

NOAA aerial photo taken on November 4, 2012 shows the location of the breach after the arrival of HJurrricane Sandy on October 29, 2012. **National Park Service** measurements of the breach shoreline position for specific dates between April 23 and May 22, 2013 are shown in overlays. Shoreline position data is collected within 2 hours of ocean low tide by walking the breach shoreline with mapping-grade GPS equipment on consecutive days, if possible. The paired shoreline position data is used to calculate the breach width and determine if the breach has migrated.
