is deficient because it does not have a "protect the resources" alternative. Disappointing. Discouraging.

Thank you for the opportunity to provide comments.

Emilie Strauss

Name: Labiner, David

Correspondence: I am writing to comment about the Point Reyes Seashore Draft Management Plan and Environmental Impact Statement. To summarize my opinion, I favor Alternative F that would phase out ranching completely in this area. My wife and I have visited Point Reyes to enjoy the birds and other wildlife of the area. The other alternatives in the Plan would diminish our experience and desire to visit.

The plan discusses diversification (except in alternatives A and F) and this is a weak point in the plan and EIS. There is no discussion of the impact of increased agriculture and livestock on the park's wildlife and resources.

The Park Service is obliged to preserve historic and cultural resources, i.e., the infrastructure and ranch buildings NOT cows. It is time to give this land back to the public and not allow private ranches to prevent our enjoyment of this wonderful place.

Several alternatives of the plan would allow for the permanent presence of ranches on the Park. This was not the original intent of the NPS but rather the original plan was to gradually retire the ranches. The perpetuation of ranches rather than the retiring of them is unacceptable. The EIS makes reference to the fact that cattle have an impact on the plant and animal species of the park. However, none of the alternatives discuss the cost or time-frame for mitigating these impacts. The park is meant for the enjoyment and use of the public not for private business. Ranching will fundamentally change this ecosystem and not for the better. It would be best to phase out ranching in this region as originally intended. The cost of ranching to our park. The National Park Service has not provided any information on the dollar amount or portion of its budget that goes to ranching-related expenses. Ranching places increasing demands on dwindling park budgets, while park improvements and a backlog of maintenance, along with public programs and interpretation, go unfunded. Meanwhile, scarce resources go to support 24 ranchers operating in the Seashore, including killing wildlife to benefit their operations. Ranching's environmental impacts have an untallied economic impact on the Seashore. Internal Park Service memos indicate monitoring the ranches for lease compliance and environmental damages already places outsized demands on the Seashore's staff and budget. The NPS has failed to enforce lease agreements when leases are violated. Can we

expect that expanded agricultural practices will be met with responsible oversight with no expansion of budget to enforce these more complex leases?

The NPS mission does not include guaranteeing commercial operators a living. Yet, every alternative except No Action (A) and No Ranching (F) allows "diversification" for the purpose of shoring up the ranchers' bottom line. There is no discussion of diversification impacts to the park. Ranchers in the Seashore already have a competitive advantage over ranches outside the park. Seashore ranchers benefit from discounted grazing fees, below-market-rate housing, and maintenance and improvements to roads, homes, and farm buildings covered at public expense. Seashore ranches pay no property taxes.

There is no mention of mitigation for cattle's impact to the climate due to the methane production by the cattle.

Removing native Tule elk from the park to benefit the ranchers is built into four of the NPS alternatives, including the NPS's "preferred alternative." The EIS says that the Seashore's land, water and wildlife would benefit were ranching to "cease." But there is no plan for protecting wildlife from ranching's impacts or mitigating habitat loss from cattle grazing or growing crops. Other than killing Tule elk, there is no discussion of avoiding wildlife conflicts.

For these reasons my wife and I strongly oppose continued or increased ranching in Point Reyes National Seashore. We favor alternative F to have no ranching in our public park!

Correspondence: Dear National Park Service,

One of my favorite memories growing up is from visting Yellowstone national park with my mom and sister. It was so amazing to be able to see large, wild animals: bison, grizzly bears, moose, elk and even wolves. I will never forget those experiences. I would like to see wild animals more often, but getting to Yellowstone is so expensive and time-consuming. And I know I could go to Point Reyes to see elk and elephant seals, but then I am forced to see human agricultural operations as well. And seeing large numbers of cows standing in mud, or seeing cow patties and trampled ground everywhere, and trucks and ranch building and fences - that is not at ALL a wonderful wildlife experience! I don't go to Point Reyes to see cows! Or smell cow manure and cow urine! I want to see more wildlife, and have the experience of fresh clean air and beautiful natural ecosystems within easy driving distance from my home. I want Point Reyes to be what it was MEANT to be, that is a park dedicated 100% to the return of wildlife and biological diversity for humans to VISIT, not to EXPLOIT and POLLUTE (like the ranchers do). I shouldn't even have to write this comment, because it seems self-evident to me that there should be no more human agricultural operations in Point Reyes! It is obvious from the fact that ranchers were paid to get off of their land half a century ago. I am a US citizen, and the National Park Service is MY National Park Service. And I know that I am in the vast majority of people of this state and country who want to visit Point Reyes but don't. We want a wildlife experience! So hurry up and set things right asap. Get these ranchers out of Point Reyes now! Sincerely, Amaru Drescher

Correspondence: Dear Point Reyes National Seashore Superintendent,

Thank you for the opportunity to comment on the draft EIS for the Seashore. I am a West Marin resident and member of Marin County Farm Bureau, I favor "Alternative B" in this draft EIS. I support the comments of California Farm Bureau Federation, California Cattlemen's, National Cattlemen's Beef Association, Marin County Farm Bureau and the Sonoma-Marin Cattlemen's association. I support agriculture in the Point Reyes National Seashore and the ability of the farm families in the Seashore to sustainably and viably operate their farms. Thank

you for all that has been done to work with agriculture, please continue to make policies that enable the family farms and ranches in the Point Reyes National Seashore to contribute to the local food shed. Please consider "Alternative B" and the changes offered in the comments of the organizations above mentioned as the final EIS/GMPA is compiled.

Name: Pozzi, Regina

Correspondence: Dear Point Reyes National Seashore Superintendent, Please select the preferred alternative, "Alternative B" for the future of ranching in the Point Reyes National Seashore. I support agriculture in the Seashore and think it is a vital part of the region's history, culture, and current economy. I appreciate the time and effort that has gone into researching all options for the draft EIS. I support 20-year leases, the ability for farmers and ranchers to succession plan, and the opportunity for farms and ranches to diversify their operations to viability and sustainability adapt their operations for generations to come. I wish that the diversification was not so limited in scope or size, 2.5 acres around structures in ranch core with no irrigation and other restrictions is cumbersome. In addition, the draft EIS would have been more complete if research was done on an option that includes an Elk Fence between the agriculture and wilderness area or Elk relocation to the wilderness area. Agriculture is a partner in natural resource conservation and preserving open spaces. Many of the beautiful natural landscapes in the US near large urban areas are preserved because agriculture was there first to curb development. Agriculture and nature do co-exist, we support the farmers and ranchers in the Seashore for their part in providing for the local food shed in a sustainable way. Agriculture plays an important role in combating Climate Change by providing local food and carbon and greenhouse gas drawdown. Agriculture is important to me in the Point Reyes National Seashore, the preferred alternative B is the best option from the draft EIS.

Name: Spanne, Laurence

Correspondence: Point Reyes National Seashore selected and established as a National Seashore because of its unique scenic, scientific, natural, cultural, and historic qualities. It is a national treasure. Private landowners were compensated and allowed to continue some agricultural and commercial operations at a reasonable level compatible with other uses so that its overall values and important objects and resources were not damaged or otherwise harmed. Your current plan to expand agricultural operations flies in the face of the original proclamation. For the sake of a few extra dollars in the pockets of agriculturists and others, much harm will undoubtedly be done to this priceless resource. The expansion of grazing and the conversion of lands to cultivation will certainly adversely wildlife and native vegetation. Pesticide applications will undoubtedly increase.

We implore you to reconsider this unwise plan and keep Point Reyes as it was originally intended to enrich our lives. We have visited this area many times and are continually uplifted and amazed by its beauty and irreplaceable qualities. Please think about what you are doing and reverse course. No action is the best action.

Thank you for considering our opinion.

Larry and Renae Spanne

Name: Kelly, Paul

Correspondence: The DEIS fails to show how the introduction of domestic farm animals into Pt. Reyes National Seashore has the real risk of bringing with them a diversity of infectious agents and parasites that could impact the health of native wildlife and visitors within the park. Horses, cows, goats, sheep, pigs and chickens are all hosts for numerous viral and bacterial pathogens, protozoans, internal parasites such as liver flukes and round worms, and ectoparasites such as ticks, mites, fleas and lice. This potential risk is best exemplified by the recent discovery of the Asian long-horned tick infesting sheep in New Jersey. It has spread to seven other states and is moving west. This tick transmits numerous pathogens infectious to other animals and humans, including the fatal virus that causes Severe Fever with Thrombocytopenia Syndrome. The highly fatal virus of swine, African Swine Fever Virus, is rapidly spreading in Europe, and if introduced into the United States, could be imported to PRNSS by infected pigs. Goats, cows and sheep are all hosts for several Brucella species that cause Brucellosis, which is notorious for infecting humans and spreading to wild ungulates, such as elk. Other potential infectious diseases introduced with domestic live stock include Q fever, Chlamydia, Leptospirosis, Escherichia coli O157 disease, Campylobacteriosis, and Listeriosis. Sheep and cows are hosts for the liver fluke, Fasciola hepatica, which is a threat to both humans and domestic stock. Chickens can bring with them Avian Influenza Virus, Campylobacter and Salmonella, and be an amplifying host for West Nile Virus to infect resident mosquito populations. Increasing the domestic animal populations within the park will also most certainly cause an irruption of filth flies and other pest insects that feed on the animals' feces or utilize the new wealth of excrement to complete their life cycles. These insects will cause annoyance to wild and domestic animals as well as to the humans visiting the park. With more domestic stock living in the park, more animals will be dying there, many probably of undiagnosed illnesses. How the carcasses of these dead animals are handled may result in environmental contamination of unforeseen consequences. The NPS must show how imported and exported livestock would be quarantined and screened to prevent the transmission of zoonotic diseases.

Raven densities at PRNSS are among the highest in the State of California as a result of sloppy agricultural practices permitted by the NPS.

The DEIS fails to acknowledge the profound impact that ravens have on the coastal ecosystem in PRNSS. The Common Raven has been implicated as a causative factor in the declines of several threatened and endangered species including desert tortoise, California condor, marbled murrelet, California least tern and western snowy plover. Other sensitive species such as common murrets and ash storm petrels have been severely impacted by raven predation on their eggs. The DEIS fails to explain how these sloppy agricultural practices, which may increase with additional live stock on site, will be rectified.

Correspondence: Hi there, I just found out from my mom that you guys are considering keeping ranching at Point Reyes. That's crazy! I wanna see more elk and bobcats and coyotes there, not cows! I remember my favorite time at Point Reyes was walking with my mom up the tomales Point trail a few years ago and seeing elk. Wow, just wild big animals with no fences between us and the animals. It was so thrilling! I wanna see elk in more places in Point Reyes. I don't wanna go to where the ranches are on Point Reyes, cause that is just so depressing! Those poor cows with those enormous udders and no calves with them. How can humans be so cruel!?? I obviously don't eat dairy products, because I think that is just plain wrong, to treat animals that way. Plus it's gross, all the cow shit and piss that goes on the land and into the streams of Point Reyes. Those streams are supposed to be PRISTINE, not polluted by farm animals. It's just so wrong! We gotta get those ranches at Point Reyes shut down, and it should've happened a REALLY LONG TIME AGO, way before I was born (I'm 21 now). But my mom told me that the National Park Service is actually thinking of keeping the ranches there even longer. That's just nuts. SO that's why I'm writing in (I've never done a public comment like this before). I can't stand the idea of this craziness going on any longer at Point Reyes. So I'm asking you to stand up to those rich and powerful and profiteering ranchers, and to protect Point Reyes, and make it recover from those horrible ranching operations. Do it now. Please! Coya

Cicely A. Muldoon, Superintendent Point Reyes National Seashore One Bear Valley Road Point Reyes Station, CA 94956

Re: Point Reyes National Seashore Management Plan Amendment Draft Environmental Impact Statement

Dear Superintendent Muldoon;

As Director of Rangeland and Agroecosystem Management at Carbon Cycle Institute (CCI), and having farmed in Point Reyes National Seashore from 1979 to 2004, I appreciate the opportunity to comment on the General Management Plan Amendment Draft Environmental Impact Statement (DEIS) for Point Reyes National Seashore and Golden Gate National Recreation Area.

CCIs mission ([www.carboncycle.org](http://www.carboncycle.org)) is to stop and reverse climate change by engaging working landscapes with science-based solutions that remove carbon dioxide from the atmosphere while promoting environmental stewardship, social equity and economic sustainability. Our strategic partners include; the California Association of Resource Conservation Districts, Resource Conservation Districts across California, Fibershed™ and the Marin Carbon Project ([www.MarinCarbonProject.org](http://www.MarinCarbonProject.org)). We strongly support continuation of dairy and beef ranching within the historic dairy and ranching districts on Point Reyes and the Olema Valley.

Point Reyes and Olema Valley ranchers are multi-generational rangeland managers, yet key documents supporting the DEIS, including a recent Grazing Plan prepared by students at UC Berkeley, were developed, in direct contravention of accepted conservation planning practice, without consultation with those ranchers. Point Reyes ranchers have made innumerable attempts over the past several decades to engage with the Seashores ranchland planning processes, but ranchers expertise and knowledge have been ignored in the DEIS. Most significantly from the perspective of CCIs focus on the role of working landscapes in climate change, the potential for agriculture to play a significant -and essential- role in climate change mitigation and ecosystem restoration at PRNS and GGNRA has been ignored or minimized throughout the DEIS. Failure to adequately consider the climate change implications of proposed actions within the DEIS render the document significantly insufficient and incomplete, and violate the NEPA requirement to consider the greenhouse gas implications of NPS actions.

As noted by the Intergovernmental Panel on Climate Change (IPCC 2019), Increasing impacts on land are projected under all future greenhouse gas (GHG) emission scenarios. &climate change creates additional stresses on land, exacerbating existing risks to livelihoods, biodiversity, human and ecosystem health, infrastructure, and food systems.

All sections of the DEIS should be revised to recognize that ranching can help to sustain the coastal grassland ecosystem, increase environmental awareness among the general public, promote an ethic of land stewardship and sustainable agriculture, and support local food and fibersheds ([www.Fibershed.com](http://www.Fibershed.com)) in the face of worsening climate change impacts. The stability of food supply is projected to decrease as the magnitude and frequency of extreme weather events that disrupt food chains increases. Increased atmospheric CO<sub>2</sub> levels can also lower the nutritional quality of crops. Global crop and economic models project a median increase in cereal prices in 2050 due to climate change, leading to higher food prices and increased risk of food insecurity and hunger. The most vulnerable people will be more severely affected (IPCC 2019).

The Air Quality, Water Quality and Soil Quality sections of the DEIS must be revised to fully evaluate the positive impacts of carbon farming, as was requested during the public scoping period for this process. The DEIS fails to describe the GHG drawdown potential of appropriate livestock grazing strategies, as applied in the carbon farming framework. Compost application, an important carbon farming practice included in many carbon farm plans because of outstanding GHG drawdown potential - - would be specifically prohibited if the current DEIS goes unchanged.

In over 50 years, PORE/GGNRA has never hired a single agricultural ecologist or other resource specialist with meaningful agricultural (other than rangeland) experience. NPS must establish an Agricultural Advisory Committee to guide PRNS decision making on all agricultural planning and management decisions. The PRNS Agricultural Advisory Committee should be made up of local agricultural and natural resource conservation experts, including: the local office of the USDA Natural Resource Conservation Service; the Marin County Resource Conservation District; the Marin County Agricultural Commissioners Office; the University of California Cooperative Extension, and the Marin Agricultural Land Trust. Strengthened multilevel, hybrid and cross-sectoral governance, as well as policies developed and adopted in an iterative, coherent, adaptive and flexible manner can maximize co-benefits and minimize trade-offs, given that land management decisions are made from farm level to national scales, and both climate and land policies often range across multiple sectors, departments and agencies& Many sustainable land management practices are not widely adopted due to insecure land tenure, lack of access to resources and agricultural advisory services, insufficient and unequal private and public incentives, and lack of knowledge and practical experience. Public discourse, carefully designed policy

interventions, incorporating social learning and market changes can together help reduce barriers to implementation (IPCC 2019).

The DEIS draft Foundation Document is significantly deficient because it largely fails to recognize historic and culturally significant dairy and ranching activities at PORE/ GGNRA. The DEIS does not explain the fact that the historic ranches within the planning area represent nearly 20% of the agricultural land in Marin County and the ranching families and their employees within the planning area produce nearly 20% of the agricultural product value in Marin County.

The preferred alternative must exclude elk from ranch lands. Although mandated by the 1998 PRNS Elk Management Plan, NPS has never effectively separated elk from cattle. Elk consumption of forage already threatens organic certification of the Seashore ranches, while damaging ranch fences and other infrastructure, and undermining ranch pasture management capacity. Insecure land tenure affects the ability of people, communities and organizations to make changes to land that can advance adaptation and mitigation. Limited recognition of customary access to land & can result in increased vulnerability and decreased adaptive capacity. Land policies (including recognition of customary tenure) can provide both security and flexibility of response to climate change (IPCC 2019).

The analysis of on-farm diversification in the DEIS is incomplete and lacks historical and regional context. The DEIS gives the false impression that the diversification sought by ranchers is new. The final EIS should explain that farming and ranching within the planning area was historically diverse, including both irrigated and non-irrigated row crops (including beans, peas, barley, artichokes and other vegetables), a wide variety of livestock species (including hogs and sheep), on-farm processing and on-farm sales. The limitation of row crops to 2.5 acres, permitted only in the ranch core, and prohibiting irrigation and compost use, flies in the face of the widely accepted importance of crop diversification and organic matter amendments as core elements of climate-beneficial agriculture. Agricultural diversification, expansion of market access, and preparation for increasing supply chain disruption can support the scaling up of adaptation in food systems (2019 IPCC report).

The DEIS restriction of sheep and goats to the ranch core and pasture sub-zones undermines the potential of these potentially powerful vegetation managers to be deployed to advance both ranch and Seashore vegetation management objectives. Goats have been successfully deployed to address invasive weeds and fire fuels at PRNS since at least 1997; NPS should support the use of sheep and goats as an ecologically appropriate strategy within the range subzone where there is significant threat of both brush encroachment and wildfire.

The DEIS assumes only adverse impacts to soils as a result of dairying and ranching. The NPS fails to consider the potential of carbon farming and the ecological benefits of implementing farm-scale carbon farm plans that would increase soil organic matter to benefit soil, water and air quality. The NPS should engage the Marin Carbon Project, including the Marin Resource Conservation District, which have extensive expertise in carbon farming in Marin. Appropriate design of policies, institutions and governance systems at all scales can contribute to land-related adaptation and mitigation while facilitating the pursuit of climate-adaptive development pathways. Mutually supportive climate and land policies have the potential to save resources, amplify social resilience, support ecological restoration, and foster engagement and collaboration between multiple stakeholders (IPCC 2019).

On page 6 of Appendix D, NPS states: On dairies, nutrient management may also be included as a soil amendment for forage production. Nutrient management is a comprehensive, whole farm assessment process, not a soil amendment. The DEIS also incorrectly equates fertilizer with compost and prohibits both. The use of compost should be allowed on all ranches. Pathogen-free and weed-free compost improves soil fertility, enhances water retention, reduces runoff and erosion, increases biodiversity and helps sequester carbon. NPS should consult with the Natural Resource Conservation Service, the Marin Resource Conservation District, and University of California Cooperative Extension Service to identify best management practices for both dairies and beef ranches to increase soil organic matter as both a widely recognized sustainable agriculture practice and a climate change mitigation strategy. The preferred alternative only allows soil fertility improvements on the pasture subzone, but

soil fertility improvement with compost, seeding, livestock management and other carbon farming practices, including comprehensive carbon farm planning and implementation, should also be allowed on the range subzone on both dairies and beef ranches to maximize the carbon sink potential of PRNS/GGNRA soils. As noted by the IPCC (2019), Some options such as soil carbon management are potentially applicable across a broad range of land use types.

Thank you for the opportunity to comment on the General Management Plan Amendment Draft EIS for Point Reyes National Seashore and Golden Gate National Recreation Area. After over 50 years of neglect, the unique opportunity to engage the enormous potential synergies among agriculture and natural resource conservation and management at Point Reyes yet remains. In the face of the rapidly accelerating pace of climate change, the urgency of such engagement grows daily. As the IPCC report makes clear, while agriculture has certainly contributed to the global crisis, engaging our working landscapes as actively managed carbon sinks, while simultaneously meeting the needs of a growing human population, is essential for its resolution, and for human survival on our beleaguered planet.

Sincerely,

Jeffrey A. Creque, Ph.D. Director of Rangeland and Agroecosystem Management Carbon Cycle Institute

Correspondence: I support Tulle elk. Please do not harm the elk. I support alternative F. The land the elk live on is parkland and it was designated parkland to protect the habitat for wildlife. Do not harm wildlife in order to use the land for farmed cattle. The ranchers must contain their stock on their private land! Leave the parkland to the wildlife!

#7482

Name: McGinley, Jessica

Correspondence: As a member of the California-based international animal protection nonprofit organization In Defense of Animals with over 250,000 supporters, I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

#7483

Name: N/A, N/A

Correspondence: There are always going to be cattle, and places for cattle to graze and roam. So, the idea of having this one specific area that won't be open for private cattle and dairy farming is not a hard decision. Unlike cattle, this is a rare opportunity, a special place for the Tule Elk to survive and flourish in their natural environment. It would really be a shame to lose this species.

Please save the Tule Elk at Point Reyes. Make this one of your great accomplishments in life, one that you will be proud to share with your kids and grandkids - this wonderful deed that you did.

#7484

Name: Parenteau , Laura

Correspondence: Pls do not let farmers use this land for cattle and farm animals.

#7485

Name: N/A, N/A

Correspondence: I support the continuation of the ranches as they are now and the control of the Tule Elk by culling and robust fencing

#7486

Name: Morgan , Drew

Correspondence: Ranchers and cattle's is one less thing we need. We need to preserve our nature and those who dwell in it. Please do not commit this atrocity all so that you can make pennies on a dollar. Do not destroy what is natural so something that does not belong there can live. Leave the beauty of the environment the way it is and contribute to e better future for our children by leaving nature alone.

#7487

Name: Fernandez, Cynthia

Correspondence: I am outraged that you would even consider killing any native Tule elk to make room for cattle! The National Seashore should belong to the native wildlife. The cattle industry has no right to be there and cattle ranching is unsustainable as well as damaging to the environment. People are turning to plant-based alternatives to beef. The Tule elk have every right to live on their native land, the cattle do not. Do not sell out the Tule elk to line the pockets of cattle ranchers. Please do not follow through with this plan, it is wrong on so many levels!

#7488

Name: Meinberg , Michael

Correspondence: Keep it ! keep it! keep It!

It is absolutely wonderful!

#7489

Name: Casey, Charles

Correspondence: I am a Marin County resident and a frequent visitor to Point Reyes National Seashore. The following are my comments on the draft plan.

The ranches were instrumental in getting the park established and in saving Point Reyes from development. We will forever be in their debt for this, and we must uphold our promise to allow them to continue with responsible ranching into the foreseeable future.

I would also like to comment on the electric bike policy. I support responsible use of e-bikes wherever conventional bikes are currently allowed, which is primarily fire roads. E-bikes provide a great opportunity for those who are older to explore the park in a responsible fashion, and they should be accommodated in the park's future planning.

Thank you!

Brian

Correspondence: The National Park Service now has an unprecedented opportunity to end ranching on our public lands in these parks and doing anything else would be a grave disservice to the American people, as well as to the diversity of native plants and wildlife that belong on these lands.

Neither Point Reyes National Seashore nor the northern district of Golden Gate National Recreation Area were preserved as national parks to perpetuate cattle grazing and dairying. The ranches were purchased by the government and the ranchers were given more than adequate time to move elsewhere.

The proposed park management plan allows destructive levels of livestock grazing to continue on 28,000 acres of national park lands in this treasured Pacific Coast landscape, despite the myriad known adverse impacts grazing has on coastal prairie, riparian systems, springs, wetlands, and coastal dune vegetation.

The national seashore has already been degraded by ceaseless cattle grazing since this national park was established nearly 60 years ago. These public lands are essentially a sacrifice zone for a powerful special interest subsidized at taxpayer expense.

The 1916 Organic Act that formed the National Park Service mandated that natural resources on park lands shall not be impaired. The Point Reyes National Seashore legislation specifically mandates that this special coastline be "protected" and "restored."

Damaging livestock grazing has been allowed to persist for decades, and the damage to the high-value resources of the Seashore has been ongoing and intensifying. Emphasizing livestock ranching while subsidizing welfare ranchers is a takings of public land. Livestock don't belong on public lands in general and certainly not in a Seashore where fecal matter can get into the ocean.

The National Park Service should be managing the National Seashore for the benefit of wildlife and the natural ecology rather than subsidizing special interests at taxpayer expense. The proposed park management plan is flawed and must be stopped.

Re: Comments on the Draft Environmental Impact Statement for a General Management Plan Amendment for Point Reyes National Seashore

Dear Superintendent:

Thank you for the opportunity to submit these comments on the Draft Environmental Impact Statement for a General Management Plan Amendment for Point Reyes National (DEIS).

I am a regular visitor to Point Reyes National Seashore who has hiked its incredible beaches and trails multiple times each month for more than 20 years. I am drawn to Point Reyes for its natural beauty, its wildness, and its abundant wildlife. It is not an exaggeration to say that Point Reyes National Seashore is the reason I still live in California, and it is the resource in California that I cherish most. I believe that the Park should be managed to preserve and enhance its wildness and its wildlife for the benefit of the public at large.

General Comments I strongly oppose the DEIS Preferred Alternative (Alternative B). Alternative B is the most environmentally damaging alternative considered in the DEIS, and is in direct violation of the most fundamental purposes of Point Reyes National Seashore and the National Park Service Organic Act. Alternative B sacrifices the health of the Park, its incredible native wildlife, and the visitor experience, for the sole purpose of providing heavily subsidized profits to 24 ranchers.

I strongly urge the Park Service to select Alternative F as the final selected alternative to permanently phase out ranching in the Park. Alternative F is the only alternative that will protect the Park and its bounty of native wildlife, increase the resiliency of the native Tule Elk herds, and greatly improve the visitor experience.

At the absolute minimum, the National Park Service (NPS) should prioritize the protection and future viability of the Park and its native wildlife by ensuring that any amendment to the General Management Plan: (1) phases out all dairy operations, without the option to convert to beef ranches; (2) eliminates all activities and removes all fencing that limits the population growth or geographic extent of the Park's Tule Elk; (3) prohibits "diversification" at the ranches; (3) requires documentation of full compliance with existing lease and permit conditions-including all pollution prevention and mitigation measures-before any future leases are granted; and (4) restricts leases to a maximum of 5 years to ensure that the ecological impacts of any continued ranching is fully and timely assessed on a regular basis, and that changes can be implemented-including full cessation of ranching if necessary-in a timely manner.

Specific Comments

Alternative B is the most damaging alternative considered in the DEIS and continues the long history of significant, continuous subsidies to 24 ranchers. Alternative B extends grazing rights for at least 20 years; authorizes ranchers to add previously unauthorized row crops, pigs, sheep, goats and chickens to their operations;

guarantees the killing of native Tule Elk to protect grass "reserved" for cows and cattle; and prohibits the natural growth and geographic expansion of the Park's Tule Elk herds.

The DEIS and numerous studies demonstrate that dairy and ranching activities have already caused significant harm to the environment, including soil erosion, water pollution, loss of native plant species and infestation by invasive plants, declines in fish and bird populations, conflicts with wildlife, and loss of public access to public land. These harms will increase and expand under Alternative B, all for the sole purpose of providing highly subsidized profits to a handful of ranches and dairies.

Alternative B is also guaranteed to result in the direct killing of hundreds of Tule Elk and to prevent the natural expansion of the Tule Elk herd-expansion which would help ensure the long-term health and resiliency of the Park's most iconic wildlife species. Alternative B will also make the Park far less resilient to the ongoing impacts of climate change.

My personal experience underscores the significant harm to the visitor experience from the Park's industrial agriculture activities. Visitors are regularly forced to view dilapidated farm buildings, pastures that are little more than seas of mud, fences that mar the landscape, and rampant polluted runoff. Visitors must also often deal with the overwhelming smell of manure being sprayed on fields blotting out the wonderful smell of the sea air. All of this will continue under Alternative B.

The Park should be managed for the public good and for the fish and wildlife that rely on this vital resource, as required by law. The Park is a public treasure and should not be damaged for the personal profit of a few.

#### 1. Alternative B Will Ensure Unacceptable Impacts To Tule Elk and Other Wildlife

As discussed below, the DEIS and other studies document the extensive damage that ranching and dairy operations have caused to the ecological health of the Park and to the wildlife that rely on it. Alternative B will make the already significant direct, indirect, and cumulative adverse impacts much worse, with cascading impacts on the Park's wildlife.

Alternative B will also harm the Park's iconic Tule Elk-a species that exists in no other national park-in many other ways. Notably, Alternative B will result in the culling of completely healthy Tule Elk to protect rancher profits. Alternative B will also prevent the natural growth and geographic expansion of the Park's Tule Elk herds. This will doom the continued natural recovery of the Tule Elk in the Park.

Once numerous on Point Reyes peninsula, the native Tule Elk had been extirpated by early settlers and were believed to be extinct. Tule Elk were reintroduced to the park in 1978, and provide a rare success story in wildlife recovery. Despite this success, however, the Tule Elk remain at significant risk. To ensure forage for private cattle, most of the elk are confined behind a fence at Tomales Point, cut off from pasture and water that the NPS leases for cattle grazing. In 2016, the NPS disclosed that 250 of these confined elk had perished during the drought. The elk are also increasingly inbred, but cannot be relocated outside of the Park because some have tested positive for Johne's, a bacterium transmitted to wildlife when cattle manure is spread on fields and runs off into waterways. Johne's disease has been documented in dairy and beef herds at Point Reyes.

Cows also currently outnumber Tule Elk 10 to 1 in the Park. Alternative B would set these numbers in stone by ensuring that the Tule Elk population in the Park remains at its current size and restricted to its current geographic locations. The DEIS has advanced this outcome through an analysis approach that cannot be reconciled with the legislatively authorized purposes of the Park.

The DEIS has based its analysis of the Seashore's carrying capacity on the maximum number of cattle the land can support based on historical conditions. To maximize protection and restoration of the Park's resources, however, as required by the Park's authorizing legislation, the DEIS should have based its assessment on the ecological needs of Tule Elk and other wildlife. As part of this assessment, the DEIS should have fully accounted for the

unacceptable impacts to range health and the Tule Elk created by the current management regime. If a full analysis demonstrated that Tule Elk and the Park's vast numbers of other wildlife could thrive on existing and/or restored prairie lands, the DEIS then could have considered whether some degree of grazing could continue while still maintaining healthy populations of native wildlife.

## 2. The "Diversification" Authorized by Alternative B Will Harm the Environment and Create New Rancher-Wildlife Conflicts

Alternative B (and indeed all alternatives reviewed in the DEIS except Alternative A (No Action) and Alternative F (No Ranching)) allows each rancher to add crops and small livestock-pigs, sheep, goats, and up to 500 chickens-to their operations. The DEIS fails to provide any information or discussion of the impacts of this expanded agriculture on the Park's wildlife or natural resources, in direct violation of the National Environmental Policy Act.

In addition to causing environmental harm, Alternative B will create new rancher-wildlife conflicts by allowing ranchers to add crops and small livestock to their operations that will unquestionably draw predators and other wildlife. With this diversification, none of the Park's magnificent predators will be safe from calls for their extermination - not the red tailed hawks, marsh hawks, peregrine falcons, osprey, owls, fox, coyotes, bobcats, or other predator species.

While Alternative B states that "no predator management would be allowed," there is no doubt that this diversification will lead to predator conflicts that will lead to the inevitable cries from ranchers about the need to implement predator controls-i.e., kill the Park's native wildlife. Even if the Park Service stood its ground, the Park does not have adequate staff to ensure that predator control measures are not in fact carried out by ranchers. The DEIS also provides no evidence to suggest that the ranchers will not continue with their long-history of non-compliance with lease and permit conditions.

As importantly, the history of the Park strongly suggests that it is much more likely that the NPS will ultimately comply with requests for predator control. Indeed, given that Alternative B directs the killing of scores of iconic, native Tule Elk that are found nowhere else in the wild to protect rancher profits, it is hard to fathom how or why the Park Service would not also approve the killing of bobcats, mountain lions, hawks, owls, and other predators to protect rancher profits.

Predator control efforts would have direct impacts on wildlife species, and could affect the role that the Park's predators play in maintaining healthy wildlife populations and preserving native habitat. The NPS has direct experience with the role of predator populations in improving ecosystem health, including through the successful reintroduction of wolves in Yellowstone National Park. As recently reported, Yellowstone, wolves "are causing a trophic cascade of ecological change, including helping to increase beaver populations and bring back aspen, and vegetation." <https://www.yellowstonepark.com/things-to-do/wolf-reintroduction-changes-ecosystem>

This has been confirmed by a recent study:

"The reintroduction of gray wolves (*Canis lupus*) to Yellowstone National Park is the most celebrated ecological experiment in history. As predicted by population models, the rapid recovery of a wolf population caused both temporal and spatial variability in wolf-ungulate interactions that likewise generated temporal and spatial variation in the expression of trophic cascades. This has amplified spatial variation in vegetation in Yellowstone, particularly with willow (*Salix* spp.) and cottonwood (*Populus* spp.) in riparian areas, with associated changes in food webs. Increasing influences of grizzly bears (*Ursus arctos*), cougars (*Puma concolor*), and bison (*Bison bison*) are making what initially was predominantly an elk-wolf interaction into an increasingly complex system."

Mark S Boyce, Wolves for Yellowstone: dynamics in time and space, *Journal of Mammalogy*, Volume 99, Issue 5, 10 October 2018, Pages 1021-1031, <https://doi.org/10.1093/jmammal/gyy115>.

The cascading benefits of healthy predator populations are not limited to Yellowstone. For example, a 2010 scientific study concludes that:

"Predators tend to be valued for the provision of three broad services: their ability to regulate prey populations (Halpern et al. 2005; Dobson et al. 2006), as indicators of high species richness that warrant conservation (Sergio et al. 2006) and, given their charismatic nature, their economic contribution to recreation and ecotourism (Dobson et al. 2006). Unfortunately, this valuation of predators treats their losses merely as early indicators of environmental destruction that may lead to the eventual loss of species in lower trophic levels."

\* \* \*

"Mounting research reveals that top predators can have cascading effects that extend beyond their prey base to impact on ecosystem nutrient dynamics that may then feed back upward to influence the biological productivity. Ignoring this connection may mean that an important functional role of predators in ecosystems remains grossly undervalued, especially given that nutrient cycling is deemed to be among the most valuable of all ecosystem services (Costanza et al. 1997)."

Oswald J. Schmitz, Hawlena D., Trussell G.C., Predator control of ecosystem nutrient dynamics, *Ecology Letters*, (2010) 13: 1199–1209, doi: 10.1111/j.1461-0248.2010.01511.x

As another study aptly concludes:

"Current ecological knowledge indicates that large carnivores are necessary for the maintenance of biodiversity and ecosystem function. Human actions cannot fully replace the role of large carnivores. Additionally, the future of increasing human resource demands and changing climate will affect biodiversity and ecosystem resiliency. These facts, combined with the importance of resilient ecosystems, indicate that large carnivores and their habitats should be maintained and restored wherever possible."

W. J. Ripple et al., Status and Ecological Effects of the World's Largest Carnivores, *Science* 343, 1241484 (2014). DOI: 10.1126/science.1241484

### 3. Alternative B Will Increase Habitat Loss, Degrade Water Quality, Increase Greenhouse Gas Emissions, and Make the Park Less Resilient to Climate Change

The DEIS and other studies document the extensive damage that ranching and dairy operations have caused to the Park and to the wildlife that rely on it. Impacts from the Park's industrial scale agriculture are well documented and include: soil erosion, water pollution, loss of native plant species and infestation by invasive plants, declines in fish and bird populations, conflicts with wildlife, and loss of public access to public land.

For example, the heart of the Park—once a rare coastal prairie ecosystem—has been trampled and transformed by the Park's long history of industrial agriculture. Native coastal prairie is dominated by long-lived perennial bunchgrasses, such as Purple needlegrass, California fescue, and California oatgrass which can stay green year-round with the moisture provided in the fog belt. However, within the Park's "pastoral" zone, these species have been replaced by European annual grasses dominated by Italian thistle, milk thistle, and poison hemlock invading pastures. By contrast, at Tomales Point where elk graze and fences keep the cattle out, native vegetation is starting to return. Some other areas in the Park not grazed by cattle also hold examples of relict native perennial grasses.

Cattle manure is the Park's single largest source of water pollution, and studies show that the Park has some of the worst water pollution in the state of California. The NPS Coastal Watershed Assessment for PRNS (2013) found severe pollution problems in streams near commercial dairies. Some of these bodies of water measured double the lethal level for freshwater fish. Exceptionally high nitrate and ammonia and sub-optimal dissolved oxygen samples have also been identified at a number of dairy operations. Many sites in these watersheds exceeded the fecal coliform standard more than 50 percent of the time. Streams and tributaries leading to Drake's Estero, adjacent to

a number of the dairies (A Ranch, B Ranch, and C Ranch), all had a significant number of dissolved oxygen samples below the optimum range, posing a threat to fish in these streams and Drake's Estero.

The NPS has also found that spreading manure on pastures correlates with an increase in invasive and noxious weed species. The commercial cattle operations at Point Reyes National Seashore produce so much manure that the volume of animal waste itself is a cause for concern.

Methane, produced by cattle, is a greenhouse gas that is 25 to 100 times worse for climate change than carbon dioxide. In 2008, Greenhouse gas (GHG) emissions within the Seashore totaled 20,239 metric tons of carbon dioxide equivalent, with a full 62 percent of this attributed to agricultural operations in the Park. The NPS had set a goal of a 25 percent reduction of 2008 GHG levels from agriculture by 2016. Alternative B will not reduce GHG emissions in the Park.

The additive and magnifying effects of climate change on both resident and migratory wildlife species that rely on Point Reyes National Seashore are also of critical concern. As recognized by the United Nations Environment Program and the Convention on the Conservation of Migratory Species of Wild Animals, migratory wildlife is particularly vulnerable to the impacts of climate change:

"As a group, migratory wildlife appears to be particularly vulnerable to the impacts of Climate Change because it uses multiple habitats and sites and use a wide range of resources at different points of their migratory cycle. They are also subject to a wide range of physical conditions and often rely on predictable weather patterns, such as winds and ocean currents, which might change under the influence of Climate Change. Finally, they face a wide range of biological influences, such as predators, competitors and diseases that could be affected by Climate Change. While some of this is also true for more sedentary species, migrants have the potential to be affected by Climate Change not only on their breeding and non-breeding grounds but also while on migration."

"Apart from such direct impacts, factors that affect the migratory journey itself may affect other parts of a species' life cycle. Changes in the timing of migration may affect breeding or hibernation, for example if a species has to take longer than normal on migration, due to changes in conditions en route, then it may arrive late, obtain poorer quality breeding resources (such as territory) and be less productive as a result. If migration consumes more resources than normal, then individuals may have fewer resources to put into breeding . . . ."

\* \* \*

"Key factors that are likely to affect all species, regardless of migratory tendency, are changes in prey distributions and changes or loss of habitat. Changes in prey may occur in terms of their distributions or in timing. The latter may occur though differential changes in developmental rates and can lead to a mismatch in timing between predators and prey ("phenological disjunction"). Changes in habitat quality (leading ultimately to habitat loss) may be important for migratory species that need a coherent network of sites to facilitate their migratory journeys. Habitat quality is especially important on staging or stop-over sites, as individuals need to consume large amounts of resource rapidly to continue their onward journey. Such high quality sites may [be] crucial to allow migrants to cross large ecological barriers, such as oceans or deserts."

UNEP/CMS Secretariat, Bonn, Germany, Migratory Species and Climate Change: Impacts of a Changing Environment on Wild Animals (2006) at 40-43 (available at [http://www.cms.int/publications/pdf/CMS\\_CimateChange.pdf](http://www.cms.int/publications/pdf/CMS_CimateChange.pdf)). Migratory birds are at particular risk from climate change. Migratory birds are affected by changes in water regime, mismatches with food supply, sea level rise, and habitat shifts, changes in prey range, and increased storm frequency. Id.

The NPS recognizes that implementing "adaptation strategies that promote ecosystem resilience and enhance restoration, conservation, and preservation of park resources" is a key goal of the Park Services' Climate Change Response Strategy. That strategy also requires the NPS to "incorporate climate change considerations and responses in all levels of NPS planning" and "implement adaptation strategies that promote ecosystem resilience

and enhance restoration, conservation, and preservation of park resources.” National Park Service Climate Change Response Strategy (September 2010) at 14-15. It is clear, however, that Alternative B will not promote ecosystem resilience and enhance restoration, conservation, and preservation of park resources. Alternative B will not make the Park ecosystem more resilient to climate change.

Alternative B will make the already significant direct, indirect, and cumulative adverse impacts of the current ranching practices much worse. The DEIS also fails to address or discuss mitigation measures to offset any of the environmental harm caused by Alternative B, including mitigation for any impacts on climate change.

#### 4. Alternative B Will Cause Significant Harm to the Visitor Experience

As a long-time visitor to Point Reyes National Seashore, I strongly disagree with the DEIS conclusion that Alternative B “would contribute noticeable beneficial impacts by providing a wider range of recreational and educational opportunities in the planning area.”

I come to the Park to see its wildlife and hike its untrammelled beaches and trails. In an ideal world, I would also see restored native coastal prairie and a Park free from invasive species. I most definitely do not come to the Park to see cattle, cows, mud lots, and dilapidated housing. I do not come to the Park to smell manure being sprayed through the air before it makes its way into the Seashore’s streams, bays and coastal waters. I do not come to the Park to see industrial scale agriculture that is carried out on the backs of the federal taxpayers to benefit 24 leaseholders.

There quite literally has not been a single occasion when I have driven past the dairy and ranching operations in the Park when I have not been affected and highly disturbed by the ecological damage, and the inappropriateness of conducting industrial agriculture in the Seashore. The adverse impacts of the dairy and ranching activities on my experiences in the Park have not lessened over time, they have grown worse as the environmental damage and squalor have grown.

If Alternative B is adopted, my visitor experience will be made much worse because I will know that:

- The majestic Tule Elk are being killed on a regular basis to allow even more agricultural activities. There are many locations where the public can see farms and ranches in California and across the west. The Park is only one place where the public can see Tule Elk roaming free.
- The Park Service has deliberately increased the likelihood of ranchers complaining about predator impacts and requesting the ability to implement predator “controls.” These complaints and requests are almost certain to lead to even more killing of the native wildlife that I come to the Park to see.
- The Park Service has voluntarily approved even more industrial scale agriculture that will continue to significantly degrade the ecological health of the Park and eliminate opportunities to improve the health of the Park.
- In adopting Alternative B, the Park Service has ignored the interests of the public in a healthy, vibrant and resilient Park and has instead opted to sacrifice the Park and scarce taxpayer resources to benefit a handful of highly subsidized ranchers.

#### 5. Alternative B (and Any Alternative that Continues Ranching) is Contrary to the Mandates of the Point Reyes National Seashore Authorizing Legislation and the NPS Organic Act

The 1916 National Park Service Organic Act, which applies to all units of the National Park System, requires NPS to conserve the scenery, wildlife, and other natural resources, to provide for the public’s enjoyment of such resources, and to leave such resources “unimpaired for the enjoyment of future generations” by prohibiting uses that cause “unacceptable impacts.” 54 U.S.C. § 100101(a). It also provides that grazing can be authorized only when such use is not detrimental to the primary purpose for which the park unit was created. 54 U.S.C. § 102101(a)(2).

Point Reyes National Seashore was created “to save and preserve, for the purposes of public recreation, benefit, and inspiration” a portion of the nation’s diminishing seashore. 16 U.S.C. § 459c. The Seashore’s 1962 authorizing

legislation requires the Park Service to administer the Seashore “without impairment of its natural values” and in a manner that is “supportive of the maximum protection, restoration, and preservation of the natural environment.” 16 U.S.C. § 459c-6 (emphasis added).

This mandate clearly grants the Secretary the authority to end ranching in the Park. That authority was bolstered by a 1978 amendment to the Seashore’s authorizing legislation that explicitly allows the Secretary to reject leases that are not consistent with the purposes of the Park’s authorizing legislation. That amendment provides that “[w]here appropriate in the discretion of the Secretary, he or she may lease federally owned land . . . which was agricultural land prior to its acquisition. Such lease shall be subject to such restrictive covenants as may be necessary to carry out the purposes of . . . [this law].” 92 Stat. 3467 (1978). Under this language, the Secretary may issue a lease only if the lease can be operated without impairment to the park’s natural values. This legislation absolutely does not mandate that the land remain in agricultural use.

Alternative B, on the other hand, continues ranching in the Park when such activities are undeniably impairing the Park’s natural values. Alternative B goes even further by committing the Park to perpetual ranching through changes to the longstanding “succession” requirements. As part of an early accommodation to the ranchers who sold their land to the Park, the ranchers were allowed to lease back their land for 25 years or, in some cases, for their lifetime in addition to receiving generous compensation for their lands (the equivalent of \$340 million in today’s dollars). The NPS later agreed to allow ranchers’ offspring to stay on in the Park as long as they continued ranching. After that, the ranches would be retired. However, under Alternative B, the NPS will not retire the ranches when the offspring of the ranchers retire. Instead, it will offer those leases to other relatives; and if they decline, to neighbors; and if they decline, to anyone who wants to lease land in the park—no prior connection to the Seashore would be required.

Alternative B ignores the fundamental mandates of the Seashore’s authorizing legislation and the NPS Organic Act by approving continued ranching in a manner guaranteed to cause unacceptable impacts to the Park’s natural resources and wildlife, and by permanently committing the Park to ranching.

#### 6. Alternative B Sacrifices the Environment and Taxpayer Dollars to Subsidize Ranch Profits

Between 1962 and 1978, 27 ranches were purchased for the newly created Point Reyes National Seashore. Ranchers were paid \$57 million for their land, which is equivalent to more than \$380 million today, (calculated based on dollar values in 1970). Livingston, D. (1993). *Ranching on the Point Reyes Peninsula: A History of the Dairy and Beef Ranches Within Point Reyes National Seashore, 1834-1992*. Point Reyes National Seashore, Point Reyes, California.; Sadin, P. (2007). *Managing a Land in Motion: An Administrative History of Point Reyes National Seashore* Historical Research Associates, Inc., Seattle, Washington.

Ranchers in the Park continue to be highly subsidized. For example, they:

- Receive heavy discounts on grazing fees, paying just \$7-\$9 per animal while ranchers outside the park pay \$15-\$20;
- Pay no property taxes because they live and work on federal land; and
- Pay rent for NPS-owned houses at rates far below market value in Marin County.

Ranchers in the Seashore also get significant help from the NPS towards the basic cost of doing business, despite the dwindling budget of the NPS and scarce staff and staff resources. For example, the NPS:

- Repairs park roads damaged by heavy trucks serving dairy and beef ranches;
- Installs and maintains fences to avoid conflicts between wildlife and cattle, and people and cattle;
- Replaces and repairs roofs, barns, and other infrastructure at ranch residences;
- Monitors and manages ranches for lease-compliance;
- Evaluates the impacts of ranch operations to park resources; and
- Hazes elk off pastures leased to ranchers.

The National Park Service has not provided any information on the dollar amount or portion of its budget that goes to ranching-related expenses. However, the DEIS has acknowledged that the NPS has already paid almost \$1 million in costs associated with developing the DEIS (\$955,000).

Ranching places increasing demands on dwindling park budgets, while park improvements and a backlog of maintenance, along with public programs and interpretation, go unfunded. Meanwhile, scarce resources go to support 24 ranchers operating in the Seashore, including killing wildlife to benefit their operations. Ranching's environmental impacts also have an untallied economic impact on the Seashore. Internal Park Service memos indicate monitoring the ranches for lease compliance and environmental damages already places outsized demands on the Seashore's staff and budget, even as the NPS has failed to enforce lease agreements when leases are violated.

Alternative B would continue to subsidize industrial agricultural activities in the Park at the grave expense of the ecological health of the Park and its wildlife and the visitor experience.

Conclusion I strongly oppose Alternative B and urge the NPS to abandon that alternative. The NPS should instead adopt Alternative F as the final selected alternative.

Thank you for your consideration of these comments.

Sincerely,

Melissa Samet

Correspondence: To Whom it May Concern,

We appreciate the opportunity to provide comments on the draft Environmental Impact Statement (EIS) for a General Management Plan Amendment (GMP Amendment) for Point Reyes National Seashore (PRNS) and the North District of Golden Gate National Recreation Area (GGNRA).

We fully support continued ranching in the Point Reyes National Seashore (PRNS). Our family continues to pledge our commitment to our current practices of dairy and cattle ranching on our leased land in the project area. We value our family's history in the PRNS and the opportunity to have continued the operations for the last 100 years. We recently became a part of a local, sustainable, quality brand through Straus Family Creamery, where our milk and subsequent dairy products reach consumers nation-wide. We are continually committed to land stewardship, conservation and resource management through our ranching efforts, which we aim to bring value to the products SFC sells and the PRNS project area. The cultural and historic relevance of dairy and ranching in the PRNS are the main aspect making this location unlike any other and we are fully committed to continue to work together to improve our conservation and sustainability efforts to benefit this extremely unique and pristine National Park.

We support the letter submitted by Albert Straus and Alternative B - NPS Preferred Alternative in general. The letter submitted by Albert Straus articulates concerns we have in regards to meeting USDA NOP Organic Certification requirements, the impact the dairy and ranching operations have on the community and county, the positive effect livestock have on climate change, and the advantages of the availability to create a carbon farming plan. Alternative B creates an atmosphere to where all interested parties can coexist in a successful way, however, we do feel as if a few areas could use clarification and consideration. Those sections being the following:

- Public Use & Enjoyment - We believe the NPS should consider educational benefits of the diversification opportunities provided in Alternative B to further enhance visitor experience. This can be completed through

farm tours and on-farm sales. This would support the goals stated in the Purpose and Need section. We also request that the NPS clearly address and outline specific intentions and areas on a map intended for use for development for Public Use, specifically the plans in the Appendix E (Connect Drakes Beach to Drakes Estero using an old ranch road, Create a loop from D Ranch to Barries Bay-only under alternative C and alternative F, because of the potential to disturb elk). Understanding and communicating the intended improvements by the NPS in the project area to all stakeholders would be necessary for planning and logistical purposes. • Soils - Beneficial impacts to soils from carbon farming was not considered. Carbon farming provides ecological benefits that would improve soils, increase organic matter to benefit soil, water and air quality. Review and consultation in regards to the positive effects of Carbon Farming should be considered as a way to balance air quality and greenhouse gas emissions of agricultural operations and visitor impact in the project area.

We look forward to continued communication and partnership with the NPS and PRNS on this matter as our goal is shared: successful coexistence. We appreciate the invitation to provide input into the EIS/GMP Amendment and look forward to working with PRNS on all subsequent stages of this process.

Sincerely,

The Nunes Family Betty, Tim, Laura, Lianne & William Nunes GBT Nunes & Co Drakes View Dairy Historic A, E & D Ranches

Correspondence: I oppose Alternative B. As it is, wildlife has been squeezed by agriculture and other human activities. Instead, the park should support wildlife with the Alternative F measure. All ranching should be phased out. I want the National Park Service to preserve the health and beauty of the NATURAL environment at POint Reyes: land, water, air, wildlife. Livestock has no place there. Activities that exploit the park's resources while degrading it have no place there. Cow pastures should be restored to pastoral zones for wildlife habitat, native plant communities, scientific research and education. Thank you.

Correspondence: As a property owner in san geronimo valley and previous hunter, i adamantly oppose the killing of our beloved tule elk herd, or any local wildlife, on behalf of ranching interests.

#7496

Name: McQuaid, Sean

Correspondence: "Climate change is fundamentally the greatest threat to our national parks," begins the Director of the National Park Service in the Climate Change Response Strategy issued by the National Park Service.

Just days ago millions around the globe marched for action on climate change. And today, the NPS - the stewards of our public lands - respond by continuing the advancement of a plan that contradicts the Mission of the National Park Service, violates the National Park Service Organic Act of 1916, and contravenes your Climate Change Response Strategy. Alternative B, the 'preferred alternative of the NPS,' absolutely does not "preserve unimpaired the natural and cultural resources and intrinsic values of the National Park System...for future generations."

Rather, Alternative B opens even more avenues for commercializing the Point Reyes National Seashore than even exist today by allowing for larger cattle herds, additional livestock farming, other commercial farming, and the possibility of B&Bs.

You point out in your Climate Response Strategy: "Most of the observed increase in global average temperatures since the mid-20th century is 'very likely' due to the observed increase in anthropogenic greenhouse gas concentrations," so how can the NPS favor a proposal that seeks to expand commercial agriculture, when we know it to be contributing to global warming?

Please comprehensively address the ways in which Alternative B aligns with your Climate Change Response Strategy. Just as one example, will the NPS mandate the ranches upgrade buildings and infrastructure to be sustainable?

Separately, but just as important: what measures will the NPS take to ensure that the Tule Elk have access to sufficient water resources over the next several decades to ensure that hundreds do not die as a result of being fenced in as happened between 2012-2014?

#7497

Name: Barnett, Paul

Correspondence: I am writing in support of managing Point Reyes National Seashore for the benefit a native flora and fauna, with the goal of reducing and eventually eliminating cattle grazing and other ranch activities.

Allowing cattle to browse in the seashore is harming rare plants, including beach layia, coastal marsh milkvetch, swamp harebell, Marin checker lily, North Coast phacelia, and the Point Reyes checkerbloom. Many other rare plant species are also being harmed. There are many areas in the park where the landscape is denuded of vegetation because of ranching activities.

I am especially opposed to the plan to reduce or even eliminate the Drake's Beach Tule Elk herd. In the words of the report, "removal of a native species for ranching considerations would be unprecedented in the national park system and would be inconsistent with state management of elk on ranchlands outside the park." The Drake's beach herd represents 2% of the Tule Elk in California. The 28,000 acres of cattle range land in the Pt. Reyes and Golden Gate National Parks represent 0.07% of the 38 million acres of cattle range land in California. While Tule Elk are a threatened species, milk and dairy products are in chronic oversupply. The plan to allow producers to diversify into other types of livestock is certain to create new, unanticipated harms.

Isn't the mission of the National Park Service, and the purpose of our natural parks, is to be the last refuge in wild? There is no mandate to continue agricultural enterprises, and these ranch leases should be discontinued as soon as possible. There is lots of ranch land, but only one Pt. Reyes National Seashore.

#7498

Name: Vivaldi, Greg

Correspondence: Give the ranchers 20 even 50 year leases. They are great stewards of the land. The elk can co exist, 125 should serve the tourists. You ran out the Oysters, don't do the same to the ranches. They are the history of our county.

#7499

Name: Molloy, Molly

Correspondence: I would like to recommend Alternative F: No Ranching.

I have been going to Pt. Reyes since the 1980s to enjoy the wildlife - the birds and the elk, the wide open spaces, and the seashore. All of this will be threatened by the continuation of ranching and the additional proposals, adding other animals, more farming, and visitor housing.

1. Environmental degradation has increased over the years. None of the alternatives discuss the impacts of expanded agricultural options on wildlife and natural resources. They do not discuss how to mitigate the destruction of the ecosystems or how to repair the damage that has been done. The EIS makes it clear that cattle ranching and dairy farming are bad for the environment and accelerate harm in our climate crisis. As a birder, I have always hated the smell of the ranches, especially when trudging through the muck looking for tri-colored blackbirds! Cattle ranching was never supposed to be permanent. Adding chickens and pigs is also bad for the environment. The water will be poisoned, as well as the land.

2. Historical resources - The ranch buildings and infrastructure are historic - not the cows. You can show the history of the park through maintaining one of these ranch buildings. The white huts for veal have always upset me. Ranching does not belong here.

3. Wildlife impacts - The Tule elk should not be removed, but set free. The EIS makes it clear that wildlife as well as the land and water will benefit from the cessation of ranching. There is no plan in your other alternatives for protecting wildlife from ranching's impacts. Birds are also having problems. This should be a safe place for them. Native wildlife should not have to compete with cows or other animals like chicken and pigs.

4. Purpose of parks - People need open space and parks. They are not made for business and should not be. Ranchers can go elsewhere - and pay market prices and taxes. They should not take advantage of the park.

After reading about this in the Point Reyes Light, I found other newspaper articles online. It was very hard to find information on the park website or the Point Reyes Seashore Association site. You could have had more comments with wider publicity.

PLEASE do not let this magical place be destroyed!

Re: NPCA comments on Pt Reyes National Seashore GMPA DEIS

National Parks Conservation Association (NPCA) and its members care deeply about the protection and enhancement of the Point Reyes National Seashore, and have engaged in significant efforts over the years to ensure this treasured landscape is protected for generations to come. NPCA is a non-partisan, non-profit organization that was formed in 1919, and with its more than 1.3 million members and supporters throughout the country, works to protect and enhance America's National Park System for present and future generations. We write to provide comments on the Point Reyes National Seashore General Management Plan Amendment Draft Environmental Impact Statement (DEIS).

We believe Alternative B incorporates science-based management regarding Tule Elk that can demonstrate the continued co-existence of wildlife, recreation, ranching, and the other values and uses of the Seashore.

However, the DEIS suffers from numerous problems, specifically around diversification, succession and transparency to the public, the owners of the Seashore, unfortunately undermining the Park Service's efforts to rebuild public confidence that the Seashore will be managed consistent with law, policy and science.

The Park Service should resolve these matters in its Final EIS. This is because the DEIS:

- Fails to provide an explanation of the Park Service's authority to allow the immense scale of diversification contemplated, considering the Seashore's authority to continue multi-generational beef and dairy ranching. Taking this a step further, the DEIS fails to provide any reasonable accountability to the public on diversification issues ranging from appraisals and on-site vs off-site activities to definitions and row crops. The problems are illustrated in the 9/23/19 Save Our Seashore comments on the DEIS's diversification proposal and we incorporate by reference those identified problems.

- Fails to explain how its economic rationale for diversification is supported by law or policy.

- Fails to explain the role of NEPA in analyzing individual diversification proposals and cumulative impacts, and how the diversification plan is not a form of piecemealing. Diversification proposes environmental impacts, some potentially very significant, including but not limited to conflicts with wildlife, wildlife habitat and recreation, yet the DEIS is silent on this environmental analysis. As an example, the DEIS contemplates turning the Seashore into an industrial pig farm, with what appears to be a lack of limit and no meaningful analysis on the environmental risks of introducing this animal to the landscape. As another example, the DEIS suggests guard animals could be appropriate, which confirms that impacts from diversification are potentially significant requiring mitigations that themselves create other potentially significant impacts on wildlife and visitors.

- Lacks adequate discussion on how described anticipated/contemplated/proposed and unknown, future diversification proposals would be consistent with NEPA, the NPS Concession Act and other laws and policies.

- Fails to ensure public disclosure and opportunity for public review of Ranch Operating Agreements prior to their finalization, so that management decisions impacting these public lands are not conducted in a vacuum only involving the Park Service and individual ranchers. As well documented in prior letters from the public to the Park Service, unauthorized activities at the Seashore have occurred in the past and the problems were only identified by the Park Service as a result of being alerted by members of the public. The need to increase transparency should be embraced by Seashore ranchers who wish to increase public confidence that ranching operations in this national park is appropriate and respectful of the environment.

- Fails to protect taxpayers, the owners of the Seashore, from failure of rancher that could lead to significant costs, such as environmental clean-ups and removal of abandoned structures and property. A bond mechanism could help address this matter.

- Fails to provide milestones for implementation of Best Management Practices, a purported justification of long-term leases, denying the public any assurance that important environmental improvements will be on the horizon.

- Fails to safeguard the public interest and congressional intent of multi-generational ranching. The DEIS' proposal undermines this through creating a bidding process wholly unrelated to multi-generational ranching. The DEIS should ensure that when a leaseholder or approved multi-generational successor decides not to continue, the NPS retains jurisdiction to evaluate environmental conditions, conduct appropriate planning processes, and determine how that land should be managed. The outcome may be grazing in some fashion, for example commercial or conservation grazing in part or full, but it also may not. Such retention of jurisdiction by the NPS ensures science-based decision-making and sound public policy considering the Park Service's mission and diverse goals of the Seashore. If after due diligence, the Park Service determines that some form of grazing should continue, then the Park Service should first consider evaluating if the lands could be used for forage mitigations from potential elk impacts rather than a net increase in cattle and rather than a free-for-all, arbitrary bidding process within the Seashore as currently proposed.

- Lacks any discussion of how the park plans to fund the implementation of the plan.

NPCA's colleagues at Save Our Seashore and the Environmental Action Committee of West Marin have detailed other important concerns and opportunities for the Park Service to consider.

Thank you for your efforts, Neal Desai

Subject: Review Comments on the Point Reyes National Seashore General Management Plan Amendment - Draft  
Environmental Impact Statement

Dear Superintendent Muldoon:

Introduction

Thank you for this opportunity to provide comments on the Draft Environmental Impact Statement [DEIS] for the North District of the Golden Gate National Recreation Area and the Point Reyes National Seashore [GGNRA/PRNS] General Management Plan Amendment [GMPA]

Following these comments is a copy of our November 15, 2017 Scoping Comments, which are incorporated in their entirety herein by reference, in which we urged that:

". . . in at least one alternative (a) the scope of the proposed amendment be expanded to include all of the lands within the Olema Valley and Point Reyes Historic Districts, whether or not currently in ranching, (b) elk be fenced out of the pastoral zone on the Point Reyes peninsula and (c) consideration be given to the climate benefits of encouraging the ranchers to implement best management practices that increase carbon sequestration in the soil."

We are pleased to see that in the preferred alternative the GMPA/DEIS addresses to some extent the climate benefits of permitting ranchers to implement best management practices on the ranches. We support the Marin Conservation League and MALT recommendations for improving on these provisions. The following comments focus on the failure to include within the scope of the preferred GMPA alternative all of the lands within the two historic ranch districts and lands in the Wilderness Area to the extent the future of tule elk at Point Reyes is inextricably linked to conditions in the adjacent Wilderness Area.

Expansion of Scope of Proposed Amendment to All Lands in Historic Ranch Districts:

In our scoping comments, we asked that the National Park Service [NPS] expand the scope of the proposed GMPA to include all lands in the Point Reyes and Olema Valley Historic Ranch Districts. Some of these ranches have been acquired since the 1980 General Management Plan for the GGNRA/PRNS [1980 GMP] was published. Furthermore, conditions on or uses of some of the historic ranches included within the 1980 GMP have changed without prior environmental review. Expanding the scope of the GMPA to include all lands within these historic districts could lead to the following benefits:

" Restoration of ranching and/or dairying on ranches in the Olema Valley Historic Ranch District, which would also increase the contribution of agricultural production in the parks to the local community and economy while meeting the larger goal of preserving these cultural and historic resources;

" Would reduce management demands upon NPS staff, which are already in excess of capacity as evidenced by such examples as the sad and deteriorate condition of the once beautiful and historic Randall House, the Wilkins Ranch, and the nonnative species visible along Highway One south of Olema; and

" Perhaps the most compelling reason for expanding the scope of the GMP Amendment is the need to have the lands on the east side of Highway One grazed and managed in an environmentally sound way to reduce the fire fuel load and consequent threat to the urban areas in East Marin and the San Geronimo Valley. The purpose of a General Management Plan [GMP] is to set the long-term goals for the park . . . Section 2.2 Major Elements of Park Planning and Decision Making, at page 24. [www.nps.gov/policy/MP\\_2006.pdf](http://www.nps.gov/policy/MP_2006.pdf). Section 2.3.1.2 Management Zoning requires the NPS to develop:

". . . a map that delineates management zones or districts that correspond to a description of the desired resource and visitor experience conditions for each area of the park. Management zoning will outline the criteria for (or describe the kind of) appropriate uses and facilities necessary to support these desired conditions. For example, highly sensitive natural areas might tolerate little, if any, visitor use, while other areas might accommodate much higher levels of use. . . . [https://www.nps.gov/policy/MP\\_2006.pdf](https://www.nps.gov/policy/MP_2006.pdf)."

Despite these NPS requirements, ranchlands acquired by the NPS since 1980 are currently managed by staff without the benefit of a public planning process or prior environmental review. Historic ranch buildings in the Olema Valley south of Five Brooks, an area the 1980 GMP calls a natural zone, have been allowed to deteriorate, e.g., the historic Randall House in the Olema Valley, which itself has been determined to be eligible for the National Register of Historic Places and the Wilkins Ranch are the most obvious examples of ranches allowed to deteriorate despite the fact that conditions have changed in the 39 years since the 1980 GMP was released. And the Jewell Ranch in the Olema Valley Historic Ranch District is an example of a ranch which the NPS ceased leasing without prior environmental review.

The lease for what was an exceptionally well-maintained Wilkins Ranch and related cultural landscape was terminated in 2001 on the grounds that the 1980 GMP required it become an educational center if more educational facilities were needed. The 2001 Environmental Assessment [2001 EA] touted new trails and more public access as well as an education center. We understand that there was not an adequate source of water to support the proposed educational facility. In the absence of an educational facility, or a rancher responsible for maintaining the ranch, the ranch-related buildings and cultural landscape have deteriorated. Trails maintained by the former tenant have become unusable. The new rails promised in the 2001 EA were not created. There is less public access. There is a dangerous fire fuel load on the slopes up the Inverness Ridge that adjoin the Marin Municipal Water District land that connects over the hill into densely populated east Marin. A channel for saltwater that created a wetlands and fish habitat at the intersection of the Bolinas/Fairfax Road and Highway One formerly maintained by the rancher, is clogged by willows and brush.

If the scope of the GMPA is expanded to include all ranches in the historic ranch districts, consideration would be given to returning the Wilkins ranch to active ranch use. Interestingly, in dismissing comments suggesting that NPS consider an alternative that manages park lands as stated in the proposed action for the 1980 GMP, the DEIS acknowledges that, among other things the presence of National Register historic districts has rendered inappropriate elements in the 1980 GMP:

"Since the 1980 GMP was released, other elements of the 1980 GMP are no longer feasible or appropriate because new and different issues and objectives have arisen, and new information is available to inform decision-making (e.g., the presence of National Register historic districts and a free-ranging elk herd in the planning area)." [DEIS page 59]

The Jewell Ranch, atop the Inverness Ridge near the western mouth to the San Geronimo Valley, is an example of a ranch, which, in recent years the NPS ceased to lease for ranching without prior environmental review. As a consequence, the ungrazed land has been taken over by coyote bush, thistles and other highly flammable vegetation and poses a fire danger to densely populated neighborhoods in the San Geronimo Valley to the east. The Jewell Ranch is within the Olema Valley Historic Ranch District, but since it is no longer actively ranched, it is not included in the GMPA.

Finally, there are two popular trailheads in the Olema Valley that provide access for hikers, bikers and equestrians to cross over Highway One between trails in the PRNS and the GGNRA, one at the foot of the Randall Trail, the other at Dogtown. Expanding the scope of the GMPA would allow the NPS to address a means to provide more and safer parking and crossings at these trailheads.

#### Improve Elk Habitat in Wilderness and Fencing

NPS dismisses comments recommending that habitat in the Phillip Burton Wilderness Area [Wilderness] be improved so the elk will cease moving from the Wilderness area onto the ranch lands. The reasons given include that manipulation of wilderness is inconsistent with the Wilderness Act; the unsubstantiated claim that improving the habitat in the Wilderness would increase the productivity of the herds and result in more encroachment on the ranches; and that the Limantour portion of the Wilderness is outside the scope of the EIS. [DEIS page 80.]

Many, if not all, of the elk from the Muddy Hollow/Limantour herd that move into the pastoral zone also spend time in the Wilderness area. These two habitats are inextricably linked within the lives of the elk.

At a minimum, the DEIS should be expanded to assess how conditions in the Wilderness impact the elk herds, which could inform methods of controlling the elk in the pastoral zone. Section 6.3.2 in the 2006 Management Policies provides:

"As appropriate, wilderness monitoring programs may assess physical, biological, and cultural resources and social impacts. Monitoring programs may also need to assess potential problems that may originate outside the wilderness to determine the nature, magnitude, and probable source of those impacts." The 2006 Management Policies require the NPS to develop and maintain a wilderness management plan or equivalent planning document. Section 6.3.4.2., page 81. However, there is no management plan for the Wilderness area at Point Reyes. And much of the vegetation in the Muddy Hollow/Limantour Area has changed significantly since the free ranging herd of Tule elk was moved there 20 years ago on the basis of an Environment Assessment. Furthermore, the Natural Resource Management Chapter of the 2006 Management Policies, Section 6.3.7, contemplates management actions within wilderness areas:

"Management actions, including the restoration of extirpated native species, the alteration of natural fire regimes, the control of invasive alien species, the management of endangered species, and the protection of air and water quality, should be attempted only when the knowledge and tools exist to accomplish clearly articulated goals." The 2006 Management Policies specifically recognize that management actions may be necessary in wilderness areas to deal with the risk of fire. Reducing the fire fuel load in the Limantour/Muddy Hollow area would improve habitat for Tule elk while reducing the fire hazard in West Marin:

"Guidance on the need to suppress wildland fire or to use some wildland fires to achieve desired future conditions should appear in the parks planning documents (for example, in the wilderness management plan and fire management plan). Information in these documents will guide managers in the selection of fire management tactics that protect natural and cultural resources from fire and from fire suppression actions." [Emphasis added, 2006 Management Policies Section 6.3.9.]

#### NPS Has Authority to Expand the Scope of the Geographic Area Considered

There is nothing in the Settlement Agreement that precludes NPS expanding the scope of the GMPA to provide management guidance for the Wilderness Area. Section A, paragraph 1 in the July 14, 2017 NPS Settlement Agreement with the Resource Renewal Institute, et al, [Agreement] provides in relevant part;

". . . NPS shall prepare a GMP Amendment and an EIS that, at a minimum, addresses the lands currently leased for ranching in Point Reyes and in the north district of Golden Gate National Recreation Area. [Emphasis added.]

Further, Section A, paragraph 2 provides that the Agreement does not preclude NPS from exercising its lawful discretion to consider, and expressly preserves, NPS 's right to examine other potential action alternatives.

Respectfully submitted,

Barbara Ravizza, President Marinwatch

MARINWATCH November 15, 2017

Subject: First Phase Comments for the Point Reyes National Seashore General Management Plan Amendment

Dear Acting Superintendent MacLeod:

Introduction:

Thank you for this opportunity to provide comments during the first phase of the process for amending the 1980 General Management Plan for the lands in Marin managed by the Point Reyes National Seashore. For reasons discussed below, we urge that in at least one alternative (a) the scope of the proposed amendment be expanded to include all of the lands within the Olema Valley and Point Reyes Historic Districts, whether or not currently in ranching, (b) elk be fenced out of the pastoral zone on the Point Reyes peninsula and (c) consideration be given to the climate benefits of encouraging the ranchers to implement best management practices that increase carbon sequestration in the soil. In all other respects we concur in the comments offered by the Marin County Board of Supervisors and the Marin Conservation League.

Specific Comments:

Expansion of Scope of Proposed Amendment:

There are lands added to the Golden Gate National Recreation area managed by the PRNS since the 1980 GMP was released. Some of these lands were being ranched when they were acquired by the NPS but are not currently ranched. They will continue to be managed without the guidance of a general management plan unless the scope of the current process is expanded to include all lands in these Historic Districts and more recently acquired agricultural lands in the GGNRA that are managed by PRNS. A detailed plan for managing lands not currently in ranching could be deferred until the GMP Amendment for the ranches within the scope of the settlement agreement is completed.

Ranching and dairying on the greatest acreage possible as authorized in legislation creating the PRNS and GGNRA will assure the continued and increased contribution of agricultural production in the parks to the local community and economy and meet the larger goal of preserving these cultural and historic resources. It will also reduce the management demands upon NPS staff, which are already in excess of capacity as evidenced by such examples as the sad and deteriorated condition of the once beautiful and historic Randall House, the Wilkins Ranch, which was to become more accessible to the public as an environmental education center, and the nonnative invasive species visible along Highway One south of Olema.

Perhaps the most compelling reason for expanding the scope of the GMP Amendment is the need to have the lands on the east side of Highway One grazed and managed in an environmentally sound way to reduce the fire fuel load and consequent threat to the urban areas in East Marin and the San Geronimo Valley. The recent wildfires that destroyed so much of the inhabited areas in Sonoma and Napa Counties are a fierce cautionary tale.

For planning purposes, both the 1980 GMP and the unreleased draft 1980 GMP Update include what is called a Natural Zone. Implicit in this description is an assumption that managing land for agricultural purposes harms the land:

These areas are outside of wilderness, but would be managed to minimize adverse impacts caused by human activity to the greatest extent possible. In most cases, areas in the Natural Zone would not be as undisturbed as areas within the Wilderness Zone. Grazing activities could take place within the Natural Zone when used as a treatment tool for resource management. [Emphasis added.]

Despite the implicit assumption that land is best left unmanaged, the definition acknowledges that grazing can be a treatment tool for resource management. Realistically, does the PRNS have the staff and other resources necessary to sporadically use grazing as a resource management treatment tool? Would the PRNS competitively bid the opportunity to temporarily bring cattle in to graze on the ranches in the southern part of the Olema Valley? Would this require preparing an Environmental Assessment first? If cattle are brought in too late, and the vegetation has become woody, cattle won't eat it. The fire fuel load that had developed will continue to increase if these lands remain unmanaged. These unmanaged lands are also a haven for invasive plant species. To see how invasive species spread on unmanaged land, take a hike through the formerly ranched Limantour Wilderness area where it is sometimes difficult at a distance to distinguish between a herd of elk and pampas grass.

Speakers at the November 2013 California-Pacific Society of Range Management meeting at the PRNS identified the benefits of managed grazing as including "ecosystem services, food production, preservation of view sheds and heritage values, fire fuel load reduction, wildlife habitat and the potential for carbon sequestration. See the report in the Marin Conservation League Jan/Feb 2014 Newsletter, beginning on page 6:  
[www.marinconservationleague.org/images/stories/Newsletters/nl14a\\_janfeb2014\\_forweb.pdf](http://www.marinconservationleague.org/images/stories/Newsletters/nl14a_janfeb2014_forweb.pdf)

In addition, Sheila Barry, a Natural Resource and Livestock Advisor for the U.C. Cooperative Extension, who has been conducting applied research on grassland and oak woodland management for over 20 years, observed in a May 2015 Bay Nature article reasons why Public Lands Need Cattle to Meet Conservation Goals:

. . . the stewardship provided by ranchers on public lands is a significant benefit that is often overlooked. Ranchers pick up trash, watch for wildfires, talk to and help visitors, repair fences, roads and trails, and report problems at a time when budgets for park rangers and maintenance are reduced.

As Ms. Barry also said in her Bay Nature article: Concerns with grazing on public lands have focused on overgrazing and impacts to riparian woodlands. These are legitimate concerns, but have been effectively addressed with modern range management practices, such as maintaining proper stocking rates, creating riparian pastures, limiting grazing in sensitive areas and adding off-stream water sources.

The assumption that managing land for agriculture necessarily has adverse impacts is both wrong and out-of-date. It is not supported by the science of good soil and land management. There is a world of literature on the environmental benefits of managing rangeland. For example, see the conservation benefits of invasive plant management in chapter 7 of this NRCS article:  
[www.nrcs.usda.gov/Internet/FSE\\_DOCUMENTS/stelprdb1045802.pdf](http://www.nrcs.usda.gov/Internet/FSE_DOCUMENTS/stelprdb1045802.pdf).

In a rebuttal article, Cattle Grazing Is Incompatible with Conservation, by Karen Klitz, of the Western Watersheds Project, and Jeff Miller, an advocate with the Center For Biological Diversity, a plaintiff in the case that led to the current environmental review process, the authors observed:

Public agencies simply do not have the staff or funding to properly monitor grazing operations, let alone reduce cattle damage or intensively rotate and manage cattle for beneficial impacts. The best-intentioned grazing management plans are often not carried out due to lack of monitoring, personnel, or funding, and can be abandoned or altered when committed and experienced project managers leave an agency. Meanwhile, our public lands suffer from soil erosion, impaired water quality, invasive weeds and damaged streams.

These remarks about public agencies not having the staff to properly monitor grazing operations are very relevant when the NPS is facing a 13% cut in a budget that is already insufficient to adequately manage the range lands land that are not in active agriculture. However, given the fire danger and the need for the stewardship services ranchers can provide, it becomes even more important to lease the Olema Valley lands for agriculture under terms that provide the benefits described in the NRCS article, including implantation of NRCS best management practices that increase the sequestration of carbon in the soil resulting in both healthier soil and a reduction in GHGs in the atmosphere.

The solution to the limitations on NPSs resources to oversee the operation of agricultural leases may lie with the Cuyahoga Valley National Park model, where the Park contracts with a nonprofit corporation to manage compliance with agricultural leases. It is an efficient and cost effective way to ensure compliance and would relieve the PRNS staff from the day-to-day responsibility for ensuring use of best management practices. It would also ensure that the ranchlands would be managed consistent with the high standards common to West Marin ranches. There are existing bodies capable of providing this service, e.g., the Marin Resource Conservation District and the Marin Agricultural Land Trust or another non-profit could be formed exclusively for this specific purpose if that were deemed more appropriate.

In addition to all of the other benefits, restoring the Olema Valley rangelands to agriculture would provide more opportunities for existing ranches to expand their capacity to support additional family members and create opportunities for new folks to become agriculturists in what otherwise becomes a closed society.

Restoring agriculture to these lands would also bring the NPS into compliance with the State of Californias Coastal Management Plan. The Federal Coastal Zone Management Act requires that Federal activities in a coastal zone be carried out in a manner which is consistent to the maximum extent practicable with the enforceable polies of approved State management programs. See 16 U.S.C. Section 1456(c)(1)(A). The California Coast Act provides that to the extent possible under Federal law, Federal agencies comply with the provision in the Coast Act. California Public Resources Code Section 300003. The same code provides in Section 30242 that:

All . . . lands suitable for agricultural use shall not be converted to nonagricultural uses unless . . . continued or renewed agricultural use is not feasible . . . .

Benefit of Fencing Elk Out of Historic Ranch Districts:

For all of the reasons the Marin County Board of Supervisors identified in their comments, [g]razing livestock and free-range elk are not compatible. Lands in the historic ranching districts should be given protection corresponding to their intended use and purpose as should lands in the area designated wilderness. In addition, one of the benefits of fencing the elk out of the pastoral zone is having more elk in the Limantour Wilderness to help keep the fire fuel load down. Instead of competing with the cattle for forage, the elk, which are both foragers and browsers, will necessarily feed more on the plentiful vegetation in the Wilderness. The PRNS may need to take additional steps to reduce the fire danger posed by the dense vegetation and dead and dying trees in the Limantour Wilderness but having additional elk at work on the vegetation would be a good starting point for addressing the problem that has only gotten worse since the disastrous 1995 Inverness Fire.

Mitigation of Ongoing Climate Effects:

The research in preparing the draft 1980 GMP Update could be very useful in preparing a GMP Amendment, but one area in the draft hat is clearly out-of-date is the proposed response to the threat of climate change. The unreleased draft focuses solely on the reduction of the carbon footprint of the Seashore. Thanks to research supported through the Marin Carbon Project since 2007, it is clear that instituting carbon farming practices through implementation of NRCS-recognized best management practices benefits soil health, improves wildlife habitat, and could offset all of the greenhouse gases generated in the course of managing the PRNS and by visitors to the PRNS. For history of the Marin Carbon Project, see [www.marincarbonproject.org/about](http://www.marincarbonproject.org/about).

Implementing the NRCS best management practices would go far beyond the current PRNS practice of implementing best management practices for the limited purpose of protecting sensitive resources including water quality and rare and endangered species. See the General Management Plan Amendment Frequently Asked Questions. In addition to the benefits identified earlier, applying NRCS best management practices will also protect sensitive resources and increase water retention in the soil thereby increasing the growing season and reducing the need to draw water from other sources. These effects are documented in studies by UC Berkeley College of Natural Resources Prof. Whendee Silver, among others. Selected publications by Dr. Silver are listed on: <https://ourenvironment.berkeley.edu/people/whendee-silver>.

The lands managed by the PRNS could become a model for the nation if the proposed GMP Amendment fully supports the long-term leases necessary for the ranchers to invest both capital and their sweat equity to implementing carbon-farming practices.

Respectfully submitted,

Barbara Ravizza, President

Name: Phelan, Alexandra

Correspondence: Cicely Muldoon, Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

Dear Superintendent Muldoon,

I am writing today to express my strong support for "Alternative F" as outlined within the General Management Plan Amendment Draft Environmental Impact Statement for Point Reyes National Seashore and the North District of Golden Gate National Recreation Area. The significant adverse short- and long-term impacts of Alternatives A, B, C, D and E that are identified within the DEIS are unsatisfactory from the standpoint of compliance with laws and regulations, addressing public health & environmental quality concerns, and minimizing overall impacts to the integrity of our nations natural and cultural resources that the National Park Service is tasked to steward and preserve for future generations.

Further analysis and evidence is necessary to prove that any proposed ranching use in the DEIS is in conformance with the following laws and regulations:

**ENDANGERED SPECIES ACT (ESA)** The ESA requires NPS to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of any listed species or result in the destruction or adverse modification of designated critical habitat of such species. Alternates A-E should be expanded to detail how proposed agricultural activities in particular mowing, and spraying of manure, will not further the documented destruction of each of the more than fifty species of animals within PRNS that are listed by the state or federal government as threatened, rare or endangered.

Several studies have found that the agricultural practice of mowing (whether for silage or hay) is detrimental to breeding birds because nests, flightless young, and sometimes adults are destroyed. In a 2015 study conducted by Point Blue Conservation Science (PBCS) for the NPS, researchers found that mowed silage fields in Point Reyes National Seashore did not appear to be suitable for bird nesting. Alternates A-E should be adjusted to describe in detail how the NPS will eliminate or significantly alter the land use currently leased to silage mowing following the methodology and recommendations outlined in the PBCS study to prevent further destruction of critical habitat of species protected by the ESA.

In its Coastal Watershed Assessment for GGNRA and PRNS (2013) the NPS found that spreading manure on pastures correlates with an increase in invasive and noxious weed species, as well as degradation of riparian areas and creeks. Alternates A-E should be adjusted to describe in detail how the NPS will significantly alter the proposed manure management practices, or eliminate the production and untreated release of manure altogether, to avoid further degradation of critical habitat and invasion of non-native species. Current descriptions of mediative measures are wildly inadequate considering the noted significant adverse impacts on environmental resources, notably those of sensitive or endangered native species.

Chapter 3 of the DEIS regarding Federally Listed Wildlife states that the various listed endangered marine animals that use the beaches adjacent to the planning area are not included in this analysis because ranch activities would not affect these species in the planning area. This claim is not backed by scientific data and should be expanded with verifiable data or removed from the report and replaced with an adequate analysis of impacts. Per page 69 of the DEIS: NPS programs and other sampling efforts have observed high concentrations of total suspended solids and nutrients in Drakes Bay and Drakes Estero watersheds (NPS 2004a; Pawley and Lay 2013). Surrounding land uses such as ranches and pastures for dairies and other livestock operations contribute nutrients and sediment to Drakes Bay and Drakes Estero (NPS 2004a). Potentially pathogenic bacteria and nutrient loading from non point sources associated with ranching activities (especially inadequate manure management practices) do not stop at the boundaries of the Planning Area and the impacts on critical habitats of surrounding federally listed species must be analyzed in more detail within the EIS to prevent noncompliance with ESA and other regulations.

Additional federally protected critical habitats of the following species were found to be within the Planning Area, but not annotated within Appendix Figure 46 nor described in Chapter 3 of the DEIS: Tidewater goby (*eucyclogobius newberryi*) Marbled Murrelet (*brachyramphus marmoratus*). Note that common ravens are one of the main predators of this endangered seabird species. These omissions should be corrected and adverse impacts of ranching on these critical habitats should be analyzed within the EIS.

**CLEAN WATER ACT (CWA)** As mentioned above, the Park Services 2013 Coastal Watershed Assessment for Point Reyes National Seashore documented numerous examples of cattle ranching polluting water resources in the park and identified bacterial and nutrient pollution from dairies and ranches as a principal threat to water quality. The Park Services assessment determined that dairies pollute the Drakes Estero, Limantour, Kehoe and Abbots Lagoon areas with high concentrations of fecal coliform. Other studies show that cattle ranches are one of the major contributors of fecal coliform and *E. coli* to Tomales Bay. Alternates A-E should be adjusted to describe in detail how the NPS will significantly alter the manure managements practices following the methodology and recommendations outlined in the Coastal Watershed Assessment to minimize impacts to coastal watersheds protected by the CWA.

**NATIONAL HISTORIC PRESERVATION ACT (NHPA)** Section 106 of the National Historic Preservation Act mandates NPS to "take into account" the effect a project may have on historic properties. Modern ranching and farming operations within the two historic districts conflict with the historic character defining features of the district from its period of significance. Notably, the highly prominent visual presence of white plastic veal crates in many of the view sheds within the historic district has a significant negative impact on the historic character of the districts. Additionally, commercial ranches eliminate public access to the historic resources of the district, further conflicting with the historic preservation goal of providing public access and educational opportunities to publicly owned historic resources.

It has been widely documented through surveys that visitors do not come to the National Seashore to witness a land use (ranching) which by most estimates occupies almost 40,000,000 acres of land throughout the state of California. This leads me to fundamentally call to question the assumptions within the DEIS in which Alternates A-E present various strategies of managing public lands that first benefit livestock permittees with other users and public values secondary. Point Reyes National Seashore is supposed to be managed under the Point Reyes Act for "maximum protection, restoration, and preservation of the natural environment." There's no mandate for prioritizing commercial agricultural leases on these public lands. Natural values, native wildlife, public access and enjoyment should take priority over commercial activities at Point Reyes. If Alternates A-E are to be considered, this DEIS will require significant revisions, additional back up information and further documentation to reprioritize the stewardship responsibilities of the NPS which include the re-wilding of the public lands under its control, and the rehabilitation of species and ecosystems damaged by human activities.

