The actions associated with Alternative 3 would generally result in segmentwide, long-term, minor to moderate, beneficial impacts on special status species habitats within the Merced River corridor, with the exception of valley elderberry longhorn beetle. These actions would be focused on restoring and improving aquatic, meadow, and riparian habitat quality within the Merced River Corridor; therefore, special status species that are associated with these habitat types would be most likely to be affected cumulatively by the proposed actions. The past, present, and future actions in the region would have varying effects on special status species habitats, with some projects restoring or enhancing habitats, while many other projects would result in loss or decline.

In general, past actions have impaired and reduced the abundance and quantity of aquatic, meadow, and riparian habitats in the region. These past actions, especially at lower elevations from development and resource extraction, have resulted in a reduction in special status species populations and ranges. Present and reasonably foreseeable future actions also have the potential to further reduce or impair these habitat types; however, in general, potential effects on these habitat types are mitigated and/or compensated through habitat preservation and/or enhancement at an off-site location (including mitigation banks). These actions provide the most benefit when coordinated with larger, regional conservation strategies that protect intact corridors or provide linkages to other areas of suitable habitat. Because the actions proposed for Alternative 3 would further increase the habitat value of the Merced River corridor, these actions would not contribute towards a cumulative adverse effect on special status species.

The actions under Alternative 3 would have long-term, beneficial effects on special-status species in the Merced River corridor. However, in relation to past, present, and reasonably foreseeable future actions throughout the Sierra Nevada and larger region, (e.g., introduction and spread of nonnative species, direct displacement of habitat) the actions under Alternative 3 would have a minimal beneficial effect. Overall, in conjunction with actions proposed in Alternative 3, cumulative actions on special status species would result in long-term, adverse effects on special status species.

## ***Environmental Consequences of Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 4, grazing would be eliminated and administrative pack stock would be required to carry pellet feed in Merced Lake East Meadow, as described for Alternatives 2. Beneficial effects to special status species would be the same as described for Alternative 2.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Several actions related to management of visitor use and facilities would have the potential to affect special status species in Segment 1 under Alternative 4. Visitation within Segment 1 would be reduced through a decrease in the Little Yosemite Valley trailhead quota (from 150 to 100), closure of the Merced Lake High Sierra Camp, and wilderness campground modifications. Under Alternative 4, there would be a 100% reduction in the Merced River corridor's wilderness lodging units. All 60 units and associated facilities at the Merced Lake High Sierra Camp would be removed. The park would reduce the total number of designated campsites within the corridor's wilderness. This change would result primarily from the decrease in designated camping at Little Yosemite Valley Backpackers Campground and removal of bear boxes (composting toilet remains). Designated camping at Moraine Dome would continue and dispersed camping at the Merced Lake Backpackers Campground would be expanded, but facilities would be reduced (i.e., flush toilets and wastewater system would be replaced with composting toilets and bear boxes removed).

The removal of existing improvements could result in local, short-term, adverse impacts on special status wildlife, including noise related to removal of infrastructures and human presence. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. These management actions would have a local, long-term, minor, beneficial impact on special status wildlife species that use coniferous forests in the upper Merced River watershed (WHR: white fir, red fir, Douglas-fir). Special status wildlife species that may benefit from these actions over the long term include northern goshawk, golden eagle, California spotted owl, olive-sided flycatcher, yellow warbler, western white-tailed jackrabbit, Pacific fisher, and Sierra Nevada red fox.

Special status plants may be adversely affected in the short term by restoration and monitoring activities associated with the programmatic management actions proposed for Segment 1. Potential impacts include temporary disturbance and loss of habitat, although these impacts would be local. Special status plant species would be avoided during management activities. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. Overall, these actions would result in local, long-term, minor, beneficial impacts on special status plants that occur in upper montane coniferous forests in Segment 1.

**Merced Lake High Sierra Camp.** The actions in the Merced Lake High Sierra Camp area proposed under Alternative 4 involve the conversion of the area to designated Wilderness, the closure of the Merced Lake High Sierra Camp, and restoration of the former camp area to natural conditions. As described above, construction activities associated with the demolition and removal of the Merced Lake High Sierra Camp could result in short-term, local, adverse impacts on special status species related to noise, potential for sediment discharge from disturbed soils, and human presence. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. Once completed, these actions would result in a local, long-term, minor, beneficial impact on special status species in Segment 1 by reducing stresses related to concentrated human use.

**Segment 1 Impact Summary:** Overall, actions in Segment 1 under Alternative 4 would result in local, long-term, minor, beneficial impacts on special status species.

Actions in Segment 1 under Alternative 4 would have no effect on the following federally listed and candidate species: valley elderberry longhorn beetle, Sierra Nevada bighorn sheep, and whitebark pine.

Actions in Segment 1 under Alternative 4 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, and Pacific fisher.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Ecological management actions that would occur within Segment 2 under Alternative 4 include measures to restore and protect meadows, riparian habitat, and areas within the 100-year floodplain of the Merced River. Projects proposed in Segment 2 to protect and enhance river values involve rerouting and revegetating the Valley Loop Trail through Slaughterhouse Meadow out of wetlands and meadows to an upland area; restoration of 10.9 acres of riparian habitat at the former Yosemite Lodge units and cabins; and moving 780 feet of the Valley Loop Trail out of Bridalveil Meadow.

Special status species that inhabit wetlands, riparian habitat, and riverine ecosystems would benefit from actions that remove infrastructure within a 150-foot buffer of the river. Restoration of these areas would prevent further riverbank erosion, provide hydrologic connectivity for meadows and riparian habitats, reduce vegetation trampling, enhance the hydrologic function within the floodplain, enhance water quality, increase the amount of wildlife habitat, increase productivity within riparian and aquatic ecosystems, and reduce human presence and human-related impacts.

Special status wildlife and their habitats may be adversely affected in the short term by construction/removal, restoration, and monitoring activities associated with these management actions. Potential impacts include disturbance associated with noise from construction/restoration activities, human presence, and modification to habitat. These activities could cause wildlife to relocate or avoid the area and could cause breeding birds to abandon their nests or avoid using the immediate area. Although the

disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular.

The use of heavy equipment would create the potential for wildlife injuries or death, and could cause wildlife to relocate or avoid the area and could cause breeding birds to abandon their nests or avoid using the immediate area. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular. With the implementation of mitigation measures such as surveying potential habitat prior to construction (especially during important breeding seasons), noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. However, these measures would also improve hydrologic function and restore ecological integrity of the river corridor and associated habitats, in particular meadow, riparian, and wetland habitats; address ongoing and future impacts to park resources and infrastructure; and manage visitor use and development along the river corridor.

As summarized in the “Wildlife” section of this chapter, a total of 194 acres of floodplain, riparian, meadow, woodland, and forest habitat would be restored in Segment 2 under Alternative 4 (this includes restoration actions common to Alternatives 2-6), resulting in direct benefits to fish and wildlife that use these habitat types. Thus, over time these management actions would have segmentwide, long-term, moderate, beneficial impacts on species of special status wildlife that use the Merced River and adjacent meadows and riparian habitats in the Valley (WHR types: riverine, wet meadow, montane riparian). Special status wildlife species that may benefit from these actions over the long term include western pond turtle, harlequin duck, bald eagle, peregrine falcon, long-eared owl, great gray owl, California spotted owl, black swift, willow flycatcher, yellow warbler, pallid bat, spotted bat, western red bat, and Pacific fisher.

Vegetation removed under Alternative 4 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities along the Merced River corridor. These impacts would be local and occur within or adjacent to the river corridor. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. Special status plant species would be avoided during management activities. However, these measures would improve the hydrologic function and restore the ecological integrity of Valley meadows. Associated beneficial impacts would include reduced fragmentation and disturbance of meadows, increased opportunities for revegetation and restoration, and enhanced hydrological connectivity between the meadows and the Merced River. Thus, restoration management actions would likely have a local, long-term, moderate, beneficial impact on special status species occurring within Segment 2 plant communities.

### **Biological Resource Actions.**

***Yosemite Valley Campgrounds:*** Like Alternative 3, specific restoration actions under Alternative 4 to enhance the river’s biological values in Segment 2 include removing all campsites within 150’ of the

bed and banks of the Merced River and restoring 12 acres of floodplain/riparian habitat, and designating river access at the North Pines Campground. Restoration of riparian habitat throughout Yosemite Valley would result in segmentwide, long-term, moderate, beneficial impacts to special status species including long-eared owl, yellow warbler, and Townsend's big-eared bat.

***El Capitan Meadow:*** In addition to actions common to Alternatives 2-6, Alternative 4 would install restoration fencing along the northern perimeter of El Capitan Meadow to designate appropriate meadow access points along boardwalks and viewing platforms. Alternative 4 would remove all informal trails in sensitive and frequently inundated areas and in areas that trails incise meadow and promote habitat fragmentation. Restoration of El Capitan Meadow and rerouting or removal of informal trails would result in local, long-term, minor to moderate, beneficial impacts on special status species from reduction of trampling from foot traffic that causes habitat fragmentation. Special status wildlife species that may benefit from these actions over the long term include northern harrier, peregrine falcon, long-eared owl, Vaux's swift, pallid bat, Townsend's big-eared bat, and spotted bat.

***Ahwahnee Meadow:*** Specific actions under Alternative 4 in Segment 2 to enhance the river's biological values at the Ahwahnee Meadow include: removing fill in sections of trails that passes through meadow and wetland habitats and replace the trails with boardwalk. However, unlike Alternatives 2 and 3, Northside Drive and the adjacent bike path would remain under Alternative 4. Hydrological connectivity between both sides of Northside Drive would be enhanced by increasing the number of culverts. Trail improvement and meadow restoration would result in local, long-term, minor to moderate, and beneficial impacts on special status species at the Ahwahnee Meadow as wetland fragmentation and vegetation trampling is reduced, and wetland connectivity to the river is enhanced. Special status wildlife species that may benefit from these actions over the long term include northern harrier, peregrine falcon, long-eared owl, Vaux's swift, pallid bat, Townsend's big-eared bat, and spotted bat.

***Stoneman Meadow:*** Like Alternatives 2 and 3, specific actions in Alternative 4 to enhance the biological values of the Merced River include restoring Stoneman Meadow by removing 1,335 feet of Southside Drive and re-aligning the road through Boystown area. The Orchard Parking Lot would be redesigned and engineering solutions would be applied to promote water flow and improve meadow health to increase drainage from the cliff walls to Stoneman Meadow. The meadow boardwalk would be extended through wet areas to Curry Village (up to 275 feet). Restoration of Stoneman Meadow and protection of sensitive wetland habitat would result in local, long-term, minor to moderate, and beneficial impacts on special status species. Special status wildlife species that may benefit from these actions over the long term include northern harrier, peregrine falcon, Vaux's swift, pallid bat, Townsend's big-eared bat, and spotted bat.

***Former Upper and Lower Rivers Campgrounds:*** Specific actions to enhance biological values of the Merced River at the Former Upper and Lower Rivers Campgrounds in Alternative 4 include restoring the topography of 19.7 acres of the floodplain. Alternative 4 would remove remaining asphalt, decompact soils of former roads and campsites and re-establish channels that have been filled, place large box culverts under the road to allow water flow, and fence and close the riparian zone at former Upper River to protect the riverbank from trampling. Restoration of the Former Upper and Lower

Rivers Campgrounds would result in local, long-term, moderate, and beneficial impacts on special status species including long-eared owl, yellow warbler, and Townsend's big-eared bat.

These restoration management actions would improve hydrologic function and restore ecological integrity of the Merced River corridor in Segment 2 and associated plant communities and wetlands, address ongoing and future impacts on park resources and infrastructure, and manage visitor use and development along the river corridor. These actions would be part of a comprehensive strategy to reduce existing adverse impacts on meadow and riparian vegetation. Overall, these actions would result in a segmentwide, long-term, moderate, beneficial impact on special status species in Segment 2.

**Hydrologic/Geologic Resource Action.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 4 include: relocating unimproved Camp 6 parking; placing large wood and engineered logjams along the base of Stoneman Bridge; removing the Ahwahnee and Sugarpine Bridges; and restoring these areas to natural conditions. These actions would result in enhanced channel free flow, increased channel complexity, increased streambank stability, and restored riparian habitat segmentwide. Overall, these actions would result in a segmentwide, long-term, moderate, beneficial impact on special status species in Segment 2.

#### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Alternative 4 would reduce the maximum daily visitation allowed in Yosemite Valley from current levels to allow for increased resource restoration and reduce crowding and congestion. Actions to manage visitor use and facilities under Alternative 4, specifically those concerning vehicle access, would result in a 19% decrease in daily Yosemite Valley visitation, from approximately 20,900 to 17,000. Day use visitation would decrease by 29%. However, due in part to increases in campground facilities, overnight visitation would increase by about 7%. Under Alternative 4, there would be a net reduction in Valley lodging units. This would be achieved through removal of units from Housekeeping Camp and Curry Village. The park would increase the total number of campsites within the Valley. This increase would be largely due to the development of new campsites near Yosemite Lodge (west) and Camp 4 (east), as well as at Boys Town, Upper Pines Campground, Curry Village stables, and the former Upper River and Lower River campgrounds.

Restoring habitat following the removal of facilities and parking lots would increase the extent and contiguity of habitat for special status species, while limiting day use activities and roadside parking would reduce impacts to sensitive habitats such as riparian woodland and wet meadows. While a general reduction in focused visitor use near special status species or their habitats would result in a reduction of ongoing minor, adverse impacts, the construction, removal, and restoration activities associated with these management actions could disturb special status wildlife habitat where facilities are removed and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence.

The use of heavy equipment would create the potential for wildlife injuries or death, specifically for small wildlife. These activities could cause wildlife to relocate or avoid the construction area and could

cause breeding birds to abandon their nests or avoid using the immediate area. New parking areas and paths may require some tree removal; removing potentially occupied habitats such as mature conifer and hardwood trees, hollowed-out trees, or snags could affect breeding bats or birds by removing nests or roosts and result in the harassment of adults from active nests or roosting sites located in the vicinity. Tree removal would be minimized through site design, and, if possible, older trees and snags would be retained for habitat. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular. With the implementation of mitigation measures such as surveying potential habitat prior to construction (especially during important breeding seasons), noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse.

Vegetation removed under Alternative 4 in Segment 2 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities in the Valley because new construction would primarily occur in or adjacent to previously disturbed locations or in more resilient, upland habitat. Special status plant species would be avoided during construction activities. Adhering to proposed mitigation measure MM-WL-3 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce short-term impacts to minor and adverse.

**Curry Village & Campgrounds.** Actions under Alternative 4 in Segment 2 related to managing visitor use and facilities at Curry Village include the reorganization of Curry Village; the rerouting of South Side Drive at Boys Town; and the construction of a 40-site campground at Boys Town. Construction activities associated with proposed actions at Curry Village could disturb special status wildlife habitat where new facilities are constructed. These activities would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence. Outside of previously developed areas, impacts to wildlife habitats would occur in ponderosa pine forest (6.35 acres impacted) and, to a much lesser extent, wet meadow (0.03 acres impacted) habitat. Special status species that could be affected by actions at Curry Village are presented in **table 9-111**. As described in the “Vegetation” section, the proposed actions at Curry Village would primarily affect ponderosa pine habitat surrounding areas that are currently developed and experience a high level of human disturbance.

Construction of new facilities will require some tree removal. As noted in **table 9-111**, up to 6.35 acres of ponderosa pine habitat would be affected by the actions proposed for Curry Village under Alternative 4. Removing mature conifer and hardwood trees, trees with cavities, or snags could affect bats or birds by removing suitable roosts or perches. Due to the proximity of this habitat to already developed sites as well as the structure and canopy closure of the stands that would be affected, it is not anticipated that any active nest sites for long-eared owls or spotted owls would be affected by the proposed actions. Tree removal would be minimized through site design however, and, if possible, older trees and snags would be retained for habitat. In addition, pre-construction surveys for these species would be conducted to ensure that no active nest sites would be affected.

**TABLE 9-111: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT CURRY VILLAGE & CAMPGROUNDS – ALTERNATIVE 4**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Birds</b>				
<i>Asio otus</i> Long-eared owl	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 6.35 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Strix occidentalis</i> <i>occidentalis</i> California spotted owl	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 6.35 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<b>Mammals</b>				
<i>Antrozous pallidus</i> Pallid bat	Ponderosa Pine Wet Meadow Urban	6.35 0.03 N/A	0.4% <0.1% N/A	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Corynorhinus townsendii</i> Townsend's big-eared bat	Ponderosa Pine Wet Meadow Urban	6.35 0.03 N/A	0.4% <0.1% N/A	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Euderma maculatum</i> Spotted bat	Ponderosa Pine Wet Meadow	6.35 0.03	0.4% <0.1%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat). Roosting habitat (cliffs and caves) not impacted.
<i>Lasiurus blossevillii</i> Western red bat	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of trees could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.

**TABLE 9-111: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT CURRY VILLAGE & CAMPGROUNDS – ALTERNATIVE 4 (CONTINUED)**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Mammal (cont.)</b>				
<i>Eumops perotis</i> Western mastiff bat	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat) and indirect impacts from disturbance associated with construction. Roosting habitat (rock features) not impacted.
<i>Martes pennanti pacifica</i> Pacific fisher	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Although suitable foraging habitat for this species would be impacted by proposed actions, this species is sensitive to human presence and is not likely to utilize habitats in Curry Village.
<sup>a</sup> This is a comparison of the acres of habitat impacted to the total acres of that habitat type in the segment. SOURCE: NPS 2012c				

The use of heavy equipment during construction could cause wildlife to relocate or avoid the area and could cause birds and mammals to avoid using the immediate area for foraging. Although the disturbance from construction activities would be temporary, displacement of individuals would have an adverse impact on local special status bird and bat populations. With the implementation of mitigation measures such as surveying suitable habitat prior to construction during the breeding season, noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these local, short-term impacts to minor and adverse.

It is unlikely that any special status plant species occur in the Curry Village area due to the high levels of visitation and human-related impacts such as vegetation trampling and soil compaction. In addition, no special status plants found during rare plant surveys conducted in 2010 at the Curry Village area. Therefore, it is unlikely that special status plant species will be affected by actions to manage visitor use and facilities at Curry Village under Alternative 4.

**Camp 6 and Yosemite Village.** Actions under Alternative 4 in Segment 2 related to managing visitor use and facilities at Camp 6 and Yosemite Village include measures to formalize and relocate parking facilities 150 feet away from the river in order to facilitate riparian restoration goals. The Camp 6/Village Center Parking Area will be formalized with 750 parking spaces by redeveloping part of the current administrative footprint. 100 parking spaces would be added at Yosemite Village. The intersection at Northside Drive and Village Drive (Camp 6 intersection) would be re-aligned to meet standards for a proper four-way intersection and improve performance. A three-way intersection at Sentinel Drive and

the entrance to the parking area would be added to improve traffic flow and alleviate congestion. An entry road to Camp 6 parking lot from Sentinel Drive would be added to improve traffic flow and alleviate congestion at nearby intersections. On-grade pedestrian crossings with proper sight lines would be provided to alleviate pedestrian/vehicle conflicts.

Construction activities at Camp 6 and Yosemite Village could disturb special status wildlife habitat where facilities are removed, relocated and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence. Outside of previously developed areas, impacts to wildlife habitats would occur in montane riparian (0.81 acres impacted), ponderosa pine forest (12.22 acres impacted), and wet meadow (0.28 acres impacted) habitat types. Special status species that could be affected by actions at Camp 6 and Yosemite Village are presented in **table 9-112**. As described in the “Vegetation” section, the proposed actions at Camp 6 and Yosemite Village would primarily affect ponderosa pine forest and montane riparian habitats surrounding areas that are currently developed and experience a high level of human disturbance.

Construction of new facilities will require some tree removal. As noted in **table 9-112**, up to 12.22 acres of ponderosa pine habitat and 0.81 acres of montane riparian habitat would be affected by the actions proposed for Camp 6 and Yosemite Village under Alternative 4. Removing mature conifer and hardwood trees, trees with cavities, or snags could affect bats or birds by removing suitable roosts or perches. Due to the proximity of this habitat to already developed sites as well as the structure and canopy closure of the stands that would be affected, it is not anticipated that any active nest sites for special status bird species would be affected by the proposed actions. Tree removal would be minimized through site design however, and, if possible, older trees and snags would be retained for habitat. In addition, pre-construction surveys for these species would be conducted to ensure that no active nest sites would be affected.

The use of heavy equipment during construction could cause wildlife to relocate or avoid the area and could cause birds and mammals to avoid using the immediate area for foraging. Although the disturbance from construction activities would be temporary, displacement of individuals would have an adverse impact on local special status bird and bat populations. With the implementation of mitigation measures such as surveying suitable habitat prior to construction during the breeding season, noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these local, short-term impacts to minor and adverse.

It is unlikely that any special status plant species occur in the Camp 6 and Yosemite Village area due to the high levels of visitation and human-related impacts such as vegetation trampling and soil compaction. In addition, no special status plants found during rare plant surveys conducted in 2010 at the Camp 6 and Yosemite Village area. Therefore, it is unlikely that special status plant species will be affected by actions to manage visitor use and facilities at Camp 6 and Yosemite Village under Alternative 4.

**TABLE 9-112: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT CAMP 6 & YOSEMITE VILLAGE – ALTERNATIVE 4**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Birds</b>				
<i>Asio otus</i> Long-eared owl	Ponderosa Pine Montane Riparian	12.22 0.81	0.7% 0.3%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 13.03 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Strix occidentalis occidentalis</i> California spotted owl	Ponderosa Pine	12.22	0.7%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 12.22 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Chaetura vauxi</i> Vaux's swift	Montane Riparian	0.81	0.3%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 0.81 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Contopus cooperi</i> Olive-sided flycatcher	Montane Riparian	0.81	0.3%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 0.81 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Setophaga petechia</i> Yellow warbler	Montane Riparian	0.81	0.3%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 0.81 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<b>Mammals</b>				
<i>Antrozous pallidus</i> Pallid bat	Ponderosa Pine Montane Riparian Wet Meadow Urban	12.22 0.81 0.28 N/A	0.7% 0.3% <0.1% N/A	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.

**TABLE 9-112: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT CAMP 6 & YOSEMITE VILLAGE – ALTERNATIVE 4 (CONTINUED)**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Mammals (cont.)</b>				
<i>Corynorhinus townsendii</i> Townsend's big-eared bat	Ponderosa Pine Montane Riparian Wet Meadow Urban	12.22 0.81 0.28 N/A	0.7% 0.3% <0.1% N/A	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Euderma maculatum</i> Spotted bat	Ponderosa Pine Montane Riparian Wet Meadow	12.22 0.81 0.28	0.7% 0.3% <0.1%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat). Roosting habitat (cliffs and caves) not impacted.
<i>Lasiurus blossevillei</i> Western red bat	Ponderosa Pine Montane Riparian	12.22 0.81	0.7% 0.3%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of trees could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Eumops perotis</i> Western mastiff bat	Ponderosa Pine	12.22	0.7%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat) and indirect impacts from disturbance associated with construction. Roosting habitat (rock features) not impacted.
<i>Martes pennanti pacifica</i> Pacific fisher	Ponderosa Pine	12.22	0.7%	May Affect, Not Likely to Adversely Affect. Although suitable foraging habitat for this species would be impacted by proposed actions, this species is sensitive to human presence and is not likely to utilize habitats in Camp 6 and Yosemite Village.
<sup>a</sup> This is a comparison of the acres of habitat impacted to the total acres of that habitat type in the segment. SOURCE: NPS 2012c				

**Yosemite Lodge and Camp 4.** Actions under Alternative 4 in Segment 2 related to managing visitor use and facilities at Yosemite Lodge and Camp 4 include: the removal of old and temporary housing at Highland Court and the Thousands Cabins; the construction of two new concessioner housing areas and the construction of 78 employee parking spaces; redevelopment west of Yosemite Lodge to provide an additional 150 day-use parking spaces and area for 15 tour buses; relocation of existing tour

bus drop off area to Highland Court to provide 3 bus loading/unloading spaces; and the construction of a pedestrian underpass to alleviate pedestrian/vehicle conflicts.

Construction activities at Yosemite Lodge and Camp 4 could disturb special status wildlife habitat where facilities are removed, relocated and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence. Outside of previously developed areas, impacts to wildlife habitats would occur in ponderosa pine forest (14.80 acres impacted) and montane hardwood habitat (0.08 acres impacted). Special status species that could be affected by actions at Yosemite Lodge and Camp 4 are presented in **table 9-113**. As described in the “Vegetation” section, the proposed actions at Yosemite Lodge and Camp 4 would primarily affect ponderosa pine habitat surrounding areas that are currently developed and experience a high level of human disturbance.

Construction of new facilities will require some tree removal. As noted in table 9-113, up to 14.80 acres of ponderosa pine habitat and 0.08 acres of montane hardwood habitat would be affected by the actions proposed for Yosemite Lodge and Camp 4 under Alternative 4. Removing mature conifer and hardwood trees, trees with cavities, or snags could affect bats or birds by removing suitable roosts or perches. Due to the proximity of this habitat to already developed sites as well as the structure and canopy closure of the stands that would be affected, it is not anticipated that any active nest sites for long-eared owls or spotted owls would be affected by the proposed actions. Tree removal would be minimized through site design however, and, if possible, older trees and snags would be retained for habitat. In addition, pre-construction surveys for these species would be conducted to ensure that no active nest sites would be affected.

The use of heavy equipment during construction could cause wildlife to relocate or avoid the area and could cause birds and mammals to avoid using the immediate area for foraging. Although the disturbance from construction activities would be temporary, displacement of individuals would have an adverse impact on local special status bird and bat populations. With the implementation of mitigation measures such as surveying suitable habitat prior to construction during the breeding season, noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these local, short-term impacts to minor and adverse.

It is unlikely that any special status plant species occur in the Yosemite Lodge and Camp 4 area due to the high levels of visitation and human-related impacts such as vegetation trampling and soil compaction. In addition, no special status plants found during rare plant surveys conducted in 2010 at the Yosemite Lodge and Camp 4 area. Therefore, it is unlikely that special status plant species will be affected by actions to manage visitor use and facilities at Yosemite Lodge and Camp 4 under Alternative 4.

**Segment 2 Impact Summary:** Overall, actions in Segment 2 under Alternative 4 would result in segmentwide, long-term, minor to moderate, beneficial impacts on special status species.

**TABLE 9-113: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT YOSEMITE LODGE AND CAMP 4 – ALTERNATIVE 4**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
Birds				
<i>Asio otus</i> Long-eared owl	Ponderosa Pine	14.80	0.8%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 14.88acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
	Montane Hardwood	0.08	<0.1%	
<i>Strix occidentalis occidentalis</i> California spotted owl	Ponderosa Pine	14.80	0.8%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 14.88acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
	Montane Hardwood	0.08	<0.1%	
Mammals				
<i>Antrozous pallidus</i> Pallid bat	Ponderosa Pine	14.80	0.8%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
	Montane Hardwood	0.08	<0.1%	
	Urban	N/A	N/A	
<i>Corynorhinus townsendii</i> Townsend's big-eared bat	Ponderosa Pine	14.80	0.8%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
	Montane Hardwood	0.08	<0.1%	
	Urban	N/A	N/A	
<i>Euderma maculatum</i> Spotted bat	Ponderosa Pine	14.80	0.8%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat). Roosting habitat (cliffs and caves) not impacted.
<i>Lasiurus blossevillii</i> Western red bat	Ponderosa Pine	14.80	0.08%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of trees could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
	Montane Hardwood	0.08	<0.1%	

**TABLE 9-113: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT YOSEMITE LODGE AND CAMP 4 – ALTERNATIVE 4 (CONTINUED)**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Mammals (cont.)</b>				
<i>Eumops perotis</i> Western mastiff bat	Ponderosa Pine	14.80	0.8%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat) and indirect impacts from disturbance associated with construction. Roosting habitat (rock features) not impacted.
<i>Martes pennanti pacifica</i> Pacific fisher	Ponderosa Pine	14.80	0.8%	May Affect, Not Likely to Adversely Affect. Although suitable foraging habitat for this species would be impacted by proposed actions, this species is sensitive to human presence and is not likely to utilize habitats in Yosemite Lodge and Camp 4.
<sup>a</sup> This is a comparison of the acres of habitat impacted to the total acres of that habitat type in the segment. SOURCE: NPS 2012c				

Actions in Segment 2 under Alternative 4 would have no effect on the following federally listed and candidate species: valley elderberry longhorn beetle, Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, Sierra Nevada bighorn sheep, and whitebark pine.

Actions in Segment 2 under Alternative 4 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Pacific fisher.

### Segments 3 and 4: Merced Gorge and El Portal

#### *Impacts of Actions to Protect and Enhance River Values*

Currently, vehicles park under the dripline of the 38 valley oak trees in Segment 4. This practice compacts soil under the trees, which impacts root health, water uptake, and soil aeration. Additionally, existing development and trampling in the vicinity limits the area where oak seedlings can be recruited. Under Alternative 4, valley oaks in El Portal would be enhanced by creating an oak recruitment area of one acre in Old El Portal in the vicinity of the current bulk fuel storage area, including the adjacent parking lots. Parking and new building construction within the oak recruitment area would be prohibited. Nonnative fill would be removed and soils decompacted. Appropriate native understory plant species would be planted. The fuel storage area would be relocated outside of the river corridor. Overall, these actions would result in local, long-term, moderate, beneficial impacts on valley oaks in Segment 4. Valley oaks are a park-designated special status species.

These restorative actions could result in local, short-term, adverse impacts on special status wildlife within the adjacent riparian habitat, including noise associated with construction-related activities, ground disturbance, human presence, increases in sedimentation, and potential for incidental spills to reach aquatic habitats (including the Merced River). Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. However, implementation of these restorative actions would restore the 100-year floodplain and associated riparian community, improve hydrological connectivity to the river, and improve habitat for riparian-dependent species.

As summarized in the “Wildlife” section of this chapter, a total of 12 acres of riparian, floodplain, and valley oak woodland habitat would be restored in Segment 4 under Alternative 4 (this includes restoration actions common to Alternatives 2-6), resulting in direct benefits to fish and wildlife that use these habitat types. Thus, these actions would be expected to have a local, long-term, minor, beneficial impact on special status wildlife species that use riparian habitats in El Portal (WHR: montane riparian). Special status wildlife species that may benefit from these actions over the long term include valley elderberry longhorn beetle, western pond turtle, long-eared owl, yellow warbler, and western red bat.

Biological resource surveys have identified suitable habitat (elderberry shrubs) in the El Portal area for valley elderberry longhorn beetle. Actions in the El Portal area (Segment 4) include the restoration of the Greenemeyer sand pit and the restoration of riverside habitat in Abbieville and the Trailer Village. The NPS would avoid all impacts within 100-feet of elderberry plants containing stems measuring 1.0 inch or greater in diameter at ground level when implementing these common to all restoration actions. If these actions were to result in unanticipated direct or indirect impacts on valley elderberry longhorn beetle habitat, the NPS would implement avoidance and mitigation measures outlined in the 1999 USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (mitigation measure MM-WL-4, as applicable; see Appendix C).

Vegetation removed under Alternative 4 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities in Segment 4 because new construction would primarily occur in or adjacent to previously disturbed locations or in more resilient, upland habitat. Special status plant species would be avoided during construction activities. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce short-term impacts to minor and adverse. Overall, restoration actions would result in local, long-term, minor, beneficial impacts on special status plants that occur in riparian habitats in Segment 4.

### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Under Alternative 4, visitor day parking would be expanded by 200 parking spaces at Abbieville; this area would primarily be used for visitor access to Yosemite Valley. NPS employee housing would be added to Abbieville, El Portal Village Center, and Rancheria Flat along with a total of 292 employee parking spaces. While all new units would be built outside of the 100-year floodplain, they would fall within the river corridor. This increase in capacity in El Portal would be a function of the decrease in

employee housing capacity in the Valley (Segment 2). The addition of employee housing and park facilities development would increase the total built environment within Segment 4.

Construction, removal, and restoration activities associated with these management actions could disturb special status wildlife habitat where facilities are removed and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure in Segment 4 would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence.

The use of heavy equipment would create the potential for wildlife injuries or death, and could cause wildlife to relocate or avoid the construction area and could cause breeding birds to abandon their nests or avoid using the immediate area. New construction may require some tree removal; removing potentially occupied habitats such as mature conifer and hardwood trees, hollowed-out trees, or snags could affect breeding bats or birds by removing nests or roosts and could result in the harassment of adults from active nests or roosting sites located in the vicinity. Tree removal would be minimized through site design, and, if possible, older trees and snags would be retained for habitat. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular. With the implementation of mitigation measures such as surveying potential habitat prior to construction (especially during important breeding seasons), noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse.

Biological resource surveys have identified suitable habitat (elderberry shrubs) in the El Portal area for valley elderberry longhorn beetle. Approximately 124 elderberry plants of a size sufficient to support the Valley elderberry longhorn beetle occur in areas of potential development or management activities in El Portal. Valley elderberry longhorn beetle exit holes that verify beetle activity were found in 11 of these elderberry plants, though beetle larvae could still be present in elderberry plants without exit holes. Actions in Segment 4, including moving temporary housing units to El Portal and development at the Abbieville and Trailer Village, would result in potential indirect or direct impacts on elderberry shrubs, including removal of shrubs. Approximately 37 elderberry plants were documented within potential areas of ground disturbance, seven with exit holes. Complete impact avoidance would not be possible for these plants. The infill in El Portal would affect up to nine elderberry shrubs with stems greater than one inch in diameter. The development at Abbieville would affect up to 16 shrubs, while the development at Trailer Village would affect up to 12 shrubs. Direct or indirect impacts on valley elderberry longhorn beetle habitat would result in local, long-term, minor, adverse impacts on this beetle species. If these actions were to result in direct or indirect impacts on valley elderberry longhorn beetle habitat, the NPS would implement avoidance and mitigation measures outlined in the 1999 USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (mitigation measure MM-WL-4, as applicable; see Appendix C).

Vegetation removed under Alternative 4 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities in Segment 4 because new construction would primarily occur in or adjacent to

previously disturbed locations or in more resilient, upland habitat. Special status plant species would be avoided during construction activities.

**Segments 3 and 4 Impact Summary:** Overall, actions in Segments 3 and 4 under Alternative 4 would result in local, long-term, minor, beneficial impacts on most special status species.

Actions in Segments 3 and 4 under Alternative 4 would have no effect on the following federally listed and candidate species: Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, Pacific fisher, Sierra Nevada bighorn sheep, and whitebark pine.

It is the determination of the NPS that the actions proposed in Segment 4 under Alternative 4 may affect, and are likely to adversely affect, the valley elderberry longhorn beetle.

### **Segments 5– 8: South Fork Merced River**

#### ***Impacts of Actions to Protect and Enhance River Values***

Actions specifically targeted to protect culturally sensitive areas in Segment 7, including the relocation or removal of select campsites and stock campground sites within the 100-year floodplain or culturally sensitive areas, would also benefit special status species. Campsite removal within the floodplain would result in local, long-term, minor, beneficial impacts on special status species as riparian habitat is restored and wildlife are subject to less human presence and human-related pressures.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 4 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. Overall, this action would result in a local, long-term, minor, beneficial impact on special status species in Segment 7.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Under Alternative 4, Wawona stables operations would be eliminated and two stock campsites would be relocated to the stables area from the current Wawona stock camp. At the Wawona Campground, 27 campsites would be removed from within 150 feet of the South Fork Merced River or from cultural sites and the area would be restored. Soils would be decompacted and the restoration area would be replanted with riparian vegetation. This would reduce visitor use in this area and result in a decrease of vegetation trampling.

These actions would result in short-term, adverse impacts on special status wildlife that use riparian habitat. Adverse impacts include noise associated with demolition, removal, and restoration activities; ground disturbance; human presence; habitat modification; and potential increase in suspended sediments to the South Fork Merced River. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of riparian vegetation, where possible, would reduce these short-term impacts to minor and adverse. However, implementation of these actions would reduce the built environment within Segment 7, restore riparian habitat, and reduce riverbank erosion.

As summarized in the “Wildlife” section of this chapter, a total of seven acres of riparian habitat would be restored in Segment 7 under Alternative 4 (this includes restoration actions common to Alternatives 2-6), thus directly benefiting wildlife that use this habitat type. Thus, this restoration action would be expected to have a segmentwide, long-term, minor, beneficial impact on special status wildlife species that use riparian habitats in Wawona (WHR: montane riparian). Special status wildlife species that may benefit from these actions over the long term include long-eared owl and yellow warbler.

Special status plants may be adversely affected in the short term by removal, restoration, and monitoring activities associated with these management actions. Potential impacts include temporary disturbance and loss of habitat, potential loss of individual plants or populations, and the potential introduction and spread of invasive nonnative species. These impacts would be local. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. Overall, actions under Alternative 4 would result in local, long-term, negligible, beneficial impacts on special status plants that occur in the Wawona area.

**Wawona Campground.** Facilities actions at the Wawona Campground would involve removal of 27 sites that are either within the 100-year floodplain or in culturally sensitive areas. Overall, these actions would result in a local, long-term, minor, beneficial impact on special status species in Wawona.

**Segments 5, 6, 7 and 8 Impact Summary:** Overall, actions in Segments 5-8 under Alternative 4 would result in segmentwide, long-term, minor to moderate, beneficial impacts on special status species.

Actions in Segments 5-8 under Alternative 4 would have no effect on the following federally listed and candidate species: valley elderberry longhorn beetle, Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, Sierra Nevada bighorn sheep, and whitebark pine.

Actions in Segments 5-8 under Alternative 4 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Pacific fisher.

### **Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

Past development and human activity in the Merced River corridor have in some cases adversely affected special status species habitat and use of those habitats. As described in the preceding paragraphs, many of the Alternative 4 actions would address existing adverse impacts on habitats for special status species, including actions targeted to improve habitat quality for aquatic, riparian-dependent, and meadow-dependent special status species where these habitats are near or adjacent to existing developments and high visitor use areas. Additionally, the park would implement measures to restore the ecological integrity of riparian, meadow, and aquatic habitat in targeted areas, increase channel free flow, improve water quality, and reduce erosion and scouring. Notable actions the park would implement under Alternative 4 include the following:

- Restrict recreational use of rivers and riverbanks to reduce riverbank erosion.

- Remove, restore, relocate, or repurpose park facilities to efficiently use park facilities and reduce the built environment within the park; some facilities would be built to accommodate visitors or employees.
- Manage total visitors to the park and visitor demands for day parking space, lodging, and camping space.
- Remove facilities within 150 feet of the Merced River and restore riverbanks, meadows, and riparian habitat.
- Enhance meadow, riparian, and river hydrologic function, complexity, and connectivity.
- Improve the free flow, complexity, and water quality of the Merced River.

Generally, Alternative 4 is focused on intensive restoration of meadow, riparian, and riverbank habitats in Yosemite Valley (Segment 2); removing many facilities located within 150 feet of the river and jeopardized by flooding; repurposing park facilities to improve efficiency of use; adding additional campground facilities; and providing adequate lodging, camping, and parking space for visitors and employees. Adverse effects from these actions would be associated with the active construction or restoration phase and would be local, short term, and minor or negligible. However, there would be local, long-term, negligible, adverse impacts on habitats for special status species from construction of some facilities. When combined, the long-term effect of all of these measures would be a moderate, beneficial impact on special status species as habitats are restored and fragmentation and indirect detriments to habitat are reduced. These effects would be most pronounced in areas of high human use such as Yosemite Valley and Wawona (Segments 2 and 7, respectively).

Overall, there would be a slightly lessened potential for beneficial effects under Alternative 4 compared to Alternative 2 and about the same level of beneficial actions as under Alternative 3. However, there would be a somewhat increased potential for adverse impacts over either Alternatives 2 or 3 because more new construction would occur in and adjacent to habitat suitable for special status species.

Implementation of a comprehensive ecological restoration program to restore natural processes to the Merced River corridor, in combination with much lower visitor use levels and extensive site-specific restoration including implementation of mitigation measures MM-WL-1 through MM-WL-7 (see Appendix C) as applicable, would result in a corridorwide, long-term, moderate, beneficial impact on special status species habitat. In the long term, these measures would improve hydrologic connectivity of meadows and floodplains to the river; enhance habitat complexity in riparian, meadow, and aquatic areas; reduce human and pack stock-related disturbances; and reduce nonnative species and conifer intrusion into sensitive habitats. Adverse effects related to the construction phase of these actions would be local, short term, and minor or negligible.

Actions under Alternatives 4 would have no effect on the following federally listed and candidate species: Sierra Nevada bighorn sheep and whitebark pine.

Actions under Alternative 4 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, and Pacific fisher.

Actions in Segment 4 under Alternative 4 would result in potential indirect or direct impacts on elderberry shrubs, including possible removal of shrubs. Direct or indirect impacts on valley elderberry longhorn beetle habitat would result in local, long-term, minor, adverse impacts on this beetle species. Therefore, it is the determination of the NPS that the actions proposed may affect, and are likely to adversely affect, the valley elderberry longhorn beetle.

#### **Cumulative Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

The past, present, and reasonably foreseeable plans and projects that could have a cumulative impact on special status species in combination with Alternative 4 are the same as those listed under Alternative 1 (No Action).

#### ***Overall Cumulative Impact from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

The actions associated with Alternative 4 would generally result in segmentwide, long-term, minor to moderate, beneficial impacts on special status species habitats within the Merced River corridor, with the exception of valley elderberry longhorn beetle. These actions are focused on restoring and improving aquatic, meadow, and riparian habitat quality within the Merced River corridor; therefore, special status species that are associated with these habitat types are most likely to be affected cumulatively by the proposed actions. The past, present, and future actions in the region would have varying effects on special status species habitats, with some projects restoring or enhancing habitats and many other projects resulting in habitat loss or decline.

In general, past actions have impaired and reduced the abundance and quantity of aquatic, meadow, and riparian habitats in the region. These past actions, especially at lower elevations from development and resource extraction, have resulted in a reduction in special status species populations and ranges. Present and reasonably foreseeable future actions also have the potential to further reduce or impair these habitat types; however, in general, potential effects on these habitat types are mitigated and/or compensated through habitat preservation and/or enhancement at an off-site location (including mitigation banks). These actions provide the most benefit when coordinated with larger, regional conservation strategies that protect intact corridors or provide linkages to other areas of suitable habitat. Because the actions proposed with Alternative 4 would further increase the habitat value of the Merced River corridor, this alternative would not contribute toward a cumulative adverse effect on special status species.

The actions under Alternative 4 would have long-term, beneficial effects on special-status species in the Merced River corridor. However, in relation to past, present, and reasonably foreseeable future actions throughout the Sierra Nevada and larger region, (e.g., introduction and spread of nonnative species, direct displacement of habitat) the actions under Alternative 4 would have a minimal beneficial effect. Overall, in conjunction with actions proposed in Alternative 4, cumulative actions on special status species would result in long-term, adverse effects on special status species.

## ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 5, grazing in Merced Lake East Meadow would be managed as described for Alternatives 3. Beneficial effects to special status species would be the same as described for Alternative 3.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Several actions related to management of visitor use and facilities would have the potential to affect special status species in Segment 1 under Alternative 5. Visitation within Segment 1 would not be expected to change appreciably under Alternative 5; wilderness access quotas would remain as under Alternative 1 (No Action) (150) and modifications to overnight accommodations would be nominal. Under Alternative 5, the Merced Lake High Sierra Camp would remain in operation and continue to host overnight guests and through-hikers during the summer months. However, the camp's 60 beds would be reduced to 42 (11 units). The park would not reduce the total number of designated campsites within the Merced River corridor's wilderness. Designated camping at Moraine Dome and Little Yosemite Valley Backpackers Campground would continue. The Merced Lake Backpackers Campground would remain.

The removal of existing improvements could result in local, short-term, negligible, adverse impacts on special status wildlife, including noise related to removal of infrastructures and human presence. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. In the long-term, the programmatic management actions described above would have a local, long-term, minor, beneficial impact on special status wildlife species that use coniferous forests in the upper Merced watershed (WHR: white fir, red fir, Douglas-fir). Special status wildlife species that may benefit from these actions over the long term include northern goshawk, golden eagle, California spotted owl, olive-sided flycatcher, yellow warbler, western white-tailed jackrabbit, Pacific fisher, and Sierra Nevada red fox.

Special status plants may be adversely affected in the short-term by restoration and monitoring activities associated with the programmatic management actions proposed for Segment 1. Potential impacts include temporary disturbance and loss of habitat. These impacts would be local. Special status plant species would be avoided during management activities. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. Overall, these actions would result in local, long-term, minor, beneficial impacts on special status plants that occur in upper montane coniferous forests in the Segment 1.

**Merced Lake High Sierra Camp.** The project-level actions in the Merced Lake High Sierra Camp area proposed under Alternative 5 involve retention of the Merced Lake High Sierra Camp, reducing the capacity to 42 beds, and replacing the flush toilets with composting toilets. These actions would result in a local, long-term, negligible, beneficial impact on special status species in Segment 1 by reducing stresses from visitor use.

**Segment 1 Impact Summary:** Overall, actions in Segment 1 under Alternative 5 would result in local, long-term, minor, beneficial impacts on special status species.

Actions in Segment 1 under Alternative 5 would have no effect on the following federally listed and candidate species: valley elderberry longhorn beetle, Sierra Nevada bighorn sheep, and whitebark pine.

Actions in Segment 1 under Alternative 5 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, and Pacific fisher.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Ecological management actions that would occur within Segment 2 under Alternative 5 include measures to restore and protect meadows, riparian habitat, and areas within the 100-year floodplain of the Merced River. Projects proposed in Segment 2 under Alternative 5 to protect and enhance river values involve constructing a boardwalk for the Valley Loop Trail through sensitive wet meadow habitat in Slaughterhouse Meadow; restoration of 10.9 acres of riparian habitat at the former Yosemite Lodge units and cabins; and moving 780 feet of the Valley Loop Trail out of Bridalveil Meadow. Special status species inhabiting wetlands, riparian habitat, and riverine ecosystems would benefit from actions that remove infrastructure within 100 feet of the ordinary high-water mark. Restoration of these areas would prevent further riverbank erosion, provide hydrologic connectivity for meadows and riparian habitats, reduce vegetation trampling, enhance the hydrologic function within the floodplain, enhance water quality, increase the amount of wildlife habitat, increase productivity within riparian and aquatic ecosystems, and reduce human presence and human-related impacts in Segment 2.

Special status wildlife and their habitats may be adversely affected in the short term by construction/removal, restoration, and monitoring activities associated with these management actions. Potential impacts include disturbance associated with noise from construction/restoration activities, human presence, and modification to habitat. These activities could cause wildlife to relocate or avoid the area and cause breeding birds to abandon their nests or avoid using the immediate area. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular.

The use of heavy equipment would create the potential for wildlife injuries or death, and could cause wildlife to relocate or avoid the area and could cause breeding birds to abandon their nests or avoid using the immediate area. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular. With the implementation of mitigation measures such as surveying potential habitat prior to construction (especially during important breeding seasons), noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. However, these measures would also improve hydrologic function and restore ecological integrity of the river corridor and associated habitats, in particular meadow, riparian, and wetland habitats; address ongoing and future impacts to park resources and infrastructure; and manage visitor use and development along the river corridor in Segment 2.

As summarized in the “Wildlife” section of this chapter, a total of 182 acres of floodplain, riparian, meadow, woodland, and forest habitat would be restored in Segment 2 under Alternative 5 (this includes restoration actions common to Alternatives 2-6), resulting in direct benefits to fish and wildlife that use these habitat types. Thus, over time these habitat restoration management actions would have long-term, moderate, beneficial impacts on species of special status wildlife that use the Merced River and adjacent meadows and riparian habitats in Yosemite Valley (WHR types: lacustrine, wet meadow, montane riparian). Special status wildlife species that may benefit from these actions over the long term include western pond turtle, harlequin duck, bald eagle, peregrine falcon, long-eared owl, great gray owl, California spotted owl, black swift, willow flycatcher, yellow warbler, pallid bat, spotted bat, western red bat, and Pacific fisher.

Vegetation removed under Alternative 5 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities along the Merced River corridor in Segment 2. These impacts would be local and occur within or adjacent to the river corridor. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. Special status plant species would be avoided during management activities. However, these measures would improve the hydrologic function and restore the ecological integrity of Valley meadows. Associated beneficial impacts would include reduced fragmentation and disturbance of meadows, increased opportunities for revegetation and restoration, and enhanced hydrological connectivity between the meadows and the Merced River. Thus, habitat restoration actions would likely have a local, long-term, moderate, beneficial impact on special status species occurring within Segment 2 plant communities.

### **Biological Resource Actions.**

**Yosemite Valley Campgrounds:** Specific restoration actions under Alternative 5 to enhance the river’s biological values in Segment 2 include removing all campsites within 100’ of the bed and banks of the Merced River and restoring 6.5 acres of floodplain/riparian habitat, and designating river access at the North Pines Campground. Restoration of riparian habitat throughout Yosemite Valley would result in segmentwide, long-term, minor to moderate, beneficial impacts to special status species including long-eared owl, yellow warbler, and Townsend’s big-eared bat.

***El Capitan Meadow:*** In addition to actions common to Alternatives 2-6 and similar to Alternative 4, Alternative 5 would install restoration fencing along the northern perimeter of El Capitan Meadow to designate appropriate meadow access points along boardwalks and viewing platforms. Alternative 5 would remove all informal trails in sensitive and frequently inundated areas and in areas that trails incise meadow and promote habitat fragmentation. Conifers that block views of El Capitan from the roadside would be selectively removed. Restoration of El Capitan Meadow and rerouting or removal of informal trails would result in local, long-term, minor to moderate, beneficial impacts on special status species from reduction of trampling from foot traffic that causes habitat fragmentation. Special status wildlife species that may benefit from these actions over the long term include northern harrier, peregrine falcon, long-eared owl, Vaux's swift, pallid bat, Townsend's big-eared bat, and spotted bat.

***Ahwahnee Meadow:*** Similar to Alternative 4, specific actions under Alternative 5 in Segment 2 to enhance the river's biological values at the Ahwahnee Meadow include: removing fill in sections of trails that passes through meadow and wetland habitats and replace the trails with boardwalk. Unlike Alternatives 2 and 3, Northside Drive and the adjacent bike path would remain under Alternative 5. Hydrological connectivity between both sides of Northside Drive would be enhanced by increasing the number of culverts. Trail improvement and meadow restoration would result in local, long-term, minor to moderate, beneficial impacts on special status species at the Ahwahnee Meadow as wetland fragmentation and vegetation trampling is reduced, and wetland connectivity to the river is enhanced. Special status wildlife species that may benefit from these actions over the long term include northern harrier, peregrine falcon, long-eared owl, Vaux's swift, pallid bat, Townsend's big-eared bat, and spotted bat.

***Stoneman Meadow:*** Specific actions in Alternative 5 to enhance the biological values of the Merced River include restoring Stoneman Meadow by redesigning the Orchard Parking Lot. Through engineering solutions, Alternative 5 would promote water flow by increasing drainage from the cliff walls of the parking lot to Stoneman Meadows, thus improving meadow health. Improving hydrological connectivity between the Orchard Parking Lot cliff walls and Stoneman Meadow would result in local, long-term, minor, beneficial impacts on special status species. Special status wildlife species that may benefit from these actions over the long term include northern harrier, peregrine falcon, Vaux's swift, pallid bat, Townsend's big-eared bat, and spotted bat.

***Former Upper and Lower Rivers Campgrounds:*** Specific actions to enhance biological values of the Merced River at the Former Upper and Lower Rivers Campgrounds under Alternative 5 include restoring 35.6 acres of riparian and floodplain habitat at Lower Rivers Campground. Alternative 5 would remove remaining asphalt, decompact soils of former roads and campsites and re-establish channels that have been filled, place large box culverts under the road to allow water flow, and fence and close the riparian zone at former Upper River to protect the riverbank from trampling. Restoration of the Former Upper and Lower Rivers Campgrounds would result in local, long-term, moderate, beneficial impacts on special status species including long-eared owl, yellow warbler, and Townsend's big-eared bat.

These restoration management actions would improve hydrologic function and restore ecological integrity of the Merced River corridor in Segment 2 and associated plant communities and wetlands, address ongoing and future impacts on park resources and infrastructure, and manage visitor use and

development along the river corridor. These actions would be part of a comprehensive strategy to reduce existing adverse impacts on meadow and riparian vegetation. Overall, these actions would result in a segmentwide, long-term, moderate, beneficial impact on special status species in Segment 2.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 5 include: relocating unimproved Camp 6 parking; removing the Sugarpine Bridge; placing large wood and engineered logjams along the base of Stoneman Bridge; and improving trail connectivity and routing in the vicinity of the Ahwahnee Bridge. These actions would result in enhanced channel free flow, increased channel complexity, increased streambank stability, and restored riparian habitat segmentwide. Overall these measures would improve the free-flowing condition of the river and restore the ecological integrity of Yosemite Valley riparian habitats.

### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Actions to manage visitor use and facilities under Alternative 5, specifically those concerning vehicle access and overnight accommodations, would result in a 5% decrease in daily Yosemite Valley visitation, from approximately 20,900 under Alternative 1 to 19,900. Day use visitation would decrease by 14%. However, due largely to increases in lodging and campground facilities, overnight visitation would increase by about 16%. Under Alternative 5, there would be a net increase in Yosemite Valley lodging units. This would largely result from the increase in units at Curry Village and removal of units from Housekeeping Camp. The park would increase the total number of campsites within the Valley.

Maintaining and constructing new overnight camping and lodging facilities would maintain dense levels of the built environment within the Valley, resulting in long-term, minor, adverse impacts on wildlife in Segment 2 from human presence and human-related pressures (noise, human food, vegetation trampling, etc.). The use of heavy equipment would create the potential for wildlife injuries or death, specifically for small wildlife. These activities could cause wildlife to relocate or avoid the area and could cause breeding birds to abandon their nests or avoid using the immediate area. New parking areas and paths may require some tree removal; removing potentially occupied habitats such as mature conifer and hardwood trees, hollowed-out trees, or snags could affect breeding bats or birds by removing nests or roosts and could result in the harassment of adults from active nests or roosting sites located in the vicinity. Tree removal would be minimized through site design, and, if possible, older trees and snags would be retained for habitat. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular. With the implementation of mitigation measures such as surveying potential habitat prior to construction (especially during important breeding seasons), noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse.

Vegetation that is removed under Alternative 5 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities in Segment 2 because new construction would primarily occur in or adjacent

to previously disturbed locations or in more resilient, upland habitat. Special status plant species would be avoided during construction activities. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce short-term impacts to minor and adverse.

**Curry Village & Campgrounds.** Actions under Alternative 5 in Segment 2 related to managing visitor use and facilities at Curry Village include the reorganization of Curry Village and the rerouting of South Side Drive at Boys Town. Construction and reorganization activities at Curry Village could disturb special status wildlife habitat where facilities are removed and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence. Outside of previously developed areas, impacts to wildlife habitats would occur in ponderosa pine forest (6.35 acres impacted) and wet meadow (0.03 acres impacted) habitat types. Special status species that could be affected by actions at Curry Village are presented in **table 9-114**. As described in the “Vegetation” section, the proposed actions at Curry Village would primarily affect ponderosa pine habitat surrounding areas that are currently developed and experience a high level of human disturbance.

Construction of new facilities will require some tree removal. As noted in table 9-114, up to 6.35 acres of ponderosa pine habitat would be affected by the actions proposed for Curry Village under Alternative 5. Removing mature conifer and hardwood trees, trees with cavities, or snags could affect bats or birds by removing suitable roosts or perches. Due to the proximity of this habitat to already developed sites as well as the structure and canopy closure of the stands that would be affected, it is not anticipated that any active nest sites for long-eared owls or spotted owls would be affected by the proposed actions. Tree removal would be minimized through site design however, and, if possible, older trees and snags would be retained for habitat. In addition, pre-construction surveys for these species would be conducted to ensure that no active nest sites would be affected.

The use of heavy equipment during construction could cause wildlife to relocate or avoid the area and could cause birds and mammals to avoid using the immediate area for foraging. Although the disturbance from construction activities would be temporary, displacement of individuals would have an adverse impact on local special status bird and bat populations. With the implementation of mitigation measures such as surveying suitable habitat prior to construction during the breeding season, noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these local, short-term impacts to minor and adverse.

It is unlikely that any special status plant species occur in the Curry Village area due to the high levels of visitation and human-related impacts such as vegetation trampling and soil compaction. In addition, no special status plants found during rare plant surveys conducted in 2010 at the Curry Village area. Therefore, it is unlikely that special status plant species will be affected by actions to manage visitor use and facilities at Curry Village under Alternative 5.

**Camp 6 and Yosemite Village.** Actions under Alternative 5 in Segment 2 related to managing visitor use and facilities at Camp 6 and Yosemite Village include measures to formalize and relocate parking facilities 150 feet away from the river in order to facilitate riparian restoration goals. The Camp 6/Village Center Parking Area will be formalized to include 850 designated parking spaces by redeveloping part of the current administrative footprint. In addition, 100 parking spaces would be added at Yosemite Village. A pedestrian underpass and a roundabout at the Village Drive/Northside Drive (Camp 6) intersection would be constructed to address traffic congestion and pedestrian/vehicle conflicts. A three-way intersection at Sentinel Drive and the entrance to the parking area would be added to improve traffic flow and alleviate congestion at nearby intersections.

Construction activities at Camp 6 and Yosemite Village could disturb special status wildlife habitat where facilities are removed, relocated and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence. Outside of previously developed areas, impacts to wildlife habitats would occur in montane riparian (0.81 acres impacted), ponderosa pine forest (12.22 acres impacted), and wet meadow (0.28 acres impacted) habitat types. Special status species that could be affected by actions at Camp 6 and Yosemite Village are presented in **table 9-115**. As described in the “Vegetation” section, the proposed actions at Camp 6 and Yosemite Village would primarily affect ponderosa pine forest and montane riparian habitats surrounding areas that are currently developed and experience a high level of human disturbance.

<sup>a</sup> This is a comparison of the acres of habitat impacted to the total acres of that habitat type in the segment. SOURCE: NPS 2012c				

Construction of new facilities will require some tree removal. As noted in table 9-115, up to 12.22 acres of ponderosa pine habitat and 0.81 acres of montane riparian habitat would be affected by the actions proposed for Camp 6 and Yosemite Village under Alternative 5. Removing mature conifer and hardwood trees, trees with cavities, or snags could affect bats or birds by removing suitable roosts or perches. Due to the proximity of this habitat to already developed sites as well as the structure and canopy closure of the stands that would be affected, it is not anticipated that any active nest sites for

special status bird species would be affected by the proposed actions. Tree removal would be minimized through site design however, and, if possible, older trees and snags would be retained for habitat. In addition, pre-construction surveys for these species would be conducted to ensure that no active nest sites would be affected.

The use of heavy equipment during construction could cause wildlife to relocate or avoid the area and could cause birds and mammals to avoid using the immediate area for foraging. Although the disturbance from construction activities would be temporary, displacement of individuals would have an adverse impact on local special status bird and bat populations. With the implementation of mitigation measures such as surveying suitable habitat prior to construction during the breeding season, noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these local, short-term impacts to minor and adverse.

It is unlikely that any special status plant species occur in the Camp 6 and Yosemite Village area due to the high levels of visitation and human-related impacts such as vegetation trampling and soil compaction. In addition, no special status plants found during rare plant surveys conducted in 2010 at the Camp 6 and Yosemite Village area. Therefore, it is unlikely that special status plant species will be affected by actions to manage visitor use and facilities at Camp 6 and Yosemite Village under Alternative 5.

**Yosemite Lodge and Camp 4.** Actions under Alternative 5 in Segment 2 related to managing visitor use and facilities at Yosemite Lodge and Camp 4 include: the removal of old and temporary housing at Highland Court and the Thousands Cabins; the construction of two new concessioner housing areas and the construction of 78 employee parking spaces; redevelopment west of Yosemite Lodge to provide an additional 300 day-use parking spaces and area for 15 tour buses; relocation of existing tour bus drop off area to Highland Court to provide 3 bus loading/unloading spaces; and the construction of a pedestrian underpass to alleviate pedestrian/vehicle conflicts.

Construction activities at Yosemite Lodge and Camp 4 could disturb special status wildlife habitat where facilities are removed, relocated and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence. Outside of previously developed areas, impacts to wildlife habitats would occur in ponderosa pine forest (15.47 acres impacted) and montane hardwood (1.73 acres impacted) habitats. Special status species that could be affected by actions at Yosemite Lodge and Camp 4 are presented in **table 9-116**. As described in the “Vegetation” section, the proposed actions at Yosemite Lodge and Camp 4 would primarily affect ponderosa pine habitat surrounding areas that are currently developed and experience a high level of human disturbance.

Construction of new facilities will require some tree removal. As noted in **table 9-116**, up to 15.47 acres of ponderosa pine habitat and 1.73 acres of montane hardwood habitat would be affected by the actions proposed for Yosemite Lodge and Camp 4 under Alternative 5. Removing mature conifer and hardwood trees, trees with cavities, or snags could affect bats or birds by removing suitable roosts or

<i>Asio otus</i> Long-eared owl	Ponderosa Pine Montane Hardwood	15.47 1.73	0.9% <0.1 %	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 17.20 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Strix occidentalis</i> <i>occidentalis</i> California spotted owl	Ponderosa Pine Montane Hardwood	15.47 1.73	0.9% <0.1 %	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 17.20 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<b>Mammals</b>				
<i>Antrozous pallidus</i> Pallid bat	Ponderosa Pine Montane Hardwood Urban	15.47 1.73 N/A	0.9% <0.1 % N/A	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Corynorhinus townsendii</i> Townsend's big-eared bat	Ponderosa Pine Montane Hardwood Urban	15.47 1.73 N/A	0.9% <0.1 % N/A	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Euderma maculatum</i> Spotted bat	Ponderosa Pine	15.47	0.9%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat). Roosting habitat (cliffs and caves) not impacted.
<i>Lasiurus blossevillei</i> Western red bat	Ponderosa Pine	15.47	0.9%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of trees could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.

**TABLE 9-116: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT YOSEMITE LODGE AND CAMP 4 – ALTERNATIVE 5 (CONTINUED)**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Mammals (cont.)</b>				
<i>Eumops perotis</i> Western mastiff bat	Ponderosa Pine Montane Hardwood	15.47 1.73	0.9% <0.1%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat) and indirect impacts from disturbance associated with construction. Roosting habitat (rock features) not impacted.
<i>Martes pennanti pacifica</i> Pacific fisher	Ponderosa Pine	15.47	0.9%	May Affect, Not Likely to Adversely Affect. Although suitable foraging habitat for this species would be impacted by proposed actions, this species is sensitive to human presence and is not likely to utilize habitats in the Yosemite Lodge and Camp 4 area.
<sup>a</sup> This is a comparison of the acres of habitat impacted to the total acres of that habitat type in the segment. SOURCE: NPS 2012c				

perches. Due to the proximity of this habitat to already developed sites as well as the structure and canopy closure of the stands that would be affected, it is not anticipated that any active nest sites for long-eared owls or spotted owls would be affected by the proposed actions. Tree removal would be minimized through site design however, and, if possible, older trees and snags would be retained for habitat. In addition, pre-construction surveys for these species would be conducted to ensure that no active nest sites would be affected.

The use of heavy equipment during construction could cause wildlife to relocate or avoid the area and could cause birds and mammals to avoid using the immediate area for foraging. Although the disturbance from construction activities would be temporary, displacement of individuals would have an adverse impact on local special status bird and bat populations. With the implementation of mitigation measures such as surveying suitable habitat prior to construction during the breeding season, noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these local, short-term impacts to minor and adverse.

It is unlikely that any special status plant species occur in the Yosemite Lodge and Camp 4 area due to the high levels of visitation and human-related impacts such as vegetation trampling and soil compaction. In addition, no special status plants found during rare plant surveys conducted in 2010 at the Yosemite Lodge and Camp 4 area. Therefore, it is unlikely that special status plant species will be affected by actions to manage visitor use and facilities at Yosemite Lodge and Camp 4 under Alternative 5.

**Segment 2 Impact Summary:** Overall, actions in Segment 2 under Alternative 5 would result in segmentwide, long-term, minor to moderate, beneficial impacts on special status species.

Actions in Segment 2 under Alternative 5 would have no effect on the following federally listed and candidate species: valley elderberry longhorn beetle, Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, Sierra Nevada bighorn sheep, and whitebark pine.

Actions in Segment 2 under Alternative 5 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Pacific fisher.

### **Segments 3 and 4: Merced Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Currently, vehicles park under the dripline of the 38 valley oak trees. This practice compacts soil under the trees and impacts root health, water uptake, and soil aeration. Additionally, existing development and trampling in the vicinity of these trees limits the area where oak seedlings can be recruited. Under Alternative 5, valley oaks in El Portal would be enhanced by creating an oak recruitment area of one acre in Old El Portal in the vicinity of the current bulk fuel storage area, including the adjacent parking lots. Parking and new building construction within the oak recruitment area would be prohibited. Nonnative fill would be removed and soils decompacted. Appropriate native understory plant species would be planted. The fuel storage area would be relocated outside of the river corridor. Overall, these actions would result in local, long-term, moderate, beneficial impacts on valley oaks in Segment 4. Valley oaks are a park-designated special status species.

These restorative actions could result in local, short-term, adverse impacts on special status wildlife within the adjacent riparian habitat, including noise associated with construction-related activities, ground disturbance, human presence, increases in sedimentation, and potential for incidental spills to reach aquatic habitats (including the Merced River). Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. However, implementation of these restorative actions would restore the 100-year floodplain and associated riparian community, improve hydrological connectivity to the river, and improve habitat for riparian-dependent species.

As summarized in the “Wildlife” section of this chapter, a total of 12 acres of riparian, floodplain, and valley oak woodland habitat would be restored in Segment 4 under Alternative 5 (this includes restoration actions common to Alternatives 2-6), resulting in direct benefits to fish and wildlife that use these habitat types. Thus, these restoration management actions would likely have a local, long-term, minor, beneficial impact on special status wildlife species that use riparian habitats in El Portal (WHR: montane riparian). Special status wildlife species that may benefit from these actions over the long term include valley elderberry longhorn beetle, western pond turtle, long-eared owl, yellow warbler, and western red bat.

Biological resource surveys have identified suitable habitat (elderberry shrubs) in the El Portal area for valley elderberry longhorn beetle. Actions in the El Portal area (Segment 4) include the restoration of the Greenemeyer sand pit and the restoration of riverside habitat in Abbieville and the Trailer Village. The NPS would avoid all impacts within 100-feet of elderberry plants containing stems measuring 1.0 inch or greater in diameter at ground level when implementing these common to all restoration actions. If these actions were to result in unanticipated direct or indirect impacts on valley elderberry longhorn beetle habitat, the NPS would implement avoidance and mitigation measures outlined in the 1999 USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (mitigation measure MM-WL-4, as applicable; see Appendix C).

Vegetation removed under Alternative 5 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities in Segment 4 because new construction would primarily occur in or adjacent to previously disturbed locations or in more resilient, upland habitat. Special status plant species would be avoided during construction activities. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce short-term impacts to minor and adverse. Overall, these restoration actions would result in local, long-term, minor, beneficial impacts on special status plants that occur in riparian habitats in Segment 4.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Under Alternative 5, visitor day parking would be expanded by 200 parking spaces at Abbieville; this area would primarily be used for visitor access to Yosemite Valley. NPS employee housing would be added to Abbieville, El Portal Village Center, and Rancheria Flat along with a total of 292 employee parking spaces at these locations. While all new units would be built outside of the 100-year floodplain, they would fall within the river corridor in Segment 4. This increase in capacity in El Portal is a function of the decrease in employee housing capacity in the Valley (Segment 2). The addition of employee housing and park facilities development would increase the total built environment within Segment 4.

Construction, removal, and restoration activities associated with these management actions under Alternative 5 could disturb special status wildlife habitat where facilities are removed and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence in Segment 4.

The use of heavy equipment would create the potential for wildlife injuries or death, and could cause wildlife to relocate or avoid the construction area and could cause breeding birds to abandon their nests or avoid using the immediate area. New construction may require some tree removal; removing potentially occupied habitats such as mature conifer and hardwood trees, hollowed-out trees, or snags could affect breeding bats or birds by removing nests or roosts and could result in the harassment of adults from active nests or roosting sites located nearby. Tree removal would be minimized through site design, and, if possible, older trees and snags would be retained for habitat. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular. With the implementation of mitigation measures such as surveying potential habitat prior to

construction (especially during important breeding seasons), noise and visual disturbances to special status wildlife would be minimized or avoided under Alternative 5. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse in Segment 4.

Biological resource surveys have identified suitable habitat (elderberry shrubs) in the El Portal area for valley elderberry longhorn beetle. Approximately 124 elderberry plants of a size sufficient to support the Valley elderberry longhorn beetle occur in areas of potential development or management activities in El Portal. Valley elderberry longhorn beetle exit holes that verify beetle activity were found in 11 of these elderberry plants, though beetle larvae could still be present in elderberry plants without exit holes. Actions in Segment 4, including moving temporary housing units to El Portal and development at the Abbieville and Trailer Village, would result in potential indirect or direct impacts on elderberry shrubs, including removal of shrubs. Approximately 37 elderberry plants were documented within potential areas of ground disturbance, seven with exit holes. Complete impact avoidance would not be possible for these plants. The infill in El Portal would affect up to nine elderberry shrubs with stems greater than one inch in diameter. The development at Abbieville would affect up to 16 shrubs, while the development at Trailer Village would affect up to 12 shrubs. Direct or indirect impacts on valley elderberry longhorn beetle habitat would result in local, long-term, minor, adverse impacts on this beetle species. If these actions were to result in direct or indirect impacts on valley elderberry longhorn beetle habitat, the NPS would implement avoidance and mitigation measures outlined in the 1999 USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (mitigation measure MM-WL-4, as applicable; see Appendix C).

Vegetation removed under Alternative 5 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities in Segment 4 because new construction would primarily occur in or adjacent to previously disturbed locations or in more resilient, upland habitat. Special status plant species would be avoided during construction activities under Alternative 5.

