Dr. Stephanie Toothman
National Park Service
Pacific West Region
909 First Street
Seattle, Washington 98104-4159

Dear Dr. Toothman:

Thank you for the opportunity to comment on the National Register Multiple Property nomination for Yosemite National Park. I concur that the properties identified and evaluated in the nomination do constitute a coherent group of geographically dispersed resources that are eligible for listing in the National Register. The nomination does an excellent job of defining separate, but related contexts that make clear the significance of the individual resources, as well as the reasons that they collectively constitute a multiple property. The inclusion of a number of the park's less elaborate, high altitude resources is particularly noteworthy. The context statements synthesize a large amount of historic documentation in a clear and concise manner and the descriptive material that is provided for the individual resources or resource groupings is excellent.

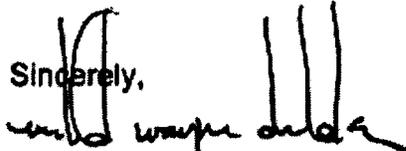

We concur in all of your findings regarding the resources enumerated in the multiple property nomination. We agree that the following properties are eligible for the National Register as a part of a multiple property.

Lake Vernon Cabin Building #2450
May Lake High Sierra Camp Historic District
Hetch Hetchy Comfort Station Building #2104
Henness Ridge Fire Lookout Building #5300
The Golden Crown Mine
Glen Aulin Sierra Camp Historic District
Chinquapin Historic District
Buck Creek Cabin Building #4800
Snow Flat Cabin #Building #3501
Snow Creek Cabin Building #3450
Sachse Springs Cabin Building #2452
Ostrander Ski Hut Building #5110
Old Big Oak Flat Road
New Big Oak Flat Road
Merced Lake Ranger Station Building #3400
Merced Lake High Sierra Camp Historic District

Wawona Tunnel
Vogelsang High Sierra Camp Historic District
Tuolumne Meadows High Sierra Camp Historic District

I have signed the application as commenting authority. If you have any questions, please call Gene Itogowa of my staff (916) 653-8936.

Sincerely,

A handwritten signature in black ink, appearing to read "Milford Wayne Donaldson". The signature is written in a cursive style with some vertical strokes.

Milford Wayne Donaldson

**NATIONAL REGISTER OF HISTORIC PLACES
REGISTRATION FORM**

This form is for use in nominating or requesting determinations for individual properties and districts. See instructions in How to Complete the National Register of Historic Places Registration Form (National Register Bulletin 16A). Complete each item by marking "x" in the appropriate box or by entering the information requested. If any item does not apply to the property being documented, enter "N/A" for "not applicable." For functions, architectural classification, materials, and areas of significance, enter only categories and subcategories from the instructions. Place additional entries and narrative items on continuation sheets (NPS Form 10-900a). Use a typewriter, word processor, or computer, to complete all items.

**1. Name of
Property**

historic name Buck Creek Cabin
other names/site number Buck Camp Snow Survey Shelter; Building #4800

**2.
Location**

street & number N/A not for publication
city or town Yosemite National Park (YOSE) vicinity _____
state California code CA county Madera code 039 zip code 95389

3. State/Federal Agency Certification

As the designated authority under the National Historic Preservation Act of 1986, as amended, I hereby certify that this ___ nomination ___ request for determination of eligibility meets the documentation standards for registering properties in the National Register of Historic Places and meets the procedural and professional requirements set forth in 36 CFR Part 60. In my opinion, the property ___ meets ___ does not meet the National Register Criteria. I recommend that this property be considered significant ___ nationally ___ statewide ___ locally. (___ See continuation sheet for additional comments.)

Signature of certifying official _____ Date _____

State or Federal agency and bureau _____

In my opinion, the property ___ meets ___ does not meet the National Register criteria. (___ See continuation sheet for additional comments.)