Lastly, I am deeply opposed to any and all of the alternatives that contemplate reduction, lethal management, or removal of any existing or new Tule Elk herds within the area under consideration. Tule elk are an important part of the landscape at Point Reyes. Their recovery is a result of successful native ecosystem restoration, which is a key element of the Park Service's mission. It's taken a lot of time, money and effort to restore tule elk to Point Reyes, the only national park where they live. With the current Tule Elk population at roughly 1% of its pre-colonial levels, opportunities for Californians to observe Tule Elk are extremely limited. Given the above, it seems unconscionable that Tule Elk populations should be either numerically reduced, or made more difficult to observe for the benefit of a commercial land use.

I appreciate the opportunity to review and comment on the DEIS. If you have any questions on my comments please feel free to contact me at 202.999.2250.

Sincerely, Alexandra Phelan

Correspondence: Comment 1.

Three National Park Service laws prohibit actions that will impair natural resources (the 1916 NPS Organic Act, Point Reyes National Seashore legislation Section 459c-6, and Golden Gate National Recreation Area legislation Section 460bb).

According to the Draft Environmental Impact Statement (DEIS) the Alternatives A,B,C,D,E (ranching alternatives) involve the impairment of natural resources within the planning area.

Consequently, the Park Service should prepare and circulate for public comment a supplemental DEIS with ranching alternatives that comply with applicable laws requiring the protection of natural resources.

Comment 2.

The Draft Environmental Impact Statement (DEIS) fails to incorporate an analysis of the impact of lethal Tule Elk removal on Visitor Use and Experience and fails to anticipate or document the vigorous public opposition to lethal elk removal.

The DEIS on page 168 Alternative B - Public Use and Enjoyment - Elk Management plainly states that Over time, the experience of visitors who oppose elk control would be indirectly adversely affected [&]. However, no further analysis is presented, nor further data gathering is contemplated.

Following the release of the current DEIS the proposed lethal removal of Tule Elk has been subject of vigorous public opposition and critical TV nationwide coverage on NBC, CBS, Fox, in the regional press and internationally (Toronto Star, Canada).

Over 9,000 online petitions have been gathered in opposition to killing of Tule Elk as of 9/23/19 at change.org web site at <https://www.change.org/p/cicely-muldoon-save-the-tule-elk> and multiple public demonstrations were held around the BayArea (e.g. <https://www.facebook.com/events/555075298655008/>)

The DEIS failed to quantify and study the effect on the visitor experience of the proposed killing of Tule Elk. The Park Service should commission a public opinion survey around the issue of killing of Tule Elk and its impact on visitor use and experience, and incorporate the findings in a new supplemental DEIS.

The design and administration of public opinion surveys relating to the proposed killing of the Tule Elk may help quantify the degree to which the potential adverse impacts listed below are a risk, as well as their potential costs.

Potential adverse effects of elk management by lethal removal include:

- 1) reduction of enjoyment of the park because of reduced visits due to continued negative publicity;
- 2) reduction of enjoyment of the park by a portion of the public that does not support killing of Tule Elk and is emotionally affected by the proposed killing program;
- 3) reduction of enjoyment of the park by young children should they learn that the elk are being killed by the Park Service;
- 4) reduction of public support of the Park programs due to the killing of the Elk;
- 5) reduction of rancher revenue and reduced financial viability of ranching in the area due to consumer boycotts because of rancher support of elk management by lethal removal;
- 6) increased costs associated with potential public protests in the Park related to elk management by lethal removal;
- 7) increased costs to the Park Service due to continued and expanded litigation;
- 8) other adverse impacts to the Park and the public.

In light of the vigorous public opposition and negative publicity resulting from the proposed "lethal removal" of the Tule Elk from portions of the planning area, the Park Service should consider abandoning this management tool in favor of alternative approaches and revising the proposed Alternatives accordingly.

Marin Independent Journal. Opinion: Time for ranchers to leave our national seashore. June 10, 2019. <https://www.marinij.com/2019/06/10/marin-voice-time-for-ranchers-to-leave-our-national-seashore>

The Draft Environmental Impact Statement (DEIS) fails to provide sufficient analysis to justify the preference of elk management by lethal removal over the option to translocate elk individuals outside the park in collaboration with the State of California as part of Alternatives B,C,D.

As a result, the DEIS recommendations as currently presented fail to attempt to minimize the adverse impact on the valuable Tule Elk resource.

On page 41, the DEIS states that "For translocation outside the park to be practicable, NPS would need to document that the elk are free of Johnes disease and CWD. The State of California would need to approve the move and have capacity to accept additional elk in state-managed herds. If translocation becomes a practicable option in the future, additional compliance would be completed at that time to address potential impacts on elk and other resources."

While acknowledging the potential availability of the translocation option, the DEIS fails to analyze and explore the viability of translocation and simply designates lethal removal as the preferred elk management option for Alternatives B,C,D without providing reasonable basis for such preference.

The Park Service should obtain definitive statements from the State of California on whether transportation of specific elk individuals would or would not be permitted and under what conditions. The Park Service should initiate a collaborative process with the State of California to establish the mutually acceptable procedures (e.g. for disease testing, reimbursing of costs, etc) for such transportation to prevent the killing of Tule Elk individuals as currently proposed in Alternatives B,C,D.

The Park Service should issue a supplemental DEIS and revise the Alternatives B,C,D to remove elk management by killing the Tule Elk individuals, unless the Park Service receives a written statement from the State of California indicating an unconditional refusal to establish procedures to accept select Tule Elk individuals to locations outside of the planning area.

Alternatively, the revised DEIS could definitively state that translocation is preferable to killing, and that the killing of the Tule Elk individuals would not be effected if the Park Service is able to negotiate appropriate translocation procedures with the State of California.

Comment 4.

The Air Quality analysis included in the Draft Environmental Impact Statement (DEIS) on pages 96 and 97 presents an aggregate picture of NH3 and VOC compared to total Marin County Farming Operations as well as total Marin County Emissions.

While consistent with average emission levels for industrial ranching (~20% of Marin County Farming Emission consistent with ~20% of the area's contribution to the County's farming industry's gross product) concentration levels of NH3, VOC, Ozone, PM2.5 in specific locations are not presented.

I visit Point Reyes National Seashore regularly (approximately once a month). While driving near farming operations, for instance on Pierce Point road, the smell at certain locations is extremely strong and persists, subjectively, for 5-10 minutes of driving at about 30 miles per hour.

The subjectively high levels of VOCs and other pollutants in specific areas near concentrated farming operations are not captured by the Park Service, not presented to the public, nor provided in the DEIS. The extremely strong smell is not consistent with the enjoyment of the park and is reminiscent with large scale industrial cattle

operations, not low impact historic agriculture. In addition, the extreme smell may be indicative of other extremely adverse impacts on environment.

The DEIS should be revised to include VOC, NH3, Ozone and PM2.5 measurements at specific locations near concentrated farming operations and exposure to visitors (drivers, bicyclists or hikers). The DEIS could consider a roadmap to add continuous programmatic monitoring of air quality in multiple specific in the future. Many low cost air quality monitoring sensors and systems for continuous monitoring are now available with newly developed technology (e.g. <https://purpleair.com>).

At a minimum, the DEIS should include the results of air quality audits at multiple specific locations, especially near areas of visitor transit or concentration, and provide those measurements to the public in addition to the aggregate levels.

The current concentrated emission levels at locations close to ranch operations (e.g. Pierce Point road near cattle structures) likely exceed applicable limits, interfere with park enjoyment, and negatively affect visitor use and experience.

The Park Service should revise the DEIS to include air quality measurements at farm sites in addition to aggregate area levels.

Comment 5.

The Draft Environmental Impact Statement (DEIS) fails to provide the basis for the proposed succession framework which is outlined, for instance, on page 37 for Alternative B as "Succession. In the event an existing rancher decides to discontinue ranching, NPS would implement succession planning that is consistent with maintaining multi-generational ranching in the planning area." The DEIS fails to substantiate why succession planning consistent with multi-generational ranching is a preferred framework.

The paragraph below represents one reference point as to why mandating multi-generational succession policy may not be in the public interest, at least for the present circumstances in the Point Reyes National Seashore.

While the current group of ranchers present themselves as great stewards of the land (e.g. Point Reyes Seashore Ranchers Association Public Comments Re: Ranch Comprehensive Management Plan Dated 6/2/14) , in fact they have been opposed to the objectives of the park not related to narrow interests related to industrial ranching. The current ranchers' opposition to public interest in preserving the natural resources of Point Reyes goes back to the original opposition of the prior generation to the legislation that established the Point Reyes National Seashore, to present-day advocacy for lethal elk removal including the complete removal of the Drakes Bay herd, to advocating against public access to public land, to not maintaining the visual quality of cattle structures and operations consistent with historic preservation objectives, to insisting on continuing industrial-scale cattle operations with significant adverse environmental impacts to the natural resources of the National Park, to organized lobbying of elected officials to advance legislation and policy in their narrow self-interest.

The DEIS fails to present alternative frameworks for lease succession, does not analyze the pros and cons of alternative lease award and renewal frameworks, as well as does not establish clear criteria or process for granting and renewal of leases in the planning area.

The current lease renewal process is opaque and appears to be biased in favor of current lease holders without basis. In other area of federal government engagement with the private sector, such as the federal contracting process, the awardees are subject to a competitive process based on criteria outlined in an RFP. If the award is non-competitive, justification is typically provided.

DEIS should be revised to include criteria and process for lease award and renewal, an analysis as to whether current leaseholders would satisfy the objectives of the Park, of the relevant legislation and the public interest, as well as propose a competitive solicitation process for lease award and renewal open to all interested parties.

-----  
-----

Comment 6.

The Draft Environmental Impact Statement (DEIS) fails to propose alternative models for permitted ranch operations that would preserve the historic agricultural aspects of the area without the detrimental impacts associated with modern industrial-scale cattle farming and ranching as practised by the current lessees.

To the extent that preserving the historic ranching character of the area is a valid or desirable objective, it is clear that industrial-scale ranching using modern technology is not an appropriate way to achieve that objective, considering its significant adverse environmental impacts as outlined in the DEIS. Because industrial-scale ranching involves significant impairment of park natural resources it is not consistent with applicable legislation, including the 1916 NPS Organic Act, Point Reyes National Seashore legislation Section 459c-6, and Golden Gate National Recreation Area legislation Section 460bb.

The DEIS should propose additional alternatives involving significantly scaling down industrial operations and transitioning to leases permitting only very small scale, low impact activities highlighting historic agriculture, perhaps with expanded opportunities for visitor interaction, and more resources devoted to historic programs.

-----  
-----

Comment 7.

The present visual quality of industrial ranch structures and operations, as one drives on park roads near the operating ranch structures and activities, is detrimental to the objective of preserving the historic quality of the area and maximising the enjoyment of the park resources.

The Park Service should revise the Draft Environmental Impact Statement (DEIS) to include images of ranch structures and operations, and a discussion of costs and benefits, i.e. how they add or detract from the goal of preserving the historic character of the area, as well as provide for remediation and improvement requirements as part of the lease terms.

Name: Morgan, Megan

Correspondence: Ranching has changed considerably since it was initially allowed at Point Reyes and it needs to stop. The Tule Elk are more important than cattle and must be protected. This Plan B to add other farm animals to the area is short sighted and truly against the spirit of the National Park system.

#7506

Name: Blackie, Heather

Correspondence: Authors of DEIS Pages 196-197 list the team and the qualifications they have in drafting this DEIS. The list contains not a single farmer or rancher, nor does it contain a representative from an as yet

unformed "agricultural advisory board", the request for which had been included in the public scoping comments. With the fate of ranching on the seashore potentially in the balance, not to include a rancher or someone deeply familiar with an agrarian way of life is like asking a park ranger to grow food and a lot of it, or like asking a rancher to create a plan for a park. Something, indeed many things are lost without that perspective.

The list of qualifications included many qualities that a rancher must have, such as an understanding of ecology, hydrology, biology, resource management, watershed management, in addition to a host of other skills such as animal husbandry, plumbing, fencing, and economics. In addition, there has been this persistent need over the years to defend the livelihood of ranching while continuing to ranch. There aren't many livelihoods, if any, that require such defense, certainly none of the positions listed are as vulnerable. It is worth mentioning as well that those who drafted the DEIS are all paid for their work, while ranchers, of course, are not.

From this imbalance comes a draft that unfortunately reflects that imbalance as there are few positives listed concerning the presence of the ranchers and the work and land to which they devote their skills, their resources, their lives.

Alternatives considered but dismissed List of Tables Nowhere in this section (p. 59 - 63) is there mention of carbon farm plans in spite of the fact that they were mentioned numerous times in public scoping comments and carry significance based on the science that has defined the practices that comprise such plans.

The list of tables, of which there are 20, carry information about emissions, based on science. But the science about carbon sequestration, which has been conducted in places around the globe but most notably right here in Marin County (Marin Carbon Project, Carbon Cycle Institute), is never mentioned. Given the climate crisis we are facing, to neglect that there are agricultural practices that have the capacity to sequester carbon, indeed to recognize that soil is the singular carbon sink we have left, is to suggest the park exists in isolation. Because the park doesn't exist in isolation, because it is reliant on the inputs of the team that compiled the DEIS, because it is reliant on visitors and markets and resources, because it is willing to consider emissions, it must recognize its place in the greater ecosystem and as part of the planet and take into consideration what we have learned in the last ten years about carbon capture. Cutting emissions will not be enough if we are to avoid climate catastrophe and the science that has led to the crafting of carbon farm plans indicates range management and agriculture as part of the solution.

History of Ranching and Cultural Significance While there is brief (p. 3, p. 171-2) mention of the historical significance of ranching on the seashore, the focus, albeit brief, is on the infrastructure, not on the diverse farms that speckled the landscape. That diversity created a resilience that lasted up until the industrial model took hold which was promoted by the farm bill and the practices of industrial agriculture. In order to keep up economically, monocultures took over, not just at Point Reyes, but all across the country.

Because Point Reyes has a history of vibrant, resilient, diverse agricultural practices – which fed the local communities as well as city dwellers in San Francisco, those practices should be part of the DEIS. While biodiversity is mentioned regarding rangeland and the ecosystem health that coincides with it, the same is true for a diverse farm.

Because it is impossible to make an economically viable row crop operation on 2.5 acres without irrigation and confined to a place because there is a line on a map and proximity to buildings (ranch core), there needs to be reconsideration of this condition. Dry farming in somewhat predictable conditions is challenging enough but with climate change, it drastically increases the unpredictability and risk, not to mention the range of crops that would be possible to farm.

Visitor Use, Experience, and Access The presence of a working landscape that could be comprised of diverse farms that supply local food and contribute to the economies of ranchers and their communities would be a wonderful learning opportunity for the public. While people have become disconnected from nature, they have

become disconnected from where their food comes from as well – agriculture as well as wild places offer complementary ways for people to connect with nature.

The fact that millions of visitors come to Point Reyes already and travel trails and see elk that are not eating in ranchers' fields illustrates that there are high population densities of humans in parts of the park. The ranches, on the other hand, are inhabited by people who call them home, who are on the land 24/7 and the population density of humans is significantly lower on these working landscapes. This is worth considering as other populations of birds, rodents, insects, plants, coincide with the presence of working ranches.

Point Reyes can have both. It does now. What's been learned about agricultural practices in the past ten years cannot be ignored. Point Reyes is a magnificent wild place. But the ranches, their history and their diversity are part of that fabric.

In need of additional modifications and considerations, Alternative B comes the closest to fitting the landscape at Point Reyes.

#7507

Name: Eagle-Gibbs, Ashley

Correspondence: Dear Superintendent Muldoon,

I was born and raised in San Anselmo in Marin County, and I have been visiting and enjoying the Point Reyes National Seashore (Seashore) since I was a child. I feel privileged to be able to share the Seashore with my own twin boys now. I have a background in law and policy.

I submit these comments in a hope that the National Park Service remains consistent with their purpose and Congressional direction to conserve natural resources for future generations. I am concerned, because the Draft Environmental Impact Statement (DEIS) appears to be inconsistent with the Seashore's purpose in that the DEIS appears to prioritize economic interests over natural resource preservation and the enjoyment by future generations.

Resource protection is the highest value for the Seashore as intended by Congress in requiring the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area..." 16 U.S.C. Section 459c (6)(a) (emphasis added).

Regarding the Succession Policy, the policy to extend requests for proposals to new operators appears to be inconsistent with the purpose of the Seashore, the planning documents, and the historic designation of solely dairy and beef ranching in the Seashore

In addition, the DEIS fails to consider several foreseeable impacts of the proposed diversification, as is required by the National Environmental Policy Act, such as cumulative and connected impacts, as well as indirect and direct impacts. Some of the impacts which are not considered in the DEIS include the impacts of wildlife conflicts, additional traffic, and infrastructure impacts (like impacts to already degraded public roadways).

Regarding impacts to environmental resources, the DEIS also completely fails to consider climate change and sea level rise impacts to natural resources. Regarding water quality impacts, additional water quality monitoring is needed in the Seashore to have sufficient baseline data, as well as monitoring data, especially on the Pacific Ocean side. Greater buffers are needed around the sensitive Drakes Estero Marine Wilderness area. Although perhaps well intentioned, Schooner Bay should not be opened to additional boat-in public access with the Seashore's extremely limited resources.

My family and I greatly enjoy visiting the Seashore and the tule elk, and we will be saddened if the elk population is harmed in the name of economic interests. I am against culling the elk for economic reasons.

Lastly, the DEIS fails to adequately consider the economic impacts and tradeoffs associated with the additional staffing and planning needed to fully implement the General Management Plan Amendment. Unfortunately, the Seashore is already over-burdened with their limited budget, so the economic considerations of this additional planning, review and implementation must be thoroughly analyzed in order for the changes to be effective.

Thank you for all that you do and for the consideration of my comments.

Sincerely, Ashley Eagle-Gibbs, Esq.

Name: Corning, Glenda

Correspondence: I believe that the Point Reyes Seashore should be restored as a wild habitat and that ranching should be phased out or extremely limited. We are going through a huge extinction of birds, insects and other wildlife on this planet. We need to protect and cultivate our wild spaces for greater biodiversity. Managing the Point Reyes Seashore with Tule elk grazing and fire could revitalize the grasslands and create a wonderful opportunity for native plants and animals to thrive and for people to interact with wild nature in areas that are currently off-limits when the land is used for dairy ranching. The conflicts between the needs of elk, predators and ranch cows will escalate. Degradation of the waterways will continue as manure is leached into them. Many of these ranches are overgrazed and poorly maintained. I prize local agriculture but there has to be a balance with wild nature. Please protect the Point Reyes Seashore and bring it back to its wild state.

#7509

Name: Pinto, Erin

Correspondence: It is tremendously disturbing that NPS wants to protect livestock ranching in a national park at the expense of actual park values of open space, wildlife protection, and visitor experience. DO NOT go back on the plan to phase out ranching just because it's been there. And especially do not continue the abuse and extermination of the elk. They are the victims of political manipulation of MY national park land. Do not use my tax dollars to prop up cattle ranching! Do what's right and honor the ranching phase out plan!

#7510

Name: N/A, N/A

Correspondence: Point Reyes National Seashore is just that, a National Park to be enjoyed and protected by all!! The tule elk, which were almost once extinct, belong here, not cows, chickens, and other animals that are being allowed to be raised here for the economic gain of a few. The NPS should be concerned about the methane gas and waste that is being produced by all these cows. I really feel that the preferred alternative that part staff recommends is a sellout, I am shocked and disappointed. They are taking the road of least resistance. Let's remember when decisions are being made and remind ourselves that this is a precious area that needs to be protected and preserved, the cows need to go not the tule elk!

#7511

Name: Johnson, Huey

Correspondence: I write to comment about the conditions at Pt Reys Seashore. I have had years working on it. I was involved in buying some of the land now included in Seashore.

Two ignored factors are management and money. I criticize based on experience. I have a graduate degree in resource management, and served as California's Secretary of Natural Resources, those duties included overseeing the state Park system.

I appointed Russ Cahill as the State Director at that time.

The problem at Pt. Reyes is one of management. The two key positions, the superintendent and the Seashore biologists position are both filled with people who are locals. Mr. Press, grew up in the park and is a close friend of the heirs behind the attempt to capture and control cattle ranching.

The Superintendent, Cicely Muldoon was born and raised in Marin. and has no experience in park management. She is a close friend of the economic interests there,

This problem isn't new to public land management. I recall in my graduate school studies that local people, captured by their friends and neighbors are do not provide necessary oversight or enforce park regulations.

The 6,000 cattle are a huge industrial business. The federal subsidy paid each month per cow is a huge financial windfall to the grazers and are the real reason for the conflict which is based on greed with no park enhancement. Based on my experience I sense the Farm Bureau's presence behind the park's problem of overstocking and overriding park management values.

Basically the problem is solvable by transferring the Superintendent and Mr. Press, the biologist to another park system. Even better would be cut them loose, and replace them with professionals without local ties.

If the situation is left adrift I fear it will affect the NPS and parks elsewhere.

Huey D Johnson Former California Secretary of Resources Founder of the Trust for Public Land Former President of the Nature Conservancy Founder of the Grand Canyon Trust Founder of the Resource Renewal Institute

#7512

Name: Holmes, Ellen

Correspondence: Many important issues were not thoroughly analyzed in the DEIS, including cumulative impacts on climate change. However, I am not an expert on the matters under consideration but EAC (Environmental Action Committee) is and they have no agenda outside of doing what is best for the Park in terms of maximum protection of the Natural Resources within the Park. Therefore, the most useful comment I can make is to urge you to listen carefully to their analyses of the DEIS and to make your decision based on their concerns and advice !

#7513

Name: Kreklau, Nicole

Correspondence: Please do not grant further lease agreements to farming and ranching. The specific elk herd already has land protected to help them survive - the elk do not live elsewhere or have other places to go - it is the ecosystem naturalized for the creatures that inhabit. Ranchers (only who kill the animals that pasture on the lands at issue) are competition that cannot be tolerated. Ranchers and farmers can be flexible and are not permanent, being able to move livestock or plant crops elsewhere - in less protected and less vital lands.

I come from a family of farmers, who purchase or lease land out of their own pockets/profits, not like these opportunist ranchers and farmers using taxpayer subsidized lands to oust delicate ecosystems with magnificent creatures and flora.

Please give reason to hold heads high like the glorious bugling elk.

#7514

Name: Law, Todd

Correspondence: I don't want my public land given ranchers that is causing damage to our environment

#7515

Name: Meghrouni, Sara

Correspondence: To whom it may concern,

I oppose all options to allow cattle grazing in Point Reyes national seashore. Save the elk!

Sara Meghrouni

#7516

Name: Baker, Elizabeth

Correspondence: Like many, I have been visiting Pt. Reyes for my entire life and feel that its wild places and wildlife have helped shape who I am. From beach days as a young kid to trail work as a teenager to my wedding day hike on the Bear Valley trail, some of the greatest moments of my life have taken place within the park boundaries. I believe that its singular, spectacular qualities deserve to be managed to support the park's wild - not domesticated - life.

While I respect Pt. Reyes ranchers and dairy farmers, ranching should be phased out. Ranching operations are simply incompatible with biodiversity-focused park management, particularly as the varied impacts of climate change are projected to stress flora and fauna in coming years. The ranching way of life need not be erased; it can live on as a part of the park's socio-historical education programming, which I hope would be a meaningful part of a transition away from active ranching.

Alternative F is the only option that puts nature ahead of everything else, which is just as it should be inside a national park.

When I picture my two young children visiting Pt. Reyes in twenty, forty, or sixty years from now, it's the bugling of the elk I hope they hear. It's that fierce wind sweeping the native meadows in the pastoral zone that I hope they feel. It's the migrating birds that I hope they spy as they rest, mid-route. Cows, on the other hand, they can experience just outside the Pt Reyes boundaries.

#7517

Name: McKee, Michael

Correspondence: I want to support alternative F, favoring the phasing out of cattle ranching in Point Reyes. I am a 4th generation bay area native, and find the cattle really out of character and unpleasant. I feel the majestic Elk population should rule without competition. The cattle are also a crazy road hazard at night.

#7518

Name: Boss, Tom

Correspondence: Marin County Bicycle Coalition (MCBC) greatly appreciates the opportunity to comment on the Environmental Impact Statement (EIS) for the Point Reyes National Seashore and North District of Golden Gate National Recreation Area (PRNS/GGNRA) General Management Plan Amendment (GMP Amendment).

Founded in 1998, MCBC's mission is to promote safe bicycling for everyday transportation and recreation. Our advocacy efforts focus largely on closing gaps in Marin's networks of pathways and trails, enabling people of all ages and abilities to ride safely without exposure to traffic.

MCBC views the GMP Amendment and any subsequent trail planning it catalyzes as a key opportunity to 1) enable and encourage car-free access to PRNS/GGNRA, contributing to the Green Parks Plan's goal to reduce carbon emissions in NPS parks, 2) expand bicycling access across these beautiful public lands, 3) improve connectivity between existing routes on and adjacent to PRNS/GGNRA, and 4) create routes that enable people to travel throughout the area on trails, pathways, and ranch/administrative roads without having to ride on roads with traffic.

We support the public use and enjoyment improvements outlined under Alternatives B, C, D, E, and F. While identifying a preferred alternative is outside of our organization's scope, we oppose Alternative A (no action) on the basis that it would not significantly expand or improve public access on leased lands.

## PUBLIC USE AND ENJOYMENT: DEVELOPMENT OF TRAILS AND TRAIL-BASED RECREATION

Much of the PRNS trail system resides in designated wilderness, which prohibits bike access. Hikers and equestrians enjoy over 100 miles of trails in the Seashore that will continue to remain off-limits to people on bicycles, which is why the GMP Amendment is a critical opportunity toward expanding access in PRNS/GGNRA public lands and providing safe alternatives to riding on roads with traffic.

We were pleased to see NPS call out improved "hiking, biking, and equestrian access" and trail opportunities that "would focus on loop routes, connectivity with adjacent public lands, and facilitation of north-south connectivity across the landscape" as elements common to Alternatives B, C, D, E, and F. We believe our trail priorities (outlined below) share these characteristics.

### Priorities

We strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to:

- A connection between Devil's Gulch and Platform Bridge Road using existing ranch roads.
- A connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail.
- A connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads.
- A connection between Drakes Estero and Abbotts Lagoon Trail using existing ranch roads.
- A connection between Marshall Beach Trailhead and Pierce Point Road using existing ranch roads.
- An Estero Trail loop using existing ranch roads.

MCBC also recommends the inclusion of a pilot project to illustrate compatibility between public access and ranching operations, should they continue. A terrific candidate would be the creation of an Estero Trail loop at Drakes Estero, where there are an abundance of roads and social trails that could be used to bridge the gap between White Gate Trail and Estero Trail along the east side of Home Bay, as well as existing fences that would separate livestock and visitors.

## VISITOR CARRYING CAPACITY

We support the inclusion of several strategies to improve the visitor experience, including through wayfinding, permitting and managing trail-based event requests, and education aimed at promoting safe and responsible trail use.

## CONCLUSION

We are confident that any concerns that may arise around trail construction, trail safety, or compatibility between public access and ranching operations can be mitigated. MCBC stands ready to assist through our well-established trail stewardship and education programs.

We greatly appreciate the public access improvements outlined in Alternatives B-F and look forward to participating in subsequent planning processes to identify and implement new trail connections. We hope that NPS' chosen outcome will expand access throughout the planning area, enable more people to visit the park without driving, and dramatically improve visitor safety and enjoyment.

Re: Comments on the Draft EIS/GMPA for Point Reyes National Seashore

Thank you for the opportunity to provide comment on the Draft Environmental Impact Statement (DEIS) and the General Management Plan Amendment (GMPA) for the Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA), a planning area of more than 28,000 acres of National Park Service (NPS) lands collectively referred to as the park. I have mailed a hard copy of this letter to the Park Service at Bear Valley, and wish for that to be included as the comment given that I have color-coded text that is central to my examination of the DEIS/GMPA, but wanted to be sure the comment is counted and so I am also submitting electronically.

The Resource Renewal Institute (RRI) is an environmental nonprofit organization located in Mill Valley, California. The organization's mission is to foster innovative solutions for increasingly complex environmental problems, and to test new ideas. This innovation focuses on sustainable practices and solutions to natural resource management. RRI has programs focusing on advocacy, education, organizational development, sustainability analysis, and applied research. RRI has successfully incubated and nurtured new programs and strategies to improve our environment and well-being, and leaders who have become catalysts for change.

Environmental leadership and inventive land and water management practices are at the heart of RRI's work. For example, Fish in the Fields is an integrated agricultural land use system with massive implications for carbon sequestration, protein sourcing, and ocean conservation. Defense of Place and Public Trust Alliance are organizations that uphold the inviolability of protected lands through policy analysis and collaboration with citizen activists nationwide

Huey Johnson, the founder of RRI, has been involved in issues in Point Reyes since he moved to Marin decades ago. In the 1970s, Huey founded the Trust for Public Land and, through that organization, acquired various parcels from the RCA Corporation in the 1970s. For example, in 1976 and 1977, the Trust for Public Land announced the purchase of 2,300 acres (G Ranch and what is now Niman Ranch/Commonweal area) of coastal Marin property for eventual inclusion into the Golden Gate National Recreation Area and Point Reyes National Seashore.

To prepare our comments, RRI has read and reviewed the draft Foundation Statement, DEIS/GMPA, the 2019 Natural Resources Condition Assessment, the 2018 Grazing Plan, the Freshwater Quality Monitoring in the San

Francisco Bay Area Network Biennial Report on Water Years 2015 and 2016, the 2013 Coastal Watershed Assessment, the 2006 NPS Management Policies, the 2004 NMFS Biological Opinion, the 2002 USFWS Biological Opinion, the 1998 Elk Plan, the 1990 Range Management Guidelines, the Foundation Statements and Cultural Resource Inventories/Plans for various other National Parks with similar cultural resources (e.g., Grand Teton National Park, Channel Islands National Park), and numerous other documents and data applicable to the DEIS/GMPA and the current planning area, many of which we obtained from the NPS under a Freedom of Information Act Request.

### Impacts of Each Alternative: An Overview

For the record, RRI wants to acknowledge the following environmental impacts identified by the National Park Service (NPS) under each of the proposed alternatives (with positive impacts highlighted in blue and negative impacts highlighted in red-neutral or questionable impacts will be left un-highlighted and addressed in the following section):

#### Alternative A

Activities associated with beef and dairy ranching will continue to affect soils because of erosion, compaction, and alteration of soil fertility. Activities associated with beef and dairy cattle ranching would continue to affect watersheds in the planning area. Activities associated with ranching would have adverse impacts on some plant species and beneficial impacts on others. Impacts from disturbance associated with ranching activities and altered habitat conditions would be adverse while impacts related to the maintaining key habitats such as grasslands and stock ponds would continue to be beneficial. Fencing and hazing will remain adverse impacts for the free-ranging Drakes Beach Tule elk herd. Activities will continue to contribute beneficial impacts to the Point Reyes Dairy Ranching Historic District and Olema Dairy Ranches Historic District cultural landscapes through ongoing grazing and to the ranch structures that remain occupied. Impacts on historic buildings may be adverse depending on the level of funding available for deferred maintenance. Activities associated with ranching would continue to emit criteria pollutants and greenhouse gases associated with cattle grazing, manure management on dairies, fugitive dust, and mobile source emissions. Dairy operations are the primary contributors for ammonia (NH<sub>3</sub>), volatile organic compounds (VOC), and carbon dioxide-equivalent (CO<sub>2</sub>e) emissions in the park, while beef cattle are the primary contributors to fugitive dust and particulate matter (PM<sub>2.5</sub>) emission rates. Mobile source emissions would be similar to existing conditions because a change in visitor use levels is not anticipated.

#### Alternative B

Activities associated with beef and dairy ranching will continue to affect soils because of erosion, compaction, and alteration of soil fertility. Activities associated with beef and dairy cattle ranching would continue to affect watersheds in the planning area. Activities associated with ranching would have adverse impacts on some plant species and beneficial impacts on others. A zoning framework is said to limit impacts on wildlife from authorized activities such as ranch diversification and remove grazing from sensitive resources such as riparian areas, surface waters, and federally listed species habitat. Impacts on wildlife would also continue to be avoided, minimized, or mitigated through the implementation of mitigation measures. Impacts on wildlife would remain beneficial or adverse, depending on the species. Size of the Drakes Beach elk herd would be limited to 120 individuals through lethal removal. Fencing and hazing will remain adverse impacts for the free-ranging Drakes Beach tule elk herd. Adverse impacts on visitor use and experience could occur as a result of killing of elk would be temporary and localized. Activities will continue to contribute beneficial impacts to the Point Reyes Dairy Ranching Historic District and Olema Dairy Ranches Historic District cultural landscapes through ongoing grazing and to the ranch structures that remain occupied. Activities associated with ranching would continue to emit criteria pollutants and greenhouse gases associated with cattle grazing, manure management on dairies, fugitive dust, and mobile source emissions. Dairy operations are the primary contributors for ammonia (NH<sub>3</sub>), volatile organic compounds (VOC), and carbon dioxide-equivalent (CO<sub>2</sub>e) emissions in the park, while beef cattle are the primary contributors to fugitive dust and particulate matter (PM<sub>2.5</sub>) emission rates. Mobile source emissions would be similar to existing conditions because a change in visitor use levels is not anticipated.

## Alternative C

Activities associated with beef and dairy ranching will continue to affect soils because of erosion, compaction, and alteration of soil fertility. Activities associated with beef and dairy cattle ranching would continue to affect watersheds in the planning area. Activities associated with ranching would have adverse impacts on some plant species and beneficial impacts on others. A zoning framework is said to limit impacts on wildlife from authorized activities such as ranch diversification and remove grazing from sensitive resources such as riparian areas, surface waters, and federally listed species habitat. Impacts on wildlife would also continue to be avoided, minimized, or mitigated through the implementation of mitigation measures. Impacts on wildlife would remain beneficial or adverse, depending on the species. The NPS would lethally remove the Drakes Beach herd, totaling approximately 124 individual elk-eliminating one of two free-range tule elk herds in the national park system. Impacts on the Drakes Beach herd would be significant because it would no longer exist. Overall viability of the tule elk population in Point Reyes would not be affected. Adverse impacts on visitor use and experience could occur as a result of the removal of the Drakes Beach herd. Activities will continue to contribute beneficial impacts to the Point Reyes Dairy Ranching Historic District and Olema Dairy Ranches Historic District cultural landscapes through ongoing grazing and to the ranch structures that remain occupied. Activities associated with ranching would continue to emit criteria pollutants and greenhouse gases associated with cattle grazing, manure management on dairies, fugitive dust, and mobile source emissions. Dairy operations are the primary contributors for ammonia (NH<sub>3</sub>), volatile organic compounds (VOC), and carbon dioxide- equivalent (CO<sub>2</sub>e) emissions in the park, while beef cattle are the primary contributors to fugitive dust and particulate matter (PM<sub>2.5</sub>) emission rates. Mobile source emissions would be similar to existing conditions because a change in visitor use levels is not anticipated

## Alternative D

Activities associated with beef and dairy ranching will continue to affect soils because of erosion, compaction, and alteration of soil fertility. Activities associated with beef and dairy cattle ranching would continue to affect watersheds in the planning area. Alternative D would have beneficial impacts on water quantity from the reduction of authorized livestock numbers. Activities associated with ranching would have adverse impacts on some plant species and beneficial impacts on others. Vegetation composition would likely change in areas where ranching is removed. While cessation of grazing would eliminate adverse impacts such as high-intensity-use areas, it may also result in an increase in invasive annual and perennial species such as thistles and grasses; a likely decrease in native forb species abundance and richness; scrub encroachment into areas currently characterized as coastal prairie; and an increase in vegetative fuels. Eliminating livestock grazing could also adversely affect several federally listed plants that occur in coastal grassland. A zoning framework is said to limit impacts on wildlife from authorized activities such as ranch diversification and remove grazing from sensitive resources such as riparian areas, surface waters, and federally listed species habitat. Impacts on wildlife would also continue to be avoided, minimized, or mitigated through the implementation of mitigation measures. Impacts on wildlife would remain beneficial or adverse, depending on the species. Impacts on federally listed plants that occur in certain habitat, such as dune or serpentine habitat, may be beneficial because the potential for cattle to trample individual plants would be reduced. Impacts on wildlife related to dairy and beef ranching would cease, including disturbance trampling erosion, and nutrient inputs. Ecological succession would occur as grassland habitats transition into scrublands or forested habitats, which would increase habitat for some wildlife but decrease it for others. Fencing and hazing will remain adverse impacts for the free-ranging Drakes Beach Tule elk herd. Cessation of ranching on 7,500 acres would have beneficial impacts on elk by removing existing fencing, reducing hazing, and impacts from hazing. Adverse impacts on visitor use and experience could occur as a result of killing of elk would be temporary and localized. Reduced ranching would have some beneficial impacts related to experience natural sights and sounds. Activities will continue to contribute beneficial impacts to the Point Reyes Dairy Ranching Historic District and Olema Dairy Ranches Historic District cultural landscapes through ongoing grazing and to the ranch structures that remain occupied. Activities associated with ranching would continue to emit criteria pollutants and greenhouse gases associated with cattle grazing, manure management on dairies, fugitive dust, and mobile source emissions. Dairy operations are the primary contributors for ammonia (NH<sub>3</sub>), volatile organic compounds (VOC), and carbon dioxide- equivalent (CO<sub>2</sub>e) emissions in the park, while beef cattle are the primary

contributors to fugitive dust and particulate matter (PM<sub>2.5</sub>) emission rates. The reduction in the number of beef cattle would see a large reduction in PM<sub>2.5</sub> emission rates relative to existing conditions. Mobile source emissions would be similar to existing conditions because a change in visitor use levels is not anticipated.

#### Alternative E

Noticeable beneficial impacts to soils would occur compared to existing conditions from the conversion of the six dairy ranches to beef operations, elimination of manure management practices, seeding, forage production, and diversification activities. The removal of dairy operations under alternative E would eliminate adverse impacts on surface water quality associated with livestock congregation and concentrated manure storage near milking barns and would eliminate potential impacts from spreading manure in the Pasture subzone. Alternative E would have beneficial impacts on water quantity from the reduction of authorized livestock numbers. Activities associated with ranching would have adverse impacts on some plant species and beneficial impacts on others. Impacts on wildlife from forage production, manure spreading, diversification, and high-intensity-use areas would be eliminated. Fencing and hazing will remain adverse impacts for the free-ranging Drakes Beach Tule elk herd. Adverse impacts on visitor use and experience could occur as a result of killing of elk would be temporary and localized. The closure of dairy operations would have some beneficial impacts related to experiencing natural sights and sounds. Discontinuing dairy operations would result in an adverse impact by removing the opportunity for visitors to observe and experience active dairy ranching in a historic district. Activities will continue to contribute beneficial impacts to the Point Reyes Dairy Ranching Historic District and Olema Dairy Ranches Historic District cultural landscapes through ongoing grazing and to the ranch structures that remain occupied. It is anticipated that some dairy infrastructure may become vacant on the six dairies, resulting in potentially adverse impacts on historic structures. Activities associated with ranching would continue to emit criteria pollutants and greenhouse gases associated with cattle grazing, manure management on dairies, fugitive dust, and mobile source emissions. The elimination of dairy cattle would result in a reduction of NH<sub>3</sub>, VOCs, and CO<sub>2e</sub> emissions relative to existing conditions. Mobile source emissions would be similar to existing conditions because a change in visitor use levels is not anticipated.

#### Alternative F

Cessation of ranching would eliminate all impacts on soils associated with ranching activities. Alternative F would have beneficial impacts on water quantity from the elimination of authorized livestock numbers. Impacts on water quality would be noticeable, long term, and beneficial because ranching activities would be phased out across the entire planning area. Vegetation composition would likely change in areas where ranching is removed. While cessation of grazing would eliminate adverse impacts such as high-intensity-use areas, it may also result in an increase in invasive annual and perennial species such as thistles and grasses; a likely decrease in native forb species abundance and richness; scrub encroachment into areas currently characterized as coastal prairie; and an increase in vegetative fuels. Eliminating livestock grazing could also adversely affect several federally listed plants that occur in coastal grassland. Impacts on federally listed plants that occur in certain habitat, such as dune or serpentine habitat, may be beneficial because the potential for cattle to trample individual plants would be eliminated. Impacts on wildlife related to dairy and beef ranching would cease, including disturbance trampling erosion, and nutrient inputs. Ecological succession would occur as grassland habitats transition into scrublands or forested habitats, which would increase habitat for some wildlife but decrease it for others. Impacts on wildlife from forage production, manure spreading, diversification, and high-intensity-use areas would be eliminated. Impacts on elk related to hazing and fencing would be eliminated. Removing ranching operations would eliminate a unique experience for visitors to experience the role of coastal prairie ranching in California and in the historic districts, resulting in an adverse effect for visitors seeking those opportunities. Visitor opportunities related to experiencing natural sights and sounds would be expanded and there could be additional recreational trail linkages and public opportunities through the adaptive reuse of ranch complexes no longer used for active ranching, resulting in beneficial impacts for visitors seeking these experiences. The potential expansion of the elk population would result in long-term, beneficial impacts for visitor use and experience related to observing elk in their native habitat. Low priority structures may deteriorate or be demolished if in poor condition, potentially resulting in long-term, adverse impacts on those properties and the National Register districts to which they

contribute. Loss of pastures that are considered contributing sites could cause them to lose the integrity necessary to retain eligibility for listing in the National Register. The phase out of ranching would end ranching-related emissions of criteria pollutants: NH<sub>3</sub>, VOCs, CO<sub>2</sub>e, fugitive dust and PM<sub>2.5</sub>. Mobile source emissions would be similar to existing conditions because a change in visitor use levels is not anticipated.

#### Applicable Natural Resource Protection Laws and Policies

Based on the findings above, RRI finds the alternatives proposed by the NPS for the management of the park to be woefully inadequate and out of compliance with current laws and regulations that aim to prevent impairment of park resources and their values. Furthermore, RRI finds that, in the majority of the alternatives-especially the Preferred Alternative-the NPS fails to ensure that conservation will be predominant when there is a conflict between protection of resources and their use.

As displayed by the color-coded environmental and cultural impacts displayed above, the proposed alternatives remain in conflict with the most important statutory directive for the National Park Service: The NPS Organic Act.

The key management-related provision of the Organic Act is as follows:

[The National Park Service] shall promote and regulate the use of the Federal areas known as national parks, monuments, and reservations hereinafter specified... by such means and measures as conform to the fundamental purpose of the said parks, monuments, and reservations, which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations (16 USC 1, emphasis added).

Per the National Park Service Management Policies (2006): The fundamental purpose of the national park system, established by the Organic Act and reaffirmed by the General Authorities Act (1970), as amended (1978), begins with a mandate to conserve park resources and values. This mandate is independent of the separate prohibition on impairment and applies all the time with respect to all park resources and values, even when there is no risk that any park resources or values may be impaired. NPS managers must always seek ways to avoid, or to minimize to the greatest extent practicable, adverse impacts on park resources and values.

While RRI acknowledges the laws give the NPS management discretion to allow impacts to park resource and values when necessary and appropriate to fulfill the purposes of a park, RRI believes the cumulative direct and indirect impacts of lessees in the planning area for proposed Alternatives A, B, C, D, and E constitute an impairment because the NPS must leave park resources and values unimpaired unless a particular law directly and specifically provides otherwise (e.g., in relevant legislation or by the proclamation establishing the park) The enabling legislation, The Point Reyes Act (1962) and the GGNRA enabling legislation (1972, 1988), provides neither explicitly:

The Point Reyes Act provides, in pertinent part:

§ 459c-6. Administration of property (a) Protection, restoration, and preservation of natural environment: Except as otherwise provided in sections 459c to 459c- 7...the property...shall be administered by the Secretary without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with...the maximum protection, restoration, and preservation of the natural environment within the area (16 U.S.C. § 459c-6, emphasis added)

The GGNRA enabling legislation (1972, 1988) provides, in pertinent part: §460bb - Establishment: In the management of the recreation area, the Secretary...shall utilize the resources in a manner which will provide for recreation and educational opportunities consistent with sound principles of land use planning and management. In carrying out the provisions of this subchapter, the Secretary shall preserve the recreation area, as far as possible,

in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area (16 U.S.C. § 460bb, emphasis added).

The National Environmental Policy Act (NEPA) requires not only the analysis of an agency's alternatives, including the proposed action, are the heart of the environmental impact statement (40 CFR § 1502.14). NEPA regulations require an agency to rigorously explore and objectively evaluate all reasonable alternatives (40 CFR § 1502.14(a)), to devote substantial treatment to each alternative (40 CFR § 1502.14(b)), to identify the preferred alternative where one or more exists (40 CFR § 1502.14(e)), and to present the environmental impacts of the proposed action and the alternatives in comparative form to sharply define the issues and provide a clear basis for a choice among alternatives by the decision maker and the public. Other requirements include:

" Providing a no action alternative (40 CFR § 1502.14(d)); " Explaining why any alternatives were eliminated from detailed analysis (40 CFR § 1502.14(a)); " Identifying the environmentally preferred alternative (40 CFR § 1502.14(e), emphasis added).

RRI believes the NPS has not identified the environmentally preferred alternative, which it should have done.

### Questionable Impacts and DEIS Deficiencies

#### Vegetation, including Federally listed Species

The DEIS/GMPA states that under Alternatives D and F, ecological succession would occur as grassland habitats transition into scrublands or forested habitats, and-where ranching is removed-scrub encroachment into areas currently characterized as coastal prairie and an increase in vegetative fuels may occur. Yet, this supposed transition is dependent on a variety of ecological characteristics (e.g., elevation, soil types, hydrological cycling, etc.). Furthermore, as the DEIS points out, much of the most of the native species in coastal scrub and coastal prairie now compete with a large number of non-native annual grasses and forbs that were not historically present (DEIS 61). Human settlement and more than 150 years of grazing greatly increased the spread of Eurasian grasses and forbs, altering natural disturbance regimes of coastal prairies and affecting habitat structure and quality, species genetics, pollination dynamics, soil structure and microbes, as well as watershed hydrology, stream flow and erosion and sediment dynamics (DEIS 61). RRI takes note that none of the DEIS/GMPA alternatives include opportunities for significant restoration of natural resources and natural ecosystems, despite the NPS's mandate and obligation under its management policies (NPS 2006) to not only prevent impairment of park resources and values, but to actually improve natural, cultural, and physical resources and opportunities for enjoyment of the parks for the benefit of future generations.

Based on data collected between 1974 and 1993, vegetation changes on the Tomales Point elk range have shown relatively consistent levels of thick scrub while grassland- -particularly lupine grassland, and baccharis grassland populations-expanded dramatically (Bartolome, 1993). RRI points to that study as indicative of possible restoration projects that can take place throughout the seashore with great success for native flora and fauna, while supporting public recreation, use and enjoyment of natural and cultural resources at Pierce Point Ranch

#### Wildlife, including Federally listed Species

##### Tule Elk

For Alternatives A, B, C, D, and E, the NPS states that the future existence and overall viability of the tule elk population in Point Reyes would not be affected by management decisions. However, RRI believes the threat of Johnes disease from continued animal agriculture as well as genetic diversity were not adequately addressed in the DEIS/GMPA. Loss of landscape connectivity and habitat fragmentation are major threats to the biodiversity of plant and animal life in California (Spencer et al. 2010, Theobald, et al. 2011, Lacher and Wilkerson 2013). For this reason, California's State Wildlife Action Plan (California Department of Fish and Wildlife 2015) contains a

specific goal to maintain and improve wildlife corridors and genetic diversity (Goal 2.1, Connectivity). Mammals such as elk require large interconnected regions to maintain the genetic diversity of healthy populations (Kucera 1991, Lyon and Christensen 2002, Williams et al. 2004, Cronin et al. 2008).

Each of aforementioned alternatives are counter to California Department of Fish and Wildlifes (CDFW) 2018 Elk Conservation and Management Plan. In their 2018 Elk Conservation and Management Plan, CDFW note that elk populations are recovering but will never reach historic levels due to permanent loss of habitat and, given threats such as climate change and ongoing habitat loss - we must learn how to preserve biodiversity on a scale that protects entire ecosystems as well as the species that live within those systems (emphasis added).

Each alternative that provides ranch operating agreements (ROAs) to lessees with livestock herds known to be infected with Johnes disease-a fatal chronic wasting disease- will put elk and other ungulate populations that travel through the planning area at risk of Johnes disease. Furthermore, the state of California does not currently allow the translocation of elk outside the park because of concerns about spreading this cattle-born disease. Although tule elk do not currently exhibit the effects of inbreeding depression, such as low reproductive rates, or morphological deformities, the individual herds are at risk if they remain genetically isolated (Meredith et al. 2007) The DEIS/GMPA notes that the tule elk at Point Reyes are believed to be among the most inbred in California, but does not discuss any methods, solutions or efforts to counteract this or improve the genetic interchange of the Point Reyes herds, or whether or not reductions and maintained isolation of tule elk herds would affect the long-term viability of the population.

Furthermore, effective conservation and management of elk requires reliable information on population size, density, age structure, fecundity (birth rates), mortality (death rates), sex ratio, predation, parasites, pathogens, density dependence, genetics, stochastic events, and their use of habitats throughout the year and over time. These data were not presented for the public to understand the overall viability of the tule elk population in Point Reyes.

RRI believes the NPS should expound on the possible opportunities to manage herd size through translocation and genetic interchange throughout state populations once the threat of Johnes disease is eliminated due to cessation of ranching proposed in Alternative F.

#### Endangered California red-legged frog (*Rana draytonil*)

Livestock and ranching impacts on red-legged frogs are complex, with habitat provided for frogs by stock ponds, but many adverse impacts from grazing including removal of vegetation, trampling and siltation of streams and ponds, trampling of individual frogs or eggs, reducing habitat for invertebrates that provide prey, and decreased water quality and increased nutrient inputs from cattle manure.

The DEIS and the USFWS (2002) Biological Opinion extensively cover the numerous adverse impacts to frogs from grazing. The DEIS also notes that a variety of diversification activities could harm California red-legged frogs through mortality, capture, injury, and harassment.

RRI would encourage the NPS to expound on the potential for restored stock ponds, as well as perennial and seasonal springs and ponds to provide habitat for the California red-legged frog for proposed Alternative F.

#### Endangered Western snowy plover (*Charardrius alexandrines nivosus*)

The negative impacts of cattle grazing and ranching impacts on snowy plovers at PRNS are well documented and discussed in the DEIS. The biggest impact is from unnatural elevation of populations of common ravens near snowy plover beaches, which increases predation upon snowy plover eggs and chicks. Large raven populations are subsidized by ranch activities that provide food sources, such as livestock feeding and forage mowing that kills birds and small mammals, attracting ravens (USFWS, 2002; Point Blue, 2015).

Snowy plover populations which declined 32% from 1986-2000 largely because of nest predation by ravens (Ruhlen and Abbott 2000, Point Reyes National Seashore report).

In 2012, of the 52 disturbances to 10 predefined common murre sub-colonies at Point Reyes National Seashore, 23 events were predation events during which murre eggs or chicks were taken by ravens (Press, 2012). In this same year, juvenile brown pelican nests were also disturbed by ravens, causing loss of eggs and/or chicks. Results indicate that the proximity to ranch lands may play a role in the amount of corvid predation on common murre colonies (Press, 2012).

Starting in 2011, the National Park Service has routinely contracted with USDA Wildlife Services for targeted removal of ravens adjacent to common murre colonies in Point Reyes National Seashore. These expenses cost an average of \$40,000/y.

Press (2012) suggested immediate changes could be made by ranches to reduce common raven attraction, such as covering food troughs and calf housing areas, erecting exclusion fencing to keep cows away from sensitive areas, and prompt removal of raven food sources (e.g. uneaten or scattered feed, placentas, and carcasses).

And yet, common ravens have continued to cause number of snowy plover nest failures so far in 2019. Of the 14 nests discovered by May 15th, eight have failed; of these eight failed nests, six were preyed upon by common ravens (75%) (Lau, 2019).

The efficacy of wildlife protection at PRNS calls into question the validity of well-meaning but idealist approaches to balance conservation and restoration of natural resources/values and proposed agricultural uses in the planning area for proposed Alternatives A, B, C, D, and E.

#### Diversification

The zoning framework in alternatives B, C, and D is said to limit impacts on wildlife from authorized activities such as ranch diversification and remove grazing from sensitive resources such as riparian areas, surface waters, and federally listed species habitat. Impacts on wildlife would also continue to be avoided, minimized, or mitigated through the implementation of mitigation measures. Impacts on wildlife would remain beneficial or adverse, depending on the species.

The DEIS/GMPA promotes agricultural diversification because it "allows ranchers to react to poor forage production years and fluctuations in the economic market" (DEIS, p. 20), permits ranchers to continue...viable agricultural operations" (DEIS, p. 11), could provide a possible economic buffer for ranchers (DEIS, p. 181), accrue additional economic benefits for ranchers (DEIS, p. 181), and provide for ranchers financial security (DEIS, p. 181). None of these are valid or appropriate goals for NPS to consider as part of the DEIS/GMPA.

RRI opposes allowing any diversification, or new agricultural activities, under any alternative, due to unacceptable potential impacts to native wildlife and wildlife habitat. Diversification is included in all the alternatives except proposed Alternative A and F. Diversification would allow each rancher to add crops and previously unauthorized small livestock such as pigs, sheep, goats, and chickens to their operations. The DEIS fails to fully evaluate the impacts of this expanded agriculture on the parks wildlife or natural resources. There is no discussion of what measures will be taken when inevitably park predators such as coyotes, bobcats or foxes take chickens, lambs or other small livestock.

As mentioned above, regarding the efficacy of snowy plover protection, RRI is unconvinced the proposed attempts to avoid, minimize, and mitigate conflict with wildlife will be achieved through the proposed zoning framework. Wildlife, unfortunately, do not understand zoning frameworks. Instead, RRI recommends the NPS invoke the precautionary principle, and truly avoid, minimize, and mitigate impacts on wildlife by not allowing diversification to impair natural resource in the first place.

## Visitor Use, Experience, and Access

The DEIS/GMPA states that removing ranching operations would eliminate a unique experience for visitors to experience the role of coastal prairie ranching in California and in the historic districts in addition to discontinuing dairy operations would result in an adverse impact by removing the opportunity for visitors to observe and experience active dairy ranching in a historic district.

RRI believes the NPS overstates this impact. RRI points the NPS to a 2003 Survey conducted by Responsive Management on Regional Residents Opinions on Management Issues at Point Reyes National Seashore conducted for the Point Reyes National Seashore Association, 87% of the respondents thought the protection of wildlife habitat was a very important reason to have a National Park, while 80% of respondents thought that preservation of native ecosystems was a very important reason. Conversely, only 30% of respondents thought the preservation of small dairy and beef ranches was a very important reason to have a National Park.

## Visitor Circulation and Transportation

GMPs are required to include: (1) measures for the preservation of the areas resources; (2) indications of types and general intensities of development (including visitor circulation and transportation patterns, systems, and modes) associated with public enjoyment and use of the area, including general locations, timing of implementation, and anticipated cost. As mentioned in the Air Quality section below, RRI asked about emissions from transportation related to agricultural operations at PRNS in its 2017 and 2018 scoping comments. Not only were these not addressed, but nowhere in the DEIS/GMPA was there an assessment of intensities of development (transportation patterns of agricultural vehicles), which routinely affect road health and the public enjoyment and use of the seashore.

## Recreation development

Under alternatives B, C, D, E, and F, the NPS proposes to increase visitor use and enjoyment through new trails, expanded recreation, and addition of day use and overnight accommodations. RRI supports additional planning for visitor use to enhance trail-based recreation, day use, and overnight opportunities in the planning area that are aligned with conservation and interpretation natural and cultural resources.

Under proposed Alternative F, many of the former ranch areas and their associated facilities would be converted and offered for public not-for-profit education, research, outdoor experiential activities, and other public recreation and visitor opportunities. RRI support this concept and finds this to be aligned with practices employed at historic ranches and in historic ranching districts throughout the National Park System.

## Cultural Landscapes, Historic Districts, and Historic Structures

The DEIS/GMPA states that the desired condition for the preservation of cultural resources is that National Register of Historic Places (National Register) historic district, including contributing landscapes and structures, are preserved in a manner that maintains their integrity.

In considering impacts, the NPS states that Alternative F will result in a loss of pastures that are considered contributing sites could cause them to lose the integrity necessary to retain eligibility for listing in the National Register. Furthermore, the NPS anticipates that some dairy infrastructure may become vacant on the six dairies, resulting in potentially adverse impacts on historic structures.

RRI notes that even under Alternative F the seven qualities of historic integrity (location, design, setting, materials, workmanship, feeling and associations) relating to the ranching operation can remain intact as they have in other significant historic ranching districts such as the Santa Rosa Island Ranching District, Channel Islands National Park as well as the Hunter Hereford Ranch Historic District, Grand Teton National Park. As described in Alternative F, the NPS would apply a Historic Ranch Preservation subzone that would be managed for adaptive

reuse of approximately 24 historic ranch complexes in the planning area based on condition and integrity of the existing infrastructure.

It remains unclear why the vacancy of the six dairies, reduction in wear-and-tear, and the ability to manage for adaptive reuse and public use, interpretation and enjoyment of these resources would have adverse impacts on these historic structures.

RRI encourages park staff to look to other rural vernacular landscapes and historic ranching districts on the National Historic Register within the National Park system for inspiration. As a RRI believes the Point Reyes Ranching District and the Olema Valley Ranching District, in retaining their integrity in all landscape characteristics except land use (aside from prescribed grazing where applicable) would be of the highest benefit for the protection of natural resources and public use and enjoyment of structures and landscapes in the planning area.

#### Air Quality

Each of the alternatives states that mobile source emissions would be similar to existing conditions because a change in visitor use levels is not anticipated; however, no CO<sub>2</sub>e accounting is provided for mobile source emissions that pertain to the commercial beef and dairy ranching in the planning area. In its 2017 and 2018 scoping comments, RRI asked the NPS at PRNS to, identify what portion of the remaining park emissions from transportation sources are from ranching. No analysis is conducted to account for increase in VMTs for commercial agriculture due to the diversification of livestock proposed in Alternatives B, C, D, and E.

#### Frustration of the Public Comment Process

The NPS has stated that they will not accept public comments by fax, email, or in any way other than through the NPS comment portal website or by hard copy of comments which are mailed or hand delivered. So-called bulk comments in any format submitted on behalf of others will not be accepted. These rules seem explicitly designed to prevent public interest conservation groups from generating thousands of comments from their members through action alerts, as happened during scoping comments on the GMPA. These rules limit public participation. More public participation should be a goal of the NEPA process for this controversial management plan on public lands.

#### Conclusion

As the DEIS/GMPA is presented, Alternative F is the only proposed action in the planning area that would comply with the Organic Act, Point Reyes Act, and GGNRA enabling legislation. As such, RRI currently supports Alternative F, and looks forward to continued participation in the planning process.

Correspondence: The National Park Service has a golden opportunity to help slow down gGlobal warming by phasing out ranching on our public lands in our parks.

Killing elk to raise farm animals is short-sighted and destructive to a wide range of native plants and wildlife that belong on these lands.

The proposed park management plan allows destructive levels of livestock grazing to continue on 28,000 acres of national park lands in this treasured Pacific Coast landscape, despite the numerous known adverse impacts grazing has on coastal prairie, riparian systems, springs, wetlands, and coastal dune vegetation.

The National Park Service should be managing the National Seashore for the benefit of wildlife and the natural ecology rather than subsidizing special interests at taxpayer expense.

The proposed park management plan is flawed and must be stopped. This is not what the vast majority of the American people want.

Name: Thomas, Craig

Correspondence: Comments on the General Management Plan Amendment Draft Environmental Impact Statement considering extension of ranching at Point Reyes National Seashore from Craig Thomas and Vivian L. Parker 9-23-19:

Comment 1. We have enjoyed our regular visits to Point Reyes National Seashore to hike the beaches, enjoy shorebird birding, whale watching, photographing the plant community and seeing the Tule Elk and other wildlife. We both have science backgrounds and Vivian is former Forest Service and NPS botanist. We decided to never return because on the heartbreaking level of impacts associated with the cattle ranching.

We have never been fond of the permitted ranching idea but on our last visit the degradation was so severe in terms of more than a century of cattle grazing which has altered and degraded the natural ecosystems of the park. The GMPA EIS notes impacts to plant and animal species and their habitat from cattle grazing; water pollution from cattle manure runoff; and greenhouse gases and air pollution from cattle operations, and the invasive species that are proliferating throughout this once pristine landscape.

None of the alternatives discusses the costs or timeline for mitigating these impacts. None of the alternatives considers the Seashore's restoration-what it might cost; where the NPS might focus attention; what the benefits would be to wildlife, water, climate change mitigation, or public visitation and use.

2. We are strongly opposed to the concept of "succession" and allowing permanency of use or 20-year leases. We also object to the "diversification" concept to grant further rights to ranching families to expand production of various animals beyond cattle and to grow and sell crops on this public land that is a national treasure that should be restored to its pre-ranching natural state. There is no discussion of diversification impacts to the park. Ranchers in the Seashore already have a competitive advantage over ranches outside the park. Seashore ranchers benefit from discounted grazing fees, below-market-rate housing, and maintenance and improvements to roads, homes, and farm buildings covered at public expense. Seashore ranches pay no property taxes. NPS should not grant any stronger private foothold on Point Reyes National Seashore.

3. These ranching practices are not sustainable. Manure runoff polluting the only marine wilderness south of Alaska is not sustainable, it is an outrage. Allowing cattle to give elk and other wildlife life-threatening diseases is not sustainable. Subsidizing and endorsing methane-producing confined animal feeding operations (CAFOs) in an era of climate change is not sustainable or socially acceptable. Trucking hay for hundreds of miles as a supplemental feed, because pastures are overstocked and overgrazed, is not sustainable. And now NPS is proposing to kill off the Tule Elk to maintain the ranching special status offered by the NPS.

4. Cows are not a cultural resource, the ranch houses and barns maybe but a cow is a cow with nothing historically specific about them.

5. Welfare Ranching- -The National Park Service has not provided any information on the dollar amount or portion of its budget that goes to ranching-related expenses. Ranching places increasing demands on dwindling park budgets, while park improvements and a backlog of maintenance, along with public programs and interpretation, go unfunded. Meanwhile, scarce resources go to support 24 ranchers operating in the Seashore, including killing wildlife to benefit their operations. Ranching's environmental impacts have an uncounted economic impact on the Seashore. Internal Park Service memos indicate monitoring the ranches for lease compliance and environmental damages already places outside demands on the Seashore's staff and budget. The NPS has failed to enforce lease agreements when leases are violated. Can we expect that expanded agricultural practices will be met with responsible oversight with no expansion of budget to enforce these more complex leases?

6. It is past time for the ranching on Point Reyes National Seashore to end! We strongly support Alternate F - - Ending ranching, not allowing any diversification of production or the extended allowance of 20-year leases on public NPS National Seashore.

Thank you for this opportunity to comment on the GMPA.

Craig Thomas and Vivian L.Parker

Name: Krasnov, Alex

Correspondence: The Tule elk were extinct. Then! A single breeding pair was discovered. The herds that originated from this pair are a national treasure and the jewel of Point Reyes. Millions of visitors, this author among them, come to see the majestic Tule elk every year. Very few come to see the cattle- -cattle which are not native to Point Reyes and which reside on public land largely off limits to the public.

The broad negative environmental impacts of the cattle operations are well documented, including in the current Environmental Impact Statement. This author will state only two: competition for resources with the Tule elk and black-tailed deer in the latter's habitat and, per policy, the resulting needless death of some 250 Tule elk during the recent drought, and likely transmission of fatal paratuberculosis to the Tule elk and black-tailed deer. On the other hand, the Tule elk have largely positive impacts on their grassland habitat, increasing the diversity and abundance of native species and decreasing that of non-native ones, per recent research at Tomales Point. Furthermore, the resource equation is simple. Cattle consume approximately 5 times as much forage per day as do Tule elk, and approximately 10 times as many cattle reside at Point Reyes as do Tule elk. Therefore, the carrying capacity of Tule elk at Point Reyes is easily between 5 and 50 times the current number.

The policy considerations pertaining to natural value are equally simple. The cattle are non-native and domesticated and reside on public land. Previously, per policy, the non-native Axis and Fallow deer were removed, primarily because of competition for resources with and transmission of disease to the Tule elk and black-tailed deer. The same policy did not extend to the cattle. Later, per policy, the non-native oysters in Drakes Estero were removed. Again, the same policy did not extend to the cattle. The time has come to apply policy consistently for the conservation of this unique environment.

The policy considerations pertaining to historic value lead to the same conclusion. The current cattle operations are not consistent with conservation for the enjoyment of the public because they are not of conservational or interpretive nature, are not open to the public and do not benefit the public.

The only alternative which is ethical and lawful, and consistent with both the natural and the historic value aspects of the National Park Service mandate, "to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations", is one that phases out all cattle operations at Point Reyes, converts the historic infrastructure to conservational and interpretive status and fully opens the utilized land to the public and to the Tule elk (Alternative F in the EIS). Any alternatives which harm or artificially restrict native animals in their habitat for the benefit of competing human operations, much less expand such operations, as does the alternative preferred by the NPS (Alternative B in the EIS), are unethical and unlawful, and perpetuate the negative impacts of human activity in this environment for generations to come.

Name: Krieger, Frederick

Correspondence: The following comments concern the adequacy of the analysis in the Draft EIS. - 1. Tomales Bay - Impacts on 303(d) listed waters The draft EIS should identify and assess the potential adverse impacts on the adjacent waters in Tomales Bay, including impacts on the parameters for which the Bay is classified as impaired on the Clean Water Act, 303(d) list of impaired waterways in California.

Tomales Bay is currently included on the 303(d) list as impaired due to the presence of the following pollutant parameters: • Nutrients • Pathogens • Sedimentation/Siltation

These listings were made by the State Water Boards and approved by EPA in 1992. The sources of the impairment are listed as unknown, but the presence of the Park on one side of the Bay suggests that the Park could potentially be a major source. Very limited information was presented in the Draft EIS concerning possible impacts, and no information was available on the specific concentrations of pollutants in waterways draining to the Bay or in sheet runoff entering the Bay from stock pastures. These three parameters, for which the Bay is listed, are commonly the

result of agricultural operations. In addition, the heavy sedimentation in the upper of the three lagoons at Abbotts Lagoon due to the I Ranch (?) dairy, as reported by USGS, strongly suggests that these agricultural operations have the potential for very significant adverse impacts. The USGS sampled bed sediments from each of the three lagoons at Abbotts Lagoon in 1999/2000 and found very heavy sedimentation in the uppermost lagoon. USGS also sampled for nutrients and found that most of the nutrients in Abbotts Lagoon came from the I Ranch (?) dairy operations. This information should be included in the Draft EIS.

No assessment was included in this draft concerning these past impact-have they been mitigated-and whether similar impacts may occur elsewhere in the park.

2. Compliance with Regional Water Board Water Quality Objectives and potential impacts from non-compliance  
The document states:

"...other parameters (temperature, specific conductance, turbidity, and nitrate) do not have established water quality objectives but can be compared to ecological objectives drawn from scientific literature (Wallitner and Pincetich 2017)."

This statement is not accurate. The Regional Water Board's Basin Plan, Chapter 3, does include objectives for these parameters.

Temperature: Temperature objectives for enclosed bays and estuaries are as specified in the "Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays of California," including any revisions to the plan.

In addition, the following temperature objectives apply to surface waters:

- The natural receiving water temperature of inland surface waters shall not be altered unless it can be demonstrated to the satisfaction of the Regional Board that such alteration in temperature does not adversely affect beneficial uses.
- The temperature of any cold or warm freshwater habitat shall not be increased by more than 5°F (2.8°C) above natural receiving water temperature Specific conductance, turbidity, etc: The Basin Plan applies the California secondary maximum contaminate levels (MCLs) to waters potentially used for agricultural or municipal supply. The MCLs include specific conductance and turbidity.

From the Basin Plan:

3.3.22 CONSTITUENTS OF CONCERN FOR MUNICIPAL AND AGRICULTURAL WATER SUPPLIES At a minimum, surface waters designated for use as domestic or municipal supply (MUN) shall not contain concentrations of constituents in excess of the maximum (MCLs) or secondary maximum contaminant levels (SMCLs) specified in the following provisions of Title 22, which are incorporated by reference into this plan: . . .

At a minimum, surface waters designated for use as agricultural supply (AGR) shall not contain concentrations of constituents in excess of the levels specified in [Basin Plan] Table 3-6. Table 3-6 includes objectives for pH, electrical conductivity and many other parameters.

Other parameters with objectives in the Basin Plan and Ocean Plan

More importantly, the impacts on the other objectives in the Basin Plan and the California Ocean Plan are not assessed. For example, does runoff from the stock operations contain pollutants exceeding the toxic and other pollutant objectives in the Basin Plan including the secondary MCLs for aluminum, iron, color, odor, turbidity, TDS, or the Primary MCLs? (See the Secondary Drinking Water Standards In Title 22, CCR., Division 4, Chapter 15, Article 16). Does the periodic outflow from lower Abbotts Lagoon and from other Westside waterways carry

nutrients or pathogens at levels of concern into the adjacent Ocean waters in violation of Ocean Plan standards? Site-specific data is necessary to make this assessment.

The following statement in the EIS is not adequate and provides no information whatsoever on the concentrations of pollutants of concern in runoff from the agricultural operations. Sources of nutrients and potentially pathogenic bacteria include animal waste, human waste from failing septic or treatment systems, boat discharges, fertilizers, and decomposing organic material (SWRCB 2013).

The draft EIS also includes this statement:

Grazing and dairy operations in the planning area can receive a waiver of waste discharge requirements instead of meeting numeric constituent targets established either by TMDLs in the planning area or by the RWQCB's Basin Plans.

This statement identifies possible regulatory options but does not assess the actual environmental impacts of the agricultural operations in the Park on the waters of Tomales Bay or the Ocean. The EIS discusses various mitigation measures to address pollution in Abbots Lagoon and Kehoe Beach but provides no data whatsoever on the concentrations of pollutants currently being discharged and the resulting impacts on fresh or marine waters.

In addition to impacts, mitigation measures should also be discussed.

3. Human/Cattle interactions In some park locations, trails for the use of park visitors pass through stock grazing areas. At times, cattle may move towards the hikers and start to gather around them. The stock are most likely curious, but this situation can be very disconcerting for those not familiar with the habits of stock animals. The draft EIS does not appear to address these impacts on Park users.

4. Impacts of overgrazing Particularly during dry years, some of the pasture lands are severely overgrazed. Overgrazed land results in increased soil erosion which carries nutrients, soil particulates, and animal wastes into waterways. Overgrazing also reduces the biodiversity of the land and ultimately decreases productivity. None of these impacts of the agricultural operations are assessed. Alternative E states:

All ranches would continue to follow specified RDM standards to minimize overgrazing. A zoning framework and applicable mitigation measures, as described under alternative B, would also reduce impacts. Continued grazing by beef cattle under alternative E would provide habitat conditions suitable for many species of wildlife that prefer grasslands. [emphasis added]

Overgrazing obviously does not provide habitat suitable for many species of wildlife. The Draft EIS should describe the conditions and frequency with which overgrazing occurs and address the impacts of the overgrazing which is very evident within the Park. Potential mitigation options should also be discussed.

Correspondence: I support increased bicycling access in the Pt. Reyes area. Bicycling is my primary form of recreation and I love Pt. Reyes.

I'm writing to support the public access and bicycling improvements outlined under Alternatives B, C, D, E, and F. I strongly support proposals that would lead to the planning and implementation of bicycling routes on trails, ranch roads, and pathways throughout the planning area, including but not limited to: 1) a connection between Devil's Gulch and Platform Bridge Road using existing ranch roads, 2) a connection between Bolinas Ridge Trail at Olema Hill and Point Reyes Station to serve as an interim connection for the Cross Marin Trail, 3) a connection between Bolinas Ridge Trail and Five Brooks Stables using existing ranch roads 4) a connection between Drakes Estero and Abbots Lagoon Trail using existing ranch roads, 5) a connection between Marshall Beach Trailhead

and Pierce Point Road using existing ranch roads, and 6) an Estero Trail loop using existing ranch roads. I encourage NPS to collaborate with ranchers and other stakeholders to educate the public and address concerns related to public access on working ranch lands.

The improvements outlined above would enable and encourage me to visit the Seashore more regularly-and by bike, rather than car. I would feel much safer riding in the Seashore and surrounding areas on trails, pathways, and ranch roads, rather than on roads shared with fast-moving vehicular traffic. Bicycling opportunities are currently very limited and fragmented, so any improvements in connectivity and the creation of new loop options would enable me to enjoy more of the Seashore and surrounding areas by bike.

Thank you, Marc

#7533

Name: Collett, Dede

Correspondence: I do not believe that the elk should be shot, and I desire that they spread throughout the park as they appear to be doing. The elk are a pleasure to see and hear in their "wild" way, to have them systematically killed as to maintain a specific herb, impresses me as being "manufactured.", if this occurs, I will never be able to look at the elk again in the same way - it will be just like the situation with the cattle. Staged and artificial. I would rather not have the elk in the park, then have the majority killed and a number left to present the impression of a thriving natural herd. I am at the park regularly and love seeing the Drake elk. And, when we come upon them in places where we hadn't seen them before, we are overjoyed and excited. It feels like such a betrayal to control the elk by killing them, an injustice to the elk, as well as all of us. I say, let the herd expand and die off naturally. The prospect of them being shot as a means to control the population saddens me terribly, it also is terribly disturbing.

Thank you, Dede Collett

Correspondence: I'd like people to say they support alternative F, the only alternative that phases out ranches and restores the land to what it was bought and paid to be - a national park dedicated to wildlife protection. Cattle grazing is harmful to the environment in so many ways, and this space is meant for the native residents, the Tule Elk.

#7535

Name: Hipps, James

Correspondence: To The National Park Service:

I comment today because the proposed General Management Plan amendment for Point Reyes National Seashore and Golden Gate National Recreation Area fails to protect and restore these vital public lands. The Point Reyes National Seashore legislation specifically mandates that this special coastline be "protected" and "restored."

I append my comments to those of Denise Boggs, Director of Conservation Congress, who wrote: "The National Park Service should be managing the National Seashore for the benefit of wildlife and the natural ecology. Emphasizing livestock ranching while subsidizing welfare ranchers is a takings of public land. Livestock don't belong on public lands in general and certainly not in a Seashore where fecal matter can get into the ocean."

Additionally, I append my comments to those of Laura Cunningham, California Director of Western Watersheds Project, whose testimony includes this statement: "I have seen coho salmon streams (within Point Reyes National Seashore) eroded from heavy trampling by the hooves of beef cattle, native bunchgrasses grazed out of existence..."

Managers for NPS, GGNRA, or Point Reyes National Seashore should not allow hazing elk out of cattle pastures or any action to lethally remove native elk. I add my voice to oppose any such plans or proposals.

Thank you for the timely consideration of these comments.

Sincerely, James Hipps

Name: Wilson, Karen

Correspondence: Comments on Draft EIS for GMP Amendment: I, my family, and friends use Pt Reyes National Seashore often for its intended purpose "to save, preserve, or purposes of public recreation, benefit and inspiration." It is "a portion of the diminishing seashore of the US that remains undeveloped," as stated in the enabling legislation for establishment.

A modified version of Alternative D would best meet the purposes of the proposed Plan. Ranching should be discontinued in the two areas where it is inconsistent with zoning. However, no increase in the level of commercial activity should be allowed by leaseholders. Their rights to any such increases were given up when they agreed to being compensated in the 1960's. Expanding such uses as bed/breakfast or large crops or large herds of other livestock are not in the interest of purpose and need.

New lease permits on 27,000 acres for successive family members should be for terms of 10 years, which gives some guarantee of continuity, as long as conditions are met. Alternative A has good provisions, such as fencing 800 acres from cattle to protect sensitive resources. Also not to alter or limit the population level or geographic range of elk in Pt Reyes so there is no conflict with ranchers, yet an opportunity for Recreation it's to enjoy observing them.

It is important to restore the Pastoral Zone and allocate funds for this. Scientific research and public education are good uses for buildings that can be re-purposed. Although some new building and trail improvements would be good on disturbed places, generally there should be no new development.

Alternative F should be the eventual goal, long-term, since eventually ranch families will discontinue their ranching on these lands. In the meantime, improved BMPs need to be used to provide beneficial impacts on water quality. As stated, discontinuing ranching - "beneficial impacts on water quality would be noticeable, long term."

Also vacant ranch complexes should be utilized for car-camping campgrounds, larger trailhead, and other visitor facilities. Currently use is so concentrated and is becoming more and more popular. Wider distribution of visitor facilities would be best.

Serpentine habitat needs to be mapped and protected.

Correspondence: Tule elk are an important part of California's natural history. Agriculture monopolizes quite a bit of our open space and resources in California. I don't find it appropriate to prioritize cows and chickens over elk, when there are other areas already dedicated to domesticated animals. I find it your responsibility to create extensive wildlife corridors, so that elk, among other large wildlife, are able to successfully build their populations in California.

#7538

Name: Nabavi, Faramarz

Correspondence: I oppose the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. For this reason, I support Alternative F.

As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits.

The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals.

Please abandon this inhumane and destructive plan by selecting Alternative F. I urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

Additionally, any grazing that conflicts with native species must be eliminated.

#7539

Name: LaSasso, Victoria

Correspondence: Thank you for allowing me to provide comment for Point Reyes National Seashore's environmental impacts statement and the general management plan.

I am thankful to the planners that many of my comments during the 2018 comment process were heard. I was particularly heartened to see that Alternative F could provide absolutely incredible opportunities for public use and enjoyment of the 1/3 of the park that is mainly off-limits to hikers, campers, and other outdoor explorers; as well as wildlife that could, in time, reclaim their home.

I have traveled all over the National Park System and I believe in the potential of Point Reyes National Seashore. Though much of the land is currently in bad condition, I have read that more than half of the bird species in the United States can be found here. This means that the restoration of this coastal dune/scrub/prairie landscape could be a safe haven for birds. The American Association for the Advancement of Science published a paper last week stating that we have lost over 3 billion birds across the United States (30%) since 1970. Much of this loss, like the loss of tule elk and other wildlife, is due to the encroachment of human use of our protected lands and rural open spaces.

I am concerned that your preferred Alternative is not in line with the writing on the wall for our climate, nor the global effort to sustain and restore biodiversity. Alternative B appears to be the worst option for the planet, for biodiversity, the majority of endangered species, water quality, and public use and enjoyment. So why is that the preferred alternative? What justification does the park service have?

Scientists say we have less the twenty years to turn things around on this planet we call home. As a government agency holding this park in public trust, isn't there some obligation to mitigate all impacts? As mentioned in my scoping comments, but not addressed in this general management plan amendment, the park makes no effort to delineate a path to become carbon-neutral and instead appears to double down on animal agriculture? For what cultural resources? I've learned and explored more of Peirce Point Rance and D Ranch than any other ranch in that park. I think my family and friends would say the same. These are fantastic places to see elk, barn owls, weasels, coyotes, and other wildlife that have reclaimed the peninsula. That is the true balance of natural and cultural resources at Point Reyes and, hopefully, the trajectory of the human continuum for all our National Parks.

VL

Name: Rowland, Rene

Correspondence: Point Reyes GMP Amendment EIS Cicely Muldoon, Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956

September 23, 2019

RE GMP Amendment: Point Reyes National Seashore and the north district of Golden Gate National Recreation Area

Dear Ms. Muldoon,

On behalf of PawPAC and its 6,000 members, I write to support the Tule Elk Preserve at Point Reyes Seashore. A preserve was established for the elk, yet corporate interests would undermine the elks and undercut the peoples interest in one of our national, public treasures. Sustained by tax dollars of the many, the National Park Service should not accept private arrangements from the few. That is to say, We, the Public do not support priority given

to private cattle and dairy ranchers on public lands that we fund. We do not support 20-year grazing permits. And we do not support killing the elk to clear the land.

Since 2006, dropping meat and dairy became a sweeping movement after the Food and Agriculture Organization of the United Nations released its groundbreaking report that the animal agriculture sector is responsible for approximately 18%, or nearly one-fifth, of human-induced greenhouse gas emissions. Now, it's a matter of life and death, as humanity faces an irreversible fate due to global warming, unless we stop all routes to advancing global warming. Ethics and the preservation of not only the Tule elk's home, but the planet that sustains life for all, are fully enough reason to disallow any lease with private ranching operations. These arguments are neither vague nor unresearched. The tax-paying public should not even be put in a position to defend what has already been granted us: our national parks and preserves.

Sincerely,

René Rowland, Chair

Name: Allen, Sarah

Correspondence: Thank you for the opportunity to comment on the Draft General Management Plan Amendment (DGMPA) for Point Reyes National Seashore (PRNS) and the North District of Golden Gate National Recreation Area (GGNRA). The document is extensive but lacks important information for the parks to properly manage the resources that they are entrusted to protect unimpaired for future generations of the American public. Under the preferred alternative (Alternative B), the parks likely will be significantly altered because of the probable effects on resources from diversifying ranching activities. Diversifying ranching operations to include grazing sheep, goats, pigs, and developing row crops expose park resources to potential new threats. Each of these types of ranch animals graze in significantly different ways, magnifying already existing stresses to natural resources such as air and water quality, native biodiversity, and introduction of non-native species and livestock diseases. While the document notes that diversification will not include ducks, geese, turkeys and rabbits because of potential disease or parasites, it lacks information on the potential conflicts with native wildlife and the introduction of zoonotic diseases to wildlife from sheep, goats and pigs. There is little information on how management proposes to mitigate wildlife conflicts with native predators that do not prey on cattle but will attempt to prey on smaller livestock. Also, the document contains recommendations for testing of disease, especially Johne's disease, in native elk but not for testing livestock that may introduce disease to native wildlife. The California Department of Food and Agriculture provides extensive information on the risk of disease introduction (see [https://www.cdfa.ca.gov/AHFSS/Animal Health/Swine Health.html](https://www.cdfa.ca.gov/AHFSS/Animal%20Health/Swine%20Health.html)). The preferred alternative provides little analysis to explain potential impacts to park resources and the public by diversifying ranching. The preferred alternative supports agricultural resources over natural resources by increasing existing agricultural livestock numbers with the addition of diversification while reducing native Tule elk numbers to a threshold of only 120 and preventing any new elk herds within the park. Lethal management of native wildlife to benefit commercial interests of a lessee are prioritized over the adaptive management strategies that are outlined in recommendations provided in the 1998 Tule Elk Management Plan. The herd threshold of 120 elk is not based on a comprehensive scientific review of factors other than forage competition with cattle. Strategies to manage elk populations should be in the context of managing other resources within the Seashore such as water quantity and quality. Finally, Tule elk in the pastoral zone should be managed in the context of the overall population level in the park. The preferred alternative lacks any analysis of anthropogenic climate change effects with ranch operations. The document does report on the magnitude of carbon dioxide contributed by livestock under existing conditions but does not report on the additional contribution from diversified livestock. Scientists have documented projected and existing effects of anthropogenic climate change on resources at the parks (see Gonzalez et al. 2018). Most models, including downsized models for the San Francisco Bay Area predict increased rainfall and drought events. The six year drought in this century that had direct effects at Point Reyes is a stark example of the types of environmental conditions that projected climate changes will have on the parks. Scientists have already documented declines in biodiversity and other changes in birds at the Palomarin Field Station at

Point Reyes related in part to changes in climate (Ballard et al. 2003 and Goodman et al. 2011). Vulnerability assessments of bird species (see Gardali et al. 2012) are especially important to apply to protected areas such as parks, which are often the last refuge for rare and endangered species. The U.S. Committee of the North American Bird Conservation Initiative (NABCI) just released an alarming report on the status of birds in North America (<https://www.stateofthebirds.org/20190> where they document a 30% decline of birds over the past 50 years. The proposed actions of the DGMPA (diversification of livestock, introduction of thousands of chickens, brushing, manure spreading, and silage production) will further depress bird diversity and abundance at Point Reyes. The omission of climate change projections in the DGMP A analyses seriously hinders managers from adaptively managing parks to preserve and protect birds and other irreplaceable natural resources. The National Park Service (NPS) Natural Resource Stewardship Strategy (2016) presents four pillars to guide NPS "to adapt and respond to continuous change, with a focus on long-term ecological integrity and viability." One pillar, "Hold the Line" is especially pertinent to the DGMP A because it emphasizes the importance to "conserve and restore biodiversity and ecosystem integrity." The proposed addition of diverse ranching practices will accomplish the opposite intent of this stewardship strategy by reducing native biodiversity, increasing wildlife conflicts, and introducing non-native species and disease at a time when environmental challenges are unprecedented because of climate change. As noted in the Report Revisiting Leopold: Resource Stewardship in the National Parks (2012), "Environmental changes confronting the National Park System are widespread, complex, accelerating, and volatile." Now is the time to work creatively with ranchers to face the immediate and urgent challenges of climate change by reducing their carbon footprint from ranching/livestock emissions (24,611 metric tons of CO2 per year compared to mobile source emissions of only 3,734 per year; page 96 of the DGMPA) as well as other practices, while continuing their historic beef and dairy ranching. Thank you for the opportunity to comment and for your efforts to resolve such complex issues while preserving these precious resources.

