HOUSE SPARROW		r		u		r		r	

Based on data from 1998 to present, the methodology to determine the relative abundance for each species was to divide the total number of sightings for a species during a specific season (numerator) by the total number of documented outings for that season (denominator). The number determined after this division was then compared to a percentage scale created to produce a final answer for the species' population status.

**The scale is defined as the following:**

**0-25%=rare 26-59%=uncommon 60-85%=common 86-100%=abundant**

This list was compiled by Jordan Rutter with the help of many. Special thanks go to: Ranger Kate Bucco, Gail McKiernan, John Beetham, Michael Bowen, Pete Marra, as well as Pam & Keith Rutter.