Signature of commenting or other official _____ Date _____

State or Federal agency and bureau _____

4. National Park Service Certification

I, hereby certify that this property is:
 ___ entered in the National Register
 ___ See continuation sheet.
 ___ determined eligible for the
 National Register
 ___ See continuation sheet.
 ___ determined not eligible for the
 National Register

Signature of Keeper _____ Date of Action _____

8. Statement of Significance

Applicable National Register Criteria

(Mark "x" in one or more boxes for the criteria qualifying the property for National Register listing)

- A** Property is associated with events that have made a significant contribution to the broad patterns of our history.
- B** Property is associated with the lives of persons significant in our past.
- C** Property embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components lack individual distinction.
- D** Property has yielded, or is likely to yield, information important in prehistory or history.

Areas of Significance

(Enter categories from instructions)

- Architecture
- Conservation
- Science

Period of Significance

1931-1938

Criteria Considerations

(Mark "X" in all the boxes that apply.)

- A** owned by a religious institution or used for religious purposes.
- B** removed from its original location.
- C** a birthplace or a grave.
- D** a cemetery.
- E** a reconstructed building, object, or structure.
- F** a commemorative property.
- G** less than 50 years of age or achieved significance within the past 50 years.

=====

Summary

The Buck Camp cabin, constructed in 1931 by the State of California in cooperation with the National Park Service, is of unusual construction. Built by Park Service personnel using materials found on-site, the cabin's exterior logs were placed vertically rather than horizontally. The cabin is of frame construction resting on a stone and wood pier foundation. Its vertical log walls act as a shell, supporting the roof beams and rafters and concealing the one-by-six-inch rough-cut boards comprising the cabin's interior walls.

General Description

The Buck Camp ranger station can be reached from the Quartz Mountain trailhead and hiking in past Chiquito Lake and over Chiquito Pass.

The one-story cabin, of vertical log construction with a sugar pine shake-shingled gable roof, rests on log sills supported by log posts and stone piles. The windows are galvanized sheet metal on wooden frames, hinged, and secured from the inside. Each room contains a door to the outside, which is vertical board with metal hinges. The two-room interior contains a kitchen with painted board and batten finish on the walls and ceiling. Furnishings include a screened storage shelf, a sink with plumbed water, a hutch, a water heater, a wood-burning stove, a propane stove, and a small table with two bench-type seats. The sleeping/living room has wood split-shingle walls and a board and batten ceiling with a trapdoor. All surfaces are unpainted. The building dimensions are approximately twelve by twenty-four feet, with its major axis oriented north-south.

About forty feet west of the cabin is a tack and equipment storage shed, measuring about four by eight feet. A privy, of log pole and split-shingle construction, sits nearby. About twenty-five feet from the shed is a spring box, approximately two feet deep, with a wooden lid and concrete sides. These structures are of more recent origin and are not considered to be contributing resources.

In 1984 a flagpole and a new outhouse were erected, and a new rock wall was built by YCC laborers along a new dirt bank partially surrounding the cabin. That same year the front porch foundation was replaced and new plumbing installed. As of 2004, preservative maintenance had been carried out on all logwork, and structural framing had been replaced.

=====
Significance

Property Type: Resources Associated with Settlement and Industry (1851-1951)
Subtype: Exploration, Settlement, and Resource Exploitation.
Period of Significance: 1931-1938.

The Buck Camp snow survey/patrol cabin is considered significant in conservation and architecture. Originally constructed for winter service in connection with the acquisition of hydrologic data along the Tuolumne and Merced River watersheds within Yosemite National Park, these cabins, located in isolated areas, served as shelters for personnel and as bases of operation for employees patrolling snow courses and for equipment maintenance. The Buck Camp Cabin was intended from the outset to double as a permanent ranger station for the park's south end. Built under various agreements with the state of California and city of San Francisco, the cabins were used during the summer seasons by National Park Service rangers patrolling the backcountry, serving as supply bases and shelters. They became increasingly important in that latter role, giving added flexibility to rangers in the wilderness who no longer had to carry quantities of dishes and bedding with them. The cabins continue to serve an important function as centers of backcountry maintenance and patrol activities.