Correspondence: I urge the National Park Service not to kill Tule Elk at Point Reyes National Seashore in order to protect the profits of the beef and dairy industry. Tule Elk, which are native to Point Reyes, were exterminated and then reintroduced by the National Park Service. Now the beef and dairy ranchers, which no longer own the land they occupy, want extend their land leases and cull the Drakes Bay Tule Elk herd. We ask the Park Service to protect wildlife over industry profits and select the alternative of no ranching and protection of the Tule Elk herd. Point Reyes National Seashore is a biologically diverse park that visitors from all over the world come visit to see the Tule Elk. Our National Parks are for nature not agribusiness.

The tule elk have been here for thousands of years and are essential to the biodiversity of Point Reyes. Ranching is killing our environment.

Correspondence: Dear Ms. Muldoon, I attended the workshops last month which showed the same plans as I saw

last year. I have learned since last year that female elk can be darted with contraceptives, yet David Press, your employee (who announced the tragedy of the 200 dead elk in 2015), seems not interested in pursuing this option. With the current burning of forests worldwide and the fact that raising cattle contributes very significantly to global warming, I beg you to consider removing cattle from Point Reyes National seashore and permit the area to be a sanctuary for Tule Elk and also an area of reforestation. To offset climate change, it is said we need to plant a million trees. Why not use the land that has been degraded by the cattle for trees? Any actions to prolong the cattle and dairy industries on this public land will be judged as contributions to the destruction of our planet.

Correspondence: 1. I oppose the proposal to allow horse boarding in the Ranch Core subzone for the following reasons: Horse boarding facilities visible from our west Marin roads, especially along the Road between Sir Francis Drake and Nicascio are abusing the land. The paddocks are bare ground; the exposed surfaces drain directly into streams; the hillsides are also bare. This is the worst kind of stream abuse. Why should we expect property mgt. to be in the Seashore to be different? In addition, only food and fiber production are identified as agricultural uses. Horse keeping is not an agricultural use according to the Marin County General Plan.

2. Visitor Experiences and access Allowing increased visitor access by increasing the number and or width of trails in addition to the potential to allow e-bikes in the SeaShore can only lead to increased management problems. All of the visual and physical impacts of bikes in and on Marin's Open Space District trails are only too visible for all to see and provide an object lesson for PRNS management. In 1993 for example, adjacent to the open space and Nature Center located on the north side of Highway 92, bordering the eastern approach to the San Mateo Bridge, a trail extension to allow access to a way across Highway 92 was proposed. The Bay trail is next to the shoreline and the trail leading to the bike crossing at the freeway cuts diagonally through the marsh/wetland habitat. A study conducted in Marin in 1985 to document impacts of trails on marsh habitats documented measurable losses of plant and animal resources adjacent to the trails and additional impacts extending out from the trails. Why should the PRNS expect a different result? 3. Managing the Tule Elk The document does not provide actual evidence of consultations with the California Dept. Of Fish and Wildlife, especially concerning the possibility of relocating the excess elk to suitable habitat in other locations in California. The Tule elk were widely distributed in California, ranging from coastal areas to 3,000' elevations. Relocation would allow the separation of the small groups of the inbred herd to other locations. Culling should be used very selectively and thoughtfully.

4. Consultation and Coordination PRSN is an integral part of the Golden Gate UNESCO Biosphere Reserve. The Reserve was created in 1988.(see attachment). There two MABs in France that share the same challenges as PRNS. The Reserve in Brittany, Iles et Mer d'Iroise actually had staff members working here in the mid 1990's with our people doing research for GGNRA. It was a 4 year contract. There must be records of this somewhere. In addition. The Cevennes Biosphere Reserve in the mountainous region of central France, contains France's only park that includes active agriculture. They also have an elk, referred to as the RED DEER, Cervus elaphus that was extirpated from the region in years past. The Park was working on a reintroduction program when I visited there in 2006. PRNS could benefit from the experiences of the staff at the Cevenne National Park Headquarters(see attachment). For local GGBiosphere information the contact is: Lia J Hull. c/o Jasper Ridge Bio Preserve, Stanford University, CA 94305-5020 Conclusion In conclusion, I fully support the positions of MALT, Phyllis Faber and all the dedicated ranchers of PRNS.

Name: Kramer, Ann

Correspondence: I recently visited Point Reyes NP Seashore for the second time. I've been making it a practice to visit the National Parks within the Western States as I'm a California resident and plan to retire soon. I enjoy the

rolling hills of Point Reyes NP, the climate, the assorted wildlife, the Lagoon, and the city. It's a beautiful spot. I've seen, on my two visits, Bobcats, a Weasel, River Otters, Badgers, Hawks, Osprey, Elk, Coyotes, Herriers and a skunk! It is refreshing to see wildlife in it's natural habitat free from encroachment. I learned of the proposed changes to the park by the National Park Service. The plan to cull (kill) the elk herd to maintain 120 and to convert some of the land to crops and farm animals was stunning and sad to me. I had to read it a couple of times to believe what I was reading. It is incomprehensible to me how a National Park could be developing land with crops and more farm animals when there are abundant acres of farm crops all over California. I think it is the mission of National Parks to protect and preserve what is wild and natural. How do crops and farm animals serve that goal? My understanding of PRNS was that when the park became a dedicated national park, the ranches in the area were allowed to continue their ranches for 25 years or the life of the owner. That has long been surpassed and it looks as though there is no intention for the ranches to be eliminated or finished. It's an odd thing for me to drive through a NP with cows in every sector of the park. I have to surmise this tolerance and violation of the original agreement is a contributor to these current decisions which will further put the nature and wildlife at peril. How will a bobcat or a coyote or a hawk or any other predator be treated when they invade crops? What about small animals? Is a predator likely to know this is hands off? There is already a bit of a war going on with ranchers and coyotes. How will these new rules provide sanctuary for wildlife? We are undergoing a reversal in our current political environment for concern for environment, protection of wildlife and endangered species, provision of migration paths, protection of national parks and wetlands. This administration has consistently catered to money and industry over the welfare of our country, it's people and our natural resources. I did not expect this to extend to California and I am further disheartened and angry to see these decisions. I'm strongly against what the National Park system is allowing here. This would be an opportunity in the least to set an example for the nation and how to manage cattle and nature in some coexistence, to live with respect for one another. We are, after all, on their land. Respect for the natural should, in the least, be a priority in a National Park. I implore you to reconsider this decision. It is obvious that these decisions are based on money and the undermining of what a National Park is intended to be. A Cree proverb: "Only when the last tree has died and the last river has been poisoned and the last fish has been caught will we realize we can't eat money." And, we can't breathe it, or visit it, or find our connection with ourselves and nature in it either. Thank for your time and consideration in this matter.

Correspondence: Dear Sir: Why in the world would anyone want to curtail one of the most successful wildlife reintroduction projects in California's history? I have read there were once about 500,000 tule elk stretching from the lush floodplains of the Central Valley to the grassy coastal hills in California, but by 1874 they were thought to be extinct. What I learned is that early mariners and explorers wrote about vast herds on the Point Reyes peninsula, but these herds were hunted relentlessly after the Gold Rush. Consequently, their habitat was converted to crops and cattle grazing land. I understand that after a wealthy landowner, Henry Miller, discovered a dozen or so tule elk in Kern County, the herd grew. Gratefully, the elk became protected in 1971. The effort to restore tule elk populations has progressed very well. I heard that in 1978, 10 tule elk were moved to the 2,600-acre Tamales Point Elk Reserve at Pierce Point. Apparently, their success there encouraged the Park Service to move 28 animals to the Limantour Beach area, in 1999. According to what I read, within two years, the free-ranging herd had split up, with some apparently swimming across Drakes Estero, where they began grazing among the cows near the historic ranches. There are now three elk herds. According to the winter count, 95 freeranging elk live in the Drakes Beach area, and 130 hang out in the vicinity of Limantour Beach. There are 285 animals in the fenced reserve at Pierce Point. It flies in the face of history to protect cattle grazing at the historic ranches when 500,000 tule elk narrowly escaped extinction because of it! We now are graced by about 4,300 tule elk in 25 separate herds in California. Killing any of them in favor of cattle grazing is criminal. Surely, our sacred public trust is honor, celebrate and protect the natural biodiversity of our national parks. Please do not constrict the long nurtured comeback of tule elk herds. I can't imagine a single visitor to Pt. Reyes National Seashore just hoping to catch sight of cattle, or to see a ranch. In fact, I often travel to Pierce Point Road specifically in order to see at least one tule elk. Please respect wildlife over cattle. The elk herd deserves and needs our protection. Their expansion is our

success story. In good faith, we need to continue to support and celebrate their comeback from the brink of extinction.

Correspondence: Dear friends: I am writing to urge your adoption of Alternative B of the Pt. Reyes National Seashore general management plan (GMP) amendment addressing grazing at the seashore and the Golden Gate National Recreation Area. I have been a frequent visitor to the seashore, beginning in 1973. I enjoy it in many ways - hiking, birdwatching, beachcombing, sightseeing, and backpacking. I have also seen it as a professional environmental planner, including time as California State Parks' planning chief, a Coastal Commission analyst, and a lifetime member of the American Institute of Certified Planners with expertise in ecosystem management and conservation of agricultural lands. Key points underlying the continued ranching use of these seashore and GGNRA lands are documented in the amendment's draft EIS. Already, three fourths of the seashore and seven eighths of GGNRA are managed for primarily natural values. Areas where grazing is allowed are a modest fraction of the NPS' lands. Wildlife, fish, and native plants on the NPS' wildlands are unharmed by agricultural uses elsewhere in the seashore. Because of the seashore's benign coastal climate, its pastures and grazing lands are unusually productive 1. Continued grazing helps control wildfire risk and maintains native prairies. Farming systems that reduce environmental effects of grazing, such as those proposed in Alternative Bs resource protection zone, can help to further integrate continued agricultural use with wilder parts of the parks. Importantly too, continued agricultural use of these lands will sustain family farming as a living culture, not simply an historical artifact, at the seashore, enriching interpretive opportunities, recreational potential, and visitor experience. I have seen firsthand, at California State Parks' Coast Dairies property near Santa Cruz, the limited visitor interest and maintenance liabilities of historic farmsteads without livestock, other agricultural use, and farm families. The seashore's and GGNRA's agricultural lands and the 24 families who farm them are critical, too, to the landscape within which the parks sit. They comprise a sixth of Marin County's farmland, an eighth of its dairies, and a twelfth of its cattle ranches. Despite their modest acreage, they produce over 40 percent of the county's milk, supporting world class cheesemakers such as Cowgirl Creamery and key regional milk processors including Clover Stornetta. Terminating agricultural use of the parks' lands would undermine the region's agricultural economy and protection of Marin's 140,000 acres of private farms and ranches by injuring the agricultural infrastructure and economy that support them. Indeed, the NPS' farmlands are unique among those in Marin County because they are protected from a threat identified as the greatest peril to agriculture there - conversion of agricultural properties to nonagricultural rural estate<sup>2</sup>. By protecting lands for exclusive agricultural use, removed from the risk of conversion to estates, the NPS' lands provide a protect a stable core of the region's farm economy. Because the NPS' lands are available by lease, rather than purchase, over time they may even provide opportunities for entry of young farmers who are unlikely to be able to afford to purchase private farms and ranches on the coast. Since its establishment, the seashore and its west Marin environs have modeled how people and nature can coexist harmoniously. Please continue that tradition by adopting Alternative 8.

Correspondence: [note for reviewer: footnotes added as \* after number] Re: Draft Environmental Impact Statement for Point Reyes National Seashore General Management Plan Amendment Dear Superintendent Muldoon: The California Cattlemen's Association, California Farm Bureau Federation, National Cattlemen's Beef Association, and Public Lands Council appreciate the opportunity to provide feedback on the Draft Environmental Impact Statement (DEIS) for the Point Reyes National Seashore (PRNS) General Management Plan Amendment (GMPA). The California Cattlemen's Association (CCA) represents more than 1,700 cattle ranchers throughout the state of California, including many of the beef ranchers throughout the PRNS and the Golden Gate National Recreation Area (GGNRA). The California Farm Bureau Federation (CFBF) is a non-government, non-profit, voluntary membership California corporation whose purpose is to protect and promote agricultural interests throughout the state of California and to find solutions to the problems of the farm, the farm home and the rural community. CFBF currently represents nearly 36,000 members throughout California,

including many of the beef ranchers and dairy producers at PRNS and the GGNRA. The National Cattlemen's Beef Association (NCBA) is the national trade association representing United States cattle producers, with more than 25,000 individual members throughout the nation. The Public Lands Council (PLC) is the only organization devoted solely to representing the 22,000 cattle and sheep producers who hold public lands grazing permits throughout the western United States, and counts among its members all lessees within the PRNS and the north district of the GGNRA. Our organizations have long been actively involved in issues of ranch management at PRNS and GGNRA, previously engaging throughout every phase of the now-superseded Ranch Comprehensive Management Plan process and in the initial public comment and scoping periods of the current GMPA process, in addition to numerous other policy issues on which we have engaged the PRNS Superintendent. We urge NPS to examine our prior correspondences with the Service in addition to these comments as it develops its Final EIS/GMPA. Our organizations generally favor Alternative B, the NPS Preferred Alternative, of the DEIS, though we propose additional significant edits to the Alternative regarding Tule elk management and on-ranch diversification activities, as detailed below, prior to finalization of the EIS/GMPA.

### 20-YEAR LEASES

Our organizations are pleased to see that the NPS Preferred Alternative continues to contemplate 20-year leases for the beef ranchers and dairy producers at PRNS. In our November 30, 2018 scoping comments, our organizations stressed that short-term leases stymie efforts at good stewardship by limiting ranchers' ability to obtain external financing for ranch improvements that could benefit the land. Additionally, without any intermediate- or long-term certainty regarding the continuation of ranching [leases], ranchers are hesitant to invest their own capital in ranch improvements, as there is no assurance that they will see returns on those investments. Implementing 20-year leases at PRNS will improve the economic viability of ranch and dairy operations and will result in further investments which benefit the Seashore's land, water, and wildlife resources. Our organizations strongly support the inclusion of 20-year leases in the Final EIS. Annual Ranch Operating Agreements will adequately allow the Seashore and ranchers to respond to any on-the-ground challenges that arise during the life of the 20-year leases, and will ensure conservation of the Seashore's environmental resources.

### ELK MANAGEMENT

Among the most important considerations of the DEIS and GMPA is improved management of Tule elk. Improved elk management is necessary not only to reduce impacts upon the historic ranches and dairies of the Seashore, but also to ensure that the elk population remains stable and viable. Between 2012 and 2015, extreme drought conditions in California led to lack of water and available forage that devastated the Tule elk herd at Tomales Point. During that period, the Tule elk population at Tomales Point declined from 540 animals to 286. 1\* While the same fate did not befall the Limantour and Drakes Beach herds of Tule elk—partly because those herds had access to the forage and water resources of the ranches and dairies at the Seashore—the fate of the Tomales Point herd teaches the lesson that elk populations should not be allowed to grow unchecked. Resource scarcity in California is an unfortunate reality, whether due to recurring droughts, wildfires, or other causes; if elk herds grow unmanaged, they risk devastation during these periods of scarcity. To avoid this, the Final EIS/GMPA must improve management of elk at Point Reyes. 2\* Additionally, improperly managed Tule elk wreak havoc on the ranches and dairies of the Seashore. In prior communications with the Point Reyes National Seashore in response to the now-abandoned Ranch Comprehensive Management Plan<sup>3\*</sup> and the Notice of Intent to prepare the present DEIS,<sup>4\*</sup> our organizations previously outlined the "devastating and well-documented" impacts that Tule elk have caused at Seashore ranches and dairies, including (1) competing with livestock for forage, often necessitating the purchase of supplemental feed (2) damaging fencing and other ranch and dairy infrastructure, (3) threatening lessees' compliance with PRNS grazing standards, such as residual dry matter standards, and (4) threatening organic or other certifications obtained by lessees, among other impacts. Additionally, elk incursions into the pastoral zone risk transmission of serious diseases, such as Chronic Wasting Disease and Johne's Disease, to cattle. To remedy these impacts, we once again suggested that NPS "take immediate action to remove elk from the pastoral zone and ... ensure that elk do not return to the pastoral zone." Geographic Distribution The DEIS states that "The management of free-range elk under alternative B [the NPS Preferred Alternative] would allow elk in the Point Reyes portion of the planning area but with limited geographic distribution ... on areas under lease/permit." 5\* With regard to "limited geographic distribution," the DEIS clarifies that the Drakes Beach herd would be geographically limited to "its existing core area (i.e., between Barries Bay and the C Ranch and B Ranch boundary)." 6\* Troublingly, this existing core area almost entirely overlaps the C Ranch/D Ranch dairy operation and the E Ranch and F Ranch beef cattle operations. 7\* With regard to the Limantour Herd, the DEIS states that "Hazing and lethal removal may be used to manage the geographic extent if individuals establish outside the core use areas" and that "Elk from the Limantour herd would be allowed to wander outside a core area, if they do not establish new herds." 8\* According to Figures 2 and 3 of Appendix A, however, existing core use areas of the

Limantour Herd exist on ranches, including portions of the D. Rogers Ranch, M Ranch, N Ranch, and Home Ranch. Limantour Herd elk already roam on ranches outside of those core areas, including H Ranch and L Ranch. While the DEIS states that "actions may be taken to mitigate for impacts on ranching operations,"<sup>9\*</sup> the fact that the GMP A perpetuates the status quo by allowing elk to continue to utilize significant swaths of ranch property means that ranches will continue to see significant elk-related impacts from the Limantour Herd.<sup>10\*</sup> Unfortunately, the DEIS and GMPA do not appear to contemplate the appropriate removal of Tule elk from ranches, instead proposing to maintain Tule elk in core areas which already exist on the ranches. Indeed, NPS explicitly dismissed from further analysis two proposed alternatives raised in the scoping process which aimed to exclude Tule elk from ranchlands: (1) Fencing Elk into Specific Geographic Regions and (2) Complete Removal of Elk from Ranchlands. The DEIS rejects the concept of fencing elk into specific geographic regions, citing as reasons for this rejection "the high cost of construction and maintenance of a fence."<sup>11\*</sup> While our organizations recognize that construction and maintenance of a border fence may be costly, we believe that NPS could see significant cost savings as a result of conducting less monitoring and management associated with elk which would otherwise stray onto ranchlands-including hazing, rebuilding livestock fencing damaged by the elk, and lethal removal of elk. Additionally, our organizations believe the construction of such a fence would be feasible, as livestock fencing is already present in the area. The Final EIS should explore as an alternative the construction of elk fencing between the Phillip Burton Wilderness Area and the ranchlands, and should consider this alternative in comparison with the costs of monitoring and management contemplated under the NPS Preferred Alternative. The DEIS also rejects the complete removal of elk from ranchlands, arguing that "the roughly 50 individual elk that move onto ranch lands from the Limantour herd do not affect the forage availability or RDM for ranches in that area."<sup>12\*</sup> Ranchers at the Point Reyes National Seashore reject the notion that the elk "do not affect the forage availability or RDM for ranches," noting that elk forage consumption requires ranchers to either (1) reduce their stocking rates or (2) purchase and import supplemental feed for their livestock. Both come at a significant cost to ranchers, place them at a significant disadvantage compared to ranchers elsewhere in the state and country, and threaten the viability of ranching operations which already operate on thin profit margins. The DEIS also justifies rejecting the complete removal of elk from ranchlands on the basis that "in an extreme scenario, such as a fire ... all free-ranging elk could temporarily move onto the ranch lands to forage," and that "the Tamales Point herd occasionally enter ranchlands, so complete removal of elk from ranchlands is not feasible."<sup>13\*</sup> Our organizations appreciate that ensuring that elk never enter ranchlands may be infeasible. But the EIS need not choose between the status quo geographic distribution (in which the Limantour Herd and possibly the Drakes Beach herd are allowed to remain within all established core areas on ranchlands) and complete removal, without fail of elk from ranchlands; a middle-ground can be sought. The Final EIS ought to consider an alternative which strives to remove elk completely from rangelands, but which recognizes that elk may infrequently enter ranchlands nevertheless-as with the Tamales Point herd-and that "in the event of an unforeseen circumstance that causes the herds to completely move, NPS would reevaluate the impacts and management approaches as needed to ensure maintenance of a free-ranging herd in Point Reyes" <sup>14\*</sup>-as is already contemplated under the NPS Preferred Alternative. In drafting a Final EIS, our organizations urge the NPS to more fully examine the impacts of Tule elk upon ranching and dairy operations and to examine alternatives which seek to exclude Tule elk from ranchlands. With regard to the Drakes Beach herd, this exclusion may be undertaken by adopting Alternative C's lethal removal proposal, by installing exclusionary infrastructure which limits the elk to the small portion of the Drakes Beach area upon which ranching does not occur (which would require an attendant reduction in the target population level), or examining the "Translocation in the Park" alternative rejected by NPS in the DEIS (perhaps in conjunction with the "Fencing Elk into Specific Geographic Regions" alternative likewise dismissed from further analysis). With regard to the Limantour Herd, the Final EIS ought to fully examine alternatives dismissed for prior analysis in the DEIS which would exclude the Limantour elk from ranchlands, including the "Fencing Elk into Specific Geographic Regions" alternative and the "Complete Removal of Elk from Ranchlands" alternative. Finally, the Final EIS should include within its appendices a map which clearly showcases the geographic distribution of elk which is contemplated under the GMP A, as the DEIS fails to incorporate maps which demonstrate the permitted range of elk under each of the contemplated Alternatives.

**Herd Size** While the DEIS states that the NPS Preferred Alternative "would allow elk in the Point Reyes portion of the planning area ... with ... controls on herd size," <sup>15\*</sup> it only sets a population goal for the Drakes Beach herd (120), establishing no such herd size target for the Limantour Herd. In our scoping comments to the NPS regarding this GMP A, our organizations asserted that it is essential that the NPS carefully analyze the Phillip Burton Wilderness Area's carrying capacity for tule elk (factoring in available forage and water) as a basis for establishing a reasonable

population limit for the elk. Once such an appropriate management level is identified, the NPS should develop a detailed plan for managing the elk population to ensure that it does not exceed the population limit. Any population limit should be conservative in nature, accounting for a wide variety of environmental factors that could impact the elk population, including the likelihood of future drought conditions in the region. It is unfortunate that this analysis of the Limantour Herd was not undertaken in the DEIS, and we urge NPS to resolve this oversight in the Final EIS. Examining the carrying capacity of the Phillip Burton Wilderness Area would also further NPS' s goals as stated in the 1998 Tule Elk Management Plan/EA "to maintain viable populations of a free-range elk herd in Point Reyes" 16\*: in order to maintain a viable population, NPS must determine what constitutes a viable population and at what point overpopulation might threaten the herd's viability. Translocation of elk elsewhere in the state The NPS Preferred Alternative states that "NPS would manage the Drakes Beach herd to the population threshold using ... translocation outside the park" to a state-managed herd elsewhere in California if practicable.17\* Our organizations oppose translocation of Tule elk from Point Reyes to elsewhere in the state. Agricultural operations elsewhere in range of California's statemanaged Tule elk herds have reported conflicts similar to those reported at the Point Reyes National Seashore. Translocation of Tule elk elsewhere in the state would simply shift the burden from ranches and dairies at PRNS to farmers, ranchers, and dairies elsewhere in the state. Additionally, translocating elk elsewhere in the state risks transmission of serious diseases, such as Chronic Wasting Disease and Johne's Disease, to cattle and other wildlife. To avoid further elk/agriculture conflicts, the Final EIS should not consider translocation of elk to herds elsewhere in the state. DIVERSIFICATION Our organizations appreciate that the DEIS/GMP A contemplates opportunities for flexibility and increased diversification of farming and ranching operations on the leased properties within the Seashore. However, we believe that the DEIS/GMPA is overly-limiting in terms of what diversification will be allowed on the ranchlands ( e.g. the blanket prohibition on row crops exceeding 2.5 acres). The ability to diversify one's farming/ranching operation is essential to ensure an agricultural operations' viability in response to economic, environmental, and other stressors. In examining which diversification activities will be permitted and to what extent diversification on the ranches will be permitted, the Final EIS should examine diversified agricultural operations elsewhere in Marin County. Additionally, in an effort to effectuate the Point Reyes National Seashore Enabling Act's mandate of historical preservation, the Final EIS ought to examine the historical role of other farming and ranching operations at the Seashore, which included irrigated and non-irrigated row crops such as beans, peas, barley, artichokes, etc.; other livestock species aside from cows and chickens; and on-ranch activities such as processing and sales. ALTERNATIVES D, E, AND F Our organizations continue to believe that Alternatives D (Reduced Ranching), E (No Dairy Production), and F (No Dairy or Ranching) violate the law and would be catastrophic to the economy of Marin County, and should therefore be rejected in the Final EIS/GMPA. Alternatives D, E, and F are inconsistent with laws governing the PRNS and GGNRA As we noted in our scoping comments, and as NPS notes in the DEIS, 18\* the Point Reyes National Seashore Enabling Act seeks to promote, among other things, "historic preservation ... of the natural environment within the area" of the Seashore and the Golden Gate National Recreation Area Enabling Act established the GGNRA in order to preserve outstanding "historic ... values." Cattle grazing has occurred at PRNS and GGNRA since as early as 1820, and is a fundamental element of the historical value of the area. Any alternative which seeks to diminish or remove dairy production and cattle ranching from the PRNS and GGNRA would explicitly violate the intent of Congress in establishing these areas. Indeed, as the DEIS notes, just this year a Joint Explanatory Statement regarding the Consolidated Appropriations Act of 2019 clarified that "multi-generational ranching and dairying is important both ecologically and economically" and is "fully consistent with Congress's intent for the management of Point Reyes National Seashore," and that the conferees support the NPS Preferred Alternative.19\* Alternatives D, E, and F, then, would violate the plain language of the Point Reyes National Seashore Enabling Act and the Golden Gate National Recreation Area Enabling Act, and would violate Congressional intent. Consequently, these alternatives should be rejected in the Final EIS. Alternatives D, E, and F are inconsistent with the Coastal Zone Management Act of 1972 As we noted in our scoping comments, the federal consistency provision of the Coastal Zone Management Act of 1972 requires that "Each Federal agency activity within or outside the coastal zone that affects any land or water use or natural resource of the coastal zone shall be carried out in a manner which is consistent to the maximum extent practicable with the enforceable policies of approved State management programs."20\* The Marin Local Coastal Program approved by the California Coastal Commission explicitly "recommends that agriculture in the GGNRA and PRNS be encouraged" and the "continuation of the agricultural operation[s]"21\* there. As discussed more fully in our scoping comments, Alternatives D, E, and F would violate the Coastal Zone Management Act's consistency provision because those alternatives violate the State-approved Marin Local Coastal Program by

discouraging and/or discontinuing the beef and dairy operations at the Seashore. Unfortunately, the DEIS fails to examine whether Alternatives D, E, or F would be consistent with "approved State management programs" in accordance with the Coastal Zone Management Act.<sup>22\*</sup> We encourage NPS to conduct federal consistency analyses for each Alternative in the Final EIS, and to rely on this inconsistency with the State-approved Marin Local Coastal Program as a justification for dismissing Alternatives D, E, and F. Alternatives D, E, and F would devastate Marin County's economy. Our organizations largely approve of the DEIS' analysis of the economic impact of agriculture at PRNS and GGNRA upon Marin County and surrounding areas. The DEIS' analysis of directly-supported, indirectly-supported, and induced jobs from the economic activity at PRNS and GGNRA reflect the information available to our organizations at the time we prepared our scoping comments, and we are pleased to see this information reflected in the DEIS. One element in which the DEIS' analysis of "Agriculture in Marin County and the Planning Area" could be improved, however, is in consideration of the overall economic impact that agriculture at PRNS and GGNRA has on Marin County's economy. While the DEIS discusses the impact of beef ranching and dairy production in PRNS and GGNRA as a percentage of beef ranching and dairy production in Marin County, it does not paint the full picture of the importance of beef and dairy production at PRNS and GGNRA to the overall economic health of Marin County. As we stated in our scoping comments, beef and dairy production at PRNS and GGNRA account for nearly 20% of the agricultural production of Marin County.<sup>23\*</sup> Alternatives D, E, and F, then, would deprive the highly-agriculturally-productive County of 1/5 of its agricultural economy, which would be economically devastating for Marin County and would have significant economic impacts in neighboring areas, such as Sonoma County. CONCLUSION CCA, CFBF, PLC, and NCBA appreciate the opportunity to review the DEIS and suggest improvements prior to the finalization of the EIS/GMPA. Our organizations favor the NPS finalizing Alternative B of the DEIS in its final EIS/GMPA, though we urge NPS to (1) adopt significant amendments to the Alternative's elk management provisions to ensure that Tule elk are kept off of ranchlands and (2) improve diversification opportunities to ensure that agriculture at PRNS and GGNRA remain viable.

Footnotes: 1 Peter Fimrite, Conservationists Upset as Much of Point Reyes Elk Herd Dies, SF GATE (San Francisco), April 19, 2015. 2 The DEIS itself seems to recognize this fact, acknowledging in its analysis of Alternative A (the "No Action" alternative) that "Under alternative A, the elk population would continue to grow ... at some point, population management would be necessary, and NPS would need to undertake a separate planning process to determine how to manage elk at Point Reyes." NATIONAL PARK SERVICE, GENERAL MANAGEMENT PLAN AMENDMENT AND DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR THE POINT REYES NATIONAL SEASHORE AND NORTH DISTRICT OF GOLDEN GATE NATIONAL RECREATION AREA 24 (2019) [hereinafter "DEIS"]. 3 Letter from Dave Daley, President, California Cattlemen's Association; Dave Eliason, President, Public Lands Council; and Craig Uden, President, National Cattlemen's Beef Association to Cynthia MacLeod, Acting Superintendent, Point Reyes National Seashore (Nov. 16, 2017). 4 Letter from Dave Daley, President, California Cattlemen's Association; Jamie Johannsson, President, California Farm Bureau Federation; Kevin Kester, President, National Cattlemen's Beef Association; Bob Skinner, President, Public Lands Council; and Lucas Deniz, President, Western United Dairymen to Cicely Muldoon, Superintendent, Point Reyes National Seashore (Nov. 30, 2018). 5 DEIS at 40 (emphasis added). 6 Id. at 41. 7 Id. at app. A, figs. 2 and 3. 8 Id. (emphasis added). 9 Id. 10 The DEIS itself appears to acknowledge that Alternative B essentially maintains the status quo regarding Limantour Herd management, stating that "Management of the Limantour herd would be minimal and would focus on limiting the geographic extent of the herd to reduce their presence on leased ranch lands in Point Reyes, which would not result in a change from existing conditions." Id. at 163 (emphasis added). 11 DEIS at 62. 12 Id. at 63. 13 Id. 14 Id. at 40. 15 Id. at 40. 16 Id. At 41. 17 Id. 18 Id. at 3. 19 Jd 20Coastal Zone Management Act of 1972, 16 U.S.C. § 1456(c)(1)(A). 21 Marin Local Coastal Plan Unit II-Amended, 56-57 (1981). 22 The only references to the Coastal Zone Management Act are at pages ix-x and 195 of the DEIS, which merely state that NPS "had discussions" with the California Coastal Commission regarding federal consistency, but fail to provide consistency analyses. 23 Ana Guth, Comments Out Early on Park GMP A, POINT REYES LIGHT (March 1, 2018) ( quoting Marin County Board of Supervisors comments).

Correspondence: I would like to offer the following comments on the Point Reyes National Seashore General Management Plan Amendment Draft Environmental Impact Statement. The DEIS has a number of inadequacies that apply to all the alternatives analyzed. 1. It does not have a budget or financial overview that outlines how any of the alternatives and actions will be implemented and paid for. It fails to state the amount or portion of its budget that goes to ranching-related expenses. Even at the current level of ranching, oversight (monitoring for lease compliance and environmental damage), assistance (such as killing wildlife to protect ranching operations) and mitigation (of negative impacts of cattle on sensitive habitats) place significant demands on the park budget. Expanding agriculture in the Park will only increase these costs and this must be reported and analyzed. The economic costs of existing agricultural operations and of the proposed expansion of those operations must be quantified. 2. It proposes a succession policy that is radically different from the original intentions of the public planning process, which emphasized multi-generational beef and dairy ranching. Originally, the ranchers who sold their land to the Park were allowed to lease it back at a discounted rate and to continue ranching it for 25 years or their lifetime. Later, this was extended to their offspring. Now it is proposed that leases be offered to other relatives, then to neighbors, and if there are no takers, to anyone who wants to lease land in the park even if they have no prior connection to the Seashore. 3. It proposes sweeping changes to the zoning of the Park, including expanding the area where agriculture is allowed and reducing the environmentally protected area, but it fails to consider the impacts on the Park as a whole of these zoning changes. It also proposes new trails, visitor accommodations, and other amenities without cumulative analysis of existing park facilities. Overall, the DEIS does not consider the impacts that the changes it proposes in the Amendment area will have on adjacent wilderness areas. 4. It fails to properly analyze the cumulative impacts of the proposed changes. Although it does consider a limited number of cumulative impacts, it does not, as it should do, consider past actions that are cumulative in nature such as expanded parking and increased visitation, transportation changes, new visitor serving facilities, and trail additions and enhancements. 5. It attempts to update a forty year-old GMP, without taking into account the full impact of the changes it proposes on the Park as a whole and without taking into account changes that have occurred since the Plan was adopted, such as the 2006 update of the NPS Management Policies. 6. The DEIS suffers from the fact that the PRNS does not have the wilderness plan required by policy and law. Such a plan would require additional data and baselines studies to ensure that its wilderness areas are managed to maintain wilderness character, as required by law. Without a wilderness plan and baseline information, it is impossible to identify indirect and direct impacts on wilderness values. 7. It does not address the issue of whether commercial diversification conflicts with the NPS Concession Act and fails to state what authority would be used to enact diversification activities, such as overnight accommodations operated by the leasee. Through concession contracts or commercial use authorizations, selected in a competitive public process, the National Park Service can authorize commercial visitor services that are determined to be "necessary and appropriate for public use and enjoyment." However, it is required that "concession operations ... be consistent to the highest practicable degree with the preservation and conservation of resources and values of the park unit." The DEIS does not analyze the consistency of its proposals with the NPS Concession Act. 8. It fails to address the impact of its proposals on climate change. Cattle are the leading source of greenhouse gases at the Seashore. Methane, produced by cattle, is a greenhouse gas with a much higher impact than carbon dioxide. There is no discussion of mitigation for cattle's impacts to the climate in any of the NPS's ranching alternatives. 9. The EIS says that the Seashore's land, water and wildlife would benefit were ranching to "cease, however it offers no plan for protecting wildlife from the impacts of ranching or for mitigating habitat loss from grazing or from growing crops. Other than killing Tule elk, there is no discussion of avoiding wildlife conflicts. The preferred alternative, Alternative B, is fatally flawed and should not be adopted for the following reasons: 1. In prioritizing the expansion and diversification of agriculture in the Park, without adequately reporting on and analyzing the impact such expansion and diversification would have on Park natural resources, it ignores a key provision of the Seashore's original enabling legislation, which requires that the Park be administered for "the maximum protection, restoration, and preservation of the natural environment." 2. In proposing a significant expansion of the types of agriculture and agriculture-related commercial activities allowed in the Park, it goes beyond the directive of the former Secretary of Interior, which was to extend leases to dairy and cattle ranches to 20 year terms. The diversification described in the Preferred Alternative B is a movement away from the historic beef and dairy ranching that is stated as a cultural and historic value in the Seashore. It also carries risks to natural systems and to public access and enjoyment of the Seashore. Although a modicum of diversification might be compatible with the Park's goal of natural resource protection, it should be small-scale and limited to the ranch core. Certainly it is unacceptable to allow new uses in the Ranchland zone based on 3. the economic interests of private

businesses. It is important to note that ranchers in the Seashore already have a competitive advantage over ranches outside the park. Seashore ranchers benefit from discounted grazing fees, below-market-rate housing, and maintenance and improvements to roads, homes, and farm buildings covered at public expense. Seashore ranches pay no property taxes. 4. Because cattle are the seashore's primary source of greenhouse gases, Alternative B (along with several of the other alternatives) is inconsistent with the Park's "Climate Friendly Parks" plan. 5. The new Ranching Operations Agreements will need oversight, but there provides no evidence that the Park has the resources to properly implement such programs. 6. It proposes types of agriculture (row crops, orchards and grain production) that have no historic or cultural connection with the Park and that depend on the use of rodenticides, pesticides and high water use. These inputs are incompatible with NPS policy and values and their impacts are not considered in the DEIS. 7. The new agricultural uses it proposes will result in changes to ranch cores and historic pastures that will damage the scenic and historic values of the Seashore. 8. Its proposal to allow ranch guard dogs would have a significant negative effect on the visitor experience. These dogs are quite aggressive by nature and should not be allowed free range in the Park. The need for dog-fencing will also limit public access and add visual impairments to park landscapes and cultural landscapes. 9. It fails to analyze the impact of actions that may be required to protect commercial ranchers' interests. In particular, sheep, goats, and chickens are likely to provoke conflicts with many forms of native wildlife, from mountain lions through raccoons to eagles and large hawks. There is no discussion of how these conflicts will be management, apart from the killing of Tule Elk. 10. All long-term strategies to manage the Tule Elk populations should be in the context of NPS policy and law as are other natural resources within the Seashore and not for the benefit of commercial lease holders. Additional research and data are needed to determine what the carrying capacity of the Park is and how best to manage elk populations and to understand the impacts of ranching operations on tule elk by ranching operations, as well as their impact on ranching. 11. The proposal to increase "boat-in" campgrounds would have environmental consequences that are not considered in the DEIS. This is especially important given that PRNS already has a significant challenge with the management of camping on Tamales Bay, particularly with issues of human waste disposal, camper misbehavior, and the protection of archeological sites. Expanding camping to Drake's Estero, a wilderness area, is not justified. To summarize, Point Reyes National Seashore must be managed for "maximum protection, restoration, and preservation of the natural environment." There is no mandate for prioritizing commercial agricultural leases over natural resource protection and visitor experience on these public lands. Cattle ranching should only be allowed if it is consistent with preserving the natural environment and the onus of accommodation should be on agriculture, not on wildlife and other natural resources. Moreover, there is no good argument for expanding the types of agricultural activities allowed in the Park. The No Ranching alternative is the only one in the DEIS that adequately prioritizes "maximum protection, restoration, and preservation of the natural environment." If ranching is to continue at a level compatible with the wildlife and other resources of the Park and in a way that maximizes the visitor experience, a new alternative is needed and it must be supported by the documentation and analysis so bad missing in this DEIS. Thank you for the opportunity to comment on this ve1y inadequate and disappointing DEIS. Sincerely,

Correspondence: Have you folks studied the elk problems that plagued Yellowstone until the reintroduction of wolves brought about a balanced ecosystem? I am not suggesting that wolves or grizzly bears be re-introduced, but I am sure you are aware that the elk herds will likely grow quite enormous before running out of food and water without a major predator(s) or disease infecting the elk. In the meantime the plants will be heavily browsed. Sooner or later human culling will be called for. Or the entire park could be inundated with these large animals. I did not see a discussion of these realities. Many people seem to think that culling can be avoided. Humans become the top predator in the absence of wolves, unless coyote packs can take down an elk. Is that possible? Of course, those coyotes could also prey on children or some adults. Would have liked a discussion on this whole issue in the shortened version of this plan. I think the dairy farms, that concentrate so much manure, should be removed to help ensure some reasonable water quality. I am not sure that several thousand beef cattle should be grazing there, but people more familiar with the ecology of the area can address numbers. I come closest to option E, with the

realization that just allowing elk numbers to climb to the moon is likely to cause a crash somewhere in the future. Humans hiking through large numbers of large animals may become unsafe. Turning PRNS into a second Slide Ranch is not a good idea. Although not a wilderness, PRNS should be kept as wild as possible. Small animals will attract predators, of course. I am not against the Historic Ranches and favor their preservation. I was born in San Francisco and remember the battle to get the ranchers to let a national park into existence. And I visited the site of the Sweet Lumber Mill logging operation on Inverness Ridge. I photographed it and wrote a term paper about it for Civics in my senior year at Washington High School in San Francisco. The ranchers had to give up a lot for the Park to come into existence, so I think the grazing operations should continue for the Historic Ranches on a 20-year lease basis. I value the presence of near-by cattle herds to provide grass-fed beef to our local stores. I don't know where the animals are slaughtered, but I hope the transport is not extensive. Keep the carbon footprint as low as possible. Thank you for the opportunity to comment.

Correspondence: Make the point wild- no cows, row crops, vegetable stands, ranches, wire, development etc. what would John Muir think and say to all that. Point Reyes National Park - Doesn't sound like a suburbia, casinos, neon lights or race tracks. No, it sounds like hiking trails, tent camping, ranger led field trips to Sculpture beach, Double point, bass hike, sky camp, pierce point, White Gulch, etc. Get my point- Nature of every kind, lets go people and wild!

Correspondence: This is Jennifer Militzer-Kopperl, wife of award-winning amateur photographer Ben Kopperl, writing about our concern about Environmental Impact Statement (EIS) regarding ranching and tule elk management in the agricultural lease/permit areas of the park. Ben likes to go to Point Reyes to take pictures such as the one in figure 1. (photo) Figure 1: Honorable Mention Outdoor California photo contest issue March/April 2019 vol 80 #2 (22-23) Ben does not want to go to Point Reyes to take pictures such as the one in figure 2. (photo) Figure 2: Roadside Livestock Ranch

On Ben's last visit to Point Reyes on September 4, 2019, he took the disturbing picture shown in figure 3. Note the livestock in what is supposed to be clear water that is supposed to flow to the ocean. Note how the water is overgrown with algae from all the cow manure. I trust you do not need a full environmental impact review to detail why the algae bloom is happening or why it is bad. I find it self-evident. I hope you do, too. (photo) Figure 3: Livestock in Algae-Infested Water in Point Reyes Kindly get the livestock out of our parks. Kindly protect the tule elk herd. Kindly protect our ocean.

Name: Machung, Anne

Correspondence: Dear Superintendent Muldoon, I am writing to provide comment, as requested, on the Point Reyes GMP Amendment EIS. First of all, I want you to know how much I love Point Reyes National Seashore. I have walked and hiked every one of the trails there for over 40 years. It is one of my favorite parks in the National Park system; indeed it is a national treasure. One of my favorite trails - one I hike multiple times every year - is the path that leads from the historic Pierce Point ranch out to Pierce Point and back. Not only is the scenery- the ocean, the beaches and the wildflowers - - spectacular, but the Tule Elk one often sees out there are incomparable in their grace and beauty. It is only at Point Reyes National Seashore that one can see, and appreciate, such spectacular animals. Over the years, I have met literally hundreds of people who have come to that relatively remote spot, even on cold and windy and rainy days, precisely to see the elk. For that reason, and others as well, I am very distressed by the National Seashore's General Management Plan Amendment Draft Environmental Impact Statement (GMPA) which clearly favors ranching and agricultural interests over the protection and preservation of wildlife, natural ecosystems, and public lands. The mission of the national park system is to protect native plants and animals both for their own sake and for the enjoyment of the public, including generations to come. It is not to protect cows, ranching and industrial agriculture. Yet five of the six alternatives the GMPA proposes allow dairy or beef farming to continue at Point Reyes National Seashore for the next 20 years. Several of the alternatives even allow the ranchers - who in 1962 were paid the equivalent of \$340 million in today's dollars for their ranches -not only to continue grazing on public lands, at public expense - but to actually expand their operations to include pigs, goats, sheep, chickens, row crops and even "home stays" for visitors, as if visitors come to the park to see chickens and cows! This is outrageous. It represents an extraordinary misuse and misappropriation of public lands, public places and public funds for private gain. The incremental, long term and cumulative impacts of ranching are well documented, and I am sure you are aware of those: the destruction of native plants and animals, degradation of their habitats, introduction of invasive plants, and loss of endangered species. At Point Reyes National Seashore, manure runoff has contaminated waterways where coho salmon spawn and elephant seals raise their young and the heart of the Seashore -once a rare coastal prairie ecosystem -has been transformed by 6,000 cows into a dairy farm (or, more accurately, into 24 dairy farms). Ranchers claim that the Tule Elk - the pride and joy of hundreds and thousands of visitors to the park-are "the problem" because they compete with cattle for food and water. Yet consider the following: • There are less than 600 Tule Elk at Point Reyes compared to about 6,000 cows. • The average size of a Tule Elk is about 300-500 pounds; the average cow weighs about 1,400 pounds. • Cows eat an average of 50 pounds of forage a day; Tule Elk eat an average of 9 pounds a day. • At Point Reyes National Seashore, the almost 6,000 cattle produce over 133 million pounds of manure annually, making some of the waterways within this national seashore some of the most polluted within the state of California. • And they are the highest emitter of noxious greenhouse gas emissions in the park since cows burp methane, a greenhouse gas that is 25-100 times more potent than carbon dioxide. Yet, there is no discussion of mitigation for cattle's impacts to the climate in any of the NPS' s ranching alternatives -and this at a time when the United Nations estimates the world has only 12 years left to reverse the accumulation of CO2 in the atmosphere before the effects of climate change become irreversible. Methinks the problem is not the elk but the cattle. For that, and many other reasons, I am asking the National Park Service to prohibit any further diversification of ranch operations at Point Reyes National Seashore, to phase out dairy and beef ranching there within the next five years, and to restore the park to its original intention, as established in 1962 by the U.S. Congress: "To save and preserve, for the purposes of public recreation, benefit and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped." If we don't start now, when?? And if we don't act locally, where do we act??

Correspondence: MISLEADING AD in HIGH COUNTRY NEWS The ad paints a picture of the elk in Pt Reyes as being exterminated as one of the solutions to the General Management Plan of the Seashore. 1. First there is no industrialized dairying or beef operations in the seashore but rather historic FAMILY farms. 2. The elk herd has 432 elk in one group and 120 and 170 in the other 2 herds. The elk are 80% inbred and the Seashore has had NO management plan in place. 3. ONE of the six alternatives in the plan calls for the extermination or removal of the elk. The elk were extirpated from the land since 1860. 4. The Seashore has developed comprehensive management plans for the ranches within its boundaries. 5. The ranches identified in the Management plan are all part of the pastoral zone which is an integral part of the enabling legislation for the establishment of the Seashore. This ad appeared in High Country News September 16, 2019 and was paid for by the Resource Renewal Institute of Mill Valley, California THIS LETTER WAS SENT ALSO TO THE HIGH COUNTRY NEWS FOR CORRECTION ON THE MISINFORMATION

Name: McDonald, Mervin

Correspondence: September 23, 2019

Superintendent Cicely Muldoon 1 Bear Valley Road Point Reyes Station, California 94956 Dear Superintendent Muldoon:

We are a family of 5 generation ranchers in Marin County. We are currently 3 generations ranching in Point Reyes National Seashore. We lease and raise beef cattle on the beautiful N and Home Ranches. We value our working ranches which provide an opportunity for the public to learn about where and how their food is produced.

The McDonald Lucchesi family appreciates the opportunity to comment on the PRNS and GGRNA draft Environmental Impact Statement for the General Management Plan Amendment.

Home Ranch Core and Residential Use Requirement When the Home Ranch permittee went out of business in 2003, NPS took the core (20 acres) out of the middle of the ranch and permitted it as residential use. The rest of the Home Ranch (2660 acres) was permitted as an Ag permit. The permit on the residence has ended. A ranch cannot be operated without a core.

PRNS has mentioned that they plan to make employee housing in one of the houses in the core. We strongly object to this idea. There are no other seashore ranches with park housing on it. Just for safety alone, the idea is bad. The way this ranch is designed, the cattle have to run through the core to get to the con-als. We can't have park employee's children, pets, and cars in the yard when we bring cows and bulls through the core. We predict we will need ranch housing in the not too distant future. Housing for anyone other than ranch workers would not be feasible. PRNS must include the core of the ranch back into the Ag permit to make Home Ranch whole again as it was before it was split out for a residential permit. Our current lease has "incidental residential use" but the draft lease/special use permit 4.1 states "For leases where residential use is authorized, Lessee agrees to use Premises as the principle residence " We believe there should be flexibility in the principle residence requirement, and it should be determined on a case-by-case basis. In our case, the ranch house that we use for incidental residential use is not suitable for a permanent residence. We believe that our lease should continue to allow for incidental residential use and would like to meet to discuss the residential use issue before the Final EIS and the Record of Decision is issued.

We support creating a loop trail around the Home Ranch core. It is much too dangerous to have visitors walking directly through the ranch core when we are working cattle. We had a close call just this summer - we brought a

herd of cows down through the core and were just shutting them into the corral when two people and an infant came walking through. It scared them and us! If they had been just 3 minutes sooner, who knows what would have happened. The ridge above the ranch core would be a perfect spot for a trail. From up there on the ridge, you can look down on the ranch complex and see the ranch activity. This trail would bring them back to the Estero parking lot. Elk Missing in the DEIS is any analysis or plan to control the movement of the Limantour herd onto the ranch lands. The migration of this herd out of the designated elk range and on to ranch lands is already causing significant harm to us. These impacts have increased over the last few years and are well documented. The DEIS has not fully analyzed these impacts or considered the likely increase in elk migration onto ranch lands in the near future. Because this would simply be an expansion of the Limantour herd that is already causing problems, and not the establishment of a new herd, the NPS would have no direction or responsibility to control further proliferation. This omission would very likely result in devastating consequences. This EIS must analyze the impacts of all the elk on the ranch lands and direct management responsibilities for NPS to control population and reduce elk impacts of all elk in the entire planning area, not just the Drakes Beach herd. NPS needs to follow the existing 1998 elk management plan to manage for separation from ranch lands. The 1998 elk plan stated the "area chosen for the Limantour herd" would be restricted by "buffers from major highways, ranches, and lands outside the Seashore." 1998 Elk Plan p.46. There was no intent to expand the Limantour herd on to ranch land. In fact, this Draft EIS for the GMP Amendment confirms that the elk were to be separated from the ranch lands. The Draft EIS states, "the 1998 Tule Elk Management Plan/EA did not contemplate the expansion of elk into the ranchlands." DEIS p. 5. By not removing the elk from Home Ranch and relocating the elk back into their intended area in the wilderness, our business will be in jeopardy of going out of business. The elk are competing with our cattle for forage despite the NPS model results that conclude the elk do not affect forage available or the RDM. If in fact NPS believes the elk do not affect forage availability, then our lease should not have a provision that we will lose AUMs or have a more restricted RDM because of elk. Actually the elk decision is very simple. Do you want elk OR Historic ranches to remain on the ranch lands in the limited area of Point Reyes Peninsula Dairy Ranches Historic District? We do not object to elk elsewhere on the Seashore but clearly, sustainable historic ranching and elk cannot coexist if the elk are not managed for effective separation. Elk must be managed for effective separation by (1) identifying the specific area (range) to which the elk will be limited under the preferred alternative, (2) setting the maximum number of elk the herd will be allowed to grow to on that range, and (3) adopting management actions required if the elk are found outside the range or the herd exceeds the established size limit.

First, there is no map of the elk range that will be established under the preferred alternative. The Final EIS and Record of Decision should include a map of the area where the herd will be located in the preferred alternative, like the proposed elk range map on page 48 of the 1998 Elk Plan. The DEIS includes Appendix Page A-2 showing the "Existing Range of Tule Elk in the Planning Area." However, there is no map of where elk will be permitted in the preferred alternative. Second, the area where elk will be allowed to range in the preferred alternative must exclude historic ranch land in the Point Reyes Peninsula Dairy Ranches Historic District and the Limantour herd should be limited to the Phillip Burton Wilderness. Third, the Final EIS and Record of Decision should set a limit on the size of the Limantour elk herd. If the decision only includes a map of where the elk range is located without including a herd size limit, the population can expand outside or within that area causing resource conflicts and damage. The public, the ranchers, and NPS should know what the established capacity size limit is for the number of elk in the Limantour herd. Fourth, the Final EIS and Record of Decision should include required and effective management actions to remove elk that go beyond the boundaries of the preferred alternative elk range and to reduce the size of the elk herd if it exceeds the herd size limit. Finally, we strongly recommend a fence to effectively separate the Limantour herd from the Historic District ranch lands. The fence should terminate on the Inverness Ridge at a wooded area, in dense vegetation, or at a significant dropoff on the ridge which elk already avoid. Zoning The outdated zoning maps in this DEIS have not been analyzed. We appreciate "NPS would make on-the-ground field verification and determinations based on activity regarding slope to further delineate the Range subzone." Agriculture Advisory Committee Because of the history of the inconsistency of NPS Range Managers, an Ag Advisory Committee needs to be analyzed and created. This Ag Advisory Committee should include a member from each: The USDA Natural Resource Conservation Service, The Marin County Resource Conservation Service, The Marin County Agricultural Commissioner, The University of California Cooperative Extension, Marin Agricultural Land Trust, Marin County Farm Bureau, a PRNS dairy rancher and a PRNS beef rancher. This committee should be utilized by PRNS decision makers whenever there is a question or decision

regarding the agricultural activities or other agricultural issue in the planning area. The benefits of an Ag Advisory Committee would be: improved relationship and trust between parties, informed decisions about agricultural activities by individuals with experience in agriculture, reduced concerns about how much agricultural experience the PRNS and the National Park Service has, informed decisions about agricultural activities by individuals with experience in dealing with local conditions in an agricultural community recognized nationally and internationally as a leader in sustainable and ecologically sound agricultural practices, increased continuity, as members of the committee will have less turnover than PRNS staff, increased community involvement with the future of food production in the planning area, and reinforced public commitment to continue viable agriculture in the planning area in perpetuity.

Leases If this DEIS is going to use a formula for fair market value to determine rental rates, then NPS needs to take on the responsibilities as a fair market value lessor such as prompt building maintenance and repair and more flexible and varied ranching practices on the land. A 20 years lease with annual rent adjustments means nothing more than a one-year lease. The ranchers will have a 20-year Possessory Use tax with only one-year stability. Given this uncertainty we may be interested in a shorter lease such as a 10-year lease. Nothing is mentioned in this DEIS about what happens to the ranches after 20 years. At that time will a new Management Plan need to take place? This issue needs to be made clear. This DEIS needs to make clear what the regulations of the maintenance reserve account is. Whose name is this account in? Is it individual accounts, or a PRNS ranching account? Does it consist entirely from a portion of rental proceeds? At this time, most of our ranch buildings are not in our permit. They are falling apart. PRNS must get them to a certain standard before they can expect us to maintain them. It is not fair for us to bear the cost of years of Park Service maintenance neglect and the Park Service should have the financial responsibility to bring the infrastructure up to useable and safe condition.

Foundation Document Finally, the Draft "Foundation Document" must be revised to recognize the existence and importance of ranching as part of PRNS. The draft Foundation Document will provide basic guidance for planning and management decisions. The draft Foundation Document is significantly deficient because it mostly fails to recognize historic and culturally important dairy and ranching. The Document contains several sections including Park Purpose, Park Significance, and Fundamental Resources and Values. All of these sections should be revised to recognize that the ranches can help to perpetuate the coastal grassland ecosystem, increase environmental awareness, promote the ethic of land stewardship and sustainable agriculture, support the local foodshed, and continue to favorably influence regional trends in the way food is produced, distributed, and consumed. To save space and avoid repetition, we incorporate by reference and support the points in the comment letter submitted by Point Reyes Seashore Ranchers Association and the letter submitted by PRNS and GGNRA Family Ranchers.

Name: Baty, Tom

Correspondence: To Whom It May Concern:

We appreciate the opportunity to comment on the Draft Point Reyes GMP Amendment (DGMPA). The National Seashore (PRNS) and North District of Golden Gate National Recreation Area (GGNRA) are truly two of America's treasures.

In general, the Public Lands Conservancy (PLC) is not against continuation of historic dairy and beef ranching by the families that sold their land to the PRNS and GGNRA. However, the DGMPA preferred alternative outlines a concerning future for the National Park Service (NPS) by emphasizing commercial interests over protecting other values such as water quality, air quality, wildlife, traditional recreation activities, and visitor experience. The preferred alternative for the DGMPA fails to balance the National Park Service environmental values with the proposed continuance of agriculture within the Park. In addition, the preferred alternative, Alternative B fundamentally ignores a key tenet of the Seashore's original enabling legislation.

The Point Reyes National Seashore legislation provides, in pertinent part, as follows: § 459c-6. Administration of property (a) Protection, restoration, and preservation of natural environment Except as otherwise provided in sections 459c to 459c-7, ... the property shall be administered by the Secretary without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with the maximum protection, restoration, and preservation of the natural environment within the area, subject to the provisions of sections 1, 2, 3, and 4 of this title ... and in accordance with other laws of general application relating to the national park system as defined by sections 1b and 1d of this title ...5

The Preferred Alternative also inaccurately conflates the Secretary of Interior Ken Salazar's directive to extend the ranch leases to essentially expand the agricultural footprint in the Park

It's important to note that the former Secretary of Interior stated very specifically that his directive to extend the ranch leases only authorized cattle and dairy ranches to have new longer leases:

"I direct that the Superintendent work with the operators of the cattle and dairy ranches within the pastoral zone to reaffirm my intention that, consistent with applicable laws and planning processes, recognition of the role of ranching be maintained to pursue extending permits to 20- year terms for the dairy and cattle ranches within the pastoral zone. "

In turn, in his Delegation of Authority, former NPS Director Jonathan Jarvis again only authorized cattle and beef and dairy operations,

"the issuance of lease/permits for the purpose of grazing cattle and operating beef and dairy ranches, along with associated residential uses by the lessees and their immediate families and their employees, and their employees' immediate families, within the pastoral zone of Point Reyes National Seashore and the northern District of Golden Gate National Recreation Area 2 administered by Point Reyes National Seashore. Under this delegation, you may issue lease/permits with terms of up to twenty years. These long-term lease/permits will provide greater certainty for the ranches operating within the national park's pastoral zone and demonstrate the support of the National Park Service (NPS) and the Department of the Interior for the continued presence of dairy and beef ranching operations. (emphasis added) "

Fundamentally the park's preferred Alternative B inadequately addresses the intent of NPS and park enabling legislation, NPS policy, practical considerations, and significant negative impacts of expanded agriculture. Also, we do not believe NPS has the capacity to administer the oversight program developed in Alternative B. Our specific comments follow:

1. As stated in 54 U.S.C. § 100502, general management plans for the preservation and use of each System unit, including areas within the national capital area, shall be prepared and revised in a timely manner by the Director. On January 1 of each year, the Secretary shall submit to Congress a list indicating the current status of completion or revision of general management plans for each System unit. General management plans for each System unit shall include- (1) measures for the preservation of the area's resources; (2) indications of types and general intensities of development (including visitor circulation and transportation patterns, systems, and modes) associated with public enjoyment and use of the area, including general locations, timing of implementation, and anticipated costs; (3) identification of and implementation commitments for visitor carrying capacities for all areas of the System unit; and (4) indications of potential modifications to the external boundaries of the System unit, and the reasons for the modifications.

With this statute in mind, we believe the DGMPA has segmented the requirement to develop a timely, updated, and comprehensive GMP. Segmentation occurs when an action is broken down into small parts in order to avoid the appearance of the significance of the total action. An action can be too narrowly defined, minimizing potential impacts in an effort to avoid a higher level of impacts. Because the 1980 Point Reyes General Management Plan (GMP) is almost 40 years old (and required by law to be updated), amending this outdated document by focusing

only on the new Ranchland Zone has the potential to reduce and exclude potential impacts and mislead the public. For example, the DGMPA alters other zoning areas and increases the ranchland portion and decreasing environmental protection zones of the GMP designated in the two parks; however, it does not fully evaluate the impacts to these other park areas. And the GMPA is proposing new trails, visitor accommodations, and other amenities without cumulative analysis of existing park facilities. In addition, the DGMPA is deficient because the 1980 GMP overall environmental analysis and guidance in law and policy has not been updated as required by legislation. For example, visitation, facilities such as parking, historic features, special status species numbers, and abundance, and water quality standards have all dramatically changed since 1980. In turn, the 1980 GMP did not consider NPS Management Policies that were significantly updated in 2006. Because of these issues, the public cannot fully understand what changes are being made to the 1980 GMP because a complete document with changes has not been produced. A full GMP process 3 would be required to fully understand management direction and the impacts of cumulative actions for the two park areas. Finally, it is not clear which document the NPS is amending the joint OONA/Point Reyes Plan/Assessment (1980) or the standalone 1980 Point Reyes OMP. The documents are substantially different.

2. The PRNS does not have a wilderness plan as required by policy and law. However, much of the DGMPA planning area is adjacent to the parks designated wilderness and will have direct, indirect, and cumulative impacts on wilderness values. We believe additional data and baselines studies need to be completed to ensure the Philip Burton Wilderness is managed to maintain its wilderness character, as required by law. At present, lack of a wilderness plan and baseline information makes characterization of indirect and direct impacts on wilderness values impossible. The DGMPA dismisses wilderness as a topic; however, ranching activities have documented water quality and sedimentation issues from ranching activities that impact Drakes Estero, part of the wilderness area. In addition, natural viewsheds are impacted by ranching activities and the park's tule elk population utilizes designated wilderness areas.

3. The Seashore's proposed policy for managing rancher succession will determine who will take over a ranch lease once it has expired or if the primary lease holder is no longer able to ranch or has passed away. Changes made during the initiation of a new lease would be considered a federal action, and would be subject to additional NEPA documentation. We recommend the policy be rewritten to include that a first step would be to complete a site analysis of the area to be leased. This first step would include (but not be limited to) a detailed analysis of cultural, recreational, and natural values that must be protected by law and NPS policy. From that analysis, the NPS may and should remove certain lands from leasing to protect a cultural, recreational, or natural feature such as an archeologic site, a special status species, or for a recreational asset (e.g., critical grassland/brush habitat or trailhead improvements). The analysis would also identify whether grazing systems must be altered to preserve natural resources or a cultural values. In turn, as written, the Seashore's draft proposed policy again strays away from the policy that emphasize multi-generational beef and dairy ranching. Rather, the proposed policy creates a new opportunity for any individual (an individual from outside the Ranchland Zone) to apply to take over a lease through an open Request for Proposals that would continue ranching activities. In keeping with the original intentions of the public planning process, continuation of ranching should focus on the cultural and historical significance of multi-generational beef and dairy ranching.

4. We believe diversification as described in the Preferred Alternative Bis a movement away from the historic beef and dairy ranching that is stated as a cultural and historic value in the Seashore. The inclusion of diversification in the Alternative B represents an unwarranted expansion of the agriculture and the intrinsic risks to both natural systems and public access and enjoyment of the Seashore. Agricultural diversification would introduce a new range of agricultural activities, like grazing sheep, goats, keeping pigs, developing row crops, and farm stays and farm stands throughout the Ranchland zone. Diversification activities should be limited to the ranch core and small in scale. The DGMPA goes far beyond established families' continued beef and dairy ranching by allowing new uses in the Ranchland zone based on economic considerations for private businesses.

As potential types of agricultural diversification, row crops (as well as orchards and grain production) present another set of practical considerations that are seemingly incompatible with NPS policy and values. Agricultural applications of rodenticides and pesticides, even those approved for use in organic farming, should not be

permitted within the Seashore as they kill far more than the targeted "pest" species. Park policy on the potential widespread agricultural use of rodenticides and pesticides needs to be clearly presented in the GMPA.

We believe if diversification is pursued additional site-specific NEPA will be required.

5. Finally, impacts not analyzed by the DGMPA includes future conflicts with other Seashore wildlife to protect commercial rancher interests. In the future, if sheep, goats, and chickens are added to the pastoral zones, there will be significant wildlife conflicts. The analysis of the additional diversification is basically non-existent for many of the potential diversification items proposed. Small animal husbandry would obviously increase conflicts with virtually all predators, from mountain lions through raccoons as well as eagles and large hawks. Depredation permits are not permitted in the Seashore and this policy needs to be clearly addressed in the planning process. Even so-called nonlethal predator controls such as dogs (which are very often quite lethal to mesa-predators) and elaborate fencing programs represent significant impacts to native fauna as well as park visitor experience and need to be considered in planning process if agricultural diversification is being considered. Ranch guard dogs are especially problematic because of potential visitor and wildlife conflicts and should be removed from the Preferred Alternative. Despite the referenced caveats in the proposal, the reality is that these guard dogs will present true risks to wildlife and human uses in the Park. These dogs are quite aggressive by nature and should not be allowed to free range in the Park. Anyone who doubts this claim should try to approach one of the dogs currently guarding chickens on the Rogers Ranch. When a park visitor is attacked by one of these animals will the Park share in the liability with the Park leaseholder? Background literature acknowledges that these dogs are roamers by nature and generally need to be constrained with their flocks. They bark incessantly and will routinely kill anything that seems to be disturbing their flocks. The need for dog-fencing (to attempt to contain flocks to allowed "pasturelands") will create yet another layer of limiting public access and visual impairments to park landscapes and cultural landscapes.

6. We are concerned about how cumulative impacts are addressed. The CEQ regulations (40 CFR §§ 1500 -1508) define the cumulative impacts and effects that must be addressed and considered by Federal agencies in satisfying the requirements of the NEPA process. This includes direct, indirect and cumulative impacts: Cumulative impact is the impact on the environment, which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time. (405 CFR § 1508.7). The DGMPA does attempt to consider a selective and limited number of cumulative impacts (page 99); however, because the document amends the 1980 GMP, it should consider past actions that are cumulative in nature such as (by not limited to) expanded parking (increases visitation), transportation changes, new visitor serving facilities, and trail additions and enhancements. The list of cumulative impacts from projects is too limited.

7. DGMPA is missing a budget and financial overview that outlines how any of the alternatives and actions will be implemented and paid for. The Seashore funding capability has been in decline. Without a proposed budget and anticipated costs, it is impossible for the public to understand how the Ranch Operating Agreements and the Preferred Alternative will be implemented. Without this information made available to the public there may be negative impacts to natural resources management, visitor services, and other vital existing park programs to protect the environment that have not been disclosed. As stated in 54 U.S.C. § 100502, general management plans for the preservation and use of each System unit, including areas within the national capital area, shall include "indications of types and general intensities of development (including visitor circulation and transportation patterns, systems, and modes) associated with public enjoyment and use of the area, including general locations, timing of implementation, and anticipated costs."

8. All long-term strategies to manage the elk populations should be in the context of NPS policy and law as are other natural resources within the Seashore and not for the benefit of commercial lease holders. Tule elk at Point Reyes should be managed in the context of the overall population level. We strongly believe the continuation of a managed Tule elk herd is important ecologically (restores natural process as directed in NPS Policies and park's legislation) and provides for enjoyment for park visitors. We support the retaining of the Drakes Beach and

Limantour Herds. The Final GMPA should fully address this issue by providing specific guidance for management to include additional research and data collection. This would inform the public of the potential impacts to ranching operations, and turn, impacts to tule elk by ranching operations. In addition, we do not believe the park has sufficient data to set a carrying capacity number at this time. The Final GMPA should protect and manage natural resources, including tule elk, with conservation of these resources as the highest priority, as mandated by the Seashore's mission and current NPS management policies. Long-term leases and overall management strategies should strive to reduce conflicts and find non-lethal management strategies to balance and accommodate the presence of elk and cattle. The park's legislation directs protection and restoration of the natural environment the highest priority for park management.

9. The FGMPA should clarify whether commercial "diversification" conflicts with the NPS Concession Act and what current authority would be used to enact diversification activities such as overnight accommodations operated by the lessee. We would assume the concession process for all visitor activities, such as farm stands and bed and breakfast facilities, would be authorized by the concessions program. Through the use of concession contracts or commercial use authorizations, the National Park Service can authorize commercial visitor services that are determined to be "necessary and appropriate for public use and enjoyment." However, "concession operations will be consistent to the highest practicable degree with the preservation and conservation of resources and values of the park unit." In addition, the selection of a concessioner is through a competitive public process.

10. As stated NPS policy and law requires superintendents to "identify visitor carrying capacities for managing public use. Superintendents will also identify ways to monitor for and address unacceptable impacts on park resources and visitor experiences. We applaud the effort in the DGMP (Appendix G) to identify a carrying capacity process. However, there is not information in the document on how the park will implement and fund this program. The FGMPA, as required by law, should provide an implementation schedule, public process for sharing results, and anticipated costs.

11. In general PLC supports increasing visitor access through the ranch leases as long as it is limited to trails (and trail improvements) and day use amenities such as parking, picnic areas and view pullouts. We are opposed to the expansion and/or introduction of camping facilities, particularly "boat-in" campgrounds presumably in Drakes Estero. PRNS already has a significant challenge with the management of camping on Tomales Bay, particularly with issues of human waste disposal, camper misbehavior, and the protection of archeological sites. The park currently does not have the resources to effectively manage the Tomales Bay sites and allowing camping on Drakes Estero would be nearly impossible given the intent of wilderness designation and what boats should or should not be permitted in the Estero. In turn, impacts could be unacceptable to harbor seals, eel grass, and other aspects of this marine wilderness estuary. Alternative B appears to incorrectly suggest the potential use of Schooner Landing and the Home Ranch as camping areas: if these areas are the old oyster company site or the non-grazed area in the Tree Farm, both of these sites are clearly designated outside the planning area and cannot be considered or evaluated here.

12. The preferred alternative lacks a thorough analysis of anthropogenic climate change effects. Climate change, as demonstrated in studies by USGS, will include sea level rise and inundation of proposed ranch lands; this cumulative action was not analyzed in the DGMP. In addition, predicted increased rainfall and drought events would significantly alter grazing regimes and native grassland communities. The document does report on the magnitude of carbon dioxide contributed by livestock under existing conditions but does not report on the additional contribution from diversified livestock. Scientists have documented projected and existing effects of anthropogenic climate change on resources at the parks (see Gonzalez et al. 2018). The omission of a climate change analyses hinders managers from adaptively managing parks to preserve and protect resources. We recommend that FGMPA needs to have a climate change impact topic that has a full analysis of the specific and cumulative effects.

We appreciate the opportunity to comment. Thank you for your public service in maintaining and preserving our precious parks.

#7562

Name: Lunny, N/A

Correspondence: Dear Superintendent Muldoon, The Lunny Ranch is a member of the Point Reyes Seashore Ranchers Association (PRSRA) and fully endorses the points made in the PRSRA DEIS Comment letter. Also, to save space and avoid repetition, we incorporate by reference and support the points in the longer and much more detailed DEIS Comment letter submitted by PRNS and GGNRA Family Ranchers. This letter is meant to focus more specifically on the Lunny Ranch (aka the Historic G Ranch).

During the Shafter era, the same time frame the new historic working landscape designation is meant to protect, the G Ranch, like other ranches on the Point Reyes Peninsula, was quite diversified. A dairy, many large barns for cattle and horses, a slaughterhouse to kill and process cattle, sheep and hogs, a cheese processing plant, pastures, hayfields, and worker housing all existed at the G Ranch. It is unknown whether row crops or field crops were raised on the G Ranch prior to World War II. As thousands of acres were under cultivation on the peninsula for artichokes, beans, peas and other vegetables, it is quite likely that these crops were grown at the G Ranch because most of the ranch is level with deep soil.

Post-World War II, with the availability of inexpensive shipping, the landscape at Point Reyes began to change. Ranchers realized that they did not need to depend on the local food system to make a living. More money could be made by concentrating all effort on the dairy, leaving traditional diversification behind. The local diversified farms turned into a non-diversified dairy monoculture - shipping feed in from distant locations and shipping milk to distant markets. This same transition to large scale, single commodity agriculture was happening all over the country. The Congress and the NPS created PRNS just after the conversion to a cow-only, mostly dairy monoculture.

At the time that the Lunny Ranch (G Ranch) was purchased by the federal government in the 1970s to include in the Pastoral Zone of PRNS, the Lunny family enjoyed hunting, fishing and water skiing (very occasionally) at Abbotts Lagoon and grazed cattle to the edge of the lagoon. The Lunny family also had an annual 4th of July party on the edge of the lagoon. The beef cows preferred calving in the clean sand in the sand dunes. We milked about 250 cows at our dairy and we still had a few pigs around from the time when every ranch had pigs. We could add any species of farm animal we wanted - for commercial sale of meat, for our own consumption or for additional management of invasive brush. We made decisions about stocking rates and stocking densities that would utilize available forage, but never overgrazed. We took excellent care of our pastures and rangelands because our future depended on it. When the Seashore was established, the Lunny Ranch had approximately 500 acres in crop production. We plowed, disked and planted barley, oats, vetch, beans and other forage crops and stored and fed the feed as silage. We had a makeshift runway where fixed wing aircraft and helicopters would land, load with fertilizer, and spread on the crop land. Much of the several thousand tons of silage produced annually on the Lunny Ranch was sold to neighboring dairies. During this time, if a building needed repair, we repaired it. If a waterline failed, we replaced it. If we needed a water trough in a new location, we put it there. And the natural resources were protected.

Ranching at PRNS is very different today. We are no longer allowed to hunt, we are not allowed to use the sand dunes or Abbotts Lagoon, we are not allowed to make our own decisions about stocking density or stocking rates, and we are now limited to 180 acres for crop production per year. In the draft EIS, NPS makes an attempt to allow ranchers to restore other livestock species grazing for our pastures and has also made an attempt to allow more row crop production. Unfortunately, the diversification activities would not be economically viable if the DEIS limitations on these activities are not revised. The DEIS states: "Diversification of ranching activities allows ranchers to react to poor forage production years and fluctuations in the economic market." Without the modifications proposed by the ranchers in PRNS and GGNRA, the diversification components of the DEIS would not meet the NPS goals.

It is our understanding that NPS policy does not require that activities in a cultural landscape present at the time of purchase be frozen in time, ignoring and/or disallowing the rich historical activities and/or the need to allow

modernization and change from that moment in time. We have been very pleased with the fact that the NPS has allowed significant changes, upgrades, construction and development to be undertaken over the years by the ranchers, which has allowed seashore ranches to better compete in commodity markets. Since the 1960's when PRNS was created, PRNS family farms generally strove to compete in a nationally price driven commodity-based agriculture, competing with large scale industrial agricultural operations.

The reality for the family farm has changed. Over the past decade or so, the U.S. is losing approximately 50 family farms per week and big industrial agriculture is getting bigger. Small family farms have realized that the secret to survival is to begin to move away from large scale single commodity monoculture and refocus on small scale diversified agriculture and local markets. The local marketing allows small farmers to build local relationships, and to collaborate with other ranchers on value added products processing and distribution. This "new" model is actually a restoration of the traditional diversified farms found on the Point Reyes peninsula during the Shafter era, not long before it became a unit of the NPS. We applaud the NPS for the attempt it has made in this DEIS to allow the restoration of these historic activities. With the modifications proposed by the ranchers in the planning area, these goals can be accomplished.

We appreciate that the PRNS initial proposal includes ranching with 20 year leases but are concerned that ranching may not remain viable because of the elk conflicts built into preferred alternative. The Lunny family still interprets the 1998 Elk Management Plan the same way that PRNS did in 2001 (see attached copy of PRNS document "A Year in Review"), only 3 years after the plan was completed. This contemporary understanding of the Elk Management Plan is certainly the correct interpretation. NPS more recently has not adhered to the 1998 Elk Management plan and the conflicts described in the current, 1998 Elk EA, while contemplating elk on the ranch lands, are now occurring. Allowing the result of this failure to manage to become the de-facto baseline for this EIS is wrong and misleading. An attempt to validate the mismanagement through a NEPA process, by allowing the elk conflicts to continue, could be best described as a crime. NPS, in this EIS, must portray a full and honest description of the 1998 Elk EA and Management Plan, the NPS and the public's understanding of that plan (at least until 2001), an honest history of the elk management to date and a reasonable baseline that respects the current, operative 1998 Elk Management Plan and EA for this analysis. The DEIS comments from the ranchers who have experienced the history and impacts of this problem give the NPS reasonable solutions the problem so that both the elk and the historic ranches benefit - solutions already allowed under the current 1998 Elk Management Plan.

Upon reading the PRSRA comment letter, it is evident that all seashore ranchers are encouraged and excited to see the PRNS focus on preserving the continuing landscapes, now recognized as historic districts - the Shafter era diversified agriculture. This gives new hope that our ranches and farms will survive as viable businesses into the future. Small family farms cannot compete with industrial agricultural operations producing the same commodity for the same price. Without allowing the seashore ranchers to restore a reasonable portion of the historic diversity and practical operational flexibility, NPS would, in actuality, be contributing to the elimination of the ranches and the loss of an important cultural resource. The 29-page rancher comment letter details the modifications to the DEIS that are necessary to preserve ranching within the planning area.

The Lunny family has specific plans for the Lunny Ranch, most of which have been evaluated so that PRNS can approve these changes in a 20-year lease and Ranch Operating Agreement (ROA). The Lunnys plan to return the ranch to a diversified farm consistent with the time frame the National Historic Register meant to preserve and protect, 1860 to 1960, also described and celebrated by NPS as the Shafter era. While doing so, recognizing that its location is inside the highly visited working landscape of a national seashore, all improvements will be ecologically responsible, compatible with public visitation, public viewing, on farm tours and educational opportunities. The Lunny Ranch will become a current time, viable reflection of what originally protected Point Reyes and what made Point Reyes worth protecting into the future. The following planned activities, to be allowed in the GMPA, some minor modifications or clarifications to the EIS will be required.

1. Enhance row crop production. The Lunny Family would like permission to increase the row crop acreage from 6 to 30 acres. The EIS process should consider the fact that this small increase in acreage (24 acres) represents only

2 to 3 percent of the Lunny Ranch and approximately 1/10th of 1% of the planning area. This is properly viewed as small scale, historically appropriate diversification with all its social, economic and environmental benefits over monoculture. Historic records demonstrate that thousands of acres were planted with vegetables on the seashore ranches. Even if many ranchers elected to plant 30 acres each, it would total only a fraction of what existed during the Shafter era. The EIS should poll the ranchers to determine the level of interest in restoring row crop production. It is likely that few ranchers will be interested and the percentage of agricultural property that would restore row crops would be very low, but important. The EIS team should also acknowledge the fact that the Lunnys intend to simply convert 24 acres of silage fields (crop land) to vegetable fields (crop land). This should not be considered a change in use, it should be recognized as simply a change of crop. Normal agricultural activities in a continuing agricultural landscape. The Lunnys are not asking to convert native, untouched rangelands to crop land. The Lunnys recognize that there will be 24 acres less to continue silage crop production. The DEIS incompletely analyzes the restoration of this historic use. The DEIS comment letter from the ranchers within the planning area provides experienced insight for the EIS team to include in its analysis. The Lunny Ranch has some specific comments. Issues to consider are:

- a. This use in all likelihood existed on the G Ranch during the Shafter era;
- b. This use currently exists on the G Ranch. The DEIS proposes to limit diversification into row crops to 2-1/2 acres. The Lunny Ranch already has 6 acres, so it wouldn't be "diversifying" into row crops. By this, we assume our 6 acres can remain in row crop use because it pre-existed the GMPA - just as forage crop production, as it existed prior to the GMPA, can continue;
- c. The DEIS suggests, in the diversification section, that irrigation would be prohibited in row crops. The 6-acre Lunny Ranch row crop area has had permanent, underground irrigation, including 8 irrigation zones, electric vales and electronic timers. All of this infrastructure has been in place since about 2003 - 16 years. The Lunny Ranch has enough water for this purpose and there have been no conflicts with NPS or the visiting public. Because this activity pre-existed the GMPA by 16 years, we assume that this activity can continue and will not be taken away. The Final EIS should clarify that new restrictions apply to new activities and existing irrigation systems can remain in use. NPS must also follow the suggestions in the rancher comment letter, the reasons for irrigation, and allow irrigation on new row crop areas as well;
- d. Lunny Ranch intensive farm land acreage will decrease in forage cropland and increase from current 6 acres to about 30 acres in row cropland which represents less than 3% of the G Ranch and a minute fraction of the overall agricultural properties within the planning area. This is simply a change in crops at the Lunny Ranch and should be analyzed as such. The DEIS proposes 2-1/2 acres per rancher, which amounts to about 75 total acres of row crops in the planning area. Scoping comments requested that NPS ask each rancher if they plan to include row crops in their ranch plans. NPS met with most, if not all ranchers, to discuss specific plans, issues and questions. The final EIS should include the results of that analysis - how many ranchers are planning to include row crop production on their ranch? Knowing this answer, NPS can set a planning area maximum of 75 or more acres and allow the interested ranchers to use a reasonable portion of this total. This would allow ranchers to include a viable, historic row crop component to the ranch. 2-1/2 acres is not viable and therefore does not meet the stated goals of the GMPA. In conversations among ourselves and at Seashore Rancher meetings, we estimate that only two or three ranchers are planning to grow row crops. If this is true, the current restrictions in the DEIS would allow only the restoration of 7-1/2 acres of historic row crops - not the 75 acres NPS has deemed appropriate. This section of the EIS must be revised;
- e. At the Lunny Ranch, crop production will be located on land that is currently authorized for crop (forage) production, no new areas will be converted to cropland;
- f. Production in the 24-acre current crop area that will rotate into row crops will focus on crop species that were historically grown during the Shafter era, including artichokes, potatoes, beans and peas; and,
- g. Production in the 24-acre current crop area that will rotate into row crops will include dry-farming techniques.

2. Restore dairy production. The DEIS wrongly dismisses the restoration of historic dairy activities within the Point Reyes Historic Dairy District prior to evaluation. This was a use in this location during the historic period NPS is charged to protect and it is a continuing use on other ranches within the District and planning area. Only a few years ago, NPS correctly allowed another dairy in the district that had ceased operations to restore production. This DEIS carefully analyzes the environmental effects of dairy farms in the planning area. Now, in this EIS, is the time to analyze and consider the restoration of a dairy. Most of the analysis necessary has already been completed in the DEIS. If restoring this activity is not considered during this process, it would force the Lunny Family, or any other family, to initiate an expensive, onerous NEPA process to evaluate the exact same impact topics again. This would be wrong and unfair. Although the Lunnys do not plan to immediately re-start the dairy, we may, or another ranch may plan to re-start a dairy sometime in the near future. Knowing this NEPA review and GMPA will likely be the policy for NPS for at least the duration of the first 20-year permit and is intended to consider and evaluate the ranching activities during this future time frame, all potential activities necessary to ranching should be evaluated. This will allow the GMPA EIS to be used as expected - complete NEPA evaluation on all ranch activities, including mitigation measures, so that further NEPA analysis will not be required to implement the approved activities and mitigation measures. The Lunny Ranch proposes a small (100 cows), grass fed, organic Jersey herd much smaller than the other dairies in the planning area. The Grade A milking barn, corrals, fencing as well as most other infrastructure necessary to restore production already exist. A composting barn will be constructed near the milking barn in the ranch core - almost exactly where a much larger barn previously existed. The Lunnys will restore the small, on-farm butter making activity inside one of the existing buildings within the Lunny Ranch core. The whey bi-product of butter making will be fed to the hogs as was done on this G-Ranch historically. The butter will be sold at the on-farm retail location as well as other local, organic markets. This will be part of an important reconnection of PRNS and GGNRA ranches to the local food system. The Lunny Ranch dairy plan incorporates mitigation for most, if not all adverse effects of dairy production, including:

- a) Traffic Impacts. Because the plan includes a small, grass-fed herd, very little feed will need to be imported. Also, with on-farm processing, fewer milk trucks will be required for milk transportation.
- b) Air Quality. A composting barn will allow the cows to be inside and will keep the manure safely composting inside the barn. This eliminates the requirement to store manure in manure a manure lagoon and eliminates the need to spread the raw manure. A significant reduction in GHG emissions result from composting barns. Grass fed cattle produce less gastroenteric GHG than grain fed cattle.
- c) Water Quality. Compost will be spread on pastures, not raw manure. Cows resting in the composting barn will reduce the chance of water quality problems from manure and mud in storm water runoff.
- d) Visitor Enjoyment. Farm tours and visits to the on-farm retail will include a more comprehensive view of a historic dairy and associated activities within the historic dairy district. The small dairy component will allow for a more complete and sustainable farming system at the Lunny Ranch. The Final EIS must evaluate the restoration of this dairy activity and recognize the environmental benefits and mitigations built into the Lunny Ranch plan, which could be also be utilized elsewhere in the planning area.

3. Restore small scale hog production. The DEIS appears to support the Lunny Ranch plan to restore the following historic hog production: a. This use existed on the G Ranch during the Shafter era; b. The number of sows on the ranch would be limited to 8 and would be kept in the ranch core area; c. The hogs will utilize the waste vegetables from the row crop operations; d. Hog and cow manure will be composted on-farm; and, e. This use will avoid disposal of the above ranch resources.

4. Restore small scale chicken production. The DEIS appears to support the Lunny Ranch plan to restore the following historic hog production: a. This use existed on the G Ranch during the Shafter era; b. Both eggs and meat will be produced; c. The number of birds would be limited to 500; d. Chickens will be pastured; e. Chickens will be used to enhance pasture management; and, f. Chickens will be used to help control parasites within organic pastures.

5. The DEIS appears to support the Lunny Ranch plan to expand on farm organic composting. Currently, small scale composting occurs at the Lunny Ranch. Manures and green waste, including green waste, from PRNS can be co-composted. The Lunnys own and operate West Marin Compost in Nicasio, CA, and are expert, organically certified composters. Issues about organic composting to consider are: a. The Lunnys are experienced and qualified composters; b. Soil nutrient balancing - reduces nutrient loading on nutrient-rich soils and adds nutrients to soils in need of nutrients, organic matter and microbes; c. Preserves organic matter & nutrients from PRNS and keeps them within PRNS; d. Facilitates carbon farming BMPs; e. Increases carbon sequestration; f. Reduces raw manure spreading; g. Eliminates odors; h. Composting kills weed seeds before spreading on pastures and rangeland; i. Reduces GHG production from manure lagoons; j. Reduces GHG production caused by PRNS exporting greenwaste; k. Improves soil health; l. Improves pasture health; m. Improves quality of storm water runoff; n. Improves collaboration between PRNS and the ranchers; o. Improves collaboration between ranchers; p. Helps PRNS achieve GHG reduction goals; and q. Would take place within the ranch core area- within the feed lot area. 6. Build a roof over the feed storage area. This construction would help meet the Lunny Ranch goals as well as the NPS goals in the EIS: a. Protection of feed from rain damage; b. Keeping birds, including ravens, away from the livestock feed; c. Allows the Lunny family to purchase feed at the right time if a safe storage location is available; d. Would not change the use of the area; e. The roof will be the location of solar panels capable of producing all the electricity to operate the Lunny Ranch.