**Segments 3 and 4 Impact Summary:** Overall, actions in Segments 3 and 4 under Alternative 5 would result in local, long-term, minor, beneficial impacts on most special status species.

Actions in Segments 3 and 4 under Alternative 5 would have no effect on the following federally listed and candidate species: Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, Pacific fisher, Sierra Nevada bighorn sheep, and whitebark pine.

It is the determination of the NPS that the actions proposed in Segment 4 under Alternative 5 may affect, and are likely to adversely affect, the valley elderberry longhorn beetle.

## **Segments 5–8: South Fork Merced River**

### ***Impacts of Actions to Protect and Enhance River Values***

Actions specifically targeted to protect culturally sensitive areas under Alternative 5 would also benefit special status species, including the relocation or removal of selected campsites and stock campground sites that are within 100 feet of the South Fork Merced River or in culturally sensitive areas. Removing

some campsites within the floodplain would result in local, long-term, minor beneficial impact on special status species as riparian habitat is restored and wildlife are subject to less human presence and human-related pressures.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 5 include the relocation of stock use campsites from sensitive resource areas to the Wawona Maintenance Yard. Overall, this action would result in a local, long-term, minor, beneficial impact on special status species in Segment 7.

### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Under Alternative 5, Wawona stables operations would be eliminated and two stock campsites would be relocated to the Wawona Maintenance Yard from the current Wawona stock camp. In the Wawona Campground, 13 campsites would be removed from within 100 feet of the South Fork Merced River or from cultural sites and the area would be restored. Soils would be decompacted, and the area would be replanted with riparian vegetation; these actions would reduce visitor use in this area and result in decreased vegetation trampling.

These actions would result in short-term, adverse impacts on special status wildlife that uses riparian habitat. Adverse impacts would include noise associated with demolition, removal, and restoration activities; ground disturbance; human presence; habitat modification; and potential increase in suspended sediments to the South Fork Merced River. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding removal of riparian vegetation, where possible, would reduce these short-term impacts to minor and adverse. However, implementation of these actions would reduce the built environment within Segment 7, restore riparian habitat, and reduce riverbank erosion.

As summarized in the "Wildlife" section of this chapter, a total of three acres of riparian would be restored in Segment 7 under Alternative 5 (this includes restoration actions common to Alternatives 2-6), resulting in direct benefits to wildlife that use this habitat type. Thus, this restoration action would be expected to have a local, long-term, moderate, beneficial impact on special status wildlife species that use riparian habitats in Wawona (WHR: montane riparian). Special status wildlife species that may benefit from these actions over the long term include long-eared owl and yellow warbler.

Special status plants may be adversely affected in the short term by removal, restoration, and monitoring activities associated with these restoration management actions. Potential impacts include temporary disturbance and loss of habitat, potential loss of individual plants or populations, and the potential introduction and spread of invasive nonnative species. These impacts would be local. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. Overall, these actions under Alternative 5 would result in local, long-term, negligible, beneficial impacts on special status plants that occur in the Wawona area (Segment 7).

**Wawona Campground.** Facilities actions at the Wawona Campground would involve removal of 13 sites that are either within the 100-year floodplain or in culturally sensitive areas. Overall, these actions would result in a local, long-term, minor, beneficial impact on special status species in Wawona.

**Segments 5, 6, 7 and 8 Impact Summary:** Overall, actions in Segments 5-8 under Alternative 5 would result in segmentwide, long-term, minor to moderate, beneficial impacts on special status species.

Actions in Segments 5-8 under Alternative 5 would have no effect on the following federally listed and candidate species: valley elderberry longhorn beetle, Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, Sierra Nevada bighorn sheep, and whitebark pine.

Actions in Segments 5-8 under Alternative 5 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Pacific fisher.

### **Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Past development and human activity in the Merced River corridor have in some cases adversely affected special status species habitat and use of those habitats. As described in the preceding paragraphs, many of the actions proposed for Alternative 5 would address existing adverse impacts on habitats for special status species, including actions targeted to improve habitat quality for aquatic, riparian-dependent, and meadow-dependent special status species where these habitats are near or adjacent to existing developments and high visitor use areas. Additionally, the park would implement measures to restore the ecological integrity of riparian, meadow, and aquatic habitat in targeted areas, increase channel free flow, improve water quality, and reduce erosion and scouring. Notable actions the park would implement under Alternative 5 include the following:

- Restrict recreational use of rivers and riverbanks to reduce riverbank erosion.
- Remove, restore, relocate, or repurpose park facilities to efficiently use park facilities and reduce the built environment within the park; some facilities would be built to accommodate visitors or employees.
- Manage total visitors to the park and visitor demands for day parking space, lodging, and camping space.
- Remove facilities within 100 feet of the Merced River and restore riverbanks, meadows, and riparian habitat.
- Enhance meadow, riparian, and river hydrologic function, complexity, and connectivity.
- Improve the free flow, complexity, and water quality of the Merced River.

Generally, Alternative 5 is focused on intensive restoration of meadow, riparian, and riverbank habitats in Yosemite Valley (Segment 2); removing many facilities that are located within 100 feet of the river and are jeopardized by flooding; repurposing park facilities to improve efficiency of use; maintaining existing usage levels; and providing adequate lodging, camping, and parking space for visitors and employees. Adverse effects from these actions would be associated with the active construction or restoration phase and would be local, short term, and minor or negligible. However, there would be local, long-term, negligible, adverse impacts on habitats for special status species from construction of some facilities. When combined, the long-term effect of all of these measures would be a moderate, beneficial impact on special status species as habitats are restored and fragmentation and

indirect detriments to habitat are reduced. These effects would be most pronounced in areas of high human use such as Yosemite Valley and Wawona (Segments 2 and 7, respectively).

Overall, there would be a lessened potential for beneficial effects under Alternative 5 compared with Alternative 2, and a slightly lessened beneficial effect compared with Alternatives 3 and 4. However, there would be a somewhat increased potential for adverse impacts over Alternatives 2 and 3, and about the same adverse impact potential compared to Alternative 4 because more new construction would occur in and adjacent to suitable habitat for special status species.

Implementation of a comprehensive ecological restoration program to restore natural processes to the Merced River corridor, in combination with much lower visitor use levels and extensive site-specific restoration, would result in a corridorwide, long-term, moderate, beneficial impact on special status species habitat. In the long term, these measures would improve hydrologic connectivity of meadows and floodplains to the river; enhance habitat complexity in riparian, meadow and aquatic areas; reduce human and pack stock-related disturbances; and reduce nonnative species and conifer intrusion into sensitive habitats. Adverse effects related to the construction phase of these actions would be local, short term, and minor or negligible.

Actions under Alternatives 5 would have no effect on the following federally listed and candidate species: Sierra Nevada bighorn sheep and whitebark pine.

Actions under Alternative 5 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, and Pacific fisher.

Actions in Segment 4 under Alternative 5 would result in potential indirect or direct impacts on elderberry shrubs, including possible removal of shrubs. Direct or indirect impacts on valley elderberry longhorn beetle habitat would result in local, long-term, minor, adverse impacts on this beetle species. Therefore, it is the determination of the NPS that the actions proposed may affect, and are likely to adversely affect, the valley elderberry longhorn beetle.

### **Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

The past, present, and reasonably foreseeable plans and projects that could have a cumulative impact on special status species in combination with Alternative 5 are the same as those listed for Alternative 1 (No Action).

### ***Overall Cumulative Impact from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

The actions associated with Alternative 5 would generally result in segmentwide, long-term, minor to moderate, beneficial impacts on special status species habitats within the Merced River corridor, with the exception of valley elderberry longhorn beetle. These actions are focused on restoring and improving aquatic, meadow, and riparian habitat quality within the Merced River corridor; therefore, special status species associated with these habitat types are most likely to be affected cumulatively by

the proposed actions. The past, present, and future actions in the region would have varying effects on special status species habitats, with some projects restoring or enhancing habitats and many other projects resulting in habitat loss or decline.

In general, past actions have impaired and reduced the abundance and quantity of aquatic, meadow, and riparian habitats in the region. These past actions, especially at lower elevations from development and resource extraction, have resulted in a reduction in special status species populations and ranges. Present and reasonably foreseeable future actions also have the potential to further reduce or impair these habitat types; however, in general, potential effects on these habitat types are mitigated and/or compensated through habitat preservation and/or enhancement at an off-site location (including mitigation banks). These actions provide the most benefit when coordinated with larger, regional conservation strategies that protect intact corridors or provide linkages to other areas of suitable habitat. Because Alternative 5 proposed actions would further increase the habitat value of the Merced River Corridor, this alternative would not contribute toward a cumulative adverse effect on special status species.

The actions under Alternative 5 would have long-term, beneficial effects on special-status species in the Merced River corridor. However, in relation to past, present, and reasonably foreseeable future actions throughout the Sierra Nevada and larger region, (e.g., introduction and spread of nonnative species, direct displacement of habitat) the actions under Alternative 5 would have a minimal beneficial effect. Overall, in conjunction with actions proposed in Alternative 5, cumulative actions on special status species would result in long-term, adverse effects on special status species.

### ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 6, grazing in Merced Lake East Meadow would be managed as described for Alternatives 3. Beneficial effects to special status species would be the same as described for Alternative 3.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Several actions related to management of visitor use and facilities would have the potential to affect special status species in Segment 1 under Alternative 6. Visitation within Segment 1 would not be expected to change appreciably under Alternative 6; wilderness access quotas would remain as under Alternative 1 (No Action) (150) and modifications to overnight accommodations would be nominal. Under Alternative 6, the Merced Lake High Sierra Camp would remain in operation and continue to host overnight guests and through-hikers during the summer months. The camp's 60 beds (22 units) would remain. The park would not reduce the total number of designated campsites within the Merced River corridor's wilderness.

Total daily use levels in Segment 1 under Alternative 6 are estimated at 380 overnight visitors and approximately 450 day visitors. Compared with Alternative 1 (No Action), with which daily use levels are estimated at 380 overnight visitors and approximately 450 day visitors, Alternative 6 would maintain the level of use within Segment 1. Collectively, actions to maintain similar kinds and levels of use as current levels would result in continued local, long-term, minor, adverse impacts on special status species within Segment 1.

**Merced Lake High Sierra Camp.** The project-level actions in the Merced Lake High Sierra Camp area proposed under Alternative 6 involve retention of the Merced Lake High Sierra Camp and replacing the flush toilets with composting toilets. Actions to maintain similar kinds and levels of use as current levels would result in continued local, long-term, minor, adverse impacts on special status species within Segment 1.

**Segment 1 Impact Summary:** Overall, actions in Segment 1 under Alternative 6 would result in local, long-term, minor, adverse impacts on special status species.

Actions in Segment 1 under Alternative 6 would have no effect on the following federally listed and candidate species: valley elderberry longhorn beetle, Sierra Nevada bighorn sheep, and whitebark pine.

Actions in Segment 1 under Alternative 6 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, and Pacific fisher.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Ecological management actions that would occur within Segment 2 under Alternative 6 include measures to restore and protect meadows, riparian habitat, and areas within the 100-year floodplain of the Merced River. Projects proposed in Segment 2 under Alternative 6 to protect and enhance river values involve constructing a boardwalk for the Valley Loop Trail through sensitive wet meadow habitat in Slaughterhouse Meadow; and moving 780 feet of the Valley Loop Trail out of Bridalveil Meadow.

Special status species inhabiting wetlands, riparian habitat, and riverine ecosystems in Segment 2 would benefit from removal of some overnight camping and lodging facilities within 100 feet of the ordinary high-water mark of the Merced River under Alternative 6. Restoration of these select areas would prevent further riverbank erosion, provide hydrologic connectivity for meadows and riparian habitats, reduce vegetation trampling, enhance the hydrologic function within the floodplain, enhance water quality, increase the amount of wildlife habitat, increase productivity within riparian and aquatic ecosystems, and reduce human presence and human-related impacts.

Special status wildlife and their habitats may be adversely affected in the short-term by construction/removal, restoration, and monitoring activities associated with these management actions. Potential impacts include disturbance associated with noise from construction/restoration activities, human

presence, and modification to habitat. These activities could cause wildlife to relocate or avoid the area and could cause breeding birds to abandon their nests or avoid using the immediate area. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular.

The use of heavy equipment would create the potential for wildlife injuries or death, and could cause wildlife to relocate or avoid the area and could cause breeding birds to abandon their nests or avoid using the immediate area. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular. With the implementation of mitigation measures such as surveying potential habitat prior to construction (especially during important breeding seasons), noise and visual disturbances to special status wildlife would be minimized or avoided. Adherence to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoidance of the removal of vegetation where possible would reduce these short-term impacts to minor and adverse. However, these measures would also improve hydrologic function and restore ecological integrity of the river corridor and associated habitats, in particular meadow, riparian, and wetland habitats; address ongoing and future impacts to park resources and infrastructure; and manage visitor use and development along the river corridor.

As summarized in the “Wildlife” section of this chapter, a total of 156 acres of floodplain, riparian, meadow, woodland, and forest habitat would be restored in Segment 2 under Alternative 6 (this includes restoration actions common to Alternatives 2-6), resulting in direct benefits to fish and wildlife that use these habitat types. Over time, these management actions would have segmentwide, long-term, moderate, beneficial impacts on special status wildlife species that use the Merced River and adjacent meadows and riparian habitats in the Valley (WHR types: riverine, wet meadow, montane riparian). Special status wildlife species that may benefit from these actions over the long term include western pond turtle, harlequin duck, bald eagle, peregrine falcon, long-eared owl, great gray owl, California spotted owl, black swift, willow flycatcher, yellow warbler, pallid bat, spotted bat, western red bat, and Pacific fisher.

Vegetation removed under Alternative 6 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities along the Merced River corridor in Segment 2. These impacts would be local and occur within or adjacent to the river corridor. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. Special status plant species would be avoided during management activities. However, these measures would improve the hydrologic function and restore the ecological integrity of Valley meadows. Associated beneficial impacts would include reduced fragmentation and disturbance of meadows, increased opportunities for revegetation and restoration, and enhanced hydrological connectivity between the meadows and the Merced River. Thus, this management action would be expected to have a local, long-term, moderate, beneficial impact on special status species occurring within Segment 2 plant communities.

### Biological Resource Actions.

***Yosemite Valley Campgrounds:*** Like Alternative 5, specific restoration actions under Alternative 6 to enhance the river's biological values in Segment 2 include removing all campsites within 100' of the bed and banks of the Merced River and restoring 6.5 acres of floodplain/riparian habitat, and designating river access at the North Pines Campground. Restoration of riparian habitat throughout Yosemite Valley would result in segmentwide, long-term, minor to moderate, beneficial impacts to special status species including long-eared owl, yellow warbler, and Townsend's big-eared bat.

***El Capitan Meadow:*** Alternative 6 would install restoration fencing along the northern perimeter of El Capitan Meadow to designate appropriate meadow access points along boardwalks and viewing platforms. The NPS would remove all informal trails in sensitive and frequently inundated areas and in areas that trails incise meadow and promote habitat fragmentation. Additionally, Alternative 6 would selectively remove conifers that block the views of El Capitan from the roadside. Restoration of El Capitan Meadow and rerouting or removal of informal trails would result in local, long-term, minor to moderate, beneficial impacts on special status species from reduction of trampling from foot traffic that causes habitat fragmentation. Special status wildlife species that may benefit from these actions over the long term include northern harrier, peregrine falcon, long-eared owl, Vaux's swift, pallid bat, Townsend's big-eared bat, and spotted bat.

***Ahwahnee Meadow:*** Similar to Alternatives 4 and 5, specific actions under Alternative 6 in Segment 2 to enhance the river's biological values at the Ahwahnee Meadow include: removing fill in sections of trails that passes through meadow and wetland habitats and replace the trails with boardwalk. Unlike Alternatives 2 and 3, Northside Drive and the adjacent bike path would remain under Alternative 6. Hydrological connectivity between both sides of Northside Drive would be enhanced by increasing the number of culverts. Trail improvement and meadow restoration would result in local, long-term, minor to moderate, beneficial impacts on special status species at the Ahwahnee Meadow as wetland fragmentation and vegetation trampling is reduced, and wetland connectivity to the river is enhanced. Special status wildlife species that may benefit from these actions over the long term include northern harrier, peregrine falcon, long-eared owl, Vaux's swift, pallid bat, Townsend's big-eared bat, and spotted bat.

***Stoneman Meadow:*** Like Alternative 5, specific actions in Alternative 6 to enhance the biological values of the Merced River include restoring Stoneman Meadow by redesigning the Orchard Parking Lot. Through engineering solutions, Alternative 6 would promote water flow by increasing drainage from the cliff walls of the parking lot to Stoneman Meadows, thus improving meadow health. Improving hydrological connectivity between the Orchard Parking Lot cliff walls and Stoneman Meadow would result in local, long-term, minor, beneficial impacts on special status species. Special status wildlife species that may benefit from these actions over the long term include northern harrier, peregrine falcon, Vaux's swift, pallid bat, Townsend's big-eared bat, and spotted bat.

***Former Upper and Lower Rivers Campgrounds:*** Like Alternative 5, specific actions to enhance biological values of the Merced River at the Former Upper and Lower Rivers Campgrounds under Alternative 6 include restoring the topography of 19.7 acres of the floodplain. Alternative 6 would remove remaining asphalt, decompact soils of former roads and campsites and re-establish channels that have been filled, place large box culverts under the road to allow water flow, and fence and close

the riparian zone at former Upper River to protect the riverbank from trampling. Restoration of the Former Upper and Lower Rivers Campgrounds would result in local, long-term, moderate, beneficial impacts on special status species including long-eared owl, yellow warbler, and Townsend's big-eared bat.

These restoration management actions would improve hydrologic function and restore ecological integrity of the Merced River corridor in Segment 2 and associated plant communities and wetlands, address ongoing and future impacts on park resources and infrastructure, and manage visitor use and development along the river corridor. These actions would be part of a comprehensive strategy to reduce existing adverse impacts on meadow and riparian vegetation. Overall, these actions would result in a segmentwide, long-term, moderate, beneficial impact on special status species in Segment 2.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 6 include: relocating unimproved Camp 6 parking and placing large wood and engineered logjams along the bases of Stoneman, Sugar Pine, and Ahwahnee Bridges. These actions would result in enhanced channel free flow, increased channel complexity, increased streambank stability, and restored riparian habitat segmentwide. Overall, these actions would result in a segmentwide, long-term, moderate, beneficial impact on special status species in Segment 2.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 6, specifically those concerning vehicle access and overnight accommodations, would result in a 4% increase in daily Yosemite Valley visitation, from approximately 20,900 under Alternative 1 to 21,800. Daytime visitation would decrease by 7%. However, due largely to increases in lodging and campground facilities, overnight visitation would increase by about 33%. Under Alternative 6, there would be a net increase in Yosemite Valley lodging units. This would largely result from the substantial increase in units at Yosemite Lodge and Curry Village, along with a slight reduction in Housekeeping Camp units. The park would increase the total number of campsites within the Valley.

Maintaining and constructing new overnight camping and lodging facilities would maintain dense levels of the built environment within the Valley, resulting in segmentwide, long-term, minor, adverse impacts on wildlife from human presence and human-related pressures (such as noise, human food, and vegetation trampling). The use of heavy equipment would create the potential for wildlife injuries or death, specifically for small wildlife. These activities could cause wildlife to relocate or avoid the area and could cause breeding birds to abandon their nests or avoid using the immediate area. New parking areas and paths may require removal of some trees; removal of potentially occupied habitats such as mature conifer and hardwood trees, hollowed-out trees, or snags could affect breeding bats or birds by removing nests or roosts and could result in the harassment of adults from active nests or roosting sites located in the vicinity. Tree removal would be minimized through site design, and, if possible, older trees and snags would be retained for habitat. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular. With the implementation of mitigation measures such as surveying potential habitat prior to construction (especially during important breeding seasons), noise

and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse.

Vegetation removed under Alternative 6 in Segment 2 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities in Segment 2 because new construction would primarily occur in or adjacent to previously disturbed locations or in more resilient, upland habitat. Special status plant species would be avoided during construction activities. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce short-term impacts to minor and adverse.

**Curry Village & Campgrounds.** Actions under Alternative 6 in Segment 2 related to managing visitor use and facilities at Curry Village include the reorganization of Curry Village including the construction of 98 hard-sided units. Construction and reorganization activities at Curry Village could disturb special status wildlife habitat where facilities are removed and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence. Outside of previously developed areas, impacts to wildlife habitats would occur in ponderosa pine forest (6.35 acres impacted) and wet meadow (0.03 acres impacted) habitat types. Special status species that could be affected by actions at Curry Village are presented in **table 9-117**. As described in the “Vegetation” section, the proposed actions at Curry Village would primarily affect ponderosa pine habitat surrounding areas that are currently developed and experience a high level of human disturbance.

Construction of new facilities will require some tree removal. As noted in table 9-117, up to 6.35 acres of ponderosa pine habitat would be affected by the actions proposed for Curry Village under Alternative 6. Removing mature conifer and hardwood trees, trees with cavities, or snags could affect bats or birds by removing suitable roosts or perches. Due to the proximity of this habitat to already developed sites as well as the structure and canopy closure of the stands that would be affected, it is not anticipated that any active nest sites for long-eared owls or spotted owls would be affected by the proposed actions. Tree removal would be minimized through site design however, and, if possible, older trees and snags would be retained for habitat. In addition, pre-construction surveys for these species would be conducted to ensure that no active nest sites would be affected.

The use of heavy equipment during construction could cause wildlife to relocate or avoid the area and could cause birds and mammals to avoid using the immediate area for foraging. Although the disturbance from construction activities would be temporary, displacement of individuals would have an adverse impact on local special status bird and bat populations. With the implementation of mitigation measures such as surveying suitable habitat prior to construction during the breeding season, noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these local, short-term impacts to minor and adverse.

**TABLE 9-117: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT CURRY VILLAGE & CAMPGROUNDS – ALTERNATIVE 6**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Birds</b>				
<i>Asio otus</i> Long-eared owl	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 6.35 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Strix occidentalis</i> <i>occidentalis</i> California spotted owl	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 6.35 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<b>Mammals</b>				
<i>Antrozous pallidus</i> Pallid bat	Ponderosa Pine Wet Meadow Urban	N/A 6.35 0.03	N/A 0.4% <0.1%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Corynorhinus townsendii</i> Townsend's big-eared bat	Ponderosa Pine Wet Meadow Urban	N/A 6.35 0.03	N/A 0.4% <0.1%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Euderma maculatum</i> Spotted bat	Ponderosa Pine Wet Meadow	6.35 0.03	0.4% <0.1%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat). Roosting habitat (cliffs and caves) not impacted.
<i>Lasiurus blossevillii</i> Western red bat	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of trees could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.

**TABLE 9-117: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT CURRY VILLAGE & CAMPGROUNDS – ALTERNATIVE 6 (CONTINUED)**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Mammals (cont.)</b>				
<i>Eumops perotis</i> Western mastiff bat	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat) and indirect impacts from disturbance associated with construction. Roosting habitat (rock features) not impacted.
<i>Martes pennanti pacifica</i> Pacific fisher	Ponderosa Pine	6.35	0.4%	May Affect, Not Likely to Adversely Affect. Although suitable foraging habitat for this species would be impacted by proposed actions, this species is sensitive to human presence and is not likely to utilize habitats in the Curry Village area.
<sup>a</sup> This is a comparison of the acres of habitat impacted to the total acres of that habitat type in the segment. SOURCE: NPS 2012c				

It is unlikely that any special status plant species occur in the Curry Village area due to the high levels of visitation and human-related impacts such as vegetation trampling and soil compaction. In addition, no special status plants found during rare plant surveys conducted in 2010 at the Curry Village area. Therefore, it is unlikely that special status plant species will be affected by actions to manage visitor use and facilities at Curry Village under Alternative 6.

**Camp 6 and Yosemite Village.** Actions under Alternative 6 in Segment 2 related to managing visitor use and facilities at Camp 6 and Yosemite Village include measures to formalize and relocate parking facilities 150 feet away from the river in order to facilitate riparian restoration goals. The Camp 6/Village Center Parking Area will be formalized with 850 parking spaces by redeveloping part of the current administrative footprint. 100 parking spaces would be added at Yosemite Village. A pedestrian underpass and two roundabouts (one at the Village Drive/Northside Drive intersection and one at the Sentinel Drive/Northside Drive intersection) would be constructed to address traffic congestion and pedestrian/vehicle conflicts. A three-way intersection would be added at Sentinel Drive and the entrance to the parking area to improve traffic flow and alleviate congestion.

Construction activities at Camp 6 and Yosemite Village could disturb special status wildlife habitat where facilities are removed, relocated and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence. Outside of previously developed areas, impacts to wildlife habitats would occur in montane riparian (0.81 acres impacted), ponderosa pine forest (12.22 acres impacted), and wet meadow (0.28 acres impacted) habitat types. Special status species that could be affected by actions at Camp 6 and

Yosemite Village are presented in table 9-118. As described in the “Vegetation” section, the proposed actions at Camp 6 and Yosemite Village would primarily affect ponderosa pine forest and montane riparian habitats surrounding areas that are currently developed and experience a high level of human disturbance.

**TABLE 9-118: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT CAMP 6 & YOSEMITE VILLAGE – ALTERNATIVE 6**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Birds</b>				
<i>Asio otus</i> Long-eared owl	Ponderosa Pine Montane Riparian	12.22 0.81	0.7% 0.3%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 13.03 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Strix occidentalis</i> <i>occidentalis</i> California spotted owl	Ponderosa Pine	12.22	0.7%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 12.22 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Chaetura vauxi</i> Vaux's swift	Montane Riparian	0.81	0.3%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 0.81 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Contopus cooperi</i> Olive-sided flycatcher	Montane Riparian	0.81	0.3%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 0.81 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Setophaga petechia</i> Yellow warbler	Montane Riparian	0.81	0.3%	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 0.81 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.

**TABLE 9-118: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT CAMP 6 & YOSEMITE VILLAGE – ALTERNATIVE 6 (CONTINUED)**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Mammals</b>				
<i>Antrozous pallidus</i> Pallid bat	Ponderosa Pine Montane Riparian Wet Meadow Urban	12.22 0.81 0.28 N/A	0.7% 0.3% <0.1% N/A	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Corynorhinus townsendii</i> Townsend's big-eared bat	Ponderosa Pine Montane Riparian Wet Meadow Urban	12.22 0.81 0.28 N/A	0.7% 0.3% <0.1% N/A	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Euderma maculatum</i> Spotted bat	Ponderosa Pine Montane Riparian Wet Meadow	12.22 0.81 0.28	0.7% 0.3% <0.1%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat). Roosting habitat (cliffs and caves) not impacted.
<i>Lasiurus blossevillii</i> Western red bat	Ponderosa Pine Montane Riparian	12.22 0.81	0.7% 0.3%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of trees could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Eumops perotis</i> Western mastiff bat	Ponderosa Pine	12.22	0.7%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat) and indirect impacts from disturbance associated with construction. Roosting habitat (rock features) not impacted.
<i>Martes pennanti pacifica</i> Pacific fisher	Ponderosa Pine	12.22	0.7%	May Affect, Not Likely to Adversely Affect. Although suitable foraging habitat for this species would be impacted by proposed actions, this species is sensitive to human presence and is not likely to utilize habitats in Camp 6 and Yosemite Village.
<sup>a</sup> This is a comparison of the acres of habitat impacted to the total acres of that habitat type in the segment. SOURCE: NPS 2012c				

Construction of new facilities will require some tree removal. As noted in table 9-118, up to 12.22 acres of ponderosa pine habitat and 0.81 acres of montane riparian habitat would be affected by the actions proposed for Camp 6 and Yosemite Village under Alternative 6. Removing mature conifer and hardwood trees, trees with cavities, or snags could affect bats or birds by removing suitable roosts or perches. Due to the proximity of this habitat to already developed sites as well as the structure and canopy closure of the stands that would be affected, it is not anticipated that any active nest sites for special status bird species would be affected by the proposed actions. Tree removal would be minimized through site design however, and, if possible, older trees and snags would be retained for habitat. In addition, pre-construction surveys for these species would be conducted to ensure that no active nest sites would be affected.

The use of heavy equipment during construction could cause wildlife to relocate or avoid the area and could cause birds and mammals to avoid using the immediate area for foraging. Although the disturbance from construction activities would be temporary, displacement of individuals would have an adverse impact on local special status bird and bat populations. With the implementation of mitigation measures such as surveying suitable habitat prior to construction during the breeding season, noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these local, short-term impacts to minor and adverse.

It is unlikely that any special status plant species occur in the Camp 6 and Yosemite Village area due to the high levels of visitation and human-related impacts such as vegetation trampling and soil compaction. In addition, no special status plants found during rare plant surveys conducted in 2010 at the Camp 6 and Yosemite Village area. Therefore, it is unlikely that special status plant species will be affected by actions to manage visitor use and facilities at Camp 6 and Yosemite Village under Alternative 6.

**Yosemite Lodge and Camp 4.** Actions under Alternative 5 in Segment 2 related to managing visitor use and facilities at Yosemite Lodge and Camp 4 include: the removal of old and temporary housing at Highland Court and the Thousands Cabins; the construction of two new concessioner housing areas and the construction of 78 employee parking spaces; redevelopment west of Yosemite Lodge to provide an additional 300 day-use parking spaces and area for 15 tour buses; relocation of existing tour bus drop off area to Highland Court to provide 3 bus loading/unloading spaces; and the construction of a pedestrian underpass to alleviate pedestrian/vehicle conflicts.

Construction activities at Yosemite Lodge and Camp 4 could disturb special status wildlife habitat where facilities are removed, relocated and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence. Outside of previously developed areas, impacts to wildlife habitats would occur in ponderosa pine forest (15.47 acres impacted) and montane hardwood (1.73 acres impacted) habitats. Special status species that could be affected by actions at Yosemite Lodge and Camp 4 are presented in table 9-119. As described in the “Vegetation” section, the proposed actions at Yosemite Lodge and Camp 4 would primarily affect ponderosa pine habitat surrounding areas that are currently developed and experience a high level of human disturbance.

**TABLE 9-119: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT YOSEMITE LODGE AND CAMP 4 – ALTERNATIVE 6**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Birds</b>				
<i>Asio otus</i> Long-eared owl	Ponderosa Pine Montane Hardwood	15.47 1.73	0.9% <0.1 %	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 17.20 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<i>Strix occidentalis</i> <i>occidentalis</i> California spotted owl	Ponderosa Pine Montane Hardwood	15.47 1.73	0.9% <0.1 %	May Affect, Not Likely to Adversely Affect. Impacts include direct loss of 17.20 acres of potential foraging habitat and indirect impacts from disturbance associated with construction activities. Preconstruction surveys will ensure no active nest sites are affected.
<b>Mammals</b>				
<i>Antrozous pallidus</i> Pallid bat	Ponderosa Pine Montane Hardwood Urban	15.47 1.73 N/A	0.9% <0.1 % N/A	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of structures could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.
<i>Corynorhinus townsendii</i> Townsend's big-eared bat	Ponderosa Pine Montane Hardwood Urban	15.47 1.73 N/A	0.9% <0.1 % N/A	May Affect, Not Likely to Adversely Affect. <i>Lasiurus blossevillei</i> Western red bat	Ponderosa Pine	15.47	0.9%	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat and roosting sites) and indirect impacts from disturbance associated with construction. Removal of trees could impact roosting sites. Preconstruction surveys will ensure no active roost sites are affected.

**TABLE 9-119: SPECIAL STATUS SPECIES POTENTIALLY AFFECTED BY ACTIONS TO MANAGE VISITOR USE AND FACILITIES AT YOSEMITE LODGE AND CAMP 4 – ALTERNATIVE 6 (CONTINUED)**

Scientific Name Common Name	WHR Habitat Type Impacted	Acres Impacted	Percent of Habitat Type Affected in Segment <sup>a</sup>	Impact Summary
<b>Mammals (cont.)</b>				
<i>Eumops perotis</i> Western mastiff bat	Ponderosa Pine Montane Hardwood	15.47 1.73	0.9% <0.1 %	May Affect, Not Likely to Adversely Affect. Impacts include habitat loss (foraging habitat) and indirect impacts from disturbance associated with construction. Roosting habitat (rock features) not impacted.
<i>Martes pennanti pacifica</i> Pacific fisher	Ponderosa Pine	15.47	0.9%	May Affect, Not Likely to Adversely Affect. Although suitable foraging habitat for this species would be impacted by proposed actions, this species is sensitive to human presence and is not likely to utilize habitats in the Yosemite Lodge are.
<sup>a</sup> This is a comparison of the acres of habitat impacted to the total acres of that habitat type in the segment. SOURCE: NPS 2012c				

Construction of new facilities will require some tree removal. As noted in table 9-119, up to 15.47 acres of ponderosa pine habitat and 1.73 acres of montane hardwood habitat would be affected by the actions proposed for Yosemite Lodge and Camp 4 under Alternative 6. Removing mature conifer and hardwood trees, trees with cavities, or snags could affect bats or birds by removing suitable roosts or perches. Due to the proximity of this habitat to already developed sites as well as the structure and canopy closure of the stands that would be affected, it is not anticipated that any active nest sites for long-eared owls or spotted owls would be affected by the proposed actions. Tree removal would be minimized through site design however, and, if possible, older trees and snags would be retained for habitat. In addition, pre-construction surveys for these species would be conducted to ensure that no active nest sites would be affected.

The use of heavy equipment during construction could cause wildlife to relocate or avoid the area and could cause birds and mammals to avoid using the immediate area for foraging. Although the disturbance from construction activities would be temporary, displacement of individuals would have an adverse impact on local special status bird and bat populations. With the implementation of mitigation measures such as surveying suitable habitat prior to construction during the breeding season, noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these local, short-term impacts to minor and adverse.

It is unlikely that any special status plant species occur in the Yosemite Lodge and Camp 4 area due to the high levels of visitation and human-related impacts such as vegetation trampling and soil

compaction. In addition, no special status plants found during rare plant surveys conducted in 2010 at the Yosemite Lodge and Camp 4 area. Therefore, it is unlikely that special status plant species will be affected by actions to manage visitor use and facilities at Yosemite Lodge and Camp 4 under Alternative 6.

**Segment 2 Impact Summary:** Overall, actions in Segment 2 under Alternative 6 would result in segmentwide, long-term, minor to moderate, beneficial impacts on special status species.

Actions in Segment 2 under Alternative 6 would have no effect on the following federally listed and candidate species: valley elderberry longhorn beetle, Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, Sierra Nevada bighorn sheep, and whitebark pine.

Actions in Segment 2 under Alternative 6 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Pacific fisher.

### **Segments 3 and 4: Merced Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Currently, vehicles park under the dripline of the 38 valley oak trees. This practice compacts soil under the trees, thus impacting root health, water uptake, and soil aeration. Additionally, existing development and trampling in the vicinity limits the area where oak seedlings can be recruited. Under Alternative 6, valley oaks in El Portal would be enhanced by creating an oak recruitment area of one acre in Old El Portal in the vicinity of the current bulk fuel storage area, including the adjacent parking lots. Parking and new building construction within the oak recruitment area would be prohibited. Nonnative fill would be removed and soils decompacted. Appropriate native understory plant species would be planted. The fuel storage area would be relocated outside of the river corridor. Overall, these actions would result in local, long-term, moderate, beneficial impacts on valley oaks in Segment 4. Valley oaks are a park-designated special status species.

These restorative actions could result in local, short-term, adverse impacts on special status wildlife within the adjacent riparian habitat, including noise associated with construction-related activities, ground disturbance, human presence, increases in sedimentation, and potential for incidental spills to reach aquatic habitats (including the Merced River). Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse. However, implementation of these restorative actions would restore the 100-year floodplain and associated riparian community, improve hydrological connectivity to the river, and improve habitat for riparian-dependent species.

As summarized in the “Wildlife” section earlier in this chapter, a total of 12 acres of montane riparian and valley oak woodland habitat would be restored in Segment 4 under Alternative 6 (this includes restoration actions common to Alternatives 2-6), resulting in direct benefits to fish and wildlife that use these habitat types. These actions would be expected to have a local, long-term, minor, beneficial impact on special status wildlife species that use riparian habitats in El Portal (WHR: montane

riparian). Special status wildlife species that may benefit from these actions over the long term include valley elderberry longhorn beetle, western pond turtle, long-eared owl, yellow warbler, and western red bat.

Biological resource surveys have identified suitable habitat (elderberry shrubs) in the El Portal area for valley elderberry longhorn beetle. Actions in the El Portal area (Segment 4) include the restoration of the Greenemeyer sand pit and the restoration of riverside habitat in Abbieville and the Trailer Village. The NPS would avoid all impacts within 100-feet of elderberry plants containing stems measuring 1.0 inch or greater in diameter at ground level when implementing these common to all restoration actions. If these actions were to result in unanticipated direct or indirect impacts on valley elderberry longhorn beetle habitat, the NPS would implement avoidance and mitigation measures outlined in the 1999 USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (mitigation measure MM-WL-4, as applicable; see Appendix C).

Vegetation removed under Alternative 6 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities in Segment 4 because new construction would primarily occur in or adjacent to previously disturbed locations or in more resilient, upland habitat. Special status plant species would be avoided during construction activities. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce short-term impacts to minor and adverse. Overall, restoration actions would result in local, long-term, minor, beneficial impacts on special status plants that occur in riparian habitats in these areas.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Under Alternative 6, visitor day parking would be expanded by 200 parking spaces at Abbieville; this area would primarily be used for visitor access to Yosemite Valley. NPS employee housing would be added to Abbieville, El Portal Village Center, and Rancheria Flat along with a total of 467 employee parking spaces at these locations. While all new units would be built outside of the 100-year floodplain, they would fall within the river corridor in Segment 4. This increase in capacity in El Portal would be a function of the decrease in employee housing capacity in the Valley (Segment 2). The addition of employee housing and park facilities development would increase the total built environment within Segment 4.

Construction, removal, and restoration activities associated with these management actions could disturb special status wildlife habitat where facilities are removed and restored as well as where new facilities are constructed. Demolition or removal of existing buildings and associated infrastructure would generate noise and ground vibrations, disturb habitat, and create other disturbances associated with human presence.

The use of heavy equipment under Alternative 6 would create the potential for wildlife injuries or death, and could cause wildlife to relocate or avoid the area and could cause breeding birds to abandon their nests or avoid using the immediate area. New construction may require some tree removal; removing potentially occupied habitats such as mature conifer and hardwood trees, hollowed-out trees, or snags could affect breeding bats or birds by removing nests or roosts and could

result in the harassment of adults from active nests or roosting sites located in the vicinity. Tree removal would be minimized through site design, and, if possible, older trees and snags would be retained for habitat. Although the disturbance would be temporary, species mortality, loss of reproductive potential, or abandonment of breeding sites would have an adverse impact on local special status bird and bat populations in particular. With the implementation of mitigation measures such as surveying potential habitat prior to construction (especially during important breeding seasons), noise and visual disturbances to special status wildlife would be minimized or avoided. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of vegetation, where possible, would reduce these short-term impacts to minor and adverse.

Biological resource surveys have identified suitable habitat (elderberry shrubs) in the El Portal area for valley elderberry longhorn beetle. Approximately 124 elderberry plants of a size sufficient to support the Valley elderberry longhorn beetle occur in areas of potential development or management activities in El Portal. Valley elderberry longhorn beetle exit holes that verify beetle activity were found in 11 of these elderberry plants, though beetle larvae could still be present in elderberry plants without exit holes. Actions in Segment 4, including moving temporary housing units to El Portal and development at the Abbieville and Trailer Village, would result in potential indirect or direct impacts on elderberry shrubs, including removal of shrubs. Approximately 37 elderberry plants were documented within potential areas of ground disturbance, seven with exit holes. Complete impact avoidance would not be possible for these plants. The infill in El Portal would affect up to nine elderberry shrubs with stems greater than one inch in diameter. The development at Abbieville would affect up to 16 shrubs, while the development at Trailer Village would affect up to 12 shrubs. Direct or indirect impacts on valley elderberry longhorn beetle habitat would result in local, long-term, minor, adverse impacts on this beetle species. If these actions were to result in direct or indirect impacts on valley elderberry longhorn beetle habitat, the NPS would implement avoidance and mitigation measures outlined in the 1999 USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (mitigation measure MM-WL-4, as applicable; see Appendix C).

Vegetation removed under Alternative 6 would not substantially fragment existing native vegetation communities, reduce species diversity, or substantially reduce the overall size or quality of native plant communities in Segment 4 because new construction would primarily occur in or adjacent to previously disturbed locations or in more resilient, upland habitat. The NPS would avoid special status plant species during construction activities.

**Segments 3 and 4 Impact Summary:** Overall, actions in Segments 3 and 4 under Alternative 6 would result in local, long-term, minor, beneficial impacts on most special status species.

Actions in Segments 3 and 4 under Alternative 6 would have no effect on the following federally listed and candidate species: Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, Pacific fisher, Sierra Nevada bighorn sheep, and whitebark pine.

It is the determination of the NPS that the actions proposed in Segment 4 under Alternative 6 may affect, and are likely to adversely affect, the valley elderberry longhorn beetle.

## **Segments 5– 8: South Fork Merced River**

### ***Impacts of Actions to Protect and Enhance River Values***

Actions specifically targeted to protect culturally sensitive areas in Segment 7 would also benefit special status species, including the relocation or removal of some campsites and stock campground sites within 100 feet of the river or in culturally sensitive areas. The removal of selected campsites within the floodplain would result in local, long-term, minor, beneficial impacts on special status species as riparian habitat is restored and wildlife are subject to less human presence and human-related pressures.

**Biological Resource Actions.** Specific projects to protect and enhance the river’s biological values that would occur within Segment 7 under Alternative 6 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. Overall, this action would result in a local, long-term, minor, beneficial impact on special status species in Segment 7.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Under Alternative 6, Wawona stables operations would be eliminated and two stock campsites would be relocated to the stables area from the current Wawona stock camp. In the Wawona Campground, 13 campsites would be removed from within 100 feet of the South Fork Merced River or from cultural sites, and the area would be restored. Soils would be decompacted, and the area would be replanted with riparian vegetation. This would reduce visitor use in Segment 7, with a resulting decrease of vegetation trampling.

These actions would result in short-term, adverse impacts on special status wildlife that uses riparian habitat. Adverse impacts include noise associated with demolition, removal, and restoration activities; ground disturbance; human presence; habitat modification; and potential increase in suspended sediments to the South Fork Merced River. Adhering to proposed mitigation measure MM-WL-1 through MM-WL-7, as applicable (see Appendix C), and avoiding the removal of riparian vegetation, where possible, would reduce these short-term impacts to minor and adverse. However, implementation of these actions would reduce the built environment within Segment 7, restore riparian habitat, and reduce riverbank erosion.

As summarized in the “Wildlife” section of this chapter, a total of three acres of riparian habitat would be restored in Segment 7 under Alternative 6 (this includes restoration actions common to Alternatives 2-6), resulting in direct benefits to wildlife that use this habitat type. Thus, this restoration action would be expected to have a local, long-term, moderate, beneficial impact on special status wildlife species that use riparian habitats in Segment 7 (WHR: montane riparian). Special status wildlife species that may benefit from these actions over the long-term include long-eared owl and yellow warbler.

Special status plants may be adversely affected in the short term by removal, restoration, and monitoring activities associated with these management actions. Potential impacts include temporary disturbance and loss of habitat, potential loss of individual plants or populations, and the potential introduction and spread of invasive nonnative species. These impacts would be local. Adhering to proposed mitigation measure MM-WL-3, as applicable (see Appendix C), and avoiding the removal of

vegetation, where possible, would reduce these short-term impacts to minor and adverse. Overall, actions in Segment 7 under Alternative 6 would result in local, long-term, negligible, beneficial impacts on special status plants that occur in the Wawona area.

**Wawona Campground.** Facilities actions at the Wawona Campground would involve removal of 13 sites that are either within the 100-year floodplain or in culturally sensitive areas. Overall, these actions would result in a local, long-term, minor, beneficial impact on special status species in Wawona.

**Segments 5, 6, 7 and 8 Impact Summary:** Overall, actions in Segments 5-8 under Alternative 6 would result in local, long-term, minor to moderate, beneficial impacts on special status species.

Actions in Segments 5-8 under Alternative 6 would have no effect on the following federally listed and candidate species: valley elderberry longhorn beetle, Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, Sierra Nevada bighorn sheep, and whitebark pine.

Actions in Segments 5-8 under Alternative 6 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Pacific fisher.

### **Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Past development and human activity in the Merced River corridor have in some cases adversely affected special status species habitat and use of those habitats. As described in the preceding paragraphs, many of the actions under Alternative 6 would address existing adverse impacts on habitats for special status species, including actions targeted to improve habitat quality for aquatic, riparian-dependent, and meadow-dependent special status species where these habitats are near or adjacent to existing developments and high visitor use areas. Additionally, the park would implement measures to restore the ecological integrity of riparian, meadow, and aquatic habitat in targeted areas; increase channel free flow; improve water quality; and reduce erosion and scouring. Notable actions the park would implement under Alternative 6 include the following:

- Restrict recreational use of rivers and riverbanks to reduce riverbank erosion.
- Remove, restore, relocate, or repurpose park facilities to efficiently use park facilities and reduce the built environment within the park; some facilities would be built to accommodate visitors or employees.
- Manage for an increase (4%) in total daily visitors to the park and visitor demands for day parking space, lodging, and camping space.
- Remove selected facilities within 100 feet of the Merced River and restore riverbanks, meadows, and riparian habitat.
- Enhance meadow, riparian, and river hydrologic function, complexity, and connectivity.
- Improve the free flow, complexity, and water quality of the Merced River.

Generally, Alternative 6 would be focused on restoration of meadow, riparian, and riverbank habitats in Yosemite Valley (Segment 2); retaining most park facilities but removing selected facilities that are located within 100 feet of the river and are jeopardized by flooding; repurposing park facilities to improve efficiency of use; and providing adequate lodging, camping, and parking space for visitors and employees. Additionally, the park would continue to provide river access to visitors in designated areas, and continue to protect the river and riverbanks by requiring permits or limiting use of put-in areas. Alternative 6 would allow for an increase in total daily visitations to the park, and park infrastructures (lodging, camping space, and parking lots) would be retained or expanded in selected locations to accommodate increased demand. Adverse effects from these actions would be associated with the active construction or restoration phase and would be local, short term, and negligible to moderate, depending on the type of project and location. Although some habitat would be restored and fragmentation and indirect detriments to habitat would be reduced in selected areas, an increase in park visitors accompanied by continued operation of most park facilities and construction of new facilities would result in adverse impacts on special status species. When combined, the long-term effect of these measures would be a moderate, beneficial impact on special status species. These effects would be most prominent in areas of high human use such as Yosemite Valley and Wawona (Segments 2 and 7, respectively).

Overall, there would be a lessened potential for beneficial effects under Alternative 6 compared with Alternative 2 and a slightly lessened beneficial effect compared with Alternatives 3 and 4. However, there would be a somewhat increased potential for adverse impacts over Alternatives 2 and 3, and about the same adverse impact potential compared with Alternatives 4 and 5 because more new construction would occur in and adjacent to suitable special status species habitat.

Implementation of a comprehensive ecological restoration program to restore natural processes to the Merced River corridor, and extensive site-specific restoration, would result in a corridorwide, long-term, moderate, beneficial impact on special status species habitat. In the long term, these measures would improve hydrologic connectivity of meadows and floodplains to the river; enhance habitat complexity in riparian, meadow and aquatic areas; reduce human and pack-related disturbances; and reduce nonnative species and conifer intrusion into sensitive habitats. Adverse effects related to the construction phase of these actions would be local, short term, and minor or negligible.

Actions under Alternatives 6 would have no effect on the following federally listed and candidate species: Sierra Nevada bighorn sheep and whitebark pine.

Actions under Alternative 6 may affect, but would not be likely to adversely affect, the following federally listed and candidate species: Yosemite toad, Sierra Nevada yellow-legged frog, California wolverine, and Pacific fisher.

Actions in Segment 4 under Alternative 6 would result in potential indirect or direct impacts on elderberry shrubs, including possible removal of shrubs. Direct or indirect impacts on valley elderberry longhorn beetle habitat would result in local, long-term, minor, adverse impacts on this beetle species. Therefore, it is the determination of the NPS that the actions proposed may affect, and are likely to adversely affect, the valley elderberry longhorn beetle.

**Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

The past, present, and reasonably foreseeable plans and projects that could have a cumulative impact on special status species in combination with Alternative 6 are the same as those listed under Alternative 1 (No Action).

***Overall Cumulative Impact from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

The restoration actions associated with Alternative 6 would generally result in segmentwide, minor to long-term, moderate, beneficial impacts on special status species habitats within the Merced River corridor, with the exception of valley elderberry longhorn beetle. These actions are focused on restoring and improving aquatic, meadow, and riparian habitat quality within the Merced River corridor; therefore, special status species that are associated with these habitat types are most likely to be affected cumulatively by the proposed actions. Actions that would retain current facilities or services and construct new facilities would generally contribute to adverse impacts on special status species in the river corridor over the long term. Because actions with Alternative 6 would allow for higher levels of total daily visitors to the park, more park facilities and services would be retained within the floodplain of the river. Additionally, new or extended parking spaces and campsites would be constructed to accommodate increase in visitor demand for day parking and camping opportunities. The past, present, and future actions in the region would have varying effects on special status species habitats, with some projects restoring or enhancing habitats, while many other projects would result in loss or decline.

In general, past actions have impaired and reduced the abundance and quantity of aquatic, meadow, and riparian habitats in the region. These past actions, especially at lower elevations from development and resource extraction, have resulted in a reduction in special status species populations and ranges. Present and reasonably foreseeable future actions also have the potential to further reduce or impair these habitat types; however, in general, potential effects on these habitat types are mitigated and/or compensated through habitat preservation and/or enhancement at an off-site location (including mitigation banks). These actions provide the most benefit when coordinated with larger, regional conservation strategies that protect intact corridors or provide linkages to other areas of suitable habitat. Because the actions proposed under Alternative 6 would increase the habitat value of the Merced River corridor in certain areas and reduce habitat values in others, these actions would contribute towards a cumulative minor, adverse effect on special status species.

Special status species and their habitats have been manipulated by human development and population growth throughout the region for decades, and these actions have negatively influenced the populations and ranges of special status species. The cumulative effects of past, present, and future reasonably foreseeable cumulative effects would be mixed, combining both adverse and beneficial effects. Cumulative beneficial effects on special status species include habitat restoration, enhancement projects, and ecosystem management, generally carried out by federal, state, and local public agencies as well as privately owned and managed conservation lands, open space, and mitigation banks. Adverse cumulative adverse effects would be related to increased facilities, regional growth, and visitor demand. Each of the aforementioned projects has the potential to have substantial

site-specific adverse effects on special status species during construction (short term) and by direct displacement of populations or habitat (long term).

The actions under Alternative 6 would have long-term, beneficial effects on special-status species in the Merced River corridor. However, in relation to past, present, and reasonably foreseeable future actions throughout the Sierra Nevada and larger region, (e.g., introduction and spread of nonnative species, direct displacement of habitat) the actions under Alternative 6 would have a minimal beneficial effect. Overall, in conjunction with actions proposed in Alternative 6, cumulative actions on special status species would result in long-term, adverse effects on special status species.

## Lightscapes

### *Affected Environment*

#### Scope of the Analysis

The National Park Service (NPS) defines lightscapes as “natural resources and values that exist in the absence of human-caused light” (NPS 2006). This section addresses the lightscape environment across the Merced River and South Fork Merced River corridors within Yosemite National Park. Particular attention is paid to existing sources of artificial lighting and their implications for the lightscape environment. River segments with similar types of developments and sources of lighting are discussed together.

#### Regulatory Framework

##### *NPS Management Policies 2006*

The *NPS Management Policies 2006* set forth specific measures overseen by the park superintendent for the preservation of natural lightscapes in an effort to “minimize light that emanates from park facilities, and also seek the cooperation of park visitors, neighbors, and local government agencies to prevent or minimize the intrusion of artificial light into the night scene of the ecosystems of parks” (NPS 2006). These policies commit the NPS to protecting natural darkness and other components of natural lightscape within parks. To achieve the dual goal of providing for visitor safety and management of natural lightscapes, section 4.10 of the NPS management policies direct the park to:

- Restrict the use of artificial lighting in parks to those areas where security, basic human safety, and specific cultural resource requirements must be met.
- Use minimal-impact lighting techniques.
- Shield the use of artificial lighting where necessary to prevent the disruption of the night sky, natural cave processes, physiological processes of living organisms, and similar natural processes (NPS 2011c).

#### Overview

The national park system includes some of the few places where views of the night sky remain in-tact and relatively unimpeded by the glare of urban night lighting. The enjoyment and appreciation of these natural lightscapes depend on many factors, including the weather, the clarity of the air, and the amount of light pollution present. Light pollution is of particular concern in national parks; nearly every park in the national park system is affected by some level of artificial light in the night sky (DURISCOE 2005). Nationwide, the glare and “sky glow” from urban areas are encroaching on dark skies in areas normally considered remote, including within the Sierra Nevada region.

The NPS considers natural lightscapes as an intrinsic natural and cultural value of all parks; therefore, the protection of lightscapes has been added to the responsibilities of park managers. While natural

lightsapes are recognized as a critical component of ecological processes, the night sky is also considered a critical part of cultural heritage in national parks and, in at least one case, the night sky has been designated by a state legislature as an endangered historic resource (Rogers and Sovic 2001). In addition, night sky visibility is an important aesthetic component of wilderness values.

### **Measuring Dark Night Skies in Yosemite National Park**

In 2001, a model developed jointly by the NPS and the National Oceanic and Atmospheric Administration was used to evaluate the effects of light pollution on areas administered by the NPS for the purpose of protecting night sky visibility. This was a nationwide model that built upon previous efforts to distinguish the effects of artificial sky glow from cities and naturally occurring sky glow (e.g., moonlight). The results were calibrated by comparing the expected amount of light pollution for various locations with actual observations. According to the results of this model, about two-thirds of Yosemite National Park is at or near pristine conditions for dark night skies, while in the remaining one-third of the park, primarily the western portion, light pollution is affecting night sky quality (Albers and Duriscoe 2001).

The model was not calibrated to a level that would distinguish among segments of the Merced River corridor, but generally this would equate to near pristine conditions for the upper reaches of the river's main stem and the South Fork Merced River (i.e., Segments 1 and 5), with potential night-sky impacts detectable along the lower reaches (i.e., Segments 2, 3, 4, and 7 downstream). More localized data collection would be necessary to confirm the model's implications for the study area.

To effectively manage night skies as a resource in parks, the NPS Night Sky Team was formed in 2000 to measure and inventory night skies in parks across the nation. The Night Sky Team has developed a system for measuring sky brightness to quantify the source and severity of light pollution. This system, developed with assistance from professional astronomers and the International Dark-Sky Association, utilizes a research-grade digital camera to capture the entire sky with a series of images. Since the development of this system, inventories of night sky quality have been conducted at several parks; these night sky baseline assessments are intended to form the foundation for a monitoring program to detect long-term changes in the parks' lightscape environments.

In August and September 2005, the Night Sky Team took sky quality measurements in the park from Sentinel Dome, located west of Glacier Point on the rim of Yosemite Valley, and Pothole Dome, on the west end of Tuolumne Meadows. The results of visual observation and measurements indicate that artificial light seen from Sentinel Dome is significantly brighter than Pothole Dome. The Night Sky Team assessment indicated that sources of light pollution at both Sentinel Dome and Pothole Dome include Fresno, the Modesto/Stockton/Sacramento area, and the Reno/Carson City area. However, overall, the darkest park of the sky as viewed from Pothole Dome was observed to be "very dark," with near pristine conditions, while the darkest part of the sky at Sentinel Dome was 0.2–0.3 orders of magnitude brighter (DURISCOE 2005).

## Lighting Guidelines

While the majority of light pollution seen in national parks radiates from population centers outside park boundaries, the NPS recognizes that artificial lighting within parks may have a detrimental effect on natural lightscapes, as well. Yosemite National Park has worked with the park concessioner to develop, refine, and implement lighting guidelines for the park. These guidelines are intended to balance the safety and security of employees and visitors, universal accessibility, and the scientific and aesthetic importance of the natural lightscape that NPS is obligated to protect.

The focus of the current parkwide lighting guidelines includes Yosemite Valley and other heavily used portions of the park; there are no lighting guidelines specific to the Merced Wild and Scenic River corridor. These guidelines divide the park into nonwilderness areas, where visitor services are concentrated, and wilderness areas, which are managed and maintained as natural areas and visitors have to assume a certain degree of risk and responsibility for their own safety.

Nonwilderness areas, such as Yosemite Valley, El Portal, and Wawona, are lighted for safety, security, and accessibility in accordance with the following NPS principles: warrant light only where needed, control light only when needed, shield direct light downward, manage the light spectrum by selecting a lamp color that minimizes negative impacts, manage light intensity by using the minimum amount of light necessary, and ensure light efficiency by selecting the most energy efficacious lamp and fixture. In addition to these principles, the lighting guidelines apply effective use of good design in areas of development to minimize or eliminate light clutter.

In some wilderness areas, electric lighting may be used but only as determined necessary on a case-by-case basis by the NPS. Where artificial lighting is present, lighting guidelines are intended to prevent both light pollution and light trespass, primarily using structural means to control light and cast light downward, as noted in the light principles above. As a secondary measure, power limits (in the form of low lamp wattage) are set on all lamp types to minimize inadvertent light trespass or pollution. By applying these measures, light pollution, energy waste, and diminished visitor experience stemming from undesired light spillover would be prevented through proper NPS lightscape management (NPS 2011c).

## The Lightscape Environment within the Merced River Corridor

### *Segments 1, 5, and 8: Merced River Above Nevada Fall, and South Fork Merced River Above and Below Wawona*

Lightscapes in designated wilderness areas are dominated by natural sources of light and dark night skies. Within Segment 1, artificial lighting would be concentrated around the Little Yosemite Valley, Merced Lake Backpackers, and Moraine Dome campgrounds, as well the 60-unit Merced Lake High Sierra Camp. Campground lighting would generally include hand-held torches, lanterns, and campfires. Lighting sources around the Merced Lake High Sierra Camp would be similar to that of the campgrounds, with the additional glow of the camp's interior operational lighting. Similarly, hand-held torches, lanterns, and campfires tend to be the main sources of lighting in Segments 5 and 8, with the occasional flash of a vehicle headlight from a road or turnout within an adjacent nonwilderness area.

*Segment 3 and 6: Merced River Gorge and Wawona Impoundment*

In the Merced River Gorge and Wawona Impoundment areas (i.e., Segments 3 and 6), lightscapes are defined largely by natural sources and dark night skies. The main source of artificial night lighting within the gorge segment is from automobile headlights along Highway 140, and from the adjacent developed areas of El Portal and Yosemite Valley. At the impoundment, the only potentially detectable sources of night lighting are that of the community of Wawona and nearby Camp Wawona, described below, which are more than 0.5 mile away.

*Segments 2, 4, and 7: Yosemite Valley, El Portal, and Wawona*

Yosemite Valley, El Portal, and Wawona host the greatest concentrations of development within the park, and thus the greatest amount of artificial night lighting. Sources of light pollution within these areas include utility lamps, shaded pathway lights, spot and other exterior lights, illuminated signs, decorative architectural lights, the glow of interior lights, fluorescent service station signs, automobile headlights, and campfires. Within Segments 2, 4, and 7, lighting is most intense in existing developed areas. For example, within Segment 2, nighttime lighting is most visible within the housing and lodging areas of Curry Village, The Ahwahnee, and the Yosemite Lodge complex. Lighting within lesser developed areas, such as Housekeeping Camp and East Valley campgrounds, is also considerable, but less pronounced than in the aforementioned areas (NPS 2010e). More specific information about the facilities and infrastructure with which such lighting is associated include administrative and housing developments described in the “Park Operations and Facilities” section; the lodging units, campgrounds, and associated infrastructure described in the “Visitor Experience/Recreation” section; and the parking lots and vehicles on roadways described in the “Transportation” section.

*Environmental Consequences Methodology*

The lightscapes impact assessment evaluates how the plan would affect the dark night skies in the Merced River corridor. Impacts were evaluated in terms of their context, intensity, and duration, and whether the impacts were considered beneficial or adverse.

- **Context.** The context of the impact considers whether the impact would be local or regional. For the purposes of this analysis, local impacts would be those that occur within Yosemite National Park or impacts specific to the Merced River corridor. In considering lightscape impacts, it is assumed that impacts would be consistently local.
- **Intensity.** The intensity of the impact considers whether the impact would be negligible, minor, moderate, or major. Negligible impacts would be considered not detectable, with no discernible effect on the ambient lightscape environment. Minor impacts would be slightly detectable but not expected to have an overall effect on conditions. Moderate impacts would be clearly detectable and could have an appreciable effect. Major impacts would have a substantial, highly noticeable influence on the ambient lightscape environment.
- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term. A short-term impact would be temporary in duration or transitory in effect, such as light from passing vehicles. A long-term impact would have a permanent effect on the ambient lightscape environment.

- **Type of Impact.** Impacts are evaluated in terms of whether they would be beneficial or adverse to the ambient lightscape environment. Beneficial impacts would reduce associated levels of light, while adverse impacts would have the opposite effect.

### ***Environmental Consequences of Alternative 1 (No Action)***

The lightscapes impact assessment involves the identification and qualitative description of the types and characteristics of actions proposed under each alternative that could affect the lightscape environment and dark night skies of the Merced River and South Fork Merced River corridors. The examination of effects is limited to sources of light within the park, focused on the location of facilities and operational features that produce light.

Although sky glow radiating from population centers on either side of the Sierra Nevada affects dark night skies in the river corridor, the plan alternatives would have no effect on the regional sources of this impact; therefore, this is not addressed as part of the environmental consequences of the plan. As stated under “Affected Environment,” above, sky glow is more evident in the lower reaches of the river corridor, closer to the major population centers in California. Growth in the region would be expected to increase this adverse effect on lightscapes in the river corridor.

The lightscapes impact assessment evaluates how changes resulting from the plan’s management measures would affect the dark night skies in the corridor. Impacts are evaluated in terms of their context, intensity, and duration, and whether the impacts would be beneficial or adverse. Alternative 1 (No Action) assumes the continuation of lightscape management under NPS *Management Policies 2006* and other existing policies that could influence lighting decisions. In addition, the park recently completed parkwide lighting guidelines, as described in the “Lighting Guidelines” subsection above, and is presently working with the park concessioner on their implementation. While new sources of lighting or modifications to existing sources could occur under Alternative 1 (No Action), none is proposed. However, through continued implementation of the Lighting Guidelines, NPS will improve the park’s dark night skies. Lightscapes within the corridor are and will continue to be influenced by the level of development within each river segment. As such, the following paragraphs analyze the implications of Alternative 1 on groups of segments with similar development and sources of lighting.

#### **Segments 1, 5, and 8: Merced River Above Nevada Fall, and South Fork Merced River Above and Below Wawona**

Lightscapes in designated wilderness areas (i.e., Segments 1, 5, and 8) would continue to be dominated by natural sources of light and dark night skies. Sources of night lighting within Segments 1, 5, and 8 would continue to include campfires and occasional vehicle headlights from adjacent, nonwilderness areas (primarily within the South Fork Merced River segments). Artificial lighting associated with operation of the Merced Lake High Sierra Camp and nearby wilderness campgrounds would also continue to affect the lightscape within Segment 1. There are no actions proposed under Alternative 1 that would explicitly affect lighting within Segments 1, 5, and 8. Overnight visitation within these wilderness areas would be expected to remain similar to that of present conditions. As a result, the long-term impacts of Alternative 1 on the lightscape environment within Segments 1, 5, and 8 would be local, negligible to minor, and adverse.

### **Segments 3 and 6: Merced River Gorge and Wawona Impoundment**

In the Merced River gorge and Wawona Impoundment areas (i.e., Segments 3 and 6), lightscape would continue to be defined by natural sources and dark night skies. The main source of artificial night lighting within the gorge would continue to be automobile headlights on Highway 140. At the impoundment, the potentially detectable sources of night lighting would continue to originate within Wawona and nearby Camp Wawona. Increased visitation could result in a relatively minor increase in transient night lighting from greater numbers of cars traveling through Segment 3, or from exterior safety lighting in Wawona, adjacent to Segment 6. However, nighttime visitation or development within these areas would not be expected to increase substantially with time. As a result, Alternative 1 would have a local, long-term, negligible, adverse effect on the lightscape environment within Segments 3 and 6.

### **Segments 2, 4, and 7: Yosemite Valley, El Portal, and Wawona**

Yosemite Valley, El Portal, and Wawona (i.e., Segments 2, 4, and 7) would continue to host the greatest concentration of development within the park, and thus the greatest amount of artificial night lighting. Sources of night lighting within these areas would continue to include utility lamps, bus stations, shaded pathway lights, spot and other exterior lights, illuminated signs, decorative architectural lights, the glow of interior lights, fluorescent service station signs, automobile headlights, and campfires. Within Segments 2, 4, and 7, such lighting would continue to be most intense around those existing developed areas, as described under “Affected Environment” above, including administrative and housing facilities, lodging and campground operations, and parking lots and roadways. No new substantial sources of night lighting are anticipated under Alternative 1. However, with increased visitation, potential sources of additional lighting within the park could include those associated with increased nighttime traffic and greater numbers of overnight campground visitors during nonpeak seasons. The long-term implications for the park’s lightscape environment in Segments 2, 4, and 7 would be local, negligible to minor, and adverse.

### **Summary of Alternative 1 (No Action) Impacts**

Lightscape in designated wilderness areas (i.e., Segments 1, 5, and 8) would not be expected to change over time under Alternative 1 (No Action). In-park sources of light pollution, including occasional campfires, vehicle headlights, and artificial lighting in Little Yosemite Valley and Merced Lake High Sierra Camp, would remain in these wilderness areas. In the areas between the wilderness and more developed areas (i.e., Segments 3 and 6), lightscape would continue to be characterized by near pristine conditions, similar to wilderness areas, but with occasional intrusion of night lighting from passing vehicles or nearby developments. In the more developed areas of the corridor (i.e., segments 2, 4, and 7), lightscape would continue to be shaped by local artificial lighting along roads, housing and administrative facilities, and visitor service areas. The continuation of present visitation trends, and the associated increased nighttime traffic and overnight campground visitors during nonpeak seasons could result in an increase in parkwide night lighting, especially in areas of existing development. As a result, implementation of Alternative 1 could have local, long-term, negligible to minor, adverse impacts on lightscape within the nonwilderness segments of the Merced River and South Fork Merced River corridors.

## ***Environmental Consequences of Actions Common to Alternatives 2–6***

### **Segments 3 and 6: Merced River Gorge and Wawona Impoundment**

There are no actions proposed for Alternatives 2–6, or any individual alternative, that would impact the lightscape environment within Segments 3 and 6. As a result, these segments are not discussed further within this section.

### **Segments 2, 4, and 7: Yosemite Valley, El Portal, and Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternatives 2–6, the park would remove from Segment 2 all campsites within the 100-year floodplain. The park would also remove campsite 208 sites at Upper Pines Campground. These actions would have a local, long-term, negligible, beneficial impact on park lightscares as the sources of night lighting associated with these sites (e.g., campsite facilities, campfires, vehicle headlights, camping lanterns) would be removed or relocated away from the center of the Merced River corridor.

The park would also remove from Segment 7 a total of seven campsites from the area around archeological site CA-MRP-168/329/H (A.E. Wood Campground). For the same reasons noted for Segment 2, these actions would have a local, long-term, negligible, beneficial impact on park lightscares.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitor use management and facilities actions that could affect Yosemite Valley lightscares stem from changes to employee housing, camping, parking, and administrative facilities. The lightscape environment of the East Valley and The Ahwanhee would be affected through increased overnight visitation and associated vehicle headlights at new campsites west of Backpackers Campground (16) and east of Camp 4 (40), and an expanded parking area at The Ahwahnee. As shown in **table 9-120**, a net reduction in Curry Village housing, including the removal of temporary housing at Huff House and Boys Town, would substantially reduce sources of artificial lighting in these areas.

Expanded parking at Curry Village could increase artificial lighting through overhead lighting and/or from the headlights of greater numbers of vehicles within the area after sunset. Removal of the Village Garage, Concessioner General Offices, and Arts and Activities Center would improve the valley's lightscape environment, particularly in the vicinity of Yosemite Village. Within the Yosemite Lodge area, the construction of a new parking lot and expansion of campgrounds would increase nighttime lighting associated with these facilities. However, the lightscape environment in these areas would also be improved through elimination of housing at Highland Court and the 1,000s cabins, as well as the NPS Volunteer Office and post office.

Under Alternatives 2–6, the park would also construct infill housing units within the Rancheria area of Segment 4. These structures would affect park lightscares in the vicinity of El Portal Village. In Wawona, the park would develop new facilities to house roads, maintenance, and fire-fighting operations. These facilities would be constructed in the area of the existing Maintenance Yard and have an adverse impact on the lightscape environment in this area.

**TABLE 9-120: ALTERNATIVES 2-6 – CONCESSIONER EMPLOYEE HOUSING**

	Residential Units Removed	New Residential Units	Total Change in Residential Units
Curry Village	310	164	-146
Yosemite Lodge	90	0	-90
<b>Total Yosemite Valley</b>	<b>400</b>	<b>164</b>	<b>-236</b>
Rancheria	0	12	12
<b>Total El Portal</b>	<b>0</b>	<b>12</b>	<b>12</b>

Removal of administrative and visitor-serving facilities, campsites, and temporary housing would eliminate from the corridor numerous sources of nighttime lighting, specifically those associated with residential and administrative structures, and to a lesser extent, campgrounds. These actions would result in a net reduction in nighttime lighting and a corresponding long-term, negligible to minor, beneficial impact on the Merced River corridor's lightscape environment. Construction of new facilities would have a detrimental effect on park lightscapes, mainly in the areas of the Yosemite Lodge, El Portal, and the Wawona Maintenance Yard. However, because these areas are already somewhat developed, and any new or modified exterior lighting fixtures would be required to comply with the park's lighting guidelines and nighttime construction restrictions — incorporated by reference herein as mitigation measures MM-LITE-1 and -2 (see Appendix C) — the impact of these actions in Segments 2, 4, and 7 would be local, long-term, negligible to minor, and adverse.

