

Limestone Crystals

Grow your own cave crystals

1. Get some small pieces of limestone rock.
Limestone is the type of rock that was dissolved to form Timpanogos Caves.

2. Put the rock(s) in a small cup and pour vinegar on top. (Enough to cover up the rocks) The caves were formed by carbonic acid, but we will use vinegar because it works faster and is easy to find.

3. Let the rocks sit for a few days, and see what happens! You will find some beautiful crystal growth.