7. Begin direct on-farm sales of Lunny Ranch farm products as well as farm products produced on other seashore ranches. This EIS team should recognize that the Lunny family are experts on this issue. The Lunny family owned and operated the Drakes Bay Oyster Farm that was adjacent to the Lunny Ranch until it recently closed. The reasons for closure did not include the beloved farm stand where people could get a taste of the place or the farm tours where they could learn about the history and ecology of where their food came from. We had families from all around the world visit. We had regular school groups visit. It is not a question about whether seashore visitors would love and appreciate the farm stand - they always have, and they will love this new Lunny Ranch farm stand. NPS failed to fully analyze the continuation of the PRNS historic on-farm sales use. As this issue affects many seashore visitors and ranchers, and that the continued use of on-farm sales was properly addressed during the public scoping period of both the CRMP EA process as well as the current EIS process, NPS must fully analyze the relocation and continuation of this important asset in the final EIS. Ignoring the analysis in the EIS would imply that the status quo, including on-farm sales, is still an appropriate use. To avoid challenges to the FEIS, and to avoid the need for further NEPA evaluation to add this activity in the planning area following the FEIS and ROD, this activity should be fully evaluated and authorized where appropriate. Issues to consider are: a. This use has always been authorized within PRNS next door to the Lunny Ranch. The historic use will be relocated by only a half mile; b. Because the on-farm retail had been authorized by NPS within PRNS since the creation of the seashore (authorized for over 50 years) and only recently closed for reasons unrelated to the beloved farm stand, on-farm sales should properly be included as a baseline activity in this EIS; c. The Lunny family was the operator of the on-farm retail location within PRNS for over a decade, until it was recently closed. The Lunny family can verify that NPS never raised any concerns about the retail activities; d. NPS conducted an EIS to consider the renewal of the oyster company use permit. During this extensive NEPA process, where a report in excess of 1000 pages was generated, no adverse impacts from on-farm retail sales were identified and visitor enjoyment of the activity was recognized. The only potential concern raised by NPS was that some visitors might prefer a wilderness experience. As the ranch planning area is not a wilderness area, this would not be an issue to address in this EIS. Pursuant to NEPA, this GMPA EIS must rely on the fact that this is not a new activity and relocating the use would not create new impacts to consider and that a recent, formal NEPA EIS found no significant adverse effects of on-farm sales within this planning area; e. Seashore visitors are now temporarily missing the opportunity they had before the closure of the oyster farm; f. The Lunny Ranch farm stand will sell and interpret products from the Lunny Ranch as well as products from other ranches within the planning area; g. Allows planning area ranchers to collaborate at an on-farm sales location with safe egress and plenty of parking space; h. PRNS and other ranchers can participate in tour planning and other educational components; i. Provides opportunities for the visiting public to connect with the working landscapes; j. This activity will provide educational opportunities within the planning area as described by NPS in this DEIS: The Purpose and Need for this analysis has two goals: A) "Visitors have opportunities for diverse educational and learning experiences."; and B) "Visitors have

opportunities to enjoy expanded connections and greater access to diverse recreation." k. This activity's location will be in the ranch core.

8. Continue to produce and harvest on-farm forage crops. We appreciate that the DEIS will allow the Lunny Ranch to continue to grow forage crops on up to 180 acres per year. The Lunny Ranch believes that other ranchers could also benefit from forage production. We request that the NPS, in the Final EIS, analyze the benefits of new forage production within the pasture subzones on other ranches within the planning area.

9. Provide 2 new worker residences within the ranch building complex ranch core. The DEIS seems to support our plan to provide additional farm worker housing. The Final EIS should be more explicit. Issues to consider are: a. This use existed on the G Ranch during the Shafter era; b. Provides the rare, necessary farm worker housing in West Marin; c. Allows the Lunny Ranch to compete for good employees; and, d. Allows for the necessary staff for round the clock emergency work often encountered on a working ranch.

10. We are pleased that the DEIS includes public education as a priority in the planning area. Farm tours have become important to urban visitors as well as to ranchers and farmers for many reasons. The Lunnys are very pleased that PRNS has already allowed seashore ranchers to undertake this activity within PRNS. The Lunny Family is extremely experienced in giving farm tours. We have hosted many thousand farm tours within PRNS - mostly at the Drakes Bay Oyster Farm before it recently closed. The visiting public absolutely loves the opportunity to learn about where their food comes from - adults and children alike. The Lunnys request the approval for this activity on the Lunny Ranch as well. As PRNS has already authorized this use, it is unclear whether it needs to be evaluated in the current EIS. At the Lunny Ranch, seashore visitors could learn about how good stewardship on the farm leads to healthy food and thoughtful natural resource conservation. The visitors will be able to see a working ranch with cows, goats, pigs, chickens, small scale row crops and how the interrelationship of those farm activities are important to the sustainability and resiliency of a small, locally connected, family farm. The seashore visitors could leave the Lunny Ranch understanding why these dairy districts are now federally protected continuing landscapes and how the Lunny Ranch demonstrates that history. The Lunny Ranch could work with PRNS to plan and implement a collaborative farm tour program that could include visits not only to the Lunny Ranch, but also to other ranches within the planning area. Farm tours could be offered at no charge to the visiting public if connected with a farm stand that sells seashore rancher food products at the Lunny Ranch. This EIS should evaluate the impacts of allowing the Lunny family to charge a fee for special farm tours that may include a meal featuring foods produced in the planning area.

11. Operational Flexibility. To operate a successful ranching or dairying business, the rancher needs to be able to implement best management practices and make operational decisions quickly. Weather conditions and other factors may necessitate quick reaction by the rancher to protect natural resources and to protect their businesses. Although the DEIS attempts to create flexibility, more analysis is required. a. Brush Removal - Invasive brush has been controlled by humans in this region for millennia. For the past approximately 70 years, the Lunnys have controlled brush on the G Ranch by grazing, burning, dozing and mowing. The Lunnys request permission to continue this vital activity - specifically, mowing and planned, focused grazing with goats. The restrictions detailed in the DEIS would allow goat and sheep grazing only in the ranch core and pasture subzones. The largest risk of brush encroachment and loss of habitat and scenic vistas is within the range subzones. Furthermore, the DEIS restricts other invasive plant management tools within the range subzone. Because goats and sheep can help provide invasive plant control, these species should be allowed within the range subzone. Allowing the use of goats or sheep on rangeland would be consistent with the PRNS use of goats within the planning area for the same purpose. b. The Lunny Ranch appreciates the analysis in the DEIS and Appendix D, where NRCS water development and distribution practices will be allowed. Water and Pasture Improvements - The Lunnys request that the PRNS authorize the implementation of the NRCS designed and approved water and pasture planting project for the Lunny Ranch and approved by PRNS. (NRCS Water Development description previously provided during scoping.) Once implemented, all water on the Lunny Ranch will be moved by solar pumping systems and gravity, new red-legged frog habitat will be developed, wetland and riparian areas will be protected, cattle water troughs will be moved away from sensitive habitats and the Lunny's certified organic cattle will be provided cleaner water. The NRCS performed NEPA review for this project and approved the project. As all the

proposed practices have been analyzed by both NRCS and this EIS, no additional NEPA compliance will be required to implement the Lunny Ranch plan. c. This EIS recognizes the many benefits of composting and allows on-farm composting. For the reasons raised by the ranchers in the planning area, the EIS should be corrected to allow compost use within the pasture subzone on beef ranches and within the range subzones when appropriate. In the DEIS, NPS prohibits "fertilizers and compost" use as if they are the same. They are not, and compost, for all its benefits, should be allowed. The Lunnys plan to continue composting, using feedstocks from both on and off farm, to spread compost on pastures and cropland including row crops, silage, hay, and haylage producing areas. With prior NPS approval, the Lunny Ranch will spread compost on certain rangelands used solely for grazing. The EIS recognizes the benefits of compost application on dairy ranches. The EIS must fully analyze the identical benefits of compost application on beef ranches as well. When the analysis is corrected and compost is properly allowed on all pastures, the Lunny Ranch plan can be implemented without delay. d. The DEIS lacks meaningful analysis of Carbon Farming. The Lunny Ranch applied for a grant for Carbon Farm Plan with the Marin County Resource Conservation District (MRCRD). The Lunny Ranch was successful in obtaining the grant. The Lunny Ranch looks forward to working with the MRCRD and its carbon farm plan partners to create a plan to sequester more carbon in the soils of the Lunny Ranch. The practices included are all practices known to benefit the natural resources and most have already been allowed to be implemented on ranches within the seashore by PRNS. This EIS must evaluate creating a clear path to implementing the stewardship practices included in the carbon farm plan without delay. This EIS should fully evaluate the carbon benefits - the capture of atmospheric CO<sub>2</sub> and the increased soil carbon that results from implementing these practices. The plan must also evaluate the benefits to soil health and water quality that will result for complete farm plan implementation. Carbon farm plan implementation can improve visitor experience by visibly improving pasture and rangeland health and through education about how well-planned grazing management can improve environmental quality, including air quality. Many, if not all individual practices often used in a comprehensive carbon farm plans have been analyzed in the DEIS and no adverse effects were identified. The Final EIS must explicitly allow ranchers to implement complete carbon farm plans without further NEPA compliance and without delay.

12. Grazing activities -The Lunnys have implemented sensibly planned grazing techniques which have improved pasture and rangeland health and productivity. This is demonstrated by the PRNS range monitoring that reviews and reports on the quantity of forage left behind after the grazing season has ended in the fall - residual dry matter (RDM) measurements. PRNS requires a minimum of 1200 lbs. of RDM per acre. According to PRNS (see attached NPS RDM report), the Lunny Ranch had 7200 lbs of RDM per acre in 2018 - the highest RDM measurement in all PRNS and GGNRA agricultural properties. This excessive RDM is damaging to the natural and cultural resources in a number of ways, including increased weed invasion, increased brush proliferation, increased GHG emissions from decomposing vegetation, loss of carbon sequestration due to halted photosynthesis, reduction of native pasture species due to reduced light making it through lodged vegetation to the soil, increased fire danger and an economic loss to the Lunny family. The regular, damagingly high RDM measurements at the Lunny Ranch indicates poor pasture management - under grazing due to insufficient stocking rates and/or stocking density. Currently, the Lunny Ranch is limited by a maximum number of cows that was arbitrarily set in the 1990s. PRNS should allow the Lunnys, and all ranchers to make stocking decisions to meet resource goals, including RDM. PRNS should monitor the results to ensure resource goals are met. Ranchers have the long-term range management experience, are on the ground daily to monitor and decide how much grazing pressure is necessary, when to move cows to another pasture and when to sell cows if necessary. Ranchers need to be good stewards to preserve the productivity of the grassland. Having PRNS staff simply counting cows as the only management tool for grazing compliance can harm the very resources they think they are protecting. The Lunny family has made multiple attempts to correct this management deficiency. This EIS should review the record at PRNS. The DEIS gives reason for new concern about PRNS grazing oversight. PRNS staff recently created a new, theoretical computer model to help determine pasture and rangeland carrying capacity. The suggestion that this new, untested tool be used to help determine carrying capacity is premature. According to the DEIS, NPS used this new theoretical model to predict that 50 tule elk grazing on ranchers' pastures would not affect the forage availability or RDM. The obvious reality is that 50 elk eat lots of forage and therefore absolutely affect forage availability for the cows and absolutely affect RDM. Knowing this failure of this new model, as well as other inaccuracies that are likely to become evident in a brand new, theoretical model, NPS, in the Final EIS, must allow for some years of testing and improving the model before it is used in any way to help determine carrying capacity. Allowing time

for testing and improving the model, or discarding the model, would not create any management or environmental consequences. Carrying capacity can be derived by data already available to the rancher and the NPS. Historic records are the most useful planning tools. Ranchers know how many cows have been on their ranch throughout the years. The records of rainfall are available to consider poor forage years. In the DEIS, NPS states that it will continue to monitor RDM measurements on ranches. NPS and the ranchers can use these records to make appropriate adjustments to stocking density and stocking rates on an annual basis as part of the ROA amendment process. It may be impossible for theoretical projections to calculate the variations in individual ranch resources and ranch managers. When to move cattle from one pasture to the next can have a large impact on forage production. Only an experienced manager with a trained eye will likely make the best decisions. A theoretical model would be incapable of including these important management nuances. Theoretical carrying capacity projections may serve a more important purpose in an area where historic data and multi-generation expert rancher/ range managers are not available. For the last decade, the NPS has refused to adjust the Lunny Ranch carrying capacity. Thankfully, based on the DEIS, adjustments to carrying capacity will be made based on RDM and other historic records and the Lunny Ranch fully expects a significant revision to the allowable forage consumption. The Final EIS must not allow the new, faulty theoretical model to confound good range and pasture management decisions. The EIS team should keep this in mind while contemplating this issue: Ranchers understand carrying capacity and forage availability. Ranchers know that if the rangeland or pastureland is overgrazed, less forage will be available in subsequent years. Ranchers want sufficient RDM for long term economic reasons and know how to achieve these results. This EIS should be corrected so that the NPS role is to ensure that RDM and other resource goals are met. If goals are not met, NPS should work with the rancher and oversee individual ROA changes in order to achieve resource goals. NPS should not attempt to prescribe, limit, enforce, or otherwise micromanage cow numbers, when stocking rates are only one component a rangeland manager uses to achieve resource condition goals and different grazing practices on the same pastures and rangeland can affect carrying capacity. NPS must recognize that these leases in the planning area differ from most public land grazing leases. In the planning area, ranches are managed by the same families that have been managing the grazing for generations, the resources are in good condition and, especially with 20-year leases, the ranchers have long term goals to protect the resources - water, soil, forage - because their future economic well-being depends on it. In the planning area, the ranchers have the most experience managing the resources. Conversely, most other public land leases are for 5 years and many go back out for public bid at the end of the lease term. Ranchers may not have long term resource management goals and may not have long term experience managing the subject resources. In these more common public grazing permit instances, the public lessors (BLM, Forest Service, and others) may have more experience and may have long term resource goals. It makes more sense for these public agencies to more strictly manage these short-term grazing permits and dictate grazing methods and stocking density. NPS has the responsibility to ensure the public resources within the planning area are properly cared for. NPS is not required to micromanage ranchers. In the planning area, NPS should be partners with the ranchers and make sure that resource goals are met. NPS should monitor results. If a rancher fails to meet RDM requirements, NPS should work with the rancher, determine what could be the cause and, together make changes so that resource goals can be met.

13. Greenhouse Construction - Although the Lunnys have temporarily fallowed the 6-acre irrigated row crop garden, for the past decade, the Lunnys have depended on outside sources for organic vegetable starts. Star Route Farms in Bolinas has provided many of the plants grown in the current 6-acre vegetable crop area on the Lunny Ranch. Many plants do not do well when started by seed in the field. An on-farm greenhouse has become an economic necessity. The Lunnys request permission to build a small greenhouse on the G Ranch within the ranch core. Although the DEIS suggests that new, necessary construction is allowed within the ranch core, it did not fully evaluate the addition of a greenhouse within the ranch core area of the Lunny Ranch. Elsewhere in Marin County, this minor farm structure could be built without a permit. The Final EIS must more directly analyze and approve these types of small, necessary structures within the ranch core. Otherwise, interested ranchers could be subjected to another onerous and unnecessary NEPA process.

1. Foundation Repairs to Dairy Barn - The south end of the milking barn on the G Ranch is settling and is causing other structural damage. The Lunnys request permission to support the foundation and to make the necessary structural repairs. All work will be performed by licensed contractors upon PRNS approval. The DEIS appears to allow these kinds of repairs and the Lunny Ranch will commence with the repairs after the Final EIS and GMPA is complete.

2. Wall Replacement and New Roof on

Shop Containing the Ranch Electrical Service - - The Lunnys have made several requests to PRNS to get this building repaired. PRNS has told the Lunnys that there is no budget for this work. The Lunnys have requested permission to make the necessary repairs to this building with the Lunny Ranch paying for the repairs. All work will be performed by licensed contractors. The Lunnys have consulted with 2 contractors who have agreed that if the repairs are not made immediately, the building is likely to fall to the ground making repairs impossible. This EIS should review the record, confirm the repeated requests, confirm the offer by the Lunnys to pay for the repairs, and to confirm that the historic building will collapse soon if not repaired. The DEIS appears to allow these kinds of repairs and the Lunny Ranch will commence with the repairs after the Final EIS and GMPA is complete. 3. Lease valuation needs to be clarified in the Final EIS. It is unclear how an overall appraisal of all ranches in the planning area can be of use. It seems that individual appraisals would be more appropriate. 4. The Lunny Ranch recognizes the usefulness of creating subzones on ranches to allow for fair and streamlined management throughout the planning area. For this new zoning and the associated use restrictions to function properly, the zones need to be properly identified. We understand that this DEIS included the first attempt by NPS to create zone boundaries, and it should be expected that the boundaries may need some adjustments. For the Lunny Ranch, most of the proposed zone boundaries seem appropriate; however, two small, but critical, corrections are needed. One of the corrections necessary is an adjustment of the ranch core subzone boundary. The DEIS states that the ranch core subzones contain previously disturbed lands and little to no water resources. Correctly, NPS included the buildings, most of the livestock corrals, one of the feeding areas and the alleys that connect them. What was missed is an area closer to the buildings that includes our bull pen and our row crop area. The bull pen has always been a high impact feeding area. It contains feed racks, concrete slabs, a concrete manure pit and pump station among other improvements. This area has historically been a springer lot for cows to be contained and watched closely during calving. It has always been a high impact winter feeding area. There is no question that this area is just as much part of the ranch core as the other feedlot already included. Also, once a part of the springer lot / bull pen feeding area is the 6-acre row crop area. Prior to row crops, this area was part of the previously described feed lot / springer lot / bull pen with the same intensive use. In approximately 2003, with NPS permission, 6 acres of the bull pen was fenced with 6' tall woven wire to protect the row crops and permanent, underground irrigation was installed throughout the 6 acres, including electric valves and electronic timers. This area is ripped, tilled, amended with compost, manure and other inputs. Many varieties of vegetables and berries have been grown in this area. Some of the products have been directly sold to restaurants and some have been sold at farmer's markets. Cover crops are rotated into the organic row crop system and organically approved mulches are used from both on and off farm sources, including commercially produced, organically certified compost and mulch from West Marin Compost. Beds are listed to create planting rows. The Lunny Ranch has temporarily rested the row crop production area and plans to begin planting this area in the near future. This area does not qualify as pastureland or rangeland. It absolutely belongs within the ranch core subzone. Attached is an accurate ranch core map. The Final EIS and the Lunny Ranch ROA must include these highly developed, highly impacted, high use areas adjacent to the building complex within the ranch core subzone. The other boundary correction necessary relates to only one of the four proposed resource protection subzones. Two of the proposed subzones at the northwest end of the Lunny Ranch, near Abbotts Lagoon (see figure 14, page A-15), have water and wetland resources where increased management and protection may be appropriate. There are springs with potential red legged frog and Sonoma alepecuris wetland habitat. Currently, these areas are the only water sources available for a large area of the Lunny Ranch. The Lunnys recognized the habitat value of these two wetland areas and previously proposed a project to protect these areas. Currently, cows enter the wetlands to drink water from stock ponds developed by the Lunny Family in the 1950s. This project, already approved for cost share from the Natural Resources Conservation Service Environmental Quality Improvement Program (EQIP), will allow the Lunny Ranch to collect water from these two springs, install solar pumping stations, piping and water troughs away from sensitive habitats. This previously planned project will essentially accomplish what appears to be a goal of the NPS in the DEIS. Any use of these areas - flash grazing to improve red legged frog habitat, or other prescribed grazing - - will only occur at the direction of NPS. The complete Lunny Ranch EQIP plan was provided to NPS during scoping and the included practices are included in the DEIS analysis, therefore, the Lunny Ranch expects prompt approval and inclusion of the full EQIP project in the Lunny Ranch ROA. Once this project is completed, NPS and the Lunny Ranch will be allowed to adjust the management these wetlands. It is unclear why the NPS is proposing the resource protection area adjacent to the sand dunes along the western border of the Lunny Ranch. This is an area where following dune grass removal, the windblown dunes are completely covering rangeland forage, as well as significant Sonoma alepecuris stands.

Cattle grazing, unlike sand, has been shown to have positive effects on this endangered species. The Final EIS should identify the reason for this particular proposed resource protection subzone located near the sand dunes. The proposed resource protection subzone proposed along Sir Francis Drake Boulevard must be changed. This area, by definition, is actually pasture land. Because the Lunny Ranch farm plan does not include any uses of this area other than occasional brush control, this can be included in the Lunny Ranch rangeland subzone. This proposed resource protection subzone location along Sir Francis Drake Boulevard was discussed at a meeting at PRNS headquarters on May 9, 2019. Present at the meeting were three members of the NPS EIS team: Dylan Voeller, David Press and Brannon Ketcham. I explained the importance of this area to the Lunny Ranch. This is not only valuable forage, it is also a critical path on the pasture rotations used at the Lunny Ranch. We question the need for this extremely restrictive zoning. I was told that no sensitive or endangered species or habitat is present. The only concern the NPS has is that this can be a very wet area during the winter months. Not only does the Lunny Ranch concur with this assessment, I provided a map, before I had ever seen the proposed zoning, that includes a new, proposed fence that will allow the Lunny Ranch to exclude this area during the wet season. As with the two other NPS areas of concern, the Lunny Ranch plan already provides the solution. When I asked if the proposed map could be corrected, I was told that the proposed zones were already prepared and, most likely, could not be changed prior to the release of the DEIS. The proposed resource protection zone along Sir Francis Drake Boulevard must be changed to range land zone. This change, with specific agreements within the ROA to exclude this area when the soil is too wet, would not cause any harm to the resource that has been grazed for 150+ years. A unilateral decision to include this area as a natural resource protection zone, with the associated restrictions, would cause economic harm as well as severely impact proper rotation use of pastures at the Lunny Ranch. This correction must be made in the Final EIS. It is fully understandable that the zones created by NPS, without historic use context or rancher input, would need some adjustments prior to initiating the zoning framework conditions. The Lunny Ranch is happy to provide the necessary subzone framework input prior to the completion of the GMPA EIS and Lunny Ranch ROA. Attached is a copy of the corrected ranch core subzone.

The Lunnys recognize that most of the above can be approved without a formal NEPA analysis just as PRNS has done in the past. Nevertheless, because new, comprehensive, 20-year permits are being developed, the Lunnys want to be sure that each of the items raised by PRSRA ranchers, the PRNS and GGNRA Family Ranchers detailed DEIS comment letters and the Lunnys comments and requests, are authorized and incorporated in the new Lunny Ranch - Historic G Ranch lease and ROA. The Lunnys appreciate this opportunity to further explain our ranch plan and to further describe what is needed to fully execute an environmentally conscious, viable, small scale Shafter era type diversified farm for the benefit of the Lunny family, the community, the visiting public and the local food system.

With the necessary analysis and corrected restrictions in the Final EIS, this simple Lunny Ranch plan, once approved, would allow the Lunny family to restore an exciting, diversified, profitable, visitor-friendly farm that more closely resembles the Shafter era ranching while protecting the seashore's natural and cultural resources.

When PRNS allows the Lunny Ranch plan to come to fruition, the visiting public passing by the Lunny Ranch is not likely to notice any change. They would have to look carefully to notice the greenhouse and new farm worker housing in the core area. Only a local resident or a regular visitor could pick out the minor changes.

Even the regular visitor is likely unaware that there were several large barns and additional worker housing on the G Ranch that are now gone, and that the new structures simply are replacing a small portion that has been lost over time. They probably wouldn't notice the increased soil carbon offsetting their GHG produced during their visit to the seashore by their automobile. The new seashore visitors wouldn't probably notice that more members of the Lunny Family are now working on the farm and staying connected to the community they were raised in. The new visitor may not realize that this ranch is now more fully connected to local food system and the recovery of the historic uses makes it much more resilient and likely that it will survive through changing economic times and changes to the pasture productivity due to climate change. The Final EIS must fully evaluate the enormous benefits that would result from this complete plan.

A new or returning seashore visitor is more likely to notice the availability of on farm food products from seashore ranchers at the Lunny Ranch farm stand, the availability of farm tours in collaboration with PRNS staff, a chance to see a few hogs, chickens, some vegetables growing with farm-produced compost soil amendment created from otherwise farm waste products - all a small demonstration of the true historic use the historic G Ranch on the Point Reyes Peninsula. The Final EIS should celebrate the fact that PRNS and the NPS has allowed all or most of these uses at PRNS and at other units of the NPS. The Final EIS and GMPA should encourage restoration of these historic ranch practices with the understanding that PRNS was created because of the ranchers. PRNS is a national seashore and not a national park, where parks were created for quieter, contemplative uses, and seashores were created for more public activities, recreation and historic uses. PRNS is asked to preserve the cultural resources and the agricultural properties within the seashore that are now designated as national historic dairy districts - both PRNS and GGNRA. Supporting the Lunny Ranch farm plan meets all NPS objectives at PRNS as stated in the DEIS - natural resource conservation, cultural resource conservation, historic resource preservation and visitor enjoyment.

Clearly, this Lunny Ranch Plan includes only high-level descriptions of historic use restoration. Much more detail will be necessary for PRNS to prepare the Lunny Ranch 20-year, renewable permit and Ranch Operating Agreement. The Lunny family pledges to work with the team preparing the ROA to answer any questions regarding the Lunny Ranch farm plan.

Sincerely,

The Lunny Family

Name: Coda, James

Correspondence: Re: Comments on Your Draft EIS for a GMP Amendment Dear Superintendent Muldoon:  
INTRODUCTION

I am responding to your request for comments on a Draft Environmental Impact Statement (DEIS) regarding the development of a General Management Plan Amendment (GMPA) for the management of areas of Point Reyes National Seashore (PRNS) and Golden Gate National Recreation Area (GGNRA) now managed for beef cattle ranching, dairy farming and full-time residential use.

PRNS and GGNRA are units of the national park system and, as such, must be managed primarily to protect the natural resources of the parks and ranching is not consistent with that, at least not as practiced in these two parks. Your five ranching alternatives show that ranching will not protect natural resources, but will instead do great harm to the natural resources of each park. Under the circumstances, you have no choice but to prepare new alternatives that comply with your statutory mandates. You should prepare such alternatives and recirculate the DEIS. If you don't do that, you have no choice but to adopt Alternative F because it is the only one that complies with your statutory mandates to protect natural resources above all else. My preference is that you simply choose Alternative F now.

I have some experience in this area. I spent 35 years working in the federal government as an attorney. I started my legal career in the Department of the Interior. The first six years were spent in Interior's Headquarters handling legal matters involving BLM and its management of the public lands, especially grazing, on a national level. I then spent five years handling legal matters for the National Park Service (NPS) in the Solicitor's Office in San Francisco. One of the first

matters I worked on after arriving in the San Francisco Office was assisting the

U.S. Attorney's Office in defending a rancher's suit to stop the reintroduction of tule elk into PRNS. I finished my career as an Assistant U.S. Attorney in the San Francisco U.S. Attorney's Office specializing primarily in defending federal land management agencies, such as NPS, in suits under laws such as the National Environmental Policy Act (NEPA).

I have read the draft Foundation Statement, the DEIS, the 2019 Grazing Plan, the 2019 Natural Resources Condition Assessment, the 2013 Coastal Watershed Assessment, the 1998 Elk Plan and many other documents applicable to the DEIS, the GMPA and the cmTent ranching area. I commented during both rounds of the Comprehensive Ranch Management Plan process and both the initial request for comments on a conceptual range of alternatives and the later request for scoping comments regarding a GMPA. I incorporate those comments herein by reference. Since 2010 I have also spent over 150 days in the ranching area observing and photographing wildlife and the lands of the ranching area, including the condition those lands are in.

## SUMMARY OF MAJOR COMMENTS

While I have many comments on your DEIS, some of the main ones are summarized as follows:

First, your two previous steps in the scoping process and this DEIS show that you have pre-judged the outcome.

Second, the 1916 NPS Organic Act and provisions in the PRNS and GGNRA legislation require that the lands be managed so there is no harm to natural resources. Pages 4-5. All five ranching alternatives involve significant harm to natural resources. They are not lawful choices, given these three laws. That leaves NPS with two choices: either choose Alternative F or prepare a supplemental DEIS that has ranching alternatives that comply with the requirement to manage the land to avoid harm to natural resources. It goes without saying that I prefer Alternative F.

Third, your planning procedures require you to set forth in the Foundation Statement any language in the 1916 NPS Organic Act and/or park statutes relevant to this planning process. The Organic Act and the PRNS and GGNRA statutes

contain language concerning your overarching duty to protect natural resources and you have deliberately hidden this duty from the public. By failing to mention these three laws in the Foundation Statement you are, in effect, "hiding the ball" from the public; i.e., being dishonest. Pages 3-8.

Fourth, ignoring these three laws and hiding them from the public in the Foundation Statement won't make them go away. Neither will arguing that they don't say what they say. Yet, in the section of the DEIS called "Alternatives Considered, But Dismissed From Further Analysis," the Park Service states that the language in the seashore statute that the Secretary must manage the seashore in a manner consistent with the maximum protection, restoration, and preservation of the natural environment is not mandatory, but optional, and can be treated simply as an alternative which the Park Service then summarily rejects. Page 7-9.

Fifth, you assume dairy cows drink an average of 20 gallons of water per day when in fact they drink an average of 40 gallons of water per day. How much they eat, how much milk they produce and how much manure they produce are all related to how much water they drink. Consequently, all of your assumptions and calculations on dairy cows are wrong. Pages 12-13.

Sixth, you grossly underestimate average beef cow weight which understates forage consumed. You assume beef cow average weight is 1,000 pounds when the average Angus cow (virtually all cows in the two parks are Angus) weighs 1410 pounds. The beef cows eat much more than you assume and this makes your calculations of how many Animal Units each ranch can accommodate far too high. Consequently, beef cattle are severely overgrazing the parks which is obvious to anyone who drives through the ranching areas. Page 14-15.

Seventh, growing silage must be stopped. Sowing non-native seeds is prohibited by the three statutes. You have a statutory duty to preserve and restore the native coastal prairie, not to do the reverse. More important, the

mowing kills nesting birds and some mammals. I have seen a video showing a coyote pulling the mangled body of a deer fawn from a mowing windrow in the Seashore this past spring. Knowingly approving ranching actions that involve killing of wildlife is clearly prohibited by the Organic Act, the two park statutes, the Migratory Bird Treaty Act, and the Endangered Species Act to the extent any threatened or endangered wildlife is killed by the mowing. Page 17-18 and elsewhere.

Eighth, manure spreading must be stopped. In addition to fouling water courses, manure spreading also spreads Johne's disease. You should also require that all dairy herds be made Johne's-free by a long-term program of testing and culling cows (and elk, to the extent necessary). Manure spreading also spreads weed seeds that primarily come into the two parks mixed in the hay which is hauled in by the hundreds of eighteen-wheeler trucks that come into the parks each year for the dairy ranchers and some beef ranchers.

You could largely correct the latter problem by requiring that all hay imports be certified weed-free. You already require certified weed-free hay for people who want to bring their horses into national parks. The same is true for anyone bringing horses onto BLM and Forest Service lands. Requiring a person who wants to ride a horse in a national park to bring with him certified weed-free hay and yet allowing your ranchers to bring in hundreds of trailer trucks of hay each year that is not weed-free is astounding and unlawful under your three statutes. Page 18 and elsewhere.

Ninth, hazing elk violates your three statutes. The DEIS states that "[u]nder Alternative A, actions to reduce the impacts of elk on ranches would continue to include hazing, habitat enhancements and fence repairs." Management priorities are upside down. Your three laws, which put natural resource protection first, prohibit the practice of harassing elk. Elk are the Park Service's first priority. Ranching is not a priority, period. Pages 18 and elsewhere.

Tenth, to the extent cows are allowed to stay, you should allocate forage for elk. After determining the total amount of forage on all ranches used by elk, first allocate how much forage the elk need and then allocate the rest to livestock. Your three statutes require this. Even your 2019 Grazing Plan and NRCA recommend that forage be allocated to elk. Page 18.

Eleventh, the tens, if not hundreds, of miles of barbed wire fencing in the two parks is harmful to wildlife and contrary to the three statutes. It should be removed. To the extent it remains it should be made wildlife-friendly immediately. Page 18-19.

Twelfth, diversification, to the extent it exists today, and as envisioned under the DEIS, should not be allowed. Park wildlife will prey on these smaller domestic mammals and chickens and the ranchers will retaliate. Exclusion fencing in pastures will reduce wildlife territory in the park by 34%. Livestock guardian dogs kill predators when they can. All of this is contrary to your duties under your three statutes. Page 20-21.

Thirteenth, long term leases are inconsistent with your duty to prepare a General Management Plan every 10 to 15 years. Furthermore, ranchers don't want 20-year leases so they can get financing to improve Government-owned property; they want them to avoid having to worry about getting another lease every 5 or 10 years. Page 16.

Fourteenth, while NPS may have authority to grant leases and issue permits for ranching, there is no authority to give the ranchers any right of succession in real estate. It is also contrary to NPS's obligation to do a General Management Plan every 15 years to look again at how lands should be managed and whether ranching is still appropriate. Page 16.

Fifteenth, appraisals should be based on appraised values for other comparable ranches in Marin and Sonoma counties. Several unsupportable rationales by NPS for lowering rents, such as the fact that, technically, a hiker could walk across a fenced pasture containing cows, possibly a bull, and manure all over the ground, if he or she wanted to do that. No one wants to do that. Page 20.

Last, you have written a programmatic DEIS. To the extent you also intend it to be a site-specific one, it is totally

inadequate.

## CHAPTER 1: PURPOSE OF AND NEED FOR ACTION (Pages 1-7)

### The Foundation Statement

As explained below, the Foundation Statement misleads the public and is flawed. PRNS and GGNRA are units of the national park system and, as such, must be managed primarily to protect the natural resources of the parks. There are three natural resource protection laws applicable here.

The first is the 1916 NPS Organic Act which applies to all units of the national park system, including PRNS and GGNRA. The Organic Act provides, in pertinent part, as follows:

§ 100101 (a) In General-  
s

The Secretary ... shall promote and regulate the use of the National Park System by means and measures that conform to the fundamental purpose of the System units, which purpose is to conserve the scenery, natural and historic objects, and wild life in the System units and to provide for the enjoyment of the scenery, natural and historic objects, and wild life in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.

54 U.S.C. § 100101(a). (Emphasis added.)

With respect to the Organic Act, the Ninth Circuit Court of Appeals has held that the language quoted above means that "resource protection [is] the overarching concern" in the management of national park system units. *Bicycle Trails Council of Marin v. Babbitt*, 82 F.3d 1445, 1453 (9th Cir. 1996).

The other two laws are the PRNS and GGNRA statutes. The PRNS legislation provides, in pertinent part, as follows:

§ 459c-6. Administration of property

(a) Protection, restoration, and preservation of natural environment

Except as otherwise provided in sections 459c to 459c-7 ... the property ... shall be administered by the Secretary without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with ... the maximum protection, restoration, and preservation of the natural environment within the area ....

16 U.S.C. § 459c-6. (Emphasis added.)

The quoted language makes clear that, like the Organic Act, the Park Service is required to manage the Seashore in such a way as to not cause "impairment of its natural values." The law goes on to state that even traditional uses of national parks, such as "recreational, educational, historic preservation, interpretation, and

scientific research opportunities" are allowable [only] to the extent "consistent with ... the maximum protection, restoration, and preservation of the natural environment within the area ...." The highest priority is to not impair natural values. Recreation, education, historic preservation, etc. are all subject to that highest priority, not equal to it. It also makes clear that the Park Service's job is not just to protect the natural resources, but to restore them to their natural condition, that is, the condition they were in before man changed them.

The GGNRA legislation provides, in pertinent part, as follows:

## §46066 - Establishment

In the management of the recreation area, the Secretary ... shall utilize the resources in a manner which will provide for recreation and educational opportunities consistent with sound principles of land use planning and management. In carrying out the provisions of this subchapter, the Secretary shall preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area.

16 U.S.C. § 46066. (Emphasis added.)

These three laws are not mentioned in the draft Foundation Statement even though NPS planning procedures state that such statutory language is required to be in the Foundation Statement:

### 2.2 Major Elements of Park Planning and Decision-making

\*\*\*

Foundation Statement-The planning process begins with the development of a foundation statement that is based on the park's enabling legislation or presidential proclamation and that documents the park purpose, significance, fundamental resources and values, and primary interpretive themes. It also includes any relevant laws and executive orders that apply to the national park system or to the individual park unit ....

General Management Plan - This is a broad umbrella document that sets the long-term goals for the park based on the foundation statement. The general management plan (1) clearly defines the desired natural and cultural resource conditions to be achieved and maintained over time ....

<https://www.nps.gov/policy/mp/chapter2.htm> (Emphasis added.)

Ignoring these three laws and hiding them from the public in the Foundation Statement won't make them go away. Neither will arguing that they don't say what they say.

Yet, in the section of the DEIS called "Alternatives Considered, But Dismissed From Further Analysis," the Park Service states as follows:

Commenters suggested NPS should manage all park lands solely for the protection, restoration, and preservation of natural resources. In addition to managing park lands for the protection of natural resources, NPS also must manage cultural resources and provide for visitor use and enjoyment in a manner consistent with applicable legal requirements. As a result, management decisions cannot solely be based on impacts to natural resources. This approach was dismissed from further analysis because it would not address impacts on other NPS resources and values that NPS is mandated to consider.

DEIS, 59 (Emphasis added.).

This statement shows NPS is unwilling to follow the clear language of the three statutes. It is also in disregard of NPS management policy. (It is also wrong to treat these laws as though they can be considered as alternatives which the Park Service is free to reject. These laws apply to all the alternatives and everything else the Park Service does in managing the natural resources in these two parks.)

Here's what NPS management policy says:

#### APPLICABLE NPS POLICY

NPS management policies provide as follows:

##### 1.4.4 The Prohibition on Impairment of Park Resources and Values

While Congress has given the Service the management discretion to allow impacts within parks, that discretion is limited by the statutory requirement (generally enforceable by the federal courts) that the Park Service must leave park resources and values unimpaired unless a particular law directly and specifically provides otherwise. This, the cornerstone of the Organic Act, establishes the primary responsibility of the National Park Service. It ensures that park resources and values will continue to exist in a condition that will allow the American people to have present and future opportunities for enjoyment of them.

The impairment of park resources and values may not be allowed by the Service unless directly and specifically provided for by legislation or by the proclamation establishing the park. The relevant legislation or proclamation must provide explicitly (not by implication or inference) for the activity, in terms that keep the Service from having the authority to manage the activity so as to avoid the impairment.

Management Policies of 2006, 1.4.4. (Emphasis added.)

The Park Superintendent must also work to meet the non-discretionary standard for Improving Resource Conditions:

The Service will also strive to ensure that park resources and values are passed on to future generations in a condition that is as good as, or better than, the conditions that exist today. In particular, the Service will strive to restore the integrity of park resources that have been damaged or compromised in the past.

NPS Management Policy § 1.4.7.2.

NPS Management Policies.

NPS defines "impairment" as any authorized activity that "would harm the integrity of park resources or values, including the opportunities that otherwise would be present for the enjoyment of those resources or values." NPS

Management Policies § 1.4.5 (2006). To ensure that an authorized activity will not violate the non-impairment mandate, NPS must determine the activity will not impair park values or resources prior to authorizing the activity. See, e.g., *Sierra Club v. Mainella*, 459 F. Supp. 2d 76, 103 (D.D.C. 2006). (Emphasis added.)

As an official interpretation of the Organic Act's non-impairment mandate, § 1.4 of the Park Service's Policies have been held to be enforceable against the agency. *Greater Yellowstone Coal. v. Kempthorne*, 577 F. Supp. 2d 183, n. 1 (D.D.C. 2008).

## RANCHING'S IMPACTS ON NATURAL RESOURCES

The DEIS makes it clear that continued cattle ranching, as proposed in the current ranching alternatives, will have detrimental environmental consequences on all natural resources, including soils, vegetation, water quality, air quality, and wildlife (especially elk). Consequently, all the ranching alternatives violate the Park Service's duties under the three statutes (not to mention the policy statement above) and are therefore unlawful. Under these circumstances it makes no sense for the Park Service to go forward with a Final EIS. All funds spent on this DEIS have been wasted and will continue to be wasted.

In view of the above, the Park Service needs to develop new ranching alternatives for the DEIS that do not violate the three laws quoted above and recirculate a supplemental DEIS for public comment. Failure to do that leaves NPS no choice, but to choose Alternative F, which I favor in any case.

## CHAPTER 2. ALTERNATIVES (Pages 9-63)

All five of your ranching alternatives violate the three NPS laws and policies discussed above because they unacceptably harm natural resources. I have quoted these laws, with citations, in my Purpose and Need section

above and will only briefly summarize these laws here.

The first law is the 1916 NPS Organic Act which requires that all national park lands (including PRNS and GGNRA) be administered "to conserve the scenery, natural and historic objects, and wild life ...and to provide for the enjoyment of the scenery, natural and historic objects, and wild life in such

manner and by such means as will leave them unimpaired for the enjoyment of future generations." (Emphasis added.)

The second law is in the Seashore legislation. It provides that the Seashore "shall be administered ... without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with ... the maximum protection, restoration, and preservation of the natural environment "  
(Emphasis added.)

The third law is the GGNRA legislation which provides that the Secretary "shall preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area."

While the word "unimpaired" does not appear in the GGNRA law, its language outlines the same need to "preserve" the park in an unimpaired state. Furthermore, the Organic Act, with its "unimpaired" language, applies to GGNRA.

As discussed above under "Purpose for and Need for Action," Park Service management policies also state that "the Park Service must leave park resources and values unimpaired."

The impairment of the pastoral zone began with the first Europeans and their cattle. Modern times and methods have exacerbated the conversion of what once was a natural condition to one that is the antithesis of a natural condition. By law, the current pastoral zone must be restored to the unimpaired state it was in before European man arrived.

The Service will also strive to ensure that park resources and values are passed on to future generations in a condition that is as good as, or better than, the conditions that exist today. In particular, the Service will strive to restore the integrity of park resources that have been damaged or compromised in the past.

NPS Management Policy § 1.4.7.2. (Emphasis added.)

Given the fact that all the ranching alternatives violate the three governing laws, none of these alternatives can be chosen. You must develop ranching alternatives that avoid harm to natural resources and restore those natural resources to the condition they were in before European man and his cattle arrived and completely altered the natural environment. If you choose not to do that, the only alternative you can choose without violating your statutory duty is Alternative F.

NPS' Ranching Overview (Pages 9-11)

Before discussing the individual alternatives, the DEIS provides an overview. Some statements in it are wrong.

Dairy Cow Water Needs

Dairy Cow Water Consumption Statement Is Wrong. On page 10 the statement that dairy cattle consume 15 to 25 gallons of water per day is incorrect. The milking string, which the DEIS states is about 60% to 80% of the "dairy cattle" on a dairy farm, consume 30 to 50 gallons/day for a 40 gallon per day average as opposed to the DEIS's alleged 20 gallons per day average. <https://www.dairyherd.com/article/drinking-water-dairy-cattle-part-1>

NPS needs to change this 20 gallons/day assumption to 40 gallons/day and use it in all further discussions, including calculating how much dairy cows eat, how much milk they produce and how much manure they produce. They're all related. A dairy cow consuming 40 gallons of water a day consumes much more forage a day and she produces much more milk and manure a day than a cow drinking only 20 gallons of water a day.

### Dairy Cow Food Requirements and Milk Output

**Dairy Cow Food Consumption.** First, a dairy cow needs 13 pounds a day of dry weight forage just to live. To produce any milk at all she needs much more than that. <https://www.dairyherd.com/article/management-key-dry-matter-intake>

**Dairy Cow Milk Production.** The average Holstein produces 75 pounds of milk a day. However, they can produce much more than that per day depending on adequate food and water. As discussed below, the record is 198 pounds of milk per day.

[http://www.holsteinusa.com/holstein breed/holstein101.html?tab=2#TabbedPanels 1](http://www.holsteinusa.com/holstein%20breed/holstein101.html?tab=2#TabbedPanels%201)

Rounding up the 75 pounds of milk a day to 80 pounds in order to make use of available data, to produce 80 pounds of milk a day a dairy cow needs not only the 13 pounds for maintenance, but an additional 35 pounds of dry weight forage for the 80 pounds of milk production for a total of 48 pounds of dry weight forage/day. <https://www.dairyherd.com/article/management-key-dry-matter-intake>

To produce 100 pounds of milk a day she needs not only the 13 pounds for maintenance, but an additional 43 pounds for the 100 pounds of milk production for a total of 56 pounds of dry weight forage/day. Ibid.

To produce 120 pounds of milk a day she again needs not only the 13 pounds for maintenance, but an additional 52 pounds for the 120 pounds of milk production for a total of 65 pounds of dry weight forage/ day. Id.

To produce 140 pounds of milk a day she again needs not only the 13 pounds for maintenance, but an additional 61 pounds for the 140 pounds of milk production for a total of 74 pounds of dry weight forage/ day. Id.

While 80 pounds of milk a day (and the other figures) may seem like a lot, the record is held by a Wisconsin Holstein cow who produced a 198-pound average of milk for an entire 365-day lactation period. <https://hoards.com/blog-1188-holstein-has-a-new-milk-production-record-holder.html>

### Dairy Cow Manure Output

**Dairy Cow Manure Production.** At page 10 there is a discussion of the amount of manure produced by dairy cows, but no figure is given as to how much manure a single dairy cow produces each day. A mature Holstein cow weighs 1500 pounds and produces about 123 pounds of manure a day or 44,895 pounds/ 22.45 tons per year (123lbs. X 365days =44,895 pounds). <http://livestocktrail.illinois.edu/dairynet/paperDisplay.cfm?ContentID=274> That's 12,300 pounds per day per 100 milk cows. All six dairies have permits for well over 100 milking cows with the smallest dairy at 200 milkers and the largest at 510 milkers. That's 24,600 (12.3 tons) to 62,730 pounds (31.365 tons) of manure to deal with every day of the year and it must remain stored in some way until the dry

season when it is spread on the park lands to pollute park waters and spread non native seeds and Johne's disease.

### Total Intake and Output of a Dairy Cow.

**Summary.** The average dairy cow drinks an average of 40 gallons of water per day. Water is 8.34 pounds per gallon. So, the average dairy cow drinks 334 pounds of water per day (and more in summer and when producing more than average milk quantity). She needs 48 pounds of dry weight forage to produce an average of 80 pounds of milk. So, she takes in a combined 382 pounds of water (or more) and food a day and produces a combined 203 pounds of milk and manure a day. Rounding those numbers, she takes in almost 400 pounds of water and food a

day and puts out 200 pounds of milk and manure a day. (The rest of the water intake is lost through various forms of evaporation.)

ALTERNATIVE A-NO ACTION. (Pages 12-25) This would be a continuation of the status quo. The DEIS discloses that ranching is occurring on 7,600 acres of land that were classified in the 1980 PRNS and GGNRA GMP as "Natural Environment" and "Natural Landscape" Zones, respectively, which made ranching an incompatible use in those areas and yet ranching has been going on there in violation of the classifications since at least 1980 and would continue as incompatible uses indefinitely.

It is incredible that a national park would fail to follow its own planning decisions made in a General Management Plan, especially when it involves 7,600 acres of national park resources or over 25% of the ranching lands.

Ranch Management (Page 11)

Animal Units.

This animal unit discussion regarding beef cows should have been with the discussion of dairy cows under "NPS Ranching Overview" above. I will discuss it here in the next few paragraphs.

NPS Grossly Underestimates Beef Cow Weight which Understates Forage Consumed.

On page 13 the number of animal units allowed under each beef lease is defined as a beef cow weighing 1000 pounds with or without a calf up to one year old. This is way below what cows weigh now. Beef and dairy cows have been getting substantially bigger as the years go by. In 2010 beef cows weighed 1350 pounds. <https://www.americancattlemen.com/articles/beef-cows-how-big-too-big> They are even bigger now.

In 2019, the average cow size across all breeds was 1,390 lbs., with less than 100 lbs. separating the heaviest and lightest breeds. Herefords came in heaviest, at 1,419 lbs., followed by Angus at 1,410 lbs., then Red Angus at 1,409 lbs. In the middle were Simmental cows at 1,404 lbs., and the lightest three breeds were Gelbvieh at 1,323 lbs., Limousin at 1,391 lbs. and Charolais at 1,371 lbs. <https://www.beefmagazine.com/cow-calf/relationship-between-cow-size-production>

NPS Grossly Underestimates Forage Consumed by Beef Cows By 30%.

"Of course, bigger cows need more nutrients. The neat thing is nutrient requirements don't go up in direct proportion to the size of the cow. They actually go up at a  $3/4$  powers ratio, or 75%, not one to one. So, the maintenance energy required by the 1,400-lb. cow is about 11% higher than that required by the 1,200-lb. cow, despite the fact that she is about 16% heavier" Olson explains. Ibid.

Applying these factors, an average 1,410 pound Angus cow (the main beef cow breed in the parks) weighs 41% more than a 1000 pound cow. Applying the 75% formula, the larger cow needs 30.25% (75% of 41%) more forage than the 1,000 pound cow. The Park Service is ignoring this by using beef cow weights that are decades old and in the process the grazing lands at Point Reyes are being significantly impaired in violation of the three non-impairment statutes.

Assuming, arguendo, that the Park Service is correct that a 1000 pound cow needs about 26 pounds of dry matter per day, applying the formula above means a 1410 pound Angus cow would need 30.25% more feed, or about 7.86 more pounds per day than the 26 pounds used by NPS.

This alone means NPS has been assuming grazing is removing 30% less forage than has been actually occurring. No wonder the park are so overgrazed. The Park Service should immediately reduce AUs by 30% to account for the larger cows.

Near the bottom of page 13 NPS states that "NPS may update AU equivalents based on best available data and would adopt any changes in industry standards, as appropriate to meet management goals and objectives." NPS has shown that it does not use best available data and this is a good example of that. Data that beef cows weigh well over 1,000 pounds has been available for decades.

Succession. (Page 13) There is a short discussion of succession. NPS may have authority to grant leases and issue permits for ranching, but there is no authority to give the ranchers any right of succession in real estate. It is also contrary to NPS' s obligation to do a General Management Plan every 15 years to look again at how lands should be managed and whether ranching is still appropriate.

Long term Leases. The same problem exists regarding leases of terms of 15 years or more. Leases should be no longer than 10 years to allow a new look at management in a new or updated GMP.

Appraisal Process. (Page 20) Appraisals should be based on appraised values for other comparable ranches in Marin and Sonoma counties. Several unsupportable rationales by NPS for lowering rents, such as the fact that, technically, a hiker could walk across a fenced pasture containing cows, possibly a bull, and manure all over the ground, if he or she wanted to do that.

Diversification. (Page 20) Diversification would not occur under Alternative A, except to the extent it is authorized under current leases and permits. Many leases and permits allow 10 cow AUs for sheep or other animals, like goats. With the 1:5 ratio conversion from cattle to sheep (1:7 for goats), 10 AUs allows 50 ewes (with their 50 lambs) for a total of 100 ewes and lambs (up to one year old).

Diversification will be further discussed under Alternative B. Aside from the question of whether there should be any cattle, allowing smaller animals will create many negative consequences for native wildlife, especially predators who will prey on these smaller animals. Current diversification should be ended. It creates too many conflicts with wildlife. The current operation where 2900 chickens graze on ranch lands (DEIS at 20) is especially egregious because it subjects many more species of predators to rancher retaliation, including small mammals like foxes, raccoons, skunks and weasels and even birds like eagles, hawks and owls.

Ranch Infrastructure. (Page 20)

Stream Crossings. (Page 20) Ranchers should not be trusted to construct stream crossings. NPS should them.

Fencing. (Page 21) All fencing should be wildlife-friendly starting with any maintenance work on any fence. NPS should be responsible for all fence building and repairs to ensure wildlife-friendly fences get built.

Pond Restoration. (Page 21) Good farming practice requires that all ponds be fenced with a water trough nearby connected to the pond by pipe. This is not done in the parks and it is a major cause of water pollution because when the cows go into the ponds to drink, they urinate and defecate. Many ponds are parts of water courses and the water percolates out of the ponds and flows downgrade in the watercourse. This pollutes the watercourse with fecal material and high levels of nutrients like nitrogen which causes vegetation in the waters to bloom uncontrollably and it leads to eutrophication. It also spreads Johne's disease which many cows in the parks have.

Waterway Stabilization. (Page 21) This work should be done by NPS or an NPS contractor, not a rancher, to ensure it is done per applicable specifications.

VEGETATION MANAGEMENT. (Page 22)

Mowing and Integrated Pest Management. (Page 22) Mowing to control native shrubs should never be allowed. Native shrubs are held in check by cattle, and elk where they exist. Native shrubs provide important food and cover for a myriad of wildlife species. Cows were removed from the Tomales Point Elk Reserve (where elk are held captive behind an 8-foot tall woven-wire fence) in 1980 and the brush there has not increased because the elk are there.

## OTHER ACTIVITIES. (Page 22)

Forage Production. (Page 22) Silage growing should be prohibited because it invariably leads to killing birds. That should be reason enough for you to not allow it. Plus, NPS has statutory duties to protect, restore and preserve natural resources, including birds. Furthermore, it violates the Migratory Bird Treaty Act and, where protected species are involved, it violates the Endangered Species Act.

Finally, under your three statutes you are supposed to be trying to preserve and restore the native coastal prairie, not the reverse.

If it is allowed it should only be conducted after the bird nesting season is over in September. This is recommended by both Point Blue in its Point Reyes Silage Study and by your 2019 Grazing Plan and 2019 NRCA.

Importation of Hay. NPS should require certified weed-free hay to the extent any hay imports are allowed. Even your 2019 Grazing Plan and NRCA, prepared for you by range scientists, recommends that. Uncertified hay imports are probably the greatest source of weed seeds in the seashore.

Manure and Nutrient Management. Manure management is primarily a dairy problem. Milk cows are largely confined to small areas and their manure is collected and stored, usually in manure ponds, but also on land near feed troughs, to be spread on ranch lands in dry months. In addition to fouling water courses, manure spreading also spreads weed seeds that primarily come into the two parks mixed in the hay which is hauled in by the hundreds of eighteen-wheeler trucks that come into the parks each year for the dairy ranchers and some beef ranchers. It also spreads Johne's disease. You should also require that all dairy herds be made Johne's free by a long-term program of testing and culling cows.

## RANCH COMPLEX MANAGEMENT (Page 23)

### ELK MANAGEMENT. (Pages 24-25)

Hazing is unlawful. (Page 25) The DEIS states that "[u]nder Alternative A, actions to reduce the impacts of elk on ranches would continue to include hazing, habitat enhancements and fence repairs." Management priorities are upside down. Your three laws, which put natural resource protection first, prohibit hazing of elk. Elk are the Park Service's first priority. Ranching is not a priority, period.

Allocate forage to elk. After determining the total amount of forage on all ranches used by elk, first allocate how much forage the elk need and then allocate the rest to livestock. Even your 2019 Grazing Plan and NRCA recommend that forage be allocated to elk.

Cattle fencing in the parks is unlawful because it is harmful to wildlife and NPS has a duty to protect wildlife. With respect to fence repairs, the reason fences in elk areas are occasionally broken by elk is because the fences are too high and otherwise not wildlife-friendly. Wildlife-friendly fences are a three wire design with the top wire no more than 38" high, so animals can clear it; the middle wire is at least 12" below the top wire to prevent "scissoring" of jumping elk and deer; and the bottom wire should be smooth, not barbed, and at least 16" above ground to allow deer fawns and elk calves to go under it. NPS should be responsible for all ranch boundary fencing because the ranchers will not want to spend the time and money to do it and want fencing that is difficult for elk to cross, not easy. These specifications are used by BLM and the Forest Service.

### Disease testing and reporting. (Page 25)

Testing Elk for Johne's disease violates the three statutes requiring the protection of natural resources to the extent it involves killing elk to get tissue samples. The elk brought to the seashore in 1978 did not have Johne's disease (pers. comm. with Joe Hobbs, Cal. F&W). They contracted the disease when they arrived at Pierce Point Ranch (now the Tomales Point Elk Reserve). Instead of constantly studying the elk for Johne's disease, NPS has

an obligation under the three statutes to get rid of John's disease in the cattle by testing and culling or ordering the removal of any dairy herd where the disease exists. In 1979, half of the dairy herds in the seashore tested positive for John's. NPS has done nothing in the 40 years since the dairy cows were tested to deal with John's disease. John's is impairing the natural resources of the seashore and NPS has an obligation under the statutes to remediate the problem by regularly testing the livestock and culling those animals that have the disease.

#### ALTERNATIVE B-NPS PREFERRED ALTERNATIVE (Pages 25-42)

##### General Description and Management Zoning (Page 25)

Alternative B creates a management zone concept for each ranch called the Ranchland Zone. This approach divides each ranch into three parts: (1) a "range zone" of approximately 66% of the ranch which would be managed like all ranch lands are now managed, (2) a "pasture zone" of approximately 33% of the ranch which would allow many more uses, such as diversification, and (3) a ranch core zone of approximately 1% which would allow even more uses. Each ranch would be operated under a ranch operating agreement (ROA). The DEIS states NPS would work closely with local ag organizations and others to discuss issues related to ranching. NPS needs to be sure that it is guided by the three statutes above and not anything to the contrary. Alternative B would also provide a population threshold for the Drakes Beach elk herd. Killing elk to accommodate ranchers when NPS has a statutory duty to protect elk is in violation of the three statutes.

##### Preservation of Area's Resources (page 26)

NPS has created a Table 2 to outline the detailed management strategies that NPS would adopt to achieve the desired conditions for the preservation of park resources. However, generally, everything NPS says it will do it has failed to do since it acquired these ranch lands. The Seashore's common response as to why it hasn't done many things the public has inquired about is that it doesn't have the funds to do what the public has inquired about. I asked in writing for the last completed PRNS budget a couple of years ago and said that if I didn't get a reply within 30 days, I would assume the park has not done one. I never got a reply. NPS law requires each park to do an annual budget every year and the public is entitled to any national park budget by just asking. 54 U.S.C. § 100503 (b).

##### Ranch Management (p. 35)

Subzone framework. (Page 35) The subzone framework is just an artifice to get people to think NPS is going to be tougher in protecting natural resources when in fact it is a way to more intensively use 34% of the ranching area. One purpose is to allow ranchers to use park lands for more intensive uses than just cattle grazing, such as diversification.

Ranch Operating Agreements. (Page 36) A draft of every Ranch Operating Agreement (ROP) should be provided for public review and should normally be the subject of an EA under NEPA.

Animal Units. (Page 36) See comments under Alternative A.

Succession. (Page 37) See comments under Succession under Alternative 1 above.

Appraisal Process. (Page 37) See comments under Appraisal Process under Alternative 1 above.

Diversification. (Page 37) No diversification should be allowed.

Alternative B will allow any rancher to have up to 10 animal units (AUs) of sheep, goats or chickens in the pasture zone (34% of a ranch) and/or the ranch core (1% of a ranch). One animal unit is equal to 1 cow or 5 sheep or 7 goats. Thus, a rancher could have 50 ewes (10 AUs x 5) and 50 lambs. It also will allow 500 chickens in the pasture or in the ranch core. In addition, pigs are allowed in the ranch core as is row crop growing. So, in the pasture zone (34% of each ranch), a lessee can have 100 sheep (including lambs) and 500 free-roaming chickens, in addition to

however many cattle animals allowed under the lease (minus 10 cow AUs which were converted to the 50 sheep and 50 lambs).

Livestock guardian dogs (LGDs) would presumably be used to protect these animals from predators, such as bald eagles, red-tailed hawks, owls, mountain lions, bobcats, coyotes, foxes, raccoons, skunks and weasels.

No diversification should be allowed. It will subject many more predators to retaliation by ranchers and fights and possible death due to livestock guardian dogs. Livestock guardian dogs have been known to attack and kill predators.

Interestingly, just the presence of a guardian dog keeps some predators away. The dogs use vocal intimidation such as barking, and aggressive behavior to chase off threats, and if that doesn't work, they may attack or fight with a predator. And guardian dogs don't just stand around waiting for threats to show up, either - they often actively look for predators to either catch or run off, and have even been known to lure coyotes to a source of food in order to catch them.

[https://healthypets.mercola.com/sites/healthypets/archive/2018/06/15/guardian\\_dogs.aspx](https://healthypets.mercola.com/sites/healthypets/archive/2018/06/15/guardian_dogs.aspx)

Finally, if restrictive fencing is used with or without LGDs, it would make it much more difficult for predators to use former habitat and to move within their territories.

Vegetation management. (Page 39).

The DEIS states that vegetation management would follow Marin County Resource Conservation District's Permit Coordination Program. NPS cannot do that legally. NPS must follow its three laws and its planning policies as discussed above, at least where there is a conflict with other laws or policies.

With respect to seeding, it can only be done using seeds native to the coastal prairie that existed before European man arrived.

Forage production. (Page 39)

Silage growing should be stopped. To the extent it is allowed, it must be done in a way that would be consistent with the three statutes quoted above and NPS policy. Silage seeding should only be done using seeds native to the coastal prairie that existed before European man arrived. Furthermore, silage mowing should only be done after bird nesting season to be consistent with the three laws discussed above, the Migratory Bird Treaty Act and the Endangered Species Act to the extent applicable (and the 2019 Grazing Plan and the 2019 NRCA). With respect to "mowing and IPM," mowing and IPM treatment of native shrubs, like native plants in general, should be prohibited by NPS because of the three statutes and NPS policy.

Manure and nutrient management (Page 39)

Manure from the dairies, and even the beef ranches, is getting into the waters of PRNS and GGNRA constantly. Spreading manure is one way. It should be stopped unless and until it is clear that no manure is getting into the waters of each park. Furthermore, NPS is required to comply with the three laws quoted at the beginning of this comment letter. In addition to law violations regarding manure getting into the waters of the two parks, the manure is tainted with two things that make putting the manure on the ground prohibited by those three laws. First, some or all of the dairy herds are infected with Johne's disease and the disease is in the manure that is sprayed on the pastures. Furthermore, non-native, invasive and noxious weeds seeds are sprayed on the fields as part of the manure spraying. The seeds are first consumed by the cows and they excrete the seeds as part of their manure. The cows get the seeds by eating trucked-in hay and by eating any silage grown on site using non-native seeds.

Elk Management. (Page 40)

Elk numbers in the Drakes Beach herd would be kept at current 120 or so animals and this will require the killing of about 10 to 15 animals per year. This is to keep the "population level consistent with authorized ranching operations." Page 41.

This is contrary to statutory seashore management requirements. Ranching is only allowable under the three laws when it doesn't negatively affect natural resources, like elk. The Park Service is looking at the elk management as though ranching is the highest management duty when caring for elk (all other natural resources) is its highest duty.

**ALTERNATIVE C - RANCHERS' PREFERRED ALTERNATIVE (Pages 42-42)** The only difference between this alternative and Alternative B is that all the Drakes Beach elk would be shot. This is the most blatant violation of the three laws that protect natural resources in these two parks and which NPS must comply with.

**ALTERNATIVE D-REMOVE BEEF CATTLE ON 7,500 ACRES (pp.43-44)**

Beef ranching would be terminated on 7500 acres. These lands have no residences. This would reduce beef ranching from 2400 animals to 1700 animals and have no effect on dairy farming. Management zoning would be used but no diversification would be allowed in the pasture zone, unlike Alternatives B and C.

The settlement agreement did not specify where ranching would be reduced. The Park Service used only one factor in determining where to reduce ranching, namely stopping ranching where it would have the least effect on ranchers. Under its three statutes that require NPS to protect natural resources as the overarching duty, it paid no attention in its decision to protection of natural resources. One obvious choice would have been to place emphasis on removing ranching where it is having the biggest negative effect on natural resources. For example, the Park Service should have considered removing dairy ranching in the Drakes Beach area where the Drakes Beach elk herd lives and the biggest conflicts between ranching and elk exist. Eliminating ranching on the C, D and E Ranches would have been very important from a protection of natural resources standpoint (primarily elk) and would only really have affected one ranch family, the C Ranch family, which has the smallest dairy operation at Point Reyes. No ranchers live at the D Ranch and the E Ranch is just additional housing for employees who work at the A Ranch. Mobile homes could be placed at the A Ranch.

**ALTERNATIVE E - REPLACE DAIRY COWS WITH BEEF COWS. (pp.**

44-46) The six dairies would cease operations. They could swap dairy cows for beef cows on a less than one to one basis. Management zoning would be used. With elimination of dairy cows, manure spreading and forage/silage production would cease in the pasture zones of the dairy ranches, (but silage growing would continue on the G and H beef Ranches). No diversification would be allowed in the pastures or even the ranch cores, including ending existing chicken and horse boarding operations (Home/Murphy Ranch). Elk would not be managed because it's not necessary for beef cattle, except they would be managed if they move outside PRNS. While removing dairying from the seashore would be a big step in the right direction, it still leaves beef ranching on 19,000 acres of the two parks and that would still greatly impair natural resources.

**ALTERNATIVE F - REMOVE RANCHING; RESTORE NATURAL**

**RESOURCES. (pp. 46-48)** All ranching would cease. No management zoning. No elk limits unless they get out to GGNRA or beyond. Visitor use would increase.

This is the only alternative that does not violate the three statutes that govern Park Service management of the two parks. It is incredible that it took a lawsuit for the Park Service to consider this alternative. It is noteworthy that there is really no discussion of whether the Park Service would act in any way to return the parks to their natural condition under this alternative.

**ALTERNATIVES CONSIDERED, BUT DISMISSED FROM FURTHER ANALYSIS**

This section contains some odd characterizations of things as though they were possible alternatives. Only two of

those listed could be alternatives in this DEIS, namely converting all ranching to dairy ranching and closing the ranches that drain into Drakes Estero. The rest are not proper alternatives and therefore do not belong here. One of those non-alternatives requires further discussion.

Ignoring the three laws that require the Park Service to preserve natural resources above all else won't make them go away. Neither will arguing that they don't say what they say. In the section of the DEIS called "Alternatives Considered, But Dismissed From Further Analysis," the Park Service states as follows:

Commenters suggested NPS should manage all park lands solely for the protection, restoration, and preservation of natural resources. In addition to managing park lands for the protection of natural resources, NPS also must manage cultural resources and provide for visitor use and enjoyment in a manner consistent with applicable legal requirements. As a result, management decisions cannot solely be based on impacts to natural resources. This approach was dismissed from further analysis because it would not address impacts on other NPS resources and values that NPS is mandated to consider.

DEIS, 59 (Emphasis added.).

This statement shows NPS is unwilling to follow the clear language of the three statutes quoted above. It is also wrong to treat these laws as though they can be considered as alternatives which the Park Service is free to reject. These laws apply to all the alternatives and everything else the Park Service does in managing the natural resources in these two parks.

It is also in disregard of the following statement of NPS management policy.

#### APPLICABLE NPS POLICY

NPS management policies provide as follows:

##### 1.4.4 The Prohibition on Impairment of Park Resources and Values

While Congress has given the Service the management discretion to allow impacts within parks, that discretion is limited by the statutory requirement (generally enforceable by the federal courts) that the Park Service must leave park resources and values unimpaired unless a particular law directly and specifically provides otherwise. This, the cornerstone of the Organic Act, establishes the primary responsibility of the National Park Service. It ensures that park resources and values will continue to exist in a condition that will allow the American people to have present and future opportunities for enjoyment of them.

The impairment of park resources and values may not be allowed by the Service unless directly and specifically provided for by legislation or by the proclamation establishing the park. The relevant legislation or proclamation must provide explicitly (not by implication or inference) for the activity, in terms that keep the Service from having the authority to manage the activity so as to avoid the impairment.

Management Policies of 2006, 1.4.4. (Emphasis added.)

#### MORE ALTERNATIVES NEEDED.

As explained above, NPS needs to come up with more alternatives because the five it has created all fail to meet the Secretary's statutory obligation to manage the ranching area in an unimpaired state and in a manner that achieves the "the maximum protection, restoration, and preservation of the natural environment " As such, they can't be considered as alternatives.

#### CHAPTER 3: AFFECTED/EXISTING ENVIRONMENT (Pages 65-97)

As stated above, the Park Service has a duty to prevent the impairment of the natural resources of these parks and

to protect and even restore the lands to the condition they were in before they were altered by European man. The Park Service has failed to carry out this duty. The natural resources of the two parks is a far cry from the condition they were in when they were in a natural state when the soil was covered in coastal prairie grasses and forbs intermixed with shrubs, like coyote brush, and the prairie was roamed not only by tule elk, but also pronghorns, grizzly bears, black bears and wolves.

Cattle grazing causes significant impacts to the environment including, but not limited to, compression of soil due to the heavy weight of cattle; erosion of soil and faster runoff of rainwater due to that compression (and overgrazing), especially in hilly areas where cattle make deep trails or gullies; damage to plant life, including threatened and endangered species, by overgrazing and trampling; conversion of native plants to non-native plants; damage to water quality; damage to air quality and concomitant increase in global warming; and harm to all forms of wildlife, including threatened and endangered species. As for wildlife, some of the ways ranching and cattle harm or kill wildlife are as follows: overgrazing; mowing brush, such as native coyote brush, because ranchers would rather have all the vegetation be grass for maximum cattle feed whereas brush provides food and habitat for all kinds of birds and mammals; using fencing that is not "wildlife friendly;" hazing/harassing elk when they are on park lands that NPS has unlawfully dedicated to commercial beef and milk production; pollution of streams and bays (while the pollution of Tomales Bay and Drakes Bay due to PRNS and GGNRA ranching is well known, there are other areas in the two parks that are heavily polluted from ranching that aren't as well known, such as Kehoe Creek discussed further below); and the mowing of silage in the spring which kills any ground-nesting or near-ground-nesting birds and small and even larger mammals, such as deer fawns.

Furthermore, most of the cattle in the seashore are dairy cows. Dairy farming has much greater impacts on the environment than beef cattle ranching, including, but not limited to, greater forage consumption, greater water consumption, greater manure production (and related greater collection and disposal problems), greater methane gas production, greater water pollution, greater trampling of vegetation and soils due to the fact that milk cows tend to not go any farther than necessary to graze given the need to return to the milk barn two or three times (round trips) per day, and greater erosion due to cattle making those two to three round trips per day to and from the milk barn, especially when they travel through hilly areas and create deeply rutted trails on slopes; disposing of manure by spraying it on pastures which can infect elk and deer with Johne's disease; over-managing elk by constantly testing them for Johne's disease while never doing anything about the fact that some cattle in the Seashore (and probably GGNRA) have always had Johne's since well before the first elk were reintroduced into the Seashore in 1978 (NPS should establish a rigorous program to eliminate Johne's disease in the cattle herds, including testing and culling. See <https://johnes.org/general/control.html>); needing supplemental feed over and above what the land can provide which involved hundreds of tractor-trailer deliveries of hay which has mixed in with it non-native, invasive and, sometimes, noxious plants/seeds.

On most federal public lands grazing occurs for only a portion of the year and is limited to beef cattle. The rest of the year the cattle are on private ranch lands. In PRNS and GGNRA grazing is year-round. Plus, the ranch complexes themselves are on park lands and they can occupy several acres.

The DEIS Fails to Adequately Assess Baseline Conditions and Trends.

Baseline (current) information and long-term trend data are essential in a Draft EIS as part of the Affected Environment discussion to measure changes (impacts), and they are necessary to identify and assess alternatives which are intended to remedy those past problems and are necessary for NPS to set standards for each environmental indicator that mitigation measures must then meet.

NPS has not sufficiently established baseline data or long-term trend data for the DEIS and thus is not considering all relevant factors before determining that the actions will have no significant impact. Baseline conditions are necessary to "determine what effect the project will have on the environment" and thus to comply with the requirements of NEPA. *Great Basin Research Watch v. Bureau of Land Management*, 844 F.3d 1095, 1101 (9th Cir. 2016).

Recognizing that NPS had always had an aversion to doing scientific studies throughout its history, in 1998

Congress enacted the National Parks Omnibus Management Act, 54 U.S.C. §§ 100701-100707, which requires NPS to undertake a program of inventorying and monitoring of System resources to establish baseline information and to provide information on the long-term trends in the condition of System resources and to use these studies to make better informed decisions based on them. (The law followed on the heels of former NPS employee Richard Sellars' 1997 book entitled "Preserving Nature in the National Parks." The book documented how NPS had, throughout its existence, avoided the study of natural resources and the protection of them based on scientific studies.) The 1998 law provides in pertinent part as follows:

#### Subchapter I-System Resource Inventory and Management

§ 100701. Protection, interpretation, and research in System Recognizing the ever increasing societal pressures being placed upon America's unique natural and cultural resources contained in the System, the Secretary shall continually improve the ability of the Service to provide state-of-the-art management, protection, and interpretation of, and research on, the resources of the System.

#### § 100702. Research mandate

The Secretary shall ensure that management of System units is enhanced by the availability and utilization of a broad program of the highest quality science and information.

\*\*\*

#### 100704. Inventory and monitoring program

The Secretary shall undertake a program of inventorying and monitoring of System resources to establish baseline information and to provide information on the long-term trends in condition of System resources. The monitoring program shall be developed in cooperation with other Federal monitoring and information collection efforts to ensure a cost-effective approach.

\*\*\*

#### § 100706. Integration of study results into management decisions

The Secretary shall take such measures as are necessary to ensure the full and proper utilization of the results of scientific study for System unit management decisions. In each case in which an action undertaken by the Service may cause a significant adverse effect on a System unit resource, the administrative record shall reflect the manner in which System unit resource studies have been considered. The trend in the condition of resources of the System shall be a significant factor in the annual performance evaluation of each superintendent of a System unit.

\*\*\*

54 U.S.C. §§ 100701 - 100707. (Emphasis added.)

Baseline conditions and long-term trend data must provide a reasonable basis for determining the effect of the activities authorized by the agency, using the best available scientific information. The Draft EIS is wholly inadequate in this regard.

Soils. (Pages 65-67) The DEIS states: "Activities associated with beef and dairy cattle ranching operations such as livestock grazing and trailing; tilling/cultivation; seeding; mowing for forage production; and nutrient, brush and weed management may affect soil processes." Page 65. (Emphasis added.) This is a gross understatement and provides no baseline describing the current condition or long term trend data. "Cattle trailing results in erosion of the topsoil along pathways between areas ...." Page 66. This is so general as to be worthless.

The DEIS does admit that 56% of the soils have moderate to very severe erosion potential and 94% have moderate to high compaction potential.

Below are some photographs depicting some cattle trails which are caused by cattle walking in areas that are too steep to use. These trails cause severe erosion, which is greatly exacerbated by rainwater runoff and results in

serious pollution in receiving waters. There is no discussion of how severe the cattle trailing problem is or what the long-term trend is.

Below is a photo I took showing severe erosion from cattle trailing on the left side of Pierce Point Road on the J Ranch. These trails have grown into deep gullies.

(photo)

Below is a photo I took showing further trailing on the J Ranch. These dairy cow trails are causing soil loss and severe siltation and pollution from manure washing into Tomales Bay, which is at the bottom of these two steep areas.

(photo)

Below is a photo I took evidencing severe trailing or gullying and consequent erosion on the south/left side of Sir Francis Drake Blvd. on the E Ranch.

(photo)

Below is a photo I took evidencing severe trailing and consequent erosion on the north/right side of Sir Francis Drake Blvd. on the E Ranch. These two eroded areas drain into the Pacific Ocean just a short distance to the west of the areas depicted in the photos.

(photo)

All four of these photos were taken along roads. Trailing or gullying and consequent erosion occur when cattle walk on slopes. Such slopes exist all over hilly PRNS and GGNRA and, presumably, such trailing also exists all over PRNS and GGNRA, not just close to these two roads where the trails and gullies were easy to see and photograph from the road.

These trails and the many others throughout PRNS and GGNRA are significant environmental impacts that are not disclosed or discussed in any meaningful way, let alone discussed in terms of long-term trends. This damage is also prohibited by NPS's three statutes that require NPS to manage these lands in an unimpaired state and to protect, restore and preserve them. NPS has not done anything about them because they are the only routes to grazing areas in the hilly PRNS and closing them off and restoring them would cut off access to grazing lands.

#### Water Resources.

There is far too much water pollution occurring at Point Reyes and GGNRA due to cattle, especially from dairy operations. Leaks from farm septic tanks may also be contributing to the problem. The DEIS talks about some things that have been done to reduce polluting of various water courses, but the statements are too general and vague and don't purport to quantify the extent of the problem or discuss trends.

For example, with respect to Kehoe Creek, the DEIS states:

Data collection in Kehoe Creek has shown elevated levels of contaminants including nutrients and sediment (NPS 2004a; Pawley and Lay 2013). Stormwater runoff from nearby dairy operations and pasture land into Kehoe Creek is contributing to these high levels.

High potentially pathogenic bacteria counts have also been observed in Kehoe Creek and Abbotts Lagoon, and many samples exceeded the potentially pathogenic bacteria standard (Coopriider 2004; Pawley and Lay 2013). Many of these exceedances occurred near dairy operations. To address these water quality concerns, several conservation practices and infrastructure improvements have been implemented, including installation of a new

loafing barn at I Ranch dairy in 2004, additions and improvements to the loafing barn facilities at J Ranch dairy, and installation of exclusion fencing to create buffers along drainages.

DEIS at 69. (Emphasis added.)

The I Ranch (McClure) loafing barn was built in 2004, but the Pawley and Lay report reporting on severe pollution was done in 2013. There is no mention of the fact that two other ranches, the K and L Ranches, drain into Kehoe Creek and are polluting it today. No date is given for the improvements to the J Ranch loafing barn, but it is obvious as the photos below show, that manure is still getting into Kehoe Creek.

And stapling some Best Management Practices (BMPs) to a ranch permit isn't going to get anything done and more than they have in the past.

The Park Service's own 2013 Coastal Watersheds Assessment done by its Denver Service Center shows that Kehoe Creek and other aquatic habitats have been at severe risk for years. To quote from part of the report dealing with water quality:

Conductivity/Specific Conductance Conductivity, the ability of a solution to pass an electric current, is an indicator of dissolved solids and can be influenced by the geology of an area as well as urban runoff. Ideally, streams should have conductivity between 150-500  $\mu\text{Siem}$  to support diverse aquatic life (Behar 1997).

\*\*\*

PORE: In PORE and northern GOGA, median specific conductance measured for 1,014 samples from 1999 to 2005 is 278  $\mu\text{Siem}$  with an IQR from 181-370  $\mu\text{Siem}$ . Figure 61 shows the specific conductance maxima at PORE monitoring locations and compares values to 850  $\mu\text{Siem}$  and 1,700  $\mu\text{Siem}$ . Values higher than 1,700, indicating severe pollution, occurred at dairy locations, including North Kehoe Creek (PAC2A), at the J Ranch and K Ranch property line (PAC2B), the L Ranch Impact Yard (PAC1B), the A and B Ranches (DBY3, DBY2) and the McClure's [I Ranch] dairy swale (ABB3).

Pawley, A. and M. Lay. 2013. Coastal Watershed Assessment for Golden Gate National Recreation Area and Point Reyes National Seashore. Natural Resource Report NPS/PWR/NRR-2013/641. National Park Service, Fort Collins, Colorado. Page 137. (Emphasis added.) <https://irma.nps.gov/DataStore/DownloadFile/471087>

The significance of this statement is that the waters on five (A, B, I, J and L) of the six dairy farms (plus the K Ranch beef operation) at Point Reyes were severely polluted as of 2013 (and presumably long before that). Three of these listed dairies plus the K Ranch (beef) drain into Kehoe Creek. The Assessment and other sources also discuss other areas of Point Reyes and GGNRA that are suffering serious pollution for ranching, including Abbott's Lagoon, Drakes Bay, Tamales Bay and Olema Creek.

Based on the 2013 Assessment, Kehoe Creek is one of the most polluted, if not the most polluted, watercourse in PRNS. This is consistent with my own observations.

Kehoe Creek is comprised of a north fork and a south fork. The north fork begins on the J (Kehoe) Ranch and, possibly, the K (Evans) Ranch.

The south fork begins on the L (Mendoza) Ranch. The pond in the photo I took below is located on the L Ranch at the headwaters of the South Fork of Kehoe Creek. L Ranch cows walk into this pond every day and urinate and defecate in it and then drink the water from it. Here is a photo of a dairy cow defecating in this pond on the L Ranch. If any of the cows in this dairy herd has Johne's disease, the disease can survive for a year and travels with the water downgrade to possibly infect any wild or domestic ungulates downstream that drink the water.

All the farm ponds at PRNS and GGNRA should be fenced. That is standard practice.

A farm pond is a pool of water formed by a dam or pit. You can use it to supply drinking water for your cattle ...

On hot summer days, cattle like to stand around in ponds trying to cool off. Doing so is unhealthy for your cattle and for your pond. The cattle will urinate and defecate in the same pond water that often serves as their drinking water ...

For the foregoing reasons, most farm ponds should be completely fenced so cattle can't go around or in them. You can take advantage of gravity by using a drain pipe to bring water from the pond to a water tank at a lower elevation outside the fenced area.

"Raising Beef Cattle for Dummies," Nikki and Scott Royer, at 125-26. In addition to gravity, pond water can be moved to tanks using electric and solar power.

Fencing cattle out of ponds isn't only good for the cattle, as the Royers state, but also for any watercourse it's a part of. As with many ponds, the pond shown above was created by excavating a hole below a seep or spring and pushing the soil down elevation to form a dam which temporarily retains the water from the seep or spring. The dam and pond bottom aren't impervious though. The water in this pond eventually drains down elevation into and through a pond down elevation from it. Below is a photo I took of that second pond.

This lower pond is completely covered by algae or some plant material due to excessive nutrients from manure. The pond water ultimately flows via the surface and/or below surface to Kehoe Creek and then Kehoe Pond at the Kehoe Beach parking lot and then to Kehoe Beach and ultimately, when there are high flows from winter rains, into the Pacific Ocean.

Here is a photo I took of two beef cows from the K Ranch eating aquatic reeds in Kehoe Creek. The creek is completely choked by the reeds. It should be open water or mostly open water. The reeds are choking the creek because of excessive nutrients from manure which is in the entire creek watershed. I should point out that there is a barbed wire fence on the far side of the creek. However, I have seen beef cows in the creek numerous times. The fence is either not adequate to prevent cattle from getting past it or is not adequately maintained. Furthermore, the area above the fence line is relatively steep and cattle that graze on that large slope drop manure that eventually gets washed into the creek. The fence should be at the top of that slope, not at the creek edge, to keep the manure from getting into the creek. However, that would remove a significant amount of grazing area from what the K Ranch currently grazes and for that reason, apparently, the fence remains close to the creek.

Below is a photo I took of the Kehoe Pond. This is where the north and south forks of Kehoe Creek meet. The pond is totally covered with pennywort which has grown out of control. It wouldn't cover the pond if excessive nutrients in the form of manure weren't getting into the watercourse.

(photo)

The water then flows under the road (via culvert and, during heavy rains, over the surface of the road) at the Kehoe Beach parking lot and, ultimately, into the ocean during the wetter times of the year. From the road to the beach it is also almost completely overgrown with more aquatic vegetation.

As stated above, there is far too much water pollution occurring at Point Reyes and GGNRA due to cattle. NPS hasn't done anything to describe to the reader the condition of the creek today, except to say it's very polluted. What is the long term trend? Is it better or worse than in 2013? How can the reader contrast the condition of the creek today compared to what the alternatives would do to it? The Park Service has never done anything about the pollution and it never will, beyond stapling Best Management Practices to the permits.

## Vegetation, Including Listed Species

The areas that cattle graze on are overgrazed. This is because, in part, NPS is assuming the average size of a cow is 1,000 pounds, but as explained above under the beginning of Alternatives Section, black angus cows (the most common beef cows in the two parks today) weigh 1410 pounds.

"Of course, bigger cows need more nutrients. The neat thing is nutrient requirements don't go up in direct proportion to the size of the cow. They actually go up at a  $3/4$  powers ratio, or 75%, not one to one. So, the maintenance energy required by the 1,400-lb. cow is about 11% higher than that required by the 1,200-lb. cow, despite the fact that she is about 16% heavier" Olson explains. <https://www.beefmagazine.com/cow-calf/relationship-between-cow-size-production>

Applying these factors, an average 1,410 pound Angus cow weighs 41% more than a 1000 pound cow. Applying the 75% formula, the larger cow needs 30.25% more forage than the 1,000 pound cow. The Park Service is ignoring this by using weights that are decades old and in the process the grazing lands at Point Reyes are being seriously overgrazed.

Assuming, arguendo, that the Park Service is correct that a 1,000 pound cow needs about 26 pounds of dry matter per day, applying the formula above means a 1410 pound Angus cow would need 30.25% more feed, or about 7.86 more pounds per day.

This alone means NPS has been assuming grazing is removing 30% less forage than has been occurring. No wonder the park looks so overgrazed. The Park Service should immediately reduce AUs by 30% to account for the larger cows.

How does a rancher make up for the fact that his cows have overgrazed? He imports as much hay as he needs. Unfortunately, NPS has never required the rancher to buy certified weed-free hay. It costs more, but it keeps non-native and invasive weeds and their seeds out of the parks.