### Summary of Impacts Common to Alternatives 2–6

The removal of campsites, commercial visitor-serving facilities, and temporary employee housing would result in a beneficial impact on the lightscape environment, as these actions would remove human-caused sources of lighting from the Merced River corridor. The construction of new employee housing within Segments 2 and 4, and new administrative facilities in Segment 7, would introduce new sources of artificial lighting into these areas. However, due to the scale of these activities, and with mitigation measures implemented, the overall impact on park lightscapes would be local, negligible, and beneficial.

### *Environmental Consequences of Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration*

#### Segment 1: Merced River Above Nevada Fall

##### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Visitation within Segment 1 would be reduced through a decrease in the Little Yosemite Valley trailhead quota (from 150 to 25). This could improve the lightscape environment within Segment 1 by limiting the number of overnight visitors to the area, thereby reducing potential sources of artificial night lighting associated with that type of use (e.g., campfires). In addition, removal of the Merced Lake High Sierra Camp would eliminate sources of nighttime lighting in the vicinity of the camp,

including those associated with operation of the camp, such as fixtures around common areas and the exterior glow of internal lighting. Modifications to existing campgrounds would result in a further reduction in overnight visitation within Segment 1. As with removal of the Merced Lake High Sierra Camp, such modifications would result in a corresponding decrease in sources of nighttime lighting within these areas of Segment 1. The associated impact on the lightscape environment of Segment 1 would be local, long-term, minor, and beneficial.

**Segment 1 Impact Summary:** Actions to Manage user capacity, land use, and facilities would have a local, long-term, minor, beneficial impact on the lightscape environment of Segment 1.

## **Segments 2, 4, and 7: Yosemite Valley, El Portal, and Wawona**

### ***Impacts of Actions to Protect and Enhance River Values***

Specific Alternative 2 restoration projects that would occur within Segment 2 and have the potential to affect the Merced River corridor's lightscape environment include removal of portions of Northside Drive and Southside Drive. Road removal would have a beneficial impact on the park's lightscape environment within the vicinity of Ahwahnee and Stoneman meadows, as associated vehicle headlight impacts would be eliminated. However, the rerouting of traffic onto other roads would increase the incidence of vehicle-related night lighting along existing roadways that already experience such impacts. In the short-term, local, negligible, adverse impacts in Segment 2 may result from increased nighttime lighting of these construction areas to ensure safety. The long-term net effect of these projects would be local, negligible, and beneficial.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 2, specifically those concerning vehicle access and the number of overnight accommodations, would contribute to a 26% reduction in overnight visitation within the Yosemite Valley. As discussed in the context of specific management actions below, this reduction would effect a decrease in valley-wide nighttime lighting through the corresponding reduction in vehicles, lighted parking lots and lodging units and facilities to serve after-hours and overnight park visitors.

As shown in **table 9-121**, a substantial number of campsites would be relocated within Segment 2. These modifications would increase sources of nighttime lighting, such as campfires and vehicle lighting in some areas (i.e., Yosemite Lodge and Camp 4 areas), while decreasing it in others (i.e., Lower Pines, North Pines, Upper Pines, and Backpackers Campgrounds). Despite these adjustments, the total reduction in the number of campsites within Segment 2 would still be nominal and not have an appreciable effect on the lightscape environment within Segment 2.

As discussed in *Environmental Consequences of Actions Common to Alternatives 2–6*, and shown in **table 9-122** the lightscape environment within Segment 2 would benefit from a substantial reduction in housing at Curry Village and the Yosemite Lodge areas, and Tacoya Dorms, among others, by eliminating the exterior glow of interior lighting, the need for outdoor lighting, and reduced vehicle traffic.

**TABLE 9-121: ALTERNATIVE 2 CAMPGROUND MODIFICATIONS**

Location	Campsites (Alternative 2)	Campsites (Alternative 1)	Change from Alternative 1
Yosemite Lodge and Camp 4 Areas	174	35	139
Former Upper & Lower River Campground Areas	0	0	0
Boys Town and Upper Pines Campground Areas	216	240	-24
Lower Pines Campground Area	44	76	-32
North Pines and Backpackers Campgrounds and Curry Village Stables Areas	16	111	-95
Eagle Creek and Yellow Pine Administrative Campgrounds	0	4	-4
<b>Yosemite Valley Totals<sup>a</sup></b>	<b>450</b>	<b>466</b>	<b>-16</b>
Wawona	67	99	-32
<b>Wawona Total</b>	<b>67</b>	<b>99</b>	<b>-32</b>

**TABLE 9-122: ALTERNATIVE 2 CONCESSIONER EMPLOYEE HOUSING AND VISITOR LODGING**

Location	Total Residential Units under Alternative 2	Change in Residential Units from Alternative 1	Total Visitor Lodging Units under Alternative 2	Change in Visitor Lodging Units from Alternative 1
Yosemite Village	65	-366	0	0
The Ahwahnee	42	-6	123	0
Curry Village	387	-195	433	33
Yosemite Lodge	0	-90	0	-245
Housekeeping Camp	0	0	0	-266
<b>Total Yosemite Valley<sup>a</sup></b>	<b>494</b>	<b>-657</b>	<b>556</b>	<b>-494</b>
Rancheria	116	9	n/a	n/a
El Portal Village	92	12	n/a	n/a
Abbieville/Trailer Village	410	405	n/a	n/a
<b>Total El Portal<sup>b</sup></b>	<b>618</b>	<b>426</b>	<b>n/a</b>	<b>n/a</b>

<sup>a</sup> Totals include the 236 residential units that would be removed from the Curry Village and Yosemite Lodge areas of Segment 2 under actions common to Alternatives 2-6.

<sup>b</sup> Totals include the 12 residential units that would be constructed in the El Portal Village area of Segment 4 under actions common to Alternatives 2-6.

Construction of 78 new hard-sided cabins at Curry Village would increase sources of artificial lighting within the Boys Town area, but these impacts would be more than offset from the reduction in housing within this area. Removal of all lodging and facilities from Housekeeping Camp would further reduce artificial lighting within the valley, including the interior cabin lighting, vehicle headlights, and campfires associated with this operation. Conversion of the Yosemite Lodge to day use, despite the proposed

increase in camping and parking within this area, would also improve the natural lightscape environment through elimination of lighting associated with these structures and reduced overnight visitation.

Some of this work, specifically in the vicinity of Housekeeping Camp, Curry Village, Yosemite Village, and Yosemite Lodge – where large numbers of structures would be removed – may require a short-term increase in nighttime lighting of the construction areas to ensure safety. However, over the long-term, the impact on the Segment 2 lightscape environment would be local, major, and beneficial.

Under Alternative 2, the park would construct new housing for 405 employees within the Abbieville area of Segment 4. This project would contribute to area lightscape impacts through an increase in exterior lighting, the glow of interior lighting, and increased vehicle traffic. However, any new or modified exterior lighting would be required to comply with the park's lighting guidelines and nighttime construction restrictions, incorporated by reference herein as mitigation measures MM-LITE-1 and -2 (see Appendix C). With mitigation, the long-term impact on Segment 4 would be local, moderate, and adverse. Within Segment 7, the Wawona stables would be removed and 32 campsites eliminated from the Wawona Campground. The corresponding reduction in overnight visitation within these areas would reduce lightscape impacts. The long-term impact on Segment 7 would be local, negligible, and beneficial.

**Segments 2, 4, and 7 Impact Summary:** Actions to manage user capacity, land use, and facilities would have local, long-term, beneficial impacts on the lightscape environment, ranging from minor to moderate in Segments 2 and 7, and moderate adverse in Segment 4.

### **Summary of Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

Lightscape impacts associated with Alternative 2 management measures would result mainly from changes in park visitation, facilities serving overnight visitors, and employee housing, and generally be limited to Segments 2 and 4. The collective effect of Alternative 2 management actions would cause overnight visitation within the park to decrease. Under Alternative 2, a considerable number of housing and lodging units, as well as visitor-serving facilities, would be removed from Yosemite Valley. The lightscape environment within El Portal would be further affected through the construction of a substantial amount of new employee housing. Nonetheless, overall, existing, and potential future sources of human-caused lighting would be expected to decrease under Alternative 2, resulting in an overall improvement of the park's lightscape environment. For these reasons, the long-term impacts of Alternative 2 on the park's lightscape environment would be local, minor to moderate, and beneficial.

### **Cumulative Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

Cumulative effects on the park's lightscape environment discussed herein are based on analysis of past, present, and reasonably foreseeable future actions in the Merced and South Fork Merced River corridors, in combination with potential effects of actions common to Alternatives 2-6 and those specific to Alternative 2. The projects identified below include only those projects that could affect

park lightscapes within or in the vicinity of the Merced River corridor. Each project is described more fully in Appendix B.

### ***Past Actions***

The following is a list of cumulatively considerable past actions concerning park lightscapes:

- Cascades Housing Removal reduced artificial lighting by eliminating five housing units.
- Removal of housing units as a result of the 1997 flood reduced artificial lighting.
- Curry Village Employee Housing: the construction of 217 new housing units at Curry Village for flood-displaced employees increased artificial lighting.
- Closure of Curry Village units due to rockfall hazard reduced artificial lighting.
- Construction of temporary housing at the Curry Village Huff House for 102 rockfall-displaced employees increased artificial lighting.
- Construction of six temporary housing units at Yosemite Valley Lost Arrow complex for rockfall-displaced employees increased artificial lighting.
- Construction of 12 temporary housing units at The Ahwahnee for rockfall-displaced employees increased artificial lighting.

### ***Present Actions***

The following is a list of cumulatively considerable present actions concerning park lightscapes:

- Completion of the *Mariposa County General Plan* “Housing Element Update” may contribute to increased night lighting if it provides for additional development in the region.
- Implementation of the Yosemite Lighting Guidelines would reduce the impacts of artificial night lighting.
- Relocation of 40 park staff from offices in El Portal to Mariposa may reduce artificial lighting in El Portal.
- Permanent removal of Curry Village units within the rockfall hazard zone (noted above) would permanently reduce artificial night lighting.
- Development of a new Wauhoga Indian Cultural Center would increase artificial night lighting.

### ***Reasonably Foreseeable Future Actions***

The following is a list of cumulatively considerable, reasonably foreseeable future actions concerning park lightscapes:

- Development of the new concessioner prospectus could increase or decrease artificial night lighting, depending upon its terms.

### ***Overall Cumulative Impact***

There are no anticipated development projects outside of those described herein that would contribute to light pollution within the park. Past actions, specifically the construction of housing for employees previously residing in hazard prone areas within Yosemite Valley, have slightly increased the amount of artificial lighting within the park. Present actions may result in regional increases in night-sky impacts, and the introduction of a few new individual sources of lighting within the park, but a continued overall reduction in the impacts associated with in-park lighting. As a result, when combined with the impacts of past and present actions, including those originating from outside the park, the cumulative effect of actions common to Alternatives 2-6 and those specific to Alternative 2 would be local, long-term, minor to moderate, and beneficial.

### ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segment 1 would be reduced through a decrease in the Little Yosemite Valley trailhead quota (from 150 to 75). This could improve the lightscape environment within Segment 1 by limiting the number of overnight visitors to the area, thereby reducing potential sources of artificial night lighting associated with that type of use (e.g., campfires). In addition, removal of the Merced Lake High Sierra Camp would eliminate sources of nighttime lighting in the vicinity of the camp, including those associated with operation of the camp, such as fixtures around common areas and the exterior glow of internal lighting. Modifications to existing campgrounds would result in a further reduction in overnight visitation within Segment 1. As with removal of the Merced Lake High Sierra Camp, such modifications would result in a corresponding decrease in sources of nighttime lighting within these areas of Segment 1. The associated impact on the lightscape environment within Segment 1 would be local, long-term, minor, and beneficial.

**Segment 1 Impact Summary:** Actions to manage user capacity, land use, and facilities would have a local, long-term, minor, beneficial impact on the lightscape environment of Segment 1.

#### **Segments 2, 4, and 7: Yosemite Valley, El Portal, and Wawona**

##### ***Impacts of Actions to Protect and Enhance River Values***

Specific Alternative 3 restoration projects that would occur within Segment 2 and have the potential to affect the Merced River corridor's lightscape environment include removal of portions of Northside Drive and Southside Drive. Road removal would have a beneficial impact on the park's lightscape environment within the vicinity of Ahwahnee and Stoneman meadows, as associated vehicle headlight impacts would be eliminated. However, the rerouting of traffic onto other roads would increase the incidence of vehicle-related night lighting along existing roadways that already experience such impacts. In the short-term, local, negligible, adverse impacts in Segment 2 may occur from increased in

nighttime lighting of these construction areas, if necessary to ensure safety. However, the long-term net effect of these projects would be local, negligible, and beneficial.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 3, specifically those concerning vehicle access and number of overnight accommodations, would contribute to a 23% reduction in overnight visitation within Yosemite Valley. As discussed in the context of specific management actions below, this reduction would affect a decrease in valley-wide nighttime lighting through the corresponding reduction in vehicles, lighted parking lots, lodging units, and facilities to serve after-hours and overnight park visitors.

As shown in **table 9-123**, a considerable number of campsites would be relocated within Segment 2. These modifications would increase sources of nighttime lighting, such as campfires and vehicle lighting in some areas (i.e., Camp 4 area), while decreasing it in others (i.e., Lower Pines, Upper Pines, North Pines, and Backpackers Campgrounds). Despite these adjustments, the total increase in the number of campsites within Segment 2 would still be nominal and not have an appreciable effect on the lightscape environment within Segment 2.

**TABLE 9-123: ALTERNATIVE 3 CAMPGROUND MODIFICATIONS**

	Campsites (Alternative 3)	Campsites (Alternative 1)	Change from Alternative 1
Yosemite Lodge and Camp 4 Areas	70	35	35
Former Upper & Lower River Campground Areas	0	0	0

Lower Pines Campground Area	61	76	-15
North Pines and Backpackers Campgrounds and Curry Village Stables Areas	68	111	-43
Eagle Creek and Yellow Pine Administrative Campgrounds	4	4	0
<b>Yosemite Valley Totals<sup>a</sup></b>	<b>477</b>	<b>466</b>	<b>11</b>
Wawona	72	99	-27
<b>Wawona Total</b>	<b>72</b>	<b>99</b>	<b>-27</b>
<sup>a</sup> Totals include the construction of 16 new sites near Backpackers Campground and 40 new sites near Camp 4 area under actions common to Alternatives 2-6.			

As discussed in *Environmental Consequences of Actions Common to Alternatives 2–6*, and shown in **table 9-124**, the lightscape environment within Segment 2 would benefit from a substantial reduction in housing at Curry Village and the Yosemite Lodge areas. The lightscape environment within Segment 2 would also benefit from the removal of a notable number of housing units from the Yosemite Village area, including the Lost Arrow Cabins, among others, by eliminating the exterior glow of interior lighting, the need for outdoor lighting, and reduced vehicle traffic.

**TABLE 9-124: ALTERNATIVE 3 CONCESSIONER EMPLOYEE HOUSING AND VISITOR LODGING**

Location	Total Residential Units in Alternative 3	Change in Residential Units from Alternative 1	Total Visitor Lodging Units in Alternative 3	Change in Visitor Lodging Units from Alternative 1
Yosemite Village	340	-91	n/a	n/a
Ahwahnee hotel	42	-6	123	0
Curry Village	436	-146	355	-45
Yosemite Lodge	104	14	143	-102
Housekeeping Camp	n/a	n/a	0	-266
<b>Total Yosemite Valley<sup>a</sup></b>	<b>922</b>	<b>-229</b>	<b>621</b>	<b>-413</b>
Rancheria	126	19	n/a	n/a
El Portal Village	92	12	n/a	n/a
Abbieville	0	0	n/a	n/a
<b>Total El Portal<sup>b</sup></b>	<b>218</b>	<b>31</b>	<b>n/a</b>	<b>n/a</b>
<p><sup>a</sup> Totals include the 236 residential units that would be removed from the Curry Village and Yosemite Lodge areas of Segment 2 under actions common to Alternatives 2-6.</p> <p><sup>b</sup> Totals include the 12 residential units that would be constructed in the El Portal Village area of Segment 4 under actions common to Alternatives 2-6.</p>				

Removal of all lodging and most facilities from Housekeeping Camp, and several guest units from Curry Village, would further reduce artificial lighting within the valley, including the interior cabin lighting, vehicle headlights, and campfires associated with this facility. With reduced operation of the Yosemite Lodge and new employee housing and parking in its vicinity, lighting impacts in this area of Segment 2 would remain similar to those of Alternative 1 (No Action).

Some of this work, specifically in the vicinity of Housekeeping Camp, Yosemite Village, and Yosemite Lodge – where large numbers of structures would be removed and/or constructed – may require a short-term increase in nighttime lighting of the construction areas to ensure safety. However, over the long-term, the impact on the Segment 2 lightscape environment would be local, moderate, and beneficial.

Under Alternative 3, the park would construct new housing for 19 employees within the Rancheria area of Segment 4. This project would contribute to area lightscape impacts through an increase in exterior lighting, the glow of interior lighting, and increased vehicle traffic. However, any new or modified exterior lighting would be required to comply with the park's lighting guidelines and nighttime construction restrictions, incorporated by reference herein as mitigation measures MM-LITE-1 and -2 (see Appendix C). With mitigation, the long-term impact on Segment 4 would be local, minor, and adverse. Within Segment 7, the Wawona stables would be removed and 27 campsites eliminated from the Wawona Campground. The corresponding reduction in overnight visitation within these areas would reduce lightscape impacts. The long-term impact on Segment 7 would be local, negligible, and beneficial.

**Segments 2, 4, and 7 Impact Summary:** Actions to manage user capacity, land use, and facilities would have local, long-term, beneficial impacts on the lightscape environment, ranging from minor to moderate in Segments 2 and 7, and minor adverse in Segment 4.

### **Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Lightscape impacts associated with Alternative 3 management measures would result mainly from changes in park visitation, facilities serving overnight visitors, and employee housing, and generally be limited to Segment 2. The collective effect of Alternative 3 management actions would cause overnight visitation within the park to decrease. A considerable number of lodging units would be removed from the valley under Alternative 3, while some new employee housing would be developed in relative proximity to existing developed areas of the valley and El Portal. As a result, it is expected that existing and potential future sources of human-caused lighting would decrease, resulting in an overall beneficial impact on the park's lightscape environment. For these reasons, the long-term impact of Alternative 3 measures on the park's lightscape environment would be local, minor to moderate, and beneficial.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

#### ***Overall Cumulative Impact from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

There are no anticipated development projects outside of those described herein that would contribute to light pollution within the park. As a result, when combined with the impacts of past and present actions, including those originating from outside the park, the cumulative effect of actions common to Alternatives 2-6 and those specific to Alternative 3 would be local, long-term, minor to moderate, and beneficial.

### ***Environmental Consequences of Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segment 1 would be reduced through a decrease in the Little Yosemite Valley trailhead quota (from 150 to 100). This could improve the lightscape environment within Segment 1 by limiting the number of overnight visitors to the area, thereby reducing potential sources of artificial night lighting associated with that type of use (e.g., campfires). With designated camping only slightly reduced, and with retention of several campground facilities, sources of artificial lighting would remain concentrated within these areas of Segment 1. However, the removal and conversion of the Merced Lake High Sierra Camp would eliminate a considerable amount of nighttime lighting in the vicinity of the camp, specifically that associated with operation of the camp, such as fixtures around

common areas and the exterior glow of internal lighting. The resulting impact on the lightscape environment within Segment 1 would be local, long-term, minor, and beneficial.

**Segment 1 Impact Summary:** Actions to manage user capacity, land use, and facilities would have a local, long-term, minor, beneficial impact on the lightscape environment of Segment 1.

## **Segments 2, 4, and 7, Yosemite Valley, El Portal, and Wawona**

### *Impacts of Actions to Protect and Enhance River Values*

Specific Alternative 4 restoration projects that would occur within Segment 2 and have the potential to affect the Merced River corridor's lightscape environment include removal of portions of Southside Drive and campsites from the 150-year floodplain. Road removal would have a beneficial impact on the park's lightscape environment within the vicinity of Stoneman Meadow, as associated vehicle headlight impacts would be eliminated. However, the rerouting of traffic onto other roads would increase the incidence of vehicle-related night lighting along existing roadways that already experience such impacts. In the short-term, local, negligible, adverse impacts in Segment 2 may occur from increased nighttime lighting of road construction areas, if necessary to ensure safety. However, the long-term net effect of these projects would be local, negligible, and beneficial.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Actions to manage visitor use and facilities under Alternative 4, specifically those concerning vehicle access and number of overnight accommodations, would contribute to a 7% increase in overnight visitation within Yosemite Valley. As discussed in the context of specific management actions below, this growth would cause an increase in valley-wide nighttime lighting through the corresponding increase in vehicles, lighted parking lots, lodging units, and facilities to serve after-hours and overnight park visitors.

As shown in **table 9-125**, a substantial number of campsites would be added within Segment 2. These additions would increase sources of nighttime lighting, such as campfires and vehicle lighting in several areas, including the Former Upper and Lower River Campground areas, and Boys Town and Upper Pines Campground areas. This increase would offset lightscape benefits resulting from removal of campsites from Backpackers, Lower Pines, and North Pines campgrounds. The net effect of these changes to the lightscape environment within Segment 2 would be long-term, local, minor, and adverse.

As discussed in *Environmental Consequences of Actions Common to Alternatives 2–6*, and shown in **table 9-126**, the lightscape environment within Segment 2 would benefit from a substantial reduction in housing at Curry Village and the Yosemite Lodge areas. The lightscape environment within Segment 2 would also benefit from the removal of a considerable amount of housing from the Yosemite Village area, including the Lost Arrow Cabins, among others, by eliminating the exterior glow of interior lighting, the need for outdoor lighting, and reduced vehicle traffic. However, some of the lightscape benefits of these actions would be offset by the construction of new housing in the vicinity of Yosemite Village.

**TABLE 9-125: ALTERNATIVE 4 CAMPGROUND MODIFICATIONS**

	Campsites (Alternative 4)	Campsites (Alternative 1)	Change from Alternative 1
Yosemite Lodge and Camp 4 Areas	90	35	55
Former Upper & Lower River Campground Areas	72	0	72
Boys Town and Upper Pines Campground Areas	365	240	125

North Pines and Backpackers Campgrounds and Curry Village Stables Areas	109	111	-2
Eagle Creek and Yellow Pine Administrative Campgrounds	4	4	0
<b>Yosemite Valley Totals<sup>a</sup></b>	<b>701</b>	<b>466</b>	<b>235</b>
Wawona	69	99	-30
<b>Wawona Total</b>	<b>69</b>	<b>99</b>	<b>-30</b>
<sup>a</sup> Totals include the construction of 16 new sites near Backpackers Campground and 40 new sites near Camp 4 area under actions common to Alternatives 2-6.			

**TABLE 9-126: ALTERNATIVE 4 CONCESSIONER EMPLOYEE HOUSING AND VISITOR LODGING**

	Total Residential Units in Alternative 4	Change in Residential Units from Alternative 1	Total Visitor Lodging Units in Alternative 4	Change in Visitor Lodging Units from Alternative 1
Yosemite Village	390	-41	0	0
Ahwahnee hotel	42	-6	123	0
Curry Village	387	-195	355	-45
Yosemite Lodge	104	14	245	0
Housekeeping Camp	n/a	n/a	100	-166
<b>Total Yosemite Valley<sup>a</sup></b>	<b>923</b>	<b>-228</b>	<b>823</b>	<b>-211</b>
Rancheria	203	96	n/a	n/a
El Portal Village	92	12	n/a	n/a
Abbieville	0	0	n/a	n/a
<b>Total El Portal<sup>b</sup></b>	<b>295</b>	<b>108</b>	<b>n/a</b>	<b>n/a</b>
<sup>a</sup> Totals include the 236 residential units that would be removed from the Curry Village and Yosemite Lodge areas of Segment 2 under actions common to Alternatives 2-6.				
<sup>b</sup> Totals include the 12 residential units that would be constructed in the El Portal Village area of Segment 4 under actions common to Alternatives 2-6.				

Removal of 166 lodging units and some facilities from Housekeeping Camp would eliminate a substantial amount of artificial lighting within the valley, including the interior cabin lighting, vehicle headlights, and campfires associated with this facility. Expanded parking at Camp 6 could increase artificial lighting through overhead lighting and/or from the headlights of greater numbers of vehicles departing the area after sunset. With continued operation of Yosemite Lodge and new campgrounds

and parking in its vicinity, lighting impacts in this area would also increase, mainly due to the increase in vehicles and camping-related nighttime activities. However, over the long-term, the impact of these actions on Segment 2 lightscapes would be local, minor, and beneficial.

Under Alternative 4, the park would construct new housing for 96 employees within the Rancheria area of Segment 4. This project would contribute to area lightscape impacts through an increase in exterior lighting, the glow of interior lighting, and increased vehicle traffic. However, any new or modified exterior lighting would be required to comply with the park's lighting guidelines and nighttime construction restrictions, incorporated by reference herein as mitigation measures MM-LITE-1 and -2 (see Appendix C). With mitigation, the long-term impact on Segment 4 would be local, minor to moderate, and adverse. Within Segment 7, the Wawona stables would be removed and 27 campsites eliminated from the Wawona Campground. The corresponding reduction in overnight visitation within these areas would reduce lightscape impacts. The long-term impact on Segment 7 would be local, negligible, and beneficial.

**Segments 2, 4, and 7 Impact Summary:** Actions to manage user capacity, land use, and facilities would have local, long-term, beneficial impacts on the lightscape environment, ranging from negligible to minor in Segments 2 and 7, and adverse impacts ranging from minor to moderate in Segment 4.

#### **Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

Lightscape impacts associated with Alternative 4 management measures would result mainly from changes in park visitation and facilities serving overnight visitors, and employee housing, and generally be limited to Segments 2 and 4. The collective effect of Alternative 4 management actions would cause overnight visitation within the park to increase slightly. However, because of the shift in type and location of overnight accommodations within the park (i.e., campgrounds near existing developed areas of the park), the impacts associated with that visitation are expected to be negligible. Under Alternative 4, a considerable number of additional lodging units would be removed from the park, while some new facilities would also be developed in relative proximity to existing developed areas of the valley. The lightscape environment within El Portal would be further affected by the construction of a considerable amount of new employee housing. Taken together, it is expected that existing and potential future sources of human-caused lighting throughout the Merced River corridor would remain similar to Alternative 1 or decrease slightly, resulting in an overall long-term, local, minor, beneficial impact on the park's lightscape environment.

#### **Cumulative Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

##### ***Overall Cumulative Impact from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

There are no anticipated development projects outside of those described here that would contribute to light pollution within the park. As a result, when combined with the impacts of past, present, and reasonably foreseeable actions, including those originating from outside the park, the cumulative long-

term effect of actions common to Alternatives 2-6 and those specific to Alternative 4 would be local minor, and beneficial.

### ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segment 1 would not be expected to change appreciably under Alternative 5; wilderness access quotas would remain as under Alternative 1 and modifications to overnight accommodations would be nominal. As such, potential sources of artificial night lighting associated with overnight wilderness visitation would continue. Similarly, with designated camping unchanged, and with retention of several campground facilities, sources of artificial lighting (e.g., campfires) would remain concentrated within these areas of the Merced River corridor's wilderness. Reduction in the number of units at the Merced Lake High Sierra Camp would reduce slightly the amount of artificial lighting in the vicinity of the camp, specifically that of interior cabin lighting fixtures. The resulting long-term impact on the lightscape environment within Segment 1 would be local, negligible, and beneficial.

Segment 1 Impact Summary: Actions to Manage user capacity, land use, and facilities would have a long-term, negligible, beneficial impact on the lightscape environment of Segment 1.

#### **Segments 2, 4, and 7: Yosemite Valley, El Portal, and Wawona**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 5, namely those concerning vehicle access and number of overnight accommodations, would contribute to an 16% increase in overnight visitation within Yosemite Valley. As discussed in the context of specific management actions below, this growth would result in an increase in valley-wide nighttime lighting through the corresponding shift in vehicle headlights, lighted parking lots, lighted lodging units, and other facilities to serve after-hours and overnight park visitors.

As shown in **table 9-127**, a considerable number of campsites would be added within Segment 2 under Alternative 5. These additions would increase sources of nighttime lighting, such as campfires and vehicle lighting in several areas, including the Former Upper River, Upper Pines, and Eagle Creek Campground areas. This increase would offset lightscape benefits resulting from removal of campsites from Backpackers, Lower Pines, and North Pines campgrounds. The net effect of these changes to the lightscape environment within Segment 2 would be long-term, local, minor, and adverse.

**TABLE 9-127: ALTERNATIVE 5 CAMPGROUND MODIFICATIONS**

	Campsites (Alternative 5)	Campsites (Alternative 1)	Change from Alternative 1
Yosemite Lodge and Camp 4 Areas	70	35	35
Former Upper River Campground Area	30	0	30
Boys Town and Upper Pines Campground Areas	325	240	85
Lower Pines Campground Area	71	76	-5
North Pines and Backpackers Campgrounds and Curry Village Stables Areas	98	111	-13
Eagle Creek and Yellow Pine Administrative Campgrounds	46	4	42
<b>Yosemite Valley Totals<sup>a</sup></b>	<b>640</b>	<b>466</b>	<b>174</b>
Wawona	86	99	-13
<b>Wawona Total</b>	<b>86</b>	<b>99</b>	<b>-13</b>
<sup>a</sup> Totals include the construction of 16 new sites near Backpackers Campground and 40 new sites near Camp 4 area under actions common to Alternatives 2-6.			

As discussed in *Environmental Consequences of Actions Common to Alternatives 2–6*, and shown in **table 9-128**, the lightscape environment within Segment 2 would benefit from reductions in housing at Curry Village and the Yosemite Lodge areas. However, some of this benefit would be offset by the exterior glow of interior lighting, outdoor lighting, and continued vehicle traffic associated with the construction of new housing in the vicinity of Yosemite Village.

**TABLE 9-128: ALTERNATIVE 5 CONCESSIONER EMPLOYEE HOUSING AND VISITOR LODGING**

Location	Total Residential Units in Alternative 5	Change in Residential Units from Alternative 1	Total Visitor Lodging Units in Alternative 5	Change in Visitor Lodging Units from Alternative 1
Yosemite Village	390	-41	0	0
Ahwahnee hotel	42	-6	123	0
Curry Village	436	-146	453	53
Yosemite Lodge	104	14	245	0
Housekeeping Camp	n/a	n/a	232	-34
<b>Total Yosemite Valley<sup>a</sup></b>	<b>972</b>	<b>-179</b>	<b>1053</b>	<b>19</b>
Rancheria	191	84	n/a	n/a
El Portal Village	92	12	n/a	n/a
Abbieville	0	0	n/a	n/a
<b>Total El Portal<sup>b</sup></b>	<b>283</b>	<b>96</b>	<b>n/a</b>	<b>n/a</b>
<sup>a</sup> Totals include the 236 residential units that would be removed from the Curry Village and Yosemite Lodge areas of Segment 2 under actions common to Alternatives 2-6.				
<sup>b</sup> Totals include the 12 residential units that would be constructed in the El Portal Village area of Segment 4 under actions common to Alternatives 2-6.				

Removal of 34 lodging units from Housekeeping Camp would eliminate a notable source of artificial lighting within the valley, including the interior cabin lighting, vehicle headlights, and campfires associated with this facility. However, these benefits would likely be offset by the increase in housing at Curry Village. Expanded parking at Camp 6 could increase artificial lighting through overhead lighting and/or from the headlights of greater numbers of vehicles departing the area after sunset. With continued operation of Yosemite Lodge and parking in the vicinity of the Lodge, lighting impacts in this area would also increase, mainly due to the increase in vehicles and parking lot lighting. Over the long-term, the impact of these actions on Segment 2 lightscapes would be local, negligible, and adverse.

Under Alternative 5, the park would construct new housing for 84 employees within the Rancheria area of Segment 4. This project would contribute to area lightscape impacts through an increase in exterior lighting, the glow of interior lighting, and increased vehicle traffic. However, any new or modified exterior lighting would be required to comply with the park's lighting guidelines and nighttime construction restrictions, incorporated by reference herein as mitigation measures MM-LITE-1 and -2 (see Appendix C). With mitigation, the long-term impact on Segment 4 would be local, minor to moderate, and adverse. Within Segment 7, the park would remove 13 campsites from the Wawona Campground. The corresponding reduction in overnight visitation within these areas would reduce lightscape impacts. The impact on Segment 7 would be local, long-term, negligible, and beneficial.

**Segments 2, 4, and 7 Impact Summary:** Actions to manage user capacity, land use, and facilities would have local, long-term, adverse impacts on the lightscape environment, ranging from negligible to minor in Segments 2 and 4, and negligible beneficial in Segment 7.

### **Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Lightscape impacts associated with Alternative 5 management measures would result mainly from changes in park visitation, facilities serving overnight visitors, and employee housing, and generally be limited to Segments 2 and 4. The collective effect of Alternative 5 management actions would cause overnight visitation within the park to increase considerably. However, because of the type and location of the shift in overnight accommodations (i.e., campgrounds near existing developed areas of the park), and with mitigation, the impacts associated with that visitation are expected to be minimal. New campground and lodging facilities would be developed within Yosemite Valley, in relative proximity to existing developed areas. The lightscape environment within El Portal would be further affected by the construction of a considerable amount of new employee housing. Taken together, it is expected that existing and potential future sources of human-caused lighting throughout the Merced River corridor would increase relative to Alternative 1, resulting in an overall long-term, local, negligible to minor, adverse impact on the park's lightscape environment.

## **Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

### ***Overall Cumulative Impact from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

There are no anticipated development projects outside of those described here that would contribute to light pollution within the park. As a result, when combined with the impacts of past, present, and reasonably foreseeable actions, including those originating from outside the park, the cumulative effect of actions common to Alternatives 2-6 and those specific to Alternative 5 would be local, long-term, negligible, and adverse.

### ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segment 1 would not be expected to change appreciably under Alternative 6; wilderness access quotas would remain as under Alternative 1 and modifications to overnight accommodations would be nominal. As such, potential sources of artificial night lighting associated with overnight wilderness visitation would continue. Similarly, with designated camping unchanged, and with retention of several campground facilities, sources of artificial lighting (e.g., campfires) would remain concentrated within these areas of Segment 1. With continued operation of the Merced Lake High Sierra Camp at capacity, artificial lighting in the vicinity of the camp, including interior cabin lighting fixtures, would remain as under Alternative 1. The resulting impact on the environment within Segment 1 would be local, long-term, negligible to minor, and adverse.

**Segment 1 Impact Summary:** Actions to manage user capacity, land use, and facilities would have a local, long-term, negligible to minor, adverse impact on the lightscape environment of Segment 1.

#### **Segments 2, 4, and 7: Yosemite Valley, El Portal, and Wawona**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 6, specifically those concerning vehicle access and number of overnight accommodations, would contribute to a 33% increase in overnight visitation within Yosemite Valley. As discussed in the context of specific management actions below, this growth would affect an increase in valley-wide nighttime lighting through the corresponding shift in vehicles, lighted parking lots and lodging units, and other facilities to serve after-hours and overnight park visitors.

As shown in **table 9-129**, a considerable number of campsites would be added within Segment 2. These additions would increase sources of nighttime lighting, such as campfires and vehicle lighting in several

**TABLE 9-129: ALTERNATIVE 6 CAMPGROUND MODIFICATIONS**

	Campsites (Alternative 6)	Campsites (Alternative 1)	Change from Alternative 1
Yosemite Lodge and Camp 4 Areas	90	35	55
Former Upper & Lower River Campground Areas	72	0	72
Boys Town and Upper Pines Campground Areas	325	240	85
Lower Pines Campground Area	71	76	-5

<b>Yosemite Valley Totals<sup>a</sup></b>	<b>739</b>	<b>466</b>	<b>273</b>
Wawona	86	99	-13
<b>Wawona Total</b>	<b>86</b>	<b>99</b>	<b>-13</b>
<sup>a</sup> Totals include the construction of 16 new sites near Backpackers Campground and 40 new sites near Camp 4 area under actions common to Alternatives 2-6.			

areas, including Camp 4, the Former Upper and Lower River Campground areas, and the Upper Pines and Eagle Creek Campground area. This increase would offset lightscape benefits resulting from removal of campsites from Backpackers, Lower Pines, and North Pines campgrounds. The net effect of these changes to the lightscape environment within Segment 2 would be long-term, local, minor, and adverse.

As discussed in *Environmental Consequences of Actions Common to Alternatives 2–6*, and shown in table 9-130, the lightscape environment within Segment 2 would benefit from reductions in housing at Curry Village and the Yosemite Lodge areas. However, some of this benefit would be offset by the exterior glow of interior lighting, outdoor lighting, and continued vehicle traffic associated with the construction of new housing in the vicinity of Yosemite Village.

Removal of 34 lodging units from Housekeeping Camp would eliminate a notable amount of artificial lighting within the valley, including the interior cabin lighting, vehicle headlights, and campfires associated with this facility. Expanded parking and expansion of the Concessioner Maintenance and Warehouse Building at Yosemite Village/Camp 6 would increase artificial lighting through new exterior lighting and more vehicle traffic (i.e., headlights) departing the area after sunset. With continued operation of the Yosemite Lodge and new campgrounds and parking in its vicinity, lighting impacts in this area would also increase, mainly due to the increase in vehicles and camping-related nighttime activities. Over the long-term, the impact of these actions on Segment 2 lightscares would be local, negligible to minor, and adverse.

Under Alternative 6, the park would construct new employee housing within the Abbeville and Rancheria areas of Segment 4. These projects would contribute to area lightscape impacts through an increase in exterior lighting, the glow of interior lighting, and increased vehicle traffic. However, any new or modified exterior lighting would be required to comply with the park's lighting guidelines and nighttime construction restrictions, incorporated by reference herein as mitigation measures MM-LITE-1 and -2 (see Appendix C). With mitigation, the long-term impact on Segment 4 would be

**TABLE 9-130: ALTERNATIVE 6 CONCESSIONER EMPLOYEE HOUSING AND VISITOR LODGING**

Rancheria	151	44	n/a	n/a
El Portal Village	92	12	n/a	n/a
Abbieville	263	258	n/a	n/a
<b>Total El Portal<sup>b</sup></b>	<b>506</b>	<b>314</b>	<b>n/a</b>	<b>n/a</b>
<sup>a</sup> Totals include the 236 residential units that would be removed from the Curry Village and Yosemite Lodge areas of Segment 2 under actions common to Alternatives 2-6. <sup>b</sup> Totals include the 12 residential units that would be constructed in the El Portal Village area of Segment 4 under actions common to Alternatives 2-6.				

local, moderate, and adverse. Within Segment 7, the Wawona stables would be removed and 13 campsites eliminated from the Wawona Campground. The corresponding reduction in overnight visitation within these areas would reduce lightscape impacts. The impact on Segment 7 would be local, long-term, negligible, and beneficial.

**Segments 2, 4, and 7 Impact Summary:** Actions to manage user capacity, land use, and facilities would have local, long-term, adverse impacts on the lightscape environment, ranging from minor to moderate in Segments 2 and 4, and negligible beneficial in Segment 7.

### Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration

Lightscape impacts associated with Alternative 6 management measures would result mainly from changes in park visitation and facilities serving overnight visitors, and employee housing, and generally be limited to Segments 2 and 4. The collective effect of Alternative 6 management actions would cause overnight visitation within the park to increase. As discussed above, Alternative 6 management measures would add a considerable number of new lodging units, mainly campsites, within already developed areas of the park and some relatively remote areas of the park (i.e., the meadow east of El Capitan). Under Alternative 6, the lightscape environment within El Portal would be further affected by the construction of a substantial amount of new employee housing. Taken together, it is expected that existing and potential future sources of human-caused lighting throughout the Merced River corridor would increase relative to Alternative 1, resulting in a long-term, local, minor, adverse effect on the park's lightscape environment.

### **Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

#### ***Overall Cumulative Impact from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

There are no anticipated development projects outside of those described here that would contribute to light pollution within the park. As a result, when combined with the impacts of past, present, and reasonably foreseeable actions, including those originating from outside the park, the cumulative effect of actions common to Alternatives 2-6 and those specific to Alternative 6 would be local, long-term, minor, and adverse.

## Soundscapes

### *Affected Environment*

#### Regulatory Framework

##### *2006 National Park Service Management Policies*

**Soundscape Management** (Policy 4.9). The National Park Service (NPS) will preserve, to the greatest extent possible, the natural soundscapes of parks. The NPS will restore to the natural condition wherever possible those park soundscapes that have become degraded by unnatural sounds (i.e., noise), and will protect natural soundscapes from unacceptable impacts. Using appropriate management planning, superintendents will identify what levels and types of unnatural sound constitute acceptable impacts on park natural soundscapes. The NPS will take action to prevent or minimize all noise that through frequency, magnitude, or duration adversely affects the natural soundscape or other park resources or values, or that exceeds levels that have been identified through monitoring as being acceptable to or appropriate for visitor uses at the sites being monitored.

**Cultural Soundscapes Management** (Policy 3.3.1.7). The NPS will preserve soundscape resources and values of the parks to the greatest extent possible to protect opportunities for appropriate transmission of cultural and historic sounds that are fundamental components of the purposes and values for which the parks were established. An example of appropriate cultural and historic sound includes native drumming at Yosemite National Park. The NPS will prevent inappropriate or excessive types and levels of noise from unacceptably affecting the ability of the soundscape to transmit the cultural and historic resource sounds associated with park purposes.

##### *Director's Order #47: Soundscape Preservation and Noise Management*

Director's Order #47 outlines the operational policies guiding the protection, maintenance, and restoration of the natural soundscape resource in the national park system. The directive instructs park managers to maintain natural soundscapes that are not affected by external (i.e., human-made) noise. By definition, noise is human-caused sound that is considered unpleasant and unwanted. Where the soundscape is found to be degraded, park managers are to facilitate and promote progress toward the restoration of the natural soundscape (NPS 2000b). There are 11 such instructions and requirements outlined in Director's Order #47.

##### *National Park Service Reference Manual 47*

National Park Service Reference Manual 47, *Soundscape Preservation and Noise Management*, prepared in response to Director's Order #47, provides the following: (1) technical guidance on soundscape management planning, including direction on the preparation of soundscape preservation and noise management plans (referred to as soundscape management plans); (2) direction on the measurement of sound characteristics to be applied in soundscape management planning; (3) technical guidance on education opportunities; (4) technical guidance on noise prevention and mitigation; and (5) direction on interagency planning.

### ***Yosemite General Management Plan***

The *Yosemite General Management Plan* outlines general management priorities for resource management in the park. With regard to sound, this management plan calls for the limitation of noise to the greatest extent possible. More specifically, it places high priority on reducing traffic congestion in Yosemite Valley to reduce the exposure of visitors to noise associated with motor vehicles. Among the tools available to the park for achieving this reduction in vehicle noise, specifically motorcycle noise, is regulatory enforcement.

### **Soundscape and Noise**

Soundscape is a term used by the NPS to describe the ambient noise setting for a given parkland area. In a park setting, a natural soundscape is an area characterized by various sound sources at detectable sound levels that typically occur without the intrusion of sounds caused by humans or human technology. Park natural soundscape resources encompass all the natural sounds that occur in parks, including the physical capacity for transmitting those natural sounds and the interrelationships among park natural sounds of different frequencies and volumes. Natural sounds occur within and beyond the range of sounds that humans can perceive, and they can be transmitted through air, water, or solid materials.

Noise is often defined as human-caused sound, and is considered to be unpleasant and unwanted. Whether a sound is considered unpleasant depends on the individual listening to the sound and what the individual is doing when the sound is heard (i.e., working, playing, resting, sleeping). While performing certain tasks, people expect and, as such, accept certain sounds. For instance, if a person works in an office, sounds from printers and copiers are generally acceptable and not considered unpleasant or unwanted. By comparison, when people are resting or relaxing, these same sounds are not desired. The desired sounds during these times are referred to as *natural quiet*, a term used to describe ambient (outdoor) natural sounds without intrusion of human-caused sounds. Natural quiet can be essential for some individuals to achieve a feeling of peace and solitude.

### **Existing Sources of Noise in the Merced River Corridor**

Natural sounds in Yosemite National Park and adjacent to the Merced River include waterfalls, flowing water, animals, rustling tree leaves, and many other sounds. These are not considered noise. Typical sources of noise in the park and project area include motor vehicles, human activity and aircraft. Noise does not have to be loud to have an impact on the natural environment.

### ***Motor Vehicles and Human Activity***

Corridorwide, motor vehicle noise is generated by visitor, NPS, and concessioner vehicles along roadways. Motor vehicle noise is associated with areas of concentrated visitor and administrative use, including all park roads and parking areas, Yosemite Village, all campgrounds, Yosemite Lodge, and NPS and concessioner stables. Noise from motor vehicles is loudest immediately adjacent to roads and parking areas, but due to generally low levels of natural sound in the background, vehicle noise may be audible a long distance from roads. Other noises associated with human activities in the Merced River

corridor include human voices, stock, park maintenance operations (e.g., construction and maintenance equipment, generators), and recreational activities (e.g., lodging, camping, housing).

Atmospheric conditions (e.g., wind, temperature, humidity, rain, snow) and topography can significantly affect the presence or absence of noise in the Merced River corridor. Additionally, dense vegetation may also produce significant sound attenuation over distance. In general, noise would be expected to be louder in areas where human activities are concentrated and where sound reverberates between natural features, such as canyon walls. The frequency, volume, and source of these noises vary dramatically by season, with the highest levels of noise expected during the summer when visitor use is at its peak.

Noise can affect an animal's physiology and behavior, and if it becomes a chronic stress, noise can be injurious to an animal's energy budget, reproductive success, and long-term survival (Radle 1998; Stone 2000; Brumm 2004). Road noise specifically has been implicated in the disturbance of several bird species, resulting in decreased densities of breeding pairs in the vicinity of roads (Krause 2001).

During one 2006 study, 24% of respondents reported hearing vehicle sounds. These noises were rated as slightly annoying and slightly unacceptable. Consequently, the authors of the study recommended that these sounds be considered second priority for management behind aircraft sounds (Newman et al. 2006).

### ***Aircraft***

As part of an aircraft overflight report to Congress in 1994, the NPS conducted a visitor use survey to determine the effects of aircraft noise on the visitor experience. Of the visitors surveyed, 55% reported hearing aircraft sometime during their visit. The report notes that recognition of noise from aircraft was highly variable from location to location and that impacts were greater when visitors removed themselves from automotive transportation and areas where other visitors were present. In Yosemite, a majority of the complaints came from wilderness trail users (BRW 1994).

Measurements made in 1993 at four locations in the park (Rafferty Creek, Soda Springs, Mirror Lake, and Glacier Point) indicated that aircraft were audible 30% to 60% of the time (NPS 1994b). Similar results were found in 2006 when 51% of visitors reported hearing aircraft noise. Because aircraft noise was also considered to be "annoying and unacceptable," the authors of this study recommended that addressing aircraft sounds should be considered a first priority for NPS management consideration (Newman et al. 2006).

### **Background Sound and Noise Levels**

Sound is mechanical energy transmitted by pressure waves through a medium such as air. As previously mentioned, noise is defined as unwanted sound. Sound is characterized by various parameters that include the rate of oscillation of sound waves (frequency), the speed of propagation, and the pressure level or energy content (amplitude). In particular, the sound pressure level has become the most common descriptor used to characterize the loudness of an ambient sound level. Sound pressure level is measured in decibels (dB), a logarithmic loudness scale with zero dB corresponding roughly to the

threshold of human hearing, and 120 to 140 dB corresponding to the threshold of pain. Because sound pressure can vary by over one trillion times within the range of human hearing, the logarithmic loudness scale is used to calculate and manage sound intensity numbers conveniently.

The typical human ear is not equally sensitive to all frequencies of the audible sound spectrum. As a consequence, when assessing potential noise impacts, sound is measured using an electronic filter that deemphasizes the frequencies below 1,000 hertz (Hz) and above 5,000 Hz in a manner corresponding to the human ear's decreased sensitivity to low and extremely high frequencies instead of the frequency mid-range. This method of frequency weighting is referred to as A-weighting and is expressed in units of A-weighted decibels (dBA). Frequency A-weighting follows an international standard methodology of frequency de-emphasis and is typically applied to community noise measurements. All sound/noise levels presented in this document are A-weighted.

Given the variation of community noise level from instant to instant, community noise levels must be measured over an extended period of time to characterize a community noise environment and evaluate cumulative noise impacts. This time varying characteristic of environmental noise is described using statistical noise descriptors. For example, the descriptor  $L_{eq}$  is used to describe noise over a specified period of time, typically one hour, in terms of a single numerical value. The data presented in this section represent the  $L_{eq}$  sound levels in the Merced River corridor.

Sound-level measurements were obtained for the original *Merced River Plan/EIS* at various locations adjacent to the Merced River (from the headwaters of the Merced River to the base of Vernal Fall), in Yosemite Valley, and in the Wawona area. Additional measurements were collected at Yosemite Village in 2006 for the *Yosemite National Park Acoustic Monitoring Report 2005 & 2006*. Measurements for the original *Merced River Plan/EIS* were obtained with a Larson Davis dosimeter (Model 700). The dosimeter was calibrated with a Larson Davis sound-level calibrator. Measurements for the *Yosemite National Park Acoustic Monitoring Report* were obtained using a Brüel & Kjær sound analyzer equipped with a GRAS Type 40AQ microphone. The measurement system was calibrated immediately before measurements were taken.

Observers in both cases noted the sources contributing to the background level and noted any sources that caused intrusive levels above the typical background sound level. Appendix F includes a table that describes the measurement locations, the measurement results, and the associated sources. Appendix F also includes a figure that shows where the measurements were taken. The results of these measurement efforts are described below, in the context of the Merced River segments from which they were obtained.

### ***Segment 1: Merced River Above Nevada Fall — Sound/Noise Levels***

Sound levels at the highest elevations of the Merced River corridor (between the Merced and Triple Peak Forks) measured 35 dB. Also in the headwaters area, approximately 2 to 2.5 miles southeast of Washburn Lake, sound levels ranged from 39 to 41 dB, with the influence of aircraft noise (the maximum observed levels with the aircraft were 43 and 56 dB). At and near Washburn Lake, sound levels ranged from 31 to 36 dB, with very little influence of sound from the river.

At a lower elevation, between Soda Springs and Washburn Lake, sound levels on the trail ranged from 35 to 42 dB. In the Bunnell Cascades and Soda Springs areas, sound levels ranged from 54 to 56 dB. These sound levels primarily resulted from Merced River water washing over granite cascades in both areas. Away from the river, in the Little Yosemite Valley Campground area, sound levels measured 40 dB (in an area with no human activity). At the viewing area overlooking Nevada Fall, sound levels measured 61 dB, with little falls and visitor-related noise accounting for the audible sound.

### ***Segment 2: Yosemite Valley — Sound/Noise Levels***

Measurements from the viewing area atop Vernal Falls and on the Mist Trail adjacent to the falls ranged from 66 to 76 dB. In Yosemite Valley, sound levels ranged from 44 to 47 dB along the Lower Yosemite Fall Trail, with maximum observed levels of 66 dB when people passed the monitor on the trail. Notably, there was no water in Yosemite Creek when the monitoring was performed. At Swinging Bridge, sound levels measured 50 dB, with noise from people constituting the greatest source of sound in the area. At Sentinel Bridge, sound levels measured 59 dB. This area experiences noise from vehicle traffic, but speeds are generally slow. Overall, the greatest source of sound was the numerous buses traversing the bridge. Near Happy Isles, sound levels measured 59 dB, with most of the sound resulting from people on the trails and using facilities nearby. In the camping area (Upper Pines Campground), sound levels varied from 32 dB when human activity levels were at the lowest (early in the morning) to 55 dB when activity levels increased during the day. Measurements taken near Yosemite Village reached 52 dB in early afternoon.

West of the Valley Visitor Center area, the river was calm in El Capitan Meadow and no people were present during the monitoring. Measured sound levels in this area were 39 dB. At Devils Elbow, water was flowing through the Merced River, but the sound of the river was minimal due to the lack of rocks and rapids. Sound levels in this area were 44 dB, with a maximum observed level of 67 dB when a bus passed on nearby Northside Drive. In the Cascades area, measured sound levels were 49 dB, with a recorded maximum level of 63 dB when a bus passed on Northside Drive.

### ***Segment 3: Merced River Gorge — Sound/Noise Levels***

On El Portal Road, at the stone bridge between Arch Rock and Big Oak Flat, sound levels measured 52 dB. Rushing water sounds accounted for the majority of the background levels. Measurements were taken in an area with no people. Some vehicle noise was audible from El Portal Road, but it was relatively minor due to distance and elevation (the river is approximately 40 feet below the grade of the roadway in this area).

### ***Segment 7: Wawona — Sound/Noise Levels***

In Wawona, sound levels were measured in the middle of the old Wawona Bridge on Wawona Road, and west of the covered bridge near the Pioneer Yosemite History Center. Sound levels in these areas were 50 dB and 44 dB, respectively, with maximum observed levels of 59 dB near the covered bridge. The river accounted for some background noise in this area, with vehicle traffic accounting for maximum noise levels.

### *Environmental Consequences Methodology*

Proposed management actions for each alternative were evaluated in terms of the context, intensity, and duration of the impacts on soundscape, and whether the impacts would be considered beneficial or adverse to the soundscape environment. The methodology for evaluating impacts on soundscapes was adapted from those provided by the NPS Natural Sounds Program Office (NPS 2007e). The soundscapes impact assessment involves the identification and qualitative description of the types of actions proposed under each alternative that could affect the ambient acoustic environment. For most sound sources, such characteristics would include the location and movement of the source, its operational features that produce sound, and how the sound would be distributed over time. Impacts are described as potential changes in the existing soundscape resulting from the proposed actions, as compared with existing conditions. The analysis of effects to soundscapes is qualitative, with professional judgment applied to reach reasonable conclusions as to the context, intensity, and duration of potential impacts. The effects of these actions are considered for sensitive human receivers only. Sensitive receivers include nearby residents and recreational users (both day-use and overnight users).

- **Context.** The context of the impact considers whether the impact would be local or regional. Impacts to soundscapes were determined to be local and limited to the Merced River corridor and immediate vicinity. For this reason, context will not be further discussed for soundscapes, except to the extent of describing which segments would be affected.
- **Intensity.** The intensity of the impact considers whether the impact would be negligible, minor, moderate, or major. Negligible impacts are those in which the effects would not be detectable, having no discernible effect on the ambient environment. Minor impacts would be those that are slightly detectable but would not be expected to have an overall effect on the soundscape environment. Moderate impacts would be clearly detectable and could have an appreciable effect. Major impacts would have a substantial, highly noticeable influence on the ambient noise environment.
- **Duration.** The duration of the impact considers whether the impact would occur in the short-term or the long-term. A short-term impact would be temporary in duration or transitory in effect, such as construction noise. A long-term impact would have a permanent effect on the ambient noise environment.
- **Type of Impact.** Impacts are evaluated in terms of whether they would be beneficial or adverse to the ambient soundscape environment. Beneficial impacts would reduce noise levels, while adverse impacts would have the opposite effect.

### *Environmental Consequences of Alternative 1 (No Action)*

#### **All River Segments**

Alternative 1 (No Action) assumes the continuance of existing plans and policies, including the NPS *Management Policies 2006*, Director's Order #47, and the *Yosemite General Management Plan*, among other documents that guide management decisions and soundscapes in the Merced River corridor. Under Alternative 1, the soundscape among Segments 1–8 would remain dominated by natural sources

of sound (e.g., water, wind, birdsong and chatter). Noise levels would continue to be higher where visitor use is intense, such as campgrounds, roads, parking lots, and major trail routes and destinations.

Alternative 1 does not propose measures that would cause an increase in park visitation. However, park visitation is expected to increase at a rate of 3% per year over the next five years. As described in the “Transportation” section of this chapter, congestion around certain park entry points, busy intersections, and parking areas would continue during peak summer days, and associated noise impacts in these areas would persist. The park would continue to utilize discretionary authorities to limit park access during unusually busy days; however, no new formal systems or methods for controlling access would be implemented.

Overnight facilities, both lodging and camping, would remain at current levels, both in number and type of accommodation. This would limit potential increases in nighttime visitation and associated noise. Visitation could, however, shift to other “non-peak” periods of the year (e.g., fall and winter months, spring and fall weekends, summer weekdays). Such a shift would contribute to an increase in visitor-related noise during such periods. Maintenance and administrative activities (i.e., groundskeeping equipment, generators, HVAC, refrigeration, helicopter use in support of park operations) would also remain similar to those under present conditions. However, with increased visitation, such activities may be required more frequently, thereby causing an indirect increase in park noise. High-altitude aircraft overflights, an issue that is national in scope, would continue to affect soundscapes in the park. Aircraft noise is highly variable from location to location and impacts are greater when visitors are in areas removed from other vehicle traffic and visitor noise. Impact determinations are discussed for specific segments and summarized below.

### **Segment 1: Merced River above Nevada Fall**

Noise levels in the area of Segment 1 would remain similar to current conditions. Under Alternative 1 (No Action), soundscapes in wilderness segments would continue to remain dominated by natural sources of sound, punctuated by noises from aircraft and the occasional human voice or sound made by pack stock. Use of visitor facilities would continue to increase with visitation. Some impacts on natural soundscapes would be expected in areas of easily accessible wilderness (e.g., the trail to Half Dome) and campgrounds (e.g., Little Yosemite Valley, Merced Lake Backpackers Camp, Merced Lake High Sierra Camp, Nevada Fall Overlook). It is anticipated that annual daytime use of these areas would increase with the projected increase in visitor demand, thereby raising the level of human-related sounds (e.g., talking and hiking). A rise in human-related sounds would contribute to a long-term, negligible to minor, adverse impact on the soundscape environment by diminishing the natural quiet and sounds of nature that help make up the wilderness character that is valued in the park.

**Segment 1 Impact Summary:** A gradual increase in park visitation, and associated human-caused noise, would contribute to a long-term, negligible to minor, adverse impact on the soundscape environment.

## Segment 2: Yosemite Valley

Noise levels in the area of Segment 2 would remain similar to current conditions. Segment 2 provides the greatest diversity of recreation activities in the Merced River corridor. Day use sites, such as Swinging Bridge, Sentinel Beach, and Cathedral Beach, would continue to exceed capacity, resulting in crowding. These areas would continue to be affected by noise, and noise levels would proportionally rise with the increase of visitors. Noise levels would also continue to be affected by vehicular use. Roads are often crowded during peak months (i.e., near Camp 6, Arch Rock, Wawona proper, Yosemite Lodge). With increased visitation, the frequency and duration of transitory sound sources (i.e., passing vehicles) would also increase. Under Alternative 1, crowding and congestion would contribute to an increase of unnatural sounds that could diminish the natural quiet and sounds of nature that are valued by visitors to the park. The continuation of present visitation trends would, therefore, contribute to a long-term, minor, adverse impact on the soundscape in Segment 2.

**Segment 2 Impact Summary:** A gradual increase in park visitation, and associated human-caused noise, would contribute to a long-term, negligible to minor, adverse impact on the soundscape environment.

## Segments 3 and 4: Merced River Gorge and El Portal

Noise levels in the area of the Merced River gorge and El Portal would remain similar to current conditions. Under Alternative 1, higher noise levels caused by vehicular use near roadways would persist. As with Segment 2, the frequency and duration of transitory sound sources would increase with park visitation. The continued trends in visitor-related noise would result in a long-term, negligible to minor, adverse impact on the soundscape in Segment 3, and a long-term, minor, adverse impact in Segment 4.

**Segments 3 & 4 Impact Summary:** A gradual increase in park visitation, and associated human-caused noise, would contribute to a long-term, negligible to minor, adverse impact on the soundscape environment in Segment 3, and a long-term, minor, adverse impact on the soundscape within Segment 4.

## Segments 5, 6, 7, and 8: South Fork Merced River, Wawona Impoundment, and Wawona

Noise levels in the area of Segments 5, 6, and 8 would remain similar to current conditions. Under Alternative 1, soundscapes in wilderness segments would continue to be dominated by natural sources of sound, punctuated by noise from aircraft and the occasional human voices. Visitor noise levels are not as common because of topography and limited trail access. The increase in visitor-related noise exposure in these areas is speculative due to continued limited accessibility to these portions of the South Fork Merced River. Therefore, it is not known whether visitation to these areas would increase relative to existing conditions.

Noise levels in the area of Segment 7 would remain similar to current conditions. Segment 7 is often crowded with visitors participating in daytime recreation activities, and under Alternative 1 noise levels caused by visitor crowding and congestion would continue, especially during the peak season at popular day use areas. Furthermore, visitation would be expected to increase in these areas, which

would raise noise levels proportionally. The anticipated visitor-related noise would contribute to a long-term, minor, adverse impact on the soundscape in Segment 7.

**Segments 5-8 Impact Summary:** A gradual increase in park visitation, and associated human-caused noise, would contribute to a long-term, minor, adverse impact on the Segment 7 soundscape environment. The increase in visitor-related noise exposure in Segments 5, 6, and 8 is speculative due to continued limited accessibility to these areas. Therefore, it is not known whether visitation, or associated noise levels within these areas would increase relative to existing conditions.

### Summary of Alternative 1 (No Action) Impacts

Alternative 1 would accommodate a gradual increase in annual visitation over the next five years. Shifting visitation trends could result in additional people visiting the park during months outside of the typical peak season (i.e., April, May, September, October) and increasing noise levels during this time. Overall increased visitation would lead to a long-term, negligible to minor, adverse impact on the soundscape environment.

### Cumulative Impacts of Alternative 1

The discussion of cumulative impacts on soundscapes is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of Alternative 1. The projects identified below include only those that could affect noise in the Merced River corridor or could be affected by noise sources in the corridor.

#### *Past Actions*

Development of facilities over time has created short-term sources of noise from construction and facility removal activities. Examples of past short-term noise sources include: removal of Cascades Housing and Happy Isles Gauging Station Bridge; restoration activities at Cook's Meadow and Happy Isles; construction of housing at Curry Village and rehabilitation of Curry Village structures; and improvements to El Portal Road, Wawona Road, and Yosemite Valley Shuttle bus stops. Overall facility development and increased visitation has resulted in long-term sources of noise.

The *Superintendent's Compendium* and the 1989 *Wilderness Management Plan* indirectly limit the overall noise levels in the river corridor. The *Superintendent's Compendium* traffic thresholds were developed for use when traffic and parking conditions in Yosemite Valley are overly congested. The policy has the indirect effect of limiting the amount of vehicle noise during peak periods by restricting the number of automobiles entering certain areas of the park until the traffic volume and parking demand sufficiently decreases. The *Wilderness Management Plan* was developed to preserve a wilderness environment in which the natural world, along with the processes and events that shape it, remain largely untouched by human interference. Implementation of the permit system for overnight camping under the *Wilderness Management Plan* reduces potential noise impacts in those areas where natural quiet is an important element of the visitor experience. A switch to hybrid busses used for the Yosemite shuttle service resulted in a decrease in noise from the old shuttle system.

***Present Actions***

Utility and road improvements, including the Parkwide Communication Data Network upgrade, would have temporary noise impacts during construction that could affect the Merced River corridor. Temporary noise impacts also occur during some general, ongoing restoration activities.

***Reasonably Foreseeable Future Actions***

Under Alternative 1, park visitation is expected to increase at a rate of 3% per year over the next five years. Short-term adverse noise effects from construction, rehabilitation and removal projects are reasonably foreseeable. Examples include Ahwahnee Hotel rehabilitation, general restoration activities, rehabilitation to roadways and parking lots, Curry Village rehabilitation and removal of structures in the Curry Village rock fall hazard zone.

***Overall Cumulative Impact***

Rehabilitation and restoration activities have and would continue to result in short-term, moderate, adverse impacts, primarily in non-wilderness areas. Increasing numbers of visitors, during both peak and non-peak seasons, could result in long-term, negligible to minor impacts.

***Environmental Consequences to Actions Common to Alternatives 2–6*****All River Segments*****Impacts of Actions to Protect and Enhance River Values***

Restorative action in all river segments and under all alternatives could involve the use of heavy equipment which produce short-term, moderate, adverse impacts on the natural soundscape. For purposes of this analysis, heavy equipment in the soundscape discussion includes skid steers, excavators, loaders, and/or dump trucks. With implementation of mitigation measures MM-NOI-1 through MM-NOI-3, as applicable (see Appendix C), impacts of construction on soundscapes would be reduced.

**Biological Resource Actions.** Program level actions include the removal of informal trails and the removal of campsites from within 100 feet of the ordinary high-water mark. The use of heavy equipment during removal activities would be determined on a project specific basis, but would be expected to have a short-term, negligible to minor adverse soundscape impact. After campsites and informal trails are removed, potential noise sources would be reduced, resulting in a long-term, negligible to minor, beneficial impact on the Merced River corridor's natural soundscape.

**Hydrologic/Geologic Resource Actions.** Program level actions include the removal of rip rap, abandoned infrastructure where it alters hydrology, management of large wood and the addition of constructed log jams. These actions would involve the use of heavy equipment and/or haul trucks which would have short-term, moderate, adverse impacts on the soundscape in the vicinity of the action.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

As discussed further in “Socioeconomics”, actions to maintain or reduce visitor capacity would likely result in a displacement or “time-shift effect”. Unable to secure reservations for their first-choice time period to visit the park, some people will likely change their plans to visit the park during off-peak periods, such as the fall or winter months. Not all types of accommodations are conducive to this type of time shift. While hard-sided cabin units may be able to accommodate travelers year round, camping and tent accommodations may not work as well in colder seasons. Thus it is anticipated that human-related noise would increase during off-peak periods, primarily in high-use areas. The impact of this time-shift effect would occur under Alternatives 2–6. This would contribute to a long-term, minor, adverse impact on the soundscape environment.

### **Segment 1: Merced River above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

Programmatic removal and relocation of trails in Segment 1 could involve the use of heavy equipment although this would be determined and further analyzed during a subsequent planning process.

### **Segment 2: Yosemite Valley**

#### ***Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values within Segment 2 that would occur across Alternatives 2–6 include removal of abandoned infrastructure and other development affecting the Merced River’s hydrologic function, extensive meadow restoration, and management of high visitor-use areas to address associated impacts on riparian habitats and sensitive cultural resources. These actions would require a temporary noise increase within the vicinity of project sites, resulting from construction activities and vehicle noise. Heavy construction equipment and haul trucks would temporarily add to the noise environment in the project area. Most of these activities would occur in areas distant from noise-sensitive uses. As a result, soundscape/noise impacts resulting from implementation of these actions would be short-term, negligible to minor, adverse impact on soundscapes in the vicinity of these actions.

**Biological Resource Actions.** Heavy equipment would be used for actions throughout Segment 2 including: formalizing El Portal Road pullouts, ditching in meadows; elevation of a bike path and removal of informal trails in Leidig Meadow; protection of wetlands at Stoneman Meadow; removal of fill, road bed and roadside parking in Cook’s Meadow; removal of the abandoned Rocky Point Sewage Plant; removal of abandoned infrastructure in Royal Arches Meadow; removal of abandoned infrastructure and restoration of the former Lower Pines campground; Eagle Creek drainage channelization; riparian improvements at Swinging Bridge; restoration at Cathedral Beach picnic area; and restoration of the Ahwahnee Meadow former golf course and tennis court area. Operation of this equipment would have a short-term, moderate, adverse impact in the vicinity of the action.

**Hydrologic/Geologic Resource Actions.** Removal of pack stock trail from concessioner stables to Happy Isles, removal of former Happy Isles footbridge footings, relocation of Upper Pines dump

station, abandoning the gauging station at Pohono Bridge, restoration of floodplain areas at Camp 6, restoration of former Yosemite lodge units and cabin, and riverbank improvements between Clark's and Sentinel Bridges would involve the use of heavy equipment. Operation of this equipment would have a short-term, moderate, adverse impact in the vicinity of the action.

**Scenic Resource Actions.** Scenic Vista Management (see Appendix H) in Segment 2 under Alternatives 2-6 would largely involve the thinning and removal of trees and shrubs. Areas where more than 200 trees would be removed include Ferry Bend Turnout, The Ahwahnee area, El Capitan Meadow, and Church Bowl Picnic Area. Valley View contains a large number of dead trees from a controlled burn in 2007; over 500 trees could be removed on approximately four acres from Valley View. The impact of scenic resource actions on soundscapes would be short term, moderate and adverse in the vicinity of the actions.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Actions to manage visitor use and facilities in the vicinity of Yosemite Valley, including the removal of several visitor-serving and administrative facilities, removal of employee housing, removal of numerous campsites, and various transportation and parking management measures, would require heavy equipment and construction activity that would yield moderate levels of noise. Construction traffic including heavy construction equipment and haul trucks would temporarily add to the noise environment on local roadways. Noise from demolition/construction work would have a short-term, moderate, adverse impact on the natural soundscape. The overall reduction in visitor and residential facilities would be expected to reduce overall noise levels, contributing to a long-term, minor, beneficial impact on Yosemite Valley soundscape environment.

**Curry Village and Campgrounds.** The park would remove the Happy Isles Snack Stand at Curry Village. At The Ahwahnee, the park would remove the swimming pool and tennis courts; redesign, formalize, and improve drainage within the existing parking lot; and construct a new 50 parking space lot east of the current parking area. These actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. Facilities removal would reduce visitor-related noises within those project areas, while the parking lot expansion would have the opposite effect. The long-term impact on the soundscape environment would be local, negligible, and adverse.

**Camp 6 and Yosemite Village.** The park would remove from Yosemite Village the Concessioner General Office, Concessioner Garage, and the Arts and Activities Center (Bank Building), and repurpose the Village Sports Shop for public use. It would also construct a new maintenance building near the Government Utility Building. The park would remove roadside parking along Sentinel Drive and expand Camp 6 parking into the footprint of the Concessioner Garage. To improve visitor access between the Camp 6 area and Village, the park would construct a pathway connecting the new Camp 6 parking lot with the repurposed Village Sports Shop. These actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate and adverse. The majority of these actions would occur in a developed area, largely

within the footprint of existing development. As such, the long-term impact on the soundscape environment would be local, negligible, and adverse.