Historical Context

Snow is the principal source of the water in the Western United States. Increasingly conflicting demands for water in the West have heightened public awareness for solid management decisions concerning water. Although the West's high mountain ranges hold a vast snowpack that provides 50-80 percent of the year's water supply, nature cannot reliably provide an uninterrupted, dependable supply of melt water to meet all of the downstream requirements. To manage the variable availability, reservoirs and canals have been constructed to ensure competing needs for agriculture, industry, and communities are coordinated. Successful water management, however, begins with a detailed knowledge of the primary source of water in the West: snow.

Snow survey studies and the scientific determination of water runoff were developed by Dr. James E. Church, a University of Nevada professor whose interest in weather led to the development of the methods and technology that, for the most part, are still used today. Dr. Church made his first ascent of Mount Rose in 1895, where, overlooking the Lake Tahoe basin, he contemplated the effect of orographic precipitation and snowmelt runoff as it relates to water supply. His subsequent journeys up the mountain between Reno and Lake Tahoe resulted in his establishment of the Summit Observatory for the purpose of collecting weather data and studying the effects of mountains and forests on snow conservation.

Page 3

In 1909 Professor Church developed the Mount Rose Snow Sampler and Scale to determine the density and water content of snow. One year later, he laid out the first formal snow courses in the Lake Tahoe and Truckee River basins for the purpose of predicting water runoff for Nevada ranchers and farmers. His research also led to control of the water level at Lake Tahoe, where springtime runoff flooded occupants of the lake's shoreline. With proper and accurate predictions, the excess water could be released from the lake prior to snowmelt runoff, and the lake could be maintained at a constant level.

The State of California recognized this important source of information and, in cooperation with Dr. Church's staff, began to lay out snow courses in selected river basins in the central Sierra Nevada in 1917. This work was undertaken by the state's Department of Engineering, which conducted the surveys through 1923, when funding was discontinued.

High country snow surveys were also being conducted on a limited basis, in connection with patrol trips by park rangers, in Yosemite National Park, beginning in the mid-1920s. According to NPS Naturalist Carl Russell, a primary motivation for the snow surveys at that time were to estimate the opening date of high country roads and trails and predict the conditions of the waterfalls during the late summer and early fall. Surveys also helped park administrators predict the severity of fire conditions in the late summer and early fall. The need for scientific surveys became acute in the 1920s, when California's explosive growth made reliable and predictable water supplies essential. In 1926 the Park Service entered into an agreement with the Merced Irrigation District, which was interested in predicting runoff from its watersheds heading in the park. Because the MID had finished construction of its Exchequer Dam in 1926, the Merced River fed directly into the MID's reservoir on the eastern edge of the San Joaquin Valley. In 1926 a snow course was installed at Dana Meadow. The Merced Irrigation District donated money in 1927 to build a patrol cabin at Merced Lake, fourteen miles above Yosemite Valley, to aid in snow survey activities. That cabin still stands, slightly modified, and is still in use as a ranger patrol cabin.

The state legislature appropriated funds in 1929 enabling the Division of Water Resources, the successor to the Department of Engineering, to organize a California Cooperative Snow Surveys program with the local agencies that had previously been involved in snow survey, and which, in some cases, had continued the survey program after the state ran out of funding for the project in 1923. The DWR established 150 snow courses in 1929 throughout the Sierra for the anticipated cooperative program to begin in January 1930. The DWR supplied funding for equipment, for construction of shelter cabins, and in some cases, for personnel to conduct the surveys. The agencies included local municipalities, irrigation districts, public utility companies, and state and federal agencies, including the National Park Service.

Most of the Sierra Nevada Mountains' snow measurements are conducted by the California Department of Water Resources (CDWR) Cooperative Snow Survey Department, which has been formally monitoring winter snow

conditions since 1930, longer than any other such program in the Western United States. In 1931 the state appropriated \$600 for the construction of a snow survey cabin at Buck Camp, in the southwest portion of Yosemite National Park. The plans were prepared by John Wosky, Landscape Architect and Field Architect for Yosemite, and the cabin was completed and ready for occupation by January 1, 1932. An old logging cabin, built in 1916 at Deer Camp, was also renovated for use in snow surveys. The Buck Camp cabin is still used during the summer for patrol, and is in very good condition. The cabin at Deer Camp is no longer standing, having been razed about 1970.