NPS's 2019 Natural Resource Condition Assessment (NRCA) concludes that the Park Service at Point Reyes National Seashore has a lot of catching up to do with

simply having a current baseline vegetation map that can be used for future monitoring of trends:

The ecological communities discussed in this assessment included coastal dunes, forests, and grasslands. Assessment of these communities, as well as focal resources such as rare plants, would benefit from an updated vegetation map for the park. The detailed vegetation map for PORE is an indispensable tool for management and research. However, it is more than two decades old. Given that we are experiencing an era of accelerated ecological dynamics, the vegetation map needs to be updated as often as possible to understand ongoing shifts in the vegetation.

NRCA, page 269. And again:

[Point Reyes National Seashore] faces some significant challenges in the coming decades including climate change, exotic pests and pathogens, the presence of non-native species, and habitat loss due to human activity. In addition, although park staff have gathered a considerable amount of information regarding natural resources, there are still many significant gaps in the existing data for natural resources and stressors. NPS resource managers need to establish and continue comprehensive monitoring projects in order to ensure that management strategies can be implemented in a timely and effective manner, so that these challenges do not result in the degradation of these valuable natural resources.

Ibid. (emphasis added).

The Park needs to establish baseline conditions in order to understand how ranching and livestock grazing are

impacting sensitive resources. This has not been done yet and equates to a serious and significant gap in the EIS.

Accurate and up-to-date monitoring is fundamental to ensuring the effectiveness of monitoring commitments, meeting legal and permitting requirements, and identifying trends. Under NEPA a federal agency has a continuing duty to ensure

that new information about the environmental impact of its proposed actions is taken into account. The Park failed to analyze the significant impacts of cattle ranching and other proposed actions on a degraded landscape and does not have a proper baseline to carry out an accurate monitoring program to ensure that decisions do not further harm the environment. There are so many data gaps with coastal grassland baseline information that I cannot see how the park can justify any management alternative scientifically, in their Draft EIS.

Wildlife, Including Listed Species (Page 77)

Mammals. (Page 78)

The DEIS states that "[m]ost species use grasslands, shrublands, or pastures to complete a portion of their life history and could be affected by ranching, through disturbance, competition for resources, and habitat alteration. Some species are adaptable to agriculture (e.g., coyotes and raccoons) while others are not." Page 78. (Emphasis added.) This is a typical very general statement in the DEIS. It is neither a baseline statement nor a long-term trend statement. For all of the topics below, what is the baseline and what is the long-term trend?

Here are some facts to keep in mind about mammals living in the ranching area today.

Silage Growing on 1,000 acres. Silage, by definition, is vegetation mowed in the spring when it is still green. Some mammals use the silage fields, including for giving birth to and hiding their young. While a lot of small mammals are chopped up by silage mowers, even large mammals die from silage mowers. In the film "The Shame of Point Reyes" there is footage of a coyote grabbing a deer fawn whose body had been sliced up by a silage mower.

Manure spreading on 2,500 acres. Some manure is contaminated with Johne's disease. It is a deadly bacteria that affects the small intestine and prevents the absorption of nutrients. It can lie dormant on the ground for a year and any other ruminant that eats the grass it is on will become infected.

Brush Cutting. Ranchers like to remove brush to replace it with grass for their cattle, but the most common brush species at Point Reyes is coyote brush which is a native plant that provides important food, cover and nesting habitat for all sorts of mammals and birds.

Diversification. While diversification would expand exponentially under Alternatives A and B, there is some diversification now. Many of the ranchers' leases/permits have a provision allowing up to 10 cow animal units (AUs) of some other species, such as sheep. A sheep is assumed to be 1/5 the size of a cow so 10 cow AUs equals 50 ewes. Each ewe can produce a lamb each year which brings the total up to 100 ewes and lambs for each ranch having that allowed personal, non-commercial use. There are 11 or so leases/permits with that provision so in addition to all the cattle allowed in the park, the ranchers could have up to 550 ewes and 550 lambs at any one time. These ewes and lambs are all targets for the medium to large mammalian predators in the park, such as mountain lions, bobcats, coyotes, badgers, foxes, etc.

This makes the predators targets for the ranchers. Ranchers have three legal choices to deal with the predators. They can use livestock guardian dogs (LGDs), wire mesh fencing instead of barbed wire fencing, and/or put them in a barn at night. (Illegal methods include shooting, trapping and poisoning.) LGDs sometimes kill the predators that don't leave when the dog approaches as discussed in the Alternatives section under Alternative B.

Fencing. Fencing can kill or injure wildlife. It is used all over the ranching area for holding cattle and blocking elk or other wildlife from entering a ranch area. Wildlife-friendly fencing methods exist, but none of the ranchers use it and NPS has never seen fit to make them use it.

## Birds. (Page 78)

The DEIS states: "Many birds use the planning area ... Ground-nesting species, could be susceptible to impacts from cattle grazing and vegetation management (e.g., plowing and harvesting) ... " That's not a very forthcoming description of how ranching is harming birds.

Silage. See silage discussion under mammals. Many species of birds nest in the silage fields in the spring and the nestlings and some adults are chopped up when the mower passes over them. Allowing silage growing when it kills wildlife is in violation of the three statutes.

Brush Cutting. Some birds nest in brush and thus lose nesting habitat due to brush cutting. These lands should not be managed for what is best for making money in ranching but for what is best for avoiding any impairment of natural resources and for protecting, preserving and restoring the current natural environment to a natural environment.

According to the DEIS: "Additionally, agricultural activities ... attract some birds ... such as common ravens ... Ravens are nest predators of the federally threatened western snowy plover, which nests on beaches adjacent to the planning area ...." Pages 78-79. Again, as with everything else, what is the baseline for the snowy plovers and the ravens and what is the long-term trend?

Diversification. In addition to the discussion on diversification and mammals, one rancher (D Rogers Ranch) is allowed 3 cows worth of AUs for chickens. His lease/permit states that one cow AU is equal to 250 laying hens or 455 broilers.

So, that ranch can have out on the pastures 750 laying chickens or 1365 broilers. These are not only targets of the mammalian predators listed previously but also small mammalian predators such as raccoons, skunks and weasels. They are also the targets of avian predators such as eagles, hawks and owls.

Fencing. While it is commonly known that fencing can kill wild ungulates, fencing also kills or injures wild birds that who do not see the barbed wires as they fly low over areas with fencing.

## Tule Elk. (Page 81)

The story of the reintroduction of tule elk into Point Reyes is a sad one. They were opposed from the beginning by the ranching community. A lawsuit was filed by the rancher who held a permit for ranching at Pierce Point Ranch. I was involved in defending the lawsuit. The suit was dismissed and 10 elk finally arrived. They were confined for many months at Pierce Point while the rancher gathered his cows and left. During that period of confinement some of the elk became infected with a slow-developing, but fatal disease, called Johnne's from the rancher's cattle during their confinement. Half the dairies at Point Reyes had it then based on a study done about the time the elk arrived and half the dairy cow herds and an unknown number of beef cattle herds at Point Reyes and possibly GGNRA still have the disease because the Park Service never did anything about it. While the

10 elk were confined at Pierce Point, a 3-mile 8-foot high wire mesh fence was constructed from Tomales Bay on the east to the ocean on the west to keep the elk confined permanently in a 2,600 acre area that had no perennial streams. During the drought a few years ago, approximately 250 of the 500 elk in the enclosure died due to lack of adequate water. The 1998 elk plan warned that this would happen because the only real water supplies in those 2,600 acres are livestock ponds dug out by the ranchers who over time used to occupy the Pierce Point Ranch. During a drought the ponds dry up, leaving some elk to die of thirst. The Seashore's response to the deaths was that NPS policy with wildlife is to let nature take its course. That was roundly criticized, even by some ranchers, given that the elk were lockup behind a fence with inadequate water during droughts.

Keeping the wild elk confined behind an elk-proof fence without adequate water is a violation of all three of the statutes that require NPS to avoid impairment of natural resources, including wildlife, and to protect, preserve and restore the natural environment of the Seashore. In fact, confining them in itself is a violation of the three

statutes and NPS policy regarding not holding wildlife captive in national parks.

Johne's Disease. NPS is in violation of the three statutes listed at the beginning of this letter because it has never done anything to rid the parks of Johne's disease.

The parks are to be managed in an unimpaired condition and their natural resources are to be protected, preserved and restored. All three elk herds have the disease today thanks to the infected cattle and inaction by NPS. The Park Service studies the elk all the time to try to identify elk with Johne's by testing fecal samples (and in 2016 unnecessarily shooting 24 elk to get tissue samples as well), but they never require testing and culling the cattle to free the park of the disease (testing and culling of elk would also be necessary). Point Reyes is the only one of the 22 locations of tule elk herds that have Johne's disease. (Personal communication with Cal F&W elk manager Joe Hobbs.) The Park Service should establish a rigorous program to eliminate Johne's disease, including testing and culling. See <https://johnes.org/general/control.html>

Manure spreading.

Allowing manure spreading is contrary to the three statutes. Spreading of dairy cow manure over 2,500 acres of the seashore spreads Johne's disease because an unknown number of dairy cows have the disease and it is carried in the manure where it can last for a year on the ground. If an elk (or deer) eats grass that has manure on it the elk (or deer) will get Johne's disease. If a pregnant elk cow has the disease it is passed on to her fetus. Johne's can also be passed on to an elk calf even if the mother doesn't have the disease if the mother lies down where Johne's exists on the ground if the calf later takes in the disease by nursing. Many elk have died due to the presence of Johne's and NPS has never bothered to rectify that.

Habitat modifications for the Drakes Beach Herd. (page 81) The DEIS states:

Habitat modifications for the Drakes Beach herd included two projects. The first—a water project at D Ranch—was completed in 2013 and is ongoing; it provides reliable water sources for elk away from ranches. The second—repeatedly mowing portions of D Ranch in spring 2018—was to test both the elk's response and this approach for controlling invasive plants that degrade the suitability of habitat for elk.

DEIS at 81.

In other words, at the Tomales Point Elk Reserve where NPS keeps the elk locked up behind an 8-foot woven wire fence without adequate water during times of drought and takes a "let nature take its course" when a drought hits, while at the Drakes Beach area, where the wild free-roaming elk use dairy ranch lands and ponds for food and water some of the time, the elk get special year round water sources built for them and special forage treatments to encourage more grass to keep the elk away from the ranch lands and ponds. Such a double standard flies in the face of national park laws requiring that natural resources, including elk, be the overarching focus of management, not non-native cattle.

Brush cutting. Brush cutting is harmful to elk because while they are primarily grazers, they also browse and depend on native brush species such as coyote brush, bush lupine and other native brush species.

Fencing. There are many, many miles of barbed wire fencing in the two parks. I have checked the fencing throughout the Seashore and have seen no fencing that is "wildlife-friendly" except a couple of 16-foot long spots along Drakes Beach Road where NPS has lowered the fence at a few places to lower the number of fence breaks caused because the fences along both side of the road are too high for elk to jump over easily.

Livestock fencing (most commonly barbed wire) can kill and injure wildlife. However, it can be constructed to be much less harmful to wildlife. Such fencing is commonly referred to as "wildlife friendly." I wrote about fencing in the seashore and how none of the fencing that I examined was "wildlife friendly." As long as there is any ranching in the parks, all fencing should be "wildlife friendly." <https://jimcoda.com/2014/07/26/point-reyes-national-seashore-fencing-harmful-to-wildlife/>

On BLM grazing lands where deer or elk exist, the specifications are: three wires, top wire 38 inches above ground (to ensure deer and elk can easily clear it), bottom wire to be smooth (non-barbed) and 16 inches above ground (for fawns and elk calves to get under) and at least 12 inches clearance between the top wire and the middle wire (to prevent "scissoring" or trapping hind legs between the top two wires when jumping because their hooves face forward for part of the jump).

Fencing Manual at IV-4 and IV-5. <https://www.google.com/search?q=blm+manual+fencing+1v-4&rlz=C1CHBFenUS805US805&oq=blm+manual+fencing+1v-4&aqs=chrome..69i57j0j7&sourceid=chrome&ie=UTF-8>

Below is a photo I took on October 16, 2014, of a bull elk during the rut near Drakes Beach. It shows barbed wire tangled in the antlers.

(photo)

Below are two photos I took on July 15, 2014, of a bull elk skull that was found on Mt. Vision above Home Ranch at the Seashore. When barbed wire gets tangled in the antlers it can lead to death.

(photo)

(photo)

Note in the first photo that the wire cut into the bridge of his nose and in the second photo that it worked its way well into the lower jaw. He could not eat or drink because of the barbed wire. He must have died a slow agonizing death.

Cattle and the barbed wire fencing that goes along with the cattle don't belong in a national park. Because of the damage it can do to elk and deer, NPS is violating its duty to avoid impairment of the resources of a national park, including the wildlife. But to the extent it is there, NPS should at least require that the fencing be designed to avoid injuring and killing wildlife.

Hazing. Hazing elk in a national park which involves chasing them from lands that nature causes them to choose for feeding to a very small area the Park Service has decided they should stay in to keep ranchers happy, is wrong. It is also contrary to the duty to manage resources in an unimpaired manner and to protect, preserve and restore those resources, including the tule elk.

#### CHAPTER 4: ENVIRON. EFFECTS OF ALTERNATIVES (Pages 99-194)

The 1916 NPS Organic Act and language in the PRNS and GGNRA legislation prohibit the Park Service from impairing natural resources in its management of these parks. Yet, the DEIS admits that all the ranching alternatives will impair the natural resources of the parks. Consequently, the Park Service has no discretion to choose any of the ranching alternatives.

#### SOILS.

The Park Service admits that all the alternatives will impair soils, except Alternative F, the no ranching alternative.

Alternative A. The continuation of current ranching would continue to cause the same harm as always. Various activities, such as cattle trails and compaction of soils where cows walk and mill around would lead to erosion and compaction of soils. High intensity areas would continue to be barren of vegetation with serious compaction. Forage/silage production would compact soil because of all the heavy equipment used to spread seeds and mow and later collect the windrowed silage.

Cumulatively, Alternative A would continue to contribute noticeable long-term, adverse impacts on soils across the planning area from erosion, compaction, and altering the soil fertility, primarily from livestock grazing on 27,000 acres; 1000 acres of forage production; 150 acres of high-intensity-use areas; and manure spreading on approximately 2,500 acres over a period of years.

Alternative B. NPS says the impacts to soils under Alternative B would be the same as with Alternative A except that with a zoning framework the adverse effects would be somewhat less. This strains credulity. The use of the 65% of each ranch that would be managed as "range" zone would be managed as all of the ranch areas before were managed and the "pasture" zone, which comprises 34% of each ranch, would be subject to much more intensive uses, such as "diversification" where as many as 50 ewes and 50 lambs, plus 500 chickens, would be allowed to roam and forage. This would have a much greater impact on the land and would cause all kinds of conflicts with wildlife.

Alternative C. NPS says all ranch and vegetative management, diversification activities would be the same as under Alternative B except there would be some added ground impacts with the removal of all the Drakes Beach elk.

Alternative D. NPS says that 8400 acres would be removed from grazing which would mean much greater soil conditions on those 8,400 acres. The remaining 19,000 acres would be similar to the impacts under Alternative A.

Alternative E. Under Alternative E the impacts would be less than Alternative A because the 6,200 acres of dairy ranching would be converted to beef ranching for a total of 26,100 acres of beef cattle grazing. Impacts to soils would be reduced because activities associated with dairying would be removed. That would include manure spreading which compresses soils due to heavy manure trucks on soils. It would also remove 86 acres of the 150 acres of high intensity use areas (concentrated animal feeding operations). It would remove most of the 1,000 acres of silage growing which activity compresses soils during seeding, mowing and harvesting. (Silage growing would apparently continue on the G and H beef ranches.) Finally, there would be no need to spread manure over 2,500 acres of manure fields which avoids the compression of fields from the manure trucks, reduces the chances of Johne's disease spreading, and is friendlier to native plants that are not happy with overly fertilized soils. There would however, still remain 3,150 beef cows (the 2,400 beef cows and plus the 750 beef cows that would replace the 3320 dairy cows) still impacting natural resources.

Alternative F. Alternative F "would allow soil conditions to slowly return to natural conditions." This is the only alternative that complies with the Park Service's duties under its three statues and policies.

**WATER QUALITY.** The Park Service admits that all the alternatives will impair water quality, except Alternative F, the no ranching alternative. NPS laws, and internal procedures which implement those laws, prohibit any impairment.

The DEIS admits that some of the lands drain into and pollute Tomales Bay, but the DEIS defends that by stating that NPS lands are a small contributor. The fact that Tomales Bay is very large and many lands outside the two parks also drain into the Bay, doesn't change the fact that the two parks are polluting a very large bay. Being one of many is not a defense to water pollution. It could be that no single entity is contributing more than a small portion of the pollution of Tomales Bay.

Alternative A. "Alternative A would continue to contribute adverse impacts on water resources in the planning area from beef and dairy cattle ranching, nutrient management and water use consumption related to ranching activities." DEIS at

117. See my discussion under Affected Environment for more on water pollution under Alternative A. Water pollution would continue as it has in the past. Furthermore, under Alternative A and the other ranching alternatives, the DEIS avoids talking about baseline conditions and long-term trends regarding park lands polluting Drakes Bay, Abbott's Lagoon, Kehoe Beach, the ocean and any other water bodies those lands drain into.

Alternative B. Water quality would suffer under Alternative B in a manner similar to Alternative A.

Alternative C. Water quality impacts under Alternative C would be the same as under Alternative B.

Alternative D. Alternative D would reduce beef cattle from 2400 AUs (2400 head) head on 26,500 acres to 1700 AUs on 19,000 acres. Diversification would not be allowed on the pasture zone, just the ranch core. While reducing ranching to just 19,000 acres and 1,700 beef cattle plus 3130 dairy cows, and not allowing any diversification on the pasture areas of these non-residential lands, would be somewhat better than Alternatives A, B and C, from a water quality standpoint, it is still similar to Alternative A, except on 19,000 acres instead of 26,000 acres.

Alternative E. Alternative E involves removing dairying from the 26,100 acres of land with the six dairy ranchers substituting beef cattle for their dairy cows. Because beef cows spend essentially all their time grazing on pastures and dairy cows spend roughly one quarter of their time on pasture (and the rest of the time eating hay, silage and grains, most often indoors), the 3130 dairy cows would be replaced by a total of 750 beef cows. While phasing out dairying would be a significant improvement to water quality compared to the status quo, it would still involve beef cattle on 26,100 acres of two national parks.

Alternative F. Alternative F would involve removing all cattle from the two parks. All resources would be better off and the trend would be to move in the direction of what things were like before cattle arrived.

#### VEGETATION, INCLUDING FEDERALLY LISTED SPECIES.

The areas that cattle graze on are overgrazed and would continue to be overgrazed under all the ranching alternatives. This is because, in part, NPS is assuming the average size of a cow is 1,000 pounds, but as explained above under the beginning of Alternatives Section, black angus cows (the most common beef cows in the two parks today) weigh 1410 pounds.

Of course, bigger cows need more nutrients. The neat thing is nutrient requirements don't go up in direct proportion to the size of the cow.

They actually go up at a  $\frac{3}{4}$  powers ratio, or 75%, not one to one. So, the maintenance energy required by the 1,400-lb. cow is about 11% higher than that required by the 1,200-lb. cow, despite the fact that she is about 16% heavier.

<https://www.beefmagazine.com/cow-calf/relationship-between-cow-size-production>

Applying these factors, an average 1,410 pound Angus cow weighs 41% more than a 1000 pound cow. Applying the 75% formula, the larger cow needs 30.25% more forage than the 1,000 pound cow. The Park Service is ignoring this by using weights that are decades old and in the process the grazing lands at Point Reyes are being seriously overgrazed.

Assuming, arguendo, that the Park Service is correct that a 1000 pound cow needs about 26 pounds of dry matter per day, applying the formula above means a 1410 pound Angus cow would need 30.25% more feed, or about 7.86 more pounds per day.

This alone means NPS has been assuming grazing is removing 30% less forage than has been occurring. No wonder the park looks so overgrazed. The Park Service should immediately reduce AUs by 30% to account for the larger cows.

All the ranching alternatives would have varying degrees of negative impacts on vegetation. Alternative F, which would allow the vegetation to slowly return to natural conditions would have a beneficial effect.

#### WILDLIFE, INCLUDING FEDERALLY LISTED SPECIES. (Page 141-161)

The DEIS states that all the alternatives would have good and bad effects on wildlife, depending on the species.

The DEIS states that removing cattle will cause an increase of shrubs and reduction in grasslands. This ignores the fact that the 2,600 acres of former ranchlands which is now the Tomales Point Elk Reserve has approximately the same ratio of grasslands to shrub as existed when ranching was stopped there in 1980. The elk have kept the ratio

the same even though there were only 10 elk in 1980 to start with and no additional elk have been brought in since then. The current ranch lands outside the elk reserve have about as much shrubs as the elk reserve, especially on the dairy lands.

Furthermore, the ideal, from a vegetation standpoint, is the original native coastal prairie (which had shrubs interspersed in it) that existed until European man came with his cattle. All the native grasses are gone from current grazing lands due to cattle. Regarding shrubs, they are an important source of food and cover for many birds and mammals, including elk. The cattle changed the ideal, natural scene that existed before European man arrived to the highly disturbed scene we have today where the coastal prairie has disappeared, except for a few areas that cattle can't access. Removing cattle would be the first step in returning the unacceptable conditions of today to the ideal, natural scene of yesterday consistent with the three laws governing management of the two parks.

Diversification. Allowing any livestock on these ranches smaller than cattle, such as sheep, goats, pigs and chickens will create extreme predator conflicts that will result in killing of predators or harming them directly or indirectly, in violation of your statutory duty to protect natural resources, including wildlife. Some of the predators what will cause conflicts include bald eagles, red-tailed hawks, great horned owls, mountain lions, coyotes, bobcats, badgers, foxes, skunks and weasels. It will also require much more restrictive fencing to contain those smaller domestic animals which will in turn reduce wildlife habitat and restrict wildlife movement. Livestock guardian dogs should be prohibited because they can and will attack or fight with a predator if it is unable to drive away the predator and they have been known to look for predators to catch and kill them. Allowing the planting of row crops will also cause problems to natural resources, including, but not limited to, reduced habitat for wildlife; the use of fencing that is more impermeable to wildlife travel than the current barbed wire fencing which will further impede wildlife travel across thousands of acres of land; and the use of herbicides and pesticides, including dangerous chemicals injected into the ground where artichokes and certain other crops are grown and which may then enter the groundwater of the park.

These and any other diversification ideas are also contrary to the three statutes set forth above.

Silage growing kills wildlife. It is common knowledge that silage mowing is done in the spring when birds are nesting in it and it kills nestlings. "Estimating Impact of Mowing in the Silage Fields of Point Reyes National Seashore on Breeding Birds," by Point Blue Conservation Science (Ryan T. DiGaudio et al.), August 31, 2015. Allowing it is contrary to the three statutes and other laws. Silage mowing also kills small mammals. The documentary "The Shame of Point Reyes" even shows a coyote pulling the body of a mangled deer fawn from a silage windrow at Point Reyes in May 2019.

ELK. (Pages 161-166)

Alternative A. Alternative A would continue NPS's current method of managing the elk with hazing them off ranch lands, continuing to monitor and test the elk for Johne's and annual monitoring and no specific policy regarding elk numbers.

Hazing must be stopped. It is contrary to NPS's three statutes requiring that elk and other natural resources be protected, preserved and restored, not harassed.

Re Johne's, stop studying the elk and address the cause of the problem, the dairy cows (and possibly beef cows). NPS has a statutory duty to stop the impairment of Point Reyes caused by the dairy cows spreading Johne's disease to the elk and deer, not to mention other dairy cows. Start strict testing and culling of dairy cows.

Habitat improvements. Stop providing special water and forage for the elk when it is being done to keep the elk from feeding where their instincts tell them to go. When NPS was accused of inhumanity toward the elk that died from the drought at Tomales Point, NPS claimed that NPS policy is to let nature take its course, but when the ranchers complain about the elk, NPS does all sorts of unnatural things in

the way of providing water and food to keep for the elk to keep the elk in a small area away from the ranches.

Fencing. The DEIS seems to say that under Alternative A wildlife-friendly fencing would not be considered. NPS has a duty under its statutes to manage the Seashore in a way that protects wildlife, such as elk, and the current fencing is not protective of the elk, but harmful to the elk (and other wildlife).

Alternative B. Somewhat similar to Alternative A, except for shooting 10-15 elk a year. Shooting 10 to 15 elk a year is not justifiable when there are cattle. Elk have priority over cattle under your three statutes. Furthermore, tule elk have serious genetic problems given that all the living tule elk today are the descendants of apparently only three elk. The best thing for a species with that problem is to increase its population as much as possible, not to reduce it.

Alternative C. This alternative is similar to B, except it would involve shooting all the Drakes Beach elk. This is the most egregious and unlawful of all the alternatives.

Alternative D. This is similar to B except it removes 7,500 acres from cattle grazing. It allows the Drakes Beach elk to use the east side of the old D Ranch lands, which are currently used by A Ranch cattle, but not the west side currently grazed by C Ranch cattle. There is no explanation as to why the west side of this non-residential ranch isn't part of Alternative D. It is also not clear whether the elk herd would be limited to 120 animals as under B.

Alternative E. Removing dairy cows would have less negative consequences for elk, and other natural resources, than Alternatives A -D.

Alternative F. This alternative is by far the best for elk. The elk fence at Tomales Point would be removed allowing those elk to roam as wild free-roaming animals and to have access to water even in drought times. Point Reyes would become more popular for having the largest tule elk herd one day. All of the tens, if not hundreds, of miles of fences would be removed. Elk would no longer be injured in trying to jump over barbed wire fences. This is the only alternative that complies with the statutory duty to protect, restore and preserve the natural resources of the parks.

In summary, none of your ranching alternatives comply with your duty to avoid impairing natural resources. To avoid breaking the law, you can either select Alternative F as your decision or you can try to develop new alternatives that comply with your statutory duties.

I commented during both rounds of the Comprehensive Ranch Management Plan process and both the initial request for comments on a conceptual range of alternatives and the later request for scoping comments regarding a GMPA. I incorporate those comments herein by reference.

Correspondence: RE: General Management Plan Amendment Draft Environmental Impact Statement

Dear Superintendent Muldoon,

The Environmental Action Committee of West Marin (EAC) greatly appreciates the opportunity to provide comments on the National Park Service (NPS) Point Reyes National Seashore's General Management Plan Amendment (GMPA) Draft Environmental Impact Statement (DEIS).

Since 1971, EAC has worked to protect and sustain the unique lands, waters, and biodiversity of western Marin County, California. EAC's membership represents 1,000 individuals: 86 percent of our membership lives in the San Francisco Bay Area, 58 percent of our members are located in Marin County, with the remaining 10 percent in other counties in California, and 4 percent outside of California. Since 2014, EAC has been actively involved in the

public processes concerning proposals for continued ranching within Point Reyes National Seashore (Seashore) and Golden Gate National Recreation Area and has actively participated in collaborative discussions with a variety of stakeholders.

## 1. Introduction -The Preeminent Mission of a National Park is to Conserve Natural Resources

The GMPA, developed through a public planning process, should protect, restore, and preserve park resources using ranch leases that ensure multi-generational, environmentally sustainable ranching that is complementary to the natural resources and visitor experiences in the park.

The DEIS for the GMPA for the Seashore is mandated under the National Environmental Policy Act (NEPA). Many additional laws also govern this process including, but not limited to, 54 U.S.C. § 100101 (a)<sup>1</sup>, the four statutory elements of 54 U.S.C. § 100502, 54 U.S.C. § 100101,<sup>2</sup> and the Seashore's Enabling Legislation.<sup>3</sup> The GMPA and the DEIS must also align with the Seashore's purpose statement that is the foundation for understanding what is most important about the park which states, "Established for the public benefit and inspiration, the Point Reyes National Seashore protects a rugged and wild coastal peninsula and surrounding waters, connecting native ecosystems, enduring human history, and recreational, scientific, and educational opportunities."<sup>4</sup>

Overall, the DEIS achieves several important objectives in attempting to balance the multiple uses and at times conflicting priorities and management strategies of the Seashore's resources in order to implement practices that mitigate some environmental impacts from the beef and dairy ranching operations located within the proposed Ranchland Zone (or planning area). Unfortunately, NPS appears to have abused its discretion and authority in the DEIS by moving far beyond the originally delegated authority to

"recognize the role" of established families' continued beef and dairy ranching to allow new uses in the Ranchland zone based on economic considerations for private businesses through diversification.

Specifically, the DEIS fails to consider the full scope of cumulative impacts to environmental resources (including direct and indirect effects) and connected actions. In addition, in certain instances the DEIS also fails to include all reasonably foreseeable impacts at the time of the DEIS. As discussed below, EAC finds inconsistencies with the proposed purpose of action through the allowance of new agricultural uses and erosion of multi-generational ranching, inconsistencies with regulatory requirements, and failure to consider impacts of diversification on park resources.

Oddly, the DEIS prioritizes the effects on commercial lease holders of foreseeable financial market fluctuations ahead of foreseeable environmental impacts to park resources. This priority is inconsistent with Congressional direction for the Seashore . Resource protection is the highest value for the Seashore as intended by the 16 U.S.C. Sec. 459c (6)(a) where Congress elaborated on this statement by requiring the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational , educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area,..."<sup>16</sup> U.S.C. Section (Sec.) 459c (6)(a) (emphasis added).

EAC's comments below address inconsistencies in the actions proposed in the DEIS with the regulatory requirements as prescribed by NEPA, U.S. Code, supporting case law, and other references.

## 2. Inconsistencies with Direction to Enable Long Term Leases for Beef and Dairy Ranching, Consistent with Applicable Laws and Planning Processes

NPS exceeded their delegated authority in two areas. First, NPS presents public alternatives that would allow for new agricultural uses outside of beef and dairy ranching. Second, the DEIS erodes multi generational directives as it allows for a competitive open bidding process to grant leases through the proposed succession process.

## 2.1. Direction to Issue Long-Term Leases for the Purpose of Cattle and Dairy Ranching

In 2012, when NPS did not renew the lease for Drakes Bay Oyster Company, in order to fully designate Drakes Estero as Marine Wilderness, then Secretary of the Interior, Ken Salazar, issued a decision memorandum that stated,

... "I direct that the Superintendent work with the operators of the cattle and dairy ranches within the pastoral zone to reaffirm my intention that, consistent with applicable laws and planning processes, recognition of the role of ranching be maintained to pursue extending permits to 20-year terms for the dairy and cattle ranches within the pastoral zone<sup>5</sup>."

In 2013, NPS Director Jonathan Jarvis in his Delegation of Authority authorized,

"...the issuance of lease/permits for the purpose of grazing cattle and operating beef and dairy ranches, along with associated residential uses by the lessees and their immediate families and their employees, and their employees' immediate families, within the pastoral zone of Point Reyes National Seashore and the northern District of Golden Gate National Recreation Area administered by Point Reyes National Seashore. Under this delegation, you may issue lease/permits with terms of up to twenty years. These long-term lease/permits will provide greater certainty for the ranches operating within the national park's pastoral zone and demonstrate the support of the National Park Service (NPS) and the Department of the Interior for the continued presence of dairy and beef ranching operations <sup>6</sup>."

The DEIS exceeds NPS' discretionary authority by allowing for new agricultural uses to be developed. When the scoping process began under the 2014 Ranch Management Plan, and again in 2016 and 2017 when NPS initiated the GMPA process, EAC has repeatedly asked the NPS under what authority the NPS is able to consider diversification. EAC is unable to find any authority granted as such to NPS. EAC explores additional concerns with diversification later in this letter.

## 2.2. Direction to Issue Leases for Purpose of Multi-Generational Ranching

NPS proposes an accompanying "Succession Policy" document, that is not referenced directly within the DEIS under that title, that would allow for NPS determination whether it is "appropriate to maintain the lease/permit area in agriculture" and then states that "NPS would pursue issuance of a request for proposals (RFP) to identify a new operator. The RFP process would be conducted consistent with NPS policy and regulations, and the review criteria would be identified at that time." <sup>7</sup>

Recognition of the historic and cultural values of dairy and ranching operations located within the proposed Ranchland Zone (planning area) is highlighted by the 2018 designations of two historic districts - - the 22,237-acre Point Reyes Peninsula Dairy Ranches Historic District and the 14,127-acre Olema Valley Dairy Ranches Historic District - - that encompass more than a century of change and modernization in the industry, including the evolution from original wood frame milking barns to concrete Grade A sanitary barns of the 1940s.<sup>8</sup>

The proposed Succession Policy disregards NPS directives that emphasize the values of multi generational beef and dairy ranching . As directed by the 2012 Secretary of the Interior's directive, "... recognition of the role of ranching be maintained to pursue extending permits to 20-year terms for the dairy and cattle ranches within the pastoral zone. In addition, the values of multi-generational ranching and farming at Point Reyes should be considered in future planning efforts<sup>9</sup>."

To remain consistent with the delegated authority and the park's purpose, NPS should focus continuation of ranching on cultural and historical significance of multi-generational beef and dairy ranching and should not open ranching operations (and the proposed newly expanded uses discussed below) to operators from the general public. Opening the Seashore to outside operators would have significant impacts on the park's cultural and historic values. The DEIS fails to analyze these impacts, and even fails to provide enough detail about the RFP

process to say what the impacts may entail, or when they may occur.

### 3. Inconsistencies with NEPA Requirements

In preparing an EIS, an agency must satisfy the NEPA requirements to consider all "(a) connected, cumulative, and similar actions; (b) a no-action alternative, other reasonable alternatives, and mitigation measures; and (c) direct, indirect, and cumulative impacts." *W. Watersheds Project v. Abbey*, 719 F.3d 1035, 1046 (9th Cir. 2013), (citing 40 C.F.R. §1508.25).

The DEIS conducts its environmental analysis entirely by weighing benefits to private commercial operations versus mitigation measures to lessen harm to resources. It does so by analyzing measurements for commercial ranching metrics to meet organic standards and forage production to ensure specific numbers of animal units.

While the DEIS does address some environmental impacts through this methodology, the analysis is incomplete. The DEIS fails to adequately meet the legal requirements to analyze connected actions, cumulative impacts, direct and indirect effects, and reasonably foreseeable consequences of decisions being authorized in the plan. We discuss below the specific concerns and required agency considerations that fail to meet NEPA requirements.

### 4. Failure to Analyze Connected and Cumulative Impacts of Diversification on Environmental Resources

Looking first at diversification as proposed in Alternatives B, C, and D, the DEIS fails to address several impacts under NEPA from the introduction of diversified agriculture into the Seashore planning area that includes row crops, livestock, farm stays, small-scale processing facilities, and farm stands that would result from new types of commercial agricultural production. In addition, the DEIS does not preclude ranchers who have businesses or property outside of the Seashore from importing those products into the Seashore for retail sales or small-scale processing. These actions could lead to processing facilities and farm-stand sales or tastings for wine and whiskey. In addition, the DEIS is unclear whether small-scale processing also includes animal slaughter.

The proposed changes would allow "ranchers to react to fluctuations in the economic market<sup>10</sup>" through a menu of diversification options and lead, foreseeably, to ranchers converging on the highest profit-margin options in the future.

NPS did not evaluate cumulative e, direct or indirect impacts, connected actions, or reasonably foreseeable outcomes of diversification. Rather, the DEIS states,

The programmatic analysis in this EIS broadly addresses the general environmental issues, impacts, and benefits to establish overall management direction for the planning area. Implementation of some programmatic direction... would require additional project-level planning and compliance to develop and analyze site-specific proposals and cost estimates. Compliance for these projects would tier from the programmatic analysis in this EIS and be consistent with the general direction provided in this EIS. 11

Broadly addressing an incomplete list of impacts to park resources by means of a general list of mitigation measures while also providing for wide-ranging interpretations of diversification activities fails to evaluate connected and cumulative actions that require an environmental review at the time of the DEIS.

If the actions are reasonably foreseeable at the time of the EIS, then the impacts should be considered at that time.

"It is not appropriate to defer consideration of cumulative impacts to a future date when meaningful consideration can be given now ...." *N. Plains Res. Council*, 668 F.3d at 1078. Rather, "NEPA requires that an EIS engage in reasonable forecasting. Because speculation is implicit in NEPA, [courts] reject any attempt by agencies to shirk their responsibilities under NEPA by labeling any and all discussion of future environmental effects as crystal ball inquiry." *Id.* at 1078-79 (quotation, alterations omitted). Therefore, an agency must consider all

"foreseeable" impacts at the time it issues the EIS. *League of Wilderness Defenders v. Forest Service*, 689 F.3d 1060, 1075-76 (9th Cir. 2012). Although "NEPA does not impose a requirement that the [agency] analyze impacts for any particular length of time," the length of time analyzed must be reasonable given the facts of the case. *Selkirk Conservation All. v. Forsgren*, 336 F.3d 944, 962 (9th Cir. 2003).

If the DEIS cannot consider foreseeable impacts of diversification within the DEIS, all references to diversification should be removed before the Final EIS is filed.

#### 4.1. Diversification - Individually Reviewed Ranch Operating Agreements

The DEIS proposes a delayed, disconnected, and piecemeal review of diversification activities through individual Ranch Operating Agreements (ROAs)<sup>12</sup> that are negotiated with individual ranchers. This approach may cause interconnections of watersheds and species considerations to be overlooked as NPS range managers focus on individual ranch zones and fail to analyze cumulative and related environmental impacts within the planning area.

This methodology fails to incorporate the complete scope of impacts to park resources over time, as each ranch is not an island. Actions of one ranch may impact the neighboring ranch's sensitive resources and also impact areas which may be outside of the planning area, including designated wilderness (Drakes Estero and Abbotts Lagoon) and popular public recreational areas like beaches (Drakes Beach, Kehoe Beach, North Beach, etc.) and trails (Muddy Hollow, Estero Trail, Bull Point, Abbotts Lagoon, etc.). If the Seashore managers undertake individual evaluations of ranching operations on different timelines, scales, and operational impacts, they are unable to fully consider cumulative and connected impacts.

Thus, reasonably foreseeable adverse impacts to vegetation, air and water quality, water resources, visitor experience, and soils are not considered.

We have included two reasonably foreseeable examples below:

A) Development of an individual ROA "Ranch 1" for the sake of illustration may include a ranch that plans for restoration activities near riparian corridors to positively mitigate environmental impacts of its cattle and other diversified grazing activities, while also requesting development of row crops and/or conversion of a barn to a processing facility with a farm stand. This ranch would improve water quality with riparian mitigations but increase impacts on scenic resources including the historic character of the dairy or ranch district, and create traffic and parking issues with the new processing and visitor serving facilities. The DEIS provides a framework for NPS to evaluate these requests in the ROA under the Ranchland Zoning (programmatic resource management planning).

However, if "Ranch 2" negotiates a separate ROA at a later time, that ROA may be in alignment with the Ranchland Zone framework and would not trigger further environmental review outside of the programmatic EIS. The decisions made for operation on Ranch 2 under this framework could include continued grazing downstream of the neighboring Ranch 1's riparian corridor restoration project.

Thus, while an individualized approach to analyze individual ROAs may be appropriate for ranching plans for private property, applying this tiered methodology to public lands may be more complicated as each ROA is interconnected with other resources in the Seashore.

#### Figure 1: McFadden and Rogers Ranch Zones

This map was created by merging the NPS DEIS Appendix A - Zoning Maps Figures 24 and 25 (pages 25 and 26) with an overlay of google maps that highlights the location of Olema Creek that is defined as Steelhead Critical Habitat. The DEIS Appendix A, Figure 46: Habitat in the Planning Area identifies this area as Critical Habitat for Watersheds Containing Central California Coho Salmon .

B) Further complicating this, the DEIS does not provide any maps to past, present or planned restoration activities within the planning area, which prevents the public from understanding the restoration work that occurs within the park and how those activities are connected or disconnected from current beef and dairy ranching operations.

A specific application of examples A and B include the McFadden Ranch (Figure 24, p. A-25) that has past and present watershed restoration projects that have taken place over the last two years. The McFadden Ranch watershed restoration project has been mapped as a new Resource Protection Subzone13 and removed from active grazing in the DEIS. However, directly downstream on the neighboring Rogers Ranch (Figure 25, p. A-26) continues to be mapped as Range Subzone14 and continues to allow seasonal grazing activities. The mapped creek flows directly into wetlands, Olema Creek, and eventually to §303(d) impaired Tomales Bay. This watershed is also defined as Critical Habitat for Watersheds Containing Central California Coho Salmon.<sup>15</sup> While this specific example is limited, the DEIS fails to include any maps or references to other past, present, or future restoration planning activities for the public to evaluate eco-system connections for the Seashore.

This planning approach allows for negative environmental impacts to occur just downstream of a successful restoration project that diminishes much of the upstream rancher's beneficial work to improve water quality. Downstream livestock should be fenced away from the creek to support proactive conservation standards. ROAs must be evaluated against restoration projects and sensitive resources and remove recently restored areas from grazing unless required for prescribed invasive species controls. This should be a practice throughout the Ranchland Zone to promote beneficial uses for freshwater streams, wetlands, and connected hydrology throughout the entire Seashore.

These two examples, A and B, are illustrative of the connected and cumulative impacts that are reasonably foreseeable for diversification actions that will occur under this DEIS framework. However, the DEIS fails to analyze them in any detail, and it is not clear how NPS will analyze disconnected and individual ROAs for commercial operations in project-level programmatic planning through application of cumulative impacts, connected actions and indirect effects.

"An agency may not avoid an obligation to analyze in an EIS environmental consequences that foreseeably arise from an [Resource Management Plan (RMP)] merely by saying that the consequences are unclear or will be analyzed later when an EA is prepared for a site specific program proposed pursuant to an RMP. "[T]he purpose of an [EIS] is to evaluate the possibilities in light of current and contemplated plans and to produce an informed estimate of the environmental consequences .... Drafting an [EIS] necessarily involves some degree of forecasting." City of Davis v. Coleman, 521 F.2d 661, 676 (9th Cir. 1975) (emphasis added)."<sup>16</sup>

It is impossible for the public to understand the complexity of NPS' decision-making process and NPS' responsibility to properly evaluate the cumulative impacts and connected actions of the ROAs and how the outcomes of mitigation measures on one property may be denigrated on another without updating the DEIS to include mapping and other information, as well as an appropriate evaluation of cumulative environmental impacts of all of these ROAs at this time in the EIS process.

ROAs should be developed for current operations (not including newly proposed diversification) and included in the DEIS, so that all connected and cumulative impacts may be properly evaluated in the planning area.

Under NEPA,

"Connected actions" are "closely related and therefore should be discussed in the same impact statement." Actions are connected if they: "[a]utomatically trigger other actions which may require environmental impact statements" or "[c]annot or will not proceed unless other actions are taken previously or simultaneously," or "[are interdependent parts of a larger action and depend on the larger action for their justification." 40 C.F.R. §1508.25. "Cumulative actions" are actions which, "when viewed with other proposed actions have cumulatively significant impacts and should therefore be discussed in the same impact statement." Id. Similar actions are actions which, "when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating

their environmental consequences together, such as common timing or geography." Id.

Connected actions and indirect effects to park resources must be analyzed at the time of the DEIS. "NEPA requires that an EIS analyze environmental consequences of a proposed plan as soon as it is reasonably possible to do so." Native VIII. of Point Hope v. Jewell, 740 F.3d 489,497 (9th Cir. 2014).

In summary, a comprehensive analysis of connected and cumulative actions is required at this stage of the DEIS. If NPS is unable to satisfy this requirement, then considerations for diversified operations should be removed before the Final EIS is issued.

#### 4.2. Impacts of Diversification - Conflicts with Wildlife

The introduction of sheep, goats, and chickens into a proposed Pastoral Zone and pigs into the Ranch Core Zone will create conflicts with wildlife that are not analyzed in the DEIS. The DEIS refers loosely to potential wildlife conflicts through predation of newly introduced sheep, goats, and chickens in the Ranchland Zone by advising on the use of animal husbandry, structural measures, and repellants and frightening devices to reduce potential for conflict.<sup>17</sup>

The DEIS fails to analyze the potential for increased conflict with Seashore wildlife including coyotes, badgers, bobcats, foxes, and raptors such as hawks and owls.

For example, the United States Department of Agriculture (USDA), Animal and Plant Health Inspection Service 2018 Program Data Report for the United States summarized the numbers of killed or euthanized wild animals that included: 303 American Badgers, 2,002 Bobcats, 68,186 Coyotes, 375 Mountain Lions, and 1,784 Gray Foxes in order to protect agricultural livestock or agricultural property from predators.<sup>18</sup>

The USDA National Agricultural Statistics Services published a 2010 report on Sheep and Goat Death Losses that states, "animal predator losses totaled 247,000 head. This represents 39.0 percent losses from all causes."<sup>19</sup>

The DEIS does not address the foreseeable conflicts with sheep, goats, chickens, and pigs in the Ranchland Zone that could result in high losses for ranchers. This information is available to NPS and potential loss rates and conflicts with predators should be estimated within the DEIS to evaluate if the potential conflict will eventually require NPS actions to manage predators, similar to the current management issue the DEIS is tasked with to evaluate non-predatory tule elk.

In addition, the DEIS fails to analyze impacts of diversification on native wildlife, including fragmentation of habitat, potentially detrimental changes to movement patterns, loss of forage areas, and reductions in available range. Cattle, sheep, goats, chickens, and pigs require different confinement and management methods that create impacts to resources. A field used to graze cattle is still available to coyotes, bobcats and raptors as territory to hunt gophers and voles; the same is not true of an area used for row crops or raising chickens. Eliminating territory for predators and raptors will have a negative consequence on those populations - populations NPS managers are tasked with protecting.

Finally, as mentioned in comments above concerning visitor conflicts with diversification, the DEIS allows for the introduction of guard dogs and fencing to confine and protect sheep, goats, chickens, and pigs from predation. Foreseeable conflicts between park visitors and guard animals will occur as the DEIS does not require that guard animals be trained in specific methodologies to reduce potential harm to visitors. As discussed above, the DEIS fails to address reasonably foreseeable wildlife conflicts.

#### 4.3. Diversification - Vehicles, Public Safety, and Traffic Congestion

Diversification also presents conflicts with visitor experiences and Seashore infrastructure that are not analyzed in the DEIS. Diversification will foreseeably lead to both increased commercial trucking and visitor road usage in the Seashore.

The DEIS fails to clearly outline impacts from increased types of commercial traffic on the Seashore's infrastructure and visitor serving uses. In particular, an increase in truck traffic is reasonably foreseeable for commercial operators to distribute and conduct on-site sales. Diversified activities will add commercial trucking to export crops and livestock (sheep, goats, pigs, and chickens) for processing outside of the planning area. In addition, the DEIS allows for ranchers to import crops and livestock into the planning area for small-scale processing or retail sales at farm-stands that will also increase commercial trucking.

Ranches that engage in direct sales to the public - retail and product sales and tastings, farm-stays, and event experiences - will further impact roads, degrade air quality, congest parking, and impact driveways and ranch core areas, as visitors will increase traffic congestion and park vehicles in areas that are not developed currently as parking sites.

Impacts to public safety have not been analyzed for vehicles and biking along the main routes from the introduction of direct retail sales to the public from individual ranches. Pursuant to the Point Reyes National Seashore and North District Golden Gate Recreation Area Agricultural Lease /Permit, Exhibit B Ranch Operating Agreement 20, does not include terms and conditions for local retail or farm stands; however, the DEIS lists diversification activities to include "sale of local agricultural products."<sup>21</sup> Retail sales to the public could include tastings of alcoholic products that could impair individuals operating motor vehicles, or in the foreseeable future other products like cannabis (which could become federally legal within the foreseeable future as a row crop or cultivated in greenhouses).

The DEIS does not analyze the impacts of commercial truck traffic increases. A previous programmatic planning document (2018 Proposed Mitigated Negative Declaration for the Sir Francis Drake Boulevard Improvement Project) calls out the frequency and intensity of impacts from large, heavy commercial trucks and impacts to roadways.

The report states,

"Sir Francis Drake Boulevard [SFDB] provides primary access to the various beef and dairy ranches still in operation on the Point Reyes peninsula. With the exception of specific visitor use destinations, much of the land on either side of SFDB is a historic working ranch ... Ranchers rely on SFDB for conducting ranch operations and transportation of goods. Bulk milk hauler trucks use SFDB on a daily basis to pick up milk from dairy ranches along the road. Sections of SFDB in the vicinity of the ranches exhibit some of the highest pavement distress, as well as highest frequency of patching and pavement overlays. The large, heavy commercial trucks that transport goods to and from the ranches likely contribute to pavement degradation ... SFDB provides primary access to both ranching facilities and PRNS destinations, and is therefore used by a variety of travelers. Typical SFDB users include park visitors in personal vehicles, park shuttle buses, tourist buses, school buses, milk trucks, hay trucks, recreational vehicles, and bicyclists. Based on NPS standards, SFDB is classified as a public use park road and a Class I Principal Park Road/Rural Parkway, a designation for primary access roads or tour routes through parks. In addition, current American Association of State Highway and Transportation Officials standards classify SFDB as a Minor Collector Road. There are no designated bike lanes along SFDB, although the route is classified by Marin County as a Class III bike shared route."<sup>22</sup> (emphasis added).

In addition, the Proposed Mitigated Negative Declaration for the Sir Francis Drake Boulevard Improvement Project pointed to an average daily traffic rate (calculated in 2014) along SFDB was calculated at 1,369 average vehicles per day accessing SFDB.<sup>23</sup> Extrapolating from the daily numbers, this study indicates, on average, the Seashore should expect nearly 500,000 vehicles each year traveling on SFDB. The DEIS portrays a very different calculation of only 400,000 vehicles per year along Sir Francis Drake.<sup>24</sup> The impacts of traffic and vehicles in general appear to be underestimated in the DEIS; moreover, they do not include analysis of additional impacts from diversification activities in the foreseeable future. Therefore, impacts to traffic and visitor experiences require additional analysis and comparison with proposed increases for diversification and the impacts that will have on infrastructure, visitor experiences, and air quality as the maximum emission

thresholds may require an update.

NEPA requires,

"indirect effects are those effects 'caused by the [agency] action [that] are later in time or farther removed in distance, but are still reasonably foreseeable.'" *Ctr. For Envtl. Law & Policy v. U.S. Bureau of Reclamation*, 655 F.3d 1000, 1011 (9th Cir. 2011) (quoting 40 C.F.R. § 1508.8(b)). "Such effects 'include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems.'" ' *Id.* (quoting 40 C.F.R. § 1508.8(b)); see also, e.g., *Ocean Advocates v. U.S. Army Corps of Eng'rs*, 402 F.3d 846, 867-70 (9111 Cir. 2005) (holding that an agency violated NEPA by failing to account for the environmental effects of the additional tanker traffic that would be caused by a proposed dock expansion).

The DEIS fails to analyze potential impacts due to changes of intensity, patterns of use, and design of the roadways and ranching cores due to diversification including local agricultural sales. The DEIS also fails to evaluate potential impacts to air and water quality through the increases in truck and visitor traffic.

#### 4.4. Impacts of Diversification - Visitor Experiences

The DEIS outlines several areas where the planning area could accommodate additional trails and public access areas to improve public access in the Ranchland zone through the development of new trails, parking facilities, and third-party partnerships for interpretation. However, whereas the DEIS identifies specific subzones in which rancher diversification can occur, it does not indicate specific areas where potential new public access locations and routes could be placed or designed. As a result, diversification is prioritized over public access in the DEIS.

The DEIS highlights visitor-caused issues that include impacts from crowding and congestion, parking, ranches, trails, and trash and waste without acknowledging how these conflicts will be exacerbated by diversification. 25 The DEIS specifically notes, "visitor use will frequently conflict with ranch operations and that both visitors and ranchers understand what constitutes appropriate access. Increased use of ranchlands may also pose safety concerns related to both visitors' interaction with livestock and to ranch operations such as silage and manure spreading. 26

The concerns discussed in the DEIS present realistic concerns of potential conflicts that will arise as cumulative impacts of diversification; yet, the DEIS also continues to recommend increasing ranching operations through diversification that will only intensify these conflicts in the foreseeable future.

Once the Record of Decision has been filed, ranchers would be able to sign leases with the Seashore and develop ROAs almost immediately and initiate diversification activities and planning. While new visitor experiences, such as new trails and new educational facilities in historic buildings, could in theory also begin immediately, they likely will take much longer to come to fruition. The public engagement process, design, and review stages would take years to implement. By that time, diversified ROAs will be in place through a piecemeal approach that could prevent a network of trails or other interpretative uses in specific areas.

The DEIS prioritizes ranching activities over public use and enjoyment which is in direct contradiction to the Seashore's purpose and Fundamental Resources and Values (FRY) as established in the Seashore's Draft Foundation Document.<sup>27</sup>

FRVs include features, systems, processes, experiences, stories, scenes, sounds, smells, or other attributes that require primary consideration during planning and management processes as they are essential for achieving the purpose of the park and maintaining its significance.

NPS managers are tasked with ensuring the conservation and public enjoyment of FRY qualities to prevent deterioration that would jeopardize the park's purpose and future role. The Seashore's FRVs include: Wilderness,

Scenic and Coastal Landscapes, Marine, Estuarine, and Freshwater Environments, Diversity of Habitats and Native Species, Maritime Cultural Landscapes, Continuum of Human Use ("landscape representing more than 5,000 years of American Indian history... early cultural contacts between Coast Miwok and European explorers... two districts [Olema Valley Dairy Ranches Historic

District and Point Reyes Peninsula Dairy Ranches Historic District] that recognize more than 150 years of ranching... "28), and Opportunities for Inspiration and Recreation 29.

Diversification operations in the Seashore are in direct conflict with the FRVs of Wilderness, Scenic Landscapes, Freshwater Environments and Opportunities for Inspiration and Recreation. The continuum of human use includes recreation (hiking, fishing, photography, plain air painting, picnicking, and visiting preserved or recreated historic structures like Kule Loklo and Pierce Point Ranch). Allowing diversification as set forth in the Preferred Alternative will likely have a detrimental impact on these activities, as well as on the other FRVs.

The inclusion of diversified activities in the planning area complicates other higher priority aspects of the GMPA and makes it impossible to determine other uses and development for other FRVs until ROAs are completed.

Diversified commercial ranching activities are not a primary planning consideration of the GMPA, impacts to these activities have not been sufficiently analyzed, and these activities must not be prioritized ahead of other Seashore values and priority resources within the GMPA.

#### 5. Failure to Analyze Connected and Cumulative Impacts to Wilderness Areas

The DEIS states, "[t]he planning area for the GMP[A] includes all lands currently leased for ranching in the park as well as adjacent lands in Point Reyes where the Drakes Beach tule elk herd currently occurs. Resources outside the planning area may be described if any of the proposed alternatives could potentially affect them." 30

The DEIS is deficient in considering the impacts of ranching activities that occur within the planning area to connected resources and cumulative impacts to areas ecologically connected to the planning area, including, for example, designated wilderness areas, beaches, and wetlands. NPS Management policy 4.1 states,

"Natural resources will be managed to preserve fundamental physical and biological processes, as well as individual species, features, and plant and animal communities. The Service will not attempt to solely preserve individual species (except threatened or endangered species) or individual natural processes; rather, it will try to maintain all the components and processes of naturally evolving park ecosystems, including the natural abundance, diversity, and genetic and ecological integrity of the plant and animal species native to those ecosystems. Just as all components of a natural system will be recognized as important, natural change will also be recognized as an integral part of the functioning of natural systems. By preserving these components and processes in their natural condition, the Service will prevent resource degradation and therefore avoid any subsequent need for resource restoration<sup>31</sup>."

The DEIS incompletely identifies Resource Protection areas as they must also include wilderness protection buffers throughout the planning areas of the Seashore. Although the DEIS<sup>32</sup> provides for a new exclusion area in the Drakes Estero watershed to exclude some cattle grazing, the entire boundary of Drakes Estero is not protected from cattle encroachment. Moreover, the DEIS proposes increased uses in and near Marine Wilderness and sensitive wetland areas.

##### 5.1. Boat-In Camping, Drakes Estero Marine Wilderness

The DEIS loosely proposes boat-in camping along Schooner Bay along the shores of Drakes Estero Marine Wilderness as potential day use and overnight opportunities for "drive-in, hike-in, boat-in camping sites with limited services and amenities (several locations offer possibilities for expanding overnight camping, such as Schooner Bay near Drakes Estero or Home Ranch)." 33

The DEIS fails to analyze or propose any mitigation of impacts for boat-in camping along the shores of Drakes Estero. Proposals for camping and visitor development in areas that could impact wilderness areas must consider cumulative impacts of visitor overnight camping near marine wilderness. High visitation and overnight camping means increases in frequency and number of visitors accessing Drakes Estero, the need for installation of toilets or a program that educates and enforces appropriate human waste disposal, education and enforcement of camp fires, and establishment of trash facilities or education and enforcement for visitors to pack trash out.

The Seashore has had to close other remote boat-in camp facilities in the past along Tomales Bay, like Jack's Beach, due to negative cumulative impacts resulting from human waste and excessive trash that littered the Tomales Bay shoreline and impaired water quality and created public health issues. In addition, the lack of enforcement at remote sites also contributed to the damage of significant cultural resources of the Coast Miwok, federally recognized as the Federated Indians of Graton Rancheria.

Additionally, the introduction of boat-in camping in Drakes Estero will likely have significant negative impacts to waterfowl and shorebirds that migrate through or spend the winter in this location. NPS analyzed these impacts through an EIS, finding that impacts from human uses in Drakes Estero to estuarine birds were negative. In their submitted comments, Jules Evans, Principal at Avocet Research Associates, and John P. Kelly, PhD, Director of Conservation Science at Audubon Canyon Ranch wrote,

"Published evidence strongly suggests that estuarine birds may be seriously affected by even occasional disturbance during key parts of the feeding cycle. Fox et al. (1993) showed that American Wigeon (an abundant species in Drakes Estero) flushed from eelgrass feeding areas will abandon the area until the next tidal cycle unless the disturbance occurs early in the feeding cycle. Brant, which also feed tidally in eelgrass in Tomales Bay, display similar distributional responses (Henry 1984, Stock 1993).

Human disturbance of various types may reduce waterbird species diversity and abundance throughout the surrounding landscape of Drakes Estero and also at a broader regional scale (Boyle and Samson 1985, Rodgers and Smith 1997). Locally, increasing human use of natural areas increases incidence of disturbance and tends to disrupt foraging and social behavior of wildlife (Burger 1981, 1986, Klein 1993, Werschkul et al. 1976). Mori et al. (2001) found that distances between the position of a flush response and the disturbance source correlated positively with flock size and species diversity, and these distances were longer for waterfowl species that used open water for foraging than those that used it primarily for resting. The waters of Drakes Estero are used year-round by waterbirds for both for foraging and loafing (Shuford et al. 1989, pers. obs.)."34

Based on the level of cross-over impacts that may occur with the introduction of boat-in camping near a marine wilderness, water resources, increase in trash and pollution (including human waste), and disturbance to shorebirds; the DEIS should address these as "cumulative actions" that "when viewed with other proposed actions have cumulatively significant impacts and should therefore be discussed in the same impact statement." 40 C.F.R. §1508.25. Similar actions are actions which, "when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating their environmental consequences together, such as common timing or geography." id.

The shorelines of Drakes Estero should not be used to facilitate any camping development as part of this DEIS because the impacts to the Estero have not been analyzed.

## 5.2. Wetlands/Watershed Protection for Wilderness

The Central Coast Wetlands Group published a highly detailed study of coastal estuaries, which concludes that nearly 750,000 acres of historic tidal wetlands along the West Coast, including enormous swaths of Bay Area habitat, have disappeared largely as a result of development. The study highlights the most pristine estuary in the Bay Area is Drakes Estero, which has only lost 2.7 percent of historic tidal habitat while other Bay Area estuaries have lost 60 - 80 percent of historic areas.<sup>35</sup> In light of this study and the significance of Drakes Estero as a functional interconnected ecosystem, negative impacts to its beneficial uses of water should be fully mitigated or removed.

The DEIS notes,

"NPS programs and other sampling efforts have observed high concentrations of total suspended solids and nutrients in Drakes Bay and Drakes Estero watersheds ... Surrounding land uses such as ranches and pastures for dairies and other livestock operations contribute nutrients and sediment to Drakes Bay and Drakes Estero... Occasionally high potentially pathogenic bacteria counts have been observed in some drainages (Pawley and Lay 2013). Potentially pathogenic bacteria pollutant sources in these watersheds include storm water runoff from pasture and grazing land, sewage systems, wildlife, boat discharges in the tidal and marine environment (outside the Planning Area)." 36

The DEIS also notes, "Drakes Estero provides critical habitat for Chinook salmon<sup>37</sup> and steelhead." 38

The DEIS excludes analysis of federally listed wildlife that utilize the unique habitat of Drakes Estero stating,

"Listed marine mammals (e.g. whales, seals, sea lions, sea turtles, and abalones) may use beaches adjacent to the planning area but are not included in this analysis because ranch activities would not affect these species in the planning area ...elephant seals are found immediately adjacent to ranch lands ...however, ranch operations do not affect them.(emphasis added)"<sup>39</sup>

This analysis fails to consider the cumulative impacts of ranching activities that includes trampling, erosion, and nutrient deposits from storage and distribution of manure that flows into the creeks that drain to beaches, wetlands, and wilderness areas that are not in the planning area but are adjacent and connected by ecological functions or species movement to new areas.

The DEIS should address the

"cumulative impacts on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time."

N. Plains Res. Council, Inc. v. Surface Transp. Ed., 668 F.3d 1067, 1076 (9th Cir. 2011) (emphasis added) (quoting 40 C.F.R. §1508.7). "A cumulative impact analysis 'must be more than perfunctory; it must provide a useful analysis of the cumulative impacts of past, present, and future projects.'" Id. (quoting Kern v. U.S. Bureau of Land Mgmt., 284 F.3d 1062, 1075 (9th Cir. 2002)). "To be useful to decision makers and the public, the cumulative impact analysis must include 'some quantified or detailed information; ... general statements about possible effects and some risk do not constitute a hard look absent a justification regarding why more definitive information could not be provided.'" Id. (quoting Ocean Advocates, 402 F.3d at 868).

The shoreline of Drakes Estero should have a 100-foot buffer from development and grazing activities, to protect sensitive resources and preserve wilderness values. The impacts of boat-in camping sites along the shores of Drakes Estero are not analyzed in the DEIS. Based on the 2012 Wilderness Designation of the Estero marine system, camping site designations should be removed.

## 6. Arbitrary Selection of Reduced Ranching Areas

Alternative D proposes new programmatic guidance and a Ranchland zone that would amend the 1980 General Management Plan and reduce grazing while also actively managing a natural resource (tule elk) through culling away from leased pastures. Alternative D would reduce grazing on approximately 7,500 acres, based on ranches with grazing-only leases and ranches with minimal infrastructure. However, the selected reduction area location is arbitrary.

The standard of review of an agency's EIS decision making is governed by the Administrative Procedure Act

(APA),

"Under the APA, we may set aside an agency decision if it is 'arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law.'" *Native Ecosystems Council v. U.S. Forest Serv.*, 428 F.3d 1233, 1238 (9th Cir. 2005) (quoting 5 U.S.C. § 706(2)(A)). "Review under the arbitrary and capricious standard is narrow, and we do not substitute our judgment for that of the agency." *Lands Council v. McNair (Lands Council II)*, 537 F.3d 981,987 (9th Cir. 2008) (en banc) (alterations and internal quotation marks omitted). However, an agency's decision can be set aside if: the agency relied on factors Congress did not intend it to consider, entirely failed to consider an important aspect of the problem, or offered an explanation that runs counter to the evidence before the agency or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise. *Id.* (internal quotation marks omitted). Such actions would be "clear error[s] of judgment that would render [the agency's] action arbitrary and capricious." *Id.* at 993 (internal quotation marks omitted).

The selection criteria for reduced ranching fails entirely to consider cumulative and connected impacts with native species and foreseeable ongoing adverse impacts of changing conditions due to climate change. The Seashore's previous environmental assessments for other projects have included references to changing climate conditions as a cumulative impact, based on the potential to impact several resources.<sup>40</sup> Thus, NPS' selection of reduced ranching areas appears to be arbitrary as it fails to look at sea level rise, water quality concerns under the Clean Water Act, Endangered Species Act (ESA) protections, etc.

As noted in the 2018 Point Reyes National Seashore Sir Francis Drake Boulevard Improvement Project Supplemental Environmental Assessment /Subsequent Initial Study,

the Seashore is expected to "receive increased rainfall, more intense and frequent El Niño events, and a rise in sea surface temperature" as a result of climate change.<sup>41</sup> Climate change and sea level rise may "significantly alter coastal processes and nearshore ecosystem function."<sup>42</sup> Rising sea level is expected to cause "inundation of wetlands and estuaries... reduced nesting opportunities for birds[, and] detrimental effects on species that depend on the intertidal zone." Species currently inhabiting the park could be forced to relocate. "Changes in sea temperature could also result in...the collapse of food webs."<sup>43</sup>

Reduced ranching activities should be selected in order to reduce conflicts with and preserve and enhance habitat for natural resources. Instead, the reduced ranching criteria in the DEIS focuses on reducing impacts to financial commercial ranching operations.

The ESA defines critical habitat as,

(1) the specific areas within the geographical area occupied by the species, at the time it is listed...on which are found those physical or biological features (i) essential to the conservation of the species and (ii) that may require special management considerations or protection, and (2) specific areas outside the geographical area occupied by the species at the time it is listed...that...are essential for the conservation of the species. (16 U.S.C. 1532(5)(A)).

The selection criteria to remove areas from active ranching should be based on the best available science and legal authority and protections offered by laws such as the ESA and the Clean Water Act.

Specifically, mapping of sensitive resources and habitats that support species listed as Endangered or Threatened species including Steelhead Trout, Red Legged Frog, Western Snowy Plover, Ridgeway's Rail, and California Least Tern which are present in areas within and adjacent to the planning area should be conducted as part of the analysis of which locations ranching should be reduced in, so that NPS can be the most protective of the Seashore's protected and park resources. Decisions on management of habitats need to include connected actions that will cause impacts to resources outside the planning area.

## 7. Failure to Provide Financial Planning Analysis Necessary to Evaluate Alternative Actions

The DEIS proposes a significant change in programmatic resources management in the planning area. The total

costs to implement this plan are not available in the DEIS, thus making it difficult for the public to understand how NPS will implement this programmatic planning. The cost of implementing any of the alternatives will be substantial, and unless new funds can be identified, existing Seashore programs to protect the environment will be negatively impacted.

Pursuant to NPS Management Policies 2.3.1. specifies,

"The Park Service will maintain a general management plan for each unit of the national park system. The purpose of each general management plan, which will begin with the development of a foundation statement for the park unit, will be to ensure that the park has a clearly defined direction for resource preservation and visitor use. This basic foundation for decision-making will

be developed by an interdisciplinary team, in consultation with relevant NPS offices, other federal and state agencies, local and tribal governments, other interested parties, and the general public. The management plans will be based on full and proper use of scientific and scholarly information related to existing and potential resource conditions, visitor experiences, environmental impacts, and relative costs of alternative courses of action."44 (emphasis added)

Courts have held that agencies are not required to look the economic effects of a plan. *Ass'n of Pub. Agency Customers, Inc. v. Bonneville Power Admin.*, 126 F.3d 1158, 1186 (9th Cir. 1997); see also *City of Sausalito v. O'Neill*, 386 F.3d 1186, 1214 (9th Cir. 2004) (agency's cost-benefit analysis need not be monetary). That said, NEPA does require consideration of all of the direct and indirect effects of a plan, see 40 C.F.R. §1508.25, and the regulations expressly define the "effects" to be considered to include "ecological, aesthetic, historic, cultural, economic, social, or health" effects, 40 C.F.R. §1508.8 (emphasis added). In addition, when "economic ... and natural or physical environmental effects are interrelated," then an EIS must "discuss all of these effects on the human environment." 40 C.F.R. §1508.14.

In addition, an agency EIS cannot provide inaccurate or misleading economic information about a plan. *Nat. Res. Def Council v. U.S. Forest Serv.*, 421 F.3d 797, 811-12 (9th Cir. 2005). This is because "[i]naccurate economic information may defeat the purpose of an EIS by impairing the agency's consideration of the adverse environmental effects and by skewing the public's evaluation of the proposed agency action." *Id.* (finding agency's overestimation of revenue from plan "subverted NEPA's purpose of providing decision makers and the public with an accurate assessment of the information relevant to evaluate the ... Plan").

The DEIS fails to provide any information about the costs of the programmatic planning. This omission fails to satisfy NEPA's requirement that an EIS "ensure that agency action is fully informed and well considered." *Id.* (quotation omitted). In general, an EIS must be revised "[w]here the information in the initial EIS was so incomplete or misleading that the decisionmaker and the public could not make an informed comparison of the alternatives." *Id.* (emphasis added). Significant costs of enforcement and mitigation have been completely ignored in the DEIS, which makes it difficult for the decisionmakers and public to make an informed decision.

## 8. Management of Tule Elk

The Seashore is the only national park with a native population of tule elk. The elk have been prevalent in the Bay Area and Marin for thousands of years, long before their extirpation in the 19th century. Tule elk are considered natural resources and constitute an important part of the Seashore's ecosystem. Although tule elk are not a listed species, they are an important economic and natural resource for the Seashore that should be considered in addition to the lease /permit obligations that the Seashore holds. Removal of the Drakes Beach herd will have negative impacts to visitor experiences within the Seashore.

Any strategies to manage the elk populations should be in the context of managing resources like other natural resources within the Seashore and not for the benefit of commercial lease holders.

The GMPA should protect and manage natural resources, including tule elk, with conservation of these resources as the highest priority, as mandated by the Seashore's mission and current NPS management policies. Long-term leases and overall management strategies should strive to reduce conflicts and find non-lethal management strategies to balance and accommodate the presence of elk and cattle.

## 9. EAC is supportive of Alternative B, with Modification

EAC is supportive of Alternative B with modifications, as discussed in this letter, that strike proposed actions that are outside of the scope of the NEPA process and eliminate programs and actions from the DEIS where there was a failure to address significant impacts. This section of our letter indicates some specifics as to what should be included in a future alternative and what considerations need to be removed from a future alternative.

### 9.1. Modifications needed for Alternative B

- 1) Remove all types of diversification from DEIS consideration and programmatic planning as the DEIS does not evaluate cumulative, direct or indirect impacts, connected actions, or reasonably foreseeable outcomes of diversification.
- 2) Remove the proposed boat-in camping on the shorelines of Drakes Estero Marine Wilderness, because the DEIS fails to analyze the impacts to the Estero.
- 3) Revise development of Ranchland Zoning so that it prioritizes holistic planning areas and resource protection buffers that are connected to sensitive resources, watersheds, and wilderness areas that are within and outside of the planning area. The Ranchland Zoning also needs to consider future impacts from climate change including rising sea levels. To protect park resources these protections should be prioritized over ranching activities. Additional maps for the public should be developed that identify current restoration projects and sensitive water resources that are outside the planning area but are impacted by development within the planning area.
- 4) Impacts of climate change should be addressed as a cumulative impact as it has been analyzed in past environmental impact statements issued by the Point Reyes National Seashore. The Point Reyes National Seashore was identified in the 2018 Sea Level Rise and Storm Surge Projections for the National Park Service, as a park with potential future inundation and storm surge under four greenhouse gas emissions scenarios<sup>45</sup>. The DEIS fails to address the topic and foreseeable impacts of climate change.
- 5) Require development of ROAs to be evaluated as Resource Management Plans that consider all the foreseeable impacts on park resources before the issuance of the Final EIS. This may be accomplished with a supplemental update of the DEIS so that the current impacts of specific operations of beef and dairy ranching are analyzed and to the extent that current ranching operations impair park resources, those impairments should be cured.
- 6) To keep within the delegated authority and be consistent with the park's purpose, NPS must focus continuation of ranching on cultural and historical significance of multi-generational beef and dairy ranching in the Seashore and should not open ranching operations through competitive bidding process to the general public. Opening the Seashore to outside operators would have significant impacts on the park's cultural and historic values. The DEIS fails to analyze these impacts, and even fails to provide enough detail about the RFP process to say what the impacts may entail, or when they may occur.
- 7) Update maps to include locations of NPS and rancher restoration plans for water quality, special status species, and other important plant and animal communities. These maps need to be generated for the Seashore and should inform the development of the individual maps for Ranchland zones to inform placement of Resource Protection Zones and Pasture Zones.
- 8) Revise the reduce ranching alternative to be based on the best available science and applicable legal authority .

9) Provide the financial budget for implementation of the GMPA so that public can understand how the Seashore will implement the GMPA and ensure the plan is fully informed and well considered.<sup>45</sup> United States Department of Interior, National Park Service, Natural Resources Stewardship and Science office, Sea Level Rise and Storm Surge Projections for the National Park Service, (2018).

10) Eliminate culling of tule elk: Consistent with the park's management goals and directives, NPS management of tule elk would occur only to support other resource protection needs and management goals. New herds would be allowed to continue, regardless of geographic location if they do not move outside Point Reyes. Authorized animal units for each ranch would be adjusted as needed to meet residual dry matter goals. Resource protection is the highest value for the Seashore as intended by Congress in requiring the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area,..." 16 U.S.C. Sec. 459c (6)(a) (emphasis added).

11) Add a requirement for numeric water quality testing of surface waters (including the wilderness area and all recreational bodies of water). The best available science on water quality in, and hydrologically connected to, many parts of the planning area are outdated by as much as 20 years. While NEPA does not require the Seashore to collect data prior to issuing a DEIS, the Seashore cannot adequately monitor mitigation measures and enforce ROA terms with extremely outdated data. Consequently, the NPS must test water quality both now, and on an ongoing basis in the future. Otherwise, the DEIS mitigation terms regarding water quality are empty promises to protect public resources.

## 10. Conclusion

In sum, EAC urges NPS to adopt alternative B with modifications, as discussed in this letter, including the complete removal of all diversification. The Seashore's highest values are the protection of Wilderness, Scenic and Coastal Landscapes, Marine, Estuarine, and Freshwater Environments, Diversity of Habitats and Native Species, Maritime Cultural Landscapes, Continuum of Human Use, and Opportunities for Inspiration and Recreation. Resource protection is the highest value for the Seashore as intended by the 16 U.S.C. Sec. 459c (6)(a) where Congress elaborated on this statement by requiring the Department of the Interior to administer its Point Reyes lands "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration, and preservation of the natural environment within the area,..."

#7565

Name: Watt, Laura

Correspondence: Dear Superintendent Muldoon:

Thank you for the opportunity to provide comments on the Point Reyes National Seashore and Golden Gate National Recreation Area (PRNS/GGNRA) Draft General Management Plan (Draft GMP) Amendment and Draft Environmental Impact Statement (DEIS).

My relevant expertise includes over thirteen years as a professor of environmental history, policy, and planning at Sonoma State University, and twenty years of experience researching the history and management of PRNS, recently published by the University of California Press as a book titled *The Paradox of Preservation: Wilderness and Working Landscapes at Point Reyes National Seashore*. In addition, I have four years' experience working professionally as an environmental consultant for EDAW Inc. (now AECOM), focusing primarily on writing land management plans and EISs for federal agencies; in particular, I was project manager and primary author for the BLM's 2004 King Range National Conservation Area Resource Management Plan and EIS, which won an award for "NEPA Excellence" from the National Association of Environmental Planners. Many of the issues addressed in the King Range NCA plan are quite similar to those found at Point Reyes.

I would like to register my strong support for the continuation of ranching-both beef and dairy production-on lands managed by PRNS. As I wrote in my recent book, "The U.S. national park system contains areas that primarily aim to preserve natural scenery as well as those that primarily preserve history and cultural heritage; Point Reyes offers the suggestive possibility of protecting all types of heritage resources together as a landscape whole and including the resident users' input in management, rather than separately. The continued presence of the ranches at PRNS alludes to the strength of such a broader approach, one more based in community collaboration, with implications for how we humans might better understand nature's role in a human-built world." I still believe this current planning process is an excellent opportunity to align the Seashore's management practices with this broader, community-based approach, and yet I see little evidence of it in the Draft GMP and DEIS documents.

My view is echoed in the attached article by Rolf Diamant (Attachment 1), retired Superintendent of Frederick Law Olmsted National Historic Site and Marsh-Billings Rockefeller National Historic Park, published at the start of this planning process two years ago in the George Wright Forum.<sup>2</sup> In his essay, Diamant urges PRNS planners to "take a fresh look at ways to establish a more proactive, cooperative, and mutually beneficial relationship between ranching families and the seashore" (p. 118). He emphasizes the cultural significance of the ranching landscape, and specifically suggests longer-term leases, based on the model of Cuyahoga Valley National Park. I wholeheartedly agree with his essay, and am dismayed to not see its advice being followed in the Draft GMP and DEIS. I hope these suggestions will assist in your planning efforts as they move forward:

#### 1. Congressional Commitment to Protecting Active, Continuing Agriculture at Point Reyes

I would like to remind you of the widespread interest in and commitment to protecting agriculture within the Seashore, even among environmentalists, stemming back to the first discussions of creating PRNS. When Point Reyes National Seashore was established in 1962 it was primarily intended to provide beach access and recreation opportunities for the nearby population of the metropolitan Bay Area, even though the landscape had been in use for dairy and beef ranching since the 1850s. Initially, ranches were to be kept in private ownership, within a designated "pastoral zone." But for a variety of reasons they had all been acquired by the NPS by the early 1970s. The explicit intent of Congress in authorizing the acquisitions was that ranching activity remain part of the seashore, as stated by Senator Alan Bible, "At the time the initial authorizing legislation for Point Reyes National Seashore was enacted the federal government in effect made a promise to the ranchers in the pastoral zone that as long as they wanted to stay there, to make that use of it, they could do it. We must [now] keep our word to these people."<sup>3</sup>

I believe that these historical intentions must be kept in mind as the Seashore moves forward with its GMP Amendment process, particularly to avoid a form of "mission creep" where commitments made early on in the park unit's history are downplayed or overlooked as time goes by. I have seen suggestions recently by some members of the public that there has always been an intention to eventually remove all ranching from the Seashore; that is completely false, the original and continuing commitment to ranching is well-documented, and the GMP amendment and EIS should make that point abundantly clear. 2. Retain all existing ranches, strengthen the ranchers' ability to manage their lands, and recognize that the ranches, as eligible historic districts, are equally valuable and essential resources to PRNS as any natural resource or endangered species

Despite the long history of Congressional intention detailed above, the number of working ranches (i.e. not just the acreage of land used for grazing) within the boundaries has dwindled significantly since the Seashore was established-hence I do not support any of the alternatives that reduce or remove either dairy or beef ranching from PRNS or GGNRA lands. Both the Point Reyes Ranches and the Olema Valley Ranches have already been listed on the National Register of Historic Places as Historic Districts; this formal recognition of the ranches' importance to the overall history and sense of place at the Seashore is barely mentioned in the Draft Plan and DEIS. Removing the ranches, as proposed in Alternatives D, E, and F would irreparably destroy these historic districts, which were just formally listed last year. Furthermore, there is no recognition in any of the alternatives that historic districts protect historic land uses and practices as part of the overall cultural landscape, not just the historic structures.

The agricultural operations on PRNS and GGNRA lands represent a substantial portion of this economy, contributing 17 percent of Marin's overall agricultural production and 17 percent of its agricultural land base.<sup>4</sup> The 2007 Marin Countywide Plan lists among its core goals the protection of the area's working agricultural landscapes, and greater community food security by increasing the availability and diversity of locally-produced foods.<sup>5</sup> Grazing on these lands also provides important ecosystem services, such as managing non-native weedy species and reducing fire danger. And most of the ranching families have historic connections to the land that go back through generations, helping to anchor the overall community's sense of identity and place.

This planning effort also must give close attention to assisting the present-day ranches with remaining economically viable, so that there is no further erosion to these important cultural landscapes. One way to

increase their long-term viability would be to offer 20-year rolling leases, with automatic renewals each year that ranches remain in compliance (the NPS could retain its 30-day cancellation clause for non-compliance). This would give the ranching families, particularly the younger generations, greater security and encourage their willingness to invest in long-term maintenance of their leased properties and structures.

The GMP Amendment should also encourage re-use of ranches that have gone out of operation, like the Horick (D) Ranch, Rancho Baulines (Wilkins Ranch), and/or the Jewel Ranch, to bring them back into the overall continuing landscape of agriculture at the Seashore. In addition, establish Best Management Practices for ranching, including brush and weed control fencing, water system improvements, and variable stocking density (based on climatic factors rather than a set stocking limit), and streamline the approval process for maximum flexibility for the ranchers. NPS policies should encourage and support thoughtful and timely stewardship of the land, and particularly support management practices that can assist with carbon sequestration in the soil.

3. NPS should follow well-established international polity approach to living, continuing landscapes, as outlined UNESCO.

At the international level, world heritage management policy is increasingly articulated as the protection of both cultural and natural resources and values, emphasizing local uniqueness and community input into management. For example, UNESCO's 2009 World Heritage Cultural Landscapes: A Handbook for Conservation and Management identifies six guiding principles in its management framework:

1. People associated with the cultural landscape are the primary stakeholders for stewardship. 2. Successful management is inclusive and transparent, and governance is shaped through dialog and agreement among key stakeholders. 3. The value of the cultural landscape is based on the interaction between people and their environment; and the focus of management is on this relationship. 4. The focus of management is on guiding change to retain the values of the cultural landscape. 5. Management of cultural landscapes is integrated into a larger landscape context. 6. Successful management contributes to a sustainable society.<sup>6</sup>

I am astounded to see no mention of these guidelines in Draft GMP Amendment and DEIS; it is an embarrassment that U.S. management of cultural landscapes is so far out of step from the rest of the world. These planning documents should particularly recognize that the pastoral areas of the Seashore are "continuing landscapes," that they are not only important due to their historic influence on the land, but also due to their current-day uses and continuing influences.

4. The NPS must take PRSRA seriously as a collaborative management partner; not just an ordinary ' member of the public. "

The international policy approach to managing continuing landscapes outlined above makes clear the importance of working with local communities as primary stakeholders and management partners. In the case of PRNS, this highlights the essential importance of recognizing the Point Reyes Seashore Ranchers Association (PRSRA) as an organization that collectively represents the ranchers and their interests. These planning documents should direct Seashore staff should work collaboratively with this group to develop and maintain management of these pastoral landscapes, at a level that goes beyond just a regular member of the visiting public.

5. The NPS should establish an Advisory Committee to assist the NPS on issues of agricultural land management.

To provide additional agriculture expertise, NPS should establish a PRNS Agricultural Advisory Committee, made up of local agricultural and natural resource conservation experts including members from the local offices of the USDA Natural Resource Conservation

Service, the Marin County Resource Conservation District, the Marin County Agricultural Commissioner's Office, the University of California Cooperative Extension, and the Marin Agricultural Land Trust. This group should advise PRNS decision makers on all agricultural planning and management decisions.

6. Establish a leasing program and management arrangement similar to that already in place at Cuyahoga Valley National Park.

PRNS could easily follow the model of Cuyahoga Valley National Park (CVNP), with its Countryside Initiative bringing agricultural use back to parts of that park after decades of absence. Starting in 1999, CVNP has worked with a non-profit cooperating partner, the Countryside Conservancy, to reestablish working agriculture via rehabilitating historic farms and farmland and offering long-term leases, up to sixty years in length, via a competitive proposal process as a way of resurrecting and maintaining the rural character of the valley.<sup>7</sup>

Point Reyes could establish a similar relationship with Marin Agricultural Land Trust, which has an established track record of working well with local ranchers to conserve their lands, or some other non-profit focused on cultural landscape protection and management. The non-profit could serve as an intermediary partner, negotiating lease terms (again, ideally with rolling terms), working with ranchers to maintain land management practices, and generally buffering their tenant/landlord relationships with the NPS. It would also be essential to provide a clearer, more permanent avenue for community collaboration, viewing the ranchers and other locals as stakeholders in Seashore management and planning, distinct and separate from the general visiting public (see Point #4 above). The NPS needs to recognize that residents have a different relationship to place than visitors, and particularly that working the land, especially over generations, creates a unique connection and knowledge that should be respected and incorporated into management practices.

7. The preferred alternative should exclude tule elk from leased ranches.

Herds of tule elk are currently having significantly negative impacts on many of the working ranches and should be relocated out of the Seashore's pastoral zone entirely-including both the Drakes Beach herd and the Limantour area herd, the latter of which is not addressed by any of the alternatives. Removal via lethal means is not necessary; tule elk were transported from Tamales Point to the Limantour wilderness in 1998 via helicopter, and there is no reason this method, or transportation via livestock trailers, could not happen again.

The animals should be relocated after construction of a separation fence to keep elk in the larger Phillip Burton Wilderness, which the DEIS dismisses as not being cost-effective without adequate analysis. An elk fence could be designed and located to be only about four miles long, from the ocean's edge to the Inverness Ridge where it could end in dense vegetation, a wooded area, or at a significant drop off. A livestock fence already exists in this area, so it is readily accessible to build an elk fence, and such a fence could easily be designed to let smaller wildlife pass through while keeping the elk in the wilderness area, where they were originally intended to be. The cost of building and maintaining such a fence would be much less costly than ongoing hazing of elk, repair of ranch fences damaged by elk, and lethally removing elk from the ranching areas.

In 2015 I published an article, which I am also attaching to this comment letter (Attachment 2), that details the history of tule elk across California and specifically at PRNS.<sup>8</sup> This research clearly shows that both NPS staff and wildlife scientists have been aware since the mid-late 1990s that elk relocated to the Limantour area and allowed to "free range" would inevitably be drawn toward managed pastures and negatively impact ranching operations. The Limantour and Drakes Beach herds have become problems over the past twenty years through NPS inaction, not following the guidelines established in your own 1998 Tule Elk Management Plan. Returning both of these herds to the designated elk range near Limantour and building a separation fence to prevent them from returning to the pastoral zone will both avoid future conflicts and result in a more independent herd of elk free-ranging southward into the wilderness zone.