**Camp 4 and Yosemite Lodge.** The park would remove the NPS Volunteer Office, post office, swimming pool, and snack stand. It would also remove old and temporary employee housing (Thousands Cabins and Highland Court) and replace it with new housing. In addition, the park would relocate the Yosemite Lodge maintenance and housekeeping facilities and repurpose the food court. These actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. Facilities removal would reduce visitor-related noises within those project areas, and new housing construction would largely occur within already developed areas. As such, the long-term impact on the soundscape environment would be local, negligible, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have short-term, moderate, and adverse impacts on the soundscape environment. These actions would not be expected to have a long-term impact on the soundscape environment. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, adverse impacts on the soundscape environment in the vicinity of specific projects.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

To protect and enhance river values within the Merced River gorge and El Portal, the park would remove informal trails, nonessential roads, fill materials, and abandoned infrastructure throughout Segments 3 and 4. The planning and design; demolition, removal, transport, and disposal of waste materials; and restoration of these areas would involve the use of heavy equipment. The associated impact on the soundscape environment within Segments 3 and 4 would be short-term, local, minor to moderate, and adverse.

**Biological Resource Actions.** Removal of asphalt and fill at Trailer Park and Abbieville would involve the use of heavy equipment. Operation of this equipment within Segment 4 would have a short-term, moderate, adverse impact in the vicinity of the action.

**Hydrologic/Geologic Resource Actions.** Removal of abandoned infrastructure at Cascades Picnic area, restoration of Greenemeyer sand pit, and paving of parking areas at El Portal Maintenance and Administrative Complex would involve the use of heavy equipment. Operation of this equipment within Segment 4 would have a short-term, moderate, adverse impact in the vicinity of the action.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions concerning visitor facilities and employee housing that would occur in Segment 4 across Alternatives 2–6 would involve temporary increases in noise from construction and traffic. Noise from construction work is expected to have a short-term, moderate, adverse impact on the natural

soundscape. The construction of new employee housing would contribute to increased noise associated with housing occupation in Rancheria Flat and El Portal. The expected impact on soundscapes would be long-term, minor, and adverse.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values within Segments 3 & 4 would have short-term, minor to moderate, adverse impacts on soundscapes in the project vicinity. Actions to manage user capacities, land use, and facilities would have short- and long-term, minor, and adverse impacts on the soundscape environment within Segment 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River, Wawona Impoundment, and Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Actions proposed for Alternatives 2–6 to address campground waste management and protect cultural resources would increase construction and vehicle-related noise in the Segment 7. As a result, noise-sensitive uses near construction operations would be expected to experience a short-term, minor, adverse impact relative soundscapes. Daily operations of the proposed pump station above Wawona Campground would be expected to have a long-term, negligible to minor, adverse impact on nearby residential receivers, including campground users. Noise exposure from daily operations of this facility should be considered upon design.

**Hydrologic/Geologic Resource Actions.** Development of the Wawona Campground wastewater collection system, abandonment of infrastructure in the South Fork Merced River side channels, and relocation of the Wawona dump station would involve the use of heavy equipment. Operation of this equipment would have a short-term, moderate, adverse impact in the vicinity of the action. Daily operations of the proposed pump station above Wawona Campground would be expected to have a long-term, negligible to minor, adverse impact on nearby residential receivers and recreational park users within Segment 7. Noise exposure from daily operations of this facility should be considered upon design.

**Cultural Resource Actions.** The removal of campsites from culturally sensitive areas would reduce long-term noise exposure in Segment 7. This action would have a long-term, negligible, beneficial impact on the soundscape environment in the area of the action.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Proposed actions concerning visitor and administrative facilities and parking, including enhancing river access, restroom, picnic, and bus stops within Wawona; removing staged materials, abandoned utilities, vehicles, and a parking lot from the riparian buffer at the Wawona Maintenance Yard; and removing roadside parking between the Wawona Store and Chilnualna Falls Road would introduce temporary project-related increases in construction and traffic noise in Segment 7. Noise from construction activities within Segment 7 would have a short-term, moderate, adverse impact on the natural soundscape. Operational noise associated with the proposed administrative facilities in Wawona may have long-term, minor to moderate, adverse impacts on existing noise-sensitive uses in

the vicinity. Site-specific acoustical studies would be appropriate to address noise mitigation from these facilities at existing noise-sensitive uses within 1,000 feet.

**Wawona.** The park would redesign the bus stop at the Wawona Store to accommodate increased visitor use. This project would mostly be completed by the use of hand and power tools. The resulting impact on the soundscape environment in the project vicinity would be short-term, negligible, and adverse.

**Segments 5-8 Impact Summary:** Actions to protect and enhance river values within Segment 7 would result in local, short-term, negligible to minor, adverse impacts; but would not be expected to have long-term impacts. Operational noise at new administrative facilities would contribute to local, long-term, minor to moderate, adverse impacts on the soundscape environment.

### **Summary of Impacts Common to Alternatives 2–6**

Temporary noise from heavy equipment and construction would be a short term, local, moderate, adverse impact from proposed actions. The acoustical environment in wilderness areas would continue to be shaped largely by natural sources of sound punctuated by intrusive noise generated by high-altitude aircraft overflights. The acoustical environment in nonwilderness areas would continue to be shaped primarily by human-caused sources of noise, such as vehicles and recreational activities, and by natural sources of sound, such as rushing water and wind. With implementation of mitigation measures MM-NOI-1 through MM-NOI-3, as applicable (see Appendix C), the long-term impact on the park's natural soundscape would be local, minor to moderate, and beneficial, resulting mainly from removal of visitor serving facilities and employee housing in Segment 2.

## ***Environmental Consequences of Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration***

### **Segment 1: Merced River above Nevada Fall**

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Changes to the trailhead quota system and camping area modifications would reduce long-term noise exposure in these areas, having an overall long-term, negligible to minor, beneficial impact on soundscapes.

**Merced Lake High Sierra Camp.** The park would close the Merced Lake High Sierra Camp and remove all associated infrastructure, convert the area to designated Wilderness, and expand dispersed camping at Merced Lake Backpackers Camping Area into the former High Sierra Camp footprint. These actions would require construction efforts which would yield construction noise. In addition, such work would likely require several helicopter trips to transport camp infrastructure. Where these operations are near sensitive receivers, such as occupied campsites, they would be expected to have short-term, moderate, adverse impacts on soundscapes in the vicinity.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have short-term, moderate, adverse impacts due to construction noise; but have an overall long-term, negligible to minor, beneficial impact on soundscapes due to reduced visitation.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve removal of buildings from the Yosemite Lodge area, and rerouting and revegetating a portion of the Valley Loop Trail. This work would require the use of heavy equipment and likely take several weeks to a few months to complete. The resulting impacts on the natural soundscape environment within these areas would be short-term, minor to moderate, and adverse.

**Biological Resource Actions.** In Segment 2, restorative actions including removal of portions of Northside Drive, restoration at Stoneman and El Capitan Meadows, redesign of Curry Orchard Parking lot, removal of abandoned infrastructure and Upper and Lower Rivers Campground, removal of campsites in Yosemite Valley campgrounds, and rerouting of trail in various meadows, would include the use of heavy equipment which would have short-term, moderate, adverse impacts.

**Hydrologic/Geologic Resource Actions.** The removal of Awhawnee and Sugar Pine bridges and associated berms under Alternative 2 would involve the use of heavy equipment and explosives to drop the bridges and dismantle the abutments. Operation of this equipment would have a short-term, moderate to major, adverse impact in the vicinity of the action.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 2, including removal of lodging and campsites, parking improvements at Curry Village and Camp 6, and new camping and parking facilities at Yosemite Lodge, would involve the use of heavy equipment. Construction noise and associated traffic would have a short-term, moderate, adverse impact. The reduction in lodging, campsites, and overall visitation would combine to reduce noise within these areas of Yosemite Valley, resulting in a long-term, minor to moderate, beneficial impact on the soundscape environment.

New camping and parking facilities would result in long-term, minor, adverse impacts to soundscapes while the removal of campsites and parking would result in long-term, minor, beneficial impacts in other areas. Some of these actions may also have long-term beneficial implications for the Yosemite Valley's soundscape environment. For example, removal of campsites from the floodplain and closure of Housekeeping Camp would reduce long-term noise exposure in the affected areas, having an overall long-term, negligible to minor, beneficial impact on the soundscape environment.

**Curry Village and Campground.** The park would construct 78 new hard-sided units in Boys Town, bringing the total number of new and retained units at Curry Village to 433. The park would remove campsites from Lower Pines (32), North Pines (86), and Upper Pines (24). In addition, the park would discontinue commercial day rides from the Curry Village Stables. Several of these actions would

require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. Facilities removal would reduce visitor-related noises within those project areas, while the construction of new units would have the opposite effect. The long-term impact on the soundscape environment would be local, minor, and beneficial.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, and install walkways leading to Yosemite Village. These actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate and adverse. The majority of these actions would occur in a developed area, largely within the footprint of existing development. As such, the long-term impact on the soundscape environment would be local, negligible, and adverse.

**Camp 4 and Yosemite Lodge.** The park would move on-grade pedestrian crossing Camp 4 and Yosemite Lodge. The park would convert the Highland Court area to a walk-in campground; reconfigure pedestrian crossing of Northside Drive and Yosemite Lodge Drive, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. The latter actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. The majority of these actions would occur in close proximity to existing development. As such, the long-term impact on the soundscape environment would be local, negligible, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have short-term, minor to moderate, and adverse impacts on the soundscape environment. Actions to manage user capacities, land use, and facilities would also have short-term, local, minor to moderate, adverse, impacts on Segment 2 soundscapes. However, the long-term impacts would be local, minor to moderate, and beneficial.

## **Segments 3 and 4: Merced River Gorge and El Portal**

### ***Impacts of Actions to Protect and Enhance River Values***

Proposed actions to protect and restore areas around valley oaks in Segment 4, such as the demolition and removal of Odgers bulk fueling facility, would require the use of heavy equipment which would result in short-term, moderate, adverse impacts on soundscapes in the project vicinity.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Management actions to address facilities under Alternative 2, specifically campsite and new employee housing development, would temporarily increase noise from construction activity and project vehicles on nearby roadways. Heavy construction equipment and haul trucks would temporarily add to the noise environment in the project vicinity. Noise from demolition/construction work would be

expected to have a short-term, moderate, adverse impact on noise-sensitive uses in the vicinity. The construction of new employee housing would contribute to increased noise associated with housing occupation in Rancheria Flatt and Abbieville. The expected impact on soundscapes would be long-term, minor, and adverse.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values within Segment 4 would have short-term, moderate, adverse impacts on soundscapes in the project vicinity. These actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, minor, adverse impacts on the soundscape environment within Segment 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River Wawona Impoundment, and Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Restoration activities in Segment 7, including the removal of Wawona Golf Course, would increase construction-related noise in the general work vicinity, and project vehicles would add to the existing traffic noise production from nearby roadways. Noise from demolition/construction work would produce a short-term, minor, adverse impact at noise-sensitive uses in the vicinity. In the long-term the removal of the golf course would result in minor, beneficial impacts as maintenance- and visitor-related sources of noise in this area would be eliminated.

**Biological Resource Actions.** Restoration activities, including relocation of two stock use campgrounds, would involve heavy equipment which would have a short-term, minor, adverse impact in the vicinity of the action within Segment 7.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Elimination of concessioner stable operations and day rides and restroom improvements at Wawona would result in short-term, minor to moderate, adverse impacts on soundscapes in the vicinity from construction noise. Reduced activity in the vicinity would contribute to a long-term, negligible, beneficial impact.

**Wawona Campground:** Under Alternative 2, the park would reduce the size of the Wawona Campground. Thirty-two campsites, or 33% of all campsites within Wawona, would be removed from the floodplain. Equipment required to remove these facilities would have short-term, moderate, adverse impacts on area soundscapes. However, the removal of campsites would reduce noise exposure in these areas, having an overall long-term, negligible, beneficial impact on the soundscape environment within Segment 7 environment.

**Segments 5-8 Impact Summary:** Actions to protect and enhance river values within Segment 7 would result in local, long-term, minor, beneficial impacts. Actions to manage user capacity, land use, and facilities would reduce a long-term noise exposure, contributing to local, negligible, beneficial impacts on the soundscape environment.

## **Summary of Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

The acoustical environment in Yosemite Wilderness would benefit from the removal of the Merced Lake High Sierra Camp and modifications to the trailhead quota system. Wilderness would continue to be shaped largely by natural sources of sound punctuated by intrusive noise generated by high-altitude aircraft overflights. The acoustical environment in nonwilderness areas would continue to be shaped primarily by noise, such as vehicles and recreational activities, and by natural sources of sound, such as rushing water and wind. Care should be taken to assess potential noise production from future uses. Temporary noise from restoration and construction operations would add to the noise environment, producing short-term, moderate, adverse noise impacts in construction areas. The construction of new facilities, namely housing and campgrounds, would produce long-term, minor, noise impacts in the vicinity of such facilities, while removal activities would have the opposite effect. Overall, with implementation of mitigation measures MM-NOI-1 through MM-NOI-3, as applicable (see Appendix C), noise would be reduced relative to Alternative 1, resulting in local, long-term, minor to moderate, benefits to soundscapes in the Merced River corridor.

## **Cumulative Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

The discussion of cumulative impacts on soundscapes is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of the actions common to Alternatives 2–6. The cumulatively considerable projects are the same as those identified for Alternative 1, above, and include only those projects that could affect noise in the Merced River corridor or could be affected by noise sources in the corridor.

### ***Overall Cumulative Impact***

Rehabilitation and restoration activities have and would continue to result in short-term, moderate, adverse impacts, primarily in nonwilderness areas. The construction of new facilities, such as employee housing, would contribute to long-term, minor, adverse noise impacts to soundscapes in the vicinity of these facilities. However, these long-term increases would be offset by long-term, moderate, beneficial impacts from removal of housing and facilities in other areas of the Merced River corridor.

## ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

### **Segment 1: Merced River above Nevada Fall**

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Changes to the trailhead quota system and removal of the Merced Lake High Sierra Camp would reduce noise exposure in Segment 1, having an overall long-term, negligible to minor, beneficial impact on soundscapes.

Merced Lake High Sierra Camp. The park would close the Merced Lake High Sierra Camp and removal all infrastructure, convert the area to designated Wilderness, and use the former camp area for a temporary stock camp. These actions would require construction efforts that would yield construction noise. In addition, such work would likely require several helicopter trips to transport camp infrastructure. This noise would be short-term due to the temporary nature of the operations. Where these operations are near sensitive receivers, such as occupied campsites, they would be expected to produce short-term, moderate, adverse impacts on soundscapes in the vicinity. Where they are not near sensitive receivers, the noise impacts of these actions would be negligible.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have short-term, moderate, adverse impacts due to construction noise; but have an overall long-term, negligible to minor, beneficial impact on soundscapes due to reduced visitation.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve removal of buildings from the Yosemite Lodge area, and rerouting and revegetating a portion of the Valley Loop Trail. This work would require the use of heavy equipment and likely take several weeks to a few months to complete. The resulting impacts on the natural soundscape environment within these areas would be short-term, minor to moderate, and adverse.

**Biological Resource Actions.** In Segment 2, restorative actions including removal of portions of Northside Drive, restoration at Stoneman and El Capitan Meadows, redesign and reduction in size of Curry Orchard Parking lot, removal of abandoned infrastructure and Upper and Lower Rivers Campground, removal of campsites in Valley campgrounds, and rerouting of trail in various meadows, would include the use of heavy equipment which would have short-term, moderate, adverse impacts.

**Hydrologic/Geologic Resource Actions.** The removal of Awhawnee and Sugar Pine bridges and associated berms under Alternative 3 would involve the use of heavy equipment and explosives to drop the bridge and dismantle the abutments. Operation of this equipment would have a short-term, moderate to major, adverse impact in the vicinity of the action.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 3, including work at Curry Village and west of Yosemite Lodge, new housing development at Yosemite Lodge, new camping facilities east of Camp 4 and at Upper Pines Campground, along with several small transit and pedestrian access improvements, would require construction efforts and the use of heavy equipment. Construction noise would have a short-term, moderate, adverse impact.

New camping and parking facilities would result in long-term, minor impacts to soundscapes while the removal of campsites and parking would result in long-term, minor, beneficial impacts in other areas. Some of these actions may also have long-term beneficial implications for the Yosemite Valley's

soundscape environment. For example, removal of campsites from the floodplain and closure of Housekeeping Camp would reduce long-term noise exposure in the affected areas, having an overall long-term, negligible to minor, beneficial impact on the soundscape environment.

**Curry Village and Campground.** The park would retain 355 guest units at Curry Village. The park would remove campsites from Lower Pines (15), North Pines (34), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. Several of these actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. Facilities removal would reduce visitor-related noises within those project areas. The long-term impact on the soundscape environment would be local, minor, and beneficial.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, and install walkways leading to Yosemite Village. These actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate and adverse. The majority of these actions would occur in a developed area, largely within the footprint of existing development. As such, the long-term impact on the soundscape environment would be local, negligible, and adverse.

**Camp 4 and Yosemite Lodge.** The park would move on-grade pedestrian crossing to west of the Northside Drive and Yosemite Lodge Drive, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. The latter actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. The majority of these actions would occur in close proximity to existing development. As such, the long-term impact on the soundscape environment would be local, negligible, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have short-term, minor to moderate and adverse impacts on the soundscape environment, but would not be expected to have long-term impacts. Actions to manage user capacities, land use, and facilities would local, long-term, minor to moderate, beneficial impacts on the soundscape environment.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Proposed actions to protect and restore areas around valley oaks in Segment 4, such as the demolition and removal of Odgers bulk fueling facility, would require the use of heavy equipment which would result in short-term, moderate, adverse impacts on soundscapes in the project vicinity.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Management actions to address facilities under Alternative 3, specifically new employee housing development, would temporarily increase noise from construction activity and project vehicles on nearby roadways. Heavy construction equipment and haul trucks would temporarily add to the noise environment in the project vicinity. Increases in exposure to local roadway traffic noise. Noise from demolition/construction work would be expected to have a short-term, moderate, adverse impact on noise-sensitive uses in the vicinity. The construction of new employee housing would contribute to increased noise associated with housing occupation in El Portal. The expected impact on soundscapes would be long-term, minor, and adverse.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values within Segment 4 would have short-term, moderate, adverse impacts on soundscapes in the project vicinity, but would not be expected to have long-term impacts. Actions to manage user capacities, land use, and facilities would have long-term, negligible to minor, adverse impacts on the soundscape environment within Segment 4.

**Segment 5, 6, 7, and 8: South Fork Merced River Wawona Impoundment, and Wawona*****Impacts of Actions to Protect and Enhance River Values***

Restoration activities in Segment 7, including those at the Wawona Golf Course, would increase construction-related noise in the general work vicinity, and project vehicles would add to the existing traffic noise production from nearby roadways. Heavy construction equipment and haul trucks would temporarily add to the noise environment in the project vicinity. Noise from demolition/construction work would produce a short-term, minor, adverse impact at noise-sensitive uses in the vicinity. In the long-term the removal of the golf course would result in minor, beneficial impacts as maintenance- and visitor-related sources of noise in this area would be eliminated.

**Biological Resource Actions.** Restoration activities, including relocation of two stock use campgrounds from Segment 7, would involve heavy equipment which would have a short-term, minor, adverse impact in the vicinity of the action.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Elimination of the concessioner stable operations and day rides and restroom improvements at Wawona would result in short-term, minor to moderate, adverse impacts on soundscapes in the vicinity from construction noise. Reduced activity in the vicinity would contribute to a long-term, negligible, beneficial impact.

**Wawona Campground.** Under Alternative 3, the park would reduce the size of the Wawona Campground. Twenty seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. Equipment required to remove these facilities would have short-term, moderate, adverse impacts on area soundscapes. However, the removal of campsites would reduce noise exposure in these areas, having an overall long-term, negligible, beneficial impact on the soundscape environment within Segment 7.

**Segments 5-8 Impact Summary:** Actions to protect and enhance river values within Segment 7 would result in local, long-term, minor, beneficial impacts. Actions to manage user capacity, land use, and facilities would reduce n long-term noise exposure, contributing to local, negligible, beneficial impacts on the soundscape environment.

### **Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

The acoustical environment in Yosemite Wilderness would benefit from the removal of the Merced Lake High Sierra Camp and modifications to the trailhead quota system. Wilderness would continue to be shaped largely by natural sources of sound punctuated by intrusive noise generated by high-altitude aircraft overflights. The acoustical environment in nonwilderness areas would continue to be shaped primarily by noise, such as vehicles and recreational activities, and by natural sources of sound, such as rushing water and wind. Care should be taken to assess potential noise production from future uses. Temporary noise from restoration and construction operations would add to the noise environment, producing short-term, moderate, adverse noise impacts in construction areas. The construction of new facilities, namely housing and campgrounds, would produce long-term, minor, noise impacts in the vicinity of such facilities, while removal activities would have the opposite effect. Overall, with implementation of mitigation measures MM-NOI-1 through MM-NOI-3, as applicable (see Appendix C), noise would be reduced relative to Alternative 1, resulting in local, long-term, minor to moderate benefits to soundscapes in the Merced River corridor.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

The discussion of cumulative impacts on soundscapes is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of the actions common to Alternatives 2–6. The cumulatively considerable projects would be the same as those identified for Alternative 1, above, and include only those that could affect noise in the Merced River corridor or could be affected by noise sources in the corridor.

### ***Overall Cumulative Impact***

Rehabilitation and restoration activities have and would continue to result in short-term, moderate, adverse impacts, primarily in non-wilderness areas. The construction of new facilities, such as employee housing, would contribute to long-term, minor, adverse noise impacts to soundscapes in the vicinity of these facilities. However, these long-term increases would be offset by long-term, minor, beneficial impacts from removal of housing and facilities in other areas of the Merced River corridor.

## ***Environmental Consequences of Alternative 4: Resource-Based Visitor Experiences and Targeted Riverbank Restoration***

### **Segment 1: Merced River above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

The park proposes no actions to protect and enhance river values in Segment 1 that would occur only under Alternative 4.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Changes to the trailhead quota system and removal of the Merced Lake High Sierra Camp would reduce noise exposure in Segment 1, having an overall long-term, negligible to minor, beneficial impact on the soundscape environment.

Merced Lake High Sierra Camp. The park would close the Merced Lake High Sierra Camp and removal all infrastructure, convert the area to designated Wilderness, and restoration of the former camp area to natural conditions. These actions would require construction efforts that would yield construction noise. In addition, such work would likely require several helicopter trips to transport camp infrastructure. This noise would be short-term due to the temporary nature of the operations. Where these operations are near sensitive receivers, such as occupied campsites, they would be expected to have short-term, moderate, adverse impacts on soundscapes in the vicinity.

**Segment 1 Impact Summary:** Actions to Manage User Capacities, Land Use, and Facilities within Segment 1 would have short-term, moderate, adverse impacts due to construction noise; but have an overall long-term, negligible to minor, beneficial impact on soundscapes due to reduced visitation.

### **Segment 2: Yosemite Valley**

#### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 2, restorative actions to protect and enhance river values, such as parking area relocation, and trail and shoreline access management measures, would increase temporary demolition/construction noise and project-related vehicle noise in the project areas. Heavy construction equipment and would temporarily add to the noise environment in the project vicinity. Noise from demolition/construction work would have a short-term, minor, adverse impact on noise-sensitive uses in the vicinity.

**Biological Resource Actions.** In Segment 2, restoration at Housekeeping Camp and Stoneman Meadow, redesign and reduction in size of Curry Orchard Parking lot, removal of abandoned infrastructure at Upper and Lower Rivers Campground, removal of campsites in Valley campgrounds, and rerouting of trail in various meadows, would include the use of heavy equipment which would have short-term, moderate, adverse impacts.

**Hydrologic/Geologic Resource Actions.** The removal of Awhawnee and Sugar Pine bridges and associated berms under Alternative 4 would involve the use of heavy equipment and explosives to drop the bridge and dismantle the abutments. Operation of this equipment would have a short-term, moderate to major, adverse impact in the vicinity of the action.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 4, including the removal of lodging units, construction of new campgrounds, and parking improvements at Curry Village, Camp 6, and Yosemite Lodge, would require construction efforts that would involve heavy equipment. Construction noise would have a short-term, moderate, adverse impact.

New camping and parking facilities would result in long-term, minor impacts to soundscapes while the removal of campsites and parking would result in long-term, minor, beneficial impacts in other areas.

**Curry Village and Campground.** The park would retain 355 guest units and construct a new 40 site campground at Curry Village. The park would remove campsites from Lower Pines (15), North Pines (34), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. Several of these actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. Facilities removal would reduce visitor-related noises within those project areas. The long-term impact on the soundscape environment would be local, minor, and beneficial.

**Camp 6 and Yosemite Village.** The park would improve the configuration of and on-grade pedestrian crossing at the Northside Drive-Yosemite Village Drive intersection, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 750 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. These actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate and adverse. The majority of these actions would occur in a developed area, largely within the footprint of existing development. However, the increase in parking availability would likely increase visitor-related noise in the vicinity of the parking lot. As such, the long-term impact on the soundscape environment would be local, negligible to minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. The latter actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. The majority of these actions would occur in close proximity to existing development. As such, the long-term impact on the soundscape environment would be local, negligible, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have short-term, minor, adverse impacts on the soundscape environment, but would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would local, long-term, minor, beneficial impacts on the soundscape environment.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### *Impacts of Actions to Protect and Enhance River Values*

**Biological Resource Actions.** Proposed actions to protect and restore areas around valley oaks in Segment 4, such as the demolition and removal of Odgers bulk fueling facility, would require the use of heavy equipment which would result in short-term, moderate, adverse impacts on soundscapes in the project vicinity.

#### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Management actions to address facilities under Alternative 4, specifically new employee housing development, would temporarily increase noise from construction activity and project vehicles on nearby roadways. Heavy construction equipment and haul trucks would temporarily add to the noise environment in the project vicinity. Noise from demolition/construction work would be expected to have a short-term, moderate, adverse impact on noise-sensitive uses in the vicinity. The construction of new employee housing would contribute to increased noise associated with housing occupation in Rancheria. The expected impact on soundscapes within Segment 4 would be long-term, minor, and adverse.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values within Segment 4 would have short-term, moderate, adverse impacts on soundscapes in the project vicinity, but would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, minor, adverse impacts on the soundscape environment within Segment 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River Wawona Impoundment, and Wawona**

#### *Impacts of Actions to Protect and Enhance River Values*

**Biological Resource Actions.** Restoration activities, including relocation of two stock use campgrounds within Segment 7, would involve heavy equipment which would have a short-term, moderate, adverse impact in the vicinity of the action.

#### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Elimination of the concessioner stable operations and day rides, campsite removal and relocation, and restroom improvements at Wawona would result in short-term, moderate, adverse impacts on soundscapes in the vicinity from construction noise. The removal of campsites from culturally

sensitive areas would reduce noise exposure in these areas, having an overall long-term, negligible, beneficial impact on the soundscape environment within Segment 7.

**Wawona Campground.** Under Alternative 4, the park would reduce the size of the Wawona Campground. Twenty-seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. Equipment required to remove these facilities would have short-term, moderate, adverse impacts on area soundscapes. However, the removal of campsites would reduce noise exposure in these areas, having an overall long-term, negligible, beneficial impact on the soundscape.

**Segments 5-8 Impact Summary:** Actions to protect and enhance river values within Segment 7 would result in local, long-term, minor, beneficial soundscape impact. Actions to manage user capacity, land use, and facilities would reduce long-term noise exposure, contributing to local, negligible, beneficial impacts on the soundscape environment.

### **Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

The acoustical environment in Yosemite Wilderness would benefit from the removal of the Merced Lake High Sierra Camp and modifications to the trailhead quota system. Wilderness would continue to be shaped largely by natural sources of sound punctuated by intrusive noise generated by high-altitude aircraft overflights. The acoustical environment in nonwilderness areas would continue to be shaped primarily by noise, such as vehicles and recreational activities, and by natural sources of sound, such as rushing water and wind. Care should be taken to assess potential noise production from future uses. Temporary noise from restoration and construction operations would add to the noise environment, producing short-term, moderate, adverse noise impacts in construction areas. The construction of new facilities, namely housing and campgrounds, would produce long-term, minor, noise impacts in the vicinity of such facilities, while removal activities would have the opposite effect. Overall, with implementation of mitigation measures MM-NOI-1 through MM-NOI-3, as applicable (see Appendix C), noise would be reduced relative to Alternative 1, resulting in local, long-term, minor benefits to soundscapes in the Merced River corridor.

### **Cumulative Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

The discussion of cumulative impacts on soundscapes is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of the actions common to Alternatives 2–6. The cumulatively considerable projects would be the same as those identified for Alternative 1, above, and include only those that could affect noise in the Merced River corridor or could be affected by noise sources in the corridor.

### ***Overall Cumulative Impact***

Rehabilitation and restoration activities have and would continue to result in short-term, moderate, adverse impacts, primarily in non-wilderness areas. The construction of new facilities, such as employee housing, would contribute to long-term, minor, adverse noise impacts to soundscapes in the

vicinity of these facilities. However, these long-term increases would be offset by long-term, minor, beneficial impacts from removal of housing and facilities in other areas of the Merced River corridor.

### ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential River Bank Restoration***

#### **Segment 1: Merced River above Nevada Fall**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Alternative 5 actions related to visitor use and facilities in Segment 1, including removal of certain facilities and infrastructure, would require construction efforts that would yield construction noise. In addition, such work would likely require several helicopter trips to transport camp infrastructure. This noise would be short-term due to the temporary nature of the operations. Where these operations are near sensitive receivers, such as occupied campsites, they would be expected to have short-term, moderate, adverse impacts on soundscapes in the vicinity.

**Merced Lake High Sierra Camp.** The park would reduce the capacity of the Merced Lake High Sierra Camp to 42 beds and replace the flush toilets with composting toilets. The effort and equipment required remove these facilities would be similar to that described above, resulting in a short-term, moderate, adverse impact on soundscapes in the vicinity of the Camp. Reductions in the number of Merced Lake High Sierra Camp overnight visitors would reduce noise exposure in Segment 1, having an overall long-term, negligible, beneficial impact on soundscapes.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have short-term, moderate, adverse impacts due to construction noise; but have an overall long-term, negligible, beneficial impact on soundscapes due to reduced visitation.

#### **Segment 2: Yosemite Valley**

##### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve rerouting, revegetating, and constructing a boardwalk along a portion of the Valley Loop Trail. This work would require the use of heavy equipment and haul trucks. As such, the work associated with these actions would result in a short-term, minor to moderate, adverse impact on Segment 2 soundscapes.

**Biological Resource Actions.** In Segment 2, restoration at Housekeeping Camp and Stoneman Meadow, removal of abandoned infrastructure at Upper and Lower Rivers Campground, removal of campsites in Valley campgrounds, and rerouting of trail in various meadows, would include the use of heavy equipment which would have short-term, moderate, adverse impacts.

**Hydrologic/Geologic Resource Actions.** The removal of Sugar Pine Bridges and its associated berm under Alternative 5 would involve the use of heavy equipment and explosives to drop the bridge and

dismantle the abutments. Operation of this equipment would have a short-term, moderate to major, adverse impact in the vicinity of the action.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 5, including the removal of lodging units, construction of new campgrounds, and parking improvements at Curry Village, Camp 6, and Yosemite Lodge, would require construction efforts that involve the use of heavy equipment. Construction noise and associated traffic would have a short-term, moderate, adverse impact. New camping and parking facilities would result in long-term, minor impacts to soundscapes while the removal of campsites and parking would result in long-term, minor, beneficial impacts in other areas.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from Lower Pines (5), North Pines (14), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. Several of these actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. Facilities removal would reduce visitor-related noises within those project areas, while the construction of new units would have the opposite effect. The long-term impact on the soundscape environment would be local, negligible, and adverse.

**Camp 6 and Yosemite Village.** The park would construct a pedestrian underpass and a traffic circle at the intersection of Northside and Yosemite Village Drives, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. These actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate and adverse. The majority of these actions would occur in a developed area, largely within the footprint of existing development. However, the increase in parking availability would likely increase visitor-related noise in the vicinity of the parking lot. As such, the long-term impact on the soundscape environment would be local, minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 300 automobiles and 15 tour busses. The latter actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. The majority of these actions would occur in close proximity to existing development. As such, the long-term impact on the soundscape environment would be local, minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have short-term, minor to moderate, adverse impacts on the soundscape environment, but would not

be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible to minor, beneficial impacts on the soundscape environment.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Proposed actions to protect and restore areas around valley oaks in Segment 4, such as the demolition and removal of Odgers bulk fueling facility, would require the use of heavy equipment which would result in short-term, moderate, adverse impacts on soundscapes in the project vicinity.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Management actions to address facilities under Alternative 5, namely new employee housing development, would temporarily increase noise from construction activity and project vehicles on nearby roadways. Heavy construction equipment and haul trucks would temporarily add to the noise environment in the project vicinity. Noise from demolition/construction work would be expected to have a short-term, moderate, adverse impact on noise-sensitive uses in the vicinity. The construction of new employee housing would contribute to increased noise associated with housing occupation in Rancheria. The expected impact on Segment 4 soundscapes would be long-term, minor, and adverse.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values within Segment 4 would have short-term, moderate, adverse impacts on soundscapes in the project vicinity, but would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, minor, adverse impacts on the soundscape environment within Segment 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River Wawona Impoundment, and Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

**Biological Resource Actions.** Restoration activities, including relocation of two stock use campgrounds, would involve heavy equipment which would have a short-term, moderate, adverse impact on the Segment 7 soundscape environment.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Campsite removal and relocation, and restroom improvements at Wawona, would require construction efforts that would result in short-term, moderate, adverse impacts on soundscapes in the vicinity from construction noise.

**Wawona Campground.** Under Alternative 5, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. Equipment required to remove these facilities would have short-term, moderate,

adverse impacts on area soundscapes. However, the removal of campsites would reduce noise exposure in these areas, having an overall long-term, negligible, beneficial impact on the soundscape.

**Segments 5-8 Impact Summary:** Actions to protect and enhance river values within Segment 7 would result in local, long-term, minor, beneficial impacts. Actions to manage user capacity, land use, and facilities would reduce long-term noise exposure, contributing to local, negligible, beneficial impacts on the soundscape environment.

### **Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

The acoustical environment in Yosemite Wilderness would benefit from the removal of the Merced Lake High Sierra Camp and modifications to the trailhead quota system. Wilderness would continue to be shaped largely by natural sources of sound punctuated by intrusive noise generated by high-altitude aircraft overflights. The acoustical environment in nonwilderness areas would continue to be shaped primarily by noise, such as vehicles and recreational activities, and by natural sources of sound, such as rushing water and wind. Care should be taken to assess potential noise production from future uses. Temporary noise from restoration and construction operations would add to the noise environment, producing short-term, moderate, adverse noise impacts in construction areas. The construction of new facilities, namely housing and campgrounds, would produce long-term, minor, noise impacts in the vicinity of such facilities, while removal activities would have the opposite effect. Overall, with implementation of mitigation measures MM-NOI-1 through MM-NOI-3, as applicable (see Appendix C), noise would be reduced relative to Alternative 1, resulting in local, long-term, negligible to minor benefits to soundscapes in the Merced River corridor.

### **Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

The discussion of cumulative impacts on soundscapes is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of the actions common to Alternatives 2–6. The cumulatively considerable projects would be the same as those identified for Alternative 1, above, and include only those that could affect noise in the Merced River corridor or could be affected by noise sources in the corridor.

#### ***Overall Cumulative Impact***

Rehabilitation and restoration activities have and would continue to result in short-term, moderate, adverse impacts, primarily in non-wilderness areas. The construction of new facilities, such as employee housing, would contribute to long-term, minor, adverse noise impacts to soundscapes in the vicinity of these facilities. However, these long-term increases would be offset by long-term, minor, beneficial impacts from removal of housing and facilities in other areas of the Merced River corridor.

## ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

### **Segment 1: Merced River above Nevada Fall**

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Alternative 6 actions related to visitor use and facilities in Segment 1, including removal and replacement of certain facilities and infrastructure, would require construction efforts that would yield construction noise. In addition, such work may require one or more helicopter trips to transport camp infrastructure. This noise would be short-term due to the temporary nature of the operations. Where these operations are near sensitive receivers, such as occupied campsites, they would be expected to have short-term, minor to moderate, adverse impacts on soundscapes in the vicinity.

**Merced Lake High Sierra Camp.** The park would retain the Merced Lake High Sierra Camp and replace the flush toilets with composting toilets. The effort and equipment required to undertake these actions would be similar to that described above, resulting in a short-term, minor to moderate, adverse impact on soundscapes in the vicinity of the Camp.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have short-term, minor to moderate, adverse impacts due to construction noise, but would not be expected to have any appreciable long-term impacts.

### **Segment 2: Yosemite Valley**

#### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve removing buildings from the Yosemite Lodge area, and rerouting, revegetating, and constructing a boardwalk along a portion of the Valley Loop Trail. This work would require the use of heavy equipment and likely take several weeks to a few months to complete. The resulting impacts on the natural soundscape environment within these areas would be short-term, minor to moderate, and adverse.

**Biological Resource Actions.** In Segment 2, restoration at Housekeeping Camp and Stoneman Meadow, removal of abandoned infrastructure at Upper and Lower Rivers Campground, removal of campsites in Valley campgrounds, and rerouting of trail in various meadows, would include the use of heavy equipment which would have short-term, moderate, adverse impacts. Under this alternative, Sugar Pine Bridge would be retained, constructed log jams and large wood installed at its base, and its condition monitored. Should long-term monitoring reveal mitigation measures are not sufficient, the park may undertake more aggressive management action, including removal of the bridge. Such action would require the use of heavy equipment and explosives to drop the bridge and dismantle the abutments. In this scenario, the impact on the Segment 2 soundscape environment would be short-term, moderate to major, and adverse.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 6, including parking improvements at Curry Village, Camp 6, and in the vicinity of Yosemite Lodge, and new lodging units and campsites at several locations, would require construction efforts that would produce construction noise.

Construction noise would have a short-term, moderate, adverse impact. New camping and parking facilities would result in long-term, minor impacts to soundscapes while the removal of campsites and parking would result in long-term, minor, beneficial impacts in other areas.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from Lower Pines (5), North Pines (14), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. Several of these actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. Facilities removal would reduce visitor-related noises within those project areas, while the construction of new units would have the opposite effect. The long-term impact on the soundscape environment would be local, negligible, and adverse.

**Camp 6 and Yosemite Village.** The park would expand the Concessioner Warehouse Building to accommodate Concessioner General Office functions, construct a pedestrian underpass and two roundabouts, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. These actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate and adverse. The majority of these actions would occur in a developed area, largely within the footprint of existing development. However, the increase in parking availability would likely increase visitor-related noise in the vicinity of the parking lot. As such, the long-term impact on the soundscape environment would be local, minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 300 automobiles and 15 tour busses. The latter actions would require the use of heavy construction equipment and would increase construction-related traffic during project implementation. The resulting short-term impact on the soundscape environment would be local, minor to moderate, and adverse. The majority of these actions would occur in close proximity to existing development. As such, the long-term impact on the soundscape environment would be local, minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have short-term, minor to moderate, adverse impacts on the soundscape environment, but would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, adverse impacts on the soundscape environment.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Proposed actions to protect and restore areas around valley oaks in Segment 4, such as the demolition and removal of Odgers bulk fueling facility, would require the use of heavy equipment which would result in short-term, moderate, adverse impacts on Segment 4 soundscapes in the project vicinity.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Management actions to address facilities under Alternative 6, specifically new employee housing development, would temporarily increase noise from construction activity and project vehicles on nearby roadways. Heavy construction equipment and haul trucks would temporarily add to the noise environment in the project vicinity. Noise from demolition/construction work would be expected to have a short-term, moderate, adverse impact on noise-sensitive uses in the vicinity. The construction of new employee housing would contribute to increased noise associated with housing occupation in Rancheria Flatt and Abbieville. The expected impact on Segment 4 soundscapes would be long-term, minor, and adverse.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values within Segment 4 would have short-term, moderate, adverse impacts on soundscapes in the project vicinity, but would not be expected to have any long-term impacts. Actions to manage user capacities, land use, and facilities would have short- and long-term, minor, and adverse impacts on the soundscape environment within Segment 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River, Wawona Impoundment, and Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

**Biological Resource Actions.** Restoration activities, including relocation of two stock use campgrounds, would involve heavy equipment which would have a short-term, moderate, adverse impact in the vicinity of the action within Segment 7.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Elimination of the concessioner stable operations and day rides, and changes to visitor and administrative facilities, and various visitor access and transportation improvements in Segment 7 would require construction efforts that would result in short-term, minor to moderate, adverse impacts on soundscapes in the vicinity from construction noise. Reduced activity in the vicinity would contribute to a long-term, negligible, beneficial impact.

**Wawona Campground.** Under Alternative 6, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. Equipment required to remove these facilities would have short-term, moderate, adverse impacts on area soundscapes. However, the removal of campsites would reduce noise exposure in these areas, having an overall long-term, negligible, beneficial impact on the soundscape.

**Segments 5-8 Impact Summary:** Actions to protect and enhance river values within Segment 7 would result in local, long-term, minor, beneficial impacts. Actions to manage user capacity, land use, and facilities would reduce n long-term noise exposure, contributing to local, negligible, beneficial impacts on the soundscape environment.

### **Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

The acoustical environment in Yosemite Wilderness would not be affected by actions associated with Alternative 6, but would continue to be shaped largely by natural sources of sound punctuated by intrusive noise generated by high-altitude aircraft overflights. The acoustical environment in nonwilderness areas would continue to be shaped primarily by noise, such as vehicles and recreational activities, and by natural sources of sound, such as rushing water and wind. Care should be taken to assess potential noise production from future uses. Temporary noise from restoration and construction operations would add to the noise environment, producing short-term, moderate, adverse noise impacts in construction areas. The construction of new facilities, namely housing and campgrounds, and parking lots would produce long-term, minor, noise impacts in the vicinity of such facilities. Increased visitation would similarly increase noise throughout Yosemite Valley. Overall, with implementation of mitigation measures MM-NOI-1 through MM-NOI-3, as applicable (see Appendix C), noise would be increased relative to Alternative 1, resulting in a long-term, minor, adverse impact on soundscapes in the Merced River corridor.

### **Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

The discussion of cumulative impacts on soundscapes is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of the actions common to Alternatives 2–6. The cumulatively considerable projects would be the same as those identified for Alternative 1, above, and include only those that could affect noise in the Merced River corridor or could be affected by noise sources in the corridor.

### ***Overall Cumulative Impact***

Rehabilitation and restoration activities have and would continue to result in short-term, moderate, adverse impacts, primarily in non-wilderness areas. Increased visitation, in combination with new facilities construction and operation, such as employee housing, would contribute to long-term, minor, adverse noise impacts to soundscapes in the vicinity of these facilities.

## Air Quality

### *Affected Environment*

The primary factors that influence air quality are the locations of air pollutant sources, the types and amounts of pollutants emitted, meteorological conditions, and topographic features. Atmospheric conditions, such as wind speed, wind direction, and air temperature gradients, interact with the physical features of the landscape to determine the movement and dispersal of air pollutants. Air quality in the Merced River corridor and potential impacts associated with the project alternatives are discussed below.

### Regulatory Context

Regulation of air pollution is achieved through both national and state ambient air quality standards and emissions limits for individual sources of air pollutants.

#### *Federal and State Ambient Air Quality Standards*

The Clean Air Act of 1970 (42 USC 7401 et seq.) tasked the U.S. Environmental Protection Agency (EPA) with establishing national ambient air quality standards (NAAQS) and periodically reassessing whether these standards are adequate to protect public health and the national welfare, including those resources and values associated with national parks and wilderness areas. The NAAQS set thresholds for *criteria pollutants*, including ozone (O<sub>3</sub>), carbon monoxide (CO), nitrogen oxides (NO<sub>x</sub>), sulfur dioxide (SO<sub>2</sub>), suspended particulate matter (PM), and lead (Pb). Since that time, subsets of particulate matter have been identified for which permissible levels have been established. These include particulate matter of 10 microns in diameter or less (PM<sub>10</sub>) and particulate matter of 2.5 microns in diameter or less (PM<sub>2.5</sub>).

Under the 1988 California Clean Air Act, the California Air Resources Board has also adopted standards for these criteria pollutants (called California Ambient Air Quality Standards, or CAAQS) and applies additional standards for pollutants that are not currently included in the national standards. The federal and state ambient standards differ in some cases; in general, the California standards are more stringent, particularly for ozone and PM<sub>10</sub>. Both the EPA and the California Air Resources Board classify air basins in California as either in “attainment” or “nonattainment” with their respective standards. Areas that were once designated as nonattainment, but are now achieving the NAAQS, are termed “maintenance areas.” **Table 9-131** shows the current state and federal ambient air quality standards.

The federal government delegates the inventory of all criteria pollutants to the state, which performs this regulatory function and assesses air quality under NAAQS and CAAQS by inventorying emissions and regulating the concentrations of primary pollutants. Some of these standards contain both primary standards for human health and secondary standards for more indirect (e.g., ecological) endpoints, including acidification and eutrophication of lakes. The National Park Service (NPS) assists the State of California by measuring concentrations of pollutants and monitoring ecological endpoints to help evaluate the effectiveness of secondary NAAQS and CAAQS.

**TABLE 9-131: AMBIENT AIR QUALITY STANDARDS**

Pollutant	Averaging Time	State Standard	Federal Primary Standard	Federal Secondary Standard	Major Pollutant Sources
Ozone	8 hour	0.070 ppm	0.075 ppm	Same as primary standard	Formed when ROG and NOx react in the presence of sunlight. Major sources include on-road motor vehicles, solvent evaporation, and commercial/industrial mobile equipment
	1 hour	0.090 ppm	---		
Carbon Monoxide	8 hour	9.0 ppm	9.0 ppm	None	Internal combustion engines, primarily gasoline-powered motor vehicles
	1 Hour	20 ppm	35 ppm		
Nitrogen Dioxide	Annual Average	0.030 ppm	0.053 ppm	Same as primary standard	Motor vehicles, petroleum refining operations, industrial sources, aircraft, ships, and railroads
	1 Hour	0.180 ppm	0.100 ppm		
Sulfur Dioxide	Annual Average	---	---	--	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing
	24 Hour	0.04 ppm	---		
	3 Hour	---	---	0.5 ppm	
	1 Hour	0.25 ppm	0.075 ppm	--	
Particulate Matter (PM10)	Annual Arithmetic Mean	20 µg/m3	---	Same as primary standard	Dust- and fume-producing industrial and agricultural operations, combustion, atmospheric photochemical reactions, prescribed and wildland fires, and natural activities (e.g., wind-raised dust and ocean sprays)
	24 hour	50 µg/m3	150 µg/m3		
Particulate Matter (PM2.5)	Annual Arithmetic Mean	12 µg/m3	15 µg/m3	Same as primary standard	Fuel combustion in motor vehicles, equipment, and industrial sources; residential and agricultural burning; prescribed and wildland fires; also, formed from photochemical reactions of other pollutants, including NOx, sulfur oxides, and organics
	24 hour	---	35 µg/m3		
Lead	Calendar Quarter	---	1.5 µg/m3	Same as primary standard	Present source: lead smelters, battery manufacturing and recycling facilities. Past source: combustion of leaded gasoline.
	30-Day Average	1.5 µg/m3	---	---	
Hydrogen Sulfide	1 hour	0.03 ppm	No Federal Standard		Geothermal power plants, petroleum production and refining
Visibility-Reducing Particles	8 hour	Extinction of 0.23/km; visibility of 10 miles or more			See PM2.5.

### ***The State Implementation Plans***

The state and federal Clean Air Acts require nonattainment air districts to develop plans, known as State Implementation Plans (SIPs). SIPs are comprehensive plans that describe how the district would attain NAAQS. The 1990 amendments to the federal Clean Air Act set deadlines for attainment based on the severity of an area's air pollution problem. SIPs are not single documents. They are a compilation of new and previously submitted plans, programs (e.g., monitoring, modeling, permitting), district rules, state regulations, and federal controls. Many of California's SIPs rely on the same core set of control strategies, including emission standards for cars and heavy trucks, fuel regulations, and limits on emissions from consumer products. State law makes the California Air Resources Board the lead agency for all purposes related to the SIP. Local air districts and other agencies prepare SIP elements and submit them to the California Air Resources Board for review and approval. The California Air Resources Board forwards SIP revisions to the EPA for approval and publication in the Federal Register. The Code of Federal Regulations, title 40, chapter I, part 52, subpart F, section 52.220 lists all of the items that are included in the California SIP. At any one time, several California submittals are pending EPA approval.

The portion of the South Fork Merced River corridor within Yosemite National Park crosses into both Mariposa and Madera counties, which are located in the Mountain Counties Air Basin and the San Joaquin Valley Air Basin, respectively. The Mountain Counties Air Basin has been designated as nonattainment for state and federal ozone standards. Only the Yosemite National Park portion of Mariposa County is designated as nonattainment for the state PM<sub>10</sub> standard, primarily due to local sources near the Yosemite Valley Visitor Center monitoring site. Similarly, the San Joaquin Valley Air Basin has also been designated as nonattainment for state and federal ozone standards, state PM<sub>10</sub> standards, and state and federal PM<sub>2.5</sub> standards. The Mariposa County Air Pollution Control District (MCAPCD) is the regional agency responsible for rulemaking, permitting, and enforcement activities affecting stationary sources in Mariposa County. No air quality plans have been prepared for the Mariposa County portion of the Mountain Counties Air Basin. The state has not required an ozone plan because of the overwhelming influence of pollutant transport on ozone conditions in Mariposa County. With regard to the Madera County portion of the San Joaquin Valley Air Basin, the San Joaquin Valley Air Pollution Control District (SJVAPCD) has developed air quality plans for 1-hour and 8-hour ozone, as well as for PM<sub>10</sub> and PM<sub>2.5</sub>.

### ***General Conformity***

Under the 1990 amendment to the Clean Air Act (section 176(c)(4)), a general conformity rule was established to ensure that actions taken by federal agencies in nonattainment areas conform to state goals for the attainment and maintenance of the NAAQS. In 1993 the EPA published guidance on this rule that assists federal agencies in deciding whether a conformity determination is required, and if so, how to make such a determination (EPA 1993). The general conformity rule is currently undergoing revision.

Management actions identified herein that would occur in Mariposa County would likely be subject to the General Conformity Rule, given that the county is now a nonattainment area for the national 8-hour ozone standard. The de minimus thresholds<sup>1</sup> for ozone are 50 tons per year of volatile organic

---

<sup>1</sup> The minimum threshold for which a conformity determination must be performed.

compounds (VOC) and 100 tons per year of nitrogen oxides (NO<sub>x</sub>). Actions that would occur in Madera County are currently, and would continue to be, subject to the rule because the county lies in an area (San Joaquin Valley Air Basin) that has been designated as nonattainment for national ozone and PM<sub>10</sub> standards, which is the subject of the ozone SIP and a PM<sub>10</sub> SIP. As a result of the San Joaquin Valley Air Basin's recent designation as an extreme nonattainment area, the applicable de minimis standards for ozone are lower — 10 tons per year of VOC and 10 tons per year of NO<sub>x</sub>. With respect to particulates, Madera County's applicable de minimis threshold for PM<sub>2.5</sub> is 100 tons per year.

### *Mandatory Class I Areas*

In addition to the state and federal requirements described above for nonattainment areas, section 162(a) of the federal Clean Air Act sets forth additional provisions for the protection of air quality across certain federal lands, such as national parks, national wilderness areas, and national monuments. Yosemite National Park was designated as a Class I area in 1977. This designation gives Federal Land Managers (FLMs) the responsibility for protecting air quality related values (AQRVs) from the adverse impacts of new or modified sources of emissions. Generally, an AQRV is a resource, as identified by the FLM, that may be adversely affected by a change in air quality and may include visibility or a specific scenic, cultural, physical, biological, ecological, or recreational resource identified by the FLM for a particular federal area (NPS, 2011t). In order to achieve greater consistency in the approach each agency uses to identify and evaluate AQRVs, air resource managers from the U.S. Forest Service (USFS), the NPS, and the U.S. Fish and Wildlife Service (FWS) FLMs established the Federal Land Managers' Air Quality Related Values Work Group (FLAG) in order to:

- Define sensitive AQRVs,
- Identify the critical loads (or pollutant levels) that would protect an area and identify the criteria that define adverse impacts, and
- Standardize the methods and procedures for conducting AQRV analyses. (USFS et al. 2010)

AQRVs that have been identified for Yosemite National Park include visibility, pine (injury from ozone), high elevation lakes (acidity), and lichen (sensitive to vehicle-derived reactive nitrogen deposition) (Tarnay 2012).

In 1999, the EPA published a regional haze rule to guide the preparation of state regional haze plans to improve air quality and reduce haze in Class I federal areas. The ultimate goal of the rule is to restore natural visibility conditions in Class I areas, such as Yosemite National Park, by 2064. Under the regulations, all states are required to develop implementation plans that demonstrate reasonable progress toward this goal. In January of 2009, the California Air Resources Board adopted the *California Regional Haze Plan*, which sets forth specific visibility goals for the state. The plan is part of a broader multi-state effort to improve visibility throughout the western region. The plan details baseline conditions of individual Class I areas, including Yosemite National Park, and sets a path toward achieving interim, reasonable progress goals statewide by 2018 (CARB 2009b). The El Portal Administrative Site is located within a Class II area, in which less stringent standards apply.

## ***Federal Policies***

**Executive Order 13423, Issued by President George W. Bush, Jan. 24, 2007.** This executive order sets as a policy of the United States that “Federal agencies conduct their environmental, transportation, and energy-related activities under the law in support of their respective missions in an environmentally, economically and fiscally sound, integrated, continuously improving, efficient, and sustainable manner” (section 1, Policy). Goals for agencies include such measures as improving energy efficiency and reducing greenhouse gases generated by agency operations and actions, reducing energy intensity and requiring that energy consumed by the agency comes from new renewable sources, reducing water consumption, and ensuring that agencies reduce their fleet’s total consumption of petroleum products (NPS 2007h).

## ***National Park Service Management Policies***

The NPS has a responsibility to protect air quality under both the 1916 Organic Act and the Clean Air Act. Accordingly, the service would seek to perpetuate the best possible air quality in parks to (1) preserve natural resources and systems; (2) preserve cultural resources; and (3) sustain visitor enjoyment, human health, and scenic vistas. Through the *NPS Management Policies 2006*, the park has committed to actively promoting and pursuing measures to protect AQRVs from the adverse impacts of air pollution. In cases of doubt as to the impacts of existing or potential air pollution on park resources, the park would err on the side of protecting air quality and related values for future generations (NPS 2006a).

It is also NPS policy that internal activities at parks must comply with all applicable federal, state, and local air pollution laws and regulations (NPS 2004a). To meet these goals, parks may be required to obtain air quality permits before conducting activities, such as prescribed burning, that emit pollutants. Likewise, operating permits may be required for some emission sources, such as wastewater treatment facilities.

## **Environmental Context**

### ***Climate and Meteorology***

California is divided into air basins that are defined partly by their meteorological and topographical characteristics. As previously noted, the portions of the Merced River and South Fork Merced River that traverse Yosemite National Park are located within two air basins: Mountain Counties Air Basin and San Joaquin Valley Air Basin. Generally, the uppermost reaches of the Merced River and South Fork Merced River lie within San Joaquin Valley Air Basin, and the lower reaches lie within Mountain Counties Air Basin.

The portions of the Merced River and South Fork Merced River that traverse the park lie within the Sierra Nevada mountain range, which roughly parallels the eastern boundary of California and extends from the Cascades Range in the north to the Tehachapi Mountains in the south. Cooler climates with more wind are, in general, characteristic of the mountains, as contrasted with the nearby valleys. Mountain climatic zones are characterized by considerable vertical wind motion and by winds and temperatures different from those in the valleys. The Yosemite Valley, for instance, experiences

inversions, which occur when air temperature increases with altitude. Flat topography traps descending cold air at night, creating a shallow inversion layer that inhibits air pollutant dispersion and results in high pollutant concentrations.

### *Air Quality Monitoring Data*

Federal, state, and local agencies operate a network of monitoring stations throughout California to collect data on ambient concentrations of air pollutants. **Table 9-132** summarizes recent monitoring data from the monitoring stations in the project vicinity. Three of the stations are in Yosemite National Park (Turtleback Dome, Merced River, and Yosemite Valley Visitor Center) and one is outside of the park, in the Sierra National Forest (Jerseydale). The Merced River, Yosemite Valley Visitor Center (in Yosemite Village), and Jerseydale stations are approximately 4,000 feet above sea level, and Turtleback Dome is approximately 5,300 feet above sea level. As shown in table 9-131, exceedances of state and national standards for ozone and PM10 are recorded on occasion within the park and in the park vicinity.

**Ozone.** Ozone is a reactive pollutant that is not emitted directly into the atmosphere, but is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving volatile organic compounds (VOCs) and nitrogen oxides (NOx). These pollutants are known as precursor compounds for ozone. Significant ozone production generally requires ozone precursors to be present in a stable atmosphere with strong sunlight for approximately three hours. Ozone is a regional air pollutant because it is not emitted directly by sources but is formed downwind of sources of VOC and NOx. Short-term exposure to ozone can irritate the eyes and cause constriction of the airways. Besides causing shortness of breath, ozone can aggravate respiratory diseases such as asthma, bronchitis, and emphysema. Exposure to ozone is also associated with a wide range of effects on vegetation AQRVs, such as visible foliar injury, growth reductions and yield loss in annual crops, growth reductions in tree seedlings and mature trees, and effects that can have impacts at the forest stand and ecosystem level (EPA 1997).

**Particulate Matter (PM10 and PM2.5).** PM10 consists of particulate matter that is 10 microns or less in diameter (a micron is 1 one-millionth of a meter), and PM2.5 consists of particulate matter 2.5 microns or less in diameter. Both PM10 and PM2.5 can be inhaled into the air passages and the lungs and can cause lung irritation, but PM2.5 can penetrate more deeply into alveolar passages where diffusion into the blood stream is possible, which can result in additional adverse cardiovascular health effects. Particulate matter in the atmosphere results from many kinds of dust- and fume-producing industrial and agricultural operations, combustion, and atmospheric photochemical reactions. For instance, in Mariposa County, the principal sources of direct emissions of PM10 include entrainment of dust through vehicle travel over paved and unpaved roads, residential fuel combustion, and wildfires. However, PM10 and PM2.5 concentrations also reflect secondary pollutant formation derived from photochemical reactions involving pollutants such as VOC and NOx. As described above in connection with ozone, on-road motor vehicles are a principal source of regional VOC and NOx emissions.

**TABLE 9-132: AIR QUALITY DATA SUMMARY (2006-2010) FOR THE STUDY AREA**

Pollutant	Standard <sup>a</sup>	Monitoring Data by Year				
		2006	2007	2008	2009	2010
Ozone (Yosemite National Park — Turtleback Dome Station)						
Highest 1-Hour Average (ppm) <sup>b</sup>	0.09	0.100	0.100	0.108	0.096	0.091
Days over State Standard		4	3	11	1	0
Highest 8-Hour Average (ppm) <sup>b</sup>	0.07	0.094	0.097	0.102	0.086	0.085
Days over State Standard		52	49	56	8	23
Days over National Standard	0.075	30	25	33	26	5
Ozone (Sierra National Forest — 6440 Jerseydale)						
Highest 1-Hour Average (ppm) <sup>b</sup>	0.09	0.101	0.099	0.108	0.096	0.109
Days over State Standard		3	1	5	1	2
Highest 8-Hour Average (ppm) <sup>b</sup>	0.07	0.092	0.092	0.093	0.084	0.101
Days over State Standard		41	26	30	18	6
Days over National Standard	0.075	13	12	17	5	3
Particulate Matter (PM10) (Yosemite Village — Visitor Center)						
Highest 24-Hour Average – State/National (µg/m <sup>3</sup> ) <sup>b</sup> Highest 1-Hour Average, ppm <sup>c</sup>		97.0	116.0	118.4	82.2	74.3
Estimated days over State Standard <sup>c</sup>	50	2	1	2	3	2
Estimated days over National Standard <sup>c</sup>	150	0	0	0	0	0
State Annual Average <sup>d</sup>	20	NA	NA	NA	23.6	20.3
Particulate Matter (PM2.5) (Yosemite Village — Visitor Center)						
Highest 24-Hour Average – National (µg/m <sup>3</sup> ) <sup>b</sup> Highest 1-Hour Average, ppm <sup>c</sup>		36.1	134.0	130.1	47.2	61.0
Estimated days over National Standard <sup>c</sup>	35	NA	NA	NA	NA	NA
State Annual Average <sup>d</sup>	12	NA	14.2	NA	NA	NA
National Annual Average <sup>d</sup>	15	NA	NA	NA	NA	NA
NOTE: NA = Adequate data was not available. Values in bold exceed the respective air quality standard.						
<sup>a</sup> Generally, state standards are not to be exceeded and federal standards are not to be exceeded more than once per year.						
<sup>b</sup> ppm = parts per million; µg/m3 = micrograms per cubic meter.						
<sup>c</sup> PM10 and PM2.5 are not measured every day of the year.						
<sup>d</sup> State statistics are based on California-approved samplers, whereas national statistics are based on samplers using federal reference or equivalent methods.						
SOURCE: CARB 2011b						

On occasion, concentrations of PM<sub>10</sub>/PM<sub>2.5</sub> in the park reflect pollutant transport from upwind areas, such as San Joaquin Valley Air Basin; under other conditions, ambient concentrations reflect local sources such as campfires, entrainment of dust from vehicle movement over paved roads (particularly from wintertime sanding of roads for traction), and wildland and prescribed fires. Regional emissions of PM<sub>10</sub>/PM<sub>2.5</sub> and their precursors within the San Joaquin Valley are expected to decrease over the next decade or so, largely as a result of reductions in emissions due to state and federal motor-vehicle emissions control standards and programs. Local emissions of PM<sub>10</sub>/PM<sub>2.5</sub> would continue to be proportional to the number of campsites; the level of construction-related activity; the extent of vehicle travel on park roads; and the frequency and extent of prescribed fires.

**Visibility-Reducing Particles and Gases.** Visibility impairment occurs as a result of the scattering and absorption of light by particles and gases in the atmosphere. Both primary and secondary formations of particles contribute to visibility impairment. Primary particles, such as elemental carbon from diesel and wood combustion or dust from certain industrial activities or natural sources, are emitted directly into the atmosphere. Secondary particles that are formed in the atmosphere from primary gaseous emissions include sulfate from sulfur dioxide emissions, nitrates from NO<sub>x</sub> emissions (which can also adversely impact lichen AQRVs from nitrogen deposition), and organic carbon particles formed from VOC emissions. The only primary gaseous pollutant that directly reduces visibility is nitrogen dioxide, which is the brown-colored gas readily visible during periods of heavy air pollution.

Visibility conditions are commonly expressed in terms of three mathematically related metrics: visual range, light extinction, and deciviews. Visual range is the maximum distance at which one can identify a black object against the horizon and is typically described in miles or kilometers. Light extinction, which is inversely related to visual range, is the sum of light scattering and light absorption by particles and gases in the atmosphere and is expressed in terms of inverse megameters, with large values representing poorer visibility. Unlike visual range, the light extinction coefficient expresses the relative contribution of one particulate constituent (e.g., sulfates or nitrates) versus another to overall visibility impairment. The deciview metric was developed because changes in visual range and light extinction are not proportional to human perception. For example, a 5-mile change in visual range can be either very apparent or not perceptible, depending on the baseline level of ambient pollution. The deciview metric provides a linear scale for perceived visual changes over the entire range of conditions, from clear to hazy, analogous to the decibel scale for sound. Under many scenic conditions, a change of 1 deciview is considered to be perceptible by the average person. A deciview of zero represents pristine conditions.

Current visibility impairment in Yosemite National Park ranged from 4.6 deciviews for the clearest 20% of days during the 1990–1999 period, to 22 deciviews for the haziest 20% of days during that period (NPS 2002). In contrast, the corresponding range of deciview values was 3.9 (clearest 20%) to 13.9 (haziest 20%) and 13.6 to 31.8 in Rocky Mountain National Park and Great Smoky Mountains National Park, respectively. Yosemite National Park visibility for the clearest 20% of days is much better than the NPS average, whereas visibility for the haziest 20% of days is about average. Organic carbon, elemental carbon, crustal matter (fugitive dust originating from the earth's crust), nitrates, and sulfates are primarily responsible for visibility impairment in Yosemite Valley.

**Emission Sources.** Sources of pollution generally fall into one of three categories: stationary, mobile, or area. Stationary sources refer to emissions sources associated with industrial or commercial processes. Mobile sources refer to on-road and off-road vehicles, among other nonstationary sources. Area sources refer to a wide range of sources that are individually minor, but are more substantial in aggregate. A summary of the potential emissions sources within the project area, arranged by source category, is shown in **table 9-133**.

While air quality in a given air basin is usually determined by emission sources within the basin, it also can be affected by pollutants transported from upwind air basins by prevailing winds. A study of surface ozone in the summers of 2003 and 2005 identified the San Francisco Bay Area and eastern Nevada to be contributing sources of ozone pollution (Burley and Ray 2007). A similar study examined the potential sources of fine particulate matter within the park during the summer of 2002 and found

**TABLE 9-133: POTENTIAL EMISSIONS SOURCES WITHIN THE PROJECT AREA**

Stationary Sources	
Air conditioners and refrigeration units	Wastewater Treatment Plants
Food Preparation (e.g., grills, stoves)	Storage Tanks
Commercial/Institutional Boilers, Heaters, and Fireplaces	Stationary Pumps/Compressors/Generators
Mobile Sources	
Landscape maintenance equipment	NPS snowmobiles
NPS aircraft	NPS on-road vehicles
Visitor vehicles	Buses
Area Sources	
Landscape maintenance equipment	Campfires
Welding	Charcoal and lighter fluid consumption
Demolition activities	Consumer solvents
Road Maintenance	Dust from paved roads
Prescribed and Wild Fire	LPG Gas Combustion
Herbicides/pesticides	Solvent Use
Livestock	Surface Coating (e.g., paints/solvents)
Waste disposal	Woodworking/wood finishing
NPS = National Park Service; LPG = liquefied petroleum gas SOURCE: NPS 1999d	

that although local sources contributed, wildfires as far away as western and southern Oregon were primarily responsible for haze within Yosemite National Park during that summer (McMeeking et al. 2006). The California EPA concluded that all of the ozone exceedances in 1995 in the southern portion of the Mountain Counties Air Basin (i.e., Tuolumne and Mariposa counties) were caused by transport of ozone and ozone precursors from the San Joaquin Valley Air Basin (CARB 1996).

### ***Sensitive Receptors***

Air quality does not affect every individual in the population in the same way, and some groups are more sensitive to adverse health effects than others. Population subgroups sensitive to the health effects of air pollutants include the elderly and the young; population subgroups with higher rates of respiratory disease, such as asthma and chronic obstructive pulmonary disease; and populations with other environmental or occupational health exposures (e.g., indoor air quality) that affect cardiovascular or respiratory diseases.

Such land uses and facilities as schools, children's day care centers, hospitals, and nursing and convalescent homes are considered to be more sensitive than the general public to poor air quality because the population groups associated with these uses have increased susceptibility to respiratory distress. Parks and playgrounds are considered moderately sensitive to poor air quality because persons engaged in strenuous work or exercise also have increased sensitivity to poor air quality;

however, exposure times are generally far shorter in parks and playgrounds than in residential locations and schools, which typically lessens overall exposure to pollutants. Residential areas are considered more sensitive to air pollution conditions compared with commercial and industrial areas because people generally spend longer periods of time at their residences, with associated greater exposure to ambient air pollution conditions. Sensitive receptors within the project area include on-site staff and recreational users, specifically the elderly and the young, within developed areas of the Merced River corridor, including Yosemite Valley, Wawona, and El Portal. In addition to human sensitive receptors described above, there are also sensitive ecological receptors in the Yosemite National Park, such as pine and lichen AQRVs, which are susceptible to adverse effects from elevated ozone exposure and nitrogen deposition, respectively.

### *Environmental Consequences Methodology*

Local sources of emissions would have minimal effect on regional emissions, particularly during the summer season when regional emissions meet or exceed federal and state standards. The exceptions would be wildland and prescribed fires, which can result in regionally significant emissions on a given day. Other local emissions sources include stationary, area, and mobile sources. The air quality impact assessment involves the identification and qualitative description of the types of actions under the various alternatives that could affect air quality, sensitive receptors and AQRVs, corresponding emissions sources and pollutants, and relative source strengths. In addition, quantitative criteria pollutant emission estimates were developed for on-road vehicular traffic for each Alternative. Based on the relative source strengths, an assessment was performed to determine the potential for higher pollutant emissions or concentrations, taking into account the frequency, magnitude, duration, location, and reversibility of the potential impact. Regional pollutant transport issues were evaluated in the context of regional cumulative impacts. The criteria that follow are used to determine these impacts.

- **Context.** The context of the impact considers whether the impact would be local or regional. For the purposes of this analysis, local impacts would be those that occur in a specific area within a segment of the Merced River corridor. Regional impacts would be those related to the Mountain Counties Air Basin (MCAB) and San Joaquin Valley Air Basin (SJVAB). With respect to air quality issues, both local and regional perspectives are relevant.
- **Intensity.** The intensity of the impact considers whether the impact would be negligible, minor, moderate, or major. Negligible impacts would be effects considered not detectable and would have no discernible effect on air quality (assumed to be 1% or less of threshold). Minor impacts would be those that are present, but not expected to have an overall effect on those conditions (assumed to occur up to 50% of the applicable threshold). Moderate impacts would be clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on local or regional air quality (assumed to occur when emissions exceed applicable threshold).