Due to the Great Depression of the 1930s, funding for snow surveys was unavailable for the years 1934-35. However, the cooperating agencies continued to make surveys using state-owned equipment that remained in the field, and the disruption was not as great as anticipated. In 1934, a particularly severe drought throughout the West increased demands by farmers for better streamflow predictions for crop irrigation. Other users that counted on water for industry, power generation and municipal/domestic use also urged for reliable water predictions. In 1935, Congress passed legislation creating a federal snow survey and water supply forecasting program for the West under the direction of the Bureau of Agricultural Engineering in the Department of Agriculture. The California snow survey program remained independent of the federal program, however, with the growing importance of water prediction, the California legislature was again able to appropriate funds for snow survey in 1936. There has been no subsequent interruption in survey activities.

In 1939, the federal snow survey program was transferred to the Soil Conservation Service (SCS); this bureau, now known as the Natural Resources Conservation Service (NRCS) continues to direct a cooperative federal, state, and private snow survey program. The construction of snow survey cabins in Yosemite resumed in the 1940s, with the erection of cabins at Lake Vernon and Wilmer Lake in 1945 and Sachse Springs in 1947, all constructed by the city of San Francisco. These cabins are all located in the watershed of the Tuolumne River, which feeds the Hetch Hetchy Water and Power Project for the city of San Francisco. A cabin at Snow Flat, in the Merced River drainage, was built by the DWR in 1947. These cabins became the property of the U.S. Government, which used and maintained them, allowing city workers to use them in connection with the acquisition of hydrologic data.

After World War II, the ease and expediency of observation of snow markers from aircraft led to the placement of aerial snow depth markers in remote areas of the Sierra. All but one of these markers located in Yosemite are in the Tuolumne watershed and include Dana Meadow, Wilmer and Vernon lakes, Sachse Springs, and Beehive Meadow. The use of automatic snow sensors was approved in 1979. They have been located in Yosemite and throughout the Sierra in remote locations where access is a problem. These sophisticated pieces of equipment enable forecasters to update their information on snow accumulation and depletion at a much more rapid pace, especially during periods of high flood potential.

Page 5

The Sierra Nevada Mountain range's snowpack provides two-thirds of California's water for cities, farms, and recreation in addition to hydroelectric plants, which produce about a quarter of California's power. How "wet" or "dry" a year is predicted to be has many impacts. Public utilities use these estimates to determine hydropower generation rates. Good water years allow utilities to use more hydropower and, consequently, save oil. In a dry year, however, utilities are more dependent on steam generation using more oil, coal, and atomic fuel. Agricultural interests determine crop-planting patterns with water predictions as well as ground water pumping needs, and irrigation schedules. Operators of flood control projects determine how much water can safely be stored in a reservoir while reserving space for predicted inflows. Municipalities use the information to evaluate their water supply and determine whether (in a dry year) water rationing may be needed.

While the development and deployment of automated snow survey sensors has greatly reduced the need for remote cabins, these buildings provide a truly historic perspective of the earliest stages of snow surveying in California leading to the efficient management of water throughout most of the West today. These backcountry cabins still have a useful function during the course of snow surveys conducted on foot, serving as shelters and as bases of operation for the maintenance and repair of snow survey equipment. Many of the structures also function as ranger cabins in summer and winter, aiding in backcountry patrol, visitor assistance, law enforcement, and search and rescue activities. The number of backcountry patrol cabins is held to a minimum. They are maintained in excellent condition with as little intrusion on backcountry natural resources as possible. Their simple rustic architectural style enables them to blend in with their surroundings and remain unobtrusive. The cabins are utilized primarily as staging areas and collection points in park backcountry patrol and maintenance projects. Generally they are not utilized as fixed-station duty assignments. Park backcountry patrol assignments are scheduled with maximum mobility, resource protection, and visitor contact in mind.