Furthermore, the planning documents should include a target population size for the tule elk in the wilderness area, and identify mechanisms for addressing circumstances of overpopulation. Tule elk at Point Reyes have proved to be prolific, and with almost no predators to keep their numbers in check, are likely to reproduce beyond the capacity of their environment to support them. This has already happened numerous times in the past, so to not address this possibility in the GMP Amendment seems short-sighted. I hope that these comments will assist you and your staff with developing a strong and effective vision for the historic and continuing ranching

landscapes within the Seashore and PRNS-managed areas of the GGNRA. I will of course remain engaged with the process, and am happy to offer assistance as a scholar and planning professional at any time.

Name: N/A, N/A

Correspondence: Ranchers within Point Reyes National Seashore (PRNS) and the North District of the Golden Gate National Recreation District (GGNRA) appreciate the opportunity to comment on the General Management Plan Amendment Draft Environmental Impact Statement (DEIS). This comment letter is intended to augment the DEIS comment letter sent by the Point Reyes Seashore Ranchers Association by providing more detail on some of the important topics included in the DEIS.

We look forward to the appropriate revisions in the final EIS. Sincerely,  
PRNS and GGNRA Family Ranchers

We recognize that NPS and its EIS planning contractors dedicated significant effort to produce this Draft Environmental Impact Statement and believe that the draft is generally very good. On many topics, NPS seemed to have adequately analyzed the issues and arrived at reasonable conclusions. Alternatively, on agricultural issues, some of the analysis misses important facts and therefore arrives at wrong conclusions -conclusions and restrictions that nullify what appears to be a goal - viable and sustainable dairy and beef ranches within the historic dairy and ranching districts on Point Reyes and the Olema Valley. The DEIS is written as if the Seashore is solely responsible for rangeland management in Point Reyes. There are 20 references in the document to "range management" and every one is a reference to NPS guidelines. Point Reyes and Olema Valley ranchers are experienced rangeland managers, yet key documents supporting the DEIS, including a recent Grazing Plan, were developed without consultation with the ranchers. Point Reyes ranchers have spent countless hours over the past several years attempting to engage with the Seashore's ranch-planning processes, but ranchers' expertise and knowledge have been overlooked in this DEIS.

The following targeted comments are intended to correct and improve the EIS so that ranching can persist in the planning area, ranchers can become more connected with the local community, nutrient management and grazing activities can reduce atmospheric carbon, natural resources can be protected, and visitor experience can be improved.

#### EXECUTIVE SUMMARY:

This section highlights some of the comments and recommendations of the undersigned ranching families whose livelihoods depend on continued ranching on the limited acreage of agricultural property within the Point Reyes National Seashore (PRNS) and the northern district of the Golden Gate National Recreation Area (GGNRA). We

support the varied uses and environmental value of the PRNS and the GGNRA and believe the National Park Service (NPS) has developed a draft environmental impact statement (DEIS) for the General Management Plan Amendment (GMP Amendment) that raises many of the important issues related to dairy and ranch management. However, we believe the GMP Amendment and the preferred alternative have overlooked several key issues and must be better designed to recognize the historical, cultural, social, educational, scenic, and environmental values and opportunities of the working dairies and ranches in the limited area of the PRNS and GGNRA recognized as the Point Reyes

Peninsula Dairy Ranches Historic District and the Olema Valley Dairy Ranches Historic District.

1. Establish an Advisory Committee to assist NPS on agricultural issues. To provide additional agriculture expertise, NPS should establish a PRNS Agricultural Advisory Committee, made up of local agricultural and natural resource conservation experts including a member from: the local office of the USDA Natural Resource Conservation Service, the Marin County Resource Conservation District, the Marin County Agricultural Commissioner's Office, the University of

California Cooperative Extension, and the Marin Agricultural Land Trust to advise PRNS decision makers on all agricultural planning and management decisions.

2. The Draft "Foundation Document" must be revised to recognize the existence and importance of ranching as part of PRNS. The draft Foundation Document will provide basic guidance for planning and management decisions. The draft Foundation Document is significantly deficient because it mostly fails to recognize historic and culturally important dairy and ranching. The Document contains several sections including Park Purpose, Park Significance, and Fundamental Resources and Values. All these sections should be revised to recognize that the ranches can help to perpetuate the coastal grassland ecosystem, increase environmental awareness, promote the ethic of land stewardship and sustainable agriculture, support the local foodshed, and continue to favorably influence regional trends in the way food is produced, distributed, and consumed.

3. The DEIS seriously misleads the public and distorts the no-action alternative because it assumes no limit on the population level or geographic extent of tule elk at PRNS. The current applicable plan for tule elk at PRNS is the 1998 Tule Elk Management Plan and EA. The Elk Plan "did not contemplate the expansion of elk into the ranchlands." DEIS p.5. However, the no action alternative (which is used as a reference to describe the impacts and change that would occur in other DEIS alternatives) characterizes those alternatives as a reduction in the existing population level and the wide geographic spread of elk. In fact, given that the 1998 Elk Plan did not provide for elk on ranchland, the EIS must disclose that the alternatives that allow elk on ranchland amount to a huge and significant increase in elk. The failure to accurately characterize the current Elk Plan limitation that precludes elk on ranchland, distorts the effects of the alternatives in violation of the National Environmental Policy Act (NEPA). The NPS also violated NEPA and other management direction when it failed to exclude elk from ranchlands and follow the 1998 Elk Plan.

4. The preferred alternative must have a map that clearly establishes a limit on the geographic extent of tule elk. The only map regarding tule elk is Figure 2 which shows the current extent of elk in the planning area. DEIS A-2. The preferred alternative should include a map of the location where elk are permitted. Without a map of the permitted area, resource conflicts will arise.

5. The preferred alternative should exclude elk from the ranch land. Elk should be allowed on the PRNS but the Drakes Beach herd and the Limantour herd should not be present on the limited area of the PRNS which has ranches. This is for several reasons. Over the last 20 years NPS has not figured out how to effectively separate elk from cows; it would be better for elk if they are allowed to roam undisturbed in a much larger natural habitat in the Phillip Burton Wilderness instead of being subject to harassment, hazing, and lethal removal on ranch land; the elk consumption of forage will threaten the organic certification of ranches; elk damage ranch fences; and elk consume forage that would otherwise be available to support cattle. Additionally, elk were not part of the Dairy Ranches Historic Districts.

6. A fence should be constructed to effectively separate elk between the ranches and the Phillip Burton Wilderness area. The DEIS dismisses the possibility of an elk fence to keep elk in the larger Phillip Burton Wilderness. The elk fence could be designed and located to be only about 4 miles long, to terminate on the Inverness Ridge in dense vegetation, a wooded area, or at a significant drop off. A livestock fence already exists in this area, so it is readily

accessible to build an elk fence. We believe the cost would be reasonable and, together with maintenance costs, would be much less costly than ongoing hazing, repair of ranch fences damaged by elk, and lethal removal of elk.

7. The preferred alternative must establish a population level for the maximum number of elk in the areas where elk are permitted. In addition to providing a map that delineates the location where elk will be permitted, the EIS should set the maximum number of elk allowed in the area delineated. The number will guide management decisions and determine when the herd is beyond the permitted management capacity.

8. The analysis of diversification in the DEIS is incomplete and lacks historical and regional context. The DEIS gives the public the false impression that the diversification sought by ranchers is new and expansive. The final EIS should explain that farming and ranching outside the planning area is far more diverse. In addition, within the planning area, farms and ranches historically included both irrigated and non-irrigated row crops (such as beans, peas, barley, artichokes and other vegetables), a wider variety of livestock species (such as hogs and sheep), on-farm processing and on-farm sales.

9. The limitation of row crops to 2 ½ acres, permitted only in the ranch core, prohibiting irrigation and compost, is unnecessarily restrictive and will not meet NPS goals. We appreciate the consideration of allowing ranches to diversify with some row crops. However, the limitations are so restrictive that they will not allow NPS to meet its goal for ranchers to respond to poor forage production years and fluctuations in economic markets. Only 2 ½ acres for the 24 ranching families amounts to less than 75 acres out of the 28,000 acres of ranch land. The core restriction is unreasonable because there may be more suitable soil for row crops outside the ranch core. Prohibiting irrigation severely limits crop varieties that can be grown. Pathogen free, weed-free mulch should be allowed since weed-free straw is not available inside the planning area. The baseline restriction should allow up to 75 total acres of row crops within the planning area, on suitable soils within the ranch core and pasture subzones, using organic mulch, and irrigation if excess water is available. We do not anticipate all ranches would elect to grow row crops. Interested ranchers would make proposals for this type of diversification through the Ranch Operating Agreement process with options exercised up to a 75-acre total being reached across all ranches in the planning area.

10. The diversification that allows sheep and goats is too restrictive and will not achieve NPS goals of preserving open coastal grasslands. Diversification to allow sheep and goats could be helpful since these animals reduce the fuel load and graze on brush which encroaches on grasslands threatening open vistas, wildlife habitat, and native plants. Unfortunately, in the DEIS sheep and goats are limited to the ranch core and pasture sub-zones. Management to limit brush encroachment in these subzones is already allowed such as planting, mowing, hay and silage production. These management practices are prohibited or more limited in the range subzone. NPS should provide more flexibility to allow sheep and goats to browse within the range subzone where there is a more significant threat to grassland by wildfire and brush encroachment and fewer tools available to control the brush.

11. The DEIS fails to recognize the environmental benefits of diversified farming and ranching. Diversified agriculture can provide important wildlife habitat and soil conservation benefits that should be considered in the DEIS. For example, vegetable waste from row crops can be fed to hogs and the hog manure can be composted with other organic materials to use on row crops or pastures.

12. NPS should consider educational benefits and enhanced visitor experience from diversification. We urge the Park Service to include other diversification such as minor on-farm processing, on-farm sales of products produced in the planning area, and farm tours. Small scale diversified farming will more correctly display the historic working landscapes within the historic dairy districts. This will help enhance the visitor educational and recreational experience goals stated in the DEIS Purpose and Need.

13. The beneficial impacts to soils from carbon farming was not considered. The DEIS only considers adverse impacts to soils as a result of dairying and ranching. The NPS should consider carbon farming and the ecological benefits of implementing a carbon farm plan that would improve soils, increase soil carbon, and increase organic matter to benefit water quality and air quality. The NPS should consult with the Marin Carbon Project, Carbon Cycle Institute, and Marin Resource Conservation District who have expertise in this area. There is no

justification to ignore the beneficial effects of carbon farming.

14. The DEIS incorrectly equates fertilizer to compost and prohibits both. The use of organic compost should be allowed on all ranches. The DEIS fails to understand the benefits of soil amendments and inputs on soil health. Pathogen-free and weed-free compost can improve soil fertility enhancing water retention to minimize runoff and help sequester carbon. NPS should consult with the Natural Resource Conservation Service, the Marin Resource Conservation District, and University of California Cooperative Extension Service to analyze the best nutrient management practices that can be used on both dairies and beef ranches to improve soil health.

15. Nutrient management should be allowed on beef ranches and not be limited to dairies. Dairies have more productive soils than beef ranches because dairies feed their cows nutrient rich concentrated feeds, they have more cows per unit area than allowed on beef ranches, and dairies spread manure on pastures, all increasing the fertility of the soils. The preferred alternative only allows soil fertility improvements on the pasture subzone, but soil fertility should also be allowed on the range subzone at least with compost on both dairies and beef ranches.

16. The DEIS fails to accurately assess air quality impacts from beef ranching relative to other uses of the PRNS. Since beef cattle spend most of their time on pastures and rangeland and not on bare ground and are just occasionally gathered for removal from ranch land, the DEIS conclusion that beef cattle are the primary source of dust is unsupported. The DEIS is also misleading because it concludes that ranching represents 87% of the greenhouse gas emissions while vehicle emissions from the several million seashore visitors is less than 20%. However, this DEIS ignores the emissions from vehicles as visitors drive to and from the planning area in the PRNS from wherever they originate.

17. It is unclear how the reserve account(s) would work. It is unclear whether one reserve account will be established that is available for maintenance on all the ranches or whether individual reserve accounts will be created for each ranch. It is equally unclear whether NPS would contribute to the reserve account given that NPS has not maintained the infrastructure on the ranches and if NPS should bear some financial responsibility to bring the infrastructure up to useable and safe conditions.

18. Ranch Operating Agreements should not require new NEPA review and ESA consultation every year. The DEIS states that "The ROA would be updated or reauthorized following the annual meeting." DEIS P.36. The DEIS does not define "updated" or "reauthorized." Both these terms, especially "reauthorized", indicate a new decision each year that will require NEPA review and ESA consultation. This will grind implementation of the Plan to a halt and create annual opportunities for litigation. This is not in the interest of the NPS, which has limited budgets and staff, and is not in the interest of accomplishing resource improvements, whose implementation will be repeatedly stalled. The annual meeting about the ROA and related documentation should be referred to as "implementation" of decisions previously made in the GMP Record of Decision rather than as updates or reauthorizations. Otherwise, an annual opportunity to attack and stall the decisions will be created which is not in the interest of good resource management.

19. Leases should not require lease holders to have their primary residence in the Park. Currently, not all lease holders have their primary residence in the Park, and it may not be feasible for every lease holder to have a primary residence in the Park. In the Final EIS, NPS should require that the lease holder or an immediate family member is the agricultural business owner and that the lease holder or an immediate family member is directly involved in day-to day operations. Subletting should not be allowed.

The following are the more detailed undersigned ranchers comments meant to inform the EIS process:

DEIS Exec Summary, page ii

DEIS states "strategies addressed in the EIS would not need additional compliance and may be implemented when the EIS process concludes". The ranch infrastructure and vegetation management approval process through the EIS is exactly what is needed for streamlined and fair management and will provide needed certainty without having to wait for another layer of planning. We appreciate this approach. With this approach, all environmental review (NEPA compliance) is done as a part of this process. Conversely, any future activity or use request not

analyzed during this EIS would be subject to its own potentially lengthy and costly NEPA process. During the public scoping for this process, as well as the public scoping for the halted Ranch Comprehensive Ranch Management Plan EA, ranchers set forth requests to re-establish some historic uses as well as add potentially new compatible uses on the ranches. In the DEIS, many of the suggestions have been analyzed, environmental consequences identified, and mitigation measures established. The problem is that some suggestions that were fully described in scoping have been dismissed without full analysis in the EIS. These items include: Re establish a small-scale dairy on a ranch that already has the necessary infrastructure (Grade-A milking barn, corrals, etc.) and a plan to mitigate manure and other potential impacts. Restoring historic dairying activity should not have been dismissed without consideration. The reasons given for dismissal in the DEIS are inaccurate and demonstrate why reestablishing a historic small-scale dairy and proactive and creative ways to mitigate manure and other impacts should be evaluated.

On-farm sales of products produced within the planning area, as allowed on farms throughout Marin County, was not analyzed. These activities coupled with farm tours could improve visitor experience and education as scoping letters described. All the benefits of these activities would far outweigh any minimal adverse effects and they should be fully analyzed prior to the release of the Final EIS. The effects of these activities are already covered in this DEIS - these effects should be considered in the context of on-farm sales and tours so that implementation could be allowed when the EIS process concludes, rather than requiring a new process after the fact to adopt on-farm sales and farm tours.

Many of the errors and omissions in the DEIS that result in misleading conclusions appear to be the result of having a lack of agricultural experience on the EIS team. The deficiency of agricultural expertise at PRNS has long been recognized by both ranchers and the community. Given this history, scoping from ranchers, public agencies, NGOs, industry groups and the general public suggested an Agriculture Advisory Committee to solve the problem of the lack of PRNS agriculture expertise. This suggestion was widely supported across varied commenters.

The scoping comments requested that this EIS process fully evaluate the benefit of establishing an agricultural advisory committee. Many commenters included this language:

"Establish an PRNS Agricultural Advisory Committee, made up of local agricultural and natural resource conservation experts including a member from each: The local office of the USDA Natural Resource Conservation Service, the Marin County Resource Conservation District, the Marin County Agricultural Commissioner's Office, the University of California Cooperative Extension and the Marin Agricultural Land Trust, to advise seashore decision makers on all agricultural planning and management decisions. "

The occasional and informal contacts made by NPS with those having agricultural expertise is insufficient and we strongly support a formal Agricultural Advisory Committee. If NPS does not want to establish an "advisory committee" under the Federal Advisory Committee Act, then there should be at least a diverse agricultural "advisory group" that NPS regularly consults with about agricultural issues. Including more competent agricultural issue advisors to the NPS decision making process would result in better decisions and more favorable environmental effects. This suggestion was made repeatedly by many diverse members of the public, and is directly related to management of agricultural lands, a key purpose of the EIS. However, the DEIS did not identify any reasons for dismissing this suggestion from analysis. The EIS must be corrected by including this topic as raised during the scoping process. In reading the DEIS, had the NPS included experienced agricultural and resource advisors, it is clear that conclusions and impacts of the plan on the human environment would be different - and in most cases, showing reduced adverse effects and increased positive effects.

## Chapter 1, Purpose and Need for Action

The DEIS says in the executive summary (page 4): "In 2013, at the direction of the Secretary of the Interior, the NPS Director [John Jarvis] issued a Delegation of Authority authorizing lease/permit terms for up to 20 years and directing NPS to initiate a National Environmental Policy Act (NEPA) process to evaluate the issuance of long-term leases."

There is no mention of a NEPA process in either the Salazar directive or the Jarvis delegation of authority. The reason that NPS decided to initiate a NEPA process following the directive to renew leases for the same use that has been ongoing for over 150 years is still unknown to the public. This EIS is misleading and must be corrected so that the actual reason for this EIS process is known to the public. A GMP update is overdue and attempts have been made to update the plan. This EIS should explain the important history, including the attempt to update the GMP by NEPA analysis beginning in 1998, and the later attempt to update the GMP by re initiating an EIS in 2003. This EIS must explain what happened to these attempts and why, after years of public involvement and years of NPS effort at significant cost to the taxpayer, the efforts

were aborted. This EIS should fully evaluate and present to the public an answer as to why the planning area is now limited to ranch land and not the rest of the seashore as was the case in previous efforts. If breaking GMP updates into sections is the new NPS process, why did the NPS start with the ranch lands? As presented, the public does not understand why and how this process is under way. The EIS must be revised to make this clear.

#### Point Reyes National Seashore July 2019 DRAFT Foundation Document

The NPS explains that the Foundation Document will "provide basic guidance for planning and management decisions—a foundation for planning and management." Draft Foundation Document p.2. The draft Foundation Document is significantly deficient because it fails to recognize historic and culturally important dairy and ranching. The section, "Brief Description of the Park" mentions the Drakes Bay Historic and Archaeological District and discusses many historic features of the PRNS but not once does the section recognize the Point Reyes Peninsula Dairy Ranches Historic District and the Olema Valley Dairy Ranches Historic District. That significant omission must be corrected. In contrast, the Cuyahoga Valley National Park Foundation Document's Description of the Park states that on some lands there is a "focus on the preservation of rural landscape while encouraging modern sustainable farming methods appropriate for a national park. Nearly a dozen of the farms, including historic buildings and associated lands, are managed to ensure continued agricultural use through long-term leasing under this program." Cuyahoga Foundation Statement p.5. The PRNS's Foundation Statement "Description of the Park" should include a similar statement.

The Park Purpose also does not reflect the role of dairying and ranching. The Foundation Document explains that the Park Purpose was derived through an analysis of enabling legislation and legislative history. Foundation Document p.3. Congress in the Conference Report for the Act "Making Further Continuing Appropriations For The Department Of Homeland Security For Fiscal Year 2019, And For Other Purposes" stated that "The Conferees note that multi generational ranching and dairying is important both ecologically and economically for the Point Reyes National Seashore and the surrounding community. These historic activities are also fully consistent with Congress's intent for the management of Point Reyes National Seashore." Conf. Rep. 116-9 at 720. In addition, H.R. 6687 also recognized the importance of dairies and ranches to the Seashore.

Unfortunately, the draft Park Purpose statement does not recognize the cultural, historical, scenic, and natural value of dairying and ranching in the PRNS. The draft Park Purpose is:

Established for public benefit and inspiration, the Point Reyes National Seashore protects a rugged and wild coastal peninsula and surrounding waters, connecting native ecosystems, enduring human history, and recreational, scientific, and educational opportunities. Foundation Document p.3.

The Park Purpose Statement should be revised to read:

Established for public benefit and inspiration, the Point Reyes National Seashore protects a rugged and wild coastal peninsula and surrounding waters, connecting native ecosystems, maintaining working landscapes, enduring human history of resource use, and recreational, scientific, and educational opportunities.

Alternatively, the Park Purpose Statement should incorporate the language of H.R. 6687:

Established for public benefit and inspiration, the Point Reyes National Seashore protects a rugged and wild coastal peninsula and surrounding waters, connecting native ecosystems, enduring human history, and

recreational, scientific, and educational opportunities. Consistent with Congress' long-standing intent, working dairies and ranches shall continue to be authorized to operate on agricultural property as part of the seashore's unique historic, cultural, scenic and natural values.

Next, the Foundation Document has a section entitled "Park Significance." There is only one bullet point on ranching that merely states that ranching occurs on the PNRS but fails to mention anything about its significance. It should be revised to read as follows:

The productive coastal grassland ecosystem supported by the fog-driven climate of the Point Reyes Peninsula was the basis for development of the area's historic dairy and beef ranch tradition. These Park ranches can help to perpetuate the coastal grassland ecosystem, increase environmental awareness, promote the ethic of land stewardship and sustainable agriculture, support the local foodshed, and continue to favorably influence regional trends in the way food is produced, distributed, and consumed.

The Foundation Document then has a section entitled "Fundamental Resources and Values." There is a paragraph on Scenic Coastal Landscapes that should recognize the unique coastal grasslands that are largely maintained by the ranchers whose livestock keep the brush down to maintain the grasslands. The Scenic Coastal Landscapes paragraph should be revised to read:

Scenic Coastal Landscapes. Shaped by ongoing geologic processes, marine weather, and human influence, the Point Reyes Peninsula juts 10 miles into the Pacific Ocean and encompasses more than 80 miles of wild beaches, dramatic cliffs, coastal grasslands, and detached coastal formations. Point Reyes National Seashore offers opportunities to observe and understand the interaction of land and sea from many perspectives, including geology, ecological disturbance, working landscapes, and climate change.

Additionally, the Foundation Document's "Agricultural and Rural Landscapes" section should be revised to read:

Agricultural and Rural Landscapes. The Point Reyes National Seashore has a rich agricultural heritage. These landscapes are preserved and protected in a zone of active,

ecologically sustainable ranches. Agriculture within Point Reyes National Seashore will continue to influence regional trends in the way food is produced, distributed, and consumed.

The final section of the Foundation Document is "Interpretive Themes." There is absolutely no mention of historic ranching and its role at PRNS in the interpretive themes. Additional paragraphs should be added to the interpretive themes like the Cuyahoga National Park Foundation's Document to recognize human influence and agriculture as follows:

The diverse array of natural, historical, and cultural resources in the Point Reyes National Seashore offer an interpretive opportunity and lessons of adaptability, ingenuity, and interdependence to illustrate trends in many disciplines including sustainability, ecology, and agriculture.

There is an opportunity for interpretation of cultural, historical, and natural interplay. The wide variety of cultural, historical, and natural resources in the Point Reyes National Seashore exists singly but also meld into a mosaic of pastoral landscapes that were created and continue to be transformed by the interplay of geologic, ecologic, and human influences. Understanding human interaction with the environment from American Indian to current ranching can serve to inspire and encourage discussion of land stewardship.

#### Diversification

On the DEIS page 20, under Diversification, NPS states: "Diversification of ranching activities allows ranchers to react to poor forage production years and fluctuations in the economic market." This statement would lead the reader to believe that the minor diversification activities allowed under this plan would help to achieve this goal. Two and one-half acres of row crops would not achieve this goal. What is missing from this analysis, and should be included, are the following:

1. Historic context in the planning area. This analysis, to be clear to the public, should include the full history of irrigated and non-irrigated row crop production in the planning area that included thousands of acres beans, peas, barley, artichokes and other vegetables. Also documented on these ranches were large numbers of other livestock species, including hogs, sheep and others. The historic time frame of these activities is the exact same time frame of the Historic Dairy Districts the NPS is entrusted to protect and, therefore, these activities are fully appropriate. By ignoring the history and cultural significance of row crops, the public is misled into believing that these diversification activities would be "new". With the historic context, the public would understand that by allowing these "diversification" activities, the NPS would be supporting the restoration of the historic use of the planning area.

2. Regional context of the planning area. The planning area is located within Marin County and represents nearly 20% of Marin County's agricultural land and nearly 20% of Marin County's agricultural production. Due to economic pressures, environmental pressures, changing markets, etc., Marin County supports the ranchers and farmers by streamlining permits and approvals for diversification activities, on-farm processing and on-farm sales. Ranchers within the planning area may not be able to compete with their counterparts outside the planning area. This difference could be eliminated if the EIS includes a full analysis of these activities and how the outcome of this plan compares with the uses permitted on other farm and ranch land in the region.

3. Two and one-half acres of row crops, where irrigation is prohibited, and permitted only in the ranch core (regardless of soil quality) does not meet the NPS stated goals or description of diversification "to react to poor forage production years and fluctuations in the economic market." By using this diversification descriptor, the public is misled into believing that an economic analysis was conducted to arrive at 2-1/2 acres. There is no such analysis in the DEIS and the economics must be evaluated. A full analysis will find that 2-1/2 acres of dry-farmed row crops has little economic value and in fact, with these unexplained strict limitations, would offer little help -if any- -to the ranchers.

4. Agricultural expertise is absent in the analysis of diversification, including row crops. Any expectation by the EIS team that 2-1/2 acres of dry-farmed row crops in the ranch core, coupled with the other restrictions, would make growing row crops on 2-1/2 acres economically viable is wrong. By ignoring an economic analysis, the public is misled. By applying the onerous restrictions not found on other farms, it is clear no one experienced in sustainable, organic row crop production was consulted. This EIS must be corrected by allowing an experienced team to review the scale and conditions of the diversification activities. The team may include members of the Marin Resource Conservation District to ensure natural resource protection, the University of California Cooperative Extension Service with hands-on experience with small-scale, organic farming activities and the economic data regarding these activities, The Marin County Agricultural Commissioner who can oversee Integrated Pest Management, the Natural Resources Conservation Service where soil, soil quality, soil health and erosion avoidance experts and a historian can help define historically appropriate activities within the planning area.

5. No reason or rationale is given in the DEIS to support the extremely limited size or scope of the diversification activities. Although no explanation is provided in the document, a member of the NPS EIS team was asked, at the open meeting at the West Marin School on August 27, 2019, "Why is NPS planning to limit row crops to 2-1/2 acres?" The NPS employee stated that "We did not want to allow a diversification activity that would make more money than the principally authorized use- dairy or beef". If this was a plan objective, it should be written so that the public is aware. If this is a plan objective, it will require expert agricultural consultants to do an economic analysis. Limiting economic return from diversification should not be a plan objective. If this is a plan objective, which it is according to the NPS employee, the NPS must analyze and explain why it is important to limit ranchers' ability to produce income. Moreover, the economic return from diversification that could help provide ranchers with funds to invest in infrastructure repair and maintenance should be included in the analysis.

6. Community context is absent in the analysis. Historically, the ranches within the planning area were very diversified. History shows many dairy, meat and vegetable products were produced, processed and sent to local markets - feeding the local communities. Post-World War II, ranches in the planning area lost most of their diversification and became cow-centered. Milk and beef were then shipped to distant markets, including out-of-

state markets and feed began to be imported from distant sources, including out-of-state sources. It was at this time, around the time when the Point Reyes National Seashore was created, the ranchers began to lose their connection with the local communities and the local food system. Much of Marin County's agriculture has begun to restore that connection through diversification of farm products that can be processed and sold locally. The ranchers have asked the NPS to allow the restoration of parts of this local, sustainable model in the planning area. The EIS must consider the value to both the rancher and to the local community to restore the food connections. The analysis must include analysis of the benefit of local food security, food safety, and the improved relationship between the NPS and its gateway communities.

7. Environmental consequences evaluated are one-sided. The DEIS goes into some detail about the adverse effects but does not evaluate the environmental benefit of diversified farming and ranching. Small diversified agricultural units can add important wildlife habitat and soil conservation compared to single use agriculture units. A systems approach to agricultural production in the planning area could allow, for example, vegetable waste from the row crops being fed to hogs and the hog manure being composted on farm with other organic materials for use on the row crops or on pastures, which leads to reduced transportation and increased carbon sequestration. Allowing a ranch to diversify will likely result in a reduction of adverse environmental consequences of the ranches within the seashore. The EIS does not consider this important issue of beneficial environmental impacts from diversification and must fully address these environmental consequences before the final EIS is released.

8. Enhanced visitor experience and education benefits from diversification are ignored. The Purpose and Need for this analysis has two goals: A) "Visitors have opportunities for diverse educational and learning experiences."; and B) "Visitors have opportunities to enjoy expanded connections and greater access to diverse recreation." Keep in mind that the visitor experience in this DEIS is limited to the working landscapes in the planning area. This DEIS did not analyze how diversification, as clearly requested through scoping, would help the NPS meet these goals. Some ranchers have requested the authority to diversify their farm products, do some minor on-farm processing in existing infrastructure, have some on-farm sales of products produced within the planning area and offer farm tours to the visiting public. Currently, NPS has very little visitor interpretation of the historic ranching areas so the public is being denied an opportunity to enjoy and learn about this historic and cultural resource. The visiting public could learn about the row crops and other farm and ranch activities, learn the history of the area, learn about how food production and natural resource conservation can be complimentary and could leave with a taste of the seashore products. This EIS must fully analyze the benefits to the visiting public, including the fact that the benefit would come with NPS oversight and at little cost to the taxpayer.

9. The ranch core may not be the most appropriate site for row crops. This DEIS would limit row crops to the ranch core or adjacent to the ranch core. It may be, on some ranches, that the ranch core is not where the most appropriate soil conditions exist for row crops. An allowance should be evaluated for circumstances where a different siting of row crops is appropriate.

10. Irrigation of row crops is prohibited under the DEIS. It is an unusual challenge to dry farm row crops. Because of the typical 6-month annual drought, most row crops in the region are irrigated. This planning area restriction would make any successful row crops in the planning area highly unlikely. It would also increase the cost of production, making it difficult to compete with other local producers in the region located outside the planning area. No data or analyses were provided in the DEIS to support the prohibition on irrigation. This DEIS, before simply prohibiting what has been an ongoing use, must evaluate the consequences of the decision. There have been no conflicts or significant environmental impacts from existing irrigated row crops identified. The EIS must evaluate allowing reasonable water use irrigation techniques, like drip irrigation, when the ranchers can demonstrate that they have the necessary water available. Irrigation systems can be permanent, underground systems or temporary, above ground piping systems. Both should be analyzed in this EIS.

11. Available organic mulches would be prohibited in the current DEIS. In appendix D, page 54, regarding row crops, NPS says: "Use straw mulch (2 tons per acre) in areas where crop residue or cover crops are not present in the spring or late fall and use certified weed-free straw if purchased from outside the park or from a different ranch." Other organic, weed-free mulches should be allowed. Weed free straw is not available from inside the planning area. Certified organic, weed free

straw is almost impossible to find. Available weed free straw is usually weed free because of herbicide use and therefore cannot be used on certified organic farms. Alternatively, excellent weed free, organic mulches, perfectly suited for this use, are locally available. Furthermore, on-farm composting activities are planned within the planning area, have been evaluated in this EIS and may be started soon on one or more ranches within the planning area. Because both compost and mulches are necessary for organic row crops, ranchers within the planning area should be allowed to produce compost and mulches, sell compost and mulches to other ranchers within the planning area and all ranchers in the planning area should be allowed to use both mulches and compost from sources within or outside the planning area.

12. On Page 37, NPS states: "Existing diversification activities on ranches would be authorized consistent with the guidance under alternative B." This statement is unclear. Does this mean that existing diversification activities can continue? Or does this mean that existing diversification activities, if inconsistent with the new rules in alternative B, would have to cease or be restricted? This EIS must make it clear that any irrigated row crop areas present in the planning area before this planning process began can remain. There has been no record of problems created by the existing row crops. Therefore, the irrigated row crop production should continue - just as was decided in the DEIS for the preexisting use of land producing silage. The DEIS is unclear on this point and should be clarified that the new restrictions apply only to new row crop areas.

Small scale, organic row crop production as practiced throughout the region has the potential to add economic value to the ranch/farm operations. While the NPS does properly describe some of reasons for the purpose of diversification - a way to help ranchers and farmers survive through changing economics, changing markets, changing climate, and other challenges - unfortunately, this DEIS has failed in its analyses. Although all the twelve points above were raised during scoping, the results and restrictions in this DEIS prohibit any meaningful production and the analyses need to be corrected. The diversification sections of the DEIS, including row crops, is incomplete and, therefore, misleads the public.

The analysis and outcome of the row crop analysis can be greatly improved. Early in the EIS process and during formal scoping, the NPS asked the ranchers to include the types and scale of the activities that they would like authorized through this process. In the DEIS, NPS failed to identify how many acres of row crops have thus far been requested by the ranchers. In our reading of the scoping comments, only some of the ranchers are interested in row crops. The largest request is for 30 acres. Less than 50 acres, overall, have been requested. This acreage represents only a small fraction of the 28,000-acre planning area and is only a very small percentage of the thousands of acres previously farmed for row crops in the planning area. It also represents fewer acres than the 75 acres authorized as the DEIS is written. In the DEIS, NPS is suggesting a 2-1/2-acre maximum on about 30 ranches or so, totaling a maximum of about 75 acres. Knowing that most ranchers will not elect to grow row crops, the DEIS must evaluate a total acreage for the planning area. If NPS has objective and supported reasons to allow a maximum of 75 acres or so in the planning area, an overall planning area limit could be set at 75. With a full analysis of all the impact topics as described above, perhaps more than the 75 acres could be authorized. This would allow the few interested ranchers to create a viable row crop component in their ranch plan while keeping within the total planning area authorized acreage.

Some ranchers have asked NPS for authorization to raise some small ruminant livestock, including goats and sheep. Scoping comments detailed the reasons that these livestock would be useful to the rancher and the natural resources of the planning area. Goals of the plan include keeping open vistas for the visiting public, preserving open coastal grasslands because of the assemblages of native plants and wildlife that depend on open grassland and preserving the cultural landscapes that include the working ranches and open grassland. Preserving grassland requires management. Without management, brush encroaches, and open grassland is lost. NPS agrees with the threat posed by brush encroachment described in the DEIS. Historically, ranchers used prescribed burning to help control brush and recently, mowing is the tool most widely used. Ranchers are now asking for the authority to use these small ruminants, known to be capable and efficient browsers, to help control the brush. The NPS analyzed this request and decided to allow up to 10% of the annual AUM usage to be used by these ruminants. The problem with the DEIS conclusions, as shown in Appendix D, page 15, under 3.2.12 Diversification, 3.12.1 and 3.12.2, is that NPS restricts sheep and goats to be limited only to the ranch core subzone and the pasture subzone. As described in this DEIS, pasture subzones are areas that are generally highly managed grassland where

planting, mowing, crop production, hay and silage production and other activities have been the historic use. There is generally less brush to manage in the pasture subzone and more tools available to control the brush. The range land subzone is where the more significant threat to grassland by brush encroachment exists. To support a sustainable, non-mechanical option to brush control, NPS should fully analyze where this livestock brush control can be most useful and modify the EIS so that these small ruminants can also browse within the range land subzone within the planning area.

## Tule Elk

Executive Summary, Page i, DEIS Page 5, Paragraph 1, NPS says:

"Two separate free-ranging tule elk herds occur within the planning area-Drakes Beach herd and the Limantour herd." Tule elk, the smallest subspecies of North American elk, live only in California. Tule elk were extirpated from Point Reyes by the 1860s.

Consistent with Congressional direction, 10 tule elk were successfully reintroduced to a 2,600-acre fenced wilderness reserve on Tomales Point in 1978. The 1998 Tule Elk Management Plan/Environmental Assessment established a free-ranging herd near Limantour Beach beginning with 28 animals in 1999 with an interim management limit of 250 to 350 elk and did not contemplate the expansion of tule elk into the ranchlands. At the end of 2018, the Drakes Beach herd consisted of an estimated 124 total animals and the Limantour herd consisted of an estimated 174 total animals (NPS, Press, pers. comm. 2019c)."

The 1998 Tule Elk Management Plan and Environmental Assessment did in fact consider what would happen if the tule elk were allowed onto the ranch lands. The EA evaluated the impacts to ranchers' private property, the impact to forages availability, the impacts of spreading Johne's disease to ranchers' livestock and the impacts to both elk and cattle from other communicable diseases that can be shared between the species. Furthermore, one of the alternatives rejected in the 1998 EA was to allow the elk to roam on the ranch lands. The 1998 EA and Elk Management Plan directed NPS to move a portion of the Tomales Point herd to a Designated Elk Range, clearly delineated with a map and fully within the Limantour wilderness. The document also includes language that the tule elk would not change any other permitted use. For example, the 1998 EA explained the area chosen for the Limantour herd would be "a large area in natural zones with buffers from major highways, ranches, and lands outside the Seashore." 1998 EA P. 46. The current, operative plan, created in 1998, clearly did contemplate elk impacts to ranch lands, consider the impacts, select an alternative to move the elk into only the wilderness area and put in specific management language to ensure that the elk would not affect the ranching permittees (a permitted use). Because of these safeguards to protect ranchers and the elk, ranchers and the general public supported the preferred alternative and plan.

NPS made it clear, in 2001, only 3 years after the 1998 EA and Elk Management Plan was completed, that NPS understood the plan and understood its responsibilities. In an NPS publication entitled "Point Reyes National Seashore, 2001, A Year in Review", the NPS stated:

"Since their release, the new herd has been carefully monitored to ensure animals remain inside seashore boundaries, do not interfere with cattle ranches within the park and are not shedding the organism that causes Johne's Disease." (document attached)

This statement was made at a time when the staff at PRNS knew the plan and were following the plan. Furthermore, around this time, the NPS staff shot and killed elk that came onto the PRNS ranch lands.

In violation of the 1998 Elk Plan, the NPS later allowed elk to enter the ranch lands, after which the very conflicts with livestock and ranching, and the negative impacts to elk, as evaluated in the 1998 plan, began to occur at Point Reyes. Since then, for over more than a decade, dozens of letters from seashore ranchers to PRNS and meetings with PRNS staff objecting to the management reversal have gone unanswered. The DEIS is incorrect and misleading to tell the public that the current plan did not contemplate the expansion of tule elk into the ranchlands. It is also misleading to entirely omit from this DEIS the Designated Elk Range that was agreed upon in 1998. The public reading this DEIS would have no idea about many important facts about the tule elk management. As this NEPA review is to update the 1998 plan, the 1998 plan should be fully presented to the

public. The NPS has distorted the no action alternative. As presented in this DEIS, the NPS is simply calling the recent condition the baseline, when the actual baseline, for 150 years, was no elk on ranch lands. If the tule elk were managed pursuant to the valid 1998 plan, the baseline would have been unchanged. It is unacceptable for this EIS to redefine the baseline by hiding the history and presenting the recent elk locations in a way that attempts to validate the newly changed condition. The harm caused to ranchers by elk and the new impact to elk by hazing and exposure to diseases are results of the NPS failure to manage the elk pursuant to its own 1998 Elk Plan. The 1998 plan gave assurances that other permitted uses were not to be altered by elk, and therefore, the baseline and no action alternative must be corrected.

The elk components of the preferred alternative in this DEIS are unworkable for several reasons. The ineffective provisions to separate elk from the ranches in the preferred alternative will lead to the loss of organic certifications as elk consume quality forage on the ranches. The elk herds will also continue to expand and limit ranching and available AUMs, essentially making the preferred alternative a reduced ranching alternative. The NPS needs to adopt a preferred alternative that will allow for sustained ranching in the historic ranch districts by removing the Drakes Beach herd, limiting the expansion of the Limantour herd to exclude ranchland in the Historic District, and using management tools to effectively separate elk from the ranches so that elk reside in the natural areas of the Seashore.

There is no map of the elk range that will be established under the preferred alternative. The Final EIS and Record of Decision should include a map (like the proposed elk range map on page 48 of the 1998 Elk Plan) of the area where the herd will be located in the preferred alternative. The DEIS includes Appendix Page A-2 showing the "Existing Range of Tule Elk in the Planning Area." However, there is no map of where elk will be permitted in the preferred alternative.

The area where elk will be allowed to range in the preferred alternative must exclude historic ranch land in the Point Reyes Peninsula Dairy Ranches Historic District and the Limantour herd should be limited to the Phillip Burton Wilderness.

The Final EIS and Record of Decision should set a limit on the size of the elk herd. If the decision only includes a map of where the elk range is located without including a herd size limit, the population can expand outside or within that area causing resource conflicts and damage. The public, the ranchers, and NPS should know what the established capacity size limit is for the number of elk.

The Final EIS and Record of Decision should include required and effective management actions to remove elk that go beyond clearly identified boundaries and to reduce the size of the elk herd if it exceeds the herd size limit.

1. As written, NPS would allow 120 elk to remain in the Drakes Beach herd which would cause significant problems.

a. The NPS suggests that hazing has been effective to keep elk off ranchers' pastures. It is not effective. NPS staff, during normal working hours, chase the elk, often in circles with no success at all. Other times, staff force elk to cross fences with damage to fences and to elk. Elk usually feed in the mornings and the evenings. When the NPS staff is not around, elk are consuming pasture and imported cattle feed paid for by the ranchers.

b. Forage enhancement and water development on the D Ranch does little to encourage the elk to stay off the ranch pastures. The elk continuously feed on ranchers' pastures.

c. NPS refers to the elk as "free ranging", yet in this DEIS, NPS would force the elk to stay on the C Ranch and portions of the B and D Ranches. Any elk leaving this defined area would be the first to be shot. This suggested plan more closely resembles a fenced-in herd in a small area (under 1500 acres or so) rather than a free-range herd.

d. This proposed plan would further domesticate what should be wildlife. Constant hazing, driving the elk through fencing, allowing elk to eat alfalfa hay out of ranchers' feed troughs, not allowing the elk to roam, etc. are not indicative of "wildlife". Scoping indicated these elk concerns would be addressed, yet this

DEIS does not evaluate the short term or long-term adverse effects of constant human interaction with the elk.  
e. The proposed plan as described in the DEIS would require constant, daily management into perpetuity. This would be very expensive and there would be no end to the expenditures.

f. The current 1998 plan was not followed by NPS and that is why there is a problem on the ranches today. If recent history is any guide and if elk are left within the ranch lands, damage to ranchers' livestock and property will only get worse.

Describing why this problem should never have happened and how this newly proposed plan will not work does not really solve the problem. During scoping, ranchers and other members of the public provided ideas to remedy the existing problem. Ranchers have never asked that the elk be lethally culled. Ranchers have only asked that NPS follow the existing plan to keep elk off the ranch lands, or ranchers will go out of business. How to keep the elk where they belong is the NPS responsibility, but ranchers can help by making suggestions. One of the most obvious and appropriate solutions proposed during scoping is a fence along the border of the wilderness area and the ranch lands. Before fully evaluating a fence, NPS decided to dismiss this idea. The NPS reasons for dismissal are precisely the effects that NPS should have considered in the DEIS rather than dismiss. The excuses given for dismissal of a fence are not justified as explained below:

### Topics NPS Dismissed from Analysis

#### 1. Fencing Elk into Specific Locations

a. The title "Fencing Elk into Specific Locations" is misleading. A fence along the border of the wilderness and the Ranch Lands as suggested would not be confining elk into a specific location. It would accomplish exactly what the 1998 plan expected to exclude elk from ranch lands and what NPS tried to enforce, at least until 2001. Two-thirds of PRNS equal tens of thousands of acres of open space and wilderness where the elk are supposed to be and where the Designated Elk Range is located. The "Fencing Elk into Specific Locations" title could lead the public into believing there is an attempt to confine the elk into a small range, like Tamales Point. It clearly is not. The fence would simply keep the elk off the ranch lands so that the historic family farms could continue operating.

b. High cost of construction and maintenance. The proposed fence is only about 4 miles long. During scoping, ranchers analyzed the cost and the cost seemed reasonable. If constructed properly and with the proper materials, the maintenance would be low. This NEPA process should analyze the cost of the fence and maintenance to compare and contrast it with the cost of ongoing hazing, repairing existing ranch fences damaged by elk, shooting elk to maintain

populations and all the other controls necessary to keep the elk on the ranch land

- significant daily costs to the public that would be necessary into perpetuity.

c. Ineffectiveness and impacts on other wildlife. Fencing design should be considered and evaluated before simply dismissing the idea of a fence. Certainly, there are fences that can be effective for elk. They exist elsewhere. Why make an automatic assumption that an elk fence will have impacts on other wildlife? Elk are the largest animal to keep on one side. Why can't a fence be designed to allow smaller wildlife to pass through? Fencing and wildlife experts should be invited to participate in the analysis to design a fence that is effective in preventing elk passage and reduces impacts or barrier to smaller wildlife.

d. Visitor experience and wilderness values. Firstly, the location of the fence proposed by the ranchers, along the border of the wilderness area, is mostly out of sight to the visiting public. It is largely surrounded by brush and therefore largely out of view. Visitors would still be able to view elk at PRNS regardless of whether there is a fence or not. A livestock fence already exists on the border of the ranch land and the wilderness area. A slightly taller fence would seem to have little impact on the visiting public or wilderness values.

e. Based on the terrain, the fencing would be costly. A livestock fence already exists in the location of much of this fence, and it is accessible. The areas where new fencing is necessary was described as the most accessible location for the fence. This EIS should not have simply dismissed building a fence to separate elk from ranch land because of difficult terrain. The existing Tamales Point elk fence occupies much more difficult terrain and the NPS put that fence there. This EIS should include a thorough analysis of our comments of why a fence is feasible and we support a fence at the wilderness boundary as part of the preferred alternative.

f. The fence would not be a full enclosure fence. This observation is correct, and a complete analysis was not made

in the DEIS to determine if this would be a problem or a benefit. The fence would go from the water of Limantour Estero (like the Tamales Point elk fence that terminates at the water) and end in the wooded area on the Inverness Ridge, an area not currently visited at all by the elk (map attached). An ending location on the ridge could be chosen to discourage elk from going around the end of the fence. This could be dense vegetation, a significant drop off, etc. This needs to be fully analyzed. It should be noted that none of the Inverness Ridge is currently fenced and the elk do not pass this natural barrier. Limiting the fence distance by stopping at the ridge would accomplish the objective of protecting the elk from NPS hazing and other harassment on the ranch lands and would allow elk to free range in a natural setting without a full enclosure fence. If there is a concern that the elk could change their typical movement patterns and begin to move up to the ridge and potentially go around the end of the fence, monitoring this location to prevent this unlikely event would cost only a fraction of what is being spent to daily monitor, haze and kill excess elk on ranch lands and would be far less disruptive to the elk.

During scoping the public also suggested that the NPS evaluate complete removal of elk from the ranch lands, and to manage elk as directed in the 1998 Elk EA and Management Plan.

Instead of evaluating an obvious solution to the ongoing problems caused by the recent introduction and expansion of tule elk on ranch lands, the NPS dismissed the suggestion and did not analyze the benefits of removal. Many of the benefits of removing the elk from the ranch lands are described above. The reasons NPS used to dismiss removal of elk have little merit as described below..

1. NPS states "Based on preliminary forage model results, the roughly 50 elk that move onto ranch lands from the Limantour herd do not affect the forage availability or RDM for ranches in that area." Simply put, the only way NPS could be accurate with this statement is if elk did not consume any forage at all. The fact is that elk eat the same forages that cattle consume and therefore absolutely do affect forage availability and RDM- no matter what the NPS' theoretical model tells NPS. When elk eat the forage on the ranch lands, ranchers, in order to meet their RDM requirements, must either reduce cattle stocking rates or import more feed for the cattle. Both solutions are direct costs to ranchers, and, in at least two cases in the planning area, are already threatening the economic survival of the ranchers. If no effective separation of elk from ranch land is included in the preferred alternative, then the alternative will be simply another reduced ranching alternative.

2. NPS suggests that if elk were now relocated to the designated elk range as planned in 1998 and into the wilderness, a fire in the wilderness could lead to an inadvertent elimination of all tule elk at Point Reyes. Refusing to evaluate elk relocation due to this unlikely catastrophic fire is wrong. The concern of fire killing all the elk at Point Reyes was not even raised as a potential impact during the 1998 Elk EA and is now being used as an excuse to not seriously consider a reasonable alternative to have elk free range in the wilderness. NPS considers wilderness area forage availability in this EIS to dismiss relocation back to the Designated Elk Range. Therefore, all elements of possible use of the wilderness in the planning area for elk management should be considered as within the scope of the EIS. This EIS should study the need for vegetation management in the Limantour wilderness area, as well as an emergency elk evacuation plan, and if necessary, the possibility of creating an emergency plan to temporarily allow the tule elk to enter the ranch lands, or elsewhere, in the event of a catastrophic fire and complete loss of forage in the Designated Elk Range. The analysis should fully evaluate the reduced fire danger and fire impacts to local communities in the wildland-urban interface as well as the improved elk habitat in the wilderness area that would result from proper vegetation management.

3. The last reason (page 63) NPS gives to refuse the evaluation of relocation of the Drakes Bay herd is that the Tomales Point elk fences have occasionally failed. The result has been a few members of the Tamales Point herd entering the adjoining ranch lands.

Historically the NPS has repaired the fence and put the wayward elk back in the Tomales Point elk range. Because of a possible broken fence at Tamales Point (10 miles away from the Drakes Beach herd), NPS claims that it can't accomplish keeping the elk completely out of the ranch lands and therefore refuses to evaluate relocation of the Drakes Bay herd. Good fencing design with an appropriate monitoring and maintenance plan should be evaluated in this EIS, not dismissed. As fully evaluated in the 1998 Elk EA, relocation of elk to the Designated Elk Range is possible.

Here, all the reasons supporting tule elk relocation, a central tool in the current, operative elk management plan, are important topics to consider before NPS changes the existing NEPA compliant 1998 Elk Management Plan and excludes elk relocation as an option without analysis in this DEIS. NEPA compliant land management plans do not expire. As revisions are needed, these documents can be updated. This EIS is designed to amend the current Elk Management Plan. If the NPS refuses to analyze elk relocation in this revision, the fully analyzed,

NEPA compliant elk relocation directives would remain in the plan and could not be ignored. The NPS, in this section, simply identified potential problems or impacts that may result by building a fence and used only these potential problems to dismiss the possible solution. Notably, NPS did not mention any potential benefits to elk, ranchers or NPS staff by having a fence along the wilderness ranch land boundary. This EIS must perform a robust analysis of a fence as requested during the scoping process.

The DEIS falls short of proper analysis of tule elk in an additional way. The NPS identifies management techniques to apply to the Drakes Beach herd. Furthermore, NPS says it will manage so that another new herd will not form within the ranch lands. Missing in the DEIS is any analysis or plan to control the movement of the Limantour herd onto the ranch lands. The DEIS would direct the NPS to only "monitor" the Limantour herd. The migration of this herd out of the designated elk range and on to ranch lands is already causing significant harm to ranchers. These impacts have increased over the last few years and are well-documented. The DEIS has not fully analyzed these impacts or considered the almost certain increase in elk migration onto ranch lands into the future. Because this would simply be an expansion of the Limantour herd that is already causing problems, and not the establishment of a new herd, the NPS would have no direction or responsibility to control further proliferation. This omission would almost certainly result in more devastating consequences to both elk and ranchers. This EIS must analyze the impacts of all the elk on the ranch lands and direct management responsibilities for NPS to control population and reduce elk impacts of all elk in the entire planning area, not just the Drakes Beach herd.

The failures in the elk management section of the DEIS would likely result in a reduction of ranching in the planning area. This makes the preferred alternative-to keep all currently permitted ranch families in business-- unachievable.

A properly planned fence along the ranch land wilderness boundary would solve many problems. It would:

1. Reduce the elk impacts to currently authorized ranching activities. These adverse impacts are significant enough that at least one dairy rancher (due to the Drakes Beach elk herd) and one beef rancher (due to the Limantour elk herd) will go out of business if the DEIS does not include a comprehensive analysis of all elk in the planning area and adopt explicit limits on the number of elk, their location, an effective measures to separate elk from ranch lands. With the ineffective approach suggested in the DEIS, more ranches may also be forced out of business.
2. Reduce taxpayer spending by a one-time investment in a fence. Continuous monitoring, hazing, fence repairs, population controls and other activities on ranch land will cease.
3. Reduce human disturbance to the wildlife. It would be more natural for the elk to go undisturbed in a natural habitat in the Phillip Burton Wilderness versus facing constant harassment, hazing through livestock fences, and foraging on cattle pastures and imported feed intended for cattle.
4. Allow elk to free-range in a much larger, natural habitat. As written, the DEIS suggests major NPS intervention to contain the Drakes Beach herd in one small area.
5. Recognize that the California Department of Fish and Wildlife has determined that the Drakes Beach and Limantour herds are one herd, regarding genetics and diseases. A one time relocation following fence construction would not create any new genetic or health risks to the elk herds. Understanding the need to separate elk from cattle, as fully evaluated in the 1998 Elk EA, NPS has recently experimented with relocation between all three herds at PRNS and has found, without a fence, relocation will not solve the problem because the elk may return.
6. Eliminate the need for continuous lethal control of elk on ranch lands as described in the DEIS.
7. Simplify NPS elk management responsibilities. NPS is already responsible to manage the elk in Limantour wilderness. In this EIS, NPS has chosen to only consider elk management changes to the 1998 elk management plan within the planning area. After fencing and relocation, the NPS and the public can decide if any changes from the current policies are necessary to manage the forage resources and tule elk population within the designated elk range.
8. Allow ranches to operate as they have since the 1850's - with no elk on the ranch lands.
9. Eliminate conflicts that have arisen because of the recent lack of elk management.
10. Allow the visiting public to view this wildlife species in a natural setting, not comingled with cattle and not being chased by NPS staff.
11. Preserve elk viewing by people with disabilities because elk viewing from an automobile will still be available at

the Tamales Point elk range.

12. Disallow this EIS process to validate what is either a lack of management, or worse, an unwritten and unapproved plan to allow elk to colonize the ranching area. A well designed, wildlife friendly fence would demonstrate the NPS' commitment to the National Historic Register's Historic Dairy District designation while preserving the PRNS Tule Elk herd.

The DEIS is confusing and unclear on the topic of the 1998 Elk Management Plan and EA and how it relates to this NEPA process. Much of the discussion of elk in this document suggests that this EIS is meant to update the current, operative elk management plan published in 1998. Yet the DEIS contains no maps or other information describing the Designated Elk Range as determined and described in that plan. No reference is made to the current Designated Elk Range anywhere in the document-yet the public approval, and NPS agreement, for the elk relocation in 1998 was based on that plan. In the plan, the elk were to be relocated to the Designated Elk Range fully within the Limantour wilderness. (Map attached)

In other parts of the DEIS, NPS states that the 1998 Elk Management Plan will remain in force. On page 41, it states that under Alternative B the elk at Tomales Point would "continue to be managed as a fenced population in accordance with the 1998 Tule Elk Management Plan/EA." At the bottom of page 41, NPS states that "No population-level management that would threaten the future existence or viability of the Limantour herd, consistent with the goals of the 1998 Elk Management Plan/EA ...".

Since NPS frequently gives historic context, these critical facts need to be corrected where necessary and important missing pieces should be added. If not, the public will have a skewed historic reference and that incorrect context may lead commenters to erroneous conclusions. The one mention of elk depredations in the DEIS is entirely inaccurate (page 82): "Elk have occasionally been seen eating from the hay racks on C Ranch, but this is a rare occurrence." There is no evidence presented for this statement. The C Ranch dairy farmers have evidence to the contrary. The elk depredations there are far worse than described in the DEIS.

On page 5, NPS mentions that "The California Department of Fish and Wildlife (CDFW) manages all other tule elk herds in the state." It does not mention that the 1998 Elk Management Plan/EA contains a Memorandum of Agreement (MoA) between NPS and CDFW (then CDFG). In that MoA, the two agencies agreed to a Statement of Work under which they would together, among other things, develop a long-term management plan for Tule Elk in Point Reyes. Was such a plan ever developed? What is the status of the working relationship with CDFW? These were questions asked during scoping that have not been answered or evaluated in the DEIS.

Soils

Exec Summary, page vi

In this section, NPS states: "Soils Under alternatives A, B, C, and D, activities associated with beef and dairy ranching would continue to affect soils because of erosion, compaction, and alteration of soil fertility, primarily from livestock grazing, forage production, high intensity use areas, and manure spreading. Under alternatives B, C, D, and E, impacts on soils would be reduced compared to existing conditions by establishing management activity standards and mitigation measures, and implementing a zoning framework that would ensure more intense land uses occur in areas without sensitive resources, such as soils with high erosion potential, throughout the planning area. Under alternative E, noticeable beneficial impacts would occur compared to existing conditions from the conversion of the six dairy ranches to beef operations, elimination of manure management practices, seeding, forage production, and diversification activities. Under alternative F, cessation of ranching would eliminate all impacts on soils associated with ranching activities. Impacts from public use and enjoyment and elk management under all the alternatives would be minimal in intensity and limited in scale."

Only negative impacts to soil resulting from ongoing agriculture are discussed.

Scoping clearly and repeatedly requested that NPS fully evaluate the positive impacts to soils resulting from carbon farming (by creating and following carbon farm plans). This entire document does not evaluate carbon farming or the ecological benefits of preparing a carbon farm plan and implementing that plan. Ranchers,

government agencies and the general public asked that carbon farming be fully evaluated. Although the science related to carbon farming is international, readily available and fully describes benefits to soil, no attempt to include carbon farming as a management tool is included in the DEIS. Furthermore, carbon farming was not listed in the DEIS section entitled Alternatives Considered but Dismissed from Further Analysis. Remarkably, this section describes why NPS dismissed the raising of ducks on the ranches which had little, if any public scoping focus, yet it remains silent about carbon farming, which had significant scoping requests and the potential for significant positive impacts resulting from carbon farming. Some, but not all individual practices, that would likely be included in a carbon farm plan are found only in the appendices of this DEIS and not in the context of a carbon farm plan. As a matter of fact, one of the most beneficial carbon farm practices - compost application on grassland- is prohibited for most of the planning area. Because this DEIS failed to analyze complete carbon farm impacts, and did not include any reason for dismissal, the average reader of the DEIS would be unaware of the benefits and uninformed that the carbon farm planning and implementation was ignored in the DEIS. NPS must invite the Marin Carbon Project, Carbon Cycle Institute and Marin Resource Conservation District experts to describe the benefits of combining practices into a plan that would improve soils, increase soil carbon and increase organic matter to more closely resemble historic soil conditions. Improvements to water quality and air quality also result from carbon farming.

This DEIS emphasizes only the negative effects of livestock on soil and other natural resources and ignores the many potential benefits, including carbon farming. Notably, DEIS makes these claims of harm caused by cattle, but is silent about any potential harm caused by another large ungulate - the tule elk. This pattern of over-emphasizing the impact of livestock and ignoring the impact of elk is found throughout the DEIS. Every purported impact from livestock- on plants, animals, soil, water, and air- should also be assessed for the tule elk. The absence of that information from the DEIS invalidates its usefulness as a planning document.

## Socioeconomics

### Executive Summary page ix

The DEIS does not explain the fact that the historic ranches within the planning area represent nearly 20% of the agricultural land in Marin County and the ranching families and their employees within the planning area produce nearly 20% of the agricultural product value in Marin County. Instead, the DEIS includes all of Sonoma County's production value added to Marin County's production to compare to the value of the production and employment in the planning area. Sonoma County is a large agricultural county which includes a huge, high value wine industry product. This unusual combining of Sonoma County's high production value with Marin County's production misleads the public by presenting the planning area's production and employment as infinitesimal. This misleading comparison must be corrected in the final EIS.

## Air Quality

On page ix of the Executive Summary, NPS concludes in this DEIS that "beef cattle [not dairy cattle] are the primary contributors of fugitive dust and particulate matter PM<sub>2.5</sub> emission rates." The Air Quality section of the DEIS, beginning on page 93, does not support this conclusion.

The NPS conclusion that beef cattle are the primary contributors of dust is unsupported by data or on the ground reality. In the planning area, beef cattle spend almost all their time grazing and resting on pastures and rangeland. Beef cattle are occasionally gathered for processing - often months pass between beef cattle gatherings. Alternatively, as described in sections of this DEIS, dairy cattle are gathered twice a day for milking, plus the regular gathering of heifers and dry cows for processing. Furthermore, cattle density is very different between dairy and beef operations. In the planning area, NPS authorizes dairies to stock at an average of 1.7 acres per cow while beef ranches are authorized at an average of 8.8 acres per cow - a 5-fold difference in livestock density. The fact that NPS concludes that beef cattle are the primary source of dust demonstrates that the Air Quality section in the DEIS requires analysis and correction.

Another "conclusion" found in the air quality section of this DEIS is that ranching/livestock GHG emissions,

including dust, represents 87% of the total planning area emissions while the mobile source emissions from the several million seashore visitors and the NPS staff and equipment represent only 13%. Ignored from this analysis are the emissions from mobile sources on the drive from the visitor's starting point up to the planning area and the return trip. Excluding the emissions from visitors traveling to and from the planning area grossly underestimates the GHG emissions generated from seashore visitors' automobiles.

While NPS uses multiple pages to fully describe the negative impacts to air quality caused by agriculture and livestock, the DEIS completely fails to describe the positive effects that grazing has on air quality if carbon farming is allowed. Compost application, one of the most important carbon farming practices - a practice that is included in most farm plans because of outstanding results - - would be specifically prohibited if the current DEIS goes unchanged. (NPS did, however, include in the appendices, some of the practices that could be included in a carbon farm plan. These BMPs were only included to mitigate for other impacts-not for use in the context of a carbon farm plan.) Specifically, commercially produced compost certified for use in organic food production, must be properly evaluated by this EIS, and approved for use in the planning area. These errors and omissions have created a draft that is misleading. Public scoping from ranchers, individuals, industry groups, agencies and non-profits asked NPS to fully evaluate carbon farming in this EIS. Furthermore, ranchers within the seashore have applied for and have been selected to receive grants for the creation of carbon farm plans prepared by the Marin County Resource Conservation District (RCD). Near the beginning of this EIS process, the RCD asked the PRNS Superintendent (because landowner approval is required) if RCD and the ranchers could move forward with the carbon farm plans. The Superintendent refused to allow the carbon farm planning process to move ahead because NPS did not understand the science.

The EIS process is where NPS should have become educated about this issue. Carbon farming has significant positive impacts to analyze. Available science from around the world recognizes and quantifies the soil and air quality benefits that result from carbon farm plan implementation. Given the record of repeated attempts through scoping to have NPS evaluate carbon farming, refusing to do so is a violation of NEPA.

The Air Quality, Water Quality and Soil Quality sections must be revised to fully evaluate and report on the positive impacts of carbon farming as was requested during the public scoping period in this process. These sections, as written, are incomplete, inaccurate, mislead the public and illustrate a lack of experience and understanding by the current EIS team. The NPS must involve outside experts from The Marin Carbon Project, The Carbon Cycle Institute, the Marin Resource Conservation District, and the Marin Agricultural Land Trust with the training, skills and experience necessary to conduct a robust carbon farm plan analysis. This analysis will provide useful information as to the effects carbon farming will have on Air Quality, Soil Quality and Water Quality in the planning area. By conducting an honest, robust evaluation that fully responds to public scoping, NPS decisions and activities authorized using complete analyses as support are less likely to be challenged and the challengers are less likely to prevail.

### Manure and Nutrient Management

On page 39, NPS states: "Under alternative B, application of commercially produced compost and fertilizer would not be authorized." These two inputs should be evaluated separately. It is reasonable to prohibit commercial fertilizers in the planning area. Petroleum based, commercial fertilizer is known to produce greenhouse gases both in its production and in its use.

Commercial fertilizer has also been shown to contaminate storm water runoff. These commercial fertilizers are not allowed for use on certified organic farms. Commercial compost is completely different, however, and should be allowed. The composting process, including commercial composting, controls the decomposition of organic materials thereby reducing GHG production. The use of compost adds vital microbes to improve soil health. It would be reasonable for NPS to require that all compost used in the planning area meets the national organic rule for use in organic food production. By requiring this certification, composts entering the planning area, or produced in the planning area, would be pathogen free and weed free.

The fact that NPS combined commercial fertilizer and compost in its analysis and prohibited both shows a lack of understanding of soils, soil inputs, and the benefits of best management practices for soil health. Commercial fertilizer is a "fertilizer", compost is an "organic soil amendment" - - not a fertilizer. Furthermore, disallowing the

use of compost on pastures within the planning area would have additional consequences, including the blocking of positive impacts on Air Quality, Water Quality and Soil Quality. NPS did not address analysis of important nutrient management facts, issues and solutions in this EIS. The EIS team must include outside expertise to fully evaluate existing conditions and best practices for nutrient management. NPS must also include experts from the Natural Resource Conservation Service, the Marin Resource Conservation District and the University of California Cooperative Extension Service to analyze existing conditions and to recommend best nutrient management practices for soil health. These agencies have extensive training and decades of experience working with ranchers and the regulatory agencies in the planning area and elsewhere. Due to these significant omissions, the faulty conclusions could be challenged. Rewriting the Nutrient Management section with qualified consultants would result in different, defensible recommendations.

On page 6 of Appendix D, NPS states: "On dairies, nutrient management may also be included as a soil amendment for forage production."

In the DEIS, NPS is only allowing nutrient management on dairies and prohibiting nutrient management on beef ranches. Nutrient management should not be limited to dairies. Soil sampling in the project area, as well as on other Marin ranches outside the project area, indicates that soils on operating dairies have more carbon and more organic matter than beef ranches.

This reality, and why it is so, is not even mentioned in the DEIS analysis. Currently, NPS allows dairies to have four or five times more cows per unit area than it allows beef ranches. Furthermore, because of the high nutritional demand by lactating dairy cattle, more feed is consumed per head on a dairy ranch than on a beef ranch. Dairy cows are also fed concentrated feeds, high in nutrients, where beef cattle are not. The net result is an increase in added nutrients to soils on dairy farms. Dairies generally spread the nutrients by manure application and beef ranches do not. Beef ranch soils need added fertility more than dairy soils. Furthermore, compost application on soils with lower levels of organic matter can lead to increased carbon sequestration. Some of the project area beef ranchers interested in carbon farming (using a suite of practices known to help sequester carbon) have already been selected to receive grant-funded carbon farm plans. Properly planned application rates will be determined prior to application. These rates will consider agronomic needs of the pasture and forage areas. Soil samples, plant communities, as well as other NPS natural and cultural resource goals will be considered in the carbon farm plans.

Ranchers in Marin County that have been carbon farming for several years have noticed an increase in native plant species. This may be due to the general understanding that most Marin County soils had higher organic matter and soil carbon 100 years ago when deeper rooted perennial grasses dominated. Alternative B only allows soil fertility improvements within the pasture subzone areas that have historically been highly managed by ranchers (including mowing, fertility improvement, planting, row crops and hay production) where non-native, European grasses dominate. Highly managed pastures exist on both dairy and beef ranches. Both dairy and beef ranchers should be allowed to use organic compost. Because of the myriad benefits of carbon farming, this EIS must also consider allowing carbon farming, including compost application, within the range land subzone.

Most of the planning area is located within two Historic Dairy Districts. Most of the beef ranches were once dairies. Historically, soil fertility was treated similarly on all ranches. It would be inconsistent to allow added fertility on only dairy pastures, where soil organic matter is the highest, and to prohibit added fertility on beef ranches.

A complete, robust analysis of nutrient management in the EIS by including outside experts is necessary.

#### Composting

On page 19 of Appendix D, NPS states:

"A composting facility is a structure to contain and facilitate controlled aerobic decomposition of manure or other organic materials into biologically stable organic

matter that is suitable for beneficial reuse. It is designed to produce a soil amendment that adds organic matter and beneficial organisms to the soil, provides slow-release plant available nutrients, reduces greenhouse gas emissions from waste material decomposition, and improves soil condition. Composting can be used to reduce water pollution potential and improve handling characteristics of organic waste materials, to repurpose organic waste into animal bedding, and to suppress potential plant and animal pathogens."

Here, NPS recognizes the benefits of composting and compost use within the planning area. NPS must not limit the use of compost to dairies only. NPS must also allow compost production and compost use on beef ranches. NPS must allow commercially produced compost for use within the planning area. NPS could require that all compost used the planning area meets the National Organic Rule for use in organic food production. The National Organic Rule requires a specific compost process that kills pathogens and weed seeds and the facilities that produce these products are regularly inspected to ensure compliance with National Organic Program.

#7567

Name: Heneman, Burr

Correspondence: Dear Superintendent Muldoon,

Thank you for the opportunity to provide my comments on the August 2019 General Management Plan Amendment Draft Environmental Impact Statement (GMPA DEIS) for Point Reyes National Seashore (PRNS) and the north district of Golden Gate National Recreation Area (GGNRA).

I am commenting as someone who has been a neighbor of the Seashore for almost 50 years, who has closely followed Seashore planning and management issues for the entire time, and who was a member of the Citizens Advisory Commission for GGNRA and the Seashore in the 1970s and 1980s. In addition, I am a co-founder of Commonweal (1976) and have had a long association with that lessee within PRNS. And, in the 19890s, I was executive director of the Point Reyes Bird Observatory (now Point Blue), an NPS cooperating organization that has a field station at Palomarin in PRNS.

General Comments First of all, I want to compliment you and your staff for producing an excellent document on a challenging subject. Both ranching and national parks are complex, and the combination of the two here at PRNS and GGNRA is unique in the National Park Service system. Your task has been to break trail through new territory, and you have done an admirable job.

I strongly support the continuation of beef and dairy ranches in the planning area. I favor those operations continuing at their current scope and scale, reduced by the resource protection buffers, and enhanced by possible diversification activities. As a consequence, I support Alternative B, the Preferred Alternative, in the GMPA DEIS.

Continued ranching is consistent with all of these: •The history of the area going back to at least the 1850s; •The Seashore's enabling legislation, especially the 1978 amendments giving the Secretary authority to continue to lease "agricultural land" for "agricultural, ranching, or dairying purposes," thus maintaining the working landscape, worked primarily by families who have persisted here for multiple generations; •Maintaining the Seashore's scenic, natural, and historic resources and values without "impairment or unacceptable impacts" (as discussed in NPS Management Policies 2006, 1.4.3.1- 1.4.7.1); •National Park Service practice in the management of the planning area since the creation of PRNS; •The 2012 directive from then Secretary of the Interior Ken Salazar to

offer up to 20-year leases to ranchers in the planning area. Specific Comments A.Scenic resources and values - Chapter 3, Affected Environment

The DEIS is inadequate in its consideration of the scenic 'resources and values' of the affected environment (NSF Management Policies 2006, 1.4.6). And the DEIS is inadequate in describing the inter-relationships between ranching and the Seashore's scenic resources and values.

The only relevant mention of scenic resources and values in the DEIS is the following language in the Visitor Use, Experience, and Access section of Chapter 3: Visitor facilities and recreational opportunities in the planning area include scenic driving, hiking and biking trails, equestrian use, and the Kenneth C. Patrick Visitor Center. Many visitors to the park travel through the planning area to reach other park destinations, such as Drakes Beach, Tamales Point, and the Point Reyes lighthouse. While the roads used for traveling to these park destinations fall outside the planning area, visitors still enjoy the scenic quality of the planning area landscape while traveling along them. (DEIS, page 83)

That is not an adequate description of the scenic resources and values of the affected environment in the Point Reyes National Seashore. As I urged in my scoping comments (29 November 2018), the DEIS should explicitly and adequately include scenic resources and values for at least these reasons: •The NPS is mandated to prevent "impairment" of, or even the lesser standard of "unacceptable impacts" to, any of the Seashore's resources and values (NSF Management Policies 2006, 1.4.4 and 1.4.7.1). •Scenic resources and values are explicitly listed - and listed first - - by Congress in the NPS Organic Act of 1916. (16 USC 1) •The NPS Management Policies 2006 lists "scenery" first among resources and values subject to the no-impairment standard (NSF Management Policies 2006, 1.4.6). •While the language of the Seashore's enabling legislation does not use the words 'scenic' or 'scenery', they arguably are strongly implied:"... in order to save and preserve, for purposes of public recreation, benefit, and inspiration, a portion of the diminishing seashore of the United States that remains undeveloped ... " (16 United States Code [U.S.C.] § 459c et. seq.) The GGNRA enabling legislation is explicit: the purpose is to " ... "preserve the recreation area, as far as possible, in its natural setting, and protect it from development and uses which would destroy the scenic beauty and natural character of the area" (16 U.S.C. § 460bb et. seq.). •The Seashore's planning area has important scenic resources and values that are equal to the natural and cultural/historic resources and values and are subject to the same no-impairment and no unacceptable impacts standards. The planning area is a major part of the Seashore's mosaic of pastures, rangeland, wooded and wetland areas, water features, topographic variation, and historic structures. The expanses of coastal grassland and prairie with little or no shrub vegetation on the ranches are important elements in the Seashore's scenic resources and values.

Chapter 3 has subsections for vegetation; wildlife; and cultural landscapes, historic districts, and historic structures. The Seashore's outstanding scenic resources and values deserve their own subsection in the final GMPA and EIS.

#### B. Scenic resources and values - Chapter 4, Environmental Consequences

In its discussion of the alternatives that allow ranching to continue, the DEIS is inadequate in its description of the role intensive pasture management, including grazing by cattle, in maintaining the scenic resources and values of the planning area. To remedy that deficiency, the final GMPA and EIS should include a description and discussion of the interrelationships between the Seashore's scenic resources and values and pasture and range management as practiced on the ranches. Specifically, it should describe the extent to which the visual characteristics of the planning area depend on active management, especially grazing and weed mowing.

In its discussion of the alternatives that reduce or eliminate beef and dairy operations, the DEIS is inadequate in its description of the impact on scenic resources and values in the planning area unless the Seashore undertakes significant mitigating management actions.

The point is not whether the grasslands and rangelands that are now relatively free of brush and shrub vegetation are good or bad, or that, in alternatives D, E, and F, the coastal scrub that would replace much of the open

grasslands (without intensive management) is good or bad. The points for Chapter 4 are that, under alternatives D, E, and F: •Without major mitigation efforts, much or most of the grasslands and prairie would quickly transition to coastal scrub and invasive species such as poison hemlock, fennel, thistles, and broom in the absence of intensive management as is practiced on the ranches. •Absent significant mitigation, the vegetation changes would have a significant impact on the Seashore's scenic resources and values that needs to be disclosed and discussed. That point is supported by the vegetation changes that have occurred in the Seashore and GGNRA where intensive management, such as grazing by cattle and mowing, has ceased. (I provide illustrations of relevant past vegetation changes below.)

Scenic resources and values should be treated explicitly in their own subsection of Chapter 4, Environmental Consequences. The emphasis in the legal mandates and the importance of the scenic resources and values of the planning area justify an additional section on 'Scenic Resources' just as there are sections for vegetation; wildlife; and cultural landscapes, historic districts, and historic structures.

For alternatives D, E, and F, the final GMPA and EIS should include the following: •A description of the reasonably expected changes in major vegetation types in the absence of intensive management. That description should include at least a rough estimate of the scale of the changes: how many acres, on which ranches; •A discussion of whether the anticipated changes, absent intensive management, would constitute impairment of, or unacceptable impacts to, the Seashore's scenic resources and values (see NPS Management Policies 2006, 1.4.4 and 1.4.7.1); •If the NPS proposes mitigating management measures to conserve scenic (and natural and cultural) resources and values, the final GMPA and EIS should provide significantly more detail than is in the DEIS.

Action alternatives must be "technically and economically feasible" (DEIS, page 9). If the changes to scenic resources and values would constitute impairment or unacceptable impacts, there needs to be an adequate presentation of mitigation measures that includes evidence that they are "technically and economically feasible". In regard to management measures to maintain the character of the scenic resources and values, the brief mentions of possible mitigation in the DEIS are inadequate. For example, it is not adequate to only say for alternative F that: "NPS may use prescribed grazing on lands in the planning area to meet resource management goals and objectives (e.g., maintenance of disturbance regimes in grasslands which contribute to the historic character of the two National Register historic districts). Prescribed grazing would be conducted by contract through NPS. The scale of these operations is anticipated to be on the order of 100 to 200 AU or less in the planning area and limited to spring through fall, to avoid the wet season. NPS would identify priority areas for vegetation management." (p. 48).

Open grasslands are major scenic features of A, B, C, D, E, H, I, J, L, M, N, and Home ranches. For alternatives D, E, and F, the DEIS should address, with adequate detail, questions such as: •What management measures would maintain the scenic resources and values of the planning area where ranching is discontinued? •How much open grassland could 100-200 AU maintain during "spring through fall"? (Conversations we have had with ranchers, both inside and outside the Seashore, indicate that many more AU would be needed to maintain the visual character of the Seashore.) •At what point does the amount of prescribed grazing needed to maintain the scenic values of the planning area violate the no-ranching intent of the settlement and Alternative F? •The Seashore has very limited experience with prescribed grazing . Would such a regime with much greater geographic scope than has been used to date by the Seashore be "technically and economically feasible" for ranchers in this area? Such a regime would require a rancher or ranchers with sufficient animals to graze large areas in spring and fall and then have another location outside the Seashore to move those animals to. My conversations with ranchers in the area suggest the proposed management measures would not meet the "technically and economically feasible" standard. •Will prescriptive grazing alone prevent a transition to coastal scrub? •Is it technically or economically feasible for the NPS to supplement prescribed grazing with brush and weed mowing over a large enough area to maintain the scenic character of the planning area? •Is fire potentially available as a management tool for managing brush and weed species? •Could tule elk eventually maintain or restore the scenic character of the Seashore's grasslands and pastures? (It appears not from what has occurred at Pierce Point and in the Limantour area, without mowing or, as Native Americans on Point Reyes are believed to have done, using fire as a management tool.)

The following two photos are examples of the rapid transition of ranchlands to coastal scrub and invasive weed species.

1. Line fence between H Ranch (Evans) and portion of L Ranch that has been ungrazed for about 40 years. The L Ranch side has been solid brush for much of that time. 2. The coastal scrub area between the upper portion of Abbotts Lagoon and the grassy area (H Ranch, Evans) was used for silage as recently as 1983. The transition to coastal scrub was rapid, here, too. (The Abbotts Lagoon Trail, near the fence line, is obscured by the new coastal scrub.)

3. Another example is in the southern end of the Olema Valley where the NPS has been using prescribed burns to try to manage the heavy Scotch broom invasion that followed the end of grazing in the 1970s.

### C. Cultural landscapes, historic districts, and historic structures

The DEIS is inadequate in its treatment of the historic/ cultural resources and values in the planning area. Specifically, the DEIS considers the historic resources and values to consist only of the physical elements, such as historic structures. The DEIS ignores the reality that the 'working' nature of this 'working landscape' is an important part of the cultural resource.

1. Park resources and values subject to the no-impairment standard include cultural resources and values -- including cultural landscapes: The "park resources and values" that are subject to the no-impairment standard include: "the park's scenery, natural and historic objects, and wildlife, and the processes and conditions that sustain them, including, to the extent present in the park: cultural landscapes ... [NPS Management Policies 2006 1.4.6]

2. Cultural Landscape - A cultural landscape is a geographic area that is associated with an historic event or person or activity, and ranching is such an historic activity: "Cultural landscape- a geographic area, including both cultural and natural resources and the wildlife or domestic animals therein, associated with a historic event, activity, or person, or exhibiting other cultural or esthetic values. There are four non-mutually exclusive types of cultural landscapes: historic sites, historic designed landscapes, historic vernacular landscapes, and ethnographic landscapes." (The Secretary of the Interior's Standards for the Treatment of Historic Properties, 1996. p. 4, and Management Policies 2006, Glossary p. 157]

3. A cultural resource may be a "cultural practice" - This policy is a further link between operational nature of ranching in the Historic Districts and the cultural resources and values that are subject to the no-impairment standard: "Cultural resource- an aspect of a cultural system that is valued by or significantly representative of a culture, or that contains significant information about a culture. A cultural resource may be a tangible entity or a cultural practice." [Management Policies 2006, Glossary p. 157]

A reasonable interpretation of DOI and NPS policies is that the operational, working nature of the ranches is part of the cultural resources and values of the Seashore, and that should be reflected in chapters 3 and 4. In describing the affected environment (Chapter 4), I think one can only conclude that alternatives E and F, for example, would result in 'impairment' of the Seashore's historic/ cultural resources and values, or 'unacceptable impacts' at the very least (using those terms as the NPS uses them).

Recommendation: The final GMPA and EIS should reflect that the two Historic Districts are cultural resources that are made up of cultural landscapes, or more specifically, historic vernacular landscapes that are still associated with the historic activity of ranching. Furthermore, the cultural resource consists of both tangible elements, such as historic ranch buildings, and the ongoing cultural practice of ranching. (The Secretary of the Interior's Standards for the Treatment of Historic Properties, 1996. p. 4; Management Policies 2006, 1.4.6 and Glossary p. 157)

The DEIS should be explicit that the 'historic activity' and 'cultural practice' associated with the Historic Districts continues and, together with 'tangible entities' such as historic structures, is an integral part of the cultural resources and values of the Seashore. The language can also be explicit that the NPS is NOT responsible for the economic viability of the ranches. However, the language should also be clear that the preferred alternative allows the following: •Agricultural operations within the limits specified in Alternative B; •Agricultural operations that comply with lease/ permit agreements and ranch operating agreements; •Agricultural operations that employ generally accepted best practices; •Agricultural operations that comply with relevant federal and state laws and regulations, such as those related to water quality, wetland protection, protected species and other species of concern, historic resources, etc.

The language should get across the intention that, if ranches fail in the Seashore during the terms of their leases, it should be because of external factors, such as market forces, operating costs (other than lease/ permit payments), etc., and not from NPS restrictions that unnecessarily limit ranching activities. D. Agricultural diversification

The justification for diversification of ranching activities appears only once in the DEIS under the description of Alternative A (Page 20): "Diversification of ranching activities allows ranchers to react to poor forage production years and fluctuations in the economic market (e.g., the price of cattle, grain, hay)." To enable the economic resilience implied in this justification, I support the inclusion of proposed agricultural diversification activities as described under Alternative B, including limited row-crop production, pasture poultry raising, alternative grazing livestock species, and farm tours and stays, among others, as conditioned by the subzoning framework (Resource Protection, Range, Pasture, and Ranch Core).

The descriptions of potential diversification activities, however, raise questions that must be addressed in the Final GMPA and EIS as follows:

- Why is it necessary to limit the option for 2.5 acres of agriculture to what can be done without irrigation? As an alternative, irrigation, such as drip systems where the Seashore deems sufficient water to be available, might afford greater opportunities. The final GMPA and EIS should consider this option, including mitigation measures for any potential impacts.
- Why limit grazing or browsing by alternative livestock species to pastures? Allowing them in the rangeland zone could achieve natural resource objectives like fire fuel reduction and prevention of vegetation type conversion, as well as protection of sensitive resources. The use of multiple species in a prescribed and rotational manner could provide a diversity of options and opportunities in achieving preservation strategies outlined in the DEIS.
- Why rigidly limit diversification activities to ranch core areas? The limits of scope and scale of diversification are appropriate. However, if a proposed activity might have lower impact (visual, for instance) in an area outside the core area, why not be able to consider it?
- The final GMPA and EIS should address the possible relationship between types of diversification and proliferation of pest species; the allowable techniques that ranchers might use to control such pests, including integrated pest management for pests like gophers; and the potential impacts of pest species on sensitive resources in the park.

#### E. Tule elk management

The DEIS is inadequate in its description of the conflict between elk and dairy cows, its justifications for the size of the Drakes Beach herd to be allowed, and its considerations of management measures. All of those should receive more detailed analyses and justifications in the final GMPA and EIS.

The final GMPA and EIS should explain much more thoroughly why a significantly smaller cap on herd size is not appropriate. It should also discuss more fence options than are included in the DEIS, especially at C and D ranches.

#### F. Stewardship

The final GMPA and DEIS should add a discussion of how ranchers can be encouraged to provide the stewardship that at least meets what is required in their lease/ permits and, preferably goes further. For instance,

are there standards that can be requested or required related to appearance of ranches, especially ranch core areas. At least in ranch core areas, ranchers should be expected to manage unsightly growth of weed species, maintain buildings with repairs and paint, and remove debris piles. If ranching in the Seashore is to be a model for agriculture on public lands, all the ranches - not just some - - should look like the ranchers take pride in their operations. As a neighbor of the Seashore for nearly 50 years, a frequent visitor for longer than that, and a member of the old Citizens Advisory Commission, I have long been concerned about the question of the status of ranching in the Seashore. The current process is finally addressing those questions. The DEIS is an outstanding start. There is now an opportunity, in this last step, to make the final GMPA and EIS even better.

Correspondence: Dear Ms. Muldoon:

The California Department of Fish and Wildlife (Department) appreciates the opportunity to comment on Point Reyes National Seashore's (PRNS) General Management Plan Amendment, Draft Environmental Impact Statement (hereafter, "the Plan"). We commend your agency on the work you have accomplished to bring the Plan to its current state and agree that active management of the elk herds is necessary to balance management of cattle grazing and elk within PRNS. By addressing elk-cattle conflicts through various means, including exclusion and herd population maintenance, PRNS sets forth a pragmatic rationale for equitable management of public, natural, and agricultural resources on PRNS.