Quantitative thresholds that would apply to each river segment within the project area's respective air basins (i.e., MCAB and SJVAB) are described below. Notably, a major impact would occur if emissions exceed these thresholds.

Actions that would occur in the Mariposa County portion of the MCAB would be subject to:

Federal General Conformity Rule de minimis thresholds:

- 50 tons per year VOC or ROG
- 100 tons per year NO<sub>x</sub>

Actions that would occur in the Madera County portion of the SJVAB would be subject to:

Federal General Conformity Rule de minimis thresholds:

- 10 tons per year VOC or ROG
- 10 tons per year NO<sub>x</sub>
- 100 tons per year PM<sub>2.5</sub>

Notably, only one action — reroute Triple Peak Fork Trail upland where possible — in Segment 1, which is common to Alternatives 2–6, would occur in Madera County.

- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term. A short-term impact would be temporary in duration and would be associated with transitional types of impacts. A long-term impact would have a permanent effect on air quality.
- **Type of Impact.** Impacts are evaluated in terms of whether they would be beneficial or adverse to air quality. Beneficial air quality impacts would reduce emissions or lower concentrations, and adverse impacts would have the opposite effect.

### *Environmental Consequences of Alternative 1 (No Action)*

Under Alternative 1 (No Action), no policies that protect or enhance air quality in the corridor would be developed. Policies and actions that protect and enhance air quality in the corridor arise not from the Wild and Scenic Rivers Act but from such laws as the federal Clean Air Act. Alternative 1 would continue the current management direction and level of management intensity in the Merced River corridor. Lodging, camping, infrastructure, and parking would continue in the same locations, configurations, and at the same level of development. There would be no comprehensive approach to protect and enhance river values.

Under Alternative 1, air quality in the Merced River corridor would continue to be influenced by local pollution sources within the park and by regional sources upwind of the park. Local emissions sources include stationary, area, and mobile sources. Local air quality varies based on temperature, humidity, wind speed, elevation, topography, and other environmental factors, such as regionwide conditions. Generally, the effects of local emissions sources would be most intense in those areas where the sources are concentrated and can be compounded by inversions, such as in the Yosemite Valley. Analysis of effects is qualitative, and professional judgment was applied to reach reasonable conclusions as to the context, intensity, and duration of potential impacts.

### **All River Segments**

Impacts of wildland and prescribed fires would continue to be controlled through implementation of smoke management policies in the *2004 Fire Management Plan/EIS*. These policies are intended to minimize impacts on air quality from prescribed burning within the park and region. It should be noted that while wildland fire drives the largest and most intense exceedances of particulate matter

standards in the Merced River corridor, as is the case in Yosemite Valley, the baseline levels of particulate emissions are already high. Several assumptions were integrated into this assessment.

- Alternative 1 (No Action) would not affect the smoke management policies in the *Fire Management Plan/EIS*.
- Alternative 1 would not create campfire regulations specific to the project area.
- The NPS would continue to ensure that all stationary emissions sources under its control or under the control of its concessioners comply with applicable air district rules and regulations.
- The NPS would continue to participate in the regional air quality planning processes for ozone and visibility impairment and would continue to review applications for new or modified major stationary sources upwind of the park, pursuant to the Prevention of Significant Deterioration regulations.
- The NPS would comply with the EPA's general conformity rule for any future actions that would occur within Mariposa and Madera counties, which are part of MCAB and SJVAB, respectively.

In accordance with the 2009 Settlement Agreement, no new structures would be constructed in the Merced River corridor, except for minor structures that are small, temporary, easily removed, not habitable; designed to support existing uses, systems, and programs; located within the existing building footprint; and not created solely for commercial purposes. Temporary housing for employees displaced by the 2008 rockfall would continue as needed at Huff House, Lost Arrow, Yosemite Lodge, Ahwahnee Dorm, Boys Town, and El Portal Trailer Village, and for NatureBridge students at Curry Village. Housing for NPS employees and park partner staff would remain in current locations and at current levels.

Alternative 1 accounts for 3% growth in visitation following recent trends. It is expected that more days during the peak season would receive the visitation currently experienced during the busiest days. Visitation could also increase in the off-peak seasons. Consequently, traffic congestion and associated air pollutant emissions during those nonpeak periods could approximate current congestion during peak periods. Increases in visitation during peak periods could also occur, and to the degree that such increases do happen, traffic congestion and air pollutant emissions would marginally increase. These local mobile sources would continue to include automobiles, trucks, and buses, and would remain subject to state and federal emissions control standards and programs. For the foreseeable future, motor vehicle fleet turnover, cleaner burning fuels, improved technologies, and stricter state and federal standards would be expected to decrease emissions per vehicle-mile-traveled (VMT). Thus, the overall impact of mobile source exhaust emissions would remain approximately the same as under existing conditions. Regional AQRV impacts (such as pine injury from ozone and visibility) would also be approximately the same as under existing conditions. However, in contrast to the ozone precursors, most of the particulate matter associated with vehicle use is related to entrainment of road dust rather than to exhaust. Emissions from vehicle entrainment of road dust would continue to affect air quality, particularly in winter and early spring, when drying road surfaces expose sand deposited for traction to vehicle entrainment into the atmosphere. However, even with the anticipated annual increase in visitation, the effect would be negligible. Were visitation to increase, road dust would be expected to increase in rough proportion to VMT within the park, as would those emissions associated with traffic

congestion and delays that would accompany such increases. Under the latter scenario, the effect on local air pollution conditions would be long term, minor, and adverse.

Park management has implemented temporary access restrictions for use when traffic and parking conditions in Yosemite Valley are overly congested. This has the effect of reducing the number of incoming vehicles and their related emissions until the traffic volume and parking demand in Yosemite Valley decrease sufficiently (as departing visitors leave the Valley) to stabilize traffic conditions. These access restrictions occur when traffic in Yosemite Valley is at maximum capacity, and thus associated vehicle pollutant emissions would also be at peak levels. In addition, the Yosemite Area Regional Transportation System (YARTS) would continue to reduce the number of individual vehicles operated within the park. In 2011, YARTS transported 300,979 passengers into Yosemite National Park (NPS, 2012i). The intent of YARTS is to provide an attractive alternative to private vehicles by expanding the range of travel options for visitors to Yosemite Valley and to other primary park destinations, and for employees commuting to work in the park.

Local area pollution sources would continue to include regular maintenance activities, consumer products, natural gas combustion for heating/cooling and campfires. Most of these sources would continue in the same manner and extent as under existing conditions. However, potential future increases in visitor use levels would cause these sources to increase in relative proportion. Daily, routine, and intermittent operational maintenance intended to stabilize and protect park facilities, address visitor health and safety issues, and protect natural and cultural resources would continue, such as campground maintenance, road and trail maintenance, building and grounds maintenance, and utility system repair and maintenance throughout Segments 1–8. Trail and road maintenance would preserve the existing character, so that parking areas or trails that are currently unpaved remain so. Park facilities themselves — roads, parking spaces, bridge crossings, and overnight accommodations — would remain as they were in 2010. Campfires would continue to be subject to park regulations, and related emissions could increase in proportion to the increased visitation, especially during nonpeak periods.

#### **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

Wilderness and impoundment Segments 1, 5, 6, and 8 would be minimally affected by local emissions sources, with the exception of wildland and prescribed fires, or the occasional campfire from overnight visitors. Impacts from prescribed burning would continue to be controlled through implementation of smoke management policies in the *Fire Management Plan/EIS*. Although there are no transportation facilities in Segments 1, 5, 6, or 8, and none are proposed under Alternative 1, incidental future increases in traffic within the Merced River corridor would affect these segments by pollutant drift. In addition, impacts from in-park emissions, such as vehicles, would be more apparent in areas near road corridors and concentrations of visitor and administrative services. The overall effect on regional air pollution conditions would be long term, minor, and adverse.

**Segments 1, 5, 6, & 8 Impact Summary:** Implementation of Alternative 1 (No Action) would result in local, long-term, minor, adverse air quality impacts within these segments.

## Segment 2: Yosemite Valley

As described above, for Segments 1–8 there could be adverse air quality impacts associated with transportation conditions under Alternative 1. Specific to Segment 2, there would likely continue to be local, minor, long-term, adverse air quality impacts associated with traffic congestion and delays that would continue to occur at busy intersections in Yosemite Valley and possibly increase should visitation levels increase in the future. Traffic emissions, as a source of nitrogen deposition, are also correlated to lichen AQRVs and would also likely result in long-term local, minor, adverse air quality impacts. Park management may continue to implement temporary access restrictions in Yosemite Valley when westbound traffic is backed up from Lower Yosemite Fall to the Curry Village four-way intersection or when all of the day parking spaces have been filled.

The effect on air quality from existing stationary sources, such as fuel storage systems and generators, would be greatest immediately adjacent to the emission source, including employee housing areas, visitor facilities, and lodging. Emissions from stationary sources would continue to be regulated, as appropriate, through applicable MCAPCD regulations. In the long term, the replacement of dated equipment (e.g., generators) with newer, more energy-efficient models to meet NPS sustainability goals would result in regional and local long-term, negligible, beneficial impacts.

Area emissions would continue to affect air quality and visibility within the Yosemite Valley under certain meteorological conditions. For example, particulate matter resulting from burning wood could remain near ground level during temperature inversions. Area sources of particulate matter in the Valley are the most important driver for the PM<sub>10</sub> nonattainment status due to the strength and frequency of inversions. The majority of overnight visitor accommodations, and their associated campfires and other sources of evening smoke, are located within Segment 2. Campfires would continue to be subject to park regulations, and related emissions could increase in proportion to the increased visitation, especially during nonpeak periods. Campfires or other evening sources of smoke would continue to affect local air quality at levels that may be unhealthy for sensitive groups, including individuals with pulmonary or cardiovascular diseases, the elderly, and children. Since wood smoke can currently contribute enough local emissions to create unhealthy pollutant levels for sensitive groups, especially through many wood-burning sources operating under stable atmospheric conditions, the expected increase in the usage of campfires under Alternative 1 would have a potentially long-term, moderate, adverse impact on sensitive receptors within Segment 2. Increased usage of campfires would also result in a potentially long-term, local, moderate, adverse impact if the usage results in increased PM<sub>10</sub> measurements above the ambient air quality standard at the Yosemite Valley Visitor Center monitoring site.

**Segment 2 Impact Summary:** Implementation of Alternative 1 (No Action) would result in local, long-term, minor, adverse air quality impacts associated with vehicle emissions. Air quality within the segment would also experience long-term, moderate, adverse impacts from campfires and other evening sources of smoke.

### **Segments 3 and 4: Merced River Gorge and El Portal**

Segments 3 and 4 would continue to be affected by local and regional sources of air pollutants, as described above for Segments 1–8. There are no NPS overnight accommodations along Segments 3 and 4, and thus few campfires or other visitor-related evening sources of smoke. As described above, were visitation to increase, road dust would be expected to increase in rough proportion to VMT within the park, as would those emissions associated with traffic congestion, which would result in long-term, local, minor, adverse impacts.

**Segments 3 & 4 Impact Summary:** Implementation of Alternative 1 (No Action) would result in local, long-term, minor, adverse air quality impacts within Segments 3 & 4.

### **Segment 7: Wawona**

As described above for Segments 1–8, there could be regional, long-term, minor, adverse air quality impacts associated with transportation conditions under Alternative 1. Specific to Segment 7, there could be local, long-term, minor, adverse air quality impacts associated with traffic congestion and delays that would continue to occur at busy intersections in Wawona, and possibly increase should visitation levels increase in the future. Traffic emissions, as a source of nitrogen deposition, are also correlated to lichen AQRV impacts and would also likely result in local, long-term, minor, adverse air quality impacts. Park management may continue to implement temporary access restrictions in Wawona when all of the day parking spaces have been filled.

The effect on air quality from existing stationary sources, such as fuel storage systems and generators, would be greatest immediately adjacent to the emission source, including the Wawona Store and Wawona Hotel. Emissions from stationary sources would continue to be regulated, as appropriate, through applicable MCAPCD regulations. In the long term, the replacement of dated equipment (e.g., generators) with newer, more energy-efficient models to meet NPS sustainability goals would result in regional and local, long-term, negligible, beneficial impacts.

Campfires would continue to be subject to park regulations, and related emissions could increase in proportion to the increased visitation, especially during nonpeak periods. Since wood smoke can currently contribute enough local emissions to create unhealthy pollutant levels for sensitive groups, especially through many wood-burning sources operating under stable atmospheric conditions, the expected increase in the usage of campfires under Alternative 1 would have a potentially long-term, local, moderate, adverse impact on sensitive receptors.

**Segment 7 Impact Summary:** Implementation of Alternative 1 (No Action) would result in local, long-term, minor, adverse air quality impacts associated with vehicle emissions. Air quality within the segment would also experience long-term, moderate, adverse impacts from campfires and other evening sources of smoke.

### Summary of Alternative 1 (No Action) Impacts

Under Alternative 1, air quality in the Merced River corridor would continue to be influenced by local pollution sources within the park and by regional sources upwind of the park. The relative importance of local and regional sources would continue to vary by season, diurnally, and by pollutant.

Furthermore, nonwilderness portions of the corridor would be affected by local emissions sources to a much greater extent than wilderness portions. Local stationary sources would continue to be regulated under the MCAPCD rules and regulations, some local area sources would continue to be subject to park regulations, and mobile sources would continue to be subject to state and federal tailpipe emissions standards. With respect to ozone precursors, overall local emissions under Alternative 1 would be similar to existing conditions. AQRV impacts (such as pine injury from ozone, visibility, and lichen sensitivity to nitrogen deposition) would also be approximately the same as under existing conditions. With no increase in visitation or VMT within the corridor, the effect of particulate matter on air quality would be negligible. However, should VMT increase by 3%, the long-term impacts would be minor and adverse.

### Cumulative Impacts of Alternative 1 (No Action)

Cumulative effects on air quality discussed herein are based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with potential effects of Alternative 1. The projects identified below include only those that could affect air quality within the study area or that could be affected by air pollutant sources within the Merced River corridor.

#### *Past Actions*

Past actions have resulted in both adverse and beneficial impacts on air quality. The majority of past projects listed in Appendix C (Cumulative Actions) had short-term, regional and local adverse impacts on air quality resulting from temporary construction activities (i.e., associated with ozone precursors from equipment and motor vehicle exhaust, as well as fugitive dust from ground-disturbing activities and vehicular travel over paved and unpaved roads), which have no net adverse or beneficial impacts on current or future air pollution conditions. The following past projects had long-term, minor, beneficial impacts on transportation and associated regional and local air pollution conditions, which would continue under Alternatives 2–6.

The **Yosemite Area Regional Transportation System** is a regional transportation system, established in 2000, whose intent is to provide an alternative to private vehicles by expanding the range of travel options for visitors to Yosemite Valley and to other primary park destinations, and for employees commuting to work in the park. It also provides a means for visitors to travel to Yosemite Valley when restricted access measures are implemented for private vehicles during times of severe congestion. In 2011, YARTS transported 300,979 passengers into Yosemite National Park (NPS, 2012i). This regional transportation system has a regional and local, long-term, negligible beneficial impact by reducing the number of day visitors arriving in private vehicles.

**Housing Projects** (i.e., Curry Village Employee Housing, Curry Village Huff House Temporary Housing, Yosemite Valley Lost Arrow Temporary Employee Housing, and Yosemite Valley Ahwahnee

Temporary Employee Housing) included the construction of housing and related facilities to accommodate concessioner employees. The housing units replaced concessioner housing lost in the January 1997 flood and the rockfall events at Curry Village in October 2008, and were developed in consultation with litigants as part of a settlement agreement concerning the 2005 *Merced Wild and Scenic River Comprehensive Management Plan*. These actions provide temporary lodging for concessioner employees, and are needed to help meet immediate short-term housing needs for the park concessioner until permanent employee housing is available. Construction was completed between 2007 and 2009. Construction of housing units resulted in regional and local, short-term, minor, adverse impacts. Over the long-term, since the housing replaced lost units to maintain capacity, there would be no net adverse or beneficial impacts on current or future air pollution conditions.

**Yosemite Valley Shuttle Bus Stop Improvements** involved the preparation of preliminary design plans, environmental compliance documents, and construction drawings; the construction of six 10-foot by 80-foot concrete braking pads; the rehabilitation or replacement of 94,000 square feet of asphalt road approaches; and the construction of bus stop shelters. Construction was completed in 2010. These improvements support shuttle bus service in Yosemite Valley, a local, long-term, minor, beneficial impact.

**Hybrid Electric-Diesel Shuttle Bus Procurement** consisted of the purchase of diesel hybrid transit buses by the NPS. Hybrid bus operations result in regional and local long-term, negligible benefits related to fuel usage and air pollutant emissions compared with diesel-only buses (NPS 2005C).

### ***Present Actions***

Present actions proposed in the region are separated below into four general categories: (1) projects anticipated to have a net beneficial impact, (2) projects anticipated to have both beneficial and adverse impacts, (3) projects anticipated to have adverse impacts, and (4) projects anticipated to have a no-net adverse or beneficial impact.

Present projects that could have a corridorwide, long-term, minor, beneficial, cumulative impact on air quality include:

- *2004 Fire Management Plan/EIS* smoke management policies
- The following projects would individually, and in combination, encourage travel to the park by alternative (nonprivate vehicle) modes, and would manage traffic and parking to reduce congestion and associated air pollutant emissions:
  - Increased Yosemite Area Regional Transportation System services
  - Changeable electronic signs in Mariposa, Midpines, and El Portal, alerting drivers to traffic conditions in Yosemite Valley
  - Computer-aided Dispatch/Automatic Vehicle Locator
  - Software design and purchase to process raw data from vehicle counters to produce useful information for visitors on parking and traffic conditions

Restricted access measures would continue to control the volume of incoming vehicles when traffic and parking conditions in Yosemite Valley are overly congested. The YARTS would continue to provide an alternative to individual private vehicles operated within the park.

Present projects that could have a short-term, adverse impact due to construction activities, but a long-term, beneficial, cumulative impact on traffic-related air quality include

- South Park Intelligent Transportation System: electronic signs and automatic vehicle counters at entrance stations and parking lots to know when parking lots are full
- Parking alternative option at the El Portal Maintenance Facility
- Parkwide Communication Data Network (CDN) infrastructure upgrade

Although the above projects would have some site-specific, short-term, adverse impacts (e.g., construction-related air pollution), the general goal of each of these projects is to improve transportation circulation, which would also improve the associated air quality.

Present projects that could have a short-term, adverse impact on air quality include all projects not mentioned above that include some temporary construction activities. There would be no net, long-term, adverse or beneficial impacts on air quality from these projects.

#### *Reasonably Foreseeable Future Actions*

Similar to past actions, reasonably foreseeable future actions would result in both adverse and beneficial impacts on air quality. Reasonably foreseeable future projects that could have a long-term, beneficial, cumulative impact on air quality include:

- Transit Passenger Information System

Other beneficial impacts for reasonably foreseeable future actions are similar to those discussed for past and present actions (i.e., the restricted access measures and increased Yosemite Area Regional Transportation System services). Reducing traffic congestion and encouraging travel to the park by alternative (nonprivate vehicle) modes would have regional and local, long-term, negligible beneficial impacts on air quality.

Reasonably foreseeable future actions that could have a short-term, adverse impact on air quality include all projects that include some temporary construction activities. There would be no-net, long-term, adverse or beneficial impacts on air quality from these projects.

Human activities (e.g., suburban growth, industry, transportation, farming and ranching) in the San Joaquin Valley, San Francisco Bay Area, and Sierra foothills continue to create air quality impacts that occasionally violate federal standards, particularly for ozone and for particulates. Some of these pollutants disperse into the Yosemite area, affecting the park's air quality and visibility. These adverse impacts are expected to continue for the foreseeable future with anticipated population growth.

### ***Overall Cumulative Impact***

Because Alternative 1 would not involve substantial construction projects, it is not anticipated to contribute to short-term, adverse impacts on air quality resulting from construction activities. Continued management of traffic and encouragement of alternative forms of transportation would have regional and local, long-term, negligible to minor beneficial impacts on air quality.

Over the long term, with respect to ozone, conditions in the Merced River corridor would be determined almost entirely by regional emissions trends instead of by local emissions sources under Alternative 1. The regional, long-term impact would most likely be minor and beneficial, owing to the emissions reductions expected to occur with implementation of ongoing state and federal mobile-source control programs. With respect to particulate matter, conditions in the corridor would be determined by both regional sources and local sources, and the relative influence of these two types of sources would vary from day to day and season to season. Under Alternative 1, with visitation assumed to remain constant, impacts from particulate matter would be negligible. However, if visitation or VMT within the corridor were to increase, particulate matter would be expected to increase in rough proportion to VMT (owing to entrainment of dust), which would have a local, long-term, minor, adverse impact on air pollution conditions. The increased usage of campfires would result in a long-term, local, moderate, adverse impact on air pollution conditions.

### ***Environmental Consequences of Actions Common to Alternatives 2–6***

For Alternatives 2–6, as described above for Alternative 1 (No Action), emissions from wildland and prescribed fires would continue to be controlled through implementation of smoke management policies in the *Fire Management Plan/EIS*. These policies are intended to minimize impacts on air quality from prescribed burning within the park and region. Several assumptions were integrated into this assessment.

- Alternatives 2–6 would not affect the smoke management policies in the *Fire Management Plan/EIS*.
- Alternatives 2–6 would not create campfire regulations specific to the project area.
- The NPS would continue to ensure that all stationary emissions sources under its control or under the control of its concessioners comply with applicable air district rules and regulations.
- The NPS would continue to participate in the regional air quality planning processes for ozone and visibility impairment and would continue to review applications for new or modified major stationary sources upwind of the park, pursuant to the Prevention of Significant Deterioration regulations.
- The NPS would comply with the EPA general conformity rule for any future actions that would occur within Mariposa and Madera counties, which are part of MCAB and SJVAB, respectively.

## All River Segments

### *Impacts of Actions to Protect and Enhance River Values*

Corridorwide actions to protect and enhance river values that would occur across Alternatives 2–6 involve restoration and protection of the channel itself, meadow and riparian habitats, and upland vegetation. These include restoration of six miles of informal trails, removal of abandoned underground infrastructure, improvement of river access points, management of large wood, and the removal of riprap, among other activities. Such actions would involve temporary emissions of air pollutants, which would likely include ozone precursors from equipment and motor vehicle exhaust, as well as fugitive dust from ground-disturbing activities and vehicular travel over paved and unpaved roads. Pollutant emissions would vary based on the intensity of construction (i.e., type and quantity of equipment, number of workers and trucks, area disturbed), time of day (due to inversions during the night and mixing during days), and duration of construction activities. Construction activities for each segment are assumed to be similar to those generally described herein, just with differing intensities. Compliance with the dust abatement and exhaust mitigation measures MM-AIR-1 and -2, which would reduce particulate emissions and NO<sub>x</sub> during construction (included in Appendix C), for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur across all segments under Alternatives 2-6 include removing 3,400 feet of riprap from the river bank and revegetating with riparian species, and replacing an additional 2,300 feet of riprap with bioengineered riverbank stabilization devices. This work would require the use of heavy equipment, including loaders and dump trucks. The removal, transport, disposal, restoration, and monitoring work associated with these actions would require several weeks of park staff time to implement, but would not substantially disrupt other ongoing construction, demolition, and restoration activities in the Valley and beyond. As a result, these actions would result in short-term regional and local, negligible to moderate, adverse impacts on air quality, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Short-term construction activities and impacts associated with parking and housing facilities would involve temporary emissions of air pollutants, which would likely include ozone precursors from equipment and motor vehicle exhaust, as well as fugitive dust from ground-disturbing activities and vehicular travel over paved and unpaved roads. Pollutant emissions would vary based on the intensity of construction (i.e., type and quantity of equipment, number of workers and trucks, area disturbed), time of day (due to inversions during the night and mixing during days), and duration of construction activities. Compliance with the dust abatement and exhaust mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Long-term Impacts of Actions to Manage User Capacities, Land Use, and Facilities would primarily be associated with on-road vehicles (visitors and employees) and local area pollution sources. Local

mobile sources would include automobiles, trucks, and buses and would remain subject to state and federal emissions control standards and programs, which are expected to lead to a continuing decrease in emissions per VMT for the foreseeable future, which would likely be regionally minor and beneficial. VOC and NO<sub>x</sub> are precursor compounds associated with ozone formation. However, in contrast to the ozone precursors, most of the particulate matter associated with vehicle use is related to entrainment of road dust rather than to exhaust, which would likely be local, negligible, and adverse.

In general, local area pollution sources would include regular maintenance activities, consumer products, natural gas combustion for heating/cooling, and campfires. Daily, routine, and intermittent operational maintenance intended to stabilize and protect park facilities, address visitor health and safety issues, and protect natural and cultural resources include campground maintenance, road and trail maintenance, building and grounds maintenance, and utility system repair and maintenance throughout Segments 1–8. Visitors and employees may use consumer products, such as hair spray, that emit VOC. Natural gas combustion may be used for water heaters or other facility systems, which emit ozone precursors and particulates. Campfires emit particulate matter and would continue to be subject to park regulations. Impacts of these local sources would likely be regional and local, negligible, and adverse.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values that would occur in Yosemite Valley under Alternatives 2-6 involve removal of abandoned infrastructure and other development affecting the Merced River's hydrologic function, extensive meadow restoration, and management of high visitor-use areas to address associated impacts on riparian habitats and sensitive cultural resources. Removal of abandoned or obsolete infrastructures would reduce ongoing impacts on meadow hydrology and lessen channel scour. Upland restoration activities, including removal of informal trails, roadbeds, and parking areas, would improve meadow health. The demolition, removal, transport, disposal, restoration would require the use of heavy equipment over a period of several weeks. As a result, these actions would result in short-term regional and local, negligible to minor, adverse impacts on air quality, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternatives 2-6 include: restoring 4.5 acres of riparian habitat in the area of Yosemite Lodge and 20 acres in the area of the Former Upper Pines Loop Campground; restoring impacted areas of Ahwahnee Meadow, including through removal of tennis courts; improving access and removing infrastructure from riparian areas at Cathedral Beach, Housekeeping Camp, and Bridalveil; constructing a boardwalk extension to reduce Sentinel Meadow trampling; fencing and vegetation management at Stoneman Meadow, restoring floodplain habitat at Devil's Elbow, removing one and paving and formalizing five other roadside pullouts along El Portal Road, and filling ditches not serving current operational needs. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, removal, transport, disposal, restoration, and monitoring work associated with these actions would

require more than one year of park staff time to implement. As a result, these actions would result in short-term regional and local, negligible to moderate, adverse impacts on air quality, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternatives 2-6 include: placing engineered logjams in the channel between Clarks and Sentinel Bridges; and removing the abandoned gauging station at Pohono Bridge, removing the footings and former river gauge base at Happy Isles, and restoring these areas to natural conditions. This work would involve the use of heavy equipment, including excavators, a skid steer, and dump trucks, and require approximately more than 17 weeks to implement. As a result, these actions would result in short-term regional and local, minor to moderate, adverse impacts on air quality, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

**Cultural Resource Actions.** Specific projects to protect and enhance the river's cultural values that would occur within Segment 2 under Alternatives 2-6 include rehabilitation of informal trails and parking in the vicinity rock art and rock shelters in the area of Bridalveil Falls, fencing and/or restricting access to the archeologically significant large bedrock mortar (pounding rock) next to Yosemite Falls Trail, restoration of impacted portions of Ahwahnee Meadow, and removal of abandoned infrastructure from the Bridalveil sewer plant to enhance oak recruitment. With the exception of abandoned infrastructure removal, the majority of this work would be completed through the use of hand tools. As such, the impact on air quality would be regional and local, short-term, negligible to minor, and adverse.

**Scenic Resource Actions.** Specific projects to protect and enhance the river's scenic values that would occur within Segment 2 under Alternatives 2-6 include: selective thinning of conifers and other vegetation in the vicinities of The Ahwahnee and Meadow, Bridalveil Falls and West Valley, Cooks and Sentinel Meadows, Curry Village, El Capitan, Housekeeping Camp, Yosemite Lodge, and other areas of the Valley; restoring grassland and oak habitat in the areas of Bridalveil Straight; repairing riverbank erosion at Clark's Bridge; and addressing informal trails and trampling at the east end of El Capitan Meadow. Much of this work would be accomplished through the use of hand tools, but could also involve heavy equipment for various handling, transport, and restoration activities. This work would occur over the course of several years. As a result, these actions would result in short-term regional and local, negligible to moderate, adverse impacts on air quality.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Actions to manage visitor use and facilities within Segment 2 that would occur under Alternatives 2-6 involve substantial changes to campsites, visitor and administrative facilities, employee housing, and transportation. The construction, demolition, transport, and disposal activities associated with this work would contribute to a short-term, regional and local, moderate, adverse impact on air quality, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C). These actions would have a long-term, local, minor, beneficial impact on air quality within Segment 2, as vehicle traffic and visitation would be reduced as a result.

**Curry Village and Campgrounds.** The park would remove the Happy Isles Snack Stand at Curry Village. At The Ahwahnee, the park would remove the swimming pool and tennis courts; redesign, formalize, and improve drainage within the existing parking lot; and construct a new 50 parking space lot east of the current parking area. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The addition of parking would provide access to the valley for a greater number of private vehicles, resulting in a local, long-term, negligible, adverse air quality impact.

**Camp 6 and Yosemite Village.** The park would remove from Yosemite Village the Concessioner General Office, Concessioner Garage, and the Arts and Activities Center (Bank Building), and repurpose the Village Sports Shop for public use. It would also construct a new maintenance building near the Government Utility Building. The park would remove roadside parking along Sentinel Drive and expand Camp 6 parking into the footprint of the Concessioner Garage. To improve visitor access between the Camp 6 area and Village, the park would construct a pathway connecting the new Camp 6 parking lot with the repurposed Village Sports Shop. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse.

**West Yosemite Valley.** The park would remove the NPS Volunteer Office, post office, swimming pool, and snack stand. It would also remove old and temporary employee housing (Thousands Cabins and Highland Court) and replace it with new housing. In addition, the park would relocate the Yosemite Lodge maintenance and housekeeping facilities and repurpose the food court. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in regional and local, short-term, adverse impacts on air quality, ranging from negligible to moderate. No long-term impacts would be expected. Actions to manage user capacities, land use, and facilities within Segment 2 would have regional and local, short-term, negligible adverse impacts. Over the long-term, the impacts of these actions would be local, long-term, minor, and beneficial.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

To protect and enhance river values within the Merced River gorge and El Portal, the park would remove informal trails, nonessential roads, fill materials, and abandoned infrastructure throughout Segments 3 and 4. The demolition, removal, transport, and disposal of waste materials; and restoration of these areas would have a short-term, regional and local, negligible to minor adverse impact on air quality within Segments 3 and 4.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 4 under Alternatives 2-6 include removing development, asphalt, and imported fill from the Abbieville and Trailer Village areas and recontouring and revegetating the 150-foot riparian buffer. The project would require the use of a skid steer and dump truck, and take

several weeks to complete. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic resource values include restoring the Greenemeyer Sand Pit to natural conditions. The work would require the use of heavy equipment over a period of several weeks. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality.

**Scenic Resource Actions.** Specific projects to protect and enhance the river's scenic values that would occur within Segment 3 under Alternatives 2-6 include: selective thinning of conifers in the area of the Cascade Falls viewpoint. Much of this work would be accomplished through the use of hand tools, but could also involve heavy equipment for various handling, transport, and restoration activities. This work would occur over the course of a few days and would not be expected to disrupt other restoration activities. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality.

#### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Under each alternative, the park would construct infill housing in El Portal Village Center. The park would also construct a restroom for visitor use in Old El Portal. The work would require the use of heavy equipment throughout the construction process. As such, the projects would have a short-term, regional and local, negligible to minor, adverse impact on air quality within Segment 4. Over the long-term, occupation of the new residential units would contribute to a local, negligible, adverse impact on air quality within Segment 4.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would have a short-term, regional and local, negligible to minor adverse impact on air quality within Segments 3 and 4. These actions would not be expected to have a long-term air quality impact. Actions to manage user capacities, land use, and facilities within Segments 3 & 4 would have local, long-term, minor, adverse air quality impacts.

#### **Segments 6 and 7: Wawona and Wawona Impoundment**

##### *Impacts of Actions to Protect and Enhance River Values*

The park would improve Wawona Campground wastewater and refuse management and facilities, remove abandoned infrastructure, and undertake numerous site-specific management measures to counteract or minimize ongoing impacts on cultural resources. These actions would have a short-term, regional and local, negligible, adverse impact on air quality within Segment 7.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic values that would occur within Segment 7 under Alternatives 2-6 include developing a waste water collection system, including the construction of a pump station above the Wawona Campground. This work would require the use of heavy equipment, including an excavator, skid steer, loader, and

dump truck. This effort would require approximately one month of crew time to complete. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality.

**Cultural Resource Actions.** Specific projects to protect and enhance the river's cultural values that would occur within Segment 7 under Alternatives 2-6 include removing and relocating campsites that cause potential impacts to sensitive archeological resources. This work could require the use of heavy equipment, including an excavator, skid steer, loader, and dump truck. This effort would require approximately one week of staff time to complete. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality. Over the long-term, reduced campsites would result in reduced campfires, which would be a local, negligible, beneficial impact.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

To improve operational efficiency, the park would construct new facilities to house maintenance operations and a new wildland fire station within Segment 7. The park would also remove staged materials, abandoned utilities, vehicles, and a parking lot from the riparian buffer at the Wawona Maintenance Yard and restore the area's native ecosystem, and remove roadside parking between the Wawona Store and Chilnualna Falls Road. The construction and restoration activities associated with these projects would involve the use of heavy equipment and occur over a period of several months. The resulting impact on Segment 7 air quality would be regional and local, short-term, minor to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2.

**Wawona.** The park would redesign the bus stop at the Wawona Store to accommodate increased visitor use. This work would be completed largely with hand tools and some power tools. As a result, the air quality impact would be local, short-term, negligible, and adverse.

**Segment 7 Impact Summary:** Actions to protect and enhance river values within Segments 6 & 7 would have a local, negligible, beneficial air quality impact. Actions to manage user capacities, land use, and facilities would not be expected to have a long-term air quality impact.

### **Summary of Impacts Common to Alternatives 2–6**

Air quality in the Merced River corridor would continue to be influenced by local pollution sources within the park and by regional sources upwind of the park. The relative importance of local and regional sources would continue to vary by season and by pollutant. Furthermore, nonwilderness portions of the corridor would be affected by local emissions sources to a much greater extent than wilderness portions. Local stationary sources would continue to be regulated under the applicable air district rules and regulations, some local area sources would continue to be subject to park regulations, and mobile sources would continue to be subject to state and federal tailpipe emissions standards.

Many of the action items would involve varying degrees of short-term construction activities that would result in short-term, negligible to moderate (depending on action item construction phasing/activity overlap) impacts with regard to ozone precursors and particulate emissions from equipment and vehicular exhaust and fugitive dust. Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce these potential short-term, adverse impacts

associated with construction emissions to the extent feasible. Even after mitigation, regional and local short-term, negligible to moderate, adverse impacts from construction would be expected.

### ***Environmental Consequences of Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 2 would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

With regard to regional, long-term impacts associated with the reduced visitor capacity under Alternative 2, on-road mobile emissions were quantified using the California Air Resources Board's emissions factors model (EMFAC2007) and compared to the Federal General Conformity thresholds. The results are shown in **table 9-134**, below. Although bus operations are projected to increase under Alternative 2, the reduction in total daily visitor and administrative use and capacity would result in a regional and local long-term, minor, beneficial impact owing to reduced on-road vehicles in the park, as depicted in the table. Regional and local impacts to AQRVs (such as pine injury from ozone, visibility, and lichen sensitivity to nitrogen deposition) would also be long-term, minor, and beneficial. Other local, long-term operational impacts of Alternative 2 are described below for each segment.

#### **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

##### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**TABLE 9-134: ON-ROAD VEHICLE CRITERIA AIR POLLUTANT EMISSIONS (tons/year)<sup>a</sup>**

Scenario	NO <sub>x</sub>	ROG
Alternative 2 Emissions	18	20
Alternative 1 (No Action) Emissions	22	26
Incremental Change <sup>b</sup>	(4)	(6)
Federal General Conformity Threshold <sup>c</sup>	100	50
Impact Intensity, Type? <sup>d</sup>	Minor, Beneficial	Minor, Beneficial
<sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in chapter 7 were totaled for each alternative to determine the regional air pollutant emissions. Specific assumptions and emission factors incorporated into the calculations are included in Appendix G. <sup>b</sup> Values in (parentheses) are net reductions with respect to Alternative 1 (No Action) emissions. <sup>c</sup> Federal General Conformity thresholds for the Mariposa County portion of the MCAB. <sup>d</sup> Negligible impacts would be effects considered not detectable and would have no discernible effect on air quality (assumed to be 1% or less of threshold). Minor impacts would be those that are present but not expected to have an overall effect on those conditions (assumed to occur up to 50% of the applicable threshold). Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on local or regional air quality (assumed to occur when emissions exceed applicable threshold).		

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to the Merced Lake Backpackers Camp, Merced Lake High Sierra Camp, and Little Yosemite Valley would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Wilderness areas would be minimally affected by local emissions sources, with the exception of wildland and prescribed fires, or the occasional campfire from overnight visitors. Impacts from prescribed burning would continue to be controlled through implementation of smoke management policies in the *Fire Management Plan/EIS*. In addition, impacts from in-park emissions, such as vehicles, would be more apparent in areas close to roads and concentrations of visitor and administrative services. With fewer on-road vehicles in the vicinity under Alternative 2, the overall effect on local air pollution conditions would be long term, minor, and beneficial.

**Merced Lake High Sierra Camp.** The park would close the Merced Lake High Sierra Camp and remove all associated infrastructure, convert the area to designated Wilderness, and expand dispersed camping at Merced Lake Backpackers Camping Area into the former High Sierra Camp footprint. These actions would primarily involve the use of hand tools and a limited amount of power equipment. However, removal of these facilities would likely require several helicopter trips. As such, the impact on local air quality would be short-term, negligible, and adverse. The reduction in lodging

units would reduce total overnight visitation and energy required to run the facility, resulting in a local, long-term, negligible, beneficial air quality impact.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segments 1, 5, 6, and 8 would have long-term, minor, beneficial impacts on air quality within these segments.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 2 include: rerouting trails at Ahwahnee Meadows; removing and restoring a portion of Northside Drive (900 feet) and rerouting the bike path; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing development, asphalt, and fill material, and restoring 35.6 acres of floodplain at the former Upper and Lower River campgrounds; removing campsites and infrastructure from the 100-year floodplain and restoring an additional 25.1 acres of floodplain and riparian habitat; and removing informal trails and informal parking at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require approximately 65 weeks of crew and equipment time over a period of three years. The resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 2 include: relocating unimproved Camp 6 parking and rerouting a portion of Northside Drive; removing the Stoneman, Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 30 weeks of crew and equipment time. The resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping, lodging, parking, circulation, employee housing, and service facilities would be similar to those described above for the

analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Overnight visitation and total daily use levels would be 26% and 33% less, respectively, than under Alternative 1. With fewer on-road vehicles under Alternative 3, the effect on local air pollution conditions would be long term, minor, and beneficial. However, the majority of campsites and their associated campfires and other sources of evening smoke are located within Segment 2. These sources of smoke would continue to affect local air quality at levels that may be unhealthy for sensitive groups, including individuals with pulmonary or cardiovascular diseases, the elderly, and children. Wood smoke can contribute enough local emissions currently to create unhealthy pollutant levels for sensitive groups, especially many wood burning sources operating under stable atmospheric conditions. Reduced campsites along this segment (estimated at 450 versus 466 for Alternative 1) would result in a proportional reduction in campfire emissions, which would be a local, long-term, minor beneficial impact. With fewer on-road vehicles and potential for wood smoke under Alternative 2, the overall effect on local air pollution conditions would be long term, minor, and beneficial.

**Curry Village and Campground.** The park would construct 78 new hard-sided units in Boys Town, bringing the total number of new and retained units at Curry Village to 433. The park would remove campsites from lower Pines (32), North Pines (86), and Upper Pines (24). In addition, the park would discontinue commercial day rides from the Curry Village Stables. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The reduction in overnight accommodations would reduce total overnight visitation and number of campfires, resulting in a local, long-term, minor, beneficial air quality impact.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, and install walkways leading to Yosemite Village. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would move on-grade pedestrian crossing Camp 4 and Yosemite Lodge. The park would convert the Highland Court area to a walk-in campground; reconfigure pedestrian crossing of Northside Drive and Yosemite Lodge Drive, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The addition of parking would provide access to the valley for a greater number of private and commercial vehicles, resulting in a local, long-term, minor, adverse air quality impact.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have local, short-term, adverse impacts ranging from negligible to moderate. These actions would not

be expected to have a long-term impact on air quality. Actions to manage user capacities, land use, and facilities within Segment 2 would have local, long-term, minor, beneficial impacts on air quality.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping and employee housing facilities would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

There are no NPS overnight accommodations along Segments 3 and 4, and thus few campfires or other visitor-related evening sources of smoke. Also, as described in the Alternatives chapter, total daily use levels would be less than under Alternative 1. With fewer on-road vehicles under Alternative 1, the overall effect on local air pollution conditions would be long-term, minor, and beneficial.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would have a short-term, regional and local, negligible to minor adverse impact on air quality within Segments 3 and 4. These actions would not be expected to have a long-term air quality impact. Actions to manage user capacities, land use, and facilities within Segments 3 & 4 would have local, long-term, minor, beneficial air quality impacts.

### **Segment 7: Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 2 include the relocation of stock use campsites

from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week to implement. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to service facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Wawona Campground:** Under Alternative 2, the park would reduce the size of the Wawona Campground. Thirty-two campsites, or 33% of all campsites within Wawona, would be removed from the floodplain. There would be a proportional reduction in campfire emissions. This would result in a long-term, local, minor, beneficial impact on air quality.

**Segment 7 Impact Summary:** Actions to protect and enhance river values within Segments 6 & 7 would have regional and local, short-term, negligible to minor, adverse air quality impacts. Over the long-term, these actions would contribute to a local, negligible, beneficial impact. Actions to manage user capacities, land use, and facilities within Segment 7 would have local, long-term, minor, beneficial impacts on air quality.

### **Summary of Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

Impacts associated with implementation of Alternative 2 would be similar to those described above for the analysis common to Alternatives 2–6. In summary, compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential short-term adverse impacts associated with construction emissions to the extent feasible. Even after mitigation, short-term, negligible to moderate, adverse impacts from construction would be anticipated. With regard to long-term operations, reduced housing, campsites, or lodging would result in a proportional reduction in area source emissions (e.g., from consumer products, maintenance/landscaping, natural gas combustion for heating/cooling) and campfire emissions. In addition, reducing the overall visitor capacity would result in a regional and local, long-term, minor, beneficial impact on the air quality environment by reducing pollutant emissions associated with on-road vehicles and campfires in Yosemite Valley. Regional and local, impacts to AQRVs (such as pine injury from ozone, visibility, and lichen sensitivity to nitrogen deposition) would also be long-term, minor, and beneficial.

### **Cumulative Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following air quality analysis are the same as those identified for Alternative 1.

### ***Overall Cumulative Impact from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration***

Because management action under Alternative 2 and actions common to Alternatives 2-6 involve substantial construction activity, it would be expected to contribute to regional and local, short-term, adverse impacts on air quality resulting from construction activities.

Over the long term, with respect to ozone, conditions in the Merced River corridor would continue to be determined almost entirely by regional emissions trends instead of by local emissions sources. The regional, long-term impact would most likely be beneficial, owing to the emissions reductions expected to occur with implementation of ongoing state and federal mobile-source control programs. In addition, with reduced visitor capacity and campsites, Alternative 2 would result in a long-term, cumulatively beneficial impact on air quality from reduced VMT (ozone and particulate emissions) and campfire usage (particulate emissions). The continued management of traffic and encouragement of alternative forms of transportation would have regional and local, long-term, negligible to minor, beneficial impacts on air quality.

### ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 3 would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

With regard to regional, long-term impacts associated with the reduced visitor capacity under Alternative 3, on-road mobile emissions were quantified using EMFAC2007 emission factors and compared to the Federal General Conformity thresholds. The results are shown in **table 9-135**, below. Although bus operations are projected to increase under Alternative 3, the reduction in total daily visitor and administrative use and capacity would result in a regional and local, long-term, minor, beneficial impact owing to reduced on-road vehicles in the park, as depicted in the table. Regional and local impacts to AQRVs (such as pine injury from ozone, visibility, and lichen sensitivity to nitrogen deposition) would also be long-term, minor, and beneficial.

**TABLE 9-135: ON-ROAD VEHICLE CRITERIA AIR POLLUTANT EMISSIONS (tons/year)<sup>a</sup>**

Scenario	NO <sub>x</sub>	ROG
Alternative 3 Emissions	17	19
Alternative 1 (No Action) Emissions	22	26
Incremental Change <sup>b</sup>	(5)	(7)
Federal General Conformity Threshold <sup>c</sup>	100	50
Impact Intensity, Type? <sup>d</sup>	Minor, Beneficial	Minor, Beneficial
<sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in chapter 7 were totaled for each alternative to determine the regional air pollutant emissions. Specific assumptions and emission factors incorporated into the calculations are included in Appendix G. <sup>b</sup> Values in (parentheses) are net reductions with respect to Alternative 1 (No Action) emissions. <sup>c</sup> Federal General Conformity thresholds for the Mariposa County portion of the MCAB. <sup>d</sup> Negligible impacts would be effects considered not detectable and would have no discernible effect on air quality (assumed to be 1% or less of threshold). Minor impacts would be those that are present but not expected to have an overall effect on those conditions (assumed to occur up to 50% of applicable threshold). Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on local or regional air quality (assumed to occur when emissions exceed applicable threshold).		

Other local, long-term, operational impacts of Alternative 3 are described below for each segment.

### **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Impacts from in-park emissions, such as vehicles, would be more apparent in areas close to roads and concentrations of visitor and administrative services. With fewer on-road vehicles in the vicinity under

Alternative 3, the overall effect on local air pollution conditions would be long term, minor, and beneficial.

Merced Lake High Sierra Camp. The park would close the Merced Lake High Sierra Camp and removal all infrastructure, convert the area to designated Wilderness, and use the former camp area for a temporary stock camp. These actions would primarily involve the use of hand tools and a limited amount of power equipment. However, removal of these facilities would likely require several helicopter trips. As such, the impact on local air quality would be short-term, negligible, and adverse. The reduction in lodging units would reduce total overnight visitation and energy required to run the facility, resulting in a local, long-term, negligible, beneficial air quality impact.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segments 1, 5, 6, and 8 would have long-term, minor, beneficial impacts on air quality within these segments.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 3 include: rerouting trails at Ahwahnee Meadows; removing and restoring a portion of Northside Drive (900 feet) and rerouting the bike path; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing development, asphalt, and fill material, and restoring 35.6 acres of floodplain at the former Upper and Lower River campgrounds; removing campsites and infrastructure from within 150 feet of the river and restoring an additional 12 acres of floodplain and riparian habitat; and removing informal trails and installing signage and fencing to redirect visitor traffic at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require approximately 50 weeks of crew and equipment time over a period of two years. The resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 3 include: relocating unimproved Camp 6 parking; removing the Stoneman, Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 30 weeks of crew and

equipment time over a period of two years. The resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping, lodging, parking, circulation, employee housing, and service facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Overnight visitation and total daily use levels would be 23% and 37% less, respectively, than under Alternative 1. With fewer on-road vehicles under Alternative 3, the effect on local air pollution conditions would be long term, minor, and beneficial. However, the majority of campsites, and their associated campfires and other sources of evening smoke, are located within Segment 2. Campfires would continue to be subject to park regulations, and related emissions could increase in proportion to the increased campsites. Campfires or other evening sources of smoke would continue to affect local air quality at levels that may be unhealthy for sensitive groups, including individuals with pulmonary or cardiovascular diseases, the elderly, and children. Since wood smoke can contribute enough local emissions currently to create unhealthy pollutant levels for sensitive groups, especially many wood burning sources operating under stable atmospheric conditions, the expected increase in the usage of campfires under Alternative 3 would have a potentially local, long-term, moderate, adverse impact on sensitive receptors. Increased usage of campfires would also result in a potentially local, long-term, moderate, adverse impact if the usage results in increased PM10 measurements above the ambient air quality standard at the monitoring site at the Yosemite Valley Visitor Center.

**Curry Village and Campground.** The park would retain 355 guest units at Curry Village. The park would remove campsites from lower Pines (15), North Pines (34), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The reduction in overnight accommodations would reduce total overnight visitation and number of campfires, resulting in a local, long-term, minor, beneficial air quality impact.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, and install walkways leading to Yosemite Village. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would move on-grade pedestrian crossing to west of the Northside Drive and Yosemite Lodge Drive, relocate the existing bus drop-off area to the Highland

Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The addition of parking would provide access to the valley for a greater number of private and commercial vehicles, resulting in a local, long-term, minor, adverse air quality impact.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have local, short-term, adverse impacts ranging from negligible to moderate. These actions would not be expected to have a long-term impact on air quality. Actions to manage user capacities, land use, and facilities within Segment 2 would have local, long-term, minor, beneficial air quality impacts associated with vehicle emissions; but would also result in a local, long-term, moderate, adverse air quality impact from increased numbers of campfires.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to employee housing facilities would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

There are no NPS overnight accommodations along Segments 3 and 4, and thus few campfires or other visitor-related evening sources of smoke. Also, as described in the Alternatives chapter, total daily use levels would be less than under the Alternative 1. With fewer on-road vehicles under Alternative 3, the overall effect on local air pollution conditions would be long term, minor, and beneficial.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would have a short-term, regional and local, negligible to minor adverse impact on air quality within Segments 3 & 4. These actions would not be expected to have a long-term air quality impact. Actions to manage user capacities, land use, and facilities within Segments 3 & 4 would have local, long-term, minor, beneficial air quality impacts.

## Segment 7: Wawona

### *Impacts of Actions to Protect and Enhance River Values*

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 3 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week to complete. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality.

### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Short-term construction activities and impacts associated with changes to service facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Wawona Campground.** Under Alternative 3, the park would reduce the size of the Wawona Campground. Twenty seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. There would be a proportional reduction in campfire emissions. This would result in a long-term, local, minor, beneficial impact on air quality.

**Segment 7 Impact Summary:** Actions to protect and enhance river values within Segments 6 & 7 would have regional and local, short-term, negligible to minor, adverse air quality impacts. Over the long-term, these actions would contribute to a local, negligible, beneficial impact. Actions to manage user capacities, land use, and facilities within Segment 7 would have local, long-term, minor, beneficial impacts on air quality.

### **Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Impacts associated with implementation of Alternative 3 would be similar to those described above for the analysis common to Alternatives 2–6. In summary, compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local, short-term, adverse impacts associated with construction emissions to the extent feasible. Even after mitigation, regional and local, short-term, negligible to moderate, adverse impacts from construction would be anticipated. With regard to long-term operations, increased campsites and associated campfires in Yosemite Valley could result in a local, moderate, adverse impact. Reduced housing or

lodging would result in a proportional reduction in area source emissions (e.g., from consumer products, maintenance/landscaping, natural gas combustion for heating/cooling). In addition, reducing the overall visitor capacity would result in a regional and local, long-term, minor, beneficial impact on air quality within the Merced River corridor by reducing pollutant emissions associated with on-road vehicles and campfires in Yosemite Valley. Regional and local, impacts to AQRVs (such as pine injury from ozone, visibility, and lichen sensitivity to nitrogen deposition) would also be long-term, minor, and beneficial.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following air quality analysis are the same as those identified for Alternative 1.

#### ***Overall Cumulative Impact from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

Because management action under Alternative 3 and actions common to Alternatives 2-6 involve substantial construction activity, it would be expected to contribute to short-term, adverse impacts on air quality resulting from construction activities.

Over the long term, with respect to ozone, conditions in the Merced River corridor would continue to be determined almost entirely by regional emissions trends instead of by local emissions sources. The regional, long-term impact would most likely be beneficial, owing to the emissions reductions expected to occur with implementation of ongoing state and federal mobile-source control programs. In addition, with reduced visitor capacity, Alternative 3 would result in a long-term, cumulatively beneficial impact on air quality from reduced VMT (ozone and particulate emissions). Regarding potential particulate emissions, since campsites would increase in Yosemite Valley, campfire usage (particulate emissions) would increase proportionately which would result in a local, long-term, moderate adverse impact. The continued management of traffic and encouragement of alternative forms of transportation would have regional and local, long-term, negligible to minor beneficial impacts on air quality.

### ***Environmental Consequences of Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 4 would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

With regard to regional, long-term impacts associated with the reduced visitor capacity under Alternative 4, on-road mobile emissions were quantified using EMFAC2007 emission factors and compared to the Federal General Conformity thresholds. The results are shown in **table 9-136**, below. Although bus operations are projected to increase under Alternative 4, the reduction in total daily visitor and administrative use and capacity would result in a regional and local, long-term, minor, beneficial impact owing to reduced on-road vehicles in the park, as depicted in the table. Regional and local, impacts to AQRVs (such as pine injury from ozone, visibility, and lichen sensitivity to nitrogen deposition) would also be long-term, minor, and beneficial.

**TABLE 9-136: ON-ROAD VEHICLE CRITERIA AIR POLLUTANT EMISSIONS (tons/year)<sup>a</sup>**

Scenario	NO <sub>x</sub>	ROG
Alternative 4 Emissions	20	22
Alternative 1 (No Action) Emissions	22	26
Incremental Change <sup>b</sup>	(2)	(4)
Federal General Conformity Threshold <sup>c</sup>	100	50
Impact Intensity, Type? <sup>d</sup>	Minor, Beneficial	Minor, Beneficial
<sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in chapter 7 were totaled for each alternative to determine the regional air pollutant emissions. Specific assumptions and emission factors incorporated into the calculations are included in Appendix G. <sup>b</sup> Values in (parentheses) are net reductions with respect to Alternative 1 (No Action) emissions. <sup>c</sup> Federal General Conformity thresholds for the Mariposa County portion of the MCAB. <sup>d</sup> Negligible impacts would be effects considered not detectable and would have no discernible effect on air quality (assumed to be 1% or less of threshold). Minor impacts would be those that are present but not expected to have an overall effect on those conditions (assumed to occur up to 50% of applicable threshold). Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on local or regional air quality (assumed to occur when emissions exceed applicable threshold).		

Other local, long-term, operational impacts of Alternative 4 are described below for each segment.

## **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Impacts from in-park emissions, such as vehicles, would be more apparent in areas close to roads and concentrations of visitor and administrative services. With fewer on-road vehicles in the vicinity under Alternative 4, the overall effect on air pollution conditions would be local, long term, minor, and beneficial.

Merced Lake High Sierra Camp. The park would close the Merced Lake High Sierra Camp and removal all infrastructure, convert the area to designated Wilderness, and restoration of the former camp area to natural conditions. These actions would primarily involve the use of hand tools and a limited amount of power equipment. However, removal of these facilities would likely require several helicopter trips. As such, the impact on local air quality would be short-term, negligible, and adverse. The reduction in lodging units would reduce total overnight visitation and energy required to operate the facility, resulting in a local, long-term, negligible, beneficial air quality impact.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segments 1, 5, 6, and 8 would have long-term, minor, beneficial impacts on air quality within these segments.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 4 include: removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing asphalt and fill material, restoring topography of 19.7 acres of floodplain, and installation of box culverts or other similar design components at the former Upper and Lower River campgrounds; removing campsites and infrastructure from within 150 feet of the river and restoring an additional 12 acres of floodplain and riparian habitat; and erecting fencing, signage, and boardwalks to redirect visitor traffic, and removing informal trails at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require at least 20 weeks of crew and equipment time over a period of at least two years. The resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 4 include: relocating unimproved Camp 6 parking; placing large wood and engineered logjams along the base of Stoneman Bridge; removing the Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 30 weeks of crew and equipment time over a period of two years, during which other restoration and maintenance activities would be disrupted. The resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping, lodging, parking, circulation, employee housing, and service facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Overnight visitation and total daily use levels would be 7% greater and 19% less, respectively, than under Alternative 1. With fewer on-road vehicles under Alternative 4, the overall effect on local air pollution conditions along roadways would be long term, minor, and beneficial. However, the majority of campsites, and their associated campfires and other sources of evening smoke, are located within Segment 2. Campfires would continue to be subject to park regulations, and related emissions could increase in proportion to the increased campsites (701 sites versus 466 sites for Alternative 1). Campfires or other evening sources of smoke would continue to affect local air quality at levels that may be unhealthy for sensitive groups, including individuals with pulmonary or cardiovascular diseases, the elderly, and children. Since wood smoke can contribute enough local emissions currently to create unhealthy pollutant levels for sensitive groups, especially many wood-burning sources

operating under stable atmospheric conditions, the expected increase in the usage of campfires under Alternative 4 would have a potentially local, long-term, moderate, adverse impact on sensitive receivers. Increased usage of campfires would also result in a potentially local, long-term, moderate, adverse impact if the usage results in increased PM10 measurements above the ambient air quality standard at the monitoring site at the Yosemite Valley Visitor Center.

**Curry Village and Campground.** The park would retain 355 guest units and construct a new 40 site campground at Curry Village. The park would remove campsites from lower Pines (15), North Pines (34), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The reduction in overnight accommodations would reduce total overnight visitation and number of campfires, resulting in a local, long-term, minor, beneficial air quality impact.

**Camp 6 and Yosemite Village.** The park would improve the configuration of and on-grade pedestrian crossing at the Northside Drive-Yosemite Village Drive intersection, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 750 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The addition of parking would provide access to the valley for a greater number of private and commercial vehicles, resulting in a local, long-term, minor, adverse air quality impact.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The addition of parking would provide access to the valley for a greater number of private and commercial vehicles, resulting in a local, long-term, minor, adverse air quality impact.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have local, short-term, adverse impacts ranging from negligible to moderate. These actions would not be expected to have a long-term impact on air quality. Actions to manage user capacities, land use, and facilities within Segment 2 would have local, long-term, minor, beneficial air quality impacts associated with vehicle emissions; but a local, long-term, moderate, adverse air quality impact from increased numbers of campfires.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2

(included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to parking and employee housing facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

There are no NPS overnight accommodations along Segments 3 and 4, and thus few campfires or other visitor-related evening sources of smoke. Also, as described in the alternatives chapter, total daily use levels would be less than under Alternative 1. With fewer on-road vehicles under Alternative 4, the overall effect on local air pollution conditions would be long term, minor, and beneficial.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would have a short-term, regional and local, negligible to minor adverse impact on air quality within Segments 3 & 4. These actions would not be expected to have a long-term air quality impact. Actions to manage user capacities, land use, and facilities within Segments 3 & 4 would have short-term, regional and local, negligible to minor, adverse impacts on air quality within Segment 4. Over the long-term, these actions would have minor, beneficial air quality impacts.

## **Segment 7: Wawona**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 4 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew and equipment time. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1

and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Wawona Campground.** Under Alternative 4, the park would reduce the size of the Wawona Campground. Twenty-seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. There would also be a proportional reduction in campfire emissions. This would result in a long-term, local, minor, beneficial impact on air quality.

**Segment 7 Impact Summary:** Actions to protect and enhance river values within Segments 6 & 7 would have regional and local, short-term, negligible to minor, adverse air quality impacts. Over the long-term, these actions would contribute to a local, negligible, beneficial impact. Actions to manage user capacities, land use, and facilities within Segment 7 would have local, long-term, minor, beneficial impacts on air quality.

#### **Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

Impacts associated with implementation of Alternative 4 would be similar to those described above for the analysis common to Alternatives 2–6. In summary, compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential short-term adverse impacts associated with construction emissions to the extent feasible. Even after mitigation, regional and local, short-term, negligible to moderate, adverse impacts from construction would be anticipated. With regard to long-term operations, reduced housing or lodging would result in a proportional reduction in area source emissions (e.g., from consumer products, maintenance/landscaping, natural gas combustion for heating/cooling). In addition, reducing the overall visitor capacity would result in a regional and local, long-term, minor, beneficial impact on the air quality environment by reducing pollutant emissions associated with on-road vehicles. Regional and local, impacts to AQRVs (such as pine injury from ozone, visibility, and lichen sensitivity to nitrogen deposition) would also be long-term, minor, and beneficial. A greater number of potential campfires associated with increased campsites in Yosemite Valley, however, would result in a potentially local, long-term, moderate, adverse impact owing to particulate emissions.

#### **Cumulative Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following air quality analysis are the same as those identified for Alternative 1.

#### ***Overall Cumulative Impact from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

Because management action under Alternative 4 and actions common to Alternatives 2–6 involve substantial construction activity, it would be expected to contribute to regional and local, short-term, negligible to moderate, adverse impacts on air quality resulting from construction activities.

Over the long term, with respect to ozone, conditions in the Merced River corridor would continue to be determined almost entirely by regional emissions trends instead of by local emissions sources. The regional, long-term impact would most likely be beneficial, owing to the emissions reductions expected to occur with implementation of ongoing state and federal mobile-source control programs. In addition, with reduced overall visitor capacity, Alternative 4 would result in a regional and local, long-term, minor cumulatively beneficial impact on air quality from reduced VMT (ozone and particulate emissions). However, increased campsites could result in a local, moderate, adverse impact from increased campfire usage (particulate emissions). The continued management of traffic and encouragement of alternative forms of transportation would have regional and local, long-term, negligible to minor beneficial impacts on air quality.

### ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 5 would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

With regard to regional, long-term impacts associated with the reduced visitor capacity under Alternative 5, on-road mobile emissions were quantified using EMFAC2007 emission factors and compared to the Federal General Conformity thresholds. The results are shown in **table 9-137**, below. As depicted in the table, the reduction in total daily visitor and administrative use and capacity would result in a regional and local, long-term, minor, beneficial impact for ROG emissions owing to reduced on-road vehicles in the park. However, with the increased bus operations under Alternative 5, NO<sub>x</sub> emissions would be a regional and local, long-term, negligible adverse impact. Regional impacts to AQRVs (such as pine injury from ozone and visibility) would be similar to existing conditions, but the local impact to lichen along roadways would be long-term, negligible, and adverse due to increased nitrogen deposition.

Other local, long-term, operational impacts of Alternative 5 are described below for each segment.

**TABLE 9-137: ON-ROAD VEHICLE CRITERIA AIR POLLUTANT EMISSIONS (tons/year)<sup>a</sup>**

Scenario	NO <sub>x</sub>	ROG
Alternative 5 Emissions	23	25
Alternative 1 (No Action) Emissions	22	26
Incremental Change <sup>b</sup>	1	(1)
Federal General Conformity Threshold <sup>c</sup>	100	50
Impact Intensity, Type? <sup>d</sup>	Negligible, Adverse	Minor, Beneficial
<p><sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in chapter 7 were totaled for each alternative to determine the regional air pollutant emissions. Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on local or regional air quality (assumed to occur when emissions exceed applicable threshold).</p>		

### **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping facilities would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Impacts from in-park emissions, such as vehicles, would be more apparent in areas close to roads and concentrations of visitor and administrative services. With fewer on-road vehicles in the vicinity under Alternative 5, the overall effect on air pollution conditions would be long term, minor, and beneficial.

**Merced Lake High Sierra Camp.** The park would reduce the capacity of the Merced Lake High Sierra Camp to 42 beds and replace the flush toilets with composting toilets. These actions would primarily involve the use of hand tools and a limited amount of power equipment. However, removal of these facilities could require one or more helicopter trips. As such, the impact on local air quality would be short-term, negligible, and adverse. The reduction in lodging units would reduce total overnight visitation and energy required to run the facility, resulting in a local, long-term, negligible, beneficial air quality impact.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segments 1, 5, 6, and 8 would have long-term, minor, beneficial impacts on air quality within these segments.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternatives 5 include: removing asphalt and fill material, restoring topography of 35.6 acres of floodplain, and installation of box culverts or other similar design components at the former Upper and Lower River campgrounds; removing campsites and infrastructure from within 100 feet of the river and restoring an additional 6.5 acres of floodplain and riparian habitat; removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; reconfiguring the Curry Orchard parking lot; removing informal trails and erecting fencing, signage, and boardwalks to redirect visitor traffic, and selectively removing conifers to improve views at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require at least 40 weeks of crew and equipment time over a period of two years. The resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 5 include: relocating unimproved Camp 6 parking; removing the Sugar Pine Bridge; placing large wood and engineered logjams along the base of Stoneman Bridge; and improving trail connectivity and routing in the vicinity of the Ahwahnee Bridge. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require at least 16 weeks of crew and equipment time over a period of two years, during which other restoration and maintenance activities could be disrupted. The

resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping, lodging, visitor services, parking, circulation, employee housing, and service facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Overnight visitation and total daily use levels would be 16% greater and 5% less, respectively, than under Alternative 1. With fewer on-road vehicles and potential for wood smoke under Alternative 5, the overall effect on local air pollution conditions would be long term, minor, and beneficial. However, the majority of campsites, and their associated campfires and other sources of evening smoke, are located within Segment 2. Campfires would continue to be subject to park regulations, and related emissions could increase in proportion to the increased campsites (640 sites versus 466 sites for Alternative 1). Campfires or other evening sources of smoke would continue to affect local air quality at levels that may be unhealthy for sensitive groups, including individuals with pulmonary or cardiovascular diseases, the elderly, and children. Since wood smoke can contribute enough local emissions currently to create unhealthy pollutant levels for sensitive groups, especially many wood-burning sources operating under stable atmospheric conditions, the expected increase in the usage of campfires under Alternative 5 would have a potentially local, long-term, moderate, adverse impact on sensitive receivers. Increased usage of campfires would also result in a potentially local, long-term, moderate, adverse impact if the usage results in increased PM10 measurements above the ambient air quality standard at the monitoring site at the Yosemite Valley Visitor Center.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from lower Pines (5), North Pines (14), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The addition of overnight accommodations would increase total overnight visitation and related vehicle emissions, while the reduction in campsites would decrease the number of valley campfires and associated emissions. The resulting air quality impact would be local, long-term, negligible, and adverse.

**Camp 6 and Yosemite Village.** The park would construct a pedestrian underpass and a traffic circle at the intersection of Northside and Yosemite Village Drives, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The traffic circle and underpass would reduce emissions through

reducing intersection delays. However, addition of parking would provide access to the valley for a greater number of private vehicles. The net air quality effect would be local, long-term, minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 300 automobiles and 15 tour busses. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The addition of parking would provide access to the valley for a greater number of private and commercial vehicles, resulting in a local, long-term, minor, adverse air quality impact.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have local, short-term, adverse impacts ranging from negligible to moderate. These actions would not be expected to have a long-term impact on air quality. Actions to manage user capacities, land use, and facilities within Segment 2 would have local, long-term, minor, beneficial air quality impacts associated with vehicle emissions; but a local, long-term, moderate, adverse air quality impact from increased numbers of campfires.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to parking and employee housing facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

There are no NPS overnight accommodations along Segments 3 and 4, and thus few campfires or other visitor-related evening sources of smoke. Also, as described in the alternatives chapter, total daily use levels would be less than under Alternative 1. With fewer on-road vehicles under Alternative 5, the overall effect on local air pollution conditions would be long term, minor, and beneficial.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would have a short-term, regional and local, negligible to minor adverse impact on air quality within Segments 3 & 4.

These actions would not be expected to have a long-term air quality impact. Actions to manage user capacities, land use, and facilities within Segments 3 & 4 would have short-term, regional and local, negligible to minor, adverse impacts on air quality within Segment 4. Over the long-term, these actions would have minor, beneficial air quality impacts.

## **Segment 7: Wawona**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 3 include the relocation of stock use campsites from sensitive resource areas to the Wawona Maintenance Yard. This work could require the use of heavy equipment and would require approximately one week of crew and equipment time. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Wawona Campground.** Under Alternative 5, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. There would also be a proportional reduction in campfire emissions. This would result in a long-term, local, minor, beneficial impact on air quality.

**Segment 7 Impact Summary:** Actions to protect and enhance river values within Segments 6 & 7 would have regional and local, short-term, negligible to minor, adverse air quality impacts. Over the long-term, these actions would contribute to a local, negligible, beneficial impact. Actions to manage user capacities, land use, and facilities within Segment 7 would have local, long-term, minor, beneficial impacts on air quality.

## **Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Impacts associated with implementation of Alternative 5 would be similar to those described above for the analysis common to Alternatives 2–6. In summary, compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential short-term, adverse impacts associated with construction emissions to the extent feasible. Even after mitigation, short-term, negligible to moderate, adverse impacts from construction would be anticipated. With regard to long-term operations, reduced housing or lodging would result in a proportional reduction in area source emissions (e.g., from consumer products, maintenance/landscaping, natural gas combustion for heating/cooling). In addition, the reduction in total daily visitor and administrative use and capacity and would result in a regional and local, long-term, minor, beneficial impact for ROG emissions owing to reduced on-road vehicles in the park. However, with the increased bus operations under Alternative 5, NO<sub>x</sub> emissions would be a regional and local, long-term, negligible adverse impact. Regional impacts to AQRVs (such as pine injury from ozone and visibility) would be similar to existing conditions, but the local impact to lichen along roadways would be long-term, negligible, and adverse due to increased nitrogen deposition. A greater number of potential campfires associated with increased campsites in Yosemite Valley, however, would result in a potentially local, long-term, moderate, adverse impact owing to particulate emissions.

## **Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following air quality analysis are the same as those identified for Alternative 1.

### ***Overall Cumulative Impact from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

Because management action under Alternative 5 and actions common to Alternatives 2–6 involve substantial construction activity, it would be expected to contribute to regional and local, short-term, negligible to moderate, adverse impacts on air quality resulting from construction activities.

Over the long term, with respect to ozone, conditions in the Merced River corridor would continue to be determined almost entirely by regional emissions trends instead of by local emissions sources. The regional, long-term impact would most likely be beneficial, owing to the emissions reductions expected to occur with implementation of ongoing state and federal mobile-source control programs. In addition, with reduced overall visitor capacity, would result in a regional and local, long-term, minor, beneficial impact for ROG emissions. However, with the increased bus operations under Alternative 5, NO<sub>x</sub> emissions would be a regional and local, long-term, negligible adverse impact. Increased campsites could result in a local moderate, adverse impact from increased campfire usage (particulate emissions). The continued management of traffic and encouragement of alternative forms of transportation would have regional and local, long-term, negligible to minor beneficial impacts on air quality.

## ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 6 would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

With regard to regional, long-term impacts associated with the slightly increased visitor capacity under Alternative 6, on-road mobile emissions were quantified using EMFAC2007 emission factors and compared to the Federal General Conformity thresholds. The results are shown in **table 9-138**, below. As depicted in the table, the increase in total daily visitor and administrative use and capacity and bus operations would result in a regional and local, long-term, negligible to minor, adverse impact owing to increased on-road vehicles in the park. Regional and local, impacts to AQRVs (such as pine injury from ozone, visibility, and lichen sensitivity to nitrogen deposition) would also be long-term, negligible to minor, and adverse.

Other local, long-term, operational impacts of Alternative 6 are described below for each segment.

### **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**TABLE 9-138: ON-ROAD VEHICLE CRITERIA AIR POLLUTANT EMISSIONS (tons/year)<sup>a</sup>**

Scenario	NO <sub>x</sub>	ROG
Alternative 6 Emissions	25	26
Alternative 1 (No Action) Emissions	22	26
Incremental Change <sup>b</sup>	3	0
Federal General Conformity Threshold <sup>c</sup>	100	50
Impact Intensity, Type? <sup>d</sup>	Minor, Adverse	Negligible, Adverse
<sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in chapter 7 were totaled for each alternative to determine the regional air pollutant emissions. Specific assumptions and emission factors incorporated into the calculations are included in Appendix G. <sup>b</sup> Values in (parentheses) are net reductions with respect to Alternative 1 (No Action) emissions. <sup>c</sup> Federal General Conformity thresholds for the Mariposa County portion of the MCAB. <sup>d</sup> Negligible impacts would be effects considered not detectable and would have no discernible effect on air quality (assumed to be 1% or less of threshold). Minor impacts would be those that are present but not expected to have an overall effect on those conditions (assumed to occur up to 50% of applicable threshold). Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on local or regional air quality (assumed to occur when emissions exceed applicable threshold).		

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping facilities would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Impacts from in-park emissions, such as vehicles, would be more apparent in areas close to roads and concentrations of visitor and administrative services. With more vehicles on park roads and in the vicinity of wilderness under Alternative 6, the overall effect on local, air pollution conditions would be long term, negligible, and adverse.

**Merced Lake High Sierra Camp.** The park would retain the Merced Lake High Sierra Camp and replace the flush toilets with composting toilets. These actions would primarily involve the use of hand tools and a limited amount of power equipment. However, removal of these facilities would likely require one or more helicopter trips. As such, the impact on local air quality would be short-term, negligible, and adverse.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segments 1, 5, 6, and 8 would have long-term, negligible, adverse impacts on air quality within these segments.

## Segment 2: Yosemite Valley

### *Impacts of Actions to Protect and Enhance River Values*

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 6 include: removing asphalt and fill material, restoring topography of 19.7 acres of floodplain, and installation of box culverts or other similar design components at the former Upper and Lower River campgrounds; removing campsites and infrastructure from within 100 feet of the river and restoring an additional 6.5 acres of floodplain and riparian habitat; removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; and removing informal trails, installing viewing platforms and boardwalks, and selectively removing conifers to improve views at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require at least 40 weeks of crew and equipment time over a period of at least two years. The resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 6 include: relocating unimproved Camp 6 parking and placing large wood and engineered logjams along the bases of Stoneman, Sugar Pine, and Ahwahnee Bridges. Under this alternative, Sugar Pine Bridge would be retained, engineered log jams and large wood installed at its base, and its condition monitored. Should long-term monitoring reveal mitigation measures are not sufficient, the park may undertake more aggressive management action, including removal of the bridge. Such action would require the use of heavy equipment and explosives to drop the bridge and dismantle the abutments. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 16 weeks of crew and equipment time over a period of two years. The resulting impact on regional and local air quality would be short-term, negligible to moderate, and adverse, even after implementation of mitigation measures MM-AIR-1 and -2 (included in Appendix C).

### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Short-term construction activities and impacts associated with changes to camping, lodging, parking, circulation, employee housing, and service facilities would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

Overnight visitation and total daily use levels would be 33% and 4% greater, respectively, than under Alternative 1. With more on-road vehicles under Alternative 6, the overall effect on local air pollution conditions along roadways would be long term, minor, and adverse. In addition, the majority of campsites, and their associated campfires and other sources of evening smoke, are located within Segment 2. Campfires would continue to be subject to park regulations, and related emissions could increase in proportion to the increased campsites (739 sites versus 466 sites for Alternative 1). Campfires or other evening sources of smoke would continue to affect local air quality at levels that may be unhealthy for sensitive groups, including individuals with pulmonary or cardiovascular diseases, the elderly, and children. Since wood smoke can contribute enough local emissions currently to create unhealthy pollutant levels for sensitive groups, especially many wood burning sources operating under stable atmospheric conditions, the expected increase in the usage of campfires under Alternative 6 would have a potentially local, long-term, moderate, adverse impact on sensitive receptors. Increased usage of campfires would also result in a potentially local long-term, major, adverse impact if the usage results in increased PM10 measurements above the ambient air quality standard at the monitoring site at the Yosemite Valley Visitor Center.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from lower Pines (5), North Pines (14), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The addition of overnight accommodations would increase total overnight visitation and related vehicle emissions, while the reduction in campsites would decrease the number of valley campfires and associated emissions. The resulting air quality impact would be local, long-term, negligible, and adverse.

**Camp 6 and Yosemite Village.** The park would expand the Concessioner Warehouse Building to accommodate Concessioner General Office functions, construct a pedestrian underpass and two roundabouts, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The roundabout and underpass would reduce emissions through reducing intersection delays. However, addition of parking would provide access to the valley for a greater number of private vehicles. The net air quality effect would be local, long-term, minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 300 automobiles and 15 tour busses. These actions would require the use of heavy equipment and demolition activities. As such, the impact on local air quality would be short-term, minor, and adverse. The addition of parking would provide access to the valley for a greater number of private and commercial vehicles, resulting in a local, long-term, minor, adverse air quality impact.

**Segment 2 Impact Summary:** Actions to protect and enhance river values within Segment 2 would have local, short-term, adverse impacts ranging from negligible to moderate. These actions would not be expected to have a long-term impact on air quality. Actions to manage user capacities, land use, and facilities within Segment 2 would have local, long-term, negligible to minor, adverse air quality impacts associated with vehicle emissions; but a local, long-term, moderate, adverse air quality impact from increased numbers of campfires.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to parking and employee housing facilities would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

There are no NPS overnight accommodations along Segments 3 and 4, and thus few campfires or other visitor-related evening sources of smoke. Also, as described in the alternatives chapter, total daily use levels would be greater than under Alternative 1. With more on-road vehicles under Alternative 6, the overall effect on local air pollution conditions would be regional and local, long term, negligible, and adverse.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would have a short-term, regional and local, negligible to minor adverse impact on air quality within Segments 3 & 4. These actions would not be expected to have a long-term air quality impact. Actions to manage user capacities, land use, and facilities within Segments 3 & 4 would have short-term, regional and local, negligible to minor, adverse impacts on air quality within Segment 4. Over the long-term, these actions would have minor, beneficial air quality impacts.

### **Segment 7: Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2-6 (see discussion of Impacts of Actions to Protect and Enhance

River Values under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 6 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew and equipment time. Accordingly, this action would result in short-term regional and local, negligible, adverse impacts on air quality.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6 (see discussion of Impacts of Actions to Manage User Capacities, Land Use, and Facilities under All River Segments). Compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential regional and local short-term, negligible to moderate impacts associated with construction emissions to the extent feasible.

As described in the alternatives chapter, total daily use levels would not change and maximum overnight capacity would be 5% less than under Alternative 1. Since campsites would be reduced along this segment (estimated at 83 and one group site versus 96 and one group site for Alternative 1), there would also be a proportional reduction in campfire emissions, which would be a local, long-term, minor, beneficial impact.

**Wawona Campground.** Under Alternative 6, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. This would result in a long-term, local, minor, beneficial impact on air quality.

**Segment 7 Impact Summary:** Actions to protect and enhance river values within Segments 6 & 7 would have regional and local, short-term, negligible to minor, adverse air quality impacts. Over the long-term, these actions would contribute to a local, negligible, beneficial impact. Actions to manage user capacities, land use, and facilities within Segment 7 would have local, long-term, minor, beneficial impacts on air quality.

### **Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Impacts associated with implementation of Alternative 6 would be similar to those described above for the analysis common to Alternatives 2–6. In summary, compliance with mitigation measures MM-AIR-1 and -2 (included in Appendix C) for applicable actions would reduce potential short-term adverse impacts associated with construction emissions to the extent feasible. Even after mitigation, regional and local, short-term, negligible to moderate, adverse impacts from construction would be anticipated. With regard to long-term operations, increased housing, campsites, or lodging would result in a proportional increase in area source emissions (e.g., from consumer products, maintenance/landscaping, natural gas combustion for heating/cooling) and campfire emissions. In addition, increasing the overall visitor capacity would result in a regional and local, long-term, negligible to minor, adverse impact on the air

quality environment associated with on-road vehicles. Regional and local, impacts to AQRVs (such as pine injury from ozone, visibility, and lichen sensitivity to nitrogen deposition) would also be long-term, negligible to minor, and adverse. A greater number of potential campfires associated with increased overnight accommodations in Yosemite Valley would result in a potentially local, long-term, moderate, adverse impact owing to particulate emissions.

### **Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following air quality analysis are the same as those identified for Alternative 1.

#### ***Overall Cumulative Impact from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

Because management action under Alternative 6 and actions common to Alternatives 2-6 involve substantial construction activity, it would be expected to contribute to regional and local, short-term, negligible to moderate adverse impacts on air quality resulting from construction activities.

Over the long term, with respect to ozone, conditions in the Merced River corridor would continue to be determined almost entirely by regional emissions trends instead of by local emissions sources. The regional, long-term impact would most likely be beneficial, owing to the emissions reductions expected to occur with implementation of ongoing state and federal mobile-source control programs. However, with increased overall visitor capacity, Alternative 6 would result in a regional and local, long-term, negligible to minor cumulatively adverse impact on air quality from increased VMT (ozone and particulate emissions) and increased campfire usage (particulate emissions). The continued management of traffic and encouragement of alternative forms of transportation would have regional and local, long-term, negligible to minor beneficial impacts on air quality.

Merced Wild and Scenic River  
Draft Comprehensive Management Plan  
and Environmental Impact Statement

Yosemite National Park  
P.O. Box 577  
Yosemite, CA 95389

[www.nps.gov/yose/parkmgmt/mrp.htm](http://www.nps.gov/yose/parkmgmt/mrp.htm)

As the nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned lands and natural resources. This includes fostering sound use of our land and water resources; protecting our fish, wildlife, and biological diversity; preserving the environmental and cultural values of our national parks and historical places; and providing for the enjoyment of life through outdoor recreation. The department assesses our energy and mineral resources and works to ensure that their development is in the best interests of all people by encouraging stewardship and citizen participation in their care. The department also has a major responsibility for American Indian reservation communities and for people who live in island territories under U.S. administration.

**APPENDICES (provided on CD and available website)**

Appendix A.	Actions that Amend the General Management Plan
Appendix B.	Cumulative Actions
Appendix C.	Mitigation Measures
Appendix D.	Floodplain Statement of Findings
Appendix E.	Proposed Restoration Actions
Appendix F.	Acoustical Measurement Locations
Appendix G.	On-road Vehicle Criteria Pollutant and GHG Emission Estimates
Appendix H.	Scenic Vista Management in the Merced River Corridor
Appendix I.	Yosemite Valley Historic District Resources
Appendix J.	NHPA Assessment of Effect for Site-Specific Actions
Appendix K.	Management Considerations and Actions
Appendix L.	Determination of Extent Necessary
Appendix M.	Changes to the ORVs Over time
Appendix N.	Biological Assessment
Appendix O.	Wetland Statement of Finding

**LIST OF FIGURES- VOLUME 2A****Chapter 9: Geology, Geohazards, and Soils**

9-1	Schematic Longitudinal Profile and Bedrock Geology Along the Merced River Corridor.....	9-11
9-2	Representative Valley Cross Sections .....	9-13

**Chapter 9: Hydrology, Floodplains, and Water Quality**

9-3	100-Year Flood Zone at Yosemite Valley East.....	9-92
9-4	100-Year Flood Zone at Yosemite Valley West .....	9-93
9-5	100-Year Flood Zone at El Portal.....	9-95
9-6	100-Year Flood Zone at Wawona .....	9-96

**Chapter 9: Vegetation and Wetlands**

9-7	Vegetation in the Project Area .....	9-187
9-8	Segment 1 – Merced River Above Nevada Fall Meadows.....	9-193
9-9	Segment 1 – Little Yosemite Valley and Merced Lake High Sierra Camp Meadows.....	9-194
9-10	Segment 2 – Historic and Current Meadows.....	9-203
9-11	Meadow Acreage in Yosemite Valley (1866-2011).....	9-205
9-12	Segment 4 – Valley Oak Woodlands .....	9-2011
9-13	Curry Village Area: Common to Alternatives 2-6 Habitat Restoration Actions .....	9-231
9-14	Yosemite Village Area: Common to Alternatives 2-6 Habitat Restoration Actions and Select Facilities Actions .....	9-232
9-15	Yosemite Lodge Area: Common to Alternatives 2-6 Habitat Restoration Actions .....	9-233
9-16	West Yosemite Valley: Common to Alternatives 2-6 Habitat Restoration Actions .....	9-234
9-17	Curry Village Area: Alternative 2 Habitat Restoration Actions and Select Facilities Actions .....	9-247
9-18	Yosemite Village Area: Alternative 2 Habitat Restoration Actions and Select Facilities Actions .....	9-248
9-19	Yosemite Lodge Area: Alternative 2 Habitat Restoration Actions and Select Facilities Actions .....	9-249
9-20	West Yosemite Valley: Alternative 2 Habitat Restoration Actions and Select Facilities Actions .....	9-250
9-21	Curry Village Area: Alternative 3 Habitat Restoration Actions and Select Facilities Actions .....	9-267
9-22	Yosemite Village Area: Alternative 3 Habitat Restoration Actions and Select Facilities Actions .....	9-268
9-23	Yosemite Lodge Area: Alternative 3 Habitat Restoration Actions and Select Facilities Actions .....	9-269
9-24	West Yosemite Valley: Alternative 3 Habitat Restoration Actions and Select Facilities Actions .....	9-270
9-25	Curry Village Area: Alternative 4 Habitat Restoration Actions and Select Facilities Actions .....	9-285
9-26	Yosemite Village Area: Alternative 4 Habitat Restoration Actions and Select Facilities Actions .....	9-286
9-27	Yosemite Lodge Area: Alternative 4 Habitat Restoration Actions and Select Facilities Actions .....	9-287
9-28	West Yosemite Valley: Alternative 4 Habitat Restoration Actions and Select Facilities Actions .....	9-288
9-29	Curry Village Area: Alternative 5 Habitat Restoration Actions and Select Facilities Actions .....	9-303
9-30	Yosemite Village Area: Alternative 5 Habitat Restoration Actions and Select Facilities Actions .....	9-304

**LIST OF FIGURES- VOLUME 2A (continued)****Chapter 9: Vegetation and Wetlands (continued)**

9-31	Yosemite Lodge Area: Alternative 5 Habitat Restoration Actions and Select Facilities Actions .....	9-305
9-32	West Yosemite Valley: Alternative 5 Habitat Restoration Actions and Select Facilities Actions .....	9-306
9-33	Curry Village Area: Alternative 6 Habitat Restoration Actions and Select Facilities Actions .....	9-321
9-34	Yosemite Village Area: Alternative 6 Habitat Restoration Actions and Select Facilities Actions .....	9-322
9-35	Yosemite Lodge Area: Alternative 6 Habitat Restoration Actions and Select Facilities Actions .....	9-323
9-36	West Yosemite Valley: Alternative 6 Habitat Restoration Actions and Select Facilities Actions .....	9-324

**Chapter 9: Special Status Species**

9-37	Segments 7 and 8: Sierra Sweet Bay Distribution .....	9-509
------	---	-------

**LIST OF FIGURES- VOLUME 2B****Chapter 9: Scenic Resources**

9-38	Yosemite Valley Scenic Analysis Map .....	9-761
------	---	-------

**Chapter 9: Visitor Experience/Recreation**

9-39	Average Park Visitation by Month (1990 – 2010) .....	9-806
------	--	-------

**Chapter 9: Transportation**

9-40	Park Roadways .....	9-976
9-41	Bus Visitation to Yosemite National Park and Number of Buses, 1990–2011 .....	9-979
9-42	Percent of Annual Buses and Bus Visitors by Month (Ten-Year Average) .....	9-980
9-43	YARTS Ridership along Highway 140 May 2006 through September 2011 .....	9-981
9-44	Yosemite Valley Loop Road .....	9-983
9-45	East Valley Redirection “Shunt” .....	9-984

**Chapter 9: Socioeconomics**

9-46	Estimated Number of Recreational Visitors to Yosemite National Park .....	9-1068
------	---	--------

**Chapter 9: Historic Buildings, Structures, and Cultural Landscapes**

9-47	Segment 1 – Little Yosemite Valley and Merced Lake High Sierra Camp Historic Properties .....	9-1121
9-48	Segment 2 – Yosemite Valley Historic Properties .....	9-1131
9-49	Segment 3 – Merced George Historic Properties .....	9-1132
9-50	Segment 4 – El Portal Historic Properties .....	9-1133
9-51	Segments 6, 7, 8 – Wawona Historic Properties .....	9-1139
9-52	Area of Potential Effect .....	9-1145

**LIST OF TABLES- VOLUME 2A****Chapter 9: Hydrology, Floodplains and Water Quality**

9-1	Bridges Causing Hydraulic Constrictions in Yosemite Valley .....	9-84
-----	--	------

**Chapter 9: Vegetation and Wetlands**

9-2	Major Vegetation Types in the Merced River Corridor .....	9-185
9-3	Classes and Areal Extent of Wetlands and Riparian Habitats in the Merced River Corridor.....	9-191
9-4	Stock-Use Nights Within Segment 1 by Location (2004 to 2010).....	9-196
9-5	Informal Trails in Subalpine Meadows .....	9-197
9-6	Segment 2 Vegetation Restoration Common to Alternatives 2-6.....	9-235
9-7	Segment 2 Wetland Restoration Common to Alternatives 2-6 .....	9-235
9-8	Maximum Number of Trees Removed Under Alternatives 2–6 in Segment 2 .....	9-238
9-9	Segment 4 Vegetation Restoration Common to Alternatives 2-6.....	9-241
9-10	Segment 4 Wetland Restoration Common to Alternatives 2-6 .....	9-241
9-11	Maximum Number of Trees Removed Common to Alternatives 2–6 in Segment 3 .....	9-242
9-12	Segment 7 Vegetation Restoration Common to Alternatives 2-6.....	9-243
9-13	Segment 2 Vegetation Restoration under Alternative 2 .....	9-251
9-14	Segment 2 Wetland Restoration under Alternative 2 .....	9-252
9-15	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 2 .....	9-254
9-16	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 & Yosemite Village – Alternative 2 .....	9-256
9-17	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 2 .....	9-257
9-18	Summary of Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities in Segment 2 – Alternative 2 .....	9-258
9-19	Segment 4 Vegetation Restoration under Alternative 2 .....	9-260
9-20	Segment 4 Wetland Restoration under Alternative 2 .....	9-260
9-21	Segment 7 Vegetation Restoration under Alternative 2 .....	9-261
9-22	Segment 2 Vegetation Restoration under Alternative 3 .....	9-266
9-23	Segment 2 Wetland Restoration under Alternative 3 .....	9-271
9-24	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 3 .....	9-273
9-25	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 and Yosemite Village – Alternative 3 .....	9-274
9-26	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 3 .....	9-276
9-27	Summary of Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities in Segment 2 – Alternative 3 .....	9-277
9-28	Segment 4 Vegetation Restoration under Alternative 3 .....	9-278
9-29	Segment 4 Wetland Restoration under Alternative 3 .....	9-278
9-30	Segment 7 Vegetation Restoration under Alternative 3 .....	9-280
9-31	Segment 2 Vegetation Restoration under Alternative 4 .....	9-284
9-32	Segment 2 Wetland Restoration under Alternative 4 .....	9-289
9-33	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 4 .....	9-292
9-34	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 and Yosemite Village – Alternative 4 .....	9-293
9-35	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 4 .....	9-295

**LIST OF TABLES- VOLUME 2A (continued)****Chapter 9: Vegetation and Wetlands (continued)**

9-36	Summary of Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities in Segment 2 – Alternative 4 .....	9-296
9-37	Segment 4 Vegetation Restoration under Alternative 4 .....	9-297
9-38	Segment 4 Wetland Restoration under Alternative 4 .....	9-297
9-39	Segment 7 Vegetation Restoration under Alternative 4 .....	9-298
9-40	Segment 2 Vegetation Restoration under alternative 5 .....	9-302
9-41	Segment 2 Wetland Restoration under Alternative 5 .....	9-307
9-42	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 5 .....	9-310
9-43	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 and Yosemite Village – Alternative 5 .....	9-311
9-44	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 5 .....	9-313
9-45	Summary of Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities in Segment 2 – Alternative 5 .....	9-314
9-46	Segment 4 Vegetation Restoration under Alternative 5 .....	9-315
9-47	Segment 4 Wetland Restoration under Alternative 5 .....	9-315
9-48	Segment 7 Vegetation Restoration under Alternative 5 .....	9-316
9-49	Segment 2 Vegetation Restoration under Alternative 6 .....	9-325
9-50	Segment 2 Wetland Restoration under Alternative 6 .....	9-325
9-51	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 6 .....	9-328
9-52	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 and Yosemite Village – Alternative 6 .....	9-329
9-53	Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 6 .....	9-331
9-54	Summary of Vegetation and Wetland Impacts from Actions to Manage Visitor Use and Facilities – Alternative 6 .....	9-332
9-55	Segment 4 Vegetation Restoration under Alternative 6 .....	9-332
9-56	Segment 4 Wetland Restoration under Alternative 6 .....	9-333
9-57	Segment 7 Vegetation Restoration under Alternative 6 .....	9-334

**Chapter 9: Wildlife**

9-58	Summary of California Wildlife Habitat Relationship Types in the Merced River Corridor .....	9-343
9-59	Habitat Restoration Common to Alternatives 2–6 in Segment 2 .....	9-365
9-60	Maximum Number of Trees Removed Common to Alternatives 2–6 in Segment 2 .....	9-368
9-61	Habitat Restoration Common to Alternatives 2–6 in Segment 4 .....	9-373
9-62	Maximum Number of Trees Removed Common to Alternatives 2–6 in Segment 3 .....	9-374
9-63	Habitat Restoration Common to Alternatives 2–6 in Segment 7 .....	9-376
9-64	Alternative 2 Habitat Restoration in Segment 2 .....	9-381
9-65	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 2 .....	9-385
9-66	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 & Yosemite Village – Alternative 2 .....	9-386
9-67	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 2 .....	9-387
9-68	Summary of Habitat Impacts from Actions to Manage Visitor Use and Facilities in Segment 2 – Alternative 2 .....	9-388

**LIST OF TABLES- VOLUME 2A (continued)****Chapter 9: Wildlife (continued)**

9-69	Alternative 2 Habitat Restoration in Segment 4.....	9-389
9-70	Alternative 2 Habitat Restoration in Segment 7.....	9-390
9-71	Alternative 3 Habitat Restoration in Segment 2.....	9-395
9-72	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 3 .....	9-398
9-73	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 and Yosemite Village – Alternative 3 .....	9-399
9-74	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 3 .....	9-400
9-75	Summary of Habitat Impacts from Actions to Manage Visitor Use and Facilities – Alternative 3 .....	9-401
9-76	Alternative 3 Habitat Restoration in Segment 4.....	9-402
9-77	Alternative 3 Habitat Restoration in Segment 7.....	9-403
9-78	Alternative 4 Habitat Restoration in Segment 2.....	9-408
9-79	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 4 .....	9-413
9-80	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 and Yosemite Village – Alternative 4 .....	9-414
9-81	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 4 .....	9-414
9-82	Summary of Habitat Impacts from Actions to Manage Visitor Use and Facilities in Segment 2 – Alternative 4 .....	9-415
9-83	Alternative 4 Habitat Restoration in Segment 4.....	9-416
9-84	Alternative 4 Habitat Restoration in Segment 7.....	9-417
9-85	Alternative 5 Habitat Restoration in Segment 2.....	9-422
9-86	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 5 .....	9-426
9-87	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 and Yosemite Village – Alternative 5 .....	9-427
9-88	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 5 .....	9-428
9-89	Summary of Habitat Impacts from Actions to Manage Visitor Use and Facilities in Segment 2 – Alternative 5 .....	9-429
9-90	Alternative 5 Habitat Restoration in Segment 4.....	9-430
9-91	Alternative 5 Habitat Restoration in Segment 7.....	9-431
9-92	Alternative 6 Habitat Restoration in Segment 2.....	9-435
9-93	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 6 .....	9-440
9-94	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Camp 6 & Yosemite Village – Alternative 6 .....	9-441
9-95	Habitat Impacts from Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 6 .....	9-441
9-96	Summary of Habitat Impacts from Actions to Manage Visitor Use and Facilities in Segment 2 – Alternative 6 .....	9-442
9-97	Alternative 6 Habitat Restoration in Segment 4.....	9-443
9-98	Alternative 6 Habitat Restoration in Segment 7.....	9-444

**LIST OF TABLES- VOLUME 2A (continued)****Chapter 9: Special Status Species**

9-99	Special status Plant Species Potentially Occurring in the Study Area .....	9-455
9-100	Special status Wildlife Species Potentially Occurring in the Study Area .....	9-460
9-101	Maximum Number of Trees Removed Under Alternatives 2–6 in Segment 2 .....	9-521
9-102	Special status Species Potentially Affected by Actions to Manage Visitor Use and Facilities at Camp 6 & Yosemite Village – Alternatives 2-61 .....	9-524
9-103	Special status Species Potentially Affected by Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternatives 2-6 .....	9-526
9-104	Maximum Number of Trees Removed Common to Alternatives 2–6 in Segment 3 .....	9-528
9-105	Special status Species Potentially Affected by Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 2 .....	9-539
9-106	Special status Species Potentially Affected by Actions to Manage Visitor Use and Facilities at Camp 6 & Yosemite Village – Alternative 2 .....	9-542
9-107	Special status Species Potentially Affected by Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 2 .....	9-545
9-108	Special status Species Potentially Affected by Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 3 .....	9-560
9-109	Special status Species Potentially Affected by Actions to Manage Visitor Use and Facilities at Camp 6 & Yosemite Village – Alternative 3 .....	9-562
9-110	Special status Species Potentially Affected by Actions to Manage Visitor Use and Facilities at Yosemite Lodge and Camp 4 – Alternative 3 .....	9-565
9-111	Special status Species Potentially Affected by Actions to Manage Visitor Use and Facilities at Curry Village & Campgrounds – Alternative 4 .....	9-580

## ANALYSIS TOPICS: SOCIOCULTURAL RESOURCES

### Scenic Resources

#### *Affected Environment*

#### Regulatory Framework

Scenic views from nearly all lands in the Merced River corridor are distinct. Scenic quality is a core value embedded in the National Park Service (NPS) Organic Act of 1916:

*“Federal areas known as national parks . . . which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.”*  
(NPS Organic Act, 16 USC 1)

The Yosemite Land Grant of 1864 legislation granted the Yosemite Valley and the Mariposa Grove of Big Trees from the federal government to the State of California “upon the express conditions that the premises shall be held for public use, resort, and recreation; inalienable for all time.” This was the first time land in the United States was preserved for its scenic values and for public benefit.

The visual landscape factored prominently in the decision to designate Yosemite as a national park and is one of the primary resources that the NPS is charged with protecting. As such, the NPS has taken the approach of analyzing potential impacts on visual resources by considering these inherent resources to be self-evidently valuable, and that the crux of any analysis should focus on how visitors to the park experience these resources. Following this principle, the NPS established policies and regulations, as described above, to protect visual resources, including efforts to characterize and catalog important scenic landscapes. The NPS has further developed these policies by identifying important scenic resources and establishing a framework for protecting them, including restrictions on development of human-made structures in visually important areas. Today, although structures and infrastructure intrude into some scenic views from the main stem Merced River and South Fork Merced River, or views to the river (such as the roads near the river in Yosemite Valley), the area is largely pristine and human-made features do not dominate, even in the landscapes where they are visible.

The 1980 *Yosemite General Management Plan* specifies the following management objectives to preserve, protect, and restore scenic resources:

- Identify the major scenic resources and the places from which they are viewed.
- Provide for the preservation or protection of existing scenic resource and viewing stations.
- Provide for historic views through vista clearing.
- Permit only those levels and types of use that are compatible with the preservation or protection of the scenic resources and with the quality of the viewing experience.

Tiered from the *Yosemite General Management Plan*, the final *Scenic Vista Management Plan for Yosemite National Park (Scenic Vista Management Plan)* (NPS 2011d) provides a systematic program for documenting, protecting, and reestablishing important viewpoints and vistas outside of designated Wilderness, consistent with the natural processes and human influence that created them.

The 2005 *A Sense of Place, Design Guidelines for Yosemite Valley* provide a framework for describing appropriateness of architectural and landscape character of new buildings, site work, and alterations. In general, the goals of the Design Guidelines include:

- Retention of natural site character, including setting, materials, and ecological processes.
- Design new buildings and facilities to blend with the natural environment, emphasizing non-intrusive design. They are sensitive to the environmental capacity of the site to absorb modifications. Facilities fit in with their sites rather than dominate them. Buildings are subordinate to the environment.
- Compatibility of structures and facilities with the cultural context and character in which they are located and protection of cultural integrity.
- Coordination and integration of the design of individual structures with those of the site plan as a whole.
- Enhancement of unifying architectural and landscape themes and elements within defined areas throughout Yosemite Valley.
- Emphasis on simplicity and restraint in design and respect for past building character, traditions, and practices.
- Recognition of the principles of rustic design used by previous designers, identification of those who retain validity today, and contemporary interpretation of those principles.

The detailed guidelines sections of *A Sense of Place* provide direction as to which design strategies and themes may be suitable for particular areas, including: Yosemite Village; Curry Village; the Ahwahnee; Yosemite Lodge; campground, Camp 4, and Housekeeping Camp; and day-use areas, the Indian Cultural Center, LeConte Memorial Lodge, Happy Isles, and shuttle bus stops.

## Regional Scenic Context

The scenery of Yosemite is one of its most significant resources and is largely responsible for the high visitation of the park by people from around the world. The 2009 summer visitor study indicated that the most common visitor activity was viewing scenery (93%) and the primary activity for 41% of visitor groups was also viewing scenery (Blotkamp et al. 2010). The 2008 winter visitor study indicated that for 67% of visitors, interest in seeing Yosemite scenery in wintertime was the most common factor affecting their decision to visit the park. The most common visitor activities were viewing scenery/taking a scenic drive (84%), taking photographs/painting/drawing (73%), and day hiking (35%) (Le et al. 2008).

As described in the “American Indian Traditional Cultural Resources” subsection later in this chapter, American Indian tribes and groups assign strong spiritual value to the Merced River and Yosemite Valley, attaching names and stories to geologic and other features in the river corridor. Since the first

explorations and descriptions of the Valley by Euro-Americans in the mid-19th century, views of the pastoral Valley juxtaposed with towering geologic features and dramatic waterfalls have been recognized as outstanding resources of Yosemite Valley. Indeed, the beauty of the Yosemite landscape came to the attention of the nation largely through the early writings, paintings, and photographs produced by nationally recognized artists and visitors to the region, whose inspiration in many ways influenced the U.S. Congressional legislation, leading to the designation of Yosemite as a place worthy of preservation. The scenic resources of Yosemite have a high degree of cultural significance. Most of the quintessential views into and from the Valley are iconic and are reflected in the works of artists including Albert Bierstadt, Ansel Adams, Thomas Moran, and Myron Hunt. The entire park, including the Wilderness and other areas outside Yosemite Valley, remains a favorite subject for professional and amateur artists, photographers, and writers, whose work continues to communicate to visitors and nonvisitors alike the unique scenic resource values of the park.

Scenic views from nearly all lands in the Merced River corridor include steep valleys and canyon walls, clear air, spectacular rock formations, and panoramic views, which combine to offer a wealth of visual resources nearly unsurpassed in the United States. As people move through the varied topography and vegetation along sections of the valleys and canyons that frame the Merced River, they experience a varied sequence of visual resources that provide a cumulative visual experience that is unique and above and beyond that of enjoying any one single viewpoint. This experience involves the interaction of multiple elements in relation to each other: the juxtaposition of individual features with the foreground and background, the interface of different surfaces, and the interplay of light reflecting off the different colors and textures of the elements making up the visual landscape.

Wildfire suppression practices initiated in the early 1900s have changed vegetation patterns from open, park-like vistas to more dense vegetation that have restricted views. In addition, historic wildfire suppression practices have resulted in catastrophic fires that affect scenic views. Vegetation changes that have affected scenic viewpoints are discussed further below, by segment.

### ***Segment 1: Merced River Above Nevada Fall***

Visual resources along this segment are less studied than those in Yosemite Valley and other developed areas, but exhibit equivalent scenic resource value. The scenery of this wilderness segment of the river is characterized by dramatic, glacially carved canyons; montane lakes framed by steeply sloping and sparsely vegetated granite rock faces; and meandering creeks flowing through broad pristine meadows. Scenic landmarks visible from the river and its band, and that contribute to this segment's scenic outstandingly remarkable value (ORV), include Washburn and Merced Lakes (see Photo SCN-1), Echo Valley, Bunnell Point, and Little Yosemite Valley, and many other named and unnamed scenic landmarks.

This long river segment of great visual variety, with its largely uncompromised natural setting, provides diverse, exceptional scenery, all with the river in the foreground. Human-made features in this segment are relatively few. Moreover, the comparatively low visitor use in Segment 1 enhances its scenic quality. Noteworthy human-made features visible in the river corridor are generally limited to the Merced Lake High Sierra Camp (see Photos SCN-2 and SCN-3) and the composting toilet at Little

Yosemite Valley Campground. The Little Yosemite and Merced Lake Ranger Stations are also visible from the river corridor.

Other factors that may influence the area's aesthetic character include regional air pollution (e.g., haze), which can limit visibility during the summer (NPS and Colorado State University 2002); and crowding near the backcountry designated camping areas as viewed in the foreground of scenic views or views of the river, which operate near capacity all summer. Despite the presence of existing structures, views from the river and trails along Segment 1 continue to have high aesthetic value.

**Photo SCN-2:** Merced Lake High Sierra Camp – 2010 (Yochim 2010)

**Photo SCN-3:** Merced Lake High Sierra Camp – 2010 (Yochim 2010)

### *Segment 2: Yosemite Valley*

The Merced River enters Yosemite Valley at Nevada Fall, flows through Emerald Pool, then over Vernal Fall and through Happy Isles. Once in the flat Valley, the Merced River provides the foreground to many of Yosemite’s most famous landmarks. From the river and its banks, views consist of Yosemite Falls, Bridalveil Fall, El Capitan, Half Dome, and other named and unnamed parts of the cliffs and hanging valleys rimming the Valley (see Photos SCN-4 and SCN-5). Meandering through a sequence of compound oxbows, wetlands, and meadows, the river and its related features provide broadened panoramas. Throughout the Valley, views from the river and its banks encompass the lower montane forest as it rises up to sheer rock faces of granite cliffs and talus slopes, with a flat valley bottom serving as a contrasting foreground. The juxtaposition of granite domes and waterfalls is unique, as is the concentration of river-related views found in the Valley.

During development of the *Yosemite General Management Plan* in the late 1970s, the NPS conducted an analysis of existing and historic viewing conditions in Yosemite Valley and identified the landscape features most visitors look for and are able to distinguish (NPS 1980). The study found the 11 most important features in the Valley to be Half Dome, Yosemite Falls, El Capitan, Bridalveil Fall, Three Brothers, Cathedral Rocks and Spires, Sentinel Rock, Glacier Point, North Dome, Washington Column, and Royal Arches. The study also evaluated all points from which these features could be seen (assuming no vegetation or structures obstructed the view) to establish the scenic viewing potential of different locations on the Valley floor. Existing viewpoints were identified, and the quality of their views and their proximity to roads and trails were noted. All of the identified “most important features” included in the *Yosemite General Management Plan* analysis are visible from various sections of the Merced River through Yosemite Valley.

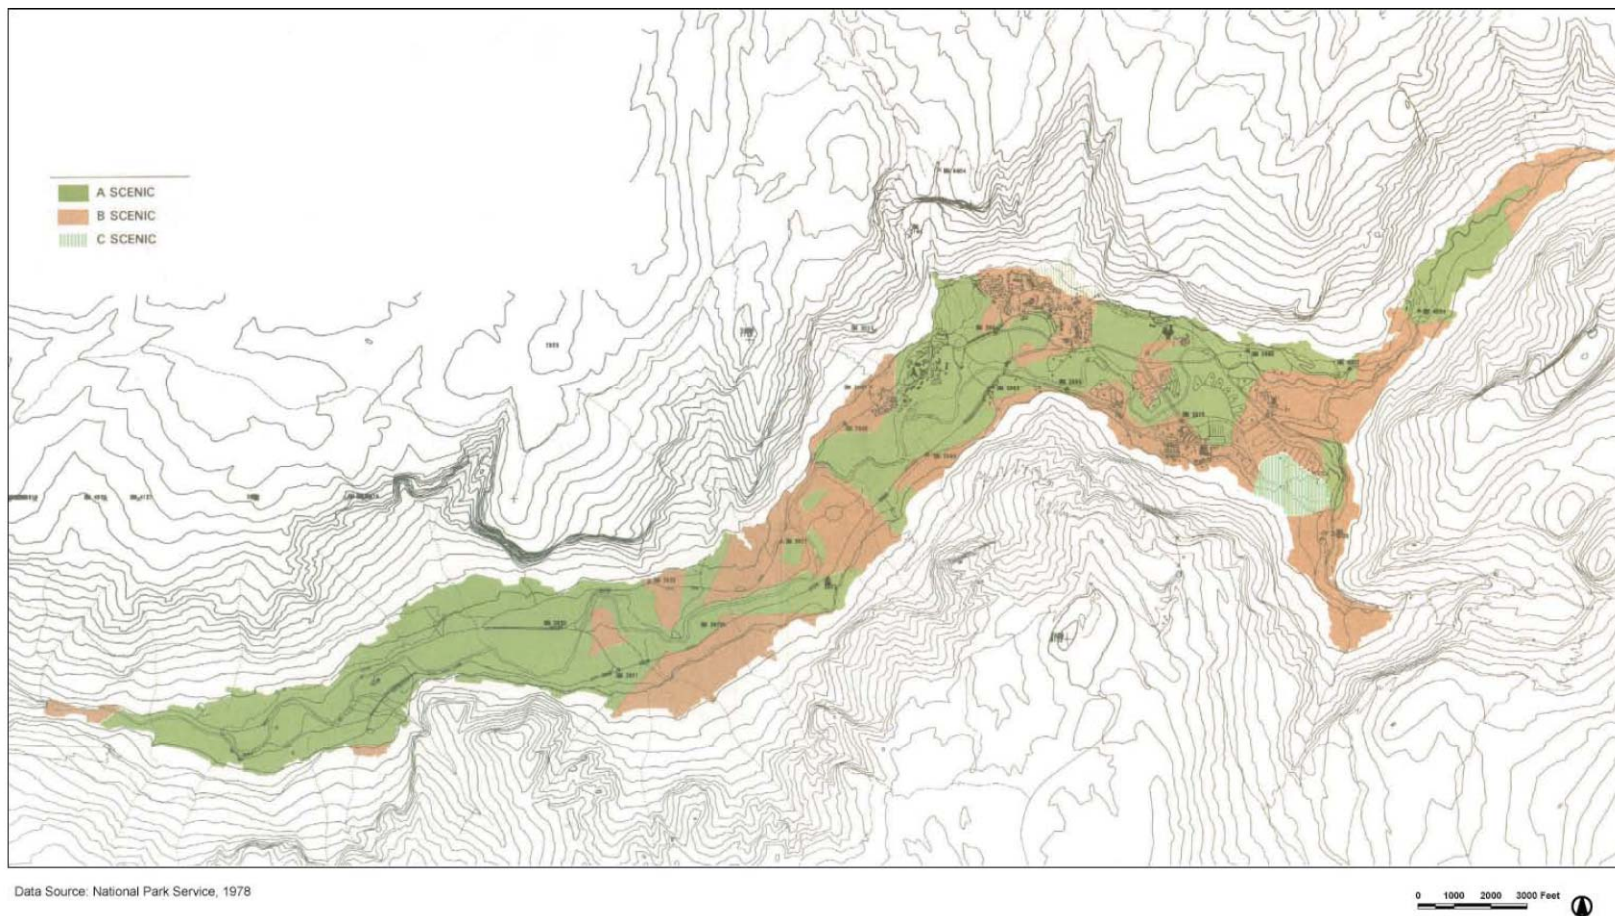

**Photo SCN-4:** El Capitan – 2009 (Yochim 2009) **Photo SCN-5:** Half Dome – 2010 (Yochim 2010)

The viewpoint analysis conducted for the *Yosemite General Management Plan* identified areas in Yosemite Valley that were consistently selected by eminent early photographers and painters as the best areas to pursue their activities. The Merced River is featured prominently in many representations of the Valley as both a foreground subject in the river corridor and a scenic feature from outside the river corridor. When the existing and historical viewpoints were established for the *Yosemite General Management Plan* viewpoint analysis, Yosemite Valley was classified according to the following criteria:

- A-Scenic: Areas included in scenic views commonly chosen by eminent early photographers and painters, or included in the most significant scenic views that exist today (includes all meadows and the entire length of the Merced River in the Valley).
- B-Scenic: Areas included in scenic views less commonly chosen by historic photographers and painters, or that compose less-significant modern views based on park management observations.
- C-Scenic: Areas of minor scenic quality and areas that can absorb visual intrusion without detracting from either primary or secondary views.

The viewpoint analysis considered potential opportunities, as well as existing and historic viewpoints, and resulted in the development of the Yosemite Valley Scenic Analysis map (see **figure 9-38**). The acreage of the classification areas is as follows: 1,800 acres classified as A-Scenic, 1,116 acres classified as B-Scenic, and 73 acres classified as C-Scenic. In these areas, the study found visual intrusions resulting from human-made features and vegetation affected views, and the major visual intrusions were roads and traffic through Ahwahnee Meadow, Stoneman Meadow, and other meadows when viewing Half Dome and other important features of Yosemite Valley from the Valley floor (including

SOURCE: NPS, 1978

Merced River Comprehensive Management Plan and EIS

**Figure 9-38**  
Yosemite Valley Scenic Analysis

from lands in the Merced River corridor). Other major intrusions into the scenic beauty of the Valley included NPS and concessioner maintenance and warehouse facilities, Camp 6, Housekeeping Camp, and Curry Village (NPS 1980).

Views from trails, bridges, and vista points throughout Yosemite Valley continue to retain high aesthetic value. However, the built and natural environments have changed somewhat since the river was designated as Wild and Scenic and the Yosemite Valley segment was classified as Recreational. These changes include those associated with damaged and removed structures, meadow and riparian conditions, park visitation patterns, and altered conditions at scenic viewpoints, as described below.

The January 1997 flood caused perhaps the most significant change in views across the Yosemite Valley segment since completion of the viewpoint analysis. The flood damaged or destroyed approximately half of the lodging units at Yosemite Lodge (which were subsequently removed) as well as many campgrounds in the Merced River floodplain. Other more recent changes to the human-made environment include installation of curbing along Northside and Southside Drives, which reduced the number of cars that could be parked in the foreground of scenic resource views; completion of the Yosemite Falls project, which removed idling buses from distant views of the falls; replacement of Sentinel Bridge; and removal of employee housing (tent cabins) at Yosemite Lodge.

Over the past 20 years, the park has undertaken a number of meadow restoration projects, including the construction of meadow boardwalks, planting native vegetation, removing nonnative vegetation, and implementing monitoring programs. While meadow conditions continue to experience damage associated with ongoing informal trail use, soil disturbance, etc., overall meadow conditions have improved; as a result, direct views of meadows as well as the contribution of foreground meadow views to iconic scenic vistas have improved as well. Constrictions to the free-flowing condition of the Merced River occur at bridges with openings too small to accommodate spring floods, resulting in bank erosion which affects views of the river or other scenic resources where eroded areas are seen in the foreground. In addition, vegetation trampling associated with visitor access to river points also causes bank erosion. Both actions affect direct views of the river and long-range iconic views where the river is visible in the foreground (see Photo SCN-6).

**Photo SCN-6:** Informal trails along Merced River riverbank – 2010 (ESA 2010)

The *Scenic Vista Management Plan* describes vegetation changes that have affected scenic viewpoints, rates and ranks the quality of viewpoints, and defines limits on management actions based on ecological conditions. The *Scenic Vista Management Plan* (NPS 2011d) prioritizes sites based on a visual resource assessment. These assessments include scores (compiled points assigned to vividness, uniqueness, access

and intactness) for vista points as of 2009. Scores of 10 to 18 (the highest possible) are considered “high value,” scores above 7 to 9.99 are considered “medium value,” and scores of 7 and below are considered “low value.” The assessment results for sites in the Merced River corridor and for sites that provide views of the river and river-dependent resources are included in Appendix H. The assessment describes the iconic features visible from each vista point and provides recommendations for vegetation management actions that would improve scenic views. The study found that vegetation currently obstructs scenic views at many of the Valley (Segment 2) vista points due to conifer encroachment in the meadows. Scenic vistas can also be obscured by regional air pollution, which results in occasional haze during the summer (NPS and Colorado State University 2002). It is noted that specific initial management actions for vista points in or near the Tuolumne River Wild and Scenic River corridor or the Merced River Wild and Scenic River corridor will be analyzed and directed by the respective river plan. No actions will be taken on vista points within either Wild and Scenic River corridor until a Record of Decision (ROD) is signed for the respective river plans.

While a substantial number of structures were removed from Segment 2 following the January 1997 flood, and several restoration projects have been completed, a number of visual intrusions identified in the *Yosemite General Management Plan* remain throughout the Valley, including traffic, parking, and crowding at popular visitor attraction sites; roads and traffic through Ahwahnee, Stoneman, and other meadows; NPS and concessioner maintenance and warehouse facilities; Housekeeping Camp; and Cathedral Beach Picnic Area.

### ***Segment 3: Merced River Gorge***

Visual resources in the V-shaped Merced River gorge downstream from Yosemite Valley are somewhat limited because of the steep terrain and forest cover. Important views from the Merced River or its banks in the gorge include panoramic views of the steep walls and rock features that define the gorge, such as Pulpit Rock, the Rostrum, and Elephant Rock, as well as the Cascades and other spectacular rapids among giant boulders.

Roadway pullouts along Segment 3 allow for short- and long-range views of the river (see Photo SCN-7). The river and Cascades Fall are intermittently visible from vehicles traveling along El Portal Road and Big Oak Flat Road. Some structures in the gorge do intrude into

**Photo SCN-7:** Merced River Gorge – 2010 (Yochim 2010)

scenic views of Segment 3, such as the Cascades Powerhouse. However, these structures do not dominate the natural landscape from any viewpoint.

With the exception of El Portal Road and the structures described above, there are few visual intrusions along Segment 3. Views from the river and roads in the Merced River gorge continue to have high aesthetic value. However, regional air pollution periodically results in haze during the summer, which can limit views.

#### ***Segment 4: El Portal***

As the river gorge widens into the El Portal area, views are slightly expanded. As in Yosemite Valley and the Merced River gorge, the canyon walls are still steep in El Portal. No formal visual resource studies have been conducted for this portion of the Merced River, and the landscape viewed from in the Merced River corridor consists primarily of the river and the canyon walls. Because the vegetation has changed from a Sierran mixed conifer to oak woodland in the lower part of the Gorge, and because the canyon walls illustrate the geologic transition from granite to metasedimentary bedrock, the El Portal segment provides scenery that is different from other parts of the Merced River corridor in Yosemite. Distinct views of Chinquapin Fall to the east of El Portal are visible from several locations in Segment 4. Human-made structures (including stores, housing, a fuel station, a trailer village, park administrative facilities, aboveground utilities, abandoned infrastructure, and riprap) and Highway 140 are adjacent to the river and some of these structures contrast in color, materials, and form, and/or lack screening (trees) from views of the river.

#### ***Segments 5 and 8: South Fork Merced River Above and Below Wawona***

The South Fork Merced River above and below Wawona is largely inaccessible, with just a few trail crossings above Wawona and none below (see Photos SCN-8 and SCN-9). While no formal visual resource studies have been conducted for this portion of the river, the wilderness segments of the South Fork Merced River remain largely natural and undisturbed. As discussed in the previous sections, summer haze can also limit views to and in Segments 5 and 8.

Scenery that can be directly viewed from in the river corridor above Wawona is generally limited to the South Fork Merced River itself at trail crossings, as well as longer-range views from the trails to Breeze Lake, Chain Lakes, Buck Camp, and Wawona Point areas (see Photo SCN-10). Views from the river corridor include distant views of forests and granite features such as Wawona Dome. Scenery along the South Fork Merced River below.

Wawona is characterized by forested slopes descending to the meandering river, with intermittent gravel bars apparent. With river access difficult and few turnouts, viewing opportunities are typically brief and experienced by motorists from the road. One scenic viewpoint in Segment 8 below Wawona and one viewpoint that provides views to the South Fork Merced River above Wawona (Segment 5) are characterized in the *Scenic Vista Management Plan*, as summarized in Appendix H.

**Photo SCN-8:** South Fork Merced River above Wawona Crossing – 2010 (Yochim 2010)

**Photo SCN-9:** South Fork Merced River – 2010 (Yochim 2010)

**Photo SCN-10:** South Fork Merced River above Wawona from a ridge between Chain Lakes and Breeze Lake (Yochim 2010)

### ***Segments 6 and 7: Wawona Impoundment and Wawona***

Scenery viewed directly from in the river corridor in the Wawona area is primarily of the South Fork Merced River itself, with distant views of forests and granite features, such as Wawona Dome. In the foreground, views include managed landscapes throughout the private development in Section 35, which consists of the largest privately owned area in the park, and downriver to the Wawona Campground. In the broader context of the watershed, these elements do not dominate the landscape but are certainly apparent among the mix of landscapes in the region. The *Scenic Vista Management Plan Environmental Assessment* (described above for the valley segment) includes an evaluation of scenic viewpoints in Segment 7 and viewpoints that afford views of this segment; the visual resources assessment findings for these segments are presented in Appendix H.

### ***Environmental Consequences Methodology***

The impact analysis associated with scenic resources is based on comparisons between Alternative 1 (No Action) and Alternatives 2–6. The effects of each alternative are evaluated by analyzing potential impacts on natural and cultural landscape features and how impacts might be experienced by visitors. Professional judgment was applied to reach reasonable conclusions as to the context, intensity, duration, and type of potential impacts.

- **Context.** For the purposes of this analysis, only local impacts are considered. This includes impacts that would occur in the Merced River corridor.
- **Intensity.** Scenic resources impacts would be assessed based on a substantial: (a) change in existing landscape character, whether foreground, intermediate ground, or background, and be visible from viewpoints the NPS has identified as important; (b) change in access to historically important viewpoints; or (c) change in the visibility of a viewpoint. The magnitude of impacts to scenic resources, either on the physical component of the natural or cultural landscape (quantitative) or on how the change might be experienced (qualitative), is described as negligible, minor, moderate, or major.
  - **Negligible:** Effects would be undetectable by visitors.
  - **Minor:** Effects would be detectable, but would only impact areas that are not highly visible.
  - **Moderate:** Effects would be noticeable and would impact highly visible areas.
  - **Major:** Effects would be clearly detectable and would impact outstanding vista points identified by the Merced River Plan.
- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term. A short-term impact would be short-lived or temporary, usually due to construction, restoration, or demolition activities. A long-term impact would have a permanent and continual effect.
- **Type.** Impacts are evaluated in terms of whether they would be beneficial or adverse to scenic resources in the Merced River corridor. Impacts are considered beneficial if the quality of the visual experience would be improved and adverse if the quality of the visual experience would be diminished.

## ***Environmental Consequences of Alternative 1 (No Action)***

### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 1 (No Action), riprap and abandoned infrastructure would remain in the river channel and meadow floodplains. Informal trails in meadows would remain and conifers would continue to encroach in meadows. In addition, localized riverbank erosion and scouring effects associated with bridges would remain. This would continue to result in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources. In addition, traffic congestion would continue to affect scenic views where seen in the foreground of the river and scenic views. Scenic vista management actions would not be implemented. Regional haze, as discussed in the “Air Quality” subsection, could adversely affect scenic vistas in the project area seasonally.

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

As discussed in the natural resources analysis topic subsection, Alternative 1 (No Action) would result in increased park visitation compared with existing conditions, based on projected population increases. Ongoing visitor use impacts on natural resources, such as the creation of informal trails, trampling of vegetation, and increased bank erosion, would continue similar to existing conditions and result in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources.

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 1 (No Action), high levels of bare ground and trampling associated with administrative pack stock grazing and informal trails would remain. This would result in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources. These conditions would result in local, long-term, minor, adverse impacts on the scenic resources in Segment 1.

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Scenic resources and views from the Merced River and its banks in Segment 1 are largely uncompromised, with the exception of human use areas that affect the scenic quality of the segment (e.g., Merced Lake High Sierra Camp and associated stock corral, the Little Yosemite Valley Campground and associated composting toilet, the Little Yosemite Ranger Station, the Moraine Dome Backpackers Campground, and the Merced Lake Backpackers Campground). Under Alternative 1 (No Action), these facilities would continue to be present, consistent with existing conditions. Since park visitation could increase over existing levels, Segment 1 could experience a higher concentration of visitors than existing levels. In the absence of a comprehensive planning effort to manage increased

visitation, increased vegetation trampling, erosion, and other damage to resources could occur (as discussed in the natural resources impact subsections of this chapter), which would affect the scenic quality of Segment 1 where damaged resources are visible from scenic viewpoints or are in the foreground of a scenic viewpoint. It is not expected that access to historically important viewpoints would change or that changes in the visibility of a viewpoint would occur. Alternative 1 would result in local, long-term, minor, adverse impacts on the scenic resources of Segment 1.

In summary, under Alternative 1 (No Action), scenic resources and views from the Merced River and its banks in Segment 1 would continue to be largely uncompromised. However, the continued presence of human-made structures and areas of disturbance continue to detract from the scenic quality of views and increased visitation could result in impacts on the scenic quality of Segment 1. No changes in access and visibility would occur under this alternative. Alternative 1 would result in local, long-term, minor, adverse impacts on the scenic resources of Segment 1.

**Segment 1 Impact Summary.** Implementation of Alternative 1 (No Action) would result in local, long-term, minor, adverse impact on the scenic resources of Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 1 (No Action), the Merced River could continue to widen in certain areas as a result of human-caused erosion, loss of bank vegetation, and trampling. Constrictions of the free-flowing condition of the Merced River would continue to result in acceleration of water velocity at bridges with openings too small to accommodate spring floods, resulting in continued erosion. The bridges themselves contribute to the landscape character of the area. Abutments and abandoned infrastructure associated with the former bridge at Happy Isles and the gage base, and Pohono Bridge gaging station would remain. Abandoned infrastructure would remain at many meadows and riparian areas. This would result in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources, and these impacts could continue to occur similar to existing conditions.

The park would proceed with restoration projects at Bridalveil, Cook's, and El Capitan meadows, as well as riverbank restoration at North Pines Campground. The park would also continue invasive species control and conifer removal from some meadows. These projects and activities would improve the scenic quality of these areas. As noted above, the *Scenic Vista Management Plan* describes vegetation changes that have resulted in intrusions on scenic viewpoints, ranks the quality of viewpoints, and defines limits on management actions based on ecological conditions. There are approximately 50 scenic vista points identified within Segment 2 or near Segment 2 that provide views of the segment with recommended vegetation management to improve scenic view quality. These vegetation management actions would not be implemented under Alternative 1 (No Action). Alternative 1 (No Action) would therefore result in local, long-term, minor to moderate, adverse impacts on the scenic resources of Segment 2.

### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Change in access to historically important viewpoints is not expected to occur under Alternative 1 (No Action). Because park visitation is anticipated to increase 3% annually over existing levels, Segment 2 could experience a higher concentration of visitors than existing levels. Though applicable throughout the park, human-caused erosion and other resource damage is likely to be much more of a concern in Yosemite Valley than in the Wilderness, El Portal, or Wawona because of the Valley's much higher concentration of visitors. In the absence of a comprehensive planning effort to manage increased visitation and improve banks or bridges in areas where they currently constrict the free-flowing condition of the river, increased damage to resources would occur. These actions affect direct views of the river and long-range iconic views where the river is visible in the foreground.

Under Alternative 1 (No Action), facilities that are visible within the foreground of views of the river or other scenic viewpoints (including roads and traffic through Ahwahnee, Stoneman, and other meadows when viewing Half Dome from the Valley floor, NPS and concessioner maintenance and warehouse facilities, and Housekeeping Camp) would continue to be present, consistent with existing conditions. Design and construction of new structures and renovation of existing structures would be subject to the design guidelines requirements of *A Sense of Place*. Alternative 1 (No Action) would therefore result in local, long-term, minor to moderate, adverse impacts on the scenic resources of Segment 2.

**Segment 2 Impact Summary.** Under Alternative 1 (No Action), scenic resources and views of and from the Merced River and its banks in Segment 2 would continue to retain high aesthetic value. However, the continued presence of visual intrusions, some structures and facilities, and increased visitation could result in impacts on the scenic quality of Segment 2. Some meadow restoration and riverbank restoration projects, and invasive species removal would improve scenic quality and the visibility of a number of scenic viewpoints. Overall, there would be no change in access under Alternative 1. Alternative 1 (No Action) would result in local, long-term, minor to moderate, adverse impacts on the scenic resources of Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Scenic resources and views from the Merced River and its banks in the Merced River Gorge include short- and long-range views of the river. Abandoned infrastructure and human-made structures would continue to be present at in El Portal, as described in Regional Scenic Context. This would result in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources, and these impacts could continue to occur similar to existing conditions.

As noted above, the Scenic Vista Management Plan describes vegetation changes that have resulted in intrusions on scenic viewpoints, ranks the quality of viewpoints, and defines limits on management actions based on ecological conditions. The quality of viewpoints was scored based on vividness, uniqueness, and intactness of the viewpoints. There is one scenic vista point identified within Segment 3, and more than 10 that provide views to the segment. The plan includes recommendations

for vegetation management to improve scenic view quality. These vegetation management actions would not be implemented under Alternative 1 (No Action). Consequently, Alternative 1 (No Action) would result in local, long-term, minor, adverse impacts on the scenic resources of Segments 3 and 4. **Impacts of Actions to Manager User Capacity, Land Use, and Facilities**

Because park visitation is expected to increase over existing levels, Segment 3 could experience a higher concentration of visitors than existing levels. In the absence of a comprehensive planning effort to manage increased visitation, increased vegetation trampling, erosion, and other damage to resources could occur. Access from the El Portal Road and Highway 140 to the river is largely via informal trails, some of which are eroding into the river and would continue to erode with increased visitation. Damage to resources would affect the scenic quality of Segments 3 and 4 where the resources are visible from scenic viewpoints or are in the foreground of a scenic viewpoint.

The El Portal Administrative Site was established by Congress in 1958 to allow relocation of operations and maintenance utilities, facilities, and services out of the park. Roadside parking and river access are largely informal, and while river use levels are low enough such that informal access is acceptable, increased visitation could result in bank erosion and vegetation trampling, which would affect the overall scenic quality of the area. Alternative 1 (No Action) would therefore result in local, long-term, minor, adverse impacts on the scenic resources of Segments 3 and 4. In summary, under Alternative 1 (No Action), scenic resources and views from the Merced River and its banks in Segments 3 and 4 would continue to be largely uncompromised. However, the continued presence of human-made structures would continue and increased visitation could result in impacts on the scenic quality of Segments 3 and 4. Increased park visitation could result in damage to resources that would affect the scenic quality of these segments. Implementation of the *Scenic Vista Management Plan* would not occur. Overall, there would be no change in access under Alternative 1. Alternative 1 (No Action) would result in local, long-term, minor, adverse impacts on the scenic resources of Segments 3 and 4.

**Segments 3 & 4 Impact Summary.** Implementation of Alternative 1 would result in local, long-term, minor, adverse impacts on the scenic resources of Segments 3 & 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Protect and Enhance River Values***

Scenic resources and views from the river and its banks along the South Fork Merced River are largely natural and undisturbed and have high aesthetic value. However, there are existing structures and facilities in the Segment 7 viewshed, including the Wawona maintenance yard, Wawona RV dump station, and abandoned metal pipes in South Fork Merced River side channels. These structures and facilities would continue to be present under Alternative 1 (No Action). In addition, vegetation trampling and bank erosion has occurred in the vicinity of campgrounds and picnic areas. This would result in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources, and these impacts could continue to occur similar to existing conditions.

As noted above, the *Scenic Vista Management Plan* describes vegetation changes that have resulted in intrusions on scenic viewpoints, ranks the quality of viewpoints, and defines limits on management actions based on ecological conditions. The quality of viewpoints was scored based on vividness, uniqueness, and intactness of the viewpoints. There are approximately 9 scenic vista points identified within these segments or near Segment 3 that provide views of the segment. The *Plan* recommends vegetation management to improve scenic view quality at these locations. These vegetation management actions would not be implemented under Alternative 1 (No Action). The resulting impacts on the scenic resources of Segments 5, 6, and 7 would continue to be local, long-term, minor, and adverse.

### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Since park visitation could increase over existing levels, Wawona could experience a higher concentration of visitors than existing levels, which could result in further trampling of vegetation and damage to resources. Damage to resources would affect the scenic quality of the segments where the resources are visible from scenic viewpoints or are in the foreground of a scenic viewpoint. Alternative 1 (No Action) would result in local, long-term, minor, adverse impacts on the scenic resources of Segments 5, 6, 7, and 8.

**Segments 5-8 Impact Summary.** Under Alternative 1 (No Action), scenic resources and views from the South Fork Merced River and its banks would continue to be largely uncompromised. However, the presence of human-made structures would continue and increased visitation could result in impacts on the scenic quality of the segments. Overall, there would be no change in access under Alternative 1. The resulting impacts on the scenic resources of Segments 5, 6, and 7 would continue to be local, long-term, minor, and adverse.

### **Summary of Alternative 1 (No Action) Impacts**

In the absence of a comprehensive planning effort to manage increased visitation, reduce human-made structures, and restore areas of natural resource damage, scenic resources impacts would continue. These effects would be most pronounced in areas with concentrated facilities that intrude on the landscape character of the river segments and visitor use (e.g., Yosemite Valley and Wawona) that result in vegetation trampling, erosion, and other resource damage that affects the scenic quality of the segment where the resources are visible from scenic viewpoints or are in the foreground of a scenic viewpoint. NPS administrative requirements do afford some protection to the river from future actions, but no comprehensive or unified plan exists to protect the scenic resources of the Merced River. Alternative 1 (No Action) would have a local, long-term, minor to moderate, adverse impact on scenic resources.

### **Cumulative Impacts of Alternative 1 (No Action)**

The discussion of cumulative impacts on scenic resources is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of Alternative 1 (No Action). The projects identified below include those projects that have the potential to affect the scenic resources of the Merced River.

### ***Past Actions***

Past actions have resulted in a range of beneficial and adverse impacts. Beneficial impacts of past actions include removal of structures and restoration of natural drainage features and meadow restoration and removal of vegetation that blocked scenic views. Specific examples of past projects include the following:

***Restoration/Removal:*** Cascades Housing Removal, Cascades Diversion Dam Removal, Happy Isles Gauging Station Bridge Removal, Cook's Meadow Ecological Restoration, Fern Springs Restoration, Happy Isles Fen Habitat Restoration Project, Merced River Ecological Restoration at Eagle Creek Project, Wawona Tunnel View Project, Lower Yosemite Fall Project

***Facility Development:*** Bridges provide scenic viewing opportunities and are viewed by some visitors as scenic features.

Adverse impacts from past actions include the introduction of obstructions in the Merced River channel, which results in bank erosion, and the introduction of facilities that intrude on the scenic quality of the river. Specific examples of such past projects include the following:

***Modified Hydrological Features:*** Previous development of bridges, riprap, dikes, flood walls, impoundments, dams, and facilities in the river channel or floodplain.

***Facility Development:*** Curry Village Employee and Temporary Housing and Showerhouse

### ***Present Actions***

Present actions contribute to similar beneficial and adverse impacts as described for past actions.

Beneficial impacts for present actions are similar to those discussed for past actions. Specific examples of present projects include the following:

***Management and Planning:*** Half Dome Trail Stewardship Plan, 2004 Fire Management Plan/EIS, upcoming Yosemite Wilderness Stewardship Plan/EIS

Adverse impacts from present actions are similar to those discussed for past actions. Specific examples of present projects include the following:

***Facility Development:*** East Yosemite Valley Utilities Improvement Plan/EA, Wauhoga Indian Cultural Center, Parkwide Communication Data Network, Yosemite Environmental Education Campus

### ***Reasonably Foreseeable Future Actions***

Impacts from future actions would be similar to those discussed for past and present actions. The Yosemite Wilderness Stewardship Plan/EIS (Management and Planning) is an example of a future projects with beneficial impacts.

### ***Overall Cumulative Impact***

Overall development and recreational uses in the Merced River watershed have resulted in localized, long-term, minor to moderate, adverse impacts on scenic resources. A number of past, present, and future projects have limited or would limit visitor uses through planning (which decreases the potential for secondary scenic resources effects), or restore vegetation and river banks, though the overall impact remains adverse. Alternative 1 (No Action) would contribute to worsening localized, adverse conditions in areas with concentrated visitor use and through the continued presence of facilities and infrastructure that are visible within scenic views, and presence of vegetation that is blocking scenic views. Cumulatively, the scenic resources impacts would be local, long term, minor to moderate, and adverse.

### ***Environmental Consequences Common to Alternatives 2–6***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Actions that would take place throughout the Merced River corridor under Alternatives 2–6 include removal of riverbank riprap and abandoned infrastructure in the river channel where possible. Denuded vegetation and informal trails would be restored in several meadows, and beach access and trails would be defined and delineated. In addition, areas of riverbank erosion would be repaired (see Appendix E). Selected scenic vista points would be improved by thinning of conifers and other trees that encroach on views (see Appendix H). Restoration activities would result in short-term, temporary intrusions into views when construction and restoration activities and equipment would be visible from area trails and visitor use areas. However, implementation of these actions would remove areas of resource damage that detract from the scenic quality of the river corridor and adjacent areas. Upon completion of restoration activities, restored areas would be more natural in appearance. Regional haze could adversely affect scenic vistas in the project area seasonally. The resulting impact on scenic resources would be local, long-term, minor, and beneficial.

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternatives 2–6, the Merced River and its banks in Segment 1 would remain largely uncompromised. Implementation of these alternatives would include restoration of informal trails and other denuded areas at Merced Lake meadow and shoreline. Implementation of these actions would remove areas of resource damage that detract from the scenic quality of the Merced Lake area. Upon completion of restoration activities, the Merced Lake area would be more natural in appearance, as viewed from the Merced Lake Trail and the visitor use areas that would be retained. Views of Merced Lake shoreline and meadows would be improved where restoration areas are in the foreground, as well as views of peaks where restored areas are in the foreground. The resulting impact on the scenic resources of Segment 1 would be local, long-term, minor, and beneficial.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, minor, beneficial impacts on scenic resources of Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

In the Happy Isles area, the former Happy Isles footbridge footings and river gage base would be removed from the bed and banks of the Merced River; informal trails would be revegetated; and wayfinding between Happy Isles and the Mist Trail from the shuttle stop would be improved to discourage further formation of informal trails. In addition, bank improvements would be installed downstream of the Happy Isles road bridge. These actions would improve the scenic quality of the area by reducing the number of human-made structures in the area and restoring vegetation, as seen from the Mist Trail, and would improve the scenic quality of the river in the area of the riverbank improvements, including views from the road bridge and the bicycle path on the downstream side of the bridge. The resulting impact on scenic resources would be local, long-term, minor, and beneficial.

In the Lower Pines and North Pines campground areas, campsites would be removed. Riverbank conditions would be improved downstream of Clark's and Ahwahnee bridges. In addition, river access would be improved to direct visitors to access points at sandy beach areas, which would reduce riparian vegetation and riverbank damage. River general restoration activities would be conducted as applicable, including riprap removal, removal of informal trails, and riverbank restoration in the area between Clark's and Stoneman bridges. These actions would reduce the number of human-made structures in the area and improve the condition of riparian vegetation and riverbanks, which would improve views of the river from the Clark's Bridge (Scenic Vista point 7), beach areas, and trails that cross the area. The resulting impact on scenic resources would be local, long-term, minor, and beneficial.

In the Housekeeping Camp area, lodging units and associated structures would be removed and restored, including removal of riprap upstream of the Housekeeping footbridge and downstream of the camp. In addition, general restoration activities would be conducted as applicable, including removal of informal trails and revegetation. These actions would reduce the number of human-made structures in the area and improve the condition of riparian vegetation and river banks, which would improve views of the river from the Housekeeping footbridge (Scenic Vista point 92), Housekeeping Beach (Scenic Vista point 26), Housekeeping Bridge Trail, Southside Drive, and the adjacent bicycle path. Views of North Dome, Glacier Point, Yosemite Falls, El Capitan, and Cathedral Rocks from the scenic vista points with the restoration areas in the foreground would be improved. The resulting impact on scenic resources would be local, long-term, minor to moderate, and beneficial.