Management of elk populations on PRNS will be necessary in perpetuity. Translocation of elk out of PRNS is not a viable option for population management due to the potential for translocation of diseases, short and long-term costs, risk to staff or contractors, and risk to animals. John's disease is documented to occur in resident cattle and elk herds at PRNS. Even with the current testing means available, it is extremely difficult to guarantee an individual elk from an infected herd is free of the disease organism. Given that John's is a livestock disease, the Department could only support the translocation of elk from PRNS with a comprehensive elk and cattle disease-monitoring program in place and the onsite capability to effectively quarantine and rigorously test for this and other diseases and parasites transmissible to native herbivores or livestock, should appropriate recipient locations be identified. The Department would expect development of such a protocol to involve, at a minimum, the National Park Service, United States Department of Agriculture-Animal and Plant Health Inspection Service Veterinary Services, the Department, and the California Department of Food and Agriculture.

The Department agrees that translocation of elk from one area of PRNS to another to reduce conflict is not a viable management option. The short distances over which elk could be moved within PRNS could easily be covered by elk in a day or less and therefore are too small to biologically justify translocation. The Department is not aware of data that indicate short-distance translocations of large, highly mobile ungulates, such as elk, are successful. In contrast, CDFW knows of several instances where ungulate translocation across distances exceeding the extent of PRNS in which translocated animals returned, or attempted to return, to their place of origin.

The Department also agrees that fencing of elk along the boundary of the Phillip Burton Wilderness Area at PRNS would be exceedingly difficult and prohibitively expensive to construct and maintain and would result in negative impacts to native wildlife. For these reasons, the Department concurs that the likelihood of successfully excluding elk from neighboring lands with fencing in the Phillip Burton Wilderness Area would be low. Any benefits of such an approach would be exceeded by negative impacts to a variety of wildlife. However, selective fencing around portions of certain ranchlands may help minimize conflicts between cattle operations and elk. The Department would gladly engage in discussions about elk exclusion as a management approach.

The Department is concerned, however, that the Plan misrepresents recreational hunting and therefore prematurely dismisses it as a viable option for population management. The Plan describes the rationale, in part, as a need "to ensure the taking of the correct numbers, ages, and sexes of elk". In fact, regulation of populations

for desired numbers, ages, and sexes of elk is easily achieved through the issuance of tags· designated specifically for bull, spike, and antlerless elk, and males of specific age classes can be targeted by setting requirements for the number of antler points (e.g., 4 pis or fewer on at least one antler). Existing regulations are highly effective in maintaining desired numbers and demographics of elk on Department managed lands. In addition, recreational hunting can be a practical and useful way to alleviate conflicts with neighboring lessees when individual elk stray outside of fenced enclosures or between desired zones. Providing hunting opportunities would also generate revenue through the sale of elk tags, which could potentially support PRNS efforts to conduct research and management of elk.

Scheduled closures of portions of PRNS would likely be required in order to conduct safe recreational elk hunts or removals of elk by sharpshooters. Hunter safety and marksmanship orientations could be offered or required prior to allowing hunters into the field as other National Parks have done. For example, the Rocky Mountain National Parks works with hunters to ensure a high level of marksmanship prior to allowing them in the field. Commitments of staff time are likely to be comparable or greater for efforts associated with sharpshooting. Sharpshooting entails extensive carcass handling and disposal by staff or contractors. This could be reduced significantly with a recreational hunting program. Recreational hunting programs also routinely collect biological data on elk which would further contribute to management goals of PRNS.

While the Department prefers recreational hunting to manage the elk population, lethal control including sharpshooters may also be necessary to effectively manage herd numbers. Any elk taken, by whatever means, should be tested for Johne's disease (*Mycobacterium avium paratuberculosis*) to provide information about its prevalence within herds and rangelands of the PRNS.

We appreciate the complexity of the issues you addressed in your Plan for both of our agencies and look forward to providing whatever assistance possible as the PRNS moves forward. If you or your staff have questions, or we can be of assistance, please contact Mr. Brad Burkholder, Game Program Manager at (916) 445-1829 or at [Brad.Burkholder@wildlife.ca.gov](mailto:Brad.Burkholder@wildlife.ca.gov).

Name: Bennett, Gordon

Correspondence: To: Cicely Muldoon, Superintendent, Point Reyes National Seashore (PRNS) National Park Service (NPS)

Re: PRNS General Management Plan Amendment (GMPA) Draft Environmental Impact Statement

Dear Superintendent:

Background: I represented Marin County on the GGNRA/Point Reyes federal Advisory Commission from 2000 until 2002, during which I successfully mediated disputes between GGNRA and Sausalito over Fort Baker and between PRNS and Bolinas over the Wilkins Ranch. I was a founding shareholder in Westbrae Natural Foods and have almost 20 years' experience with food economics. I have also served on a number of environmental boards, including Marin Audubon and Marin Sierra Club. I have extensive volunteer experience with NPS and was the 2003 Volunteer of the Year for the National Marine Sanctuary Foundation. I now preside over Save Our Seashore (SOS) and support the PRNS Preferred Alternative B ... subject to the following analysis and commentary, summarized below and as followed by detailed analysis.

Diversification: SOS supports the dEIS Diversification proposal but not justified as economic mitigation. We instead suggest that the dEIS consider diversification as mitigation for elk impacts, which would achieve a similar end. We also suggest that the dEIS consider where diversification could both be expanded and limited without altering the dEIS impact studies. We suggest that the dEIS consider that appraisals need to be strengthened in order to fairly compensate the public for use of its lands. We lastly suggest that the dEIS consider places where

diversification text could be clarified and why transparency in appraisals would be helpful.

**Elk Management:** We support the dEIS proposal as consistent with elk management throughout National Parks and as needed to balance the NPS mandates for protection of both natural as well as cultural resources. We suggest that the dEIS consider additions to the Forage Model that may better clarify elk impacts on C Ranch and suggest that the dEIS consider additional forage offsets for C Ranch. Lastly, we suggest that the dEIS consider managing to the threshold of the impact of 120 elk rather than the number of 120 elk.

**Best Management Practices/Mitigations:** We support the dEIS list of mitigations, but we also suggest that the dEIS consider adding reasonable milestones. We further suggest that the dEIS consider transparency so the public can track the progress of mitigation projects.

**Succession:** We support the dEIS succession proposal as consistent with congressional intent, but also suggest the dEIS consider more specificity about NPS discretion over closed ranches.

**Lease Template:** We support the dEIS proposed Lease Template but also suggest that the dEIS consider adding prior health inspection observations. We further suggest that the dEIS consider the value of transparency re the annual meetings.

**Public Use and Enjoyment:** We support the dEIS proposals for use of abandoned buildings, but also suggest the dEIS consider better opportunities for ranch worker housing and affordable housing to offset visitor impacts. We support the dEIS proposal to open ranch roads to bicycles, but also suggest that the dEIS consider a commensurate reduction in less-used trails.

Thank you for the opportunity to comment, we hope you find our suggestions useful.

Sincerely,

Gordon Bennett, SOS President

## ALTERNATIVE B: DIVERSIFICATION

### DIVERSIFICATION: Rationale

The dEIS pg. 20 states the (sole) rationale for considering diversification as follows:

"Diversification of ranching activities allows ranchers to react to poor forage production years and fluctuations in the economic market (e.g., the price of cattle, grain, hay)." SOS has expressed support for limited diversification, but not as justified in the dEIS.

First, multiple Department of Agriculture (USDA) programs already mitigate for "poor forage production years and fluctuations in the economic market." Since 1995 (per the EWG website), the following non-exhaustive list of PRNS ranches have received such USDA subsidies: the Dan Evans Ranch, Mendoza Dairy, Stewart Ranch, David Evans Ranch, Nunes Dairy, Grossi Ranch, Spaletta Dairy, Kehoe Dairy, L Ranch Dairy, Lunny Ranch and the McClure Dairy. For example, the Nunes Ranch received nearly a half million dollars from eighteen different USDA programs.(1) The existence of multiple USDA programs designed to mitigate for "poor forage production years and fluctuations in the economic market" undermines the rationale of the dEIS proposal that would duplicate the USDA economic mitigation by approving diversification.

Second, PRNS ranch families already have both potential and actual diversified income opportunities, including what appear to be extended family ranches in Marin and Sonoma (e.g. twelve Spaletta ranches (2) relationship unknown but likely), second jobs by lessee family members and independent businesses owned by lessee family members, including, for example the Lunny family with a paving business, a compost business, a shellfish growing/ distributing business, and a quarry. The existence of these multiple opportunities for diversification undermines the rationale of the dEIS proposal that PRNS ranchlands should be a significant source of income diversification.

Third, nothing in the enabling legislation, related congressional testimony, or Salazar's directive specifically

mentions diversification ... on the contrary, the entirety of the record speaks to "ranching and dairying" being allowed to continue, with an occasional reference to "agriculture" as simply an abbreviation for "ranching and dairying." Nevertheless, there are some who seek to re-interpret this occasional abbreviation to claim original intent for extensive agricultural diversifications based on everything that was grown, is rumored to have been grown, or could possibly in the future be grown in the dEIS planning area.

Such assertions have no merit and no relationship with "ranching and dairying" as practiced at the time these ranches were acquired by the NPS and when the original intent for continued "ranching and dairying" was discussed.

Last, we can find no reference in the National Environmental Quality Act (NEPA) that requires or allows mitigation of market impacts to NPS tenants/lessees. The purpose of NEPA is to assess the impacts of a project on the environment... not the impacts of the environment on the project. This rationale sets a precedent that could, for example, justify timbering a virgin forest in order to mitigate impacts on the logging company. SOS is concerned that the current dEIS rationale is subject to likely successful legal challenge, which would only prolong the uncertainties of this GMPA. For all of the above reasons, SOS suggests that the dEIS consider a more defensible justification for diversification that does not inadvertently undermine NEPA.

When the NPS purchased the ranches, the understanding was that the ranching families would be allowed to continue ranching subject to the NPS at its sole discretion managing (then-existing) wildlife impacts. But since those purchases, the NPS has introduced free-range Tule elk. According to the November 2017 CDFW Draft Elk Conservation and Management Plan,

"Conflicts between expanding elk and human populations are significant at some locales."

Thus it would seem reasonable for the NPS to mitigate elk impacts on PRNS ranches that were not anticipated in the original understanding. The dEIS (pg. 25) already acknowledges this rationale by its current actions to mitigate elk impacts, including "Providing pasture offsets, including identifying access to additional pasture for ranchers to offset forage lost to grazing elk." Thus we suggest that the dEIS consider amending its rationale for diversification as follows: "Diversification of ranching activities allows ranchers another economic offset to impacts from elk."

#### DIVERSIFICATION: Appraisal

In order to determine to what extent the dEIS diversification proposal represents a reasonable offset to elk impacts (as well as to determine an appropriate rent to PRNS for diversification operations), it will be necessary for PRNS to understand the economics of each diversification.

Under alternative B, "... NPS anticipates development of a master appraisal process managed by the US Department of the Interior to determine FMV for park ranch operations." Such a "master appraisal" process could be effective ... provided it addresses the multiple problems with the prior appraisal process described by our 1/27/16 letter Appendix 6. But it seems clear that this "master appraisal" cannot determine FMV rents for diversification proposals yet to be made. Thus, case-by-case FMV appraisals will need to be made based on the specifics of each diversification proposal, as was done for the one existing (chicken) diversification operation. Our 1/27/16 letter pointed out that this former appraisal was deeply flawed, with a claimed FMV rent of only \$997 per year for a chicken operation with revenues estimated at \$143,258 per year (i.e. rent at 0.7% of sales vs PRNS grazing land rent at  $-\$84\text{AU}/\$667=12.6\%$  of gross sales). Unfortunately the current dEIS appraisal process for this same chicken operation is similarly deeply flawed,<sup>(3)</sup> which points to the need for the dEIS to more clearly define (or significantly reassess) how it intends to determine FMV for diversification operations.

Further, diversification needs to have enforceable and enforced limits so that it does not in any substantial way alter the historic "ranching and dairying" landscape or become a substitute for income from "ranching and dairying." The dEIS sets explicit sideboards for diversification re the number of sheep, goats, chickens and acres of row crops, but sets no comparable limits on diversification income, without which diversification income could be so substantial that it could far exceed not just amounts needed for elk offsets, but could also exceed total ranch income (4).

We suggest that the dEIS consider limiting projected income from all diversification at the site to be at most a

combined 10% of the projected income from "ranching and dairying" at the site (unless the rancher can document the need for a greater offset for elk impacts). Such a 10% limit would also serve to quantify the dEIS language regarding "small scale processing" and would also likely be considered a de minimis departure from "ranching and dairying" as described in the enabling legislation, related congressional testimony, and Secretary Salazar's directive." Lastly, as an aside, the Marin County Crop Reports show that combined ranching and dairying income can fluctuate by 20%, so a 10% limit on diversification income intended to mitigate elk impacts would incidentally serve to flatten out those ups and downs. Thus we urge that the dEIS should consider how best to assess income from ranching operations, income from diversification operations and the appropriate rent for the diversification.

#### DIVERSIFICATION: Fixed Cash Rent

There are two common methods for agricultural landowners to assess rent for use of their land: "fixed cash method" and "crop share method." The AU-based rent calculation for the current chicken operation represents (albeit poorly) the fixed cash method. If this AU method were to be carried forward for 18 chicken operations with 500 layers each, then that would result in a grand total of merely \$3,094 rent ( 0.64% of gross sales) for chicken operations grossing a combined \$481,950. This compares to the previous estimated rent percentage (12.6% of sales) for PRNS grazing land and standard crop share agreement that have rent at 25% of sales.

In our opinion, such a fixed rent calculation for chickens based on AU would significantly shortchange the public for use of its land and unnecessarily cripple PRNS in its ability to manage diversification activities and fund environmental protection. Assessing/monitoring for multiple diversifications almost certainly requires more effort and cost than for grazing land.

If the fixed cash method is used to determine diversification rent, then to avoid the problems in past and current FMV appraisals, it would seem necessary for industry specialists in each diversification type who could provide a fair estimate of both projected income and appropriate rent. The dEIS should consider the cost and complexity of multiple separate such appraisals.

#### DIVERSIFICATION: Crop Share Rent

Consequently, we urge the dEIS to consider the alternative, which is a crop share agreement that appears to be the easiest method to assess both income and the rent. A typical crop share agreement considers 25% as rent to the land owner and could generate as much as the dEIS socioeconomic estimate of total PRNS sales of \$16M x the suggested 10% diversification limit of 10% x the standard 25% crop share rent = \$400,000 in rental income for PRNS (vs -\$480,000 in estimated rent from grazing)(5). A 25% crop share agreement would help PRNS ranchers to offset elk impacts and also help PRNS by generating rental income that could go toward better monitoring, more effective management and additional environmental improvements.

A crop share agreement would also obviate the need for the specialized assessments of the "fixed cash method" because the rent would be assessed retroactively based on the rancher providing accurate sales records for the diversification (and ranching sales). Thus the dEIS should consider modeling such language requiring sales records on the similar language in Lease Template #7: Lessee shall provide all sales documentation to NPS upon request demonstrating that Lessee has an ownership interest in all cattle on the Premises.

Lastly, extreme care must be taken so that diversification operations allowed today do not become a new baseline against which new diversification proposals are measured tomorrow. To avoid such an outcome is why we suggest that the dEIS consider measuring diversification income against income from "ranching and dairying ... so that the public can be certain that PRNS stays true to the original intent that "ranching and dairying" (rather than diversification) be allowed to continue as the principal use and be proportionate to estimated economic impacts from elk. The above suggested 10% limit could (if fully utilized on all PRNS ranches) generate as much as \$1.6M in gross sales for ranchers.

Further, elk impacts on the average ranch (with the exception of C Ranch) are not expected to exceed 10% of sales for the average ranch and thus the proposed 10% diversification income limit would seem to provides

reasonably adequate mitigation for elk impact costs (see our Elk comment).

#### DIVERSIFICATION: Definitions

Consequently, we urge that the dEIS should consider making its programmatic policy clearer (example follows) when it describes allowed diversifications (pg. 37).

"Diversification of ranching activities under alternative B could include new types of livestock, row crops, horse boarding that includes a public component. public-serving ranch tours and farm stays, small-scale processing of dairy products (e.g., cheese) produced on site. and sale of local agricultural products produced on site.

Diversification activities authorized in the...Ranch Core subzone:

- New Types Qf Livestock species (pigs, chickens, sheep, and goats)
- Horse boarding activities that include a public component (riding/renting)
- Row crops
- Public-serving ranch activities that support park goals for interpretation and education (i.e., farm stays, ranch tours)
- Small scale processing of dairy products from milk produced on site."

#### DIVERSIFICATION: Ranch Core Opportunities

There appear to be discrepancies between the Appendix A's Alternative B Ranch Maps and the underlying leases on the PRNS website, which introduce confusion as to whether diversification limited to ranch cores would be allowed. For example, Figure 20 shows Home Ranch with a developed complex, but leases AGRI-8530-9007 and -1003 do not include this developed complex, and instead reference only "incidental use of a ranch house." The dEIS should consider clarifying that AGRI-8530-9007 and -1003 will not be authorized for diversification that is limited to ranch cores (i.e. incidental use of a ranch house qualifies as neither a developed complex or a ranch core).

Figure 27 show the Mcisaac/Cheda Ranch (Lease 8530-1000-9012) with 2 developed complexes, but the dEIS should consider clarifying that if a ranch has a developed complex ranch core, then the lessee will have one ranch core diversification opportunity, no matter how many ranches with ranch cores are in the name of that lessee. This same logic should apply throughout the dEIS, including but not limited to A and E Ranches (Leases 8530-2600-9002 and -9009) and the Percy Ranch (Lease 2600-10-1002).

A related issue concerns families with multiple ranches with ranch cores, at least one of which are in (or could be changed to) virtually the same, but not identical lessee names. Simply changing one name from a list of lessees on should not add a ranch core diversification opportunity. Thus the dEIS should consider making clear that when names on different leases that are substantially (>50%) the same and more than one of the leases has ranch core, then only one ranch core diversification opportunity will be allowed per family. For example, two ranches with ranch cores that are leased to same four lessees per the prior paragraph should have one ranch core diversification (e.g. 5 pigs) opportunity and changing one of the four lessee names on one ranch lease should not create a second diversification opportunity (i.e. 10 pigs).

#### DIVERSIFICATION: On-Site

Without such clarification re on-site origin, the dEIS could be interpreted to mean, for example, that milk could be trucked in from dairies outside PRNS for "small scale processing" ... or that 18 farmers market could be established to sell local agricultural products from outside PRNS, We do not believe that any of these examples represent the intent of the dEIS, but we urge that the dEIS further clarify that intent.

We also note that first sentence of the above dEIS diversification references "sale of local agricultural products" but the bulleted list below of activities potentially authorized in the Ranch Core subzone does not reference "sale of local agricultural products." We assume this to mean that the dEIS has reasonably concluded that the traffic, heath-and- safety and liability impact of 18 farm stands (whether in ranch cores or roadsides) is unacceptable. Instead, we suggest that the dEIS consider expressly prohibiting such sales and instead expressly authorize sale of agricultural products produced on PRNS ranches at weekend seasonal "farmers markets," e.g. in Point Reyes

Station or in the visitor parking lot at Bear Valley or Drakes Beach.

#### DIVERSIFICATION: Horses

PRNS has had legacy horse boarding operations operating on public land that were de facto private facilities open only to family and friends with no public component. These operations have now or will soon end but the dEIS diversification proposal should not breathe new life into this legacy. The dEIS allows farm stays and ranch tours as diversification only when they "support park goals for interpretation and education." A similar logic should apply to boarding private horses, so the dEIS should consider authorizing horse-boarding only when the boarding opportunity is open to the public and there are rental horses available so as to support park goals for recreation and public access. This is the same public component logic the GGRNA applied to the Golden Gate Dairy's then private-only horse boarding.

The dEIS should also consider whether more publicly available horses on diversified ranches would materially impact existing public horse boarding/riding concessions in the Seashore and if so, should consider a cap on the number of horses or operations that would be allowed as diversification.

#### DIVERSIFICATION: Row Crops

The dEIS also describes the 2.5 acres potentially authorized for diversification in potentially contradictory ways, so the dEIS should consider clarification. The predominate definition

(emphasis ours) is per Page 37: Up to 2.5 acres of row crops not requiring irrigation would be allowed in previously disturbed areas in the Ranch Core subzone. However Pg. 51 reads differently: Ranch Core subzone: the developed complex of buildings and structures on each individual ranch including up to 2.5 additional acres of disturbed land immediately adjacent to the developed complex. Page 51 (and similar phrasings) should be corrected to conform to the Page 37 description of the 2.5 diversification acres as being within the -10 acre Ranch Core, not 2.5 acres in addition to the -10 acre Ranch Core.

Further, the dEIS does not make explicit the definition of its term "row crop." This leaves open the possibility that any crop planted in a row is a "row crop." We urge the dEIS to consider referencing the USDA California definition of a row crop that explicitly excludes "a crop planted in rows." This would eliminate the previously cited extreme example cited of exotic mushrooms planted in rows and would also eliminate the growing 21/2 acres of livestock food.

Although this more explicit definition of row crop would also presumably eliminate the growing of grain that could be processed (by a "small scale craft distillery) into whiskey for on-site bottle sales of agricultural products produced and processed on site, the dEIS should consider explicitly prohibiting crops grown for alcohol distillation. At the USDA's estimate of 34 bushels of rye per acre and two gallons of 190 proof whisky per bushel, then the 2112 acres could produce 2,027 of 750ml-bottles of 90 proof whisky for sale. This is just another example of the Pandora's Box that diversification could open and why diversification needs to be carefully defined, monitored and limited. Cannabis is another crop now illegal on federal land, but perhaps not for long, so the dEIS should also consider explicitly prohibiting diversification into cannabis.

#### DIVERSIFICATION: Pasture/ Chickens

The dEIS Alternative B (pg. 37) reads "Diversification activities authorized in the Ranch Core and Pasture subzones are ... Pasture subzone: Livestock species (sheep, goats, chickens)." But there appear to be two separate issues here that have been rolled into one sentence. Sheep and goats are proposed to be eligible to be authorized in the pasture zone of all ranches, but chickens are proposed to be eligible to be authorized in the pasture zone of only the 18 ranches with a ranch core (dEIS pg. 187: "if all 18 ranches that are eligible to raise chickens..').

The dEIS does not make clear the rationale for this distinction. Appendix D pg. D-48 states:

"Conduct daily inspections and quickly pick up livestock (i.e., sheep, goat, and hog) and fowl (i.e., chicken) carcasses ... " The requirement for daily inspections for sheep and goats is not a function of having a ranch core because they are authorized on pastures without a ranch core. Chicken huts need to be moved and inspected daily, so it is not clear why chickens are limited only to pastures with a ranch core. Further, if diversification is going to offset elk impacts, the handful of ranches without a ranch core could benefit from diversification into chickens just as much (if not more) than diversification into sheep and goats.

The dEIS also does not make clear the rationale for the 500 chicken limit. A 500 chicken cap produces wildly disproportionate income impacts: income from 500 chickens a small PRNS ranch would equal 100% the income from beef on that ranch, while income from the same 500 chickens on a PRNS dairy would represent less than 1% of dairy income. But, as we have suggested, income from diversification should remain supplemental to, not a replacement of income from "ranching and dairying."

Further, chicken huts need to be moved daily so that the intensity of chicken manure can be spread rather than concentrated (dEIS pg. 187), so 500 chickens on a 100-acre PRNS ranch would appear to have 5 times the potential impact compared to the same 500 chickens on a 500-acre PRNS ranch. Further still free-range chicken and cattle are synergistic (chickens control bugs from cattle dung while fertilizing the soil for cattle forage). For all these reasons, we urge the dEIS to consider whether it would make better economic, elk offset and environmental sense to retain the dEIS-impact-analyzed 9000 total chickens but divide them among ranches in the same way that sheep and goats are allocated (as a percentage of AU vs the current 500 cap).

Using the AU adjustment suggested below for sheep and goats, the 2,400 beef AU plus the 3,130 dairy head ( dEIS pg. 52) would represent an AU equivalent of 3,443 for all PRNS ranches combined. Dividing 9,000 chickens by 3,443 AU equals -2.6 chickens per AU. Thus under this allocation logic, the smaller (40 AU) PRNS ranches could be authorized for -100 chickens, while the larger (-285 AU) PRNS ranches could be authorized for -750 chickens.

The dEIS also limits the number of chicken sheds to 3. The dEIS should consider whether limiting the height and color of the sheds could result in less visual impact than limiting the number. For laying hens, the existing chicken operation uses large plastic covered hoop sheds, with a peak that appears to be 10-12 feet high (broiler coops are only 2 feet high). Other Marin pastured egg producers use old travel trailers with a height roughly the same. Fifty-four dilapidated aluminum-sided travel trailers scattered across PRNS pasture land could create 54 unnecessary visual impacts. Thus the dEIS should consider limiting the height of chicken huts to 6 feet (to allow walk-in egg collection) and limiting the colors to those beiges and greens that correspond to the pasture colors.

Further because the dEIS (pg. 187) notes that "chicken manure could adversely affect soil because of its high content of nutrients and heavy metals," and "Moving chicken huts using motor vehicles could result in adverse effects ... "it would seem that, for example, six half-sized huts could be more easily moved by hand than 3 full-sized huts. Thus the dEIS should consider removing the limitation on the number of huts and adding a mitigation that requires any chicken hut on pasture to be moved only by hand and no less than once per day.

#### DIVERSIFICATION: Pigs

The dEIS puts a maximum limit on sheep (50) and goats (67), on chickens (500) and on row crops (2.5 acres), but there are no limits on the number of pigs that could be raised within each of the 18 ten-acre ranch core zones. Assuming 5 acres (1/2) of the ranch core could be devoted to pigs as a diversification, the number of feeder pigs per ranch could be as high as 250 with the total number on PRNS ranches at  $18 \times 250 = 4,500$  pigs. The dEIS should consider whether it is appropriate to set an expectation with ranchers and the public that the number of pigs allowed as diversification is limited only by available space in the ranch core and if that expectation is not appropriate, then establish a limit per below:

Our understanding (Point Reyes Rancher personal communication) is that pigs were historically used on PRNS ranches to consume both kitchen waste and agricultural waste (chiefly whey from cheese operations) and thus their numbers were de facto limited to a few pigs per ranch due to the limited amount of food available from on-site sources. Pigs also are "escape artists" that can "root" under standard fencing. Escaped pigs go rapidly feral and do great environmental damage ... with a conservative annual estimate of \$1.5 billion in economic damage

nationally to agriculture and the environment." Having as many as 250 feeder pigs in a ranch core would make containment difficult and the discovery of one missing pig out of 250 also more difficult. Thus the dEIS should consider prohibiting the importation of hog feed from off-site sources and limit on the number of allowed pigs to no more than five.

#### DIVERSIFICATION: Pasture/ Sheep and Goats

The dEIS pg. 38 states: "For individual ranches, grazing by sheep and goats in the Pasture subzone would not be allowed to exceed 10% of their authorized AU or 10AU equivalents if the authorized AU is greater than 100 (whichever is less)." But the problem with the way this limitation is stated is that most PRNS dairies do not have authorized AU ... instead they have an authorized number of cattle. It should not be the intent of the dEIS to de facto prohibit dairies from diversifying with sheep or goats. Thus we urge the dEIS to consider how to apply the 10% AU concept that works for beef ranches also to dairy ranches. A rough method could be to consider that organic dairy cows must get a minimum ~ 1/ 3 of their dietary needs from inground forage, whereas beef cattle get closer to 100% of their needs from in-ground forage, thus 10% of authorized beef AU is approximately equal to 3.33% of authorized dairy head.

#### DIVERSIFICATION: Structures

Lastly, we urge that the dEIS consider requiring a bond to guarantee that any structure or alteration proposed to be built for use in any diversification operation will be removed and the area restored to its prior condition. We don't want a repeat of the Drakes Estero clean up that cost the NPS \$4M to remove nearly 1800 tons of mariculture debris.

#### DIVERSIFICATION: Transparency

The dEIS (pg. 37) states that proposed Alternative B fair market value (FMV) master appraisal process "would allow for ... more transparency regarding rental rates in the park." But the dEIS does not explain how that transparency would be achieved. We request that the dEIS commit to posting these appraisals on the PRNS website (with appropriate and necessary redactions). Prior leases gave only the lessee the right to challenge an appraisal. We request that the dEIS allow the public the same right as Lessees to review and challenge these appraisals.

We also urge that the dEIS consider ways to make sure that the master appraisal process fixes problems noted in our 1/27 /16 letter (incorporated by reference), including (for structures) : Poor/Unidentified Comps; Special Lease Provision (Maintenance) Discount; Bulk Lease Provision Discount; Buildings claimed as Surplus to ranch use may not be surplus to residential or diversification use, Hay Barn Rent; and Buildings Not Used. Our 1/ 27 / 16 letter also identified problems in the former appraisals for grazing land, including Poor/Unidentified Comps; Distance from Petaluma Discount; Public Access Discount; Possessory Tax Discount; Chemical Restriction Discount; Limits on the Eradication of Non-Forage Ground Cover Discount; and Regulations on the Control of Predators Discount.

#### ALTERNATIVE B: ELK MANAGEMENT

##### ELK: Overview

According to the US Fish and Wildlife Service and the California Department of Fish and Wildlife (CDFW), November 2017 Draft Elk Conservation and Management Plan, Tule elk are neither threatened nor endangered. Elk populations are booming with 5,700 Tule elk and "Conflicts between expanding elk and human populations [being] significant at some locales."

In the absence of natural predators, lethal management measures for ungulate populations are in widespread use both nationwide and in California (6) Consistent with the widespread use of lethal management, the NPS already stated in 1998 that it would use lethal means to manage the free-range elk herd (7).

Many of the public appear inconsistent in their belief that the NPS should not manage elk (a charismatic megafauna), but at the same time the public expresses no concern about NPS management of non-charismatic wildlife. But, in our opinion, the NPS must manage its wildlife based on science, rather than charisma(8).

Further, many of the public believe that the NPS is only responsible for protecting wildlife, but this belief is contradicted by the statutory requirement that the NPS must also protect cultural and recreational resources (without impairing natural resources). The public's confusion is understandable, given that most NPS-managed sites are either wildlife-oriented (Yosemite) or culturally-oriented (the Presido), whereas PRNS is a blend. Thus, PRNS management of the Drakes herd to protect cultural resources (historic ranches) is consistent with both NPS management elsewhere and with other PRNS wildlife management efforts(9).

Some of the public have argued for the elimination of the ranches to benefit the elk while others have argued the opposite position for the elimination of the elk to benefit the ranches. But the dEIS states: "NPS has set a population threshold of 120 adult elk [ for the Drakes Beach herd]." This appears to be a reasonable compromise between these two opposite positions.

#### ELK: Inconsistencies

The dEIS (pg. 24-25) describes a number of elk impact mitigations in Alternative A, including : "Providing pasture offsets, including identifying access to additional pasture for ranchers to offset forage lost to grazing elk."

The dEIS (pg. 40) re Alternative B describes all the actions on pages 24-25, but omits Providing pasture offsets : "NPS ... would continue to take actions described for alternative A to reduce conflicts related to the presence of elk on ranches (e.g., hazing); mitigate elk damage to ranches; and conduct monitoring, disease testing, and reporting."

The dEIS should consider making these two statements consistent by adding pasture offsets to the page 40 Alternative B description.

#### Elk: Forage Model additions

To provide a more complete context within which to assess the proposed 120 elk, we urge the dEIS to consider breaking out components of the Appendix I Forage Model, which now does not quantify the amount of forage that "disappears" per the Appendix I references. Some of this forage disappearance is likely be due to life cycle of the forage plants themselves, but we believe another important component is the impact of multiple other forage-consuming wildlife, including deer, birds, gophers and rabbits. We believe it would help the public better understand elk impact on ranch forage if the elk impact was considered in the context of other wildlife impact on ranch forage.

We also suggest that the Forage Model could be a better predictor if it broke its current use of total annual rainfall data into at least two segments (early and late). The impact on forage of the timely rainfall can be more important than total annual rainfall.

#### Elk: Impact of the 45 Roaming Limantour Bulls

The dEIS (pg. 81) states: "Approximately 45 males spend time on ranch lands at any one time with most concentrated use on Home Ranch, N Ranch, D. Rogers Ranch ... Most males return to the wilderness areas ...from summer into fall." According to PRNS wildlife biologist Dave Press (8/26/19 email): "Tule elk at Drakes Beach are the equivalent 0.26 to 0.47 animal units based on the actual weights." Assuming the higher .47 AU for elk males, then those 45 roaming Limantour bulls represent 21.15 AU x 9/12 months = 15.86 AU of forage consumed. We will use this figure in the subsequent analysis of the 45 Roaming Llmantour Bulls.

The dEIS appendix K shows Home Ranch with 300AU, N Ranch with 90 AU and D, Rogers Ranch with 55 AU for a total of 445 AU. Assuming all the bulls were concentrated only on these three ranches, the AU impact would be

roughly 3.6%.

However, we also believe it is useful to look at absolute economic impact in dollars in addition to looking at the forage impact in percentages. Using the dEIS estimate of \$1.6M in beef sales and 2400 beef, one head of beef represents \$667 in sales. Thus the estimated 15.85 AU of forage consumed by the roaming Limantour elk represents roughly \$10,567 in lost sales (3.6%) out of an estimated \$296,815 in estimate sales for these 3 ranches combined.

Thus, it would appear that the 10% limit on income from diversification (if fully implemented on these ranches) would more than suffice to mitigate for the lesser percentage elk impact on income.

Lastly, the dEIS (pg. 41) commits to maintaining this minor level of impact when it states: "Elk from the Limantour herd would be allowed to wander ... and they would be monitored closely and managed in consideration of ranch operations. Hazing and lethal removal may be used ... to mitigate for impacts on ranching operations. Thus, for the 45 bulls, the dEIS appears to commit to maintaining an ( un-quantified) level of ranch impact rather than a specific number of elk. Committing to a level of impact provides NPS with operational flexibility in managing elk.

For example, if all 45 roaming bulls began to concentrate only at the D. Rogers Ranch with its 55 authorized AU, then this might be determined to be an excessive 28.8% (15.86/ 55) impact on forage and income and thus action might be taken to reduce the number of not-roaming elk on D, Roger Ranch below 45. Conversely if the 45 roaming bulls began to spread out evenly across all PRNS ranches (rather than just on Home, N and D. Rogers Ranches), then it is possible that more than 45 bulls could be allowed yet have the same minor level of impact per ranch.

Elk: the Drakes Beach Herd and C Ranch

The Forage Model (Appendix I) for C Ranch (the most impacted by elk) shows that the difference between 3 elk and 170 elk is the difference between an 81% chance of meeting the 1200 RDM vs a 75% chance ... a seemingly trivial 7% difference. Thus it would appear that more than 120 elk could be supported on C Ranch without unduly impacting forage.

The dEIS references but does not quantify the non-forage impacts of elk on C Ranch (broken fences, pipes, injured cattle etc.), which the dEIS commits the Seashore to mitigate. We acknowledge that such mitigation would be facilitated if C Ranch would submit documentation of impacts, which to-date has been lacking. Lack of documentation allows stories of valid onetime/ occasional impacts to be repeated, making it appear that the impacts are chronic. As most of the public who have insurance policies understand, insurance companies require extensive documentation before issuing reimbursement checks. PRNS, as custodians of the public's money, is no different, so it is not clear to us why the C Ranch operator would fail to document elk impacts in order to support the long-term viability of the ranch.

Regardless, it would be useful if the Forage Model disclosed more detail. Unfortunately although numerous percentages, numbers and durations are given on dEIS page 91 for the time males vs females spend in one place or the other and at one season or the other, the crucial question of how much forage these elk consume of C Ranch remains unclear in the dEIS, although it presumably is a specific value that is entered into the Forage Model.

Assuming the midpoint (of the Dave Press 8/ 26/ 19 email) of 0.365 AU for Drakes Beach elk, then that is an effective AU equivalent for the 120 Drakes Beach herd of 0.365AU times 120 elk = 43.8 AU of forage consumed. But that 43.8 AU is consumed on a combination of three different areas: C Ranch, E Ranch and unpermitted grazing areas. For purposes of this analysis we will assume that absent hazing, the elk would spend 1/ 3 of their time on the C Ranch portion of the three areas which would result in a forage impact on C-Ranch of 14.6 AU

Further, the dEIS pg. 98) discusses the effect of hazing in some detail but again without disclosing the specific value that is entered into the Forage Model: "During initial hazing efforts, the elk were hazed in the morning but often returned by evening. Through repeated efforts, hazing has been more effective at keeping elk away from C Ranch for longer periods. Hazing has not been very effective for bachelor groups." For purposes of this analysis we will assume hazing is 50% effective at reducing forage impacts on C Ranch, which results in a net forage impact

on C Ranch of 7.3 AU. As we have stated re the usefulness of providing the impact of other wildlife on ranch forage, we similarly believe it would help the public better understand the reasonableness of the calculated elk impact on C Ranch forage if the actual values entered into the Forage Model were disclosed. Absent this data, our net elk forage impact of 7.3 AU on C Ranch is necessarily rough.

We also note that the Forage Model incorporates the mitigating effect of hazing, but appears to ignore the 2003 pasture offset that also serves to mitigate elk impacts, as noted on dEIS page 25: "Providing pasture offsets, including identifying access to additional pasture for ranchers to offset forage lost to grazing elk."

When D Ranch closed, the Drakes Beach herd had already established itself. D Ranch was ultimately divided between C Ranch, E Ranch and the Drakes Beach elk. As a result of this division, C Ranch got an additional 36 AU. The omission of this offset from the Forage Model demonstrates the same concern we expressed in our Diversification comment: "Extreme care must be taken so that diversification operations allowed today do not become a new baseline against which new diversification proposals are measured tomorrow." In the case of elk at C Ranch, it appears that the pasture offsets made yesterday have become a new baseline against which elk impacts are measured today.

#### ELK: Dollar vs Forage Impact

Using the previously estimated 7.3 AU of forage consumed by the Drakes Beach herd, it would appear at first blush that the previously-added 36 AU for C Ranch cattle has already more than compensated for the forage consumed by 120 Drakes Beach elk on C Ranch. This may be why the Forage Model shows little impact difference between 3 elk and 170 elk. However, not all forage is created equal. Dairy cows need to be milked twice a day, so there is a limit to how far they can forage. The D Ranch Pasture A that was given as an offset appears to be at such a distance from the C Ranch milking barn that it is used only for heifers (that are not milked). Consequently, if the offset is 36 AU for un-milked heifers, while the elk impact is on the forage used for milk cows, the two situations are not the same.

Further, if the estimated 7.3 AU of forage consumed by the Drakes herd at C Ranch is translated into absolute dollars of economic impact (rather than forage percentage impact), the result appears different than the trivial result of the Forage Model. Because organic dairy cows must consume at least 1/3 of their forage from in-ground forage, the estimated 7.3 AU consumed by elk reduces dairy cow numbers by 21.9. Using the dEIS estimates of dairy cow income (\$14.4M) and dairy cow numbers (3,130), a dairy cow represents \$4,601 in sales and 21.9 less cows represents an income loss of \$100,754 to C ranch. Applying that \$4,601 figure to Appendix K (Table 3-1) figures showing C Ranch with "200 milk cows, 40 dry cows, 100 heifers, 2 bulls," then C ranch has an estimated total income of \$1,573,542 and the loss of \$100,754 represents roughly 6.4% of C Ranch income. Our estimates are rough, but they do appear to show that the dollar impact from elk on C Ranch may be more significant than the Forage Model appears to show.

Although it would appear that the 10% limit on income from diversification (if fully implemented on C Ranch) would more than suffice (as it did for the Roaming Limantour bulls) to mitigate the percentage of elk impact on income at C Ranch, we urge the dEIS to consider whether the estimated absolute dollar impact of \$100,754 may warrant additional forage offsets if the Drake Beach herd is to remain at 120. Added forage offsets would be consistent with dEIS page 25: "Providing pasture offsets, including identifying access to additional pasture for ranchers to offset forage lost to grazing elk."

#### ELK: Forage Offset

To this point of forage impact, there appears to be two anomalies in Appendix K Table 3-1 that could be usefully applied to C Ranch mitigations. As noted above, when D ranch was divided, E Ranch got Pastures B and C, which lease# AGRI-8350-2600-9013 states is for "Grazing heifers on Pasture B at 72 Animal Unit's for 6 months per year (432 AUM's) and grazing beef cattle on Pasture C at 51 Animal Units for 6 months per year (306 AUM's), for a combined total of 738 AUM's annually." Thus this lease language shows  $738/12 = 61.5$  AU, not the 123 AU shown in Appendix K table 3-1, which appears to assume that the specified Animal Units are for 12 months instead of the actual 6 months. Thus the dEIS and Appendix K and L analyze the impacts of an overstated (by 61.5) number of

cattle AU. Rather than correct this anomaly, it could better be used.

Table 3- 1 correctly shows A Ranch with 350 milk cows, 50 dry cows, 90 heifers, and 6 bulls permitted but only 200 milk cows, 45 dry cows, and 35 heifers actual. Consequently, there appears to be more than enough capacity at A Ranch itself to absorb the 61.5 AU from D Ranch's Pastures B and C, which are currently used by A Ranch and which we suggest could instead be used by C Ranch with no change in the number of AU studied by the dEIS.

Thus in light of the growth of the Drakes Beach herd between 2003 and now, we urge the dEIS to re-consider the 2003 split of D Ranch and re-allocate its Pastures B and C to C Ranch. The additional 61.5 AU may not all be useable for C Ranch due to the distance from the C Ranch milk barn, but at least part of Pasture B is west of Drakes Beach Road. Even if none of Pastures B and C can be used to supplement dairy forage, and all went to beef forage, the added 61.5 AU combined with the previous offset of 36 AU would represent roughly  $97.5 \times \$667 = \$65,033$  of added income to offset (-64.5%) the estimated \$100,754 in income lost to elk impacts.

We note that D Ranch was a "closed" ranch that before the 2003 division and was not part of A Ranch. We have suggested that moving forward, (see Succession comments) that the dEIS should make clearer that new operators of closed ranches will not have the expectation of succession or 20-year leases because closed ranches provide PRNS important opportunities to make adjustments in ranch management as new situations arise. The D Ranch is a perfect example of this need to make adjustments. Such a re-consideration of the 2003 D Ranch split would benefit ranching because it would mean no loss for A Ranch, yet also provide more pasture offset for C Ranch, which has been hardest hit by elk impacts and the most vocal in pressing for complete removal of the elk. Thus we would also argue that PRNS could make this change on a purely environmental basis in that it would relieve pressure on the elk and insure that elk and cows could co-exist.

#### ELK: Manage to Impact vs Number

Lastly, while we support the concept of the 120 elk threshold for the Drakes Beach herd as mitigated above, we also suggest that the dEIS consider maintaining the level of impact from 120 elk, rather than the specific number of 120 elk. As noted re the 45 bulls, committing to a level of impact provides the NPS with useful operational flexibility in managing elk.

#### ALTERNATIVE B: APPENDIX D BEST MANAGEMENT PRACTICES (BMPS)

##### BMPS: Milestones

One of the rationales for extending leases to 20 years (with succession) was to allow ranchers to recoup their investments in environmental mitigations. We understand that these mitigation funding is usually split between agency and rancher...is not 100% within the control of either party and thus occurs "as funding, permits, and priorities dictate" (Appendix pg. H-1). But the dEIS, as written, could result in conditions being in 20, 50 or 100 years exactly as they are now.

For example, Appendix L 8.2.2 notes: "approximately 370 acres ... includes resource protection exclusion areas to prevent cattle grazing along the Drakes Estero shoreline, including portions of Creamery Bay, Schooner Bay, and Home Bay." But there is no indication of what percentage of the Estero shoreline protection this represents .... and the maps (dEIS Figure 6) are at such a gross scale, with each ranch map at a different scale that it is impossible for the public to understand the proposal. Similarly, Appendix L 8.2.2 notes: "In the Olema Creek watershed, new resource protection exclusion areas would restrict grazing from approximately 1.9 miles of riparian habitat ... but no indication of the extent of this habitat, what percentage has been protected, what remains to be protected and what percentage the proposed 1.9 miles represents.

This contrasts with aborted 2010 GMPA Figure 24, which graphically represents the proportion of fenced vs unfenced creeks and pg. 307 that quantifies: " ... 440 acres ... of herbaceous wetlands are in areas ... used for livestock ... " Thus we suggest that the dEIS should consider the importance of describing in both text and graphically each problem proposed to be mitigated, the percentage already mitigated and reasonable milestones by which the public should expect the remaining portion to be mitigated. The dEIS should also consider a webpage map to allow the public to see how the ranch zonings fit together, which may reveal other problems

currently un-knowable. The dEIS should also consider posting mitigations on its website so the public can follow progress toward these milestones. For example, the dEIS should consider setting a goal that within 10 years, cattle will be fenced out of creeks, herbaceous wetlands and shorelines.

Various practices are listed to manage impacts from "sacrifice" areas (feed and watering sites), but nothing is said about minimizing sacrifice areas such that no bare ground is exposed. Thus the dEIS should consider setting a goal that within 5 years, sacrifice areas shall be minimized by rotating among several beef feed areas such that no feed area has exposed ground.

Appendix D pages D-10 to D-11 provide reasons that ranchers should install alternative water sources but do not encourage installation of a single such alternative water source. The dEIS should consider setting a goal that within 5 years, watering areas shall be interconnected and water piped among disparate troughs such that no watering area has exposed ground.

Appendix D page D-10 states: "The area around the spring or seep would be fenced to control livestock access and improve habitat value." Nothing is said about ponds. The dEIS should consider setting a goal that within 5 years, spring and ponds shall be wildlife-friendly fenced at a minimum of 50 feet from the source in order to control livestock access and improve habitat.

Appendix page D-19 lists manure management actions that reduce greenhouse gas and California law (SB 1383) that targets "a 40 percent reduction in methane emissions from 2013 dairy and livestock." The dEIS should consider setting a goal that within 10 years, dairies would convert to management methods that achieve a 40% reduction in greenhouse gas.

Appendix pg. H-2 defines: as "Range subzone" where "Native grasses [are the] dominant species." Given that only 1% of California's native grasslands remain and that "90% of the state's threatened and endangered species are dependent on [these] grasslands", the dEIS should consider that native grass is a "keystone" species whose importance is not a function of being merely >50% in abundance or biomass ("dominant") in a plot. Thus the dEIS should consider a much lower metric than 50% ... for example, the ratio of the planning area dominated by native grass (9% per dEIS pg. 74). The dEIS should also consider proactive native grass restoration projects vs only reactive re-planting with native grass after a disturbance (Appendix pg. D-4).

Further, the dEIS should consider resolving the apparent conflict between Appendix L pg. 70 which states "The zoning framework would specify that only grazing would be authorized in approximately 70% of the action area" and the dEIS pg. 35, which notes that the 28,700 acre planning area (aka the action area) is divided into a Resources Protection Subzone of "2,600 acres (where only prescriptive grazing would be allowed), plus a Range Subzone of "16,900 acres and a Pasture Subzone of 9,000 acres in both of which grazing would be allowed. Thus dEIS would allow grazing in at least 91 % of the action/planning area (not 70%).

#### BMPS: Guard Animals

Appendix D pg. 49 establishes criteria for guard animals (dogs, llamas, donkeys), to protect sheep, goats and chicken in the pasture zone. We suggest that the dEIS consider (in order to reduce impacts on hikers and wildlife) limiting these livestock species to fenced sub-pastures. Further, according to PRNS chicken ranchers, a herd-trained guard dog will react to a perceived threat by defensively positioning itself between the flock the threat. A perimeter-trained dog will aggressively confront the threat at the limit of the pasture. The dEIS should consider approving only herd-trained guard animals because no inadvertent hiker should be confronted by an aggressive guard animal defending the entire pasture through which the hiker may be passing. The dEIS should also consider adding that guard animals aggressively approach hikers must be removed permanently from the pasture.

Lastly, it appears inconsistent for the dEIS on page 49 to allow dogs to haze wildlife to protect livestock, but on page 63 to prohibit dogs from hazing elk to protect livestock. Studies show the utility of dogs for this purpose. The dEIS should consider whether properly trained dogs under the management of trained on-site PRNS staff could assist in the effort to reduce elk impact.

## BMPs: Compost

We suggest the dEIS consider amending pg. 126 (underlined below) to read: "manure, compost and fertilizer spreading increases soil nutrients, which increases forage species production but may have adverse impacts on native grassland plant species." We also suggest that the dEIS consider amending pg. 35 to read: "The Range subzone is identified as lands where grazing would be authorized, but more intensive activities would not be allowed because of the documented presence of sensitive resources, including native grassland species, rare plants, wetlands, riparian/stream/pond habitats, forested areas, and critical habitat..."

The spreading of compost on dairy pasture subzone ("where no sensitive resources are known to occur"), is both environmentally and agriculturally superior to spreading slurry, but this comparative benefit does not extend to rangelands. The dEIS correctly concludes that spreading compost on rangeland "may have adverse impacts on native grassland plant species." But short-term species composition studies funded and promoted by compost advocates show little impact on native species, whereas species composition trends require long term analysis. As the California Native Plant Society 9/28/15 letter (10) noted: "critical questions must still be answered before Californians can be assured that the addition of compost will not adversely alter native species composition and structure of grassland habitats where the practice is applied." Further native grasses sequester far more carbon than the annuals(11). Thus we suggest the dEIS consider amending pg. 190 ("Carbon Farming") to point out potential risks to native species and their carbon sequestration from application of compost to previously unfertilized rangeland.

Not only does the dEIS (pg. 190) fail to point out the potential environmental risk of reduced native species due to the application of compost to rangeland but it also fails to point out the potential greenhouse gas risk from increased forage species due to application of compost to rangeland. Studies funded and promoted by compost advocates (dEIS pg. 180 footnote) show increased carbon sequestration in the soil, but fail to account for the substantially greater GHS impacts of the increased enteric emissions in the atmosphere from the additional cattle able to be sustained on the land by the "increases [in]forage species."

Instead, these studies claim that increased forage does not increase cattle numbers and only reduces the need for supplemental forage. That claim is likely true for dairy operations, where nitrogen from compost simply replaces nitrogen from slurry. But when compost is applied to previously unfertilized rangeland in beef operations (emphasis ours) "spreading the fertilizer over his land will eventually result in more forage, more beef and more profit." More beef creates more enteric methane, whose GHS impact is far greater than that of carbon.(12)

Further, the benefit of carbon sequestration in the soil plateaus, but the greater GHS impacting methane emitted into the atmosphere by "more beef" continues indefinitely. Analysis by SOS indicate that the GHG benefit of carbon sequestered in the soil (by more compost) is surpassed within a few years by the more than offsetting impact of enteric methane (by more beef). Thus, the applying compost to rangelands not only risks impacts to native species but it increases (rather than decreases) greenhouse gas. Compost application to rangeland is thus an environmental expense that is coincidentally an economic benefit to the PRNS rancher who owns a composting facility and advocates spreading his product throughout PRNS rangeland.

## ALTERNATIVE B: SUCCESSION

SOS supports the GMPA's draft Succession Policy (Policy) as consistent with long-standing Congressional intent, but the dEIS should consider making it clearer that under all circumstances when a ranch closes, the NPS will first determine whether it is still appropriate to maintain the lease/permit area in agriculture and if so to what extent and under what conditions. This is the same type of determination made for D Ranch and which resulted in some of the ranch (the steepest parts) being taken out of grazing for resource protection and the remaining (flat) parts being divided between nearby existing ranchers.

Thus, the continuation of the exact same prior grazing regime on a closed ranch newly offered to an existing PRNS rancher has not been and should not be automatic. Such closed ranches could be used to offset elk impacts, or to swap less environmentally valuable portions of that closed ranch with more environmentally valuable

portions of an existing PRNS, or to spread existing AUs, or for short-term commercial grazing as a placeholder, or to experiment with prescribed grazing. The NPS should retain full discretion on these closed ranches without creating any false expectations of how they "should" be used, Thus the dEIS should consider making this important initial consideration about closed ranches clearer by transferring language now in Succession paragraph 2 to instead be in paragraph 1.

Further, the dEIS should consider that same offer proposed to be first extended to PRNS ranch lessees to take over the operation of a closed ranch, should (if no takers among lessees) then be offered to PRNS ranch workers. We point out that many of the PRNS ranch workers have a longer history working on PRNS ranches than younger lessees. Further, many current PRNS ranch lessees are themselves descendants of former tenant farmers who owned neither the land or the cows on what is now PRNS (Livingston: Ranching on the Point Reyes Peninsula). Before the NPS seeks RFPs, the NPS should consider offers from PRNS ranch workers. Per above suggestions, see underline strikeout below.

The NPS would use the following process to maintain active ranch operations within the Ranchland Zone in a manner that supports park natural and cultural resource objectives.

1. In the event that named Lessees: (i) do not wish to enter into a lease/permit; (ii) cannot agree upon an arrangement among named lessees for continued operations under a new lease/permit, (iii) have not consistently met performance standards for the agricultural operation and other named Lessees are not willing to take on responsibility for improved operations: and NPS determines that it is appropriate to maintain the lease/permit area in agriculture (and if so, to what extent and under what conditions), the NPS would consider proposals from other leaseholders operating in the Ranchland Zone to continue ranch operations. In evaluating other park leaseholders, the NPS would assess proposed operations for consistency with the activities authorized as part of the final EIS and Record of Decision and past performance based on adherence to lease/permits and Ranch Operating Agreements.

2. In the event that no other park leaseholders are interested, and NPS determines that it is appropriate to maintain the lease/permit area in agriculture, the NPS would consider proposals from ranch workers on PRNS ranches to identify a new operator. In evaluating PRNS ranch workers, the NPS would assess work history on PRNS ranches and the criteria for review would be identified at that time.

3. In the event that no park leaseholder or PRNS ranch workers are interested, the NPS would pursue issuance of a request for proposals (RFP) to identify a new operator. The RFP process would be conducted consistent with NPS policy and regulations, and the criteria for review would be identified at that time.

The dEIS should also consider making clear that rancher operating under Reservations of Use and Occupancy (RUOs) will be offered leases (when their RUOs expire) subject to the same succession policy offered to current lessees. Conversely, the dEIS should also consider making clear that new operators of closed ranches (portions of which may be re-distributed to existing ranchers or to RFP awardees) do not qualify for the dEIS proposed on-going succession policy and such closed ranches will instead be managed on a case-by-case basis under conditions and terms wholly determined by the NPS.

#### ALTERNATIVE B: Lease Template

The dEIS should consider whether Agricultural Leases and associated documents should be a public document posted on the PRNS website with appropriate and necessary redactions. To that end, for example, the Lease Template paragraphs could be amended as follows (See underline strikeout below).

4.3 The "Ranch Operating Agreement (ROA)" shall be a public document posted on the PRNS website with appropriate and necessary redactions.

4.4 Minutes of the Annual meeting shall be a public document posted on the PRNS website with appropriate and necessary redactions.

The dEIS should also consider whether Agricultural Leases should include language to make lease conditions (including recommendations from Pacific West Region's Public Health Consultant) easier to monitor and enforce and to insure that diversification income is accessory to, not a replacement of, ranch income. To that end, for example, the Lease Template paragraph could be amended as follows.

7. ... Lessee shall provide documentation to NPS upon request demonstrating that Lessee has an ownership

interest in all cattle on the Premises. Lessees with diversification operations must provide annual sales information for both their beef/dairy operations and their diversification operations to NPS. Lessee is not permitted to allow use of the Premises for any cattle in which Lessee does not have an ownership interest. Cattle must be branded in a way that allows easy visual identification and Lessee shall include in this document (and thus make public) a copy or description of Lessee's brand.

9. Except as authorized in the ROA, Lessee shall not engage in any Diversification Activities on the Premises, including in the Pasture and Ranch Core subzones. If Lessee seeks to undertake any Diversification Activities, Lessee shall follow the approval process set forth in Article 21. Lessee shall provide documentation to NPS upon request demonstrating that Lessee has an ownership interest in any other diversification activity authorized under the ROA. Lessee is not permitted to allow use of the Premises for any activity in which Lessee does not have an ownership interest.

14.1. Wildlife management, including management of elk, removal of non-native species, and the restoration of native species, is the responsibility of the NPS. Lessee shall not engage in any activities that impact wildlife or that support or increase populations of non-native or invasive plant or animal species. Except as specifically authorized in the ROA.

18.3. If NPS authorizes Lessee to provide ranch worker housing, Lessee shall ensure, at its sole cost and expense, that such housing is safe, sanitary, and decent and that the physical condition of such housing complies with all Applicable Laws, including building codes. Lessee shall provide a copy to NPS of all health and safety inspections/reports received by Lessee, which, together with all such reports received by NPS, shall be a public document posted on the PRNS website with appropriate and necessary redactions. Lessee is also responsible for keeping exterior areas around such housing units clean and sightly.

19.4. Lessee shall maintain all water systems from the main line including the water meter, well pump and controls to the building(s) and outlying water spigots, water troughs, faucets, and stand pipes on the Premises. Lessee shall maintain water systems to show no evidence of leaks. Lessee shall also take all reasonable measures to conserve water through the use of water-restricting/low flow devices and low volume flush toilets. Lessee shall replace or repair any damage or loss to the water system within the Premises. Lessee shall prohibit livestock access within 100 feet of a water source used for human consumption. Lessee shall perform a Microscopic Particulate Analysis (MAP) on all water sources used for human consumption to determine if the source is under the direct influence of surface water and if so, will filter the water.

The dEIS should also consider whether Agricultural Leases should include language to clarify maintenance responsibilities on ranch roads newly proposed for additional public access and recreational purposes. To that end, for example, the Lease Template paragraph could be amended as follows.

19.11. Lessee shall maintain ranch service roads on the Premises in a serviceable and safe condition regardless of whether the service road is also designated for public access. No new roads or truck trails shall be established without prior written permission of the Lessor. Mitigation measures and other conditions related to ranch service road maintenance activities approved by NPS will be included in the ROA.

## ALTERNATIVE B: PUBLIC USE AND ENJOYMENT

### PUBLIC USE AND ENJOYMENT: Vacant Structures

In order to better support ranching and ranch worker housing in PRNS, and to provide affordable housing for those in the local community displaced as long term residents by use of local housing as Airbnb's for park visitors, the dEIS (pg. 33) should consider altering the decision making sequence as follows (per underlined additions and ~~strikeout~~ deleted sections: "When a structure, structures or an entire ranch complex becomes vacant, NPS would use the following process to determine its future use:

- NPS would first consider if the structure or complex could be used for NPS operational uses, such as housing, operations, visitor services, or partner use
- If NPS does not have a use for the structure or complex, NPS will offer the structure or complex to both PRNS ranchers and PRNS ranch workers for ranch operations, rancher housing, or ranch worker housing. A vacant

complex taken over by a PRNS rancher or PRNS ranch worker does not create a diversification opportunity in that complex or create any grazing opportunity in the surrounding ranchland, or any succession opportunity.

- If a PRNS rancher or PRNS ranch worker does not have a use for the complex or structure, NPS will issue a request for proposals, seeking proposals for adaptive reuse in ways compatible with park purpose and desired conditions, including use by a non-profit to provide affordable housing. Stabilization techniques such as mothballing structures may be implemented to arrest deterioration.
- If ultimately no use can be found for the complex or structure, NPS would consider demolition of the complex or structures after consultation with the SHPO.

The dEIS pg. 39 notes: "Under alternative B, ranchers would continue to use residential units, barns, and other structures. Occupancy of residential units in the building complex would be limited to immediate family members of lease/permit holders, employees of that ranch ( and their immediate family), and, with NPS approval, employees of other park ranches. However, we urge that the dEIS should instead consider whether use of residential structures in a ranch complex should be limited to that reasonably needed for ranch operation and intergenerational transfer.

We note that ranch families can be large and without this reasonable limitation, for example, a ranch owner with 4 married adult children each of whom has 4 married adult children could seek to occupy 21 residences, which would result in many members of that family commuting off-ranch to jobs while at the same time occupying on-ranch space that could house workers at PRNS ranches who would then have to commute from off-ranch sites to work on the ranch. Thus without this reasonable limitation, what the dEIS intends to be a ranch complex could turn instead into de facto family compound.

#### PUBLIC USE AND ENJOYMENT: Visitor Access

According to "Ranching on the Point Reyes Peninsula" (pg. 48) the H Ranch Road is the historic "Original Road from Olema to Point Reyes." We also request that the dEIS consider a walkover or "fat-man" gate at the current vehicle gate on the road to H Ranch because this gate prevents hikers from experiencing this historic roadway. The dEIS should also consider officially connecting this roadway to the trail to Muddy Hollow and including it on official trail maps. We know of no other historic roadway in PRNS that is similarly blocked to hiker access. Appendix E already plans to "consider alignments around the core of Home Ranch" and these could be designed to protect the privacy of occupants and use of the ranch buildings while still allowing the experience of the historic roadway.

Appendix E also suggests: Create a new trail alignment that highlights Drakes Estero. To that end, the dEIS should consider a trail to and interpretation of the site of the historic town of Point Reyes and its adjacent (former) wharf on Schooner Bay.

The dEIS should also consider adding new trails only when funding is also available for the decommissioning of surplus trails and roads that do not meet sustainability standards. For example, Appendix E suggests new trails connecting the Bolinas Ridge Trail with Highway One, but the November 2003 Trail Inventory and Condition Assessment also recommends decommissioning existing trails (McCurdy) connecting the Bolinas Ridge Trail to Highway One.

In light of the new Interior Department directive to allow electric bikes with speed up to 28 mph on all roads/trails now authorized for bicycles and in light of the dEIS proposal to newly open certain ranch roads to bicycles, the dEIS should consider prohibiting bicycle use of former ranch roads that have devolved into de-facto single track trails (e.g. Abbotts Lagoon, Kehoe, Chimney Rock and Estero Trails). The dEIS should also consider metering out such new bicycle prohibitions commensurate with ranch roads newly opened to bicycles so that there will be no short-term diminution of bicycle opportunities and as more ranch roads are open, a possible long-term increase in bicycle opportunities.

In light of the continuing inability of PRNS to manage both official and un-official boat-in sites on its parklands along the east and west shores of Tomales Bay, the dEIS should consider whether PRNS should demonstrate effective management of these official and un-official existing boat-in sites before adding any new boat-in sites.

(3) The dEIS (pg. 92) states: "Only one ranch runs a poultry operation in the planning area. It was assumed that this operation uses Rhode Island Red chickens that can produce up to 300 eggs per year and that the operation has 2,000 laying hens. It was also assumed that one dozen eggs sell for \$0.87 (2017\$) (USDA-NASS 2018a). Based on these statistics, this operation can raise \$43,300 per year from egg production. The dEIS egg statistics are suspect. The \$.87 / dozen (2017\$) is a national statistic for egg dozens that overwhelmingly represents producer-level sales to mass market distributors of eggs from caged hens on factory farms. National statistics on egg sales to mass-market distributors are inapplicable to egg PRNS producers who often bypass the traditional 33% distributor markup and sell directly to retailers or

further avoid the traditional 50% retail markup and sell directly to consumers ... both resulting in higher sales dollars per dozen than the national statistic. Further still, national statistics on egg sales based on factory farms are inapplicable to California eggs since passage of Prop 2, which increased egg prices in California. Lastly, national statistics on egg sales based on factory farms are inapplicable to PRNS-produced eggs because PRNS producers, by permit, would (and currently do) produce only pasture-raised eggs, which sell at a much higher price comparable to prices for organic eggs.

There is no ideal egg price index, but we believe that the best available price index is not the dEIS choice of the national statistic for sales to mass market distributors of eggs from caged hens on factory farms (\$.87 per dozen), but rather data from USDA-NASS-2016 California Organic that shows the California value at \$2.38 /dozen. The appropriateness of our suggested valuation (and the inappropriateness of the dEIS valuation) can also be inferred by working backwards from the local retail price of \$5.99 / dozen (less industry standard markups of 33% at wholesale and 50% at retail = \$3.00 / dozen at producer level). The dEIS also assumes 100% of eggs are marketable, which is unrealistic. Using the organic price data and a 10% loss factor, the existing PRNS poultry operation of 2000 layers can raise \$107,100 per year from egg production (not \$43,300 per the dEIS).

The dEIS (pg. 92) broiler data is similarly suspect when "it was assumed that this operation sells 900 broiler hens per year based on park permit data and that these broilers are sold for \$3.39 (2017\$) per head (USDA-NASS 2018b). But the dEIS fails to understand that the 900 broiler hens allowed in the permit are raised to market weight once every 6 to 8 weeks, so the nine months on pasture results in sales of  $900 \times 6 = 5,400$  broilers, not 900. Further, for all the same reasons cited above for egg valuation, we believe the best available data is from the USDA 2016 California Organic report, which shows broiler sales at \$7.44 per head, not the dEIS assumption of \$3.39 per head. Using this organic data and a 10% mortality factor, the existing PRNS poultry operation of 900 broilers layers can raise \$36,158 per year from broiler sales (not \$3,051 per the dEIS).

The dEIS, using inapplicable USDA data, then concludes, "One commercial chicken operation supported 2,000 laying hens and 900 broilers, which were assumed to bring in approximately \$50,000 annually in egg and meat poultry sales." The more realistic figure, based on USDA California organic data and accurate broiler data, for the current operation of 2900 chickens would be almost three times higher at \$143,258.

(4) As an extreme example, 2.5 diversification acres collecting fog condensate and growing rows of gourmet mushrooms could be a \$16 million dollar business, which would render the income from the associated ranch as insignificant and which would equal the combined income from all the ranches and dairies in the planning area. A more likely example (using our above assumptions) would be a PRNS ranch with 500 laying chickens generating \$26,775 in chicken income. Using the dEIS figures for the planning area of \$1.6M in beef income and 2400 head of beef (" \$667 /head), then income from 500 chickens (\$26,775) would exceed the beef income on smaller PRNS ranches (under 40 AU) and represent an offset for elk impacts of 100% of ranch income, which is obviously excessive.

(5) Multiplying the dEIS estimate of total PRNS ranching income of \$16M times the suggested diversification limit of 10%, would generate total diversification income of \$1.6M and at the suggest crop share rent of 25%. net rent to PRNS of \$400,000. This is comparable to current rent paid to PRNS from ranching operations, which we estimate to be roughly (dairies are different) the DEIS PRNS cattle count of  $5715 \times \sim \$84/m$  per AU =  $\sim \$480,060$ .

(6) The CDFW Plan notes: "Where it is (or may become) necessary to alleviate property damage and public health/safety problems ... regulated hunting is the recommended primary method of population control ... approximately 330 elk [hunting permit] tags per year [are issued]."

(7) In the 1998 Elk Environmental Assessment (EA), states: "The Park Service has a responsibility to be a good neighbor to adjacent and nearby landowners .... any depredations by elk on fences, crops or other property would require mitigation .... the Seashore will be ready to recapture or destroy animals should these situations arise."

(8) The January 2015 Coastal Dune Restoration Environmental Assessment (EA) assessed the elimination of habitat for (aka managing for the elimination of) thousands of native deer mice, which, like Tule elk, are native but neither threatened nor endangered. And like the GMPA dEIS conclusion that managing Tule elk to a 120 level in

the Drakes Beach herd will not significantly impact the statewide Tule elk population, the Dune EA concluded that destroying thousands of native deer mice in the Dune Restoration would have "moderate adverse impacts ... [but] ... park-wide adverse impacts would be no more than negligible." This is an example of a NPS balancing act this time between an endangered plant (Tidestrom's lupine) and native wildlife.

(9) In 2019, when elephant seals took over Drakes Beach, a popular recreational site, PRNS decided to allow pupping seals to use the beach in the winter when recreational use is low, but to haze molting seals off the beach in the summer, when recreational use is high. This is one of many typical NPS balancing acts, this time between wildlife resources and recreational resources.

(10) CNPS 9/28/15 letter to CA Assembly: "one of your witnesses may have made misleading statements giving the impression that they were representing or reflecting the views of the California Native Plant Society (CNPS). The witness was Mr. John Wick, of the Marin Carbon Project ... One of Mr. Wick's opening comments was to tell the Committee that he was a member of CNPS; indeed he was a member, he had joined on August 17th, the previous day. To be fair to Mr. Wick, he did not say he represented CNPS, but it is hard not to conclude that was the intended message. I want to be clear in assuring you that Mr. Wick did not and does not speak for CNPS, and CNPS does not entirely embrace what Mr. Wick is advocating regarding compost-onto grasslands .... The practice of applying compost to grasslands is a complex subject that deserves scrutiny ... we see potential risk in applying compost to grasslands. We need to better understand whether the addition of compost will adversely alter native species and species diversity. Unintentionally altering grassland species ...

(11) Invasion of non-native grasses causes a drop in soil carbon storage in California grasslands Koteen, Baldocchi, Harte

Name: Crawford, Kyle

Correspondence: Regarding Point Reyes National Seashore General Plan.

My family members are frequent visitors to Pt. Reyes and Tomales Bay. Our greatest Joy is to witness the Elk of Pt Reyes and their magnificent herd. We understand that resource protection in the area must take precedence over commercial businesses and actions. The Tule Elk are only at this National Park. They have been successfully managed by the Park since their resettlement. The loss of ½ tule Tomales Pt herd resulted from prioritizing cattle grazing over their free roaming. Ranches on Pt. Reyes have enjoyed subsidies from the federal government - grazing fees below market, tax funded improvements. It is critical that they accommodate the Elk and other wildlife, and Not be expanded at the expense of the National Park wildlife needs.

Or last visit to Pt Reyes 9/10/19 found a group of cattle on South Beach. They had to be transported back to pastures. The cattle are not consistent with Park values and there are inadequate buffer zones for plants and wildlife. Please assure that the National Park serves the interests of the larger public and Not the few commercial interests that benefit from their location no Park property. Very respectfully,

Louis Chiatorich/Laurence Crawford

Cicely Muldoon, Superintendent Point Reyes National Seashore  
1 Bear Valley Rd.  
Point Reyes Station, CA 94956

Dear Superintendent Muldoon:

Thank you for this opportunity to comment on the Draft Environmental Impact Statement (DEIS) for the General Management Plan Amendment (GMPA) for Point Reyes National Seashore (PRNS) and North District of the Golden Gate National Recreation Area (GGNRA) (collectively Seashore). The GMPA process will complete a necessary, important and overdue step in the issuance of 20-year lease/permits by providing a long-term management plan and environmental standards by which these ranches will operate. That is why, even though there are many commendable parts of the DEIS, I feel strongly that certain modifications to some elements of the DEIS and the preferred alternative are necessary.

Preservation of Ranching: It is good to see the preferred alternative honors the directive that then-Interior Secretary Ken Salazar issued to the Park Service in 2012 to pursue 20-year lease/permits for the historic dairy and beef ranches in the pastoral zone (which was then expanded by the park service to include the planning area in the GMPA). As he wrote in his November 29, 2012, decision memorandum on the Point Reyes National Seashore and Drakes Bay Oyster Company:

"Finally, the Department of the Interior and the NPS support the continued presence of dairy and beef ranching operations in Point Reyes' pastoral zone. I recognize that ranching has a long and important history on the Point Reyes peninsula, which began after centuries old Coast Miwok traditions were replaced by Spanish mission culture at the beginning of the 19th century. Long-term preservation of ranching was a central concern of local interests and members of Congress as they considered legislation to establish the Point Reyes National Seashore in the late 1950s and early 1960s. In establishing the pastoral zone (Point Reyes enabling legislation PL 87-657, section 4) Congress limited the Government's power of eminent domain and recognized 'the value to the Government and the public of continuation of ranching activities, as presently practiced, in preserving the beauty of the area.' (House Report No. 1628 at pages 2503-04). Congress amended the Point Reyes enabling legislation in 1978 to authorize the NPS to lease agricultural property that had been used for ranching or dairying purposes. (Section 318, Public Law 95-625, 92 Stat. 3487, 1978). The House Report explained that the "use of agricultural lease-backs is encouraged to maintain this compatible activity, and the Secretary is encouraged to utilize this authority to the fullest extent possible ." (House Report 95-1165, page 344).

Accordingly, I direct that the Superintendent work with the operators of the cattle and dairy ranches within the pastoral zone to reaffirm my intention that consistent with applicable laws and planning processes, recognition of the role of ranching be maintained and to pursue extending permits to 20-year terms for the dairy and cattle ranches within that pastoral zone. In addition, the values of multi-generational ranching and farming at Point Reyes should be fully considered in future planning efforts. These working ranches are a vibrant and compatible part of Point Reyes National Seashore, and both now and in the future represent an important contribution to the Point Reyes' superlative natural and cultural resources."

September 23, 2019

Letter to Superintendent Muldoon Page 2

As this makes clear, and as my scoping comment letter (attached) and recent congressional actions reaffirm, Congress' intent on this topic is unambiguous: the historic multigenerational working dairies and cattle ranches contribute to the Seashore's unique historic, cultural, scenic, and natural values, which NPS is required to preserve. This was reinforced in the bipartisan approval of H.R. 6687 by the House in the 115th Congress, and most recently by policy language appended to the bipartisan Consolidated Appropriations Act for 2019:

"The Conferees note that multi-generational ranching and dairying is important both ecologically and economically for the Point Reyes National Seashore and the surrounding community. These historic activities are also fully consistent with Congress's intent for the management of Point Reyes National Seashore. The Conferees

are aware that the Service is conducting a public process to comply with a multi-party settlement agreement that includes the preparation of an environmental impact statement to study the effects of dairying and ranching on the park. The Conferees strongly support the inclusion of alternatives that continue ranching and dairying, including the Service's Initial Proposal to allow existing ranch families to continue ranching and dairying operations under agricultural lease/permits with 20-year terms, and expect the Service to make every effort to finalize a General Management Plan Amendment that continues these historic activities." (p. 324 of the joint explanatory statement to Public Law No: 116- 6)

The loss of ranching at PRNS would end the valued cultural legacy and working landscapes whose preservation was one of the fundamental reasons the Seashore was created. The iconic scenic view of pastures in the Seashore would not exist without being grazed by cattle, or managed with fire as the Coast Miwok residents did prior to the ranches. The rich visual mosaic of pasture, rangeland, scrub, forest, and varied land forms that generations of visitors have treasured would be greatly diminished. Moreover, loss of the Seashore's historic multi-generational ranching culture would have significant negative consequences which the DEIS does not fully account for. The DEIS and the related foundation document should be clarified to reflect these considerations.

Elk Management: This is not a zero-sum game where park managers must choose between elk and Ranching. Successful coexistence between thriving elk herds and the cultural, historic and economic values of continued ranching is possible; but it requires a meaningful partnership between NPS and the ranchers, something I believe both sides desire. However, the starting point for that successful partnership requires an honest recognition of the ways in which poorly managed elk herds could severely undermine the ability of several ranches and dairies to continue operating.

Contrary to the characterizations of some anti-ranching stakeholders, the preferred alternative envisions more elk in PRNS going forward, not less. Elk were first reintroduced to PRNS in Pierce Point and later a Free Range herd was established for the Philip Burton Wilderness area, which is now being called the Limantour herd. The preferred alternative would embrace the ongoing presence of a third herd, an additional 120 elk that in recent years have taken up residence in the Drakes Beach area in the middle of active ranch land. This smallest and newest of the herds was not contemplated under the 1998 Elk Management Plan, and exists only because NPS allowed strays from the free-range Limantour herd to become established in the Drakes Beach area. My preference from the start of this elk management debate was to continue a management plan premised on the two planned-for herds rather than accept a new unmanaged herd on ranching land. I advocated for the aggressive use of sterilization and relocation to prevent the Drakes Beach elk from becoming established as a new herd because of the inevitable conflicts it would present with several dairies and ranches in that area. Thus, I argued in earlier comment letters that Tule elk belong in the preserve on Tamales Point and in the Philip Burton Wilderness, but not in the middle of working ranches.

September 23, 2019

Letter to Superintendent Muldoon Page 3

To put this in context, more than 70% of the planning area in the DEIS is wilderness; less than 30% of the remaining non-wilderness land in PRNS is occupied by working ranches. We can value and protect both our elk and our ranching heritage by managing for separation in places where there are conflicts. Yet the Park Service consistently minimizes the negative impacts on ranch operations posed by elk, especially in the Drakes Beach area. Ranchers have documented damaged fences, injured cattle, consumption of carefully cultivated organic pasture meant for dairy cows and cattle, as well as the highly unnatural spectacle of elk and cows eating right next to each other from cattle feeding troughs (not exactly the free-range elk experience NPS' original elk management plan contemplated).

The reality is that if the Drakes Beach herd continues to grow in size, and certainly without a major new investment in protective fencing and other separation measures, this herd will crowd out the viability of several historic ranches in the area Congress always intended to be a pastoral zone where our ranching heritage would be preserved. This is an unacceptable outcome.

Deeper analysis is needed to develop a realistic plan for effective management of elk where there are conflicts with ranching operations. At the very least, if NPS insists on accepting the new Drakes Beach herd, there must be much better safeguards to prevent untenable conflicts. That starts with managing to a smaller sized herd. All the elk in PRNS share the same genetics, making concerns about maintaining a genetically viable herd unconvincing. Since there are no natural predators in the Seashore, the only way to keep this new Drakes Beach herd from getting too big is for NPS to actively manage it. Toward that end, NPS should give further consideration to the following strategies:

- Fencing: NPS should work with the ranchers to identify effective fencing along the Limantour wilderness border and fencing along Drakes Beach Road to protect ranches. Wildlife friendly fencing that is also effective for elk needs further study, and while it may be more expensive up front, it might cost less than constantly replacing substandard fencing. NPS should collaborate more with affected ranchers on specific fencing to keep elk off the working ranches. And, NPS should share in the cost of this fencing.
- Relocation: I understand the concerns about culling, and would recommend that NPS more seriously consider relocation as an alternative. Removing or reducing the Drakes Beach herd through relocation should not be abandoned.
  - o The 2018 California State Elk Conservation and Elk Management Plan notes, "Tribes remain interested in the re-introduction of elk to tribal lands within the historical range of elk. The Department will work with Tribes interested in establishing elk and those Tribes whose aboriginal territory may represent a source of elk for translocation." The Kashia Tribe has expressed interest in introducing the PRNS Tule elk on tribal land along the Sonoma coast, in areas where there are no livestock. This is consistent with the State Elk Conservation and Management Plan and should be more fully explored, but the Park Service has dismissed these options without meaningful consideration. Farther north in my congressional district, Roosevelt elk, which are bigger than Tule elk, are being relocated to tribal land owned by Blue Creek Rancheria right now.
  - o Relocation within PRNS needs further analysis too. The few relocation experiments conducted in 2015 and 2017 are not conclusive and NPS should not close the door on this option. Relocation within the Seashore coupled with active tracking of animals to promote better retention has similarly been dismissed by NPS, but should be more fully considered.

September 23, 2019

Letter to Superintendent Muldoon Page 4

- NPS needs to significantly fund mitigation costs related to elk damage. Per the 2018 State Elk Management Plan, hunting tags are issued to landowners for resale or use to mitigate elk conflicts-an option that will never be available within PRNS.
- It is good to see a commitment by NPS in the DEIS not to allow any additional new herds to form: "Management of the Limantour herd would be based on the concept of not allowing new herds to establish in the planning area." Based on the experience with the Drakes Beach herd, bordering ranchers will need assurance that this actually means the Limanour herd will not be allowed to make ranch land become part of their permanent habitat.

The GMPA can work for both the Tule elk and the ranchers, but many of my constituents are understandably skeptical that NPS will undertake the specific commitments and follow-through necessity for that to happen, especially considering the inattention that allowed the Drakes Beach herd to establish in the first place.

Diversification. The preferred alternative lays out zones for a variety of historical diversification activities, which makes sense for management guidelines. Parts of the DEIS hint at flexibility while other sections set firm limits on types of activities and where they will be allowed to occur.

Environmental benefits should be given greater weight than a zoning requirement where feasible. For example, carbon sequestration activities might produce greater benefit when applied across zones, and compost that is not generated on site should not be prohibited for that reason alone. Likewise, there might be places on a particular landscape where diversification works better outside the designated zone. Grazing by subspecies in the range zone should not be ruled out if there are benefits that align with achieving other natural resource objectives outlined in

the DEIS, such as preserving scenic values or fire hazard reduction. Further consideration should also be given to integrated pest management and irrigation in the context of best environmental management practices and preservation of historic cultural resources.

Working with other professionals in this field—including the Marin Resource Conservation District, Marin Carbon Project and USDA Natural Resources Conservation Service—would provide valuable resources when assessing diversification and agricultural operations more broadly. Under the Community Alternative submitted by the Ranchers Association during scoping, an advisory committee was suggested, but it was not included in the DEIS. An advisory committee would be useful for creating carbon farming plans, evaluating environmental impacts, and determining best environmental practices for conservation and diversification management plans.

In closing, I want to thank you for pursuing a thoughtful and open process to update the GMPA. You and your team have worked hard to create a plan to manage and preserve many of the unique characteristics that make Point Reyes National Seashore the iconic place it is today. I appreciate the time and resources you have steadily dedicated to this effort and encourage you to continue to expand and improve on efforts to manage for effective separation of the Tule elk and the ranching and dairying operations in the Seashore, and to fine-tune the diversification elements. This will require additional commitment of resources, and a commitment to working with the ranching families, which I believe will create a plan that is durable and protects the Seashore's values for future generations. I look forward to supporting such an improved plan; it is within reach.

Sincerely,  
Jared Huffman  
Member of Congress

Correspondence: Please go with Alternative F

Cows don't belong here.

#7576

Name: Greenberg, Janis

Correspondence: The Point Reyes National Seashore was a deal between the public and ranchers on the property. The ranchers are now asking to keep what they were paid to give up. In return for cash money, extended time for operations, and tax incentives, the ranchers agreed to vacate the land at the end of the lease period. Now they don't want to. They want to stay and continue making money. And the National Park Service agrees and has drafted an amendment to the PRNS management plan which is being argued. So what does the public lose. The ranching operations pollute the land and the water around it, so the public loses access to clean land and water which was a large part of the deal. The Tule Elk and animals of all sorts lose food, water, and safety. Their lives. Point Reyes National Seashore, land and water, is what gets polluted. The lovely beaches and parks, the hiking trails, Abbott's lagoon. WHAT DOES THE PUBLIC GAIN? Will someone please tell me this? And why does the National Park Service want to do this?

Name: Bay, Vikki

Correspondence: GMP Amendment, C/O Superintendent Point Reyes National Seashore 1 Bear Valley Road Point Reyes Station, CA 94956 Superintendent of the Point Reyes National Seashore:

I am writing to express my strong opposition to the draft GMP Amendment/EIS.

For the last 40 years my family has enjoyed the wildlife, open space, fresh air, trails and water of the Point Reyes National Seashore (PRNS). We have witnessed first hand the effect that the dairy farms have had not only on the damage to the land but on the water and air qualities of its inlets, bays and surrounding seashore. The 6,000 dairy cattle owned by the 32 ranchers presently living on this public land pollute the groundwater and at the same time emit methane gases which contribute to global warming. Scientific groups like the Center for Biodiversity, have been collecting data for years to document the cattle's role on its degradation of this public land.

A second main issue of the draft GMP Amendment/EIS that is equally disturbing is the plan to "cull" the native tule elk. The use of the word "cull" is disingenuous. The proposed plan is to kill these animals that we have fought so hard to bring back to PRNS mainly to benefit the cattle ranching operations.

A third issue is the granting of 20 year leases to the 32 dairy farmers. This is not a good precedent as this will just prolong the existence of these dairy farms in a National Seashore. The reduction of these dairy farm tenants should be the goal to help ensure the restoration of this unique national treasure to its natural state. The National Park Service is charged with being a steward to the PRNS. Its role is to protect this historic national treasure. For all the aforementioned reasons, I strongly urge each and every one of you not to support this shockingly horrific National Park Service GMP Amendment/EIS.

Sincerely, Vikki V. Bay

Correspondence: Alternative F I think the dairy land use is degrading the national seashore. The animal waste is unhealthy for the environment. I do not agree with any killing of the tule elk. They are not the problem. I understand it is historic area but that does not mean the dairies need to continue polluting the area. The farmers were already paid for their land. It's time to take the national land back and let nature take its course of returning to open space with native plants + animals, especially the elk!! I don't want to have to avoid piles of poop from the cows!

Do not kill the elk!!

#7579

Name: Greene, Robert

Correspondence: Dear Sir: I am writing in response to the Draft EIS for Point Reyes as reported in the SF Chronicle. I am a parks and trails advocate who, lives in San Mateo Co. but has a longstanding interest in Marin Co. matters as a committeeman for the Bay Area Ridge Trail Council and most particularly as a person who loves Point Reyes. I have hiked nearly every trail in the park and canoed the waters of Drakes Estero. That I am not an environmental extremist is witnessed by the fact t" as a retired geologist, I support limited mining and drilling. Also, I came down as hard as I could for the continuance of oyster production in Drakes Estero. I cannot be specific about this, but I recall that less than three years ago a plan was released which called for the very gradual retirement of the leases on the "historic" ranches in the park and the return of these lands to "nature", subject to multi environmental reviews and probably lots of volunteer work by advocates like me to remove fences, etc. This is a step that should be undertaken, despite the long running hassle over the Pierce Point Ranch. Why, then, the sudden reversal of this trend with a plan to allow more commercial uses of the ranches and makes no mention of their retirement? To hit the important points: 1. Culling the elk herd certainly seems justified. This no sense in letting them multiply indefinitely. 2. Allowing sheep, pigs & chickens on the ranches may make little difference provided they are properly confined, and their was""""""t enter the runoff into the sea. However, a whole new problem with predator relationships is created. 3. Allowing the ranchers to convert their barns into inns and their kitchens into restaurants is the worst idea since the Edsel. The capacity to take care of tourists would be minuscule compared to the demand, leading to astronomical prices for the few rooms available, poor maintenance, and demand for building more facilities. 4. Tours of the ranches may be: OK, provided they are run by a responsible organization like MALT. They would give ranching advocates a chance for their say. A related matter that gets little attention - The fact that the main road down the peninsula runs right through the core of some of the ranches, between the houses and barns, particularly the last ranch approaching the turnoff for the elephant seals. Isn't it possible to build bypass roads around some of these? It seems strange to me that this hasn't been done long ago. In sum, the Point Reyes NS is a beautiful place. It is primarily for recreation, not ranching.

Correspondence: The purpose of the impact Statement is to IMPROVE the existing environment for the presentation of the land and the Native species. Alternative F is the only choice. Cattle are Dairy interests are just that. Interests in money only. They were paid for the land and wish to keep it also. "Having your cake and eat it too!" Point Reyes National Seashore is listed as one of the 10 worst polluted water areas in the state because of cattle run-off. Harbor seals are birthed in cow dung. How can any alternative be concluded?

#7581

Name: Hoffman, Walter

Correspondence: Alternative F is the answer to what should happen in Point Reyes National Park. To allow the elk to increase in population is the best answer to allowing nature to take its course and stabilize habitat for all the critters living here as our neighbors and friends not to mention less destruction to the habitat they rely on. I say more wilderness and no ranching. Wilderness and no ranching is the only answer to the problem of global warming and keeping the habitat intact. Keep it wild for our native plants and animals. Alternative F is what we need for a new uncertain future for our children and everybody who comes after us. More wilderness- no ranching! All wilderness, take down all fencing- let the elk run free. Have our children and us to pull invasive plants and keep native plants for our native animals. I love wilderness- it's the only way- no cows, row cropping, house building, roundup, miracle grow, plus, sheep, goats, horses, lodging, chickens. Lets keep it wild. And to hell with the other crapola.

Re: Killing the tule elk.

I am dismayed that the tule elk are being scapegoated by you and your associates.

When Point Reyes was saved from development, it was to be preserved as an area of natural beauty yet the Park Service has given a pass to the ugly farm buildings, destruction of native plants, and poisoning the land with sprayed on manure. Thousands of cattle have degraded the land not the elk.

Under park management more than 200 elk died unnecessary in the drought. A shameful episode.

Why do you agree to the injustice of killing more of these magnificent creatures? I plan to witness and film the killing.

Thank you,

Sidney Dent

#7583

Name: Elke, Mary

Correspondence: I believe we need to protect our wild spaces at all costs. These wild spaces at Pt. Reyes National Seashore were acquired with tax payer money. The landowners + ranchers were compensated at fair market value and given leases. This was "two bites of the apple." Now they want 3 or 4 more bites. This is not equitable.

The National Park Service should not use its resources to fund private ranch operations. I also oppose the Ranch Core subzone on 180 acres due to all the various activities sanctioned that are not in keeping with activities on park land and would only benefit the 24 ranchers.

The Tule Elk are worthy of preserving + need genetic diversity that can only happen when they can range freely.

#7584

Name: Gaffry, Kerry

Correspondence: I send this letter of the utmost concern for the natural wild lands of Point Reyes Nat. Seashore. While Californians are standing by, there's no way in hell that Nat Park Service will pull this wide spread SHENANIGAN to diblodge by death, the tule elk herd, not one of them. If blood spills from this majestic animal then the GMP team who allows the carnage will have hell and high water to pay. I'll express this symbolically not literally. The maneuvering of policy in the name of ranching interest and profit has no concern for the environmental effect and protection of watershed. The multi-use management strategy has enough non native cow pastures in the park. Enough is enough! The long arms of political interest has no hand for our national treasure, the wild lands we and tule elk call home.

The noble elk We celebrate your accomplishments with humility. Your horns are crowned with success. Powerful forces of spirit live and protect the land you graze and sleep on The challenges of the past are behind you All nations will activate to protect you always

I bless this letter with love

#7585

Name: Hughes, Paul

Correspondence: The preferred alternative by the NPS, Alternative B, would extend the government/taxpayer-subsidized operation of ranching activities on public land at the expense of native animals and plants, and contrary to majority public opinion. The long-term leases that have existed have already benefited the ranchers and should not be extended. There are many alternative locations for transferring their ranching operations that are not within a national park. The existing ranching operations within Pt. Reyes NS are a continual source of controversy and consternation and confusion for park visitors who expect to see natural landscapes. Alternative B does not even appreciably move the park toward natural conditions, as it extends and diversifies ranching. Ranching in the park is a constant source of conversation among park visitors, and as such is BAD PR for the park and the NPS. Alternative F is the best alternative, and should be adopted. Unfortunately, the NPS gives every appearance of having already decided against Alt. F, which hurts the credibility of one of America's best-loved agencies.

#7586

Name: Kroplick, Marilyn

Correspondence: Dear Superintendent Muldoon, California-based international animal protection nonprofit organization In Defense of Animals, with over 250,000 supporters, opposes the National Park Service plan to kill native Tule elk, grow commercial crops, and permit ranchers to add chickens, turkeys, sheep, pigs, and goats to their exploitative operations. As national park land, this property was specifically set aside to protect, restore, and preserve the natural environment including the wild animals who live there. The original intention was to phase out dairy and cattle ranching, not add more crops or animals to increase ranching profits. The proposed plan does not address the damage from grazing, including water-quality degradation and soil erosion. Also, adding new crops will create more conflicts with native wild animals. Please abandon this inhumane and destructive plan. We urge you to restore the Seashore's Pastoral Zone for wild animal habitat and repurpose historic ranch buildings for scientific research, interpretation, and public education.

#7587

Name: Lifton, Sherry

Correspondence: Because the national park exists as a protected area for the public benefit, I request that the park service take action for the public good, as opposed to benefiting the for-profit industry. The cattle and dairy ranches contribute to degradation of the park, clearly visible in the areas where ranching occurs. Ranching in the park has destroyed native plant species while creating the environment for invasive species. Forces that destroy the unique ecosystems at Point Reyes seashore should be removed while efforts to restore and protect the biodiversity and ecosystems that define the beauty of Point Reyes National Seashore should be protected. The Tule Elk, magnificent creatures who inspire droves of tourists to the park, need protection. Therefore, I urge the park service to adopt Alternative F. Please protect the beautiful national seashore. For profit industries that harm the ecosystems and wildlife have no place in a national park.

#7588

Name: Webster, Scheherazade

Correspondence: I support the no ranching alternative because I believe it prioritizes supporting native California ecology and biodiversity. I BELIEVE RANCHING HARMS AND POLLUTES THE ENVIRONMENT. I disagree that the national park should use its resources to fund private ranch operations because their responsibility should be towards supporting + reestablishing native landscapes, flora, and fauna - NOT financially or structurally cushioning private enterprise. Tule elk are free roaming animals. They need genetic diversity to maintain a stable and healthy population into the future. I oppose both the killing + sterilization of the tule elk + any native animal -

esp to protect private ranch/agriculture operations. Indigenous history should be prioritized over that of ranchers and others who have inherited the benefits of colonization. If the nat'l park would like to prioritize history, why not center indigenous peoples and Point Reyes original ecological history? I think it would benefit both people + parks if we were to restore pastoral zones for wildlife habitat, native plant communities, scientific research, and education. Historic Ranch Buildings can be repurposed for research, interpretation, and education.

#7589

Name: N/A, N/A

Correspondence: I support the no ranching alternative for MANY reasons!

Ranching should be phased out- life estates should have ended! - To cull the elk to improve for cattle is anti-ethical to natural resource management. Plus the fencing required will cause unintended impacts in + of themselves

Phase out ranching by native species reintroduction - native species hold soil better etc.

Better management of prehistoric sites, esp. from cattle impacts

Discussion + education by + of coast miwok people

#7591

Name: N/A, N/A

Correspondence: Reduce ranching DON'T KILL ELK No goats etc

#7592

Name: Phillips, Stu

Correspondence: Point Reyes National Seashore is supposed to be managed under the Point Reyes Act for "maximum protection, restoration, and preservation of the natural environment." There is no mandate for prioritizing commercial agricultural leases on these public lands. So, there it is, PRNS mission statement is to restore and preserve native animals. Tule Elk, native to the area, need to be free roaming, and live in their native habitat. PRNS wants to adopt Plan B option of shooting up to 15 Elk per year to keep a herd at 120. This is in a National Park Plan EIS the option to be adopted, to eliminate ranching in the PRNS. People want to see the Tule Elk and know they are safe in the National Park. There are currently about 5500 Tule Elk in California (endemic to California, once there were 500K). There are currently 5,250,000 cattle in California on 11,000 ranches. The animals are not rare, and neither are their ranches! The ranches were bought by the American people in the 60's for millions of dollars and leased back for the ranchers lifetime or 25 years. That expired years ago. All the ranchers knew this when they sold their ranches! If Plan B is adopted, this would not be considered a National Park! Maybe just a very poor example of BLM land!

#7593

Name: Reichard, R

Correspondence: Please amend the recommended alternative to exclude any grazing or darying from the ranch land east of the Inverness Ridge that abut to Tomales Bay to minimize runoff into the Bay. This would reduce the

environmental impact of the recommended alternative without reducing the rancher's ability to profit from their leases. Please also consider reducing the term of the new leases to a maximum of 10 years make them non-renewable.

#7594

Name: Rames, Linda

Correspondence: In reviewing our previous letter dated November 13, 2018, we have found that our views have not changed, nor have the views of the National Park Service. It appears that the service has ignored the opinions of any citizens other than the ranchers of the Point Reyes Peninsula and that of Representative Jared Huffman who clearly does not represent many of his constituents. We have enclosed our previous correspondence. Please add the letter to the current comments.

Currently, the ranches in the peninsula are a visual disgrace and certainly do not represent the appearance of a national park. Have any of the decision makers actually visited the area? If anyone has seen the ranches, they are aware that there are fields of mud and piles of cow manure existing above, and draining into, one of the most pristine estuaries in California. For these desolate ranches, the park service has proposed culling the tule elk herd, animals which historically resided in this area, for the dubious benefit of satisfying the ranchers whose leases were supposed to end years ago.

The idea of allowing other types of animals is especially disheartening. From past experience with the West Marin ranchers who are not part of the historic, leased ranches, the park service must be aware that smaller animals such as chickens, goats, and sheep will bring predators. The comment by Ms. Gunn that the ranchers will not be allowed to kill them is ridiculous. Who is going to be there to watch?

We were amused by the idea of tourists coming to stay at these ranches. These are not the pristine farms of New Zealand or South Africa which often cater to visitors. Instead, tourists would be staying in run down ranch houses and barns and would be treated to the noxious odors of cattle and other livestock manure and surrounded by muddy fields and barren land. Unless the park service is willing to front the cash for upgrading the current state of most of the ranches, they would probably not generate much enthusiasm from visitors.

We feel that the park service is heading in the wrong direction and is not really considering this area as a national park. We would like to see the ranching phased out and the park returned to what it once was, a beautiful wildlife refuge. Then, the Point Reyes Peninsula would qualify as a national park. Currently, this is not the case.

Linda & Robert Rames

[includes 2018 correspondence in attachment]

#7595

Name: Takalna, Jonah

Correspondence: For environmental impact, the NPS should consider photographic and cinematic documentation. In particular, the visual images from the documentary film - The Shame of Pt. Reyes, should be included in the final report.

#7596

Name: Walch, Tim

Correspondence: Thank for you taking the time to share alternatives to Pt Reyes National Seashore Management. Since the Ranches were purchased both the use of land and the economics of farming (dairy/ranching) was changed. Given the number of visitors (bikers, hikers, runners, birders, etc) consideration should be given to the economic and social impact of this land. Use has shifted and the phase-in of more public use should be prioritized.

As a taxpayer, my expectation is that the National Park Service maintains parks - certainly in fragile lands like Pt Reyes the re-introduced alt should be given priority over a small number of farms/ranches. Based on the change in environment (literally and figuratively). I support Plan F. Let's let the members drive this decision (people using the land and native animals) is the dollars from dairy/ranching).

#7597

Name: Reichard, Roberto

Correspondence: The preferred alternative is nothing but a continuation and an increase of ranching + dairy farming on Point Reyes, regardless of its impact on the quality of the air and water resources. I continued the use of public lands for the private profit of a few individuals. The preferred alternative also for new uses (pigs, chickens, goats etc) all of which will dilute air and water resources. Agriculture + ranching on Point Reyes National Seashore should be phased out not extended for another 20 years. AGAIN Agriculture + ranching on PRNS should be phased out NOT extended for 20 years. The manure stench on Tomales Bay due to the dairy farms on PRNS is often overpowering + deterred from the public's enjoyment of the bay. The runoff into the bay pollutes it + is impacting many critical species. PLEASE PLEASE PLEASE LETS HAVE ALTERNATIVE F.

#7598

Name: Huey, Patricia

Correspondence: Ranching has no business in a national Park, particularly given the climate change emergency we are undergoing right now. I commented online, but I have some additional comments. -Tule elk are vital for this delicate ecosystem to survive. Pt Reyes is one of the top 25 most biologically diverse areas in California. -In the original plan in 1962, ranching was supposed to be phased out in 25 years. Why hasn't it? -the state's largest outbreak of E. coli came from a Pt Reyes ranch. Is this something to be proud of? -one of your proposals is to allow a retiring rancher to sell his lease to another rancher. Wasn't the original idea to let the land go back to wilderness? Also, does this allow for a monopoly? -how do you plan to address the massive pollution animal agriculture causes? Animal agriculture is a leading cause of climate change. -how do you justify supporting the wishes of 24 (tax sucking) families over the wishes of thousands of wildlife lovers? -the tule elk + other native species are far more important than "cultural history" (particularly one only 160 years! -your concern for history stopped at the native tribes and species. They were better stewards of this land than we are today. All your plans are bad. Get rid of ranching, period.

#7599

Name: Huey, Patricia

Correspondence: This is an addendum to an earlier comment I made. I support plan F because: 1. It is the most environmentally sustainable option. 2. Ranching does not belong in a national park. 3. It respects the original intent of this park- ranching was supposed to be phased out 25 years after the park was started. 4. It will be in the best interests of the elk. The elk are vital for the delicate ecosystem of the park. Cows are not even native to America. 5. Animal agriculture is a leading cause of climate change, it should not be allowed in the park 6. The park will benefit financially with this plan. Ranching provides 2% of the jobs in Point Reyes; tourism provides 2090. Tourism generates far more revenue than ranching. 7. It will respect cultural history if you consider the true history of this park! The native Americans and tule elk were here long before the ranches.

#7600

Name: Kenny, Jennifer

Correspondence: The joint explanatory statement introduced into the congressional record by Rep. Jared Huffman (D. CA) stating that "ranching + dairying is fully consistent with congress's intent for the management of PRNS tied the park service's hands, forcing the park service to recommend an alternative that continue ranching + dairying, despite its negative impact on the environment and the quality of the PRNS air + water. The private for profit use of PRNS by a few ranchers/farmers is incompatible with the park services ethos and mandate. Tomales

Bay is being negatively impacted by the runoff of farm chemicals + manure into the bay. This runoff is acidifying the bay + killing its oyster + mollusks. Alternative F to re-wild PRNS + not kill the elk is the best alternative by far.

#7601

Name: Meral, Gerald

Correspondence: Dear Cicely The Natural Heritage Institute has been involved in land and water management issues in California for more than 30 years. I have personally served as Deputy Director of the California Department of Water Resources, and as Deputy Secretary of the California Natural Resources Agency. I worked with Peter Behr in 1969-1970 to successfully promote the completion of land acquisition for Point Reyes National Seashore. I have worked for many years as a volunteer in the Habitat Restoration program at the Seashore. I have visited various parts of the Seashore more than 1000 times over the past 50 years. This letter provides comments by The Natural Heritage Institute on the Point Reyes National Seashore (PORE) Foundation Document, and the Draft EIS for General Management Plan for Point Reyes National Seashore. These comments will be submitted through <https://parkplanning.nps.gov/poregmpa>. These two documents are inextricably linked, since the values described in the Foundation document must be protected through the proposed action in the EIS. Our comments address the direct and specific impacts on the environment of the funding impacts of the selection of the final alternative course of action. Protection of the values described in the Foundation document cannot be accomplished in a vacuum. Funding is required to protect them, as well as carry out whatever final action is selected pursuant to the EIS. You have provided us with PORE budget figures for the past several years. While some one-time funding is not included, and certain funding has gone in and out of the baseline budget, we converted the baseline budget to constant dollars, as show in the following table: [FIGURE] The baseline budget has dropped 17% in constant dollars since 2015. Presumably the nearly one million dollars spent to prepare the DEIS did not come from the baseline budget, but implementing the final selected action will almost certainly have to come from the baseline budget, which has already been severely cut back. PORE also has a deferred maintenance budget of more than \$100 million. The following chart of deferred maintenance categories was obtained from your office. It is a few years old, and is almost certainly an underestimate. Recent bids for road repairs indicate the underestimate may be substantial. [CHART] The National Park Service budget in constant dollars has increased less than 1% per year over the past decade, just about enough to keep up with inflation, but offering little hope for any NPS unit to receive a permanent substantial increase in operations funding. (page 2 of Congressional Research Service Report <https://fas.org/sgp/crs/misc/R42757.pdf>). The capital outlay deferred maintenance backlog of the National Park Service is nearly \$12 billion (op. cit.). New Congressional legislative proposals (S. 3172, HR 1225) regarding funding focus on reducing this backlog, making increases in ongoing operations and maintenance funding even less likely. (These legislative proposals would provide only \$1 billion per year for six years, leaving a continued large and growing backlog.)

For these reasons, we must ask how much each proposed action would cost, and if it is a cost above what is currently being spent on that action, what PORE program would likely be cut back to pay that incremental cost. We will point out specific impacts on the environment which would result from budget cuts to existing programs since, in the absence of new revenue, the final selected alternative will require shifting money from existing programs to implement the new program. PORE may be tempted to suggest that the Point Reyes National Seashore Association (PRNSA) or other private funders might pay for some of the new costs. PORE should not make that assumption. PRNSA is an important park partner, but has not donated substantial new or additional sums to park operations in the recent past, and should not be counted on as a funder beyond current levels for any new programs. Comments on Foundation document. The document opens with the following statement: The National Park Service (NPS) preserves unimpaired the natural and cultural resources and values of the national park system for the enjoyment, education, and inspiration of this and future generations. The National Park Service cooperates with partners to extend the benefits of natural and cultural resource conservation and outdoor recreation throughout this country and the world. We suggest this paragraph be revised as follows The National Park Service (NPS) preserves unimpaired the natural and cultural resources and values of the national park system for the enjoyment, education, and inspiration of this and future generations. To the extent that these resources and values are impaired by damage, invasive species, diminished air or water quality or other impairments, the National Park Service seeks to reduce or eliminate the impairment through mitigation, remediation, or

restoration. The National Park Service seeks to avoid through its own action and the action of other agencies any further impairment of the natural and cultural resources and values of the national park system. The National Park Service cooperates with partners to extend the benefits of natural and cultural resource conservation and outdoor recreation throughout this country and the world. A subsequent statement is: Respect: We embrace each other's differences so that we may enrich the well-being of everyone. Since corporations have been found to be "persons" by the Supreme Court, we suggest that "everyone" be replaced by "the people of the United States and visitors from other countries". In general, it is a major omission that the Foundation document ignores the great need to restore the biological, cultural and historical values of the Seashore. Preservation is emphasized, and restoration is ignored. This should be corrected. Comments on the DEIS. Selection of a final action must be guided by budget constraints. There is no reason to think budgets will increase over time, given recent history. This means that actions should be selected which minimize annual expenditures, and which do not rely on large capital outlay for which there is no expected revenue source. Although the Park Service was able to remediate Drake's Estero with one time funds from headquarters, coupled with donations from private foundations, these types of extraordinary funds will not be available for ongoing routine implementation of the selected action. A final action should be selected based on the following criteria: 1) preservation and enhancement of the natural values outlined in the Foundation Document. 2) minimization of capital outlay and annual implementation costs

For each possible action listed below, please answer the following questions: What would implementing this action cost per year? What one time capital costs would be incurred to implement this action? Assuming no increase in constant dollars in the PORE budget, if the cost of implementing the action is higher than what is currently being spent on that action, what existing program or programs would be cut in order to pay for the new action? What would be the environmental impact of these program reductions? It is not adequate for the Park Service to describe only the environmental impacts of the proposed actions, if implementing these actions is likely to cause reductions in other programs, resulting in other environmental impacts. While the Park Service may not know today exactly what programs will be cut to implement the selected action, it would be appropriate in the FEIS to describe the environmental impact of cuts to the budgets of all major program categories that affect the environment. We believe that the following specific and important environmental impacts will result from the implementation of any new programs which are to be implemented as a result of selection of each of the alternatives. Once PORE provides the data on the cost of implementing each alternative, we will be able quantify the specific environmental impacts of budget cuts on existing programs, and which new programs will not be implemented.

Deferred maintenance. PORE has a deferred maintenance backlog of more than \$100 million (see above). The EIS must describe the environmental impact of not addressing this backlog, and of having the backlog increase. Here are some examples of not addressing the deferred maintenance backlog, and of allowing the backlog to increase. We refer to the categories of deferred maintenance listed above: Housing. A number of park employees live in park housing. If this housing is allowed to continue to deteriorate, the housing units will become uninhabitable. This has already happened to some extent. The environmental impact of uninhabited housing is substantial. For example, the park maintains two houses on Mount Vision Road. If employees could no longer live there, there would be less enforcement of park rules in that important corridor. This could lead to people bringing dogs on to the road, which is not allowed. The result would be harassment of wildlife, dog waste, and possible introduction of canid disease to the coyote population.

Abandoned houses become infested with rodents, introducing disease and fire risk. Blighted houses detract from the park visitor experience. There are already far too many abandoned buildings along Gunn Road and Randall Trail, as well as many ranches in the pastoral zones. If park housing is allowed to deteriorate to the point where it cannot be inhabited, this problem and its environmental impacts will simply get worse. In addition, if park employees are no longer able to live in the park, they will be forced to drive each day from Petaluma or even farther away. This will result in an increase in GHG emissions caused by poor park housing maintenance. Wildlife and plant resource protection. Park staff protect wildlife and native plants (seals, fish, elk, mollusks, migratory birds, bats, etc) from harassment by dogs and visitors, illegal harvest and fishing, and other types of harm. The EIS must discuss and mitigate the effects on these plants and animals from reduced enforcement. Here are some specific examples of negative environmental impacts that will happen when the budget for wildlife and plant protection is cut as a result of implementation of any of the alternatives. Protection of breeding harbor seals. Drakes Estero is closed to navigation by vessels of all kinds during harbor seal breeding season. Budget cuts to resource protection and law enforcement staff resulting from the increased costs associated with the selected

alternative will result in increased illegal boating in Drake's Estero, which will result in disturbance of the breeding harbor seals. PORE documented this harm in the data collected previously in the Estero. Disturbance of migrating birds. In a violation of its obligations under the Migratory Bird Treaty Act, PORE presently often fails to prevent people and illegally unleashed dogs from harassing migrating shorebirds on Point Reyes beaches much of the time. Park staff occasionally patrols these beaches, and coordinates volunteers to educate the public about this problem. Budget cuts to this program will result in increased harassment of migrating birds. Sanderlings, black oyster catchers, black turnstones, whimbrels, least sandpipers, western gulls, Heerman's gulls, mew gulls, and many other avian species frequent the PORE beaches. Visitors and illegally unleashed dogs also harass animals protected under the Marine Mammal Protection Act. One example was the killing of an endangered Guadalupe Fur Seal by an unleashed dog in 2019. This harassment is sometimes prevented by the presence of park staff, but this presence will be diminished by budget cuts to this program. Protection of the federally threatened western snowy plover, listed pursuant to the Federal Endangered Species Act. PORE devotes substantial staff and dollar resources to protecting the western snowy plover by fencing its breeding habitat, doing predator abatement, patrolling the breeding area, censusing and monitoring breeding populations, and coordinating volunteers who educate the visiting public about the plover. Budget cuts to this program will increase the likelihood of extinction of the plover, since a substantial portion of the plover breeding population occurs at PORE. Reintroduction of beaver to PORE. Beaver historically lived at PORE, and played a critical role in providing habitat for coho salmon, listed as threatened pursuant to the federal Endangered Species Act. Park staff has indicated an interest in beaver re-introduction, but has stated that this program cannot be pursued at present due to lack of funding. Budget cuts to the resource protection program will decrease the chances of funding a beaver reintroduction program. This will increase the chance that coho salmon will go extinct within PORE, due to the impact of climate change on stream temperatures. These temperature changes could be mitigated by beaver ponds, which stabilize temperature. Reintroduction of sea otters to PORE. Park staff wishes to reintroduce sea otters to the ocean off PORE. This would help restore the balance between sea urchins and kelp, which would result in fisheries improvements. Cuts to the resource protection program will decrease the chances of funding a sea otter reintroduction program. Not having sea otters impacts kelp, native fisheries, and the chance for visitors to enjoy seeing sea otters. Mountain Beaver (*Aplodontia rufa*). This relatively rare species was impacted by the Vision Fire in 1995. PORE has dedicated considerable resources to restoring its habitat. The species would be negatively affected by budget cuts to this program. Habitat protection and restoration.

PORE currently spends funds to reduce invasive plant populations, and to eliminate incidents of new invasive plants. PORE also seeks to restore degraded habitat within its boundaries. The FEIS should describe the impact on park habitat of reduction or elimination of this important program. There are a myriad of examples of direct environmental impacts that would occur due to budget cuts to this program. These are just a very few examples. With the exception of Japanese Knotweed, each of the following plants is found extensively throughout the currently named Pastoral Zone, covered by the DEIS. Japanese Knotweed (*Fallopia japonica*). This is one of the top ten invasive plants in the United States. (<https://www.bobvila.com/slideshow/the-15-worst-invasive-plants-in-america-52958#bittersweet-invasive-plants>). A population has been found in San Geronimo Creek, part of which is owned and managed by PORE (through an agreement with the Golden Gate National Recreation Area.) It is absolutely vital that this invasive plant be extirpated before it spreads throughout western Marin County, especially into other PORE lands. PORE is heavily involved in fighting this plant invasion. Budget cuts resulting in a reduction of this program would have devastating environmental impacts. Jubata grass (*Cortaderia jubata*). This plant, which looks like pampas grass, is found in PORE. Recently park staff has spent hundreds of thousands of dollars to reduce jubata grass infestations. Jubata grass crowds out native plants, including species listed pursuant to the state and federal endangered species acts. It is a well known pyrophyte (spreads fire), and reduces visitor access due to its sharp serrated leaves. PORE has been provided with a map showing other infestations with park boundaries. Budget cuts to the habitat restoration program would reduce the ability to control this very highly invasive plant, with severe environmental impacts resulting. Scotch broom (*Cytisus scoparius*). PORE has spent hundreds of thousands of dollars to control this extremely invasive plant in the pastoral zone. It is especially invasive on disturbed lands, and so grows well on grazed lands. Unchecked it forms solid stands, crowding out a vast number of native plants such as iris, coyote brush, indian paintbrush and many others. It is also an extreme pyrophyte, greatly increasing the spread of wildfire, with devastating environmental consequences resulting from very hot and intense wildfires. Cuts to the existing program of control of this plant would inevitably result in

highly negative environmental consequences. Ice Plant (*Carpobrotus edulis*). This extremely invasive plant threatens a variety of listed native plants in PORE dunes and other coastal habitat, and in some inland habitats. PORE spends money coordinating volunteer programs to remove it, at least in the area near the Point Reyes Lighthouse. Cuts to this program would result in the spread of this plant, with severe environmental consequences. European beach grass (*Ammophia arenaria*). This plant is widespread along PORE coastal dunes. It threatens a variety of native plants, including Tidestrom's Lupine (*Lupinus tidestromii*), listed as endangered under both federal and state endangered species laws. PORE has spent hundreds of thousands of dollars to kill European beach grass and restore dune habitat. Cuts to this program would allow the benefits of this work to be lost as the invasive plant recolonizes the dunes, again threatening populations of Tidestrom's Lupine. English Ivy (*Hedera helix*). Another one of the top invasive species in the United States (op. cit.) this plant is beginning to cover trees throughout PORE. So far PORE staff have been unable to contain this threat, or devote significant resources to stopping its spread. Budget cuts to the habitat restoration program will prevent any funds from being spent to attack this plant, resulting in the loss of hundreds of trees and other native plants as they are covered by English ivy. Bluff lettuce (*Dudleya farinosa*). This beautiful native plant is found along the bluffs of PORE, and in some inland locations. Recently poachers have been found stealing this plant and selling it in the overseas market (<https://www.newyorker.com/news/california-chronicles/succulent-smugglers-descend-on-california>). Cuts to resource protection and law enforcement staff resulting from transfer of funds from these programs to the programs adopted pursuant to the revised GMP will result in decreased protection of this valuable native plant.

Decreased habitat restoration. PORE has spent millions of dollars restoring native habitat. A recent example was the restoration of the Giacomini Wetlands on lands owned by the Golden Gate National Recreation Area, but managed by PORE. This restoration produced huge wildlife benefits ([https://www.nps.gov/pore/learn/management/upload/planning\\_giacomini\\_wrp\\_legacyfortomalesbay\\_081026.pdf](https://www.nps.gov/pore/learn/management/upload/planning_giacomini_wrp_legacyfortomalesbay_081026.pdf)) With sufficient funds, hundreds of acres of additional degraded habitat, much of it in the Pastoral Zone, could also be restored. This would reduce the negative environmental impacts resulting from the current condition of the land, and produce many positive environmental impacts. Some examples would be reduction of habitat for invasive plants, reduced erosion, restoration of water quality, and improved visitor experience and increased habitat connectivity. Some examples of potential habitat restoration within the pastoral zone are: Restoration of wetlands and other habitat at the site of the former Drake's Bay Oyster Farm. Four years ago Gordon White of PORE told NHI that a plan was being developed to restore the wetlands and other degraded habitat at the site. Today the site remains degraded, and nothing has been done. This is a lost opportunity that will only be further delayed if funds are diverted from the habitat restoration program. See photo: [PHOTO] Olema Marsh. This 62 acre marsh is badly degraded. It formerly contained substantial numbers of common yellowthroat, cinnamon teal and other birds associated with healthy marshes. PORE recognized the need to restore the Marsh (page 6: [https://www.nps.gov/pore/learn/management/upload/planning\\_giacomini\\_wrp\\_legacyfortomalesbay\\_081026.pdf](https://www.nps.gov/pore/learn/management/upload/planning_giacomini_wrp_legacyfortomalesbay_081026.pdf)) years ago, but has never had the funds to do the restoration. Loss of funding in the habitat restoration program will cause environmental harm by failing to restore the Olema Marsh Restoration of wetlands at Laird's Landing. Restoration started at this site within the pastoral zone some years ago, but has never been completed. Only demolition of some old buildings and preservation of two historical buildings is contemplated. The wetlands were ditched by the previous occupant, causing premature draining. They should be restored, but no funds have been allocated for this purpose. The environmental damage caused by the ditch continues. Diversion of funds from the habitat restoration program will prolong the delay of this restoration. Reclamation of abandoned mines throughout the pastoral zone. Ranchers used many mines in PORE for cattle bedding and road construction in the pastoral zone. An example is shown below on Home Ranch in the pastoral zone. Further mining was prohibited, but the mines were not reclaimed, as required by the California Surface Mining and Reclamation Act. The result is erosion, pollution of streams, and loss of habitat. Diversion of funds from the habitat restoration program will prolong the delay of this restoration. [PHOTO] Soil conservation and erosion reduction projects. Land management for agriculture in the pastoral zone has resulted in many gullies and other erosional features which need to be remediated. Here is an example from Home Ranch : [PHOTO] Budget cuts to the PORE habitat restoration program resulting from funds being transferred to implementing the selected alternative in the DEIS will mean continued negative environmental impacts in all these cases, and delay of remediation. Historic Building and Archeological Preservation. This program is already failing to preserve important structures and archeological sites. The FEIS should describe the impact on these buildings and sites of further budget reductions in this

program. Buildings at D Ranch, Home Ranch, Stewart Ranch and other abandoned ranches are decaying, resulting in loss of historic values. PORE already has a very limited program to save these buildings from vandalism and the weather. Cuts to this program resulting from funds being transferred to implementing the selected alternative in the DEIS will mean continued and accelerated loss of historic values. Road and Trail maintenance and relocation. It is obvious to any driver or trail user that this program is underfunded, resulting in vehicle damage, excessive energy use, hazards to hikers, pollution of waterbodies due to erosion, and other negative impacts. The FEIS must describe the environmental impact of further reductions in this program. At the end of these comments are some photographs of road and trail problems at PORE. Cuts to the road and trail maintenance program resulting from funds being transferred to implementing the selected alternative in the DEIS will mean continued and accelerated degradation of water quality, damage to vehicles, erosion, and impairment of visitor experience. Fire. The Vision Fire of 1995 burned 15% of PORE ([https://en.wikipedia.org/wiki/Mount\\_Vision\\_Fire](https://en.wikipedia.org/wiki/Mount_Vision_Fire)). Of the 12,000+ acres that burned, thousands still harbor dead trees which are a great fire hazard. PORE has funded removal of dead trees along Limantour Road, but thousands of acres of dead trees are still standing. In addition, regrowth of pines has resulted in "dog-hair" forests. Many of these trees died, increasing the risk of another fire. A similar fire of overgrown and dead forests would cause tremendous environmental harm, including erosion, loss of habitat, and extirpation of wildlife. A photo of dead trees left from the fire: [PHOTO] Adopting programs, including mitigation and monitoring programs, pursuant to the EIS without specific commitments to funding, will lead to at least one or two results 1. The new or expanded program will not be funded, or will only be partially implemented, leading to incomplete accomplishment of program goals and failure to carry out the mitigation and monitoring program, and/or 2. Funds taken from other programs will lead to reducing or eliminating the accomplishment of those programs, leading to collateral damage and negative environmental impacts. Again, due to massive cuts to federal revenue and increases in the federal deficit even during this period of economic growth, there is no chance that that PORE will receive any substantial new revenue, except perhaps for a small amount to address deferred maintenance issues. An economic downturn will inevitably result in additional PORE budget cuts. For these reasons, it is critical that the FEIS considers these budget issues, and their inevitable environmental impact. Page numbers refer to pagination in the EIS. Page 6

"Implementation of some programmatic direction, such as future development to facilitate public use and enjoyment, would require additional project-level planning and compliance to develop and analyze site-specific proposals and cost estimates." Cost estimates need to be prepared now, so that the costs of each alternative can be compared, and the impact of those costs on the environment, as well as the impact on other park programs, can be evaluated. Page 9. "Action alternatives carried forward for detailed analysis must (1) meet the purpose of and need for taking action to a large degree, (2) be technically and economically feasible, and (3) show evidence of common sense (CEQ 1981)."

We concur. In this case, economically feasible means that the PORE budget is sufficient to carry out the alternative, both with respect to capital outlay and ongoing operations and maintenance. In discussing the alternatives, the EIS must include the cost of implementing the alternative, how it would be paid for, and what environmental impact would occur if existing programs had to be curtailed due to budget substitution to pay for the new program. Page 11. "In addition, NPS previously conducted spring species composition monitoring at key area monitoring locations during multiple, but typically nonconsecutive, years from 1987 to 2011." Why was this program discontinued? Was it budget constraints? Alternative A. While presumably no additional costs would be incurred if this alternative were selected, the discussion on page 25 makes it clear that future costs to manage elk populations would increase. Since no plan of management is proposed, the costs and environmental impacts of incurring those costs are not considered. We can accept deferring this disclosure of environmental impacts in the FEIS if this alternative is selected. Alternative B. There are a wide variety of proposed actions in this alternative. As stated above, please describe the costs of implementing each of the following actions, how these costs would be paid for. If the cost burden falls on PORE, assuming no increase in PORE general funding, describe the environmental impact of cutting the programs described above to pay for the proposed actions. If ranchers or some other funding source are expected to bear these costs, please so state. Proposed actions: Virtually every item in table 2 would have an associated cost. In some cases, these costs are already being incurred, but in most cases new expenditures would be required. Even items which mention seeking outside funding have substantial upfront costs in terms of research and grant preparation and submission. Some of these items would be substantial new programs with equally substantial costs. The only way the public can determine if PORE actually intends to carry

out the preferred alternative is to know what it would cost, where the money would come from, what existing programs would be impacted, and what the environmental consequences of those impacts would be. Page 31. "Implementation of the actions and developments proposed in this EIS depend on funding available at the time of need. The approval of this EIS does not guarantee that the funding and staffing needed to implement the plan would be immediately forthcoming. Instead, the plan establishes a long range vision to guide future management of the planning area." We appreciate the honesty of this statement, but the EIS assumes certain levels of environmental impact based on implementation of the actions described in table 2. Under NEPA agencies cannot simply list proposed mitigation or other actions if they do not have the means to carry them out. If the preferred alternative is adopted without sufficient funding, the EIS must make clear the many and varied negative environmental consequences that will occur. Even such relatively simple and low cost items in table 2 such as water quality monitoring must be considered speculative in light of the recent cutbacks of water quality monitoring by PORE. "NPS would strive to improve hiking, biking, and equestrian access in the planning area through enhanced trail connections." "NPS would also work to develop public information and safety messages to support recreational activities that involve walking through active pastures without defined trail alignments." "To facilitate north/south trail connectivity across the planning area, NPS envisions a mix of established trails and off-trail routes with crossings across ranch lands to provide recreational access." (emphasis added). Phrases like "strive", "work to", "envisions" and several other similar words promise and guarantee nothing. PORE must include these actions as mitigation and monitoring measures, and describe how it is going to fund them. The whole bicycle proposed program will require substantial funding for environmental analysis, plant surveys, erosion review and many other expensive elements. If the bicycle improvements proposed are part of the preferred action a funding source to do this work must be described. Day use and overnight accommodations. Is this part of the preferred alternative? Recently PORE demolished more than a dozen existing summer cabins at Duck Cove, which could have been restored to day use or overnight use by an outside contractor. PORE did not solicit interest in such a project. Even though the cabins have been destroyed and the area has become safer for visitors to use, the road to Duck Cove has not been opened to the public, despite the fact that the beach at Duck Cove would make an ideal day use area. This history raises the question of whether PORE really intends to increase day use and overnight accommodations. We provide this example to demonstrate that unless specific funding sources are identified, any expansion of day use cannot be considered realistic, since day use incurs substantial costs such as construction and maintenance of parking, trash removal, restroom construction and maintenance and expanded law enforcement. To our knowledge, PORE has not added even a single permanent restroom in the entire Seashore for many years, let alone created any new day use areas. This is due to lack of funding, and the same constraint will apply to these proposed facilities. Pages 31-32: "Development to Support/Enhance Interpretation and Education NPS would explore new opportunities, techniques, and contemporary media to help interpret park resources and ranching in the planning area. NPS would collaborate with ranchers and other park partners, such as Point Reyes National Seashore Association or park concessioners, on interpretive messaging and techniques that share the story of ranching in the park. As ranch operations diversify and engage in additional public serving activities using existing infrastructure, NPS would collaborate with ranchers to find opportunities to integrate interpretive and educational messaging. Selected waysides would be focused at existing destinations, such as at trailheads and the visitor center, and could also be installed at key pullouts, such as along L Ranch Road. NPS would preserve and interpret the historic RCA Receiving Station under all alternatives. NPS could cooperate with a non-profit group and could also explore expanded adaptive uses of the facility, including overnight uses, through a park partner or through a request for proposal process. NPS would also expand interpretation and visitor opportunities around the Naval Radio Compass Station. NPS would place a trailhead on Sir Francis Drake Boulevard and use the old road to/through the property as a trail to the site of the former lifesaving station and the naval radio compass facility. NPS would also provide interpretation of these historic resources to enhance the visitor experience. Non-historic structures associated with the property would be removed. Development Related to Shuttles and Parking NPS may continue to use shuttle or other operations to manage traffic and crowding issues at various locations in the park. The park would explore additional or expanded shuttle use, or collaborate with the county to expand transit systems, as tools to manage visitor use. NPS would also seek improvements to parking at trailheads to improve visitor safety and facilitate access to trails and park destinations." (Emphasis added). Words like "would", "could", "may", "would also seek", "would explore" are extremely conditional phrases. The only operative word for mitigation measures is "will". Anything less is speculative. Without cost estimates and without a discussion of the environmental impact of these costs on existing programs these speculative programs do not belong in an EIS. A myriad of court

decisions have stated that an EIS must describe real and funded, not speculative, programs and their environmental impacts. Page 36. What will be the initial and annual costs of preparing, negotiating, signing, implementing and monitoring the proposed Ranch Operating Agreements? Page 37. Diversification into row crops, poultry and other crops will attract wildlife. Ranchers will complain that wildlife is disrupting these operations. How will the park respond to these complaints, and what costs will the park incur in responding, and in subsequent additional wildlife management? This sounds like a repeat of the Elk/Cow problem. Such problems should be avoided. Alternatives C through F. We reiterate our comments from above, as they apply to these alternatives. The public needs to see the capital and operating costs of implementing each alternative, and the environmental impacts of incurring such costs, as well as the environmental impacts of diminished funding for existing programs to make an informed comment on their comparative merits. To follow up on our scoping comments, we believe that only weed free feed and seed should be used at PORE. If it is too expensive for the ranchers, PORE, as part of the preferred action should pay for the incremental cost compared to convention feed and seed, in order to avoid expensive invasive plant monitoring and elimination programs. The environmental impact of these costs should be described and mitigated. Mitigation and monitoring. Even in the extensive description of the preferred alternative, there is very little description of the timeline and cost in dollars and staff time of the required mitigation and monitoring program under NEPA. This can be very expensive, especially with respect to monitoring the management of thousands of cattle and the hundreds of elk. This section needs to be detailed with respect to what it will cost per year, and how many staff hours will be devoted to it. Assuming a level budget, what existing programs will lose funds as a result? Additional alternative which should be adopted independently, or as part of any alternative which is selected to be implemented. As part of the mitigation and monitoring requirements of NEPA, PORE should adopt a parking fee at all large parking lots. More than a million cars per year visit PORE every year. A parking fee of \$10 for a week long pass, or \$30 for an annual pass, would bring in a net of more than \$5 million per year, after the costs of administering the program. These funds could be used to avoid any budget cuts to existing programs, eliminating the very harmful environmental impacts described above. The funds could also be used to implement the selected alternative and accompanying mitigation measures. It appears that the Federal Lands Recreation and Enhancement Act (FLREA) (16 U.S.C. §§ 6802) authorizes imposition of parking fees at PORE. Entrance fees are distinguished from recreation (and parking) fees in the FLREA. PORE authorizing legislation prohibits collecting entrance fees, so that cannot be considered as an alternative source of revenue. Only Congress can authorize entrance fees. But the FLREA does authorize PORE to collect parking fees as long as recreation is provided at the parking area. This clearly is the case at PORE. Thank you for considering these comments, which should be made part of the official record. [ADDITIONAL PHOTOS ATTACHED AT END]

Correspondence: According to the EIR, many of the ranches are in "poor to good" condition - therefore removal (EIR 4.87) of many "historic" ranches will not involve substantial economic cost.

Given that the Point Reyes National Seashore is the only National Park with Tule Elk, and the small number of Tule elk, clearly, Alternative F, removing the ranches from public land and allowing the Tule Elk to roam free is the best alternative - Choose Alt F. Moreover, the ranches may have an unintended impact on protected marine mammals, recently a seal was killed by a dog on the beach- roaming on park land and public beaches are in incompatible use.

Name: Phillips, Julie

Correspondence: I submitted written comments after attending the NPS Public Meeting on Wednesday, November 14, 2018 at Point Reyes Station on the EIS Scoping Document for General Management Plan Amendment process, and also submitted extensive comments by mail on November 15, 2018. \_The Public Meeting and GMP Amendment documents handed out at the general public at the Public Meeting gave more clarity and direction to the proposed options. I do not believe that any of my concerns, comments and/or

expertise on Tule Elk (with over 35 years of research and studying Tule Elk in California) were incorporated into the GMPA. In fact the entire public process seems to have been totally disregarded by the PRNS Management Team. It, again, appears that the Ranching operations WILL TAKE PRIORITY over the native wildlife and landscape at PRNS! By observing and reviewing public comments during the hearings in 2018 and online, I still am convinced that the MAJORITY OF THE PUBLIC supports free-roaming Tule Elk at PRNS OVER a private CATTLE OPERATION as well as other proposed agricultural operations in this NATIONAL PARK! Please, again, review my extensive comments below including the FACT that the CATTLE OPERATIONS/FAMILIES were compensated millions of dollars by the American public to compensate them for their lands (i.e. sold the ranches)! So, Pt Reyes ranches enjoy taxpayer funded & subsidized grazing fees, housing & infrastructure! 1. Point Reyes National Seashore should be managed under the Point Reyes Act for "maximum protection, restoration and preservation of the natural environment". Prioritizing commercial dairy, beef and agricultural leases on these National Park Lands is not consistent with current NPS practices! This is also clearly a VIOLATION of THE PUBLIC TRUST DOCTRINE that holds these public lands in trust for present and future generations! The former commercial lease-holders were paid millions of dollars to purchase their original lands am! most of the original landowners and family no longer farm these public lands! In addition, what message is the PRNS leadership, NPS administration and elected involved in this long process sending to the young people of this country? It is time to restore PRNS to its original native landscape that supports native wildlife, including California's endemic Tule Elk, and other all native species of wildlife! Commercial agriculture and dairy ranching operations in this national park would clearly not be supported by the majority of people in the state of California as well as most Americans. In addition, what message are you sending the young people of this country about the role and mission of these Restricted-Use Lands! 2. The native landscape, native wildlife species, public access and enjoyment should be the #1 priority at Pt Reyes and should take priority of any commercial activities! The Pt. Reyes National Seashore landscape is clearly a degraded landscape as a result of overgrazing activities for many decades! These poor land use policies and practices must certainly impact the local watershed including the coastal areas. It is time to implement a Native Landscape and Species Restoration Ecology Plan and Vision for PRNS -Alternative F would help in starting this process! That vision should include protection of the native Tule Elk which will play an integral role in "restoring" the native grasses, shrubs, herbaceous forbs, trees and other wildlife across the current degraded landscape. Restoration Ecology is now taught in most public institutions including colleges and universities! Time to practice what we all preach on public lands at PRNS! The old vision and mission at PRNS are outdated and clearly confuses the public (including students and visitors from all over the world and locally) what a National Park is and should be! 3. Tule Elk are an integral part and component of the native landscape at Point Reyes. The reintroduction of Tule Elk was an important step in restoring the native landscape at Point Reyes as well. Tule Elk as an integral component of the native landscape, are critical in "restoring" the native wildlife (including native grasses and other plant species) at Point Reyes. Tule Elk are a "keystone" species of the native landscape and critical in the long term health of this National Park. What "public" meetings were conducted to come up with this vision? Who met with public officials, park officials and others to come up with the proposed direction of removing native Tule Elk as well as basically "eliminating" all native species within the park? Who authorized the decision to basically kill and let die over half of the "captive" native Tule Elk in PRNS? Has such a process or decision ever been done before within National Park lands in the United States? Who within the California Department of Natural Resources and specifically, the California Department of Fish & Wildlife, allowed the "fenced" Tule Elk to die due to a lack of access to freshwater? The current and proposed cattle and farming operations are incompatible with the mission of these public lands! Clearly, the extremely degraded landscape serves as a clear indicator that these "ranching activities" are not compatible with this fragile and highly degraded ecosystem. In addition, the other agricultural activities such as mowing should not be allowed in this park as these activities clearly harm native and protected habitat and species! As one who taught Environmental Science in the California Community College System for over 27 years including topics such as the role of National Parks in protection of our public lands and Environmental Stewards who fought to create and protect lands for the public (such as John Muir, Aldo Leopold and others), I believe they would be saddened and shocked by the current practices at PRNS as well as the proposed priority of domestic livestock and farming practices over native landscape and native species (including a California Endemic Species, the Tule Elk). Julie Phillips, Tule Elk Biologist (1982-2019), California Resident/native Californian Environmental Scientist, Community College Instructor and Educator for over 30 years Submitted in person and by mail August 27, 2019

Name: Gregg, Louise

Correspondence: PLAN B- Seems fine except for the elk issue. There are 5,530 cows and 674 elk living on the National Park Service lands. Dr. Laura Alice Watt concluded in her article, "Tule Elk at Point Reyes: A Long History Relocation," 09/19/19, to relocate The Drakes Beach herd and fence in the Limantour heard. The part about fencing in the Limantour heard makes sense but relocating the Drakes Beach herd does not when the N.P.S. says they can manage a heard of 120. I do like her about relocation though. Relocate any elk at Drakes Beach that exceeds the 120 limit. And while you are relocating elk we could bring back some from other distant herds to strenthen the gene pools. More could have been written about the environmental impact caused by agriculture. Point Blue wrote a 2 year study called, The Silage Report. This report shows ways the ranches could plant and harvest Their crops in harmony with the wild life they live with. The Ravens have become a big problem for the threatened Western Snowy Plovers. The ranches have unknowingly Supported the flocks that have increased out of proportion . They need to be controlled because they are the #1 killer Of the WSP. The Marin Co. laws that protect our water shed are not being enforced in the N.P. The ripairan setbacks of 100 ft. Should be a part of Plan B. All in all our most important job is to care for our environment, wildlife and wilderness. Like the California Coastal Commission the Point Reyes National Seashore serve the Nation not the lucky few.

Correspondence: RE: Regarding the National Park Service's Proposed Plan to Shoot Tule Elk Our family and friends are regular visitors to the Point Reyes National Seashore. We come for healthy recreation, to appreciate the Tule elk and other wildlife, and take hikes to enjoy the natural world. I am very concerned that the National Park Service is proposing that commercial activities should take priority over native wildlife at PRNS. I strongly oppose the proposed shooting of the elk, and support restoring the native ecosystem by ending the leases to the private ranchers. The elk populations at PRNS are already impacted by restricted access to water and bacterial diseases. They should be provided additional grazing acreage through the removal of fences that were put there for the containment of cows owned by private interests. The Park Service should be dealing with environmental challenges such as the impact of climate change on the local ecosystem and the state of the water quality in the park, which is affected by bacterial and nutrient pollution from the ranches. Our tax dollars were used to purchase the land at fair market value from the cattle and dairy ranchers with an agreement that these commercial operations would be phased out. Our national parks should serve the public at large and not subsidize private ranching or any other agricultural activities. Finally, I do appreciate the principle for integrating the human dimension into ecosystem management. In this case, an implicit agreement already exists for ending agricultural activities in the park and for prioritizing the native wildlife in the park. Thank you for your consideration.

Correspondence: Theodore Roosevelt addressed the crowd: "Leave it as it is, you cannot improve on it. The ages have been at work on it, and man can only mar it. What you can do is to keep it for your children, your children's children, and for all who come after you, as one of the great sights which every American, if he (or she) can travel at all, should see. He wasn't standing near the visitor center at Pt Reyes' he was speaking near what is now Bears Ears National Monument. But the 26th president offered guidance, a vision, an aspiration, you can do is to keep it for your children. (Summary of above information From Sierra magazine, Sept/Oct 2018 issue.) That guidance and directive is a reason why I am a volunteer in the Volunteer Management Office at Pt Reyes National Seashore. I became a volunteer to support the land and the creatures that live there: for your children, your children's children, and for all who come after you. Now I am having doubts: just whom am I supporting? OITA WA, Feb. 8, 2018 /CNW/ - Today, Grey, Clark, Shih and Associates, Limited (GCS) released an updated report detailing how the American government continues to provide massive levels of support to its agri-food sector at federal, state, and local levels. The study, which focuses on changes introduced by the 2014 Farm Bill, shows that in 2015, the American government doled out approximately \$22 .2 billion dollars in direct and indirect subsidies to the U.S

dairy sector. According to recent data from Metonomics, the American government spends \$38 billion each year to subsidize the meat and dairy industries. According to recent data from Metonomics, the American government spends \$38 billion each year to subsidize the meat and dairy industries. The park's 3,500 dairy cows and 2,500 beef cattle are part of the subsidy. On top of these benefits, the ranchers receive below-market rents and discounted grazing fees. The NPS improves and maintains road and other infrastructure, such as they are. Here's an overview, from the NPS website, of the operating and maintenance budget: Infrastructure - The National Park Service estimates that in FY 2017 there was more than \$11.6 billion in backlogged maintenance and repair needs for the more than 5,500 miles of paved roads, 17,000 miles of trails and 24,000 buildings that service national park visitors. In 2017 330 million people visited the 417 NPS sites across the country. The NPS retired over \$650 million in maintenance and repair work in FY 2017, but aging facilities, increased visitation, and resource constraints have kept the maintenance backlog between \$11 billion and \$12 billion since 2010. Alternative B compounds all the above documented subsidies and maintenance backlog. And transforms my volunteer work to another subsidy to an industry whose presence in the park mitigates why I chose to be a volunteer in the first place: Theodore Roosevelt addressed the crowd: "Leave it as it is, you cannot improve on it. The ages have been at work on it, and man can only mar it." Mr. Secretary, David Bernhardt: First, stop the marring!

Correspondence: Re: National Park Service's Draft Environmental Impact Statement on the General Management Plan for Point Reyes National Seashore and Golden Gate National Recreation Area Dear Superintendent: These comments to the National Park Service's (NPS) Draft Environmental Impact Statement (DEIS) on the General Management Plan for Point Reyes National Seashore and Golden Gate National Recreation Area are submitted on behalf of Project Coyote and our California supporters. Project Coyote is a national non-profit organization based in Marin County, California. We have more than 8,000 supporters, activists, advisors, volunteers and staff working together to promote compassionate conservation and coexistence between people and wildlife through education, science, and advocacy. Our supporters include nationally and internationally recognized scientists, educators, ranchers, political leaders and everyday citizens who strive to change laws and policies to protect native carnivores from abuse and mismanagement, advocating coexistence instead of killing. We seek to change negative attitudes toward wolves, bobcats, mountain lions, coyotes and other misunderstood predators by replacing ignorance and fear with understanding, respect and appreciation. Thousands of our members and supporters live and work in California, and many are regular visitors to Point Reyes, a federally designated protected area, where they partake in hiking, camping, birdwatching, photography, wildlife observation and study, kayaking, and beach-going. Project Coyote has many concerns about issues discussed in the draft, including the overall thoroughness of the DEIS, and is particularly troubled by several aspects of the "preferred alternative" identified by the NPS. Set forth below are just a few examples. In addition, we urge the NPS to include within the DEIS generalized budgetary costs of the various alternatives, and to identify relevant funding sources. Agricultural Diversification and Ecological Impacts The DEIS mentions two specified allowable forms of agricultural diversification in the Park: row crops and new livestock species (particularly pigs, goats, sheep and chickens). There is no analysis or discussion of the environmental consequences of this diversification. This must be rectified before such diversification is chosen and implemented. Row crops will attract a host of animals (native and non-native) such as various rodents, skunks, gophers, moles, voles, deer, and fox, who prefer to consume vegetables or leafy greens. These will in turn attract small to mid-size predators, such as bobcats and coyotes. Retaliation toward species deemed "pests" or "vermin" is inevitable, and despite the NPS' assurances that no rodenticides or other lethal measures will be allowed, killing and retribution will very likely occur, and these actions can have cascading detrimental effects on the local ecosystem and on non-target wildlife, including threatened and endangered species. Introduction of other livestock farm animals into the park (the livestock species referenced above-pigs, goats, sheep and chickens) will almost certainly attract other larger predators seeking easy prey. Coyote, bobcat, and mountain lion populations would undoubtedly increase, bringing with them a host of possible human/wildlife conflicts. There is a large extant literature on the ecological impacts of cattle on ecosystems, which we discuss in our comments below. In addition to these well-known ecological impacts detrimental to ecosystem function and services, agricultural diversification is likely to greatly alter the ecology and wildlife patterns in and around the park, and result in an environmental disaster for the animals, the leaseholders, and park visitors alike. All this,

combined with continued climate change and disruption that will exacerbate impacts, must be addressed as part of the EIS process. Climate Change and Climate Disruption While federal law does not yet mandate that climate change analysis be considered and presented in the NEPA/DEIS process, most policymakers and governmental agencies realize that the climate represents an existential threat to the planet, and is already affecting the weather, sea levels, polar ice levels, water temperatures, and more. Methane is known to be one of the most potent greenhouse gasses, and methane from cows to be one of the most prevalent sources of emissions. Other threats include: -Rising Seas -Tidal flooding -Shoreline erosion -Saltwater intrusion - Larger storm surges -Chronic or permanent inundation of roads, beaches, marshes, etc -Ocean acidification -Worsening air and water quality - Longer and more frequent heat waves and droughts -Longer wildfire seasons and hotter and more frequent wildfires Apart from a very cursory analysis in the air quality section (pages 188-192), none of these life-changing impacts is even mentioned in the DEIS-much less analyzed comprehensively. Not only is methane (CH<sub>4</sub>) one of the most potent greenhouse gasses, it has 80 times the heat-trapping properties of carbon dioxide (CO<sub>2</sub>). A study out of UC Davis reveals that a single dairy cow will belch 220 pounds (~99 kg.) of methane per year. Agriculture (mostly cows) contributes almost 25% of all greenhouse gas emissions worldwide according to the World Resources Institute, which found that over the next 20 years, dairy and beef cows will have twice as much impact on climate change globally as will all of the world's passenger vehicles. In addition, manure management accounts for about 14% of total greenhouse gas emissions from the agriculture economic sector in the United States. It is imperative that this impending crisis be front and center in the environmental impact analysis, and that the DEIS be redrafted to include ways to address the many serious impacts of climate change, as well as ways to mitigate cow-based emissions with better manure management, feed practices, etc. Tule Elk Culling Project Coyote strongly opposes lethal culling of the Tule Elk herd within the Point Reyes/GGNRA planning area. To the extent that reducing the elk herd to keep it sustainable becomes absolutely necessary, non-lethal control measures (including contraception, or tranquilization, removal and relocation to other suitable habitats in Northern California, etc.) should be utilized. Dairy Ranching Due to the substantial emissions and the intense and impactful manure and water quality issues resulting from their operation, dairy ranching facilities should be phased out over a period of five years, as set forth in Alternative E of the DEIS. Cattle Ranching Rather than increasing the level of allowed beef cattle AUs to offset the loss of dairy ranching operations, the number of beef cattle AUs allowed should remain constant or be reduced, in order to best serve (1) the statutory purpose of national parks under the National Park Service Organic Act, which is "to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations;" and (2) the Point Reyes Seashore enabling legislation, as amended, which states that the NPS shall administer Point Reyes "without impairment of its natural values, in a manner which provides for such recreational, educational, historic preservation, interpretation, and scientific research opportunities as are consistent with, based upon, and supportive of the maximum protection, restoration and preservation of the natural environment within the area ...." (Emphasis added.) It is clear (even from the deficient DEIS) that extensive beef ranching on park lands has, and will continue to have, deleterious environmental impacts on the area's soils, water quality, vegetation, wildlife (including the Tule Elk), and the climate. Reducing the acreage allowed for cattle ranching, as set forth in Alternative E, will help. Extension of ranching operation leases on the remaining ranch lands to the legacy ranching families shall be allowed, but such lease extensions should be limited to five years, with limited infrastructure, mandatory regular environmental impact reviews, and subject to Best Management practices. No diversification of agricultural activities shall be allowed. To the extent that lease extensions under these parameters are appropriate, only members and descendants of the original ranch families can participate. No "new" ownership interests shall be allowed, in keeping with the intent of the enabling legislation and other agreements made when these park lands were acquired from those legacy families. When and if existing families leave, retire, abandon their lease(s), or otherwise vacate their leaseholds, those lands shall be transitioned from cattle ranching to the natural and indigenous ecosystems. Conclusion The law requires that the NPS seek to implement the most protection and least detrimental consequences to the environment (including wildlife, water and soil) in its management and oversight of the Point Reyes National Seashore. Preliminary, the NPS should redraft the EIS to discuss the climate change issues referenced above, include budgetary sources and uses, and discuss how it intends to implement the plan such that it is supportive of the maximum protection of the natural environment of the area. These comments by Project Coyote outline a protocol (with parts taken from Alternatives D, E and F in the DEIS) that accomplishes this mandate, while allowing much of the historic cattle ranching operations to continue (albeit in a

more restricted manner). We welcome further discussion with you about this matter. Thank you for your consideration. Respectfully submitted,

Correspondence: Dear Superintendent Muldoon:

Thank you for the opportunity to comment on the General Management Plan Amendment and Draft Environmental Impact Statement for the Pt. Reyes Seashore and the Northern District of GGNRA. Our comments focus on the National Park Service's (NPS) responsibility to protect native wildlife, habitats and ecosystems - that we consider to be the fundamental and primary responsibility of the NPS at Point Reyes. Marin Audubon supports natural ecosystem restoration and limited agriculture at the seashore as described in our proposed preferred alternative below. The 1962 legislation establishing Pt Reyes had nothing to do with agriculture or cultural resources. It calls for reserving "a portion of the diminishing seashore of the United States that remains undeveloped." The 1972 GGNRA enabling legislation directs NPS to "preserve for public use and enjoyment of certain areas...possessing outstanding natural, historic, scenic, and recreational values...as far as possible in its natural setting areas, and protect it from interpretation and development and uses which would destroy the scenic beauty and natural character of the land" brings in historic resources with a restriction that the natural character of the land not be destroyed. The 1978 congressional directive qualifies that Pt. Reyes be managed "without impairment of natural values ...." and "that are consistent with, and based upon, and supportive of maximum protection, restoration, and preservation of the natural environment within the area." The NPS is straying far from these directives to protect the natural character of the lands, promote uses that would not destroy the natural character of the land, or would not impair natural values and that are consistent with maximum protection, restoration and preservation of the natural environment. The 2019 Resolution 31 defining multi-generational ranching and dairying as being "fully consistent with Congress's intent for the management of the Point Reyes National Seashore" is not supported by the DEIS, its analyses or science. The interests of ranching and private ranchers are taking precedent over Pt. Reyes environmental protection responsibilities. We note that the 2019 directive does not appear to apply to areas within GGNRA . This Plan amendment justifies continued, permanent ranching over natural resources based on ranching being a cultural resource. The preferred Alternative B has been developed to perpetuate 26,100 acres of ranching and would cull the native elk herd to ensure ranching is not disturbed. The alternatives that would remove or reduce ranching appear to be straw men, designed to be rejected. C, E, and F set a schedule that is unrealistic and extreme, in fact, punitive. The time line is unreasonable and would pose a hardship to expect a family to close their ranch in one year, as proposed in D, and perhaps even to change operations in five years. We have evaluated the preferred and other alternatives with consideration for ranchers with the recognition that grazing, if done responsibly can provide limited habitat for wildlife, and that the lands have sustained families through generations. We propose an alternative with the long-range goal of expanding and restoring natural habitats and eliminating ranching over an extended period of time except for a limited acreage, if necessary, to preserve agriculture as a cultural heritage.

**MAS RECOMMENDED ALTERNATIVE**

MAS recommends that a more realistic alternative that would phase out ranches gradually based on attrition, be identified as the preferred alternative. It would allow current ranchers to remain until either they or their children want to stop ranching. It would provide for a gradual transition that would be fairer to ranchers while benefitting the elk population, other wildlife and natural resources of the park by expanding and restoring their natural habitat in the long term. It would recognize the park mandates, allow the elk population to expand gradually, and provide for nature and the NPS to restore stream, grassland and other habitats on the grazed lands. Retiring of ranches should be accompanied by restoration of vegetative and aquatic habitats for wildlife. A specific reduced acreage or a few historic ranches could be retained in ranching to preserve cultural history and grassland habitat. Prescribed grazing also could be used to provide short grass habitat and/or cultural resources. This would allow visitors to observe ranching, as well as the majestic elk which are what visitors really come to see. People can view grazing cows in probably any state in the union, and just by driving along Highway 1 in West Marin. 26,100 acres of grazing cattle is not needed to protect agriculture as a cultural resource. The draft succession policy should be

modified to terminate ranching operations on a given ranch if named lessees do not wish to enter into a lease/permit; cannot agree upon an arrangement among lessees for continued operations; or have consistently not met performance standards. No other effort should be made to seek lessees from inside or outside the park. The land should be retired and revert or be restored to habitat. Discontinuing ranching based on gradual succession and restoring habitats on lands where family members do not wish to continue ranching would be kinder to ranching families and much more in keeping with the natural resource protection mandate. A few ranches could be selected to maintain cultural ranching based on lack of natural resource values. Ranches with important natural resources should be identified for habitat restoration. While the justification for continuing ranching is to preserve cultural values, continuing ranching on 26,100 acres is not necessary to protect cultural resources, even if this is a valid categorization, nor is that acreage needed to demonstrate ranching as a cultural resource. Protecting agriculture as a cultural resource could be accomplished on a few ranches and a few thousand, or even hundred acres. In addition to failing to protect natural values, the rigid long-term approach of Alternative Band other alternatives, to retaining the huge ranching acreage fails to recognize that times change, people change, families change, socio economic conditions change, and climate is changing. It is not the responsibility of the NPS to maintain cultural/agricultural uses on thousands of acres when the families do not wish to continue, nor is the NPS responsible for continuing agriculture viability in the region. This is a time when the dairy industry is declining, and recommendation has been made by the International Panel on Climate Change that to sustain the planet, people need to move to a plant based diet. MAS asked for a reduced ranching based on attrition alternative in our EIS scoping comments, and we again urge that it be considered. As discussed below, it is clear that reducing or eliminating ranching would greatly benefit the park's natural resources, would allow more water for natural resources, more habitat, fewer impacts on wildlife, and more natural vegetative communities - more in keeping with the Park's mandate to protect natural areas and character of the land. HABITAT RESTORATION NOT ADDRESSED

Considering the legislative directive to protect, restore and preserve the natural character of the land, restoration of natural values should be an integral part of the alternatives. The Plan should discuss the NPS current projects and future plans for habitat enhancement/restoration for elk and for the full range of species that depend on Point Reyes and GGNRA. Restoration does not appear to be considered in any of the alternatives. This is particularly evident in Alternative F, which discontinues ranching, but instead of increasing habitat enhancement on the vacated lands, visitor use is expanded. The DEIS should recognize that removing or significantly reducing grazing would allow gradual restoration of habitats, either by nature or active NPS projects. There should be a discussion of species and habitats that would benefit from restoration. The discussions of F and D sound like the vacated ranches would be left and would remain in a degraded state in perpetuity. How habitats where grazing would be removed, would be expanded and enhanced to benefit the ecosystems should be discussed. Staff resources needed for managing ranch activities could be redirected to restore natural habitats to benefit native species. IMPACT DISCUSSIONS INADEQUATE

The primary justification for retaining and expanding agriculture is the establishment of a zoning framework consisting of Natural Resource Protection, Range, Pasture, and Ranch Core Subzones. These zoning categories are intended to locate grazing out of sensitive resource lands and restrict grazing to what are considered to be low value lands. We'd like to first point out that the very recommendation for such a framework acknowledges that grazing has adverse impacts on natural resources that need to be avoided or reduced. A zoning framework would not be needed if all impacts were beneficial. The effectiveness of a zoning framework depends on a number of supporting components, none of which are assured as discussed below, therefore, the effectiveness of the zoning framework is unlikely: 1) Compliance. The proposed benefits depend on the ranchers complying with zoning categories and restrictions of their leases. But compliance is at best uncertain. There is no discussion of rancher compliance but there is evidence of noncompliance: there are more AUs on some ranches than limits allow. We note, also, that there are extensive reports of over grazing in comment letters. Nor is it reasonable to expect uniform compliance. The potential for noncompliance and resulting adverse effects must be acknowledged along with associated adverse impacts. We realize that the NPS assumes compliance, but this is not a realistic assumption. 2) Monitoring and Enforcement. An effective monitoring and enforcement program is necessary to assure compliance. This too is uncertain. There is no discussion of the park's monitoring and enforcement program that would enable the reader to evaluate its adequacy. The requirements that are in leases to protect the

park's wildlife and habitats are not known. The effectiveness of the monitoring and enforcement cannot be evaluated.

3) Adequate Funding. Costs of monitoring and enforcement would increase with the proposed zoning because the increased requirements will mean more oversight and enforcement is needed. The new zoning, diversified activities (e.g. goats, chickens, sheep and crops) would attract predators, even though confined by zoning, fencing or structures. More funding would be required to provide staff to manage and enforce the program. Whether funding would be sufficient to provide adequate monitoring and enforcement is at best uncertain because federal funding has been declining in recent years even though habitats, roads and trails are badly in need of repair currently. It is clear that federal funding cannot be relied upon as a means of ensuring oversight and enforcement when needed, even if the programs are adequate on paper.

4) Adequate Mitigation Measures. Measures in Appendix D are proposed to avoid, minimize or mitigate impacts. The DEIS should identify which measures are intended to mitigate adverse impacts as the vast majority of the measures in Appendix D are actually Best Management Practices that should be required of any lessee of public land. Very few would actually compensate for adverse impacts or loss of natural habitats on public lands because they do not require or provide replacement habitat for habitats lost or degraded. Appendix D, Table D-1 Management Activities by Activity Types and Table D-11 list many types of restoration and other activities types that would benefit natural resources. But it is not certain whether they would be required or voluntary. A discussion on page D-3 states "The Park would work with ranchers during annual meetings to identify projects and consolidate and; coordinate review of ranch projects to complete compliance and authorize implementation.. This indicates the activities are negotiable and not required. With no requirement that the actions be implemented, they cannot be considered adequate mitigation.

5) Activities that would be allowed under the zoning would result in additional adverse impacts that have not been adequately identified or evaluated. Diversifying with chickens, goats, sheep, pigs, horses and visitor overnight stays would involve additional impacts that include: increased water use and water loss to the ecosystem from increased water needs for maintaining the additional AUs, loss of habitat, coverage of land that could be restored to habitat, increase conflicts with native predators, degraded water quality from runoff, and increased degradation of lands from more animals needing to be confined. Some specific impacts are mentioned here and there in the DEIS, but there needs to be a comprehensive discussion that identifies adverse impacts and mitigation measures that effectively mitigate the adverse impacts of the diversification. Mitigation measures cannot be considered adequate unless they are feasible, certain to occur and effective. Another justification for retaining agriculture is that some species benefit from grazing. The resource benefits of retaining grazing are cited as being control of coyote brush and weeds. These could be.. handled by prescriptive grazing and providing short grass habitat. Some species may benefit from shorter grass, but that is likely to be a limited number in comparison with the range of species that benefit from a natural system. Stock ponds are also mentioned as a benefit for the special status red legged frog. Natural pond and stream habitat for Red-legged Frog habitat could be restored in the natural setting.

Cumulative Impact Analyses Inadequate. Cumulative analyses of many of the impact categories are comparisons of adverse impacts to specific species, plant and wildlife species in particular. Then these piecemeal analyses are compared with a combined list of projects near or in the park that are mostly beneficial projects. There is no clear or comprehensive analysis of the cumulative impacts of grazing on the natural resources within the park. The overall cumulative impact analyses are insufficient to clarify the overall impacts of grazing compared, to benefits of removing it. As discussed below, however, it is clear that the benefits of removing grazing on native wildlife and ecological systems far exceed the benefits of retaining grazing. And, any perceived benefits of retaining grazing can be provided on far fewer acres. Short grass habitat, for example, could easily be provided by a few ranches or by bringing in animals to graze in prescribed areas.

**INCOMPLETE ANALYSIS OF IMPACTS ON WILDLIFE** The DEIS should discuss the ecosystem and the food web, invertebrates, wildlife and plants etc. that ,, depend on the park's habitat's in the planning area. Discussing elk in isolation gives an inadequate picture of the predator-prey relationships. The following should be discussed: the impacts of agriculture; on the predator populations, the opportunities for habitat enhancement for these predator-prey species and all of the other species in the food webs at Pt. Reyes. A comprehensive discussion is needed to further the natural process. Much of the information is cursory and inadequate as a decision-making tool. Another insufficiency is that the DEIS focuses on Federally listed and Special-status wildlife except that there is a more broad discussion of birds, noting that Pt. Reyes has the "greatest avian diversity of any national park in

the United States, and nearly half of the bird species on North America abound with 490 recorded...." This species richness should be reason enough to ensure that the NPS addresses the full array of species and works toward optimization of their habitats. Tule Elk Surprisingly, the wildlife section mentions but does not provide any information about the two top predator species that prey Tule elk - mountain lion and coyote. There should be a discussion of the predator prey interactions between these species. Are there opportunities to enhance the habitat for these predators? What efforts are, or could be implemented to restore a more natural interaction The DEIS should address, the current status of the mountain lion and coyote populations, habitats they prefer, evidence of preying on elk and on cattle, and impacts on ranching. We would expect that these , two species as well as other predators would be attracted to ranch animals and, therefore, could be affected by ranch activities (contrary to statement on page 77). They should not have been excluded from the discussions. How do ranchers deal with them? Are there management actions taken against these predators by ranchers or the NPS? One could expect that ranchers would want to discourage large predators from coming near their livestock, and this attraction would increase with diversification with small farm animals. The coyote population status should be addressed, their use of ranchlands and other lands in the parks, evidence of preying on young elk, dairy cows and beef cattle. Some years ago, there was an intense effort to eliminate coyotes from West Marin ranches. How are they being controlled now at Pt. Reyes? How much do these predators prey on elk? Domestic animals are another non-native predator that should be addressed, specifically non-native cats that are responsible for the death of thousands of birds annually. Bird Impacts Avian impacts of grazing include, according to the DEIS: reduced habitat due to invasive species, ground nesting birds would be susceptible to trampling from livestock; bird collisions with barbed wire fencing, predation by ranch cats and reduced riparian habitat from grazing cattle. Other impacts listed below under Wildlife would also apply. Western Snowy Plover Discussion states that Mitigation measures described under A would reduce potential numbers of ravens associated with ranching. This is not what the discussion at Alternative A says. It actually says that ravens are attracted despite the mitigation measures, and that the alternative would contribute directly to impacts on snowy plover. Cumulative Impact Analyses The cumulative analyses are clear that the benefits of removing or significantly reducing grazing would be beneficial to native Wildlife. The analysis states that B would reduce some potential resource impacts because it would establish Natural Resource Subzones. Establishing this or any zoning framework will not reduce impacts. Even compliance with the zoning framework wouldn't because it would still leave vast acreages in a degraded, unnatural state. If some impacts would be reduced by removing grazing under the zoning framework, they would be reduced or eliminated even further by reducing or eliminating grazing. All of the grazing alternative analyses state that impacts would be beneficial or adverse depending on the species. This consideration of impacts to wildlife is piecemeal. There is no clear overall assessment of adverse impacts. Nor is there is consideration of the overall benefits in comparison with adverse impacts. Since the DEIS did not do a consistent or adequate cumulative analysis of adverse impacts, we have done our own from information provided in the DEIS We have compiled a list of the adverse impacts from each of the analyses and listed them here: While reduced under Alternative B, and other alternatives retaining grazing, the following stated impacts would still occur to birds and small mammals, and to a greater or lesser extent with other alternatives except F: harvest and silage mowing; impacts of grazing including, trampling, erosion and nutrient inputs; manure spreading reduced; decreased food and cover for some mammals with increased no till crops; manure spreading; with diversification the magnitude of grazing would be greater and there would be additional impacts from sheep (which could exceed 10% of AUs) and goat grazing (which would occur on 34% of the Pasture zone, chicken production which would also reduce habitat for mammals; unnatural abundance of corves, black birds, European Starlings and Brown-headed cowbirds promoted by ranching; reduced habitat for shrub dependent species; and altered habitat conditions for all native species. It follows that removing grazing from more acres would provide more benefits to native wildlife and habitats. DEIS stated benefits of no grazing include: habitat heterogeneity, increased mosaic of grazed and ungrazed, from ranching increased cover to avoid predators; higher species diversity and richness, and altered habitat conditions. The DEIS analysis recognizes that elimination (or even reduction) of grazing would have meaningful beneficial ecological impacts because the primary disturbance regime which mammals have had to adapt would be removed; wildlife would no longer be chopped up by mowers during nesting in fields; the lands would restore to natural systems' increased ground cover for small mammals, more plants would increase the abundance of deer and other species which would graze and browse on more plants; expanded wildlife movement and foraging habitat would increase with higher ungrazed grasses, there would be higher wildlife densities and more diversity, with more prey; and more cover for nesting and foraging habitats. Another benefit would be removal of domestic ranch cats which are a major cause of bird and small mammal mortality. Numerous species

would increase due to more seed producing plants, shrubs for perching and nesting; improved water quality for Tomales Bay. These benefits would be even greater with removal or significant reduction of grazing and under the MAS Preferred Alternative. Impacts that were not recognized include attraction of native predators to areas where goats, sheep are grazing, chickens confined and rancher control of predators. WATER RESOURCES

Water Quality - Under alternative B, 1,200 or 2,000 more acres of streams, ponds and wetlands would be preserved. Active ranching would be excluded from 5.9 miles of streams, 1.9 acres of ponds and 172.7 acres of wetlands. Except for prescribed grazing- there would be no ranching activities authorized in the Resource Protection Zone and the acreage of exclusion areas would increase to 2000 from 800. The statement that "The Rangeland subzone would contain nearly all the remaining surface water resources" is a concern. What are these other remaining surface waters resources and where are they? Why they are not included and what adverse impacts could occur to these surface waters from grazing and other ranching activities Adverse impacts on water quality would continue with grazing and expand with diversified AUs. Row crops, even if not irrigated, would contribute runoff during rains. It is unclear what water bodies the runoff would drain to, whether or what measures are or would be required to prevent erosion and downstream sedimentation. Manure from boarded horses and from up to 500 chickens per dairy ranch would increase nutrient loading. An increase in the number of ranches that could have chickens would increase polluted runoff. With six dairy ranches, there could be a total number of 3,000 chickens, far exceeding the current total number. Pollution from concentration of dairy cows and spreading of manure would also increase. The use of trails, particularly bike use causes erosion and downstream degradation of water. quality. Public use trails are often a source of erosion and sedimentation in downstream waterways and bodies. A more complete description of trails where bikes are being considered should be presented to enable evaluation of potential impacts of new trails on water quality and other resources Cumulative impact analysis- relies again on zoning to protect water resources and has the same problems as discussed above. The DEIS acknowledges that water quality impacts would still be adverse but diminishes the importance by saying that Tamales Bay would still be impaired. It further excuses water quality impacts of grazing saying it would be a very small contributor. This is the same justification used for removing waters from the San Francisco Estuary to go south. It's only a small part. Water Quantity Cumulative Impacts - The DEIS acknowledges that the zoning framework impact on water resources would be adverse but also that it would improve over existing conditions and be minimized by regulations and mitigations. How much B would improve over existing conditions should be described. We doubt that it would be meaningful because the acreage removed over existing conditions is not great. What are the mitigations and regulations and how will they would result in a meaningful reduction in water removed from the natural systems? The water quantity impacts are most clearly considered in terms of the total amount of water that would be restored to natural resources under the alternative that would remove grazing, F. Eliminating dairy ranching would have very significant water quantity benefits 127,000 to 300,000 gpd would be saved by eliminating dairy cow grazing and eliminating beef would save 9,192 to 39,9895 gpd for total reduction of 50 mg to 124 million gallons a day. These are incredible quantities of water that are being lost to the park, its vegetation and wildlife and other natural resources. Imagine how the wetlands, seep and stream and pond habitats on the thousands of grazed lands could increase with restoration of this immense quantity, or even a smaller portion, of water! It would undoubtedly be a different landscape. Alternatives removing cattle would have noticeable long-term beneficial impacts on the quality and quantity of water. VEGETATION

Alternative B depends on the zoning framework that will "authorize only higher intensity activities, including vegetation management and diversification, in areas without sensitive resources." We appreciate this attempt to keep damaging activities away from resources, but these unprotected areas could have sensitive resources if they were not grazed. Identified benefits of removing grazing related to resource protection include increased riparian habitat; reducing biomass; improved use areas improved; removal of dairy would reduce impacts with less concentration of cows; reducing weeds; removing manure spreading, removing forage production and fuel. All of the benefits are related to the planning areas having high levels of non-native species. More native plant communities could restore or be restored without grazing. diverse impacts of brazing - extensive non-native vegetation; special status plant species individually; light nutrient manure spreading which favors invasive plants; new livestock ( 10% above current AUs would be authorized) increased potential for (more invasive) vegetation in 30% of planning area; chicken· manure high in nutrients' adversely impact native grasslands and increase biomass,

continued abundance of non-native plants. There is no overall analysis of vegetative communities and impact of grazing on native plant communities. The Alternative F discussion does not identify any activities that would enhance or restore lands or any measures that could or should be implemented to facilitate the change to a natural ecosystem, where and when grazing would be removed. After so many years of grazing, it is unreasonable to predict adverse impacts without using measures that would convert non-native vegetation to predominantly native species to help nature along. It is disturbing that the only post- grazing activity mentioned is increasing visitor use. VISITOR USE ACCESS

Expanding visitor opportunities by expanding biking, hiking equestrian is noted in alternatives B, D, E and F, however, no information is provided about where the expansions, including day use, overnight accommodations, hiking, biking and would be located except "focusing on existing roads to facilitate connections. Some of these uses, particularly biking could have adverse impacts on natural resources as has been observed in other parts of Marin County. Until information is provided on the locations and assessment of adverse impacts of each of these uses on natural resource, this DEIS should not be certified for these activities. There is a lengthy history of trail biker-caused problems on public and private lands throughout the county. Significant sediment and erosion impacts attributed to bike trial use have been documents. The potential for "new" trails is disturbing. Why would new trails be needed to implement an early detection program? Can't this work be done off trail without creating new trails that would promote more impacts. Impacts from trail use could be significant in particular locations and should be considered in cumulative analysis. What most visitors want to actually to see at Pt. Reyes is grazing Tule elk and other wildlife. Opportunities for elk viewing would be enhanced and improved in alternative F, as would natural landscapes including native vegetation, stream and other habitats and wildlife. People have opportunities to see grazing cattle probably in every state throughout the country. If ranches are removed from planning area, they would still have opportunities to view cattle grazing outside the planning area in West Marin. The DEIS notes that Alternatives B, C, D, E, and F would contribute noticeable beneficial impacts by providing a wider range of recreational and educational opportunities. This same language is in each alternative, with the distinction in C noting that the loss of the elk herd would have a noticeable adverse impact. There should be an explanation of the distinction between the alternatives in this evaluation because it seems obvious that alternatives F and D would provide more opportunities because there would be less grazing and more natural areas.

CONCLUSION The preferred alternative is based more on politics, the former Resource Secretary Salazar's promise of 20 year leases at the time of the Drake's Bay Oyster controversy and Congressman Huffman's legislation to extend ranching leases to 20-years, than on protection of the Park's natural resources. The demand for milk is decreasing in recent years and dairy ranches are struggling. There is no expectation that this will change. The 2019 International Panel on Climate Change report recognizes the significant contribution of meat production to global warming and recommends that moving to a plant-based diet is critical for our planet's survival. Yet the NPS is putting forward a plan that locks in huge acreage for agricultural activities on the wane and may be harming our planet. The DEIS fails to demonstrate that the impact of grazing on the Pt. Reyes and GGNRA is not adverse. The DEIS is inadequate as a decision-making document. The impact analyses is inadequate, particularly cumulative impacts, and is biased in favor of specified long-time continued agriculture use which is not in the public interest and is contrary to the original intent of the park. We urge that the MAS preferred alternative be evaluated and chosen. It would be more in keeping with the park's original mandate and would allow ranching to continue with a termination and ultimate restoration of park habitats.

Name: N/A, N/A

Correspondence: 93 millions cows just in the US, @ any given time. It never makes sense to kill our natural, exquisite beings for a few hamburgers. If all the cows on Pt Reyes went away, there would be no dent in our food source. Save a way of life, the coastal ranchers? Fine, do it with 100 cows and do what is the right thing to do at this critical time in history, saving our natural world and and planet as a whole.

Name: Bohn, Diana

Correspondence: Sirs: Please adopt Alternative F! Restore the coastal habitat at Pt. Reyes!

#7611

Name: N/A, Dyami

Correspondence: Dear Park Service people: save the elk! Adopt Alternative F now!

#7612

Name: Elke, Mary

Correspondence: Dear Park Service: Please restore Point Reyes Seashore for future generations. Please adopt Alternative F.

#7613

Name: Fried, Adrian

Correspondence: Please protect our beautiful elk!

#7614

Name: Hayes, Michael & Anna

Correspondence: We reside in Point Reyes Station and we support the adoption of Alternative F. We have been underwhelmed by the Park Service management. It is time to step up and focus on the mission and core values.

Let the land, wildlife and water...[rest of sentence illegible].

#7615

Name: Kerr, Scott

Correspondence: No on B. Yes on F.

#7616

Name: Lovitt, Ronald

Correspondence: Alternative F is by far the least intensive. Please adopt alternative F.

#7617

Name: Marasovia, Carole

Correspondence: I support Alternative F. Please do not contribute to the extinction of our American elk species. Adopt Alt. F.

#7618

Name: Morrison, Kevin

Correspondence: Please do the right thing! That means no killing. That means compassion.

#7619

Name: Naparst, Marilyn

Correspondence: Save the tule elk!! Point Reyes Natl Seashore; prioritize biodiversity and environmental health restore our coastal prairie habitat. Adopt alternative F now.

#7620

Name: Oda, Mayumi

Correspondence: blank postcard

#7621

Name: Price, Marilyn

Correspondence: To whom it may concern: I understand there is discussion of the NPS draft Plan for cattle ranching at Point Reyes National Seashore. I strongly encourage you to protect our environment and adopt Alternative F. Thank you for considering my request.

#7622

Name: Sebastian, Barbara

Correspondence: Please protect the tule elk

#7623

Name: Sprague, Stan

Correspondence: I am writing to you in support of preserving the habitat for tule elk at Point Reyes Park. I have seen these elk during hikes at Pt. Reyes, and I am happy they are there and I love seeing them and sharing that place with them.

#7624

Name: Strobel, Jeanine

Correspondence: Please, protect wildlife in Point Reyes. Protect the tule elk.