Bank restoration downstream of Sentinel Bridge would be implemented. In addition, roadbed and roadside parking improvements would be implemented adjacent to Cook's Meadow. Roadside parking improvements would also be implemented along Sentinel Drive crossover. Improvements would also be made to areas of Sentinel Meadow and the boardwalk. These actions would improve the scenic quality and appearance of the meadows as seen from the boardwalk, trails, and Northside Drive, and also

improve views of north Valley wall scenic features as seen from the Sentinel Meadow boardwalk vista point (24). The resulting impact on scenic resources would be local, long-term, minor, and beneficial.

A number of restoration actions are proposed in the area between Swinging Bridge and El Capitan Picnic Area, in addition visitor use facility improvements that would focus visitor use away from sensitive resource areas. Riverbank restoration would occur downstream from Swinging Bridge. The Swinging Bridge and Sentinel Beach picnic areas and day use areas would be improved and nearby sensitive habitat would be restored. Informal trails would be removed from Leidig Meadow, bicycle path areas would be improved, and additional meadow restoration activities would be implemented. In addition, general restoration activities would be conducted as applicable, including removal of informal trails and revegetation. Bank conditions and riparian vegetation restoration would improve the scenic quality of the river, including views from Swinging Bridge beach and Swinging Bridge, and of the bridge itself (Scenic Vista points 22 and 23) and of the Swinging Bridge Picnic Area. Views of restored meadows as seen from these areas, as well as vista points on the west end of Leidig Meadow, would also be improved (Scenic Vista points 31). In addition, views of Yosemite Falls, North Dome, Sentinel Rock, Cathedral Rocks, Washington Column, and other iconic vistas with the river and/or meadows in the foreground would be improved. The resulting impact on scenic resources would be local, long-term, minor to moderate, and beneficial.

A number of restoration actions are proposed in the area between El Capitan Picnic Area and the Bridalveil parking lot, in addition to visitor use facility improvements. Bridalveil Meadow would be restored in an area near El Capitan moraine, in addition to Eagle Creek Meadow and Slaughterhouse Meadow. River access points would be improved and nearby sensitive habitat would be restored. In addition, general restoration activities would be conducted as applicable, including removal of informal trails and revegetation. Improved bank and meadow would improve the quality of views, particularly as seen from Northside Drive and the Valley Loop Trail. In addition, views of El Capitan and Cathedral Rocks, with restoration areas in the foreground, would be improved.

In the Bridalveil Meadow area, the riverbank and meadow would be restored, and conifers encroaching on the meadow would be removed. The park would remove one and pave and formalize five other roadside pullouts for river access between Pohono Bridge and the intersection of the Big Oak Flat Road. The former sewer plant area would be restored and an abandoned gaging station at Pohono Bridge would be removed and the area restored. In addition, general restoration activities would be conducted as applicable, including removal of informal trails and revegetation. These actions would generally reduce human-made structures and/or reduce ongoing disturbance within these areas by improving riverbank, riparian vegetation, and meadow conditions, which would improve the quality of views of the river and meadows. Conifer removal would open view of the meadow, particularly as seen from Northside Drive and the Valley View roadside turnout (Scenic Vista point 146). The resulting impact on scenic resources would be local, long-term, minor to moderate, and beneficial.

Throughout Segment 2, there are several isolated restoration and resource protection measures that would result in improvement in the scenic quality of the immediate area. However, these restorations are in heavily wooded areas that are not in the vicinity of the river, meadows, or other scenic resources. The impacts of these actions would be local, long-term, negligible, and beneficial.

***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Under Alternatives 2–6, an interpretive nature walk would be constructed through the Lower River area that emphasizes river-related processes, and the Upper Pines dump would be moved away from the river. Yosemite Lodge concessioner housing would be removed, several picnic areas would be improved, and use areas would be directed away from sensitive resource areas. Several other structures would be removed or relocated away from the river. Creation of an interpretive nature walk would result in a small increase in human-made structures in the area. However, these changes would be minor and would not substantially affect views of the river where the trail is in the foreground. Furthermore, an interpretive nature walk could improve visitor understanding and appreciation of the scenic resources and vistas in this area. These actions would improve the scenic quality of the area by reducing the number of human-made structures in the area, providing educational opportunities focused on scenic view opportunities, and protect the riverbank and riparian vegetation. Views of the river with the restoration areas in the foreground would be improved. Design and construction of new structures and renovation of existing structures would be subject to the design guidelines requirements of *A Sense of Place*. The resulting impact on scenic resources would be local, long-term, minor to moderate, and beneficial.

**Curry Village and Campgrounds.** The park would remove the Happy Isles Snack Stand at Curry Village. At The Ahwahnee, the park would remove the swimming pool and tennis courts; redesign, formalize, and improve drainage within the existing parking lot; and construct a new 50 parking space lot east of the current parking area. These actions would generally improve the scenic quality of the area by reducing the number of human-made structures. Parking expansion would increase human-made structures, but these would not be expected to impact scenic views. The resulting impact would be local, long-term, negligible, and beneficial.

**Camp 6 and Yosemite Village.** The park would remove from Yosemite Village the Concessioner General Office, Concessioner Garage, and the Arts and Activities Center (Bank Building), and repurpose the Village Sports Shop for public use. It would also construct a new maintenance building near the Government Utility Building. The park would remove roadside parking along Sentinel Drive and expand Camp 6 parking into the footprint of the Valley Garage. To improve visitor access between the Camp 6 area and Village, the park would construct a pathway connecting the new Camp 6 parking lot with the repurposed Village Sports Shop. The repurposing and replacement of structures within already developed areas would not be expected substantially increase the number of human-made structures or impact scenic views. The resulting impact would be local, long-term, negligible, and adverse.

**Camp 4 and Yosemite Lodge.** The park would remove the NPS Volunteer Office, post office, swimming pool, and snack stand. It would also remove old and temporary employee housing (Thousands Cabins and Highland Court) and replace it with new housing. In addition, the park would relocate the Yosemite Lodge maintenance and housekeeping facilities and repurpose the food court. These actions would reduce the number of human-made structures in the area, thereby improving the natural character of these areas. The resulting impact would be local, long-term, negligible, and beneficial.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in segment-wide, long-term moderate, beneficial impacts on scenic resources in Segment 2. Actions to manage

user capacities, land use, and facilities would have local, long-term, minor, beneficial impacts on scenic resources within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternatives 2–6, the abandoned infrastructure and imported fill would be removed at the Cascades Picnic Area, Abbieville, and Trailer Village. Management actions proposed for Segment 3 include restoration activities would be conducted as applicable, including removal of informal trails, riverbank restoration, riparian zone protection, and revegetation. Management actions proposed for Segment 4 include riverbank protection and trail, road, and structure removal and restoration. In addition, general restoration activities would include removal of informal trails, bank restoration, riparian zone protection, and revegetation. The Greenemeyer sand pit would be restored to natural conditions. These actions would improve the scenic quality of restoration areas and views of the river in the vicinity of these areas, as seen from Highway 140 and El Portal Road. The resulting impact on scenic resources within Segment 4 would be local, long-term, minor to moderate, and beneficial.

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Under Alternatives 2–6, 31 employee housing units would be constructed in the El Portal area, increasing the number of human-made structures in Segment 4. However, the new structures would be in areas of existing development and would not substantially affect the scenic quality of the river corridor and adjacent areas. The resulting impact on scenic resources within Segment 4 would be local, long-term, minor, and adverse.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in segment-wide, long-term minor to moderate, beneficial impacts on scenic resources in Segment 4. Actions to manage user capacities, land use, and facilities would have local, long-term, minor, adverse impacts on scenic resources within Segment 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternatives 2–6, the Wawona RV dump site would be relocated away from the river, and river access and picnicking would be delineated at the South Fork Merced River Picnic Area to focus public use away from areas subject to riverbank erosion. Restoration activities would result in short-term, temporary intrusions into views when construction and restoration activities and equipment would be visible from area trails and visitor use areas. However, implementation of these actions would remove areas of resource damage that detract from the scenic quality of the river corridor and adjacent areas, and views of the river with restoration areas in the foreground. Upon completion of restoration activities, restored areas would be more natural in appearance. The resulting impact on scenic resources within Segment 7 would be local, long-term, minor, and beneficial.

***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Under Alternatives 2–6, an operations building and grounds facility would be constructed, thus increasing the number of human-made structures in this area. However, the new structures would be in areas of existing development and would not substantially affect the scenic quality of the river corridor and adjacent areas. The resulting impact on scenic resources within Segment 7 would be local, long-term, minor, and adverse.

**Wawona.** The park would redesign the bus stop at the Wawona Store to accommodate increased visitor use. However, the new structures would be in areas of existing development and would not substantially affect the scenic quality of the river corridor and adjacent areas. The resulting impact on scenic resources within Segment 7 would be local, long-term, negligible, and adverse.

**Segments 5-8 Impact Summary:** Actions to protect and enhance river values would result in segment-wide, long-term minor, beneficial impacts on scenic resources in Segment 7. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, adverse impacts on scenic resources within Segment 7.

**Summary of Impacts from Actions Common to Alternatives 2-6**

The alternatives include several common restoration actions that would improve the appearance of riverbanks, meadows, and riparian vegetation, and a number of actions that would result in removal of human-made structures and paved/graded areas. These actions would improve the scenic quality of restoration areas and views of the river and meadows in the vicinity of restoration areas. In addition, views from scenic vistas with restoration areas in the foreground would be improved. New facilities or structures included in management actions are proposed in existing developed areas, would adhere to the park's design guidelines, and would not result in reduced scenic quality. Overall, with implementation of MM-VEX-2, as appropriate, (see Appendix C), actions common to Alternatives 2-6 would result in local, long-term, moderate, beneficial impacts on scenic resources.

***Environmental Consequences of Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration*****All River Segments*****Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

As discussed in the natural resources impact subsections of this chapter, Alternative 2 would result in reduced park visitation compared to Alternatives 2–6, which would reduce the potential for ongoing visitor use impacts on natural resources, such as creation of informal trails, trampling of vegetation, and increased riverbank erosion, which results in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources.

## **Segment 1: Merced River Above Nevada Fall**

### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Implementation of Alternative 2 would include conversion of the Little Yosemite Valley and Merced Lake Backpackers Camping Areas to dispersed camping, and the Moraine Dome Camping Area would be discontinued, along with general restoration activities as applicable in the Little Yosemite Valley area. Grazing of the Merced Lake East Meadow would be prohibited. Implementation of these actions would remove human-made structures and restore areas of resource damage that detract from the scenic quality of the area. Upon completion of restoration activities, the Little Yosemite Valley area would be more natural in appearance, as viewed from the Merced Lake Trail and the visitor use areas that would be retained. Views of the river would be improved where restoration areas are in the foreground, as well as views of peaks where restored areas are in the foreground.

Little Yosemite Valley Wilderness zone capacity would be decreased, which would substantially reduce trail use in the area between Little Yosemite Valley and Merced Lake. This action, in addition to reducing the number of overnight units available in Segment 1, would reduce overall visitation to the area compared to existing conditions. Therefore, the potential for ongoing visitor use impacts on the natural resources of Segment 1, as well as secondary effects on the scenic quality of the area would be reduced. Implementation of management actions related to visitor use management and facilities under Alternative 2 would result in local, long-term, minor, beneficial impacts on the scenic resources of Segment 1.

**Merced Lake High Sierra Camp.** Under Alternative 2, the Merced Lake High Sierra Camp would be removed and restored. Implementation of these actions would remove human-made structures that detract from the scenic quality of the Merced Lake area. Upon completion of restoration activities, the Merced Lake area would be more natural in appearance, as viewed from the Merced Lake Trail and the visitor use areas that would be retained. Views of Merced Lake shoreline and meadows would be improved where restoration areas are in the foreground, as well as views of peaks where restored areas are in the foreground. The resulting impacts on the scenic character of Segment 1 would be local, long-term, moderate, and beneficial.

**Segment 1 Impact Summary:** Implementation of management actions related to visitor use management and facilities under Alternative 2 would result in local, long-term, minor to moderate, beneficial impacts on the scenic resources of Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 2, in addition to actions common to Alternatives 2–6, Stoneman, Sugar Pine, and Ahwahnee bridges would be removed and the riverbank areas would be restored. Additional meadow and riparian restorations would be implemented, including areas of Housekeeping Camp, Upper and Lower Rivers Campgrounds, Stoneman Meadow, El Capitan Meadow, and other highly visible meadow areas. All campgrounds and infrastructure in the 100-year floodplain would be removed, and

the floodplain and habitat would be restored. Implementation of these actions would remove areas of resource damage that detract from the scenic quality of the river corridor and adjacent areas, and views of the river with restoration areas in the foreground. Upon completion of restoration activities, restored areas would be more natural in appearance. However, it is noted that the bridges contribute to the scenic quality of the area and provide opportunities to view scenic areas, including the river. Implementation of management actions related to protecting and enhancing river values under Alternative 2 (including actions common to all alternatives) would result in local, long-term, moderate to major, beneficial impacts on the scenic resources of Segment 2.

### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Under Alternative 2, lodging units and would be reduced at Housekeeping Camp. Yosemite Village would be substantially retained, with some structures repurposed and several structures removed. Yosemite Lodge would be converted to day use, with some visitor uses repurposed and a campsite developed northwest of the lodge area. Several lodge buildings would be removed. Restoration activities would improve the scenic quality in the immediate vicinity of building removal and restoration areas. These actions would improve the scenic quality of the area by reducing the number of human-made structures in the area and restoring vegetation, and would improve the scenic quality of the river, including views from scenic viewpoints.

In addition, visitor use would be substantially reduced from existing conditions in Segment 2. This action, in addition to the above actions, would reduce the potential for ongoing visitor use impacts on the natural resources of the area that could result in secondary effects on the scenic quality of the area. Implementation of management actions related to visitor use management and facilities under Alternative 2 (including actions common to all alternatives) would result in local, long-term, moderate, beneficial impacts on the scenic resources of Segment 2.

**Curry Village and Campground.** The park would construct 78 new hard-sided units in Boys Town, bringing the total number of new and retained units at Curry Village to 433. The park would remove campsites from Lower Pines (32), North Pines (86), and Upper Pines (24). New structures would be constructed in an already developed area, generally within previously developed sites. These actions would collectively result in a reduction in human-made structures in the Curry Village and Campground areas, and a return to more natural conditions. The impact on scenic resources would, therefore, be local, long-term, minor, and beneficial.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, and install walkways leading to Yosemite Village. As these actions would occur within already developed areas and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, negligible, and adverse.

**Camp 4 and Yosemite Lodge.** The park would move on-grade pedestrian crossing between Camp 4 and Yosemite Lodge. The park would convert the Highland Court area to a walk-in campground; reconfigure pedestrian crossing of Northside Drive and Yosemite Lodge Drive, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses.

Conversion of the Highland Court area would have a beneficial impact by reducing the number of human-made structures in the area and return it to more natural conditions. Additional parking at Yosemite Lodge would have the opposite effect as it would increase the development footprint and bring more vehicles and visitors into this area. However, as these actions would occur within already developed areas and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in segment-wide, long-term moderate to major, beneficial impacts on scenic resources within Segment 2. Actions to manage user capacities, land use, and facilities would also have local, long-term, moderate to major, beneficial impacts on the scenic resources of Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish a 2.25-acre oak recruitment zone in the vicinity of Odger's fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. These measures would have a local, long-term, minor, beneficial impact on scenic resources in the vicinity of the former fuel station.

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Under Alternative 2, employee housing would be added to the Abbieville and Rancheria Flat, along with parking for these areas. These actions would increase the number of human-made structures in the area. However, these areas are currently developed, and the addition of these structures would not substantially decrease the scenic quality of the area. Overall, visitor use would be reduced from existing conditions, which would reduce the potential for ongoing visitor use impacts on the natural resources and associated secondary effects on the scenic quality of the area. Implementation of these actions would result in local, long-term, negligible to minor, adverse impacts on the scenic resources of Segment 4.

**Segments 3 & 4 Impact Summary:** Implementation of actions to protect and enhance river values would have a local, long-term, beneficial impact on scenic resources within Segment 4. Actions to management visitor use and facilities under Alternative 2 would result in local, long-term, negligible to minor, adverse impacts on the scenic resources of Segment 4. Segments 5, 6, 7, and 8: South Fork Merced River.

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 2, a portion of the maintenance yard would be restored and other structures would be removed. The Wawona Golf Course and tennis courts would be removed. Implementation of these management actions would improve the scenic quality of the restoration areas. In particular, the restored golf course restoration area would be visible from Chowchilla Road, Highway 41, and vista

points along that road. The impact on scenic resources of Segment 7 would be local, long-term, moderate, and beneficial.

### *Impacts of Actions to Manager User Capacity, Land Use, and Facilities*

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. These actions would be expected to decrease overall visitation within this Segments 5-8.

As a result, the potential for ongoing visitor use impacts on the natural resources of Segments 5–8, and associated secondary effects on the scenic quality of these segments would be reduced.

Implementation these actions would result in local, long-term, minor, beneficial impacts on the scenic resources of Segments 5–8.

**Wawona Campground:** Under Alternative 2, the park would reduce the size of the Wawona Campground. Thirty-two campsites, or 33% of all campsites within Wawona, would be removed from the floodplain. These actions would further reduce visitation and the number of human-made structures in the vicinity, and restore the area to more natural conditions. The resulting impact on scenic resources within Segment 7 would be local, long-term, minor, and beneficial.

**Segments 5-8 Impact Summary:** Overall, implementation of management actions related to visitor use management and facilities under Alternative 2 would result in local, long-term, minor to moderate, beneficial impacts on the scenic resources of Segments 5–8.

### **Summary of Impacts from Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration**

Alternative 2 includes a substantial number of restoration actions that would improve the appearance of riverbanks, meadows, and riparian vegetation and a number of actions that would result in removal of human-made structures and paved/graded areas. These actions would improve the scenic quality of restoration areas and views of the river and meadows in the vicinity of restoration areas. In addition, views from scenic vistas with restoration areas in the foreground would be improved. New facilities or structures included in management actions are proposed in existing developed areas and would not result in reduced scenic quality. In addition, visitor use capacity management would be implemented, resulting in visitor use that is substantially lower than existing levels, which would reduce the potential for ongoing visitor use impacts on natural resources that could result in secondary effects on scenic resources. Overall, with implementation of MM-VEX-2, as appropriate, (see Appendix C), Alternative 2 would result in local, long-term, moderate to major, beneficial impacts on scenic resources.

### **Cumulative Impacts from Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration**

The discussion of cumulative impacts to scenic resources is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of

Alternative 2. The projects identified below include those projects that have the potential to affect the scenic resources of the Merced River. See Appendix C for a full list of cumulative projects.

***Past, Present and Reasonably Foreseeable Actions***

Past, present and reasonably foreseeable actions that would contribute towards cumulative effects towards scenic resources under this alternative are the same as those listed for Alternative 1.

***Overall Cumulative Impact***

Overall development and recreational uses in the Merced River watershed have resulted in localized, long-term, minor to moderate, adverse impacts on scenic resources. A number of past, present, and future projects have beneficially limited uses through planning or restored vegetation and riverbanks, and management of vegetation that is blocking scenic views, although the overall impact remains adverse. Alternative 2 would result in local, long-term, moderate, beneficial impacts on scenic resources related to restoration activities throughout the planning area, removal of human-made structures, and reduced visitor use capacity, which result in overall improvement in the scenic quality of the planning area. Cumulatively, the impact on scenic resources would be local, long term, moderate, and beneficial.

***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

**All River Segments**

***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

As discussed in the natural resources impact subsections of this chapter and similar to Alternative 2, Alternative 3 would result in reduced park visitation compared to Alternative 1 (No Action), which would reduce the potential for ongoing visitor use impacts on natural resources, such as creation of informal trails, trampling of vegetation, and increased bank erosion. These visitor use impacts result in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources.

**Segment 1: Merced River Above Nevada Fall**

***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Under Alternative 3, the Little Yosemite Valley Campground would be reduced and portions of the designated camping area would be restored, rather than restoration of the entire designated camping area and conversion to dispersed camping under Alternative 2. Merced Lake Backpackers Camping Area would be expanded. Grazing of the Merced Lake East Meadow would be regulated. Restoration activities and reduced visitor capacity would improve the scenic quality of Segment 1, and reduce ongoing visitor use impacts on the natural resources of the area and associated secondary impacts on the scenic quality of the area. Implementation of management actions related to visitor use

management and facilities under Alternative 3 would result in local, long-term, minor, beneficial impacts on the scenic resources of Segment 1.

**Merced Lake High Sierra Camp.** The park would close the Merced Lake High Sierra Camp and removal all infrastructure, convert the area to designated Wilderness, and use the former camp area for a temporary stock camp. Upon completion of restoration activities, despite the continued use of the area as a stock camp, the Merced Lake area would be more natural in appearance, as viewed from the Merced Lake Trail and the visitor use areas that would be retained. Views of Merced Lake shoreline and meadows would be improved where restoration areas are in the foreground, as well as views of peaks where restored areas are in the foreground. The resulting impacts on the scenic character of Segment 1 would be local, long-term, minor to moderate, and beneficial.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, minor to moderate, beneficial impacts on scenic resources in Segment 1.

## **Segment 2: Yosemite Valley**

### *Impacts of Actions to Protect and Enhance River Values*

Actions under Alternative 3 would be similar to Alternative 2 and would also result in an overall improvement in the scenic quality of Segment 2. For many actions, the meadow or riverbank restoration approach proposed under Alternative 3 would be different than that proposed for Alternative 2; however, the scenic quality of the restoration areas following restoration activities would be similarly improved. Implementation of management actions related to protecting and enhancing river values under Alternative 3 (including actions common to all alternatives) would result in local, long-term, moderate to major, beneficial impacts on the scenic resources of Segment 2.

### *Impacts of Actions to Manager User Capacity, Land Use, and Facilities*

A greater number of campsites would be retained and less restoration would occur under Alternative 3 than under Alternative 2. In addition, a recreational vehicle (RV) campground would be developed. However, the proposed expanded campground is in a heavily wooded area that could be seen from the bicycle path adjacent to the river and Happy Isles Loop Road. Views of the Merced River with the campground areas in the foreground would not be improved to the same degree as under Alternative 2, including views from Happy Isles bridge (Scenic Vista point 14), Clark's Bridge (Scenic Vista point 7), Housekeeping Camp footbridge (Scenic Vista point 92), Housekeeping Beach (Scenic Vista point 26), Housekeeping Bridge trail, Southside Drive, and the adjacent bicycle path and trails that cross this area. In addition, views of North Dome, Glacier Point, Yosemite Falls, El Capitan, and Cathedral Rocks from the scenic vista points with the campground areas in the foreground would not be improved to the same degree under Alternative 3 as under Alternative 2.

In Curry Village, a greater number of lodging units and parking spaces would be retained at the Curry Orchard Parking Area, than under Alternative 2. In the Yosemite Village area, some structures would be retained, rather than removed as under Alternative 2. Yosemite Lodge would be retained, rather

than converted to day use with a campground to the west as under alternative 2. However, these areas are in existing developed areas.

While Alternative 3 would retain more campground and overnight accommodations compared with Alternative 2, restoration activities and reduced visitor capacity would improve the scenic quality of Segment 2 and reduce ongoing visitor use impacts on the natural resources of the area that could result in secondary effects on the scenic quality of the area. Implementation of management actions related to visitor use management and facilities under Alternative 3 would result in local, long-term, moderate, beneficial impacts on the scenic resources of Segment 2.

**Curry Village and Campground.** The park would retain 355 guest units at Curry Village. The park would remove campsites from Lower Pines (15), North Pines (34), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. These actions would collectively result in a reduction in human-made structures in the Curry Village and Campground areas, and a return to more natural conditions. The impact on scenic resources would, therefore, be local, long-term, minor, and beneficial.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, and install walkways leading to Yosemite Village. As these actions would occur within already developed areas and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, negligible, and adverse.

**Camp 4 and Yosemite Lodge.** The park would move on-grade pedestrian crossing to west of the Northside Drive and Yosemite Lodge Drive, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. Additional parking at Highland Court and Yosemite Lodge would bring more visitors and vehicles into these areas. In the latter case, the proposed actions would increase the development footprint within the area. However, as these actions would occur within already developed areas and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, long-term moderate to major, beneficial impacts on scenic resources within Segment 2. Actions to manage user capacities, land use, and facilities would also have local, long-term, moderate, beneficial impacts on the scenic resources of Segment 2.

## **Segments 3 and 4: Merced River Gorge and El Portal**

### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish a 2.25-acre oak recruitment zone in the vicinity of Odger's fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. These measures

would have a local, long-term, minor, beneficial impact on scenic resources in the vicinity of the former fuel station in Segment 4.

***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

New low- and medium-density housing and parking would be constructed as infill development in Rancheria, outside the 100-year floodplain. These actions would increase the number of human-made structures in the area. However, these areas are currently developed, and the addition of these structures would not substantially decrease the scenic quality of the area. Overall, visitor use would be reduced from existing conditions, which would reduce the potential for ongoing visitor use impacts on the natural resources and associated secondary effects on the scenic quality of the area.

Implementation of these actions would result in local, long-term, negligible to minor, adverse impacts on the scenic resources of Segment 4. Implementation of these actions would result in local, long-term, minor, adverse impacts on the scenic resources of Segment 4.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, minor, beneficial impacts on the scenic resources of Segment 4. Actions to manage user capacities, land use, and facilities would also have local, long-term, minor, adverse impacts on the scenic resources of Segments 3 & 4.

**Segments 5, 6, 7, and 8: South Fork Merced River**

***Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values within Segment 7 include removal of the Wawona Golf Course. Implementation of these management actions would improve the scenic quality of the restoration areas. In particular, the restored golf course restoration area would be visible from Chowchilla Road, Highway 41, and vista points along that road. The impact on scenic resources of Segment 7 would be local, long-term, moderate, and beneficial.

***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. Reduced visitor capacity would improve the scenic quality of the segments and reduce ongoing visitor use impacts on the natural resources of the area, and associated secondary effects on the scenic quality of the area. Implementation of these management actions would result in local, long-term, minor, beneficial impacts on the scenic resources of Segments 5–8.

**Wawona Campground.** Under Alternative 3, the park would reduce the size of the Wawona Campground. Twenty seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. These actions would further reduce visitation and the number of human-made structures in the vicinity, and restore the area to more natural conditions. The resulting impact on scenic resources within Segment 7 would be local, long-term, minor, and beneficial.

**Segments 5-8 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, minor to moderate, beneficial impacts on the scenic resources of Segments 5-8. Actions to manage user capacities, land use, and facilities would also have local, long-term, minor to moderate, beneficial impacts on the scenic resources of Segments 5–8.

### **Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Alternative 3 would include a substantial number of restoration actions that would improve the appearance of riverbanks, meadows, and riparian vegetation, and a number of actions that would result in removal of human-made structures and paved/graded areas. These actions would improve the scenic quality of restoration areas and views of the river and meadows in the vicinity of restoration areas. In addition, views from scenic vistas with restoration areas in the foreground would be improved. New facilities or structures included in management actions are proposed in existing developed areas and would not result in reduced scenic quality. In addition, visitor use capacity management would be implemented, resulting in visitor use substantially lower than existing levels, which would reduce the potential for ongoing visitor use impacts on natural resources that could result in secondary effects on scenic resources. Overall, with implementation of MM-VEX-2, as appropriate, (see Appendix C), Alternative 3 would result in local, long-term, moderate to major, beneficial impacts on scenic resources.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

The discussion of cumulative impacts to scenic resources is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of Alternative 3. The projects identified below include those projects that have the potential to affect the scenic resources of the Merced River.

#### ***Past, Present and Reasonably Foreseeable Actions***

Past, present and reasonably foreseeable actions that would contribute towards cumulative effects towards scenic resources under this alternative are the same as those listed for Alternative 1.

#### ***Overall Cumulative Impact***

Overall development and recreational uses in the Merced River watershed have resulted in moderate localized, long-term, minor to moderate, adverse impacts on scenic resources. A number of past, present, and future projects have beneficially limited uses through planning or restored vegetation and riverbanks, and management of vegetation that is blocking scenic views, although the overall impact remains adverse. Alternative 3 would result in local, long-term, moderate to major, beneficial impacts on scenic resources related to restoration activities throughout the planning area, removal of human-made structures, and reduced visitor use capacity which result in overall improvement in the scenic quality of the planning area. Cumulatively, the impact on scenic resources would be local, long-term, moderate, and beneficial.

## ***Environmental Consequences of Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

As discussed in the natural resources impact sections and similar to Alternative 2, Alternative 4 would result in reduced park visitation compared to Alternative (No Action), which would reduce the potential for ongoing visitor use impacts on natural resources, such as creation of informal trails, trampling of vegetation, and increased bank erosion. These visitor use impacts results in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources. However, visitor use numbers would only be slightly reduced compared with Alternative 1 (No Action) and more visitation would result compared with Alternative 2. Visitor use management strategies would result in higher visitation than would occur under Alternative 2. Therefore, secondary impacts on scenic resources would not be improved to the same degree as Alternative 2 but could be improved compared to existing conditions.

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Under Alternative 4, the Little Yosemite Valley Campground would be retained, rather than restoring the entire designated camping area and converting it to dispersed camping as under Alternative 2. Restoration and prohibitions on grazing of Merced Lake East Meadow, along with other general restoration activities would improve the scenic quality of the area, but not to the degree as would occur under Alternative 2. Therefore, improvement in scenic quality in Segment 1 would be less under Alternative 4 than under Alternative 2 because areas of barren ground, designated camping areas, and other human-made structures would be retained (and expanded at the Merced Lake Backpackers Camping Area), and therefore less restoration would be implemented. While more campground sites would be retained with Alternative 4 than with Alternative 2, restoration activities and reduced visitor capacity would improve the scenic quality of Segment 1 and reduce ongoing visitor use impacts on the natural resources of the area, which could result in secondary effects on the scenic quality of the area. Implementation of management actions related to visitor use management and facilities under Alternative 4 would result in local, long-term, minor, beneficial impacts on the scenic resources of Segment 1. Merced Lake High Sierra Camp. The park would close the Merced Lake High Sierra Camp and removal all infrastructure, convert the area to designated Wilderness, and restoration of the former camp area to natural conditions. Implementation of these actions would remove human-made structures that detract from the scenic quality of the Merced Lake area. Upon completion of restoration activities, the Merced Lake area would be more natural in appearance, as viewed from the Merced Lake Trail and the visitor use areas that would be retained. Views of Merced Lake shoreline and meadows would be improved where restoration areas are in the foreground, as well as views of peaks where restored areas are in the foreground. The resulting impacts on the scenic character of Segment 1 would be local, long-term, minor to moderate, and beneficial.

**Segment 1 Impact Summary:** Implementation of management actions related to visitor use management and facilities under Alternative 4 would result in local, long-term, minor to moderate, beneficial impacts on the scenic resources of Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Actions under Alternative 4 in Segment 2 would be similar to Alternative 2 and would also result in an overall improvement in the scenic quality of this segment. For many actions, the meadow or riverbank restoration approach proposed under Alternative 4 would be different than that proposed under Alternative 2. In addition, slightly less road and trail removal/relocation would occur. However, the scenic quality of the restoration areas following restoration activities would be similarly improved. Implementation of management actions related to protecting and enhancing river values under Alternative 4 (including actions common to all alternatives) would result in local, long-term, minor to moderate, beneficial impacts on the scenic resources of Segment 2.

### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

A greater number of units would be retained under Alternative 4 than under Alternative 2. In addition, a recreational vehicle campground and a walk-in campground would be developed. However, riverbank, riparian, and other restoration actions would be implemented as under Alternative 2. The proposed expanded campground is in a heavily wooded area, but could be seen from the bicycle path adjacent to the river and Happy Isles Loop Road. The riverbank downstream of Stoneman Bridge would be restored; however, the bridge would be retained. Views of the Merced River with these areas in the foreground would not be improved under Alternative 4 to the same degree as Alternative 2, including views from Happy Isles bridge (Scenic Vista point 14), Clark's Bridge (Scenic Vista point 7), Housekeeping footbridge (Scenic Vista point 92), Housekeeping Beach (Scenic Vista point 26), Housekeeping Bridge Trail, Southside Drive, and the adjacent bicycle path and trails that cross the area. In addition, views of North Dome, Glacier Point, Yosemite Falls, El Capitan, and Cathedral Rocks from the scenic vista points with the campground areas in the foreground would be not be improved to the same degree under Alternative 4 as under Alternative 2.

In Curry Village, a greater number of lodging units and parking spaces would be retained under Alternative 4 than under Alternative 2. Yosemite Lodge would be retained, rather than converted to day use as under Alternative 2, and a campground would be developed. However, these areas are in existing developed areas.

While Alternative 4 would retain more campground and overnight accommodations compared with Alternative 2, restoration activities and maintained visitor capacity would improve the scenic quality of Segment 2 and maintain ongoing visitor use impacts on the natural resources of the area that could result in secondary effects on the scenic quality of Segment 2. Implementation of management actions related to visitor use management and facilities under Alternative 4 would result in local, long-term, minor to moderate, beneficial impacts on the scenic resources of Segment 2.

**Curry Village and Campground.** The park would retain 355 guest units and construct a new 40 site campground at Curry Village. The park would remove campsites from Lower Pines (15), North Pines (34), and Upper Pines (2). New structures would be constructed in an already developed area, generally within previously developed sites. These actions would collectively result in a reduction in human-made structures in the Curry Village and Campground areas, and a return to more natural conditions. The impact on scenic resources would, therefore, be local, long-term, minor, and beneficial.

**Camp 6 and Yosemite Village.** The park would improve the configuration of and on-grade pedestrian crossing at the Northside Drive-Yosemite Village Drive intersection, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 750 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. Additional parking at Camp 6 would bring more visitors and vehicles into these areas. However, as the project would occur within the footprint of an already developed area, and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. Additional parking at Highland Court and Yosemite Lodge would bring more visitors and vehicles into these areas. In the latter case, the proposed actions would increase the development footprint within the area. However, as these actions would occur within already developed areas and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, long-term minor to moderate, beneficial impacts on scenic resources within Segment 2. Actions to manage user capacities, land use, and facilities would also have local, long-term, minor to moderate, beneficial impacts on the scenic resources of Segment 2.

## **Segments 3 and 4: Merced River Gorge and El Portal**

### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish a 1-acre oak recruitment zone in the vicinity of Odger's fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. These measures would have a local, long-term, negligible, beneficial impact on scenic resources in the vicinity of the former fuel station in Segment 4.

### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

New high-density housing and parking would be constructed as infill development in Rancheria, outside the 100-year floodplain. These actions would increase the number of human-made structures in the area. However, these areas are currently developed, and the addition of these structures would not

substantially decrease the scenic quality of the area. Overall, visitor use would be reduced from existing conditions, which would reduce the potential for ongoing visitor use impacts on the natural resources and associated secondary effects on the scenic quality of the area. Implementation of these actions would result in local, long-term, minor, adverse impacts on the scenic resources of Segment 4. **Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, minor, beneficial impacts on the scenic resources of Segment 4. Actions to manage user capacities, land use, and facilities would also have local, long-term, minor, adverse impacts on the scenic resources of Segment 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. These actions would be expected to decrease overall visitation within this Segments 5-8. As a result, the potential for ongoing visitor use impacts on the natural resources of Segments 5-8, and associated secondary effects on the scenic quality of these segments would be reduced. Implementation of these actions would result in local, long-term, minor, beneficial impacts on the scenic resources of Segments 5-8.

**Wawona Campground.** Under Alternative 4, the park would reduce the size of the Wawona Campground. Twenty-seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. These actions would further reduce visitation and the number of human-made structures in the vicinity, and restore the area to more natural conditions. The resulting impact on scenic resources within Segment 7 would be local, long-term, minor, and beneficial.

**Segments 5-8 Impact Summary:** Actions to manage user capacities, land use, and facilities would also have local, long-term, minor, beneficial impacts on the scenic resources of Segments 5-8.

### **Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

A substantial number of restoration actions under Alternative 4 would improve the appearance of riverbanks, meadows, and riparian vegetation and a number of actions would result in removal of human-made structures and paved/graded areas. These actions would improve the scenic quality of restoration areas and views of the river and meadows in the vicinity of restoration areas. In addition, views from scenic vistas with restoration areas in the foreground would be improved. New facilities or structures included in management actions are proposed in existing developed areas and would not result in overall reduced scenic quality. In addition, visitor use capacity management would be implemented, resulting in visitor use being maintained at slightly less than or similar to existing levels, which would maintain the potential for ongoing visitor use impacts on natural resources, which could result in secondary effects on scenic resources. Overall, with implementation of MM-VEX-2, as appropriate, (see Appendix C), Alternative 4 would result in local, long-term, minor to moderate, beneficial impacts on scenic resources.

### **Cumulative Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

The discussion of cumulative impacts on scenic resources is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of Alternative 4. The projects identified below include those projects that have the potential to affect the scenic resources of the Merced River.

#### ***Past, Present and Reasonably Foreseeable Actions***

Past, present and reasonably foreseeable actions that would contribute towards cumulative effects towards scenic resources under this alternative are the same as those listed for Alternative 1.

#### ***Overall Cumulative Impact***

Overall development and recreational uses in the Merced River watershed have resulted in localized, long-term, minor to moderate, adverse impacts on scenic resources. A number of past, present, and future projects have beneficially limited uses through planning or restored vegetation and riverbanks, and management of vegetation that is blocking scenic views, although the overall impact remains adverse. Alternative 4 would result in local, long-term, moderate, beneficial impacts on scenic resources related to restoration activities throughout the planning area, removal of human-made structures, and reduced visitor use capacity, which result in overall improvement in the scenic quality of the planning area. Cumulatively, the impact on scenic resources would be local, long term, minor to moderate, and beneficial.

### ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

#### **All River Segments**

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

As discussed in the natural resources impact subsections of this chapter, Alternative 5 would result in similar park visitation compared to Alternative 1 (No Action) and ongoing visitor use impacts on natural resources, such as creation of informal trails, trampling of vegetation, and increased bank erosion, which result in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources, and these visitor use impacts could continue similar to existing conditions.

#### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Under Alternative 5, the Merced Lake Backpackers Camping Area would be retained. In addition, the Little Yosemite Valley and Moraine Dome Camping Areas would be retained, rather than being

restored and converted to dispersed camping as under Alternative 2. Wilderness zone capacity would be maintained at existing levels. Restoration and restrictions on grazing at Merced Lake East Meadow, and other general restoration activities would be implemented. As such, the scenic quality of the area would be improved, but not to the degree as would occur under Alternative 2 because the designated camping areas would be retained. Therefore, improvement in scenic quality in Segment 1 would be less under Alternative 5 than under Alternative 2 because areas of barren ground, designated camping areas, and other human-made structures would be retained; therefore, less restoration would be implemented. Maintenance of existing wilderness permit numbers could result in ongoing visitor use impacts on the natural resources of the area, and associated secondary effects on the scenic quality of the area, similar to existing conditions. Implementation of management actions related to visitor use management and facilities under Alternative 5 would result in local, long-term, negligible, beneficial impacts on the scenic resources of Segment 1.

**Merced Lake High Sierra Camp.** The park would reduce the capacity of the Merced Lake High Sierra Camp to 42 beds and replace the flush toilets with composting toilets. Continued operation of the facility, albeit at reduced capacity, would result in impacts similar to those of Alternative 1 (No Action) as the major components of the facility and its visitors would remain. The resulting impact would be local, long-term, negligible, and adverse.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, negligible, adverse impacts on scenic resources in Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Segment 2 actions under Alternative 5 would be similar to actions under Alternative 2 and would also result in an overall improvement in the scenic quality of this segment. For many actions, the meadow or riverbank restoration approach proposed under Alternative 5 would be different than under Alternative 2. In addition, slightly less road area would be removed at Ahwahnee Meadow. However, the scenic quality of the restoration areas after restoration activities would be similarly improved. Implementation of management actions related to protecting and enhancing river values under Alternative 5 (including actions common to all alternatives) would result in local, long-term, moderate, beneficial impacts on the scenic resources of Segment 2.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

A greater number of campsites would be retained under Alternative 5 than under Alternative 2. In addition, an RV campground and a walk-in campground would be developed. However, riverbank, riparian, and other restoration actions would be implemented as under Alternative 2. The proposed expanded campground is in a heavily wooded area, but could be seen from the bicycle path adjacent to the river and Happy Isles Loop Road. Restoration would occur at the former Upper River and Lower River campgrounds; however, due to the addition of campsites at Upper River, the total acreage of restoration would be less than that of Alternatives 2 through 4. The riverbank downstream of Stoneman Bridge would be restored; however, the bridge would be retained. Views of the Merced

River with the these areas in the foreground would not be improved to the same degree as with Alternative 2, including views from Happy Isles bridge (Scenic Vista point 14), Clark's Bridge (Scenic Vista point 7), Housekeeping footbridge (Scenic Vista point 92), Housekeeping Beach (Scenic Vista point 26), Housekeeping Bridge Trail, Southside Drive, and the adjacent bicycle path and trails that cross the area. In addition, views of North Dome, Glacier Point, Yosemite Falls, El Capitan, and Cathedral Rocks from the scenic vista points with the campground areas in the foreground would be not be improved under Alternative 5 to the same degree as under Alternative 2.

In Curry Village, most lodging units and parking spaces would be retained. Yosemite Lodge would be retained, rather than converted to day use as under Alternative 2. However, these areas are in existing developed areas.

Valley visitor capacity would be maintained at the same level as existing conditions. While Alternative 5 would retain more campground and overnight accommodations compared with Alternative 2, restoration activities and maintained visitor capacity would improve the scenic quality of Segment 2 and maintain ongoing visitor use impacts on the natural resources of the area that could result in secondary effects on the scenic quality of the area. Implementation of management actions related to visitor use management and facilities under Alternative 5 would result in local, long-term, minor, beneficial impacts on the scenic resources of Segment 2.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from Lower Pines (5), North Pines (14), and Upper Pines (2). New structures would be constructed in an already developed area, generally within previously developed sites. Campsite removal would reduce human-made structures in the Curry Village and Campground areas and return them to more natural conditions. The impact on scenic resources would, therefore, be local, long-term, negligible, and beneficial.

**Camp 6 and Yosemite Village.** The park would construct a pedestrian underpass and a traffic circle at the intersection of Northside and Yosemite Village Drives, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. The traffic circle, new intersection, and additional parking at Camp 6 would increase the development footprint and bring more visitors and vehicles into these areas. However, as these projects would occur largely within the footprint of an already developed area, and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would redevelop the disturbed footprint of the former Yosemite Lodge units removed after being damaged by the 1997 flood, design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 300 automobiles and 15 tour busses. Additional parking at Highland Court and Yosemite Lodge would bring more visitors and vehicles into these areas. In the latter case, the proposed actions would increase the development footprint within the area. However, as these actions would occur within

already developed areas and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, long-term minor to moderate, beneficial impacts on scenic resources within Segment 2. Actions to manage user capacities, land use, and facilities would also have local, long-term, minor, beneficial impacts on the scenic resources of Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish a one-acre oak recruitment zone in the vicinity of Odger's fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. These measures would have a local, long-term, negligible, beneficial impact on scenic resources in the vicinity of the former fuel station in Segment 4.

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

New high-density housing and parking would be constructed as infill development in Rancheria, outside the 100-year floodplain. These actions would increase the number of human-made structures in the area. However, these areas are currently developed, and the addition of these structures would not substantially decrease the scenic quality of the area. Overall, visitor use would be reduced from existing conditions, which would reduce the potential for ongoing visitor use impacts on the natural resources and associated secondary effects on the scenic quality of the area. Implementation of these actions would result in local, long-term, minor, adverse impacts on the scenic resources of Segment 4.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, minor, beneficial impacts on the scenic resources of Segment 4. Actions to manage user capacities, land use, and facilities would have local, long-term, minor, adverse impacts on the scenic resources of Segment 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. These actions would not be expected to substantially change overall visitation within Segments 5-8. As a result, the potential for ongoing visitor use impacts on the natural resources of Segments 5-8, and associated secondary effects on the scenic quality of these segments would be similar to those of Alternative 1 (No Action). Implementation of these actions would result in local, long-term, negligible, beneficial impacts on the scenic resources of Segments 5-8.

**Wawona Campground.** Under Alternative 5, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. These actions would reduce overnight visitation and the number of human-made structures in the vicinity, and restore the area to more natural conditions. The resulting impact on scenic resources within Segment 7 would be local, long-term, negligible, and beneficial.

**Segments 5-8 Impact Summary:** Actions to manage user capacities, land use, and facilities would also have local, long-term, negligible, beneficial impacts on the scenic resources of Segments 5–8.

### **Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Alternative 5 includes a substantial number of restoration actions that would improve the appearance of riverbanks, meadows, and riparian vegetation, and a number of actions that would result in removal of human-made structures and paved/graded areas. These actions would improve the scenic quality of restoration areas and views of the river and meadows in the vicinity of restoration areas. In addition, views from scenic vistas with restoration areas in the foreground would be improved. New facilities or structures included in Alternative 5 management actions are proposed in existing developed areas and would not result in overall reduced scenic quality. In addition, visitor use capacity management would be implemented, which would maintain in visitor use at existing levels and therefore maintain the potential for ongoing visitor use impacts on natural resources that could result in secondary effects on scenic resources. Overall, with implementation of MM-VEX-2, as appropriate, (see Appendix C), Alternative 5 would result in local, long-term, minor, beneficial impacts on scenic resources.

### **Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

The discussion of cumulative impacts on scenic resources is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of Alternative 5. The projects identified below have the potential to affect the scenic resources of the Merced River.

#### ***Past, Present and Reasonably Foreseeable Actions***

Past, present and reasonably foreseeable actions that would contribute towards cumulative effects towards scenic resources under this alternative are the same as those listed for Alternative 1.

#### ***Overall Cumulative Impact***

Overall development and recreational uses in the Merced River watershed have resulted in localized, long-term, minor to moderate, adverse impacts on scenic resources. A number of past, present, and future projects have beneficially limited uses through planning or restored vegetation and riverbanks, and management of vegetation that is blocking scenic views, although the overall impact remains adverse. Alternative 5 would result in local, long-term, minor to moderate, beneficial impacts on scenic resources related to restoration activities throughout the planning area, removal of human-made

structures, and reduced visitor use capacity, which could result in overall improvement in the scenic quality of the planning area. Cumulatively, the impact on scenic resources would be local, long term, minor to moderate, and beneficial.

### ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

As discussed in the natural resources impact subsections of this chapter, Alternative 6 would accommodate an increase in park visitation compared with Alternative 1 (No Action) and ongoing visitor use impacts on natural resources, such as creation of informal trails, trampling of vegetation, and increased bank erosion. These visitor use impacts would result in secondary scenic resources impacts where affected natural resources areas are in scenic views or are the foreground to scenic resources and could continue similar to existing conditions.

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

The Merced Lake Backpackers, Little Yosemite Valley, and the Moraine Dome Camping Areas would be retained, rather than being restored and converted to dispersed camping as under Alternative 2. Wilderness zone capacity would be maintained at existing levels. Restoration and grazing restrictions at Merced Lake East Meadow, and other general restoration activities would be implemented. As such, the scenic quality of the area would be improved, but not to the degree as would occur under Alternative 2 because of the retention of designated camping areas. Therefore, improvement in scenic quality in Segment 1 would be less under Alternative 6 than under Alternative 2 because areas of barren ground, designated camping areas, and other human-made structures would be retained and, therefore, less restoration would be implemented. Maintenance of existing Wilderness permit numbers could result in ongoing visitor use impacts on the natural resources of Segment 1 that could result in secondary effects on the scenic quality of the area, similar to existing conditions. Implementation of management actions related to visitor use management and facilities under Alternative 6 would result in local, long-term, negligible, beneficial impacts on the scenic resources of Segment 1.

**Merced Lake High Sierra Camp.** Continued operation of the facility would result in impacts similar to those of Alternative 1 (No Action). The resulting impact would be local, long-term, negligible, and beneficial.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, negligible, beneficial impacts on scenic resources in Segment 1.

## Segment 2: Yosemite Valley

### *Impacts of Actions to Protect and Enhance River Values*

Segment 2 actions under Alternative 6 would be similar to Alternative 2 and would also result in an overall improvement in the scenic quality of Segment 2. For many actions, the meadow or riverbank restoration approach proposed under Alternative 6 would be different than under Alternative 2. In addition, slightly less road area would be removed at Ahwahnee Meadow. However, the scenic quality of the restoration areas after restoration activities would be similarly improved. Implementation of management actions related to protecting and enhancing river values under Alternative 6 (including actions common to all alternatives) would result in local, long-term, moderate, beneficial impacts on the scenic resources of Segment 2.

### *Impacts of Actions to Manager User Capacity, Land Use, and Facilities*

A greater number of campsites would be retained under Alternative 6 than under Alternative 2. In addition, an RV campground and a walk-in campground would be developed. However, riverbank, riparian, and other restoration actions would be implemented, as under Alternative 2. The proposed expanded campground is in a heavily wooded area but could be seen from the bicycle path adjacent to the river and Happy Isles Loop Road. The riverbank downstream of Stoneman and Sugar Pine bridges would be restored; however, the bridges would be retained. Restoration would occur at the former Upper River and Lower River campgrounds; however, approximately half the acreage of restoration would be implemented compared to Alternatives 2 through 4. Views of the river with these areas in the foreground would not be improved under Alternative 6 to the same degree as under Alternative 2, including views from Happy Isles bridge (Scenic Vista point 14), Clark's Bridge (Scenic Vista point 7), Housekeeping footbridge (Scenic Vista point 92), Housekeeping Beach (Scenic Vista point 26), Housekeeping Bridge Trail, Southside Drive, and the adjacent bicycle path and trails that cross this area of Segment 2. In addition, views of North Dome, Glacier Point, Yosemite Falls, El Capitan, and Cathedral Rocks from the scenic vista points with the campground areas in the foreground would be not be improved under Alternative 6 to the same degree as under Alternative 2.

In Curry Village, most lodging units and parking spaces would be retained. Yosemite Lodge would be retained, rather than converted to day use as under Alternative 2. These areas are in existing developed areas.

The Valley visitor capacity would increase compared with Alternative 1 (No Action). Alternative 6 would retain more campground and overnight accommodations compared with Alternative 2, and ongoing visitor use impacts on the natural resources of the area could result in secondary effects on the scenic quality of the area could increase compared to Alternative 2. However, extensive meadow and riverbank restoration would be implemented. Implementation of management actions related to visitor use management and facilities under Alternative 6 would result in local, long-term, minor beneficial impacts on the scenic resources of Segment 2.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from Lower Pines (5), North Pines (14), and Upper Pines (2). New structures would be

constructed in an already developed area, generally within previously developed sites. Campsite removal would reduce human-made structures in the Curry Village and Campground areas and return them to more natural conditions. The impact on scenic resources would, therefore, be local, long-term, negligible, and beneficial.

**Camp 6 and Yosemite Village.** The park would expand the Concessioner Warehouse Building to accommodate Concessioner General Office functions, construct a pedestrian underpass and two roundabouts, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. The administrative facilities expansion, roundabout, new intersection, and additional parking at Camp 6 would increase the development footprint and bring more visitors and vehicles into these areas. However, as these projects would occur largely within the footprint of an already developed area, and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for 3 busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 300 automobiles and 15 tour busses. Additional parking at Highland Court and Yosemite Lodge would bring more visitors and vehicles into these areas. In the latter case, the proposed actions would increase the development footprint within the area. However, as these actions would occur within already developed areas and not obstruct scenic vistas, the impacts upon scenic resources would be local, long-term, minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, minor, beneficial impacts on scenic resources within Segment 2. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, beneficial impacts on the scenic resources of Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal.**

#### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish a 1-acre oak recruitment zone in the vicinity of Odger's fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. These measures would have a local, long-term, negligible, beneficial impact on scenic resources in the vicinity of the former fuel station in Segment 4.

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

New high-density housing and parking would be constructed as infill development in Rancheria and Abbieville, outside the 100-year floodplain. These actions would increase the number of human-made structures in the area. However, these areas are currently developed, and the addition of these structures would not substantially decrease the scenic quality of the area. Overall, visitor use would be reduced

from existing conditions, which would reduce the potential for ongoing visitor use impacts on the natural resources and associated secondary effects on the scenic quality of the area. Implementation of these actions would result in local, long-term, minor, adverse impacts on the scenic resources of Segment 4.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, minor, beneficial impacts on the scenic resources of Segment 4. Actions to manage user capacities, land use, and facilities would also have local, long-term, minor, adverse impacts on the scenic resources of Segment 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Manager User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. These actions would not be expected to substantially change overall visitation within Segments 5-8. As a result, the potential for ongoing visitor use impacts on the natural resources of Segments 5-8, and associated secondary effects on the scenic quality of these segments would be similar to those of Alternative 1 (No Action). Implementation of these actions would result in local, long-term, negligible, beneficial impacts on the scenic resources of Segments 5-8.

**Wawona Campground.** Under Alternative 6, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. These actions would reduce overnight visitation and the number of human-made structures in the vicinity, and restore the area to more natural conditions. The resulting impact on scenic resources within Segment 7 would be local, long-term, negligible, and beneficial.

**Segments 5-8 Impact Summary:** Actions to manage user capacities, land use, and facilities would also have local, long-term, negligible, beneficial impacts on the scenic resources of Segments 5-8.

### **Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Alternative 6 includes a substantial number of restoration actions that would improve the appearance of riverbanks, meadows, and riparian vegetation, and a number of actions that would result in removal of human-made structures and paved/graded areas. These actions would improve the scenic quality of restoration areas, and views of the river and meadows in the vicinity of restoration areas. In addition, views from scenic vistas with restoration areas in the foreground would be improved. New facilities or structures included in management actions are primarily proposed in existing developed areas and would not result in overall reduced scenic quality. Visitor use capacity management would increase, which could increase the potential for ongoing visitor use impacts on natural resources of that could result in secondary effects on scenic resources. Overall, with implementation of MM-VEX-2, as appropriate, (see Appendix C), Alternative 6 would result in local, long-term, minor, beneficial impacts on scenic resources.

## **Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

The discussion of cumulative impacts on scenic resources is based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with the potential effects of Alternative 6. The projects identified below include those projects that have the potential to affect the scenic resources of the Merced River.

### ***Past, Present and Reasonably Foreseeable Actions***

Past, present and reasonably foreseeable actions that would contribute towards cumulative effects towards scenic resources under this alternative are the same as those listed for Alternative 1.

### ***Overall Cumulative Impact***

Overall development and recreational uses in the Merced River watershed have resulted in localized, long-term, minor to moderate, adverse impacts on scenic resources. A number of past, present, and future projects have beneficially limited uses through planning or restored vegetation and riverbanks and management of vegetation that is blocking scenic views, although the overall impact remains adverse. Alternative 6 would result in local, long-term, minor to moderate, beneficial impacts on scenic resources related to restoration activities throughout the planning area, removal of human-made structures, and reduced visitor use capacity, which result in overall improvement in the scenic quality of the planning area. Cumulatively, the impact on scenic resources would be local, long term, minor, and beneficial.

## Visitor Experience/Recreation

### *Affected Environment*

Visitors to natural environments may be aware of resource conditions along trails and at recreation sites; however it is somewhat difficult to measuring human perceptions of beneficial or adverse impacts in a National Park. Generally, visitors perceptions of environmental impacts tend to be limited to what they can easily see and different people may have different perceptions based on their prior experience, education with regards to the particular environmental issues and the activities they engage in within any given park location. This section relies on a combination of park staff experience, published literature and public surveys to describe potential impacts to the visitor experience.

### Regulatory Framework

#### *The Wilderness Act of 1964*

The Wilderness Act of 1964 directed the Secretary of the Interior to study federal lands within the national wildlife refuge and national park systems, and recommend to the President those lands suitable for inclusion in a national wilderness preservation system. The Secretary of Agriculture was similarly directed to study and recommend such lands within the national forest system. The act grants Congress the final decision regarding designations. The Wilderness Act defines wilderness as including the following characteristics:

*...wilderness, in contrast with those areas where man and his own works dominate the landscape, is hereby recognized as an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain. An area of wilderness is further defined to mean in this chapter an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions and which (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation. . .*

The Wilderness Act prohibits certain uses in designated wilderness including motor vehicles, motorized equipment, landing of aircraft, other forms of mechanized transport, and structures or installations except as necessary to meet the minimum requirements for the administration of the area for the purpose of the Act.

Segments 1, 5, and 8 are located in designated wilderness areas and are therefore subject to the management provisions of the Wilderness Act. Within Segment 1, the area surrounding the Merced Lake High Sierra Camp is a Potential Wilderness Addition. To the greatest extent possible, a Potential Wilderness Addition is managed as wilderness. This area would become wilderness when current prohibited or inconsistent uses have ceased.

### ***Title 36 of the Code of Federal Regulations***

“The regulations in this chapter provide for the proper use, management, government, and protection of persons, property, and natural and cultural resources within areas under the jurisdiction of the National Park Service. These regulations would be utilized to fulfill the statutory purposes of units of the National Park System: to conserve scenery, natural and historic objects, and wildlife, and to provide for the enjoyment of those resources in a manner that would leave them unimpaired for the enjoyment of future generations”.

### ***Concessions Management Improvement Act of 1998***

The Concessions Management Improvement Act requires that contracts for visitor facilities and services “be limited to those that are necessary and appropriate for public use and enjoyment” of the national park area in which they are located, “ and that are consistent to the highest practicable degree with the preservation and conservation of the areas.” Title 36 of the Code of Federal Regulations (36 CFR 51) outlines the requirements for the preservation of the parks and administration of commercial service operations. In order to implement the requirements of law, National Park Service has Management Policies. Management policies are guiding principles or procedures that set the framework and provide direction for management decisions.  
(<http://www.nps.gov/policy/DOrders/thingstoknow.htm>)

### ***Superintendent’s Compendium***

The *Superintendent’s Compendium* is a compilation of designations, closures, permit requirements, fees, and other restrictions made by the superintendent, in addition to what is contained in Title 36 of the Code of Federal Regulations and other applicable federal statutes and regulations.

### ***Director’s Order #17: National Park Service Tourism***

The purpose of the Director’s Order #17 calls for “the promotion and support of sustainable, responsible, informed, and managed visitor use through cooperation and coordination with the tourism industry.” This purpose is elaborated upon by Operating Premises and Operational Policies that guide management decisions relating to tourism activities at Yosemite National Park.  
(<http://www.nps.gov/policy/DOrders/thingstoknow.htm>)

### ***Director’s Order #83: Public Health***

Director’s Order #83 outlines measures the NPS will take to ensure compliance with prescribed public health policies, practices, and procedures. This order establishes NPS policy with respect to all public health activities within Yosemite National Park, regardless of whether those activities are carried out by NPS and other federal employees, or by other organizations, including the U.S. Public Health Service. The core policies include prevention, control, and investigation of food-, water-, and vector-borne diseases in the national parks (NPS 2004a).

### ***The National Trails System Act***

The National Trails System Act provides for the ever-increasing outdoor recreation needs of an expanding population. To promote the preservation of, public access to, travel within, and enjoyment and appreciation of the open-air, outdoor areas and historic resources of the nation, trails should be established primarily near the urban areas of the nation, and secondarily within scenic areas, such as Yosemite National Park, and along historic travel routes of the nation, which are often more remotely located (NPS 2009).

### ***NPS 2006 Management Policies***

The *2006 Management Policies* state that the purpose of NPS interpretive and educational programs is to advance this mission by providing memorable educational and recreational experiences that will (1) help the public understand the meaning and relevance of park resources, and (2) foster development of a sense of stewardship. The programs do so by forging a connection between park resources, visitors, the community, and the national park system (NPS 2006). Yosemite National Park provides a variety of resources and support staff that allow these programs to advance the public's understanding of the park's qualities.

### **Overview of Visitation and Visitor Demographics**

People travel to Yosemite National Park for a multitude of reasons and their experiences are highly individualized. Some visit the park in the company of friends and family to marvel at its iconic landscape features — its dramatic waterfalls and geologic wonders. Others seek the solitude and primitive nature of the park's wilderness. Some come to study the park's unique and diverse plant and animal life. Others are attracted by its excellent recreational opportunities, including rock climbing and bouldering, cross country skiing, and backcountry hiking and camping. Thus, the continuum of visitor experiences extends from highly social to isolated, from independent to directed, from spontaneous to controlled, from easy to challenging, and from natural to more urban (NPS 2000c). The Merced River plays an important role in shaping these experiences. This section describes the types of visitor facilities and services, including educational and interpretive services, overnight accommodations, and recreational opportunities available throughout the Merced River corridor within the study area, which contribute to the overall visitor experience.

### ***Annual Parkwide Visitation***

Annual park visitation has risen 22% in the last five years, from a 20-year low of 3.24 million visitors in 2006, to 3.95 million in 2011. The record for visitation was set in 1996, when the park received just over four million visitors (NPS 2012a). Park visitation over the last 20 years is shown in **table 9-139**.

### ***Monthly Parkwide Visitation***

Timing and duration of park visitation varies widely throughout the year. As **figure 9-39** indicates, visitor attendance is highest between the months of May and October. Between 1990 and 2010, August has been the month of highest average visitation, while January has been the lowest.

**TABLE 9-139: ANNUAL VISITATION, YOSEMITE NATIONAL PARK 1990-2011**

Year	Annual Visitation	Year	Annual Visitation
1990	3,124,939	2001	3,368,731
1991	3,423,101	2002	3,361,867
1992	3,819,518	2003	3,378,664
1993	3,839,645	2004	3,280,911
1994	3,962,117	2005	3,304,144
1995	3,958,406	2006	3,242,644
1996	4,046,207	2007	3,503,428
1997	3,669,970	2008	3,431,514
1998	3,657,132	2009	3,737,472
1999	3,493,607	2010	3,901,408
2000	3,400,903	2011	3,951,393

SOURCE: NPS Stats. Accessed via Internet on June 29, 2012 at <http://www.nature.nps.gov/stats/park.cfm>.

**Figure 9-39**  
Average Park Visitation by Month (1990–2010)

These trends vary slightly for 2011 visitation counts; July had the highest visitation count with 704,553 people visiting the park in July, and February the lowest with 93,588 visitors (<http://www.nature.nps.gov/stats/viewReport.cfm>).

#### *Daily Parkwide Visitation*

During July, the month with the highest park visitation in 2011, there were an average of 22,728 daily visitors to the park. During February, the month with the lowest park visitation in 2011, the number of average daily visitors to the park was 3,342 (NPS Stats. 2012).

#### *Visitor Survey Responses*

**Parkwide Visitor Use Survey.** The NPS periodically conducts visitor surveys to help park managers better understand the interests and needs of park visitors. The most recent parkwide survey was

conducted in 2009. The survey looked at visitor origin and destination, reason for visit, duration of visit, activities of interest, and many other topics. Among those surveyed, 36% reported entering the park through the south entrance, while 21% reported entering through the Arch Rock entrance. The majority of those surveyed (57%) reported never having previously visited the park in their lifetime. Overnight visitors (within or near the park) constituted 69% of respondents. Duration of day visits averaged 7.2 hours, while length of stay for overnight visitors averaged 57 hours (2.4 days) (Blotkamp et al. 2009).

The survey also asked visitors about where and how they spent their time while in the park. **table 9-140** lists some of the most commonly identified destinations within the park. As the table indicates, the vast majority of respondents (70%) reported visiting Yosemite Valley generally, with specific destinations in the valley also frequently cited. Respondents named viewing scenery (93%), taking a scenic drive (64%), and day hiking (54%) as common activities within the park. When asked about primary activities in which they engaged, respondents similarly identified viewing scenery (45%), day hiking (27%), and taking a scenic drive (27%). This study indicates that visitor activities are concentrated within the Yosemite Valley and Wawona. (Blotkamp et al. 2010).

**TABLE 9-140: PERCENT OF VISITORS AT COMMON VISITOR DESTINATIONS**

Visitor Destination	Percent of Visitors
Yosemite Valley	70%
Yosemite Falls	59%
Bridalveil Fall	52%
El Captain Meadow	43%
Wawona	33%
Vernal Fall	28%
Half Dome	22%
Indian Cultural Museum	13%
Pioneer Yosemite History Center	12%
Little Yosemite Valley	8%
Yosemite Wilderness	5%
High Sierra Camps	3%
SOURCE: Blotkamp, Ariel et al. 2010. <i>Yosemite National Park Visitor Study</i> . NPS Science Program.	

**River Corridor Visitor Use Survey.** Completed in July of 2012, *Boats, Beaches and Riverbanks: Visitor Evaluations of Recreation on the Merced River in Yosemite Valley* (Whittaker, D., and B. Shelby, 2012) provides the most recent visitor use data. Data from this survey is more relevant to actions proposed for Segment 2 as this survey was specific to Yosemite Valley. The survey was conducted in July 2011 over the course of 15 days with 806 individuals completing the survey. All respondents were Merced River shore or boating users. Shore users included those who were relaxing, picnicking, swimming, hiking, or biking. Key study findings include:

- 56% of respondents were staying in Yosemite Valley.
- 85% were spending two or more days in the park.
- The most common river activities in which participants engaged during this visit were relaxing on shore (76%); swimming (58%); picnicking (48%), and hiking (44%), boating (29%), biking (27%), and fishing (5%).
- Participation in activities among river users in this survey versus parkwide users in the 2009 study differed. River users were more likely to picnic (48% vs. 33%) and bicycle (27% vs. 12%), but less likely to go hiking (44% vs. 54%).

This study also evaluated crowding. Generally, if greater than 80% of respondents report feeling crowded while participating in an activity, the area is considered greatly over capacity. Activities where greater than 80% of visitors reported feeling crowded were all transportation related: driving roads (90%), finding parking (99%), and riding shuttles (83%). If 65% to 80% of respondents report feeling crowded while participating in an activity, the area is considered over capacity. Activities where between 65% and 80% of visitors reported feeling crowded were hiking and biking (68%). Activities where between 35% (low normal) and 65% (high normal) of visitors reported feeling crowded were boating (60%), relaxing (54%), and swimming (45%).

The following sections generally describe the types of visitor facilities and services, overnight lodging accommodations, campgrounds, and recreation activities available throughout the Merced River corridor. This is followed by a description of the specific visitor facilities and services, overnight lodging accommodations, campgrounds, and recreation activities in each river segment.

## **Visitor Facilities and Services Overview**

### ***Commercial Services***

Yosemite offers a variety of commercial visitor services, including lodging, food and beverage, and retail. Among those interviewed for the 2009 visitor use study, 46% reported eating in a park restaurant; 43% shopped in a store other than the Yosemite Valley Visitor Center bookstore; and 34% shopped within the Valley Visitor Center bookstore (Blotkamp et al. 2010). The majority of the park's visitor services are concentrated within Yosemite Valley. Yosemite Village, which is approximately 90 acres, is the core area for most of the development and day use in Yosemite Valley. Visitor facilities and services are also offered at Yosemite Lodge, Curry Village, and The Ahwahnee. Beyond Yosemite Valley, commercial visitor services within the study area are relatively few and exist only in El Portal and Wawona and at the Merced Lake High Sierra Camp.

### ***Trails***

Trails and trail types within the study area range from easy to strenuous and short to long, and can be either paved or unpaved. There are 78 miles of trails within the study area — approximately 30 miles within the designated wilderness and 48 miles in non-wilderness areas.

Although no restrictions have been established for day hiking in the wilderness with the exception of hiking to Half Dome, which requires a separate permit, permits are required for overnight stays in the wilderness. Wilderness permits are issued to a limited number of people for each trailhead in order that visitors may experience solitude associated with the wilderness. Sixty percent of the permits can be reserved ahead of time and 40% are available on a first-come, first-served basis the day before departure. Wilderness permits are issued to groups of hikers. Groups are limited to 15 per group when traveling on established trails and eight per group when traveling off-trail more than 0.25 mile. Groups traveling with stock are limited to 25 head of pack and saddle stock per party (NPS 1999b).

### ***Stock Use***

Pack stock (horses, mules, burros and llamas) use in Yosemite National Park falls into three categories: commercial, administrative, and private. Parkwide, commercial trips account for approximately 50% of stock use parkwide and are booked through the park concessioner or pack stock operations located outside the park. Administrative stock use accounts for approximately 45% of stock use parkwide with park employees using stock to “clear trails, support trail crew camps, maintain composting toilets, perform research, perform resource management activities, conduct backcountry search and rescue activities, and conduct backcountry ranger patrols.” The remaining 5% of stock use is private. (Acree et al. 2010). In 2010, within the Merced River Corridor, 383 stock nights (overnight trips where stock was used) were recorded (83 commercial and 300 administrative).

There are two commercial stables in the study area — the Yosemite Valley stable and the Wawona stable. Guided stock rides are available from both stables and in 2012, rides of either two-hours or a half-day in duration were available. Guided pack and saddle trips are also available for longer visits to the wilderness and take visitors to one or more of the High Sierra Camps. The number and duration of rides varies from year to year as determined by park administration and is dependent upon trail conditions and visitation. Therefore, the actual number of days that the stables are open varies from year to year. In 2011, a total of 14,400 stock day trips (defined as one person/one horse) were taken from these two stables:

- |                          |                  |
|--------------------------|------------------|
| • Yosemite Valley stable | • Wawona stable  |
| – 2 hour = 11,250        | – 2 hour = 1500  |
| – half day = 1,500       | – half day = 100 |
|                          | – full day = 50  |

Title 36 of the Code of Federal Regulations and the Superintendent’s Compendium regulate stock use within Yosemite National Park. The use of horses or pack animals is permitted on all unpaved foot trails in Yosemite Valley and in Wawona on the Wawona Meadow Loop Road, Four-Mile Road, and Eleven-Mile Road. Bicycle paths, tram roads, shuttle bus routes, and the Mirror Lake Road are specifically closed to stock use except for administrative activities. Stock use is also permitted on all park trails except the Mist Trail from Happy Isles to Nevada Falls and the Lower Chilnualna Falls Foot Trail in Wawona.

Wilderness overnight stock parties on designated trails are limited to 25 head of stock and 15 people. Wilderness overnight stock parties using authorized, non-maintained stock routes are limited to

12 head of stock and eight people. The maximum number of stock for parties not spending nights in the wilderness is 25 head of stock on designated trails and 12 head on other authorized stock routes.

Loose herding and grazing is prohibited in front-country areas, and established front-country campsites must be cleaned daily (i.e., manure and uneaten fodder removed). Watering facilities must be used when provided.

### ***Interpretation and Education Services***

A heritage of stewardship is perpetuated through opportunities for education and interpretation of the Merced River and its unique values. These opportunities represent a proactive approach to protecting the river from human impacts. Park interpreters and volunteers serve a primary natural and cultural resource preservation role in the park. Interpreters connect people to the meaning and significance of the park by conveying information and educational programs to visitors and park employees about the history and function of park ecosystems and the relationship between various park resources. Interpretive and educational services include educational/school programs; field seminars; evening programs and ranger-led walks; valley-floor tram tours; audio-visual presentations at park visitor centers; interpretive wayside exhibits; cultural history museums; park open houses (primarily a tool to provide information about park planning projects); and published materials available at entrance stations, visitor centers, and campground and lodging registration desks. Most publications, as well as Web-based and social interpretive media, address values in Segments 1–8, while on-site programs and products are focused within three segments of the river: Yosemite Valley, Merced River Gorge, and Wawona.

**Information and Materials.** The NPS provides visitors with published information regarding Yosemite National Park in many different formats. These include Yosemite National Park's Web site, official park mailings, and e-newsletter updates. Information is also distributed at entrance stations and visitor centers and includes the free *Yosemite Guide* newspaper (published eight times a year), a free park brochure/map, handouts on self-guided nature trails, and supplemental education materials and fact sheets. (Portions of the *Yosemite Guide* are translated into German, French, Spanish, Italian, Chinese, and Japanese.) Information includes travel and directions to the park; important information for planning visits (e.g., seasonal weather conditions and road closures); activities and special events in the park; lodging and campground reservation information; information on park planning projects; and a variety of maps and graphics to provide orientation to the park's roads, features, facilities, services, and trails. It also serves as a primer on Yosemite's natural and cultural history and scenic beauty.

Park staff offer a wide range of media (e.g., the orientation audio-visual program at the Yosemite Valley Visitor Center) and interpretive programs to assist visitors in understanding the park's natural and cultural resources. The park's primary concessioner also provides information on lodging and other visitor services on their Web site, as well as interpretive programs at guest lodges and the High Sierra Camps. In addition, park partners, such as the Yosemite Conservancy and NatureBridge, collaborate with the NPS to provide evening programs and information about park events and natural history.

**Facilities.** Yosemite Village and Wawona each have a visitor center and a wilderness center. In Wawona, these functions are combined at the Wawona Visitor Center at Hill's Studio. The Yosemite Valley Wilderness Center, the Nature Center at Happy Isles, and the Wawona Visitor Center are open

seasonally during the summer. The Yosemite Valley Visitor Center is open year-round to provide visitors with wilderness trip planning information as well as permits during the winter when the Yosemite Valley Wilderness Center is closed. Additional information on park facilities, visitor services, and wilderness trip planning is available at the seasonal information and permit station at Big Oak Flat and from registration staff at campgrounds and lodging facilities. Commercial bus operators also provide orientation and information to visitors transported to and from the park. Visitors can also gain information from self-guided brochures and interpretive wayside exhibits throughout the park.

**Programs.** A wide range of interpretive programs and materials are available to the public (see **table 9-141**). Programs are offered by several entities and cover a wide variety of topics, including geology, astronomy, botany, wildlife, trees, hydrology, cultural history (American Indian, Buffalo Soldiers, settlements, and modes of transportation), Junior Ranger programs, wilderness, fire, rock climbing, and bouldering. Programs range in duration from less than 1 hour to all-day hikes and multi-day seminars and residential field science experiences. Interpretive hikes venturing into the Yosemite Wilderness aim to support wilderness management by increasing visitor understanding of park resources and management concerns.

### **Overnight Lodging Accommodations**

There are 1,160 units of overnight lodging available in the Merced River corridor at six concessioner-operated facilities: Yosemite Lodge, Housekeeping Camp, Curry Village, The Ahwahnee, the Wawona Hotel, and the Merced Lake High Sierra Camp. Facilities range from rustic tent cabins to deluxe hotel rooms and cabins. In addition, private lodging accommodations available within the corridor consist of the Yosemite View Lodge in El Portal and many independently owned, small-scale operations in Wawona.

The 2009 visitor use survey, described previously, found that 58% of visitors who stayed overnight within the park stayed in lodging (Blotkamp et al. 2010). During the summer, occupancy at lodging units in Yosemite Valley is very high.

### ***Camping Areas***

There are nine designated camping areas within the Merced River Corridor, providing 565 campsites in Yosemite Valley and Wawona and three designated camping areas in the Yosemite Wilderness. Some of these areas offer facilities, such as restrooms with flush toilets, running water, trash, and recycling collection. Others are more primitive, offering only compost toilets and food storage lockers. Camping areas within the main stem and South Fork Merced River corridor exist in the wilderness area above Nevada Fall (Segment 1), in Yosemite Valley (Segment 2), and Wawona (Segment 7). There are no designated camping areas in the Merced River gorge or El Portal (Segments 3 and 4) or in the South Fork Merced River corridor, outside of Wawona (Segments 5, 6, and 8). The 2009 visitor use survey, described previously, found that among visitors who stayed overnight within the park, 31% tent camped in a developed camping area, while 11% stayed at a backcountry campsite (Blotkamp et al. 2010). During the summer, campgrounds are usually 100% occupied on weekends and on many weekdays.

SOURCE: Merced Wild and Scenic River Plan: Preliminary Alternative Concepts Summary Comparison Table. March 2012

## Recreational Activities

The Merced River and South Fork Merced River offer diverse, river-related recreational opportunities. The experience of recreating in these areas is inextricably linked to the river's dynamic natural processes, which have helped form and continue to influence the scenery and evocative landscape. In this setting, visitors are able to experience nature on a grand scale, one in which the river is paramount. Within these surroundings, people of all ages and abilities enjoy exemplary experiences that often create personal memories, traditions, and multi-generational bonding among family and friends. A few such activities include hiking, kayaking, swimming, and fishing. The availability of these opportunities varies by location within the Merced River and South Fork Merced River corridors. A summary of recreational activities within the various segments of the corridor is provided in table 9-142.

**TABLE 9-142: RECREATIONAL ACTIVITIES WITHIN THE MERCED RIVER CORRIDOR**

River	Park Area	Recreational Opportunities
<b>Merced River</b>	Wilderness (Segment 1)	Backpacking/hiking, camping, High Sierra Camp experience, stock use, fishing, swimming/wading, nature study, photography, cross-country skiing, snowshoeing
	Yosemite Valley (Segment 2)	Walking/hiking, picnicking, camping, rock climbing and bouldering, cross-country skiing, snowshoeing, ice skating, fishing, photography, swimming/wading, floating, nature study, stock use, sightseeing, rafting, kayaking, interpretive programs, bicycling, art classes
	Merced River Gorge (Segment 3)	Rock climbing and bouldering, fishing, swimming/wading, photography, sightseeing, nature study
	El Portal (Segment 4)	Whitewater rafting/kayaking, fishing, swimming/wading
<b>South Fork Merced River</b>	Wilderness (Segments 5, 6)	Backpacking/hiking, camping, stock use, fishing, swimming/wading, nature study, photography, sightseeing, cross-country skiing, snowshoeing,
	Wawona (Segment 7)	Hiking, picnicking, camping, cross-country skiing, snowshoeing, fishing, photography, swimming/wading, floating, nature study, stock use, sightseeing, rafting, interpretive programs, golfing
	Wilderness Below Wawona (Segment 8)	Hiking, fishing, whitewater kayaking

### Segment 1: Merced River Above Nevada Fall

#### *Visitor Facilities and Services*

**Commercial Services.** Commercial services in Segment 1 are minimal and consist of the Merced Lake High Sierra Camp (see description under Overnight Lodging Accommodations) and commercial guided multi-day pack trips.

**Trails.** There are nearly 800 miles of marked and maintained trails providing access to and throughout the Yosemite Wilderness. Within the Merced River corridor, there are approximately 30 miles of

wilderness trails. The most heavily used wilderness trails are those above Nevada Fall (Segment 1). Primary access to this area is provided by the Mist and John Muir trails, which originate in Yosemite Valley. The Yosemite Falls Trail and the Four Mile Trail originate in the valley and lead to wilderness areas beyond the corridor.

**Interpretation and Education.** Interpretive and educational activities in Segment 1 occur at the Merced Lake High Sierra Camp and include ranger-led day walks and evening programs. There are also multi-day ranger-guided High Sierra Camp loop trips that include a stop at the Merced Lake High Sierra Camp.

### *Overnight Lodging Accommodations*

**Merced Lake High Sierra Camp.** This is the largest and most remote (in terms of distance from trailhead) of the five High Sierra Camps in Yosemite. It is located on the east end of Merced Lake at 7,150 feet above sea level and can accommodate up to 60 overnight guests. Most visitors arrive on foot, but some arrive via stock from other High Sierra Camps. The camp includes 22 tents, each of which can accommodate two to four people. Two of these tents are used to house employees, and one is set aside for wranglers traveling with stock. Showers and flush toilets are available, and a dining hall accommodates 70 people. The camp also serves meals to through-hiking backpackers. Helicopters are used to transport items that are too big to safely transport with stock, responses to medical emergencies, and to facilitate transport and disposal of solids from the camp's septic system. All refuse is packed out by stock. Occupancy rates at the Merced Lake High Sierra Camp during a typical season are high.

### *Camping*

There are three separate designated wilderness camping areas within the Merced River corridor above Nevada Fall: Little Yosemite Valley, Moraine Dome, and Merced Lake Backpacker's camping areas. These designated camping areas are popular wilderness camping destinations within the park and are heavily used during the summer months (NPS 2011e). In addition to these designated areas, campers may also engage in dispersed camping at wilderness locations with some restrictions.

There is no limit on the number of campers at any of the designated camping areas and no specific number of campers that they can accommodate. The number of permits for wilderness camping is controlled by an overnight quota system, but the individual number of campers on a given night is subject to the travel choices of each individual group, which is only partially regulated by the wilderness permit.

**Little Yosemite Valley Backpacker's Camping Area.** This is the western-most camping area within the Merced River corridor above Nevada Fall. This location can accommodate approximately 125 overnight campers. Facilities include one composting toilet, two fire rings, 21 bear-proof boxes for food storage, and informational signage. Use of this area during the summer months (i.e., between Memorial Day and Labor Day weekends) is generally heavy.

**Moraine Dome Camping Area.** Also in Little Yosemite Valley, this smaller, undeveloped backpacker camping area is located just east of the Little Yosemite camping area. This location can accommodate approximately 50 overnight campers and offers no facilities.

**Merced Lake Backpackers Camping Area.** This location is located further upstream, along the eastern shore of Merced Lake, near the Merced Lake High Sierra Camp. This area can accommodate approximately 90 overnight campers. Facilities include potable water, flush toilets, fire rings, and approximately eight bear boxes. As with those discussed previously, these campsites tend to be heavily used during the summer months.

### ***Recreational Activities***

**Fishing.** The headwater areas of both the Merced River and South Fork Merced River have mountain ponds and alpine lakes, as well as snowmelt and ephemeral streams, within their boundaries. Fishing in the wilderness lakes is a popular activity for visitors, particularly at Merced Lake High Sierra Camp, where fishing takes place in Washburn and Merced lakes. Wilderness lakes support nonnative brown and rainbow trout populations.

**Swimming.** In the wilderness, swimming occurs in certain reaches of the Merced River, downstream from various cascades, including Bunnell Cascade. Swimming also takes place near Moraine Dome and in the many lakes in the upper Merced River corridor, particularly in Merced Lake and Washburn Lake.

**Hiking.** Climbing Half Dome is a popular wilderness hike. Ranging from 14 to 16 miles in length depending on the route, this hike involves scaling the backside of the dome with cables and requires a permit. The current permit system allows 400 total hikers per day — 300 day visitors and 100 overnight visitors. Permits are distributed via a lottery both at the beginning of the season and on a daily basis. An environmental assessment is currently being prepared for Half Dome and will refine permit regulations.

**Stock Use.** Visitors participate in commercial overnight stock trips to the wilderness originating from various points both inside and outside of the park. More information on stock use and stock trails can be found in the “Visitor Facilities and Services Overview” section, above.

**Other Activities in the Merced River Corridor.** Visitors participate in other activities along the river that may not be specifically related to or dependent on the river. These include rock climbing and bouldering. The experiences of visitors engaged in these activities may be enhanced by the river, but the river and its values are not the primary focus of these experiences.

## **Segment 2: Yosemite Valley**

### ***Visitor Facilities and Services***

**Commercial Services.** Yosemite Valley offers the broadest range of visitor facilities and services within the river corridor. Commercial services include: food and beverage, retail, lodging, and recreation rentals. Additional non-commercial services include museums, galleries, and educational and interpretive facilities. In Yosemite Valley, visitor facilities and services are located in five distinct locations — Yosemite Village, Yosemite Lodge complex, Curry Village, The Ahwahnee, and Housekeeping Camp. **Table 9-143** below summarizes the visitor facilities and services in each location. Each location also provides overnight accommodations.

**TABLE 9-143: VISITOR FACILITIES AND SERVICES BY LOCATION AND TYPE**

Location	General Use	Specific Facilities and Services
Yosemite Village	Retail Services	Degnan's Delicatessen and gift shop, Village Store complex (gift/grocery, fast food and specialty retail), Ansel Adams Gallery
	Visitor Services	Main Yosemite National Park U.S. Post Office, ATM and check cashing facility, concessioner garage (open to visitors), medical and dental clinic, tour kiosk, recycling center
	Interpretation/Education	Visitor Center, Yosemite Museum and Research Library, Wilderness Center, Yosemite Art Center
Curry Village	Retail Services	Dining pavilion, fast food outlets, a gift/grocery store, specialty retail
	Visitor Services	Ice rink, raft and bicycle rentals, swimming pool, tour kiosk, NPS Campground Reservation Center, recycling services
	Interpretation/Education	Mountaineering school, outdoor amphitheater
Yosemite Lodge	Retail Services	Restaurant, a food court, fast food outlet, bar, a gift/grocery store, and specialty retail store,
	Visitor Services	Post office, bike rental, pool, tour desk
	Interpretation/Education	Outdoor amphitheater, indoor evening program space, two meeting rooms
Housekeeping Camp	Retail Services	Camp Store
	Visitor Services	Laundry, Showers
	Interpretation/Education	
The Ahwahnee	Retail Services	Dining room, bar and lounge, two gift shops
	Visitor Services	Swimming pool
	Interpretation/Education	Concessioner tours

**Trails.** There are over 46 miles of trails in Yosemite Valley, including approximately 7 miles of paved bike paths, 0.75 mile of boardwalks, and almost 10 miles of informal trails. The length of the trails in Yosemite Valley is illustrated in **table 9-144**.

**Interpretive and Educational Services.** Yosemite Valley provides numerous, diverse interpretive and education programs. At least 77 outdoor wayside exhibits reveal meaningful stories related to biology, hydrology, geology, scenery, and recreation. At least 10 different interpretive walks travel into the Merced River corridor, helping visitors gain a deeper understanding of river values. Six different curriculum-based education programs expose students to the same, as well as summer daily offerings of Junior Ranger programs. DNC Interpretation, Sierra Club at Le Conte Memorial Lodge, Yosemite Conservancy, and other partners also share river stories and resource protection messages with visitors to Yosemite Valley. Campfire programs are offered on multiple topics, some river related. Programming aims to meet the goals outlined in the park's *Long Range Interpretive Plan*, and is usually modified annually to match current trends in visitation and park operational capacity. Several venues provide space for interpretive and educational programming.

**TABLE 9-144: YOSEMITE VALLEY TRAIL LENGTHS AND LEVEL OF DIFFICULTY**

Trail Name	Length	Difficulty
Bridalveil Fall	0.5 mile round-trip (RT)	Easy
Lower Yosemite Fall	1.1 miles (RT)	Easy
Cook's Meadow Loop	1 mile (RT)	Easy
Mirror Lake/Meadow	2 miles (RT)	Easy
Valley Floor Loop	13 miles (RT)	Moderate
Four Mile Trail	9.6 miles (RT)	Strenuous
Panorama Trail via Mist Trail	8.5 miles one-way	Strenuous
Upper Yosemite Fall	7.2 miles (RT)	Strenuous
Vernal and Nevada falls	Footbridge: 1.6 miles (RT) Vernal Fall: 2.4 miles (RT) Nevada Fall: 5.4 miles (RT)	Strenuous
Half Dome (permit required)	via Mist Trail: 14 miles (RT) via John Muir Trail: 16.3 miles(RT) via Mist and John Muir Trails: 15.2 miles (RT)	Strenuous

- The Nature Center at Happy Isles currently sits on the historic site of the California State Fish Hatchery built by the Fish and Game Commission in 1927. The building houses wildlife dioramas, tracking tips, interactive exhibits, and four different environments including riverine. The Nature Center has been used as a hub for extensive Jr. Ranger Programs, including one- and two-hour Jr. Ranger walks and Jr. Ranger Campfires located 0.25 mile from the center at the A-frame campfire ring.
- Yosemite Valley Visitor Center was built in 1966 as part of the Service-wide Mission 66 initiative. The interior of the one-story visitor center contains updated exhibits created in 2007. Exiting the rear doors of the visitor center, one enters an open courtyard that leads to the theater where a 20-minute film, *Spirit of Yosemite*, is shown throughout the day.
- Yosemite Museum was completed in 1925, designed by architect Herbert Maier in the newly emerging National Park Service Rustic Style. It opened to the public in May of 1926 as the first building constructed as a museum within the NPS. The first floor of the building houses exhibits that are open to the public. Adjacent to the museum gift store is a small collection room that is used by NPS curatorial staff and is an area where tours are given by request. The Yosemite Museum is staffed by NPS Indian Cultural Demonstrators who demonstrate a variety of traditional skills, including basket making and preparation, acorn preparation, beading, jewelry making, string making, and flint knapping.
- Outside the back doors of the Yosemite Museum and the Valley Visitor Center, to the north, is the Indian Village of Ahwahnee. Here visitors follow a self-guided experience through the reconstructed Indian Village by way of wayside exhibits and a brochure.
- Lower Pines Campground Amphitheater is the only outdoor amphitheater located in an existing Yosemite Valley campground. Evening ranger programs are offered during summer.
- Lower River Campground Amphitheater is an outdoor amphitheater located in Yosemite Valley at the former Lower Rivers Campground. This amphitheater is used infrequently.

- LeConte Memorial Lodge, designated a National Historic Landmark in 1987, was built by the Sierra Club in 1903. LeConte Memorial Lodge is open to the public in summer and contains a library of relevant titles. Evening programs, offered Friday through Sunday, focus on natural science, and specifically the history and science of Yosemite Valley.
- NatureBridge is a primary park partner that provides curriculum-based educational programming for grades 6–12 in Yosemite National Park. Many of their programs take place in the Merced River corridor and highlight the significance of outstandingly remarkable values of the river.
- Overnight Lodging Accommodations. Lodging options available within this segment are summarized below.

**Yosemite Lodge.** Near the base of Yosemite Falls, this lodge encompasses an area of about 40 acres, and offers 245 lodge and family rooms (DNC 2011a), as well as the visitor services and facilities described in the previous section. Pine and Oak Cottages, as well as cabins with and without baths that were damaged by the January 1997 flood, have been removed.

**Housekeeping Camp.** Currently 266 units are available for use by visitors at Housekeeping Camp (DNC 2011a). Each unit (one half of a duplex structure) can accommodate six people, with a total of 12 people per structure. Food preparation is allowed in Housekeeping Camp, thereby increasing its popularity with visitors. As noted in the “Hydrology” section of this chapter, several of the Housekeeping Camp units are located within the 10-year floodplain and subject to inundation (NPS 2011e).

**Curry Village.** The Historic District at Curry Village, about 50 acres, offers a total of 400 units, including cabins with and without private baths, tent cabins, and rooms in Stoneman Lodge (DNC 2011a). Visitor services and facilities are described in the previous section. As noted in the Geology section of this chapter, 72 Curry Village units were destroyed or removed from service following the 2008 rock fall (<http://parkplanning.nps.gov/projectHome.cfm?projectId=29566>).

**The Ahwahnee.** The Ahwahnee, a 12-acre National Historic Landmark, offers 123 rooms and cottages. Of these, 99 are currently deluxe hotel rooms and 24 are cottage rooms.

### *Campgrounds*

There are five public campgrounds within Yosemite Valley: Upper Pines, Lower Pines, North Pines, Camp 4, and Backpackers. Following the 1997 flood and related infrastructure damage, 124 sites were removed at the former Upper River Campground and 138 sites were removed at the former Lower River campground. Campground availability in the Yosemite Valley is extremely limited during peak summer months, with most campgrounds operating at or near capacity during this period. In addition, as noted in the “Hydrology,” “Vegetation,” and “Wetlands” sections of this chapter, heavy use at campgrounds near the Merced River has given rise to an expansion of social trails across meadows, vegetation trampling, and streambank erosion (NPS 2011e).

**Upper Pines Campground.** Located in east Yosemite Valley, Upper Pines Campground has 240 total sites. On average, 4.5 people occupy each site and stay for an average of 2.7 nights (NPS 2011 d, e). The

10 restrooms in the campground (NPS 2011f) are connected to the Yosemite Valley sewer collection system. An RV dump station is located at the entrance to Upper Pines Campground.

**Lower Pines Campground.** Located in the east Valley to the west of Upper Pines Campground, Lower Pines Campground has 76 total sites. On average, 4.66 people occupy each site and stay for an average of 2.71 nights (Bryan 2011b, 2011e). The three restrooms in the campground (NPS 2011f) are connected to the Yosemite Valley sewer collection system. Lower Pines Campground has an amphitheater for ranger-led programs.

**North Pines Campground.** Located in the east Valley, to the north of Lower Pines across the Merced River, North Pines Campground has 86 total sites. On average, 4.2 people occupy per site and stay for an average of 2.71 nights. There are 23 RV-only sites at this campground (Bryan 2011b). The four restrooms in the campground (NPS 2011f) are connected to the Yosemite Valley sewer collection system.

**Camp 4.** Located north of Yosemite Lodge, Camp 4 has 35 sites (Bryan 2011b) which are available on a first-come, first-served basis. There is one restroom facility in the campground, which is connected to the Yosemite Valley sewer collection system. Camp 4 is listed on the National Register of Historic Places because of its nationally significant role in the development of rock climbing as a sport (NPS 2011f).

**Backpackers Campground.** Located to the north of North Pines Campground across Tenaya Creek, Backpackers Campground has 25 sites. Backpackers Campground allows only campers with wilderness permits. They may stay either the day before their departure into the Yosemite Wilderness or the evening of their return from the Wilderness. This campground has five vault toilets that are not connected to the Yosemite Valley sewer collection system, and no potable water (NPS 2011f).

### ***Recreational Activities***

**Fishing.** In the stretches of the Merced River that flow through the Yosemite Valley, brown trout, rainbow trout, brook trout, and smallmouth bass are commonly sought by visiting anglers. Fishing in Yosemite National Park is regulated under state and federal (NPS) fishing regulations prohibiting the use of live bait and barbed hooks. The area between Happy Isles to Foresta Bridge is designated as catch-and-release waters for rainbow trout.

**Swimming.** Swimming and wading in the Merced River corridor is popular during the summer. In a 2012 study of river visitors in Yosemite Valley, 58% reported participating in swimming during their visit (Whittaker, et al. 2012). The NPS does not officially designate swimming areas except those areas closed to swimming and bathing — Emerald Pool and the Silver Apron above Vernal Fall.

The park encourages visitors to avoid fast-moving water and unsafe pools above waterfalls. In the valley, swimming is a popular activity in the Merced River, Tenaya Creek, and at Mirror Lake. Most sections of the river in Yosemite Valley are within easy access from lodging areas, roads, campgrounds, and day use areas. Many of these areas are heavily used, particularly where they are adjacent to developed campgrounds and upstream or downstream of certain bridges, such as Stoneman and

Swinging bridges. Two public pools at Yosemite Lodge and Curry Village are used during the summer months. There is a year-round guest pool at The Ahwahnee.

**Rafting and Kayaking.** Visitors can rent rafts from the primary concessioner at Curry Village if water levels are sufficient. Rafting has been popular in the valley since the 1980s, and all rafting is self-guided. The concessioner is permitted to have 100 rental rafts on the river at any time when the water level and air temperature are within guidelines established by the Superintendent to protect visitor safety. The number of operating days varies on a yearly basis due to these factors. Visitors also use various personal rafts and flotation devices throughout the Merced River corridor. Motorized boating on the Merced River is prohibited.

All operational aspects of the raft rental system are controlled by the NPS pursuant to the terms of the *Concession Contract Operating Plan* and related direction to the concessioner provided by formal correspondence and periodic operational performance evaluations conducted by NPS staff. Per the Concession Contract, the concessioner may not exceed 100 rafts on the river at one time.

Rafting regulations have been implemented to protect river habitat and provide for visitor safety in the valley. In general, park management encourages visitors to launch and remove rafts at sandbars and beach locations. The concessioner must use designated areas for launching and removal of nonmotorized watercraft. Nonmotorized vessels are allowed on the section from Stoneman Bridge to Sentinel Picnic Area during the hours of 10:00 a.m. to 6:00 p.m. There is a raft launch site on the downstream side of Stoneman Bridge, where the river typically has slow-moving water during the summer. Concessioner nonmotorized watercraft is not permitted past the Sentinel Beach Picnic Area. Areas around launch sites can become denuded of vegetation due to heavy use, causing bank erosion and sedimentation (NPS 2011e).

**Picnicking.** Yosemite Valley visitors can choose from six designated picnic areas and facilities, including the Church Bowl Picnic Area near Ahwahnee Meadow, the Lower Yosemite Fall Picnic Area, the Swinging Bridge Picnic Area, the Sentinel Beach Picnic Area, the El Capitan Picnic Area, and the Cathedral Beach Picnic Area. These picnic areas offer picnic tables, vault toilets, and garbage and recycling receptacles. With the exception of the Lower Yosemite Fall and Church Bowl picnic areas, each has a grill. None has potable water. Visitor use is generally heavy at these picnic areas, often exceeding the capacity of the picnic area infrastructure during peak summer months.

**Hiking.** Visitors have access to Yosemite Valley trails that range from a short stroll to the base of Lower Yosemite Fall to an ambitious 14- to 16-mile round-trip day hike to the top of Half Dome. Thirty-five miles of hiking trails are available on the Yosemite Valley floor. Many of these closely parallel the Merced River, providing access to and views of the river along the way. Some of these trails are shared with bicyclists and/or stock users. Several walking loops are available in East Yosemite Valley, and there are two loops in West Yosemite Valley: (1) between Swinging Bridge and El Capitan Bridge, and (2) between El Capitan Bridge and Pohono Bridge. Day hikers can circumnavigate the valley using the Valley Loop Trail, which is shared by stock. A trail network provides multiple routes between the Happy Isles/Mirror Lake area and Yosemite Village. Self-guiding interpretive trails can be found at Mirror Lake and in the Indian Village of Ahwahnee behind the Yosemite Valley Visitor Center. A multi-use paved trail (shared by pedestrians and bicyclists) links Yosemite Lodge to the

Happy Isles area on both sides of the Merced River. Paved trails (multi-use trails and roads closed to private vehicles) in the valley are approved for use by visitors with pets. Heavy and multiple uses often create congestion on paved trails, especially in Yosemite Village. Several trails have wayside exhibits to interpret features encountered along the way. The Mist Trail is one of the most popular short hikes in Yosemite National Park. It follows the Merced River, starting at Happy Isles in Yosemite Valley, past Vernal Fall, Emerald Pool, to Nevada Fall. Along the trail, the Merced River is a tumultuous mountain stream, lying in a U-shaped valley. Enormous boulders are dwarfed by the sheer granite rock faces, which rise to 3,000 feet above the river. Through it all, the Merced River rushes down from its source in the high Sierra, broadening as it crosses the floor of Yosemite Valley.

**Stock Use.** Day rides on mule and horseback and overnight trips to the wilderness all originate in the Yosemite Valley stables in Curry Village. More information on stock use and stock trails can be found in the “Visitor Facilities and Services Overview” section above.

#### *Other Activities in the River Corridor*

**Biking.** Bikers can bring their own bicycles or rent them. There are two bike rental stands in Yosemite Valley, one at Curry Village and the other at Yosemite Lodge. This is a popular activity and rentals include bikes and trailers for children as well as accessible transportation rentals such as wheelchairs, electric mobility scooters, hand crank bicycles (recumbent bicycles), and tandem bicycles. Bicycle rentals vary from day to day and year to year, depending on opening/closing dates, weather, and overall visitation.

**Winter Activities.** Many activities are available to park visitors during the winter months, including cross-country skiing, tubing/sledding, ice skating, and snowshoeing. Most cross-country ski routes follow summer trails or traverse the open meadows. At elevations of 4,000 feet, Yosemite Valley sometimes has snow for long periods; however, snow at lower elevations, such as in El Portal, is rare. Ice skating is available at a concessioner-operated rink at Curry Village and is used in the winter by both visitors and residents. Yosemite Valley serves as a primary lodging center for visitors pursuing winter recreation.

**Other Activities.** Visitors participate in other activities along the river that may not be specifically related to or dependent on the river. Among these are rock climbing and bouldering, and classes offered by the Yosemite Mountaineering School, the Art Activity Center, the Yosemite Conservancy, and the Ansel Adams Gallery.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### *Visitor Facilities and Services*

**Commercial Services.** Commercial services in El Portal include a small grocery store and a gas station. Additional facilities and services include the El Portal post office, a community center, and a community park. Other services are provided on private land.

**Trails.** There are no hiking trails in Segments 3 and 4.

**Interpretation and Education.** The interpretation and education opportunities in the Merced River Canyon are currently limited to wayside exhibits. Currently, four outdoor wayside exhibits explain natural processes related to biology, hydrology, geology, scenery, and recreation.

### *Recreational Activities*

**Fishing.** The Merced River between the park boundary and the Forest Road Bridge, also known as El Portal reach, has been designated as a Wild Trout Fishery by the California Department of Fish and Game because of the favorable growing season and conditions of the river in this stretch (CDFG 2004). The popularity of angling is growing in the El Portal reach due to these favorable fishing conditions. Because anglers typically work the river as they walk upstream, there are only a few well-known fishing areas, including west of the wastewater treatment plant in El Portal, the Sand Pit, near the Highway 140 Bridge, across the road from El Portal Market, and near the confluence with Crane Creek. The California Department of Fish and Game continues to stock trout species in the Merced River just below the Foresta Road Bridge; these fish populations move upstream and have the potential to travel as far as Yosemite Valley (Stevens 2004).

Commercial fly-fishing guide services are permitted along the Merced River within El Portal Administrative Site and the park, between the Foresta Road Bridge on the west and the confluence with Yosemite Creek on the east in Yosemite Valley. Fly-fishing is most popular in late September and early October during the caddis fly hatch (Hubner 2004). Fly-fishing is least popular during the warmest summer months because of the difficulty in finding fish and the harm to the fishery that can occur when the water levels drop and the water warms up.

**Swimming.** During the summer, visitors and residents alike swim in the Merced River Canyon. The river between Pohono Bridge and the intersection of El Portal and Big Oak Flat roads is a popular swimming location, despite a lack of appropriate access in many places. There are also numerous swimming holes along the Merced River Canyon, some easier to access than others.

In El Portal, Patty's Hole is a well-known swimming location just west of the El Portal Market, but is not a formally designated day use area. The January 1997 flood washed away a number of trees that had shielded this stretch of the river from view by motorists passing on Highway 140, thus increasing public awareness and use of the swimming area.

**Rafting and Kayaking.** Whitewater rafting and kayaking occur in the El Portal reach for both commercial outfitters and private boaters. This reach of the river is generally considered Class III rapids. Certain sections can be Class V, depending on the flow rate, which attracts boaters from across the state. No commercial rafting operations are permitted upstream of the Foresta Road Bridge; however, there are no regulations on where private boaters may enter the water or when they can run the river. A launch site for private boaters is located adjacent to the Highway 140 Bridge. The NPS does not regulate private boater recreation due to low use levels. Because the Merced River is used seasonally due to the absence of dams, the highest use of the river is directly correlated with the heaviest runoff periods, typically April through mid-July (Horne 2004).

**Hiking.** There are no noteworthy hiking trails within the Merced River gorge segment. Similarly, few visitors hike in the area of El Portal, though day hiking is more common along the old Foresta Road and just west of El Portal along Incline Road.

**Picnicking.** Picnic facilities are available at Cascade Picnic Area and at the Arch Rock Entrance Station.

### Segments 5, 6, and 7: South Fork Merced River

#### *Visitor Facilities and Services*

**Commercial Services.** Dining and retail facilities, as well as a golf course, a snack stand/golf shop, and service station are available in Wawona.

**Trails.** Trails in Wawona, including length and difficulty, are identified in the **table 9-145** below:

**TABLE 9-145: TRAILS IN THE WAWONA AREA**

Trail	Distance	Difficulty
Wawona Meadow Loop (Round-trip)	3.5 miles	Easy
Swinging Bridge Loop (Round-trip)	4.75 miles	Moderate
Wawona to Mariposa Grove (One-way)	6 miles	Moderate
Mariposa Grove of Giant Sequoias		
• Grizzly Giant Tree and California Tunnel Tree (Round-trip)	1.6 miles	Moderate
• Wawona Point (Round-trip)	6 miles	Moderate
• Outer Loop Trail (Round-trip)	6.9 miles	Moderate
Alder Creek Trail (Round-trip)	12 miles	Strenuous
Chilnualna Falls Trail (Round-trip)	8.2 miles	Strenuous

Wilderness access to the South Fork Merced River (Segment 5) is from Forest Service trailheads to the south via a formal NPS trail on U.S. Forest Service land, at the Bishop Creek confluence.

**Interpretation and Education.** Wawona interpretive programming is provided late spring through early fall. Some programs focus on park history from 1864 to present. The Wawona Covered Bridge is a key element in those programs. Stage rides and interpretation of the bridge (through signage and ranger-led walks) and the Pioneer Yosemite History Center help visitors understand the significance of this covered bridge. There are also several programs in Segment 7 that provide opportunities for visitors to understand more deeply the meanings associated with outstandingly remarkable values, such as geology, hydrology, cultural history, recreation, and biology. Those programs involve ranger walks and evening campfire programs. A curriculum-based Environmental Living Program is offered in Segment 7, reaching hundreds of school children each year. Several venues provide space for a myriad of interpretive and education programming.

- Wawona Visitor Center at Hill's Studio is located on the grounds of the Wawona Hotel in the historic art studio that was constructed in the early 1880s for the famous western painter Thomas Hill. It includes a bookstore, orientation area, exhibit hall, and wilderness permit station.
- Wawona Campground Amphitheater consists of wooden benches with metal supports, and a rock-lined campfire circle. The amphitheater does not have a projector screen and has no electricity, so the interpretive programs are the "classic" old-fashioned Campfire Talks.
- Pioneer Yosemite History Center is a collection of historic cabins and a Covered Bridge. The cabins (each of which represent a different chapter in the historic development of Yosemite National Park) were moved to their current location and were relocated next to the then recently restored Covered Bridge as a Mission 66 project to allow park visitors to explore and understand the growth and development of Yosemite National Park and the National Park idea in America.

### *Overnight Lodging Accommodations*

**Wawona Hotel.** The 104-room Wawona Hotel, a national historic landmark, is within the river corridor. Visitor facilities and services at the Wawona Hotel are discussed in the previous section.

### *Campgrounds*

**Wawona Campground.** This is the only NPS campground along the South Fork of the Merced River. It is located adjacent to the river, northwest of the Wawona Hotel and Golf Course. Wawona Campground has 96 sites including one group site, two stock-use campsites, and two campground host sites (NPS 2011f). There are 46 tent-only and four RV-only campsites. The group campsite only accommodates tents. The remaining campsites would accommodate either tents or RVs. Each campsite contains a fire ring, picnic table, and food locker and is near a restroom with potable water and flushing toilets. The six restrooms in the campground (NPS 2011f) are connected to a septic system that is not part of the Wawona sewer collection system. Heavy use at the Wawona Campgrounds can stress the septic system and leach field, creating potential water quality impacts during peak use periods.

### *Recreational Activities*

**Fishing.** As described for the headwaters of the Merced River, the upper watershed of the South Fork Merced River is host to mountain ponds, alpine lakes, and ephemeral streams. Wilderness lakes support relatively good brown and rainbow trout populations. On the South Fork Merced River, however, most fishing (primarily for brown and rainbow trout) takes place downstream of the water intake and impoundment area in Wawona.

**Swimming.** In the South Fork Merced River, swimming is common in the vicinity of Swinging Bridge, alongside the Wawona Campground, and near the picnic area east of the campground. In recent years, swimming has also become more popular through the town of Wawona. Access to the river downstream of Swinging Bridge is somewhat limited due to private property along the river. Natural pools also exist in the upper reaches of the South Fork Merced River and are used by wilderness visitors. Swimming is

prohibited at the pool of the Wawona Domestic Water Intake and 100 yards upstream. A swimming pool is located on the grounds of the Wawona Hotel and is available for hotel guests.

**Rafting and Kayaking.** Limited rafting occurs on the South Fork Merced River between Swinging Bridge and Wawona Campground. In this reach, the river's gradient is relatively flat. As in the valley, rafting regulations have been implemented to protect river habitat and provide for visitor safety in the valley. In general, park management encourages visitors to launch and remove rafts at sandbars and beach locations.

Rafting and kayaking in Wawona must adhere to the following per the *Superintendent's Compendium*, which states, "the South Fork of the Merced River is closed to all vessels, except it is open to non-motorized vessels and floatation devices downstream of the Wawona Swinging Bridge. Vessels are defined by the Coast Guard definition (36 CFR, section 1.5(a)(1); CFR, section 1.5(f)).

**Picnicking.** Wawona visitors have access to picnic areas near the Wawona Store and at the Wawona Campground. These picnic areas offer picnic tables, vault toilets, and garbage and recycling receptacles. The South Fork Merced River Picnic Area, which is located approximately 0.5 mile upstream of the Wawona Campground, has a vault toilet, tables, grills, garbage and recycling.

There are flush toilets and running water at both the campground and the picnic area near the store in Wawona. Presently the toilets at the picnic area are not adequate for the number of people using them, and there is often a long wait to use the facilities. This is exacerbated by the fact that the shuttle stop for Mariposa Grove, which is located there, provides inadequate parking for visitors.

**Hiking.** There are seven hikes in the Wawona area ranging from the easy Wawona Meadow Loop to the strenuous wilderness trails to Alder Creek and Chilnualna Falls. Moderate hikes include the Swinging Bridge Loop, the Wawona to Mariposa Grove trail, and several trails in the vicinity of Mariposa Grove that are not in the study area. There are also numerous informal trails along the river in this area.

#### ***Other Activities in the River Corridor***

**Golf.** Golf is available in Wawona at the historic Wawona Golf Course (established in 1918). This golf course is an organic golf course (free of pesticides and herbicides) and is also a certified Audubon Cooperative Sanctuary. Only authorized golfing parties are permitted to use the golf course because of the danger associated with being hit by golf balls. The length of time the course is open varies year by year, depending on weather conditions, but the course is generally open when the Wawona Hotel is operating between June and October. On average, 25 to 34 groups of four people golf per day. This golf course accommodates approximately 9,000 people per year (NPS 2004d). Some cross-country skiing also takes place on Wawona Meadow and the golf course. Currently, Yosemite is preparing an amendment to the National Historic Landmark District that proposes adding the golf course and Wawona Meadow to the District. The lower portion of the golf course is within the wild and scenic river corridor. The golf course is also used as the spray field for the town's sewer system.

**Tennis.** A tennis courts is located on the grounds of the Wawona Hotel and is available for hotel guests.

### *Environmental Consequences Methodology*

This analysis evaluates the effects of the various alternatives on the visitor experience in the study area. The analysis considers changes in facilities and services, overnight lodging accommodations, camping, and recreation activities. Commercial services include food service, retail, equipment rentals, and other commercial activities. Non-commercial facilities and services include day use areas, trails, interpretation, information, and education. Visitor facilities also include roads and parking areas, which are discussed in detail in the transportation impact analysis and are referenced in this discussion. Overnight lodging accommodations include hotel, motel and cottage rooms; cabins with bath, rustic canvas tent cabins and Housekeeping Camp units. Campgrounds include facilities where visitors supply their own shelter. Recreation activities include hiking, fishing, biking, rock climbing, swimming, floating, nonmotorized boating, auto-touring, picnicking, and horseback riding.

This analysis addresses whether potential management activities under the various alternatives would result in a change in access to, availability of, type of, or quality of visitor facilities and services, overnight accommodations, campgrounds, or recreation activities. While the quality of recreation activities is affected by natural resource conditions, the current discussion does not reanalyze the natural resource impacts of each action within each alternative. Rather, this section references the natural resource impact analysis presented elsewhere in this chapter. Finally, the availability of recreation activities and overnight accommodations, including the comparison of supply and demand, overlap with aspects of the socioeconomic analysis. This section does not reanalyze the socioeconomic impacts of each alternative but instead refers to the socioeconomic analysis presented elsewhere in this chapter.

This analysis evaluates the study area of the Merced Wild and Scenic River, using the following criteria:

- **Context.** The context of the impact considers whether the impact would be local, segmentwide, parkwide, or regional. For the purposes of this analysis:
  - Local impacts would be those that occur in a specific area within a segment of the river. This analysis would further identify if there are local impacts in multiple segments.
  - Segmentwide impacts would consist of a number of local impacts within a single segment, or larger-scale impacts that would affect the segment as a whole.
  - Parkwide impacts would extend beyond the river corridor and the study area within Yosemite National Park.
  - Regional impacts would be those that extend to the Yosemite gateway region.
- **Intensity.** The intensity of the impact considers whether the impact to visitor services would be negligible, minor, moderate, or major.
  - Negligible impacts would not be detectable and would not have a discernible effect on visitor services. Where impacts are quantifiable, less than 2.5% of visitor services would be affected in a particular segment of the river corridor.
  - Minor impacts would be slightly detectable, but would not be expected to have an overall effect on the availability of visitor services. Where impacts are quantifiable,

approximately 2.5% to 5% of visitor services would be affected in a particular segment of the Merced River corridor.

- Moderate impacts would be clearly detectable to visitors and could have an appreciable effect on the availability of visitor services. Where impacts are quantifiable, approximately 5% to 10% of visitor services would be affected in a particular segment of the corridor.
  - Major impacts would have a substantial, highly noticeable influence, and could permanently alter access to and availability of visitor services. Where impacts are quantifiable, greater than 10% of visitor services would be affected in a particular segment of the corridor.
- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term.
    - A short-term impact would be temporary in duration, such as short-term impacts associated with construction or restoration activities.
    - A long-term impact would have a permanent effect on the visitor's experience, at least within the planning horizon for the *Merced River Plan*.
  - **Type of Impact.** The type of impact considers whether the impact would be beneficial or adverse to the visitor experience and its effect on access to, availability of, type of and quality of the visitor experience. Beneficial impacts would increase the access, availability, type, or quality of the recreation activities, facility or service, or overnight accommodation. Adverse impacts would reduce access to or availability of visitor services.
    - Access would include actions to increase access, such as Architectural Barriers Act Accessibility Standards (ABAAS)/Americans with Disabilities Act (ADA)-compliance, or changes to access to river segments for boating, etc.
    - Availability includes changes to the inventory available, such as campsites, wilderness permits, etc.
    - Type includes changes to the variety of recreation activities allowed, or the types of overnight accommodations, such as the mixture of tent cabins, hard-side cabins, hotel lodging, and Housekeeping Camp lodging.
    - Quality includes changes to natural resource conditions, trail and facility conditions, presence, or absence of crowding, etc. Judging whether changes to a visitor's experience are positive or negative is subject to personal preferences; what some may view as a desirable change could be considered undesirable by others. Therefore, this analysis considers multiple points of view when drawing conclusions about the type of impact.

## ***Environmental Consequences of Alternative 1 (No Action)***

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 1 (No Action), restoration and resource management activities would continue at the current level as part of the park's ongoing management of natural and cultural resources. These activities include selected meadow restoration and riverbank projects, invasive species control, and limited conifer removal from meadows to improve views. Certain alterations to the biophysical environment would

remain including riverbank riprap, abandoned infrastructure in the riverbed, informal meadow trails, conifer encroachment in meadows, and riverbank impacts from scouring and visitor use. For most visitors, the overall quality of the visitor experience would not be affected by current natural resource conditions. For all visitors, the encroachment of conifers into the non-wilderness meadows would reduce the views and vistas that draw many visitors to Yosemite.

### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

Under Alternative 1, visitation to Yosemite Valley is anticipated to increase approximately 3% annually based on current trends. Outside of wilderness areas, where wilderness permits control the number of overnight users, no formal systems or methods for controlling access would be implemented. This annual increase in the number of visitors is likely to exacerbate crowding and congestion on roads and at key visitor sites in the valley.

Increased visitation would likely affect transportation and parking. Visitors would likely experience increased traffic congestion and increased difficulty finding parking, especially during peak visitation months.

Under Alternative 1, all terms and conditions of the visitor services contract between Delaware North Corporation and the NPS would remain as negotiated. Under Alternative 1, this contract would be renegotiated in 2015, presumably with the same terms and conditions as currently exist. Under Alternative 1, the types and amounts of concessioner-operated visitor services currently offered throughout the park would remain as they are currently; however, because the visitor population would continue to expand, there would likely be fewer staff per visitor, which could result in longer lines and more crowding at concessioner-operated visitor facilities and services corridorwide. Visitor facilities and services would not be adjusted to reflect increased visitation.

Under Alternative 1, the number and type of overnight accommodations and campground sites would remain as they are currently. Demand for lodging and camping currently exceeds supply, especially during the peak season. Increasing visitation is likely to exacerbate this problem.

Under Alternative 1, routine trail maintenance would occur consistent with the current programmatic categorical exclusion for trail maintenance in the park. Visitors would experience trail quality consistent with today's conditions and trail conditions would not noticeably diminish. No new trails would be added. Under Alternative 1, there may be continued conflicts between stock and hikers on trails, while some improvements to the visitor experience will continue to be made through existing restoration actions.

Under Alternative 1, educational and interpretive activities related to natural and cultural resources would be guided by current plans and the recommendations of the recent *Comprehensive Interpretive Plan*. This document guides parkwide educational and interpretive activities for the coming five to 10 years. Visitors would continue to have access to a wide variety of interpretive activities, including exhibits, signage, talks, and guided hikes.

## **Segment 1: Merced River Above Nevada Fall**

### ***Impacts of Actions to Protect and Enhance River Values***

In Segment 1 meadows and other sensitive natural areas would continue to be affected by stock grazing and human use. NPS would continue ongoing resource management activities to improve management of stock and restore areas affected by human use.

### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

**Merced Lake High Sierra Camp.** The Merced Lake High Sierra Camp would remain at its present size (60 beds) and operate much as it does today. The Merced Lake High Sierra Camp would remain located on land designated as a Potential Wilderness Addition. The Merced Lake High Sierra Camp is the subject of differing public opinion. Some visitors feel that, despite its location in a Potential Wilderness Addition, the Merced Lake High Sierra Camp is part of Yosemite's history and adds to their visitor experience and should remain in the wilderness. Others feel that the High Sierra Camp is a developed use that is not appropriate in the wilderness and should be removed.

**Camping.** Backpacking and camping in Little Yosemite Valley, Moraine Dome, and the Merced Lake Backpackers camping area would remain unchanged from current conditions. Together, the zone capacities for these areas is approximately 200 campers in designated camping areas. Little Yosemite and Merced Lake Backpackers camping areas would retain the existing facilities including restrooms. (Bear boxes are slated for removal prior to plan adoption). Moraine Dome would continue to have no facilities. Backpackers could also continue to camp away from the Merced River in dispersed sites. Retention of designated campsites would be beneficial to those visitors who appreciate having some facilities (e.g. restrooms) as part of their experience in the wilderness. Some visitors, desiring a more primitive wilderness experience, would experience the designated camping areas and facilities as detracting from their experience. The Wilderness Character section of this chapter evaluates Alternatives 1 through 6 in light of the mandated characteristics of wilderness. This section addresses wilderness from the different perspective of visitor experience.

**Boating.** Actions that would permit (and thus limit) private boating would not be established in wilderness segments.

**Overnight Capacity and Wilderness Permits.** Overnight access to the wilderness would continue to be based upon wilderness zone capacities and regulated by wilderness permits that limit the number of overnight visitors that can enter the wilderness each day at various trailheads. Despite these regulations, some visitors would perceive crowding and an unacceptable number of visitor encounters while others would not. The total capacity of the Little Yosemite Valley Zone would remain at 150. The demand for overnight use permits in the wilderness would continue to exceed supply, leaving some visitors unable to secure a permit and thus unable to have the recreational experience they planned at the time they desired. The estimated number of overnight users in Segment 1 under Alternative 1 is 350 and the estimated number of day users is 380.

**Segment 1 Impact Summary.** Implementation of Alternative 1 would result in segmentwide, long-term, negligible, adverse impacts on visitor experience and recreation within Segment 1.

## Segment 2: Yosemite Valley

### *Impacts of Actions to Protect and Enhance River Values*

Under Alternative 1, visitors would have much the same experience as they do today but with more people due to a projected 3% annual increase in visitation. Baseline peak day use, or people at one time (PAOT) within Yosemite Valley under Alternative 1 would continue to be around 8,272, while maximum overnight capacity would remain at about 6,564. The visitor experience of those attuned to natural and cultural resource needs and conditions would likely be lessened by the impacts of human use on some of the valley's meadows and riverbanks and by the presence of structures, campsites, trails, and parking lots within the floodplain, which affect water quality and riverbank condition. Those visitors who are more interested in sightseeing, and who come for a day visit to a few select sites, would likely be less aware of resource impacts. Those visitors who stay longer and visit mainly for recreation may notice some impacts of human use along riverbanks and other high-use areas. All visitors would notice crowding during peak months at many destinations and along trails.

### *Impacts of Actions to Manage User Capacity, Land Use and Facilities*

**Activities.** Under Alternative 1, a wide range of activities would continue to be provided, but many of those activities would be crowded during peak visitation months. Those visitors engaged in water-based activities, such as swimming, rafting, and paddling in the Merced River, would likely experience crowding during peak months. Visitors engaging in land-based activities, such as hiking, bike-riding, horseback riding, and scenic driving, would be similarly affected by crowding. Nonresource-based recreation, such as ice skating and swimming in pools would continue to be available, with visitors using swimming pools experiencing crowding during warm weather. Day use sites, such as Swinging Bridge, Sentinel Beach, and Cathedral Beach, would continue to exceed their intended visitor use capacity and visitors engaged in these activities would likely experience crowded conditions. Picnic facilities and restrooms at these sites would remain undersized. Key destinations, including Yosemite, Bridalveil, Vernal, and Nevada falls and the routes leading to them, would seem crowded on peak days, lessening visitors' experience of these sites.

**Visitor Services.** In addition to recreational activities, the valley would continue to support a wide range of visitor services, including food and beverage facilities such as snack shops, buffets and food courts, bars, restaurants, and grocery stores; and retail establishments including gift shops, sporting goods stores, and bicycle and raft rental facilities. Visitors staying in overnight accommodations do not have an option to cook and rely on the food and beverage services for their meals. Some visitors consider the existing amount of commercial activities to be more than necessary and not in keeping with the natural resource qualities of the valley

**Camping and Lodging.** Under Alternative 1 in Segment 2, a total of 466 campsites would accommodate up to 2,892 people per night, and a total of 1,034 units of lodging — including hotels, lodges, and tent cabins — would accommodate up to 3,672 people per night. In both cases, demand would continue to exceed supply, especially during peak visitation months. Visitors able to secure reservations for lodging or camping may experience impacts resulting from the general crowded

nature of the Merced River corridor during peak months. Those visitors unable to secure lodging in the park would be required to change their plans or stay outside the park.

**Parking.** Under Alternative 1, approximately 2,337 parking spaces would be available for day visitors in the valley. These numbers would not increase with the increase in visitors. Demand for parking currently exceeds supply during peak season. As the number of visitors increases, visitors would notice related increases in congestion, noise, and pedestrian/vehicular conflicts, as well as a reduction in air quality. All of these would negatively affect the experience of most visitors.

**Transportation.** Regional bus service into Yosemite Valley would be expanded during the peak summer season under Alternative 1, allowing an estimated maximum of 720 people per day to arrive in the valley on regional transit. Within the park, shuttle service would continue to operate at seven to ten-minute intervals. Both the number of buses and the frequency would remain constant and could be inadequate to meet the increased number of visitors.

**Total Visitation.** Under Alternative 1, the number of peak day use (PAOT) would be 1,295, and the maximum number of overnight visitors would be 865. There would be no day-use reservation system or ability to control the number of visitors before their arrival at the entrance station. Visitors would be likely to experience some degree of crowding, congestion and difficulty finding parking spaces during periods of peak visitation. The levels of crowding, congestion and difficulty finding parking would increase if numbers of visitors increase during periods of peak use.

**Segment 2 Impact Summary.** Implementation of Alternative 1 would result in segmentwide, long-term, major, adverse impacts on visitor experience and recreation within Segment 2.

## **Segments 3 and 4: Merced River Gorge and El Portal**

### ***Impacts of Actions to Protect and Enhance River Values***

Segment 3 (Merced River Gorge) and Segment 4 (El Portal) experience minimal visitor use. Most visitors pass through these segments on their way to and from Yosemite Valley. There are no facilities in Segment 3. Primary facilities in Segment 4 are the El Portal Administrative Facility and the residences and limited commercial facilities in the community of El Portal. Due to the presence of both the Administrative Facility and employee housing, there are human-made features and activities in Segment 4 that affect the Merced River's natural condition, including a levee, abandoned infrastructure, riprap, and roadside parking affecting water quality and the community of valley oaks. Under Alternative 1, these features and activities would continue to affect natural resources and water quality, but would not have a significant effect on the visitor experience due to the small number of visitors to Segment 4.

### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

Segments 3 and 4 under Alternative 1 would continue to be lightly used by visitors. Current visitor activities in Segments 3 and 4 include scenic driving along Highway 140, rock climbing, and river-related activities such as swimming, boating, and fishing. Camping is not allowed in Segments 3 and 4, and no facilities would be provided for camping under Alternative 1. Due to the projected 3% annual

increase in visitation, activities and recreation areas in Segments 3 and 4 may become slightly more crowded as visitors, seeking an alternative to visiting the valley, recreate in this area. NPS visitor facilities in Segments 3 and 4 include the Cascades Picnic Area and the Arch Rock Entrance Station.

**Parking.** Under Alternative 1, there are 180 parking spaces in Segment 3 and 214 parking spaces in Segment 4, mostly along the roadsides and at the store and gas station. Despite future increases in visitation, parking is not likely an issue for recreational visitors in Segments 3 and 4, as recreational use is limited in these Segments.

**Total Visitors.** Under Alternative 1, the number of people recreating in these Segments could increase slightly due to the projected growth in visitors, however Segments 3 and 4 would continue to provide scenery, uncrowded conditions, and a variety of water-based recreation opportunities.

**Segments 3 & 4 Impact Summary.** Implementation of Alternative 1 would result in segmentwide, long-term, negligible, beneficial impacts on visitor experience and recreation within Segments 3 & 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Protect and Enhance River Values***

This area includes wilderness (Segments 5 and portions of Segments 6 and 7), a WSRA wild segment (Segment 8); the Wawona Impoundment (Segment 6), and Wawona (Segment 7). Segments 5 and 8 are remote and undisturbed and resource quality is high due to low use levels. Wawona Impoundment is off-limits to visitors because of safety and water quality concerns. Resource impacts would be most noticeable in Wawona.

Low summer flows related to the Wawona Impoundment and surface water withdrawals could reduce river flows downstream. Visitors participating in water-based recreation activities, especially rafting and floating, may find there is less water available, which could alter the experience and also increase crowding as visitors seek those locations where there is the most water.

Reduced flows may also result in lower water quality due to higher sediment levels. Additionally, water quality issues that could affect the quality of visitors engaged in water-based recreation activities could be negatively affected by ground and surface water contamination from septic tanks and leech fields not functioning properly at the Wawona Campground, which could affect both ground and surface water quality if capacity is exceeded.

Some facilities and activities in Segment 7 would remain in the floodplain, including abandoned infrastructure; the Wawona Campground dumpsite; informal trails, some which extend across private land; and a number of campsites. These activities would continue to cause riverbank erosion. Owners of the private property where visitors trespass to access the Wawona Swinging Bridge would continue to be unhappy with the unauthorized use and the related impacts to their private property. Others, including those visitors accessing the river via informal trails, would continue to seek out dispersed areas to recreate with fewer crowds. Those in the riverside campsites would continue to camp in these locations.

### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

Segments 5 and 8 are remote and would continue to be used by hikers. A small amount of backpacking occurs in Segment 5, and some Class 5 rafting occurs in Segment 8. These segments experience a small number of visitors and the visitor experience is satisfying to those who visit.

**Facilities.** In Wawona, visitors would continue to experience crowding at almost all venues during peak summer months. At the Wawona Store Picnic Area, crowding, resulting from a shortage of picnic facilities, seating, and shade, as well as undersized restrooms, would worsen as the number of visitors increases.

**Recreational Activities.** Visitors participating in hiking, fishing, biking, swimming, and nonmotorized boating would experience increasingly crowded conditions as the number of visitors increases. Opportunities for experiencing solitude while engaging in recreational activities would be lessened, especially during months of peak visitation at popular day-use areas along the river.

The Wawona stables would continue to offer day rides into the wilderness. This would continue to cause minor conflicts between stock and hikers and impact the quality of the trail due to stock urine, feces and flies.

**Parking.** Day parking capacity in Wawona would be 290 spaces, which would become increasingly inadequate as the number of visitors expands. This would increase congestion as people circle the area searching for parking.

**Camping and Lodging.** Under Alternative 1, a total of 99 campsites, including one group and two horse sites, would accommodate up to 618 people per night. A number of campsites would remain in the floodplain, providing a unique opportunity for visitors to camp close to the water. In terms of lodging, a total of 104 units at the Wawona Hotel would accommodate up to 247 people per night. In both cases, demand would continue to exceed supply, especially during peak visitation months.

**Total Visitors.** Visitor use in Segment 7 under Alternative 1 would be approximately 13,443 per day.

**Segments 5-8 Impact Summary.** Implementation of Alternative 1 would result in segmentwide, long-term, moderate, adverse impacts on visitor experience and recreation within Segments 5-8.

### **Summary of the Alternative 1 (No Action) Impacts**

Under Alternative 1, park visitation is expected to increase 3% annually (approximately 117,000 people per year based upon 2011 visitation). Visitor services and facilities, such as restaurants, shops, and raft and bicycle rentals, would continue at current levels. The number and types of overnight accommodations, both lodging and campsites, would not change, remaining at post-1997 flood and rockslide numbers. Access to, availability, and diversity of recreational opportunities in the Merced River corridor would be similar to current opportunities and include the use of nonmotorized watercraft (e.g., rafts, inner tubes, kayaks), swimming and wading, hiking, backpacking, camping, rock climbing, fishing, sightseeing, photography, nature study, bicycling, and stock use. Roads and parking would retain their current configurations.

Alternative 1 would not affect access to or types of visitor facilities and services, overnight lodging, campgrounds, or recreation activities. However, potential increased visitation over time could result in a corridor-wide, long-term, moderate to major, adverse impact on the visitor experience owing to uncontrolled crowding and congestion at existing recreation sites and visitor facilities; the continued inability to meet demand for camping and lodging; and congestion on roads and in parking lots. These impacts would likely be most noticeable during months of peak visitation.

### **Cumulative Impacts of Alternative 1 (No Action)**

Cumulative impacts on visitor experience are based on analysis of past, present, and reasonably foreseeable future actions in and around Yosemite National Park, in combination with potential effects of Alternative 1. The projects identified include only those that could affect visitor experience within the Merced River corridor or in the study area. See Appendix B for a full list of cumulative projects. In general, this includes construction, removal, or improvements to visitor services and does not include employee housing projects.

#### ***Past Actions***

Past actions have generally resulted in beneficial impacts on the visitor experience by providing access to recreational opportunities within the Merced River corridor and the study area, and by improving existing recreation opportunities, visitor facilities and services, and overnight accommodations. However, these past park improvements could be seen as non-beneficial to some visitors who prefer less development and a more primitive experience. These past actions include:

- Various trail and road improvement projects
- Lower Yosemite Fall Project
- Yosemite Valley Campground Restroom improvements
- A range of orientation and interpretation services in and immediately surrounding the Merced River corridor, which include visitor centers, wilderness centers, ranger-led tours, and guided wilderness trips
- The Ahwahnee improvement projects
- Curry Village development
- Curry Village Registration Building, Guest Lounge and Amphitheater Rehabilitation
- Yosemite Valley campground improvements
- Capital Improvement Fund ABAAS/ADA Compliance improvements

Past actions also include a decrease in overnight lodging and camping facilities in Yosemite Valley. The closure of the Upper River and Lower River campground facilities following the 1997 flood eliminated 376 campsites from use. As a result, there is a shortage of camping opportunities in the valley and demand regularly exceeds supply. Following the rock fall in 2008, an additional 122 lodging units were removed from use due to being located in the rock fall hazard zone.

### ***Present Actions***

Similar to past actions, present actions would result in beneficial effects. New and improved facilities enhance visitor experience. However, management plans can result in both adverse and beneficial impacts on visitor experience. For example, management plans may reduce or close existing recreational opportunities that some visitors would see as adverse for the lack of access to these resources. However, limiting recreational opportunities due to congestion would improve opportunities for solitude and a primitive and unconfined recreational experience for other visitors. Specific examples of present actions include the following:

- ***Improved Facilities:*** *Ahwahnee Comprehensive Rehabilitation Plan*, Rehabilitate Wawona Road, Tioga Road Rehabilitations
- ***New Visitor Facilities and Services:*** Wahhoga Indian Cultural Center
- ***Management Plans:*** *Half Dome Trail Stewardship Plan*, Recreation Facility Analysis, *Scenic Vista Management Plan*, *Comprehensive Interpretive Plan*

### ***Reasonably Foreseeable Future Actions***

Future actions could result in both beneficial and adverse effects. New and improved facilities that would enhance visitor experience include:

- Curry Village Rehabilitation
- Ahwahnee Dormitory Seismic Upgrades
- The Ahwahnee Improvements

Future actions that could benefit visitor services include:

- Concessioner Prospectus updates
- Curry Village and Ahwahnee facility improvements

Management plans that could result in a lack of access for some visitors and an improved experience for other visitors include:

- *Forthcoming Yosemite Wilderness Stewardship Plan/EIS*
- *Half Dome Trail Stewardship Plan*

### ***Overall Cumulative Impacts of Alternative 1 (No Action)***

Future management of Yosemite National Park, particularly areas within or near the Merced River corridor, could result in both beneficial and adverse impacts on visitor experience, as described above. Alternative 1, when considered with past, present, and future actions, would continue to allow for availability and diversity of recreation activities and visitor services and facilities similar to current conditions. This could result in enhanced visitor experience for some and reduced access for others. Thus long-term, adverse impacts would be moderate.

Alternative 1 would contribute to the adverse cumulative effect of crowded localized conditions along the river corridor.

Alternative 1 would not address the shortage of camping and overnight lodging opportunities in Yosemite Valley. Although this would not have a cumulatively additive effect compared with current conditions, when compared to conditions at the time of designation (1987), this would continue to be a reduction in camping opportunities in the study area. This would have a long-term, adverse impact on the availability and diversity of visitor services.

With the NPS anticipated 3% increase in annual visitation, crowding and congestion could increase in the gateway communities as visitors seek overnight lodging, meals, supplies, and fuel outside of the park. This could be considered a regional, short-term, moderate, adverse impact. However, in the long-term, this may be a beneficial impact because more services and facilities could be provided to visitors in areas outside of the park, thus decreasing congestion and crowding within the park. The inability to meet camping and lodging demand could constitute a regional, long-term, moderate, adverse impact because some visitors would be displaced as a result of an insufficient number of campsites and lodging units in the park.

### ***Environmental Consequences of Actions Common to Alternatives 2–6***

#### **Corridorwide Actions**

##### ***Impacts of Actions to Protect and Enhance River Values***

**Biological Resource Actions.** Corridorwide programmatic biological resource actions common to Alternatives 2-6 include removal and restoration of informal meadow trails; removal of conifer seedlings from meadows; restoration of eroded riverbanks; establishment of a 150' riparian protection zone where new development would be prohibited and removal/relocation of all campsites within 100 feet of the ordinary high water mark.

These actions would improve natural resources and the visitor experience. Eliminating informal trails would improve the overall quality of the trail system which is beneficial to the visitor experience. For a small number of visitors the closure and revegetation of meadow trails would be considered a limitation on access and availability. Associated educational and interpretive actions would improve visitor understanding of natural processes.

Actions to remove vegetation encroaching in meadows would improve views and vistas to and from key locations within the Merced River corridor and improve the visitor experience for most visitors. Being able to experience the views and vistas of important natural landmarks is a significant component of passive recreational activities, such as sightseeing, contemplation, and painting, as well as active pursuits such as hiking. If prescribed fire is used to eliminate encroaching vegetation, visitors present at the time of the burn would experience smoke and poor air quality. This would be a short-term, minor adverse impact on the visitor experience.

Removal and relocation of campsites would eliminate access to and availability of camping in close proximity to the water. This would diminish the visitor experience for those accustomed to these campsites.

There are no project level biological resource actions proposed for Alternatives 2-6.

**Hydrologic/Geologic Resource Actions.** Corridorwide programmatic hydrologic/geologic resource actions common to Alternatives 2-6 include removal of underground infrastructure that alters hydrology; removal of riprap and replacement with native vegetation; and management of large wood. These actions would improve natural resource conditions and hydrologic function throughout the corridor thereby enhancing the quality of the visitor experience.

Corridorwide hydrologic/geologic resource projects common to Alternatives 2-6 include removal of underground infrastructure that alters hydrology; removal of riprap and replacement with native vegetation; and management of large wood. These actions would improve natural resource conditions and hydrologic function throughout the corridor thereby enhancing the quality of the visitor experience.

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

**Biological Resource Actions.** Programmatic biological resource actions common to all alternatives in Segment 1 include:

- Relocating trails out of sensitive habitats
- Removal of informal trails and revegetation with native plants in Merced Lake Shore Meadow
- Rerouting trails from wetlands in Echo Valley and mineral spring outflow between Merced and Washburn Lakes
- Rerouting trails from Triple Peak Fork Meadow

These natural resource improvements would enhance the natural character of the wilderness in Segment 1 and improve the quality of the visitor experience. Boardwalk construction would detract from the undeveloped character of Segment 1. Relocating trails would be a preferable solution in the wilderness.

#### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

**Boating.** Under Alternatives 2-6, boating would be allowed in Segment 1. Allowing boating in Segment 1 by permit would provide a changed recreation opportunity. For those visitors who prefer a pristine wilderness experience with little human-caused disturbance, boating (even under permit) in Segment 1 would detract from the quality of their visitor experience.

**Segment 1 Impact Summary:** Actions to protect and enhance river values within Segment 1 would have a local, long-term, negligible to minor, beneficial impact on visitor experience and recreation. Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, negligible to minor, beneficial impacts on visitor experience and recreation within Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternatives 2-6 include: removing one and formalizing five other vehicle pullouts for river access along El Portal Road, restoring 4.5 acres of riparian habitat in the area of Yosemite Lodge, 20 acres in the area of the western portion of the Former Upper Pines Loop Campground, and removal of infrastructure and restoration of an additional 30 acres at the Former Upper and Lower Pines campgrounds; restoring impacted areas of Ahwahnee Meadow, which includes removal of tennis courts; improving access and removing infrastructure from riparian areas at Cathedral Beach, Housekeeping Camp, and Bridal Veil; constructing a boardwalk extension to reduce Sentinel Meadow trampling; fencing and vegetation management at Stoneman Meadow, restoring floodplain habitat at Devil's Elbow, and filling ditches not serving current operational needs. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks.

These projects would have significant short-term impacts on the visitor experience by limiting visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. The larger the project in size and the longer its duration, the greater the impact on the visitor. In certain circumstances, restoration activities, although beneficial to the resource, may alter the visitor's experience by limiting direct interaction with natural resources (e.g. touching versus seeing). Generally, increased visitor use results in greater restrictions in order to protect the resource and therefore would have a short-term, minor, adverse impact on visitor experience. Visitor experience benefits include improved river access, and opportunities for education and interpretation of restoration action. In the long-term, the results of these actions would improve natural resources and hydrologic function and would have moderate beneficial impact on visitor experience.

**Hydrologic/Geologic Resource Actions.** Programmatic hydrologic/geologic actions Common to Alternatives 2-6 in Segment 2 include installation of constructed log jams and bioengineered stabilization on riprap at Superintendent's Bridge; placement of large wood to lessen scouring from Clark's Bridge and the road bridge at Happy Isles; relocating the Upper Pines Dump Station to protect water quality; removal of 3800' of pack stock trail adjacent to the river; redesign of the Swinging Bridge Picnic Area; placement of large wood at Sentinel Bridge to improve free-flow; and development of a large wood management policy. These projects would all involve short-term construction impacts, and closure of the areas where work is occurring. In the long-term, these actions would have a moderate, local beneficial impact on the natural environment and hydrologic function of the river and the quality of the visitor experience. The redesign of the Swinging Bridge Picnic Area would also improve access to and the quality of this visitor facility.

Hydrologic/geologic projects also include the removal and revegetation of 3,400 feet of riprap. The 3,400 feet of restoration will take place at several locations along Leidig Meadow; along Sentinel Boardwalk; near Sentinel Crossover; on the west side near Housekeeping Camp Bridge, on both sides of the river at Stoneman's Bridge; two small areas south and east of the Ahwahnee Bridge; a small area east of Lower Pines Campground; and an area northeast of the Upper Pines Campground. In addition, the removal of 2300' of riprap and riverbank stabilization is also common to all. Stabilization activities are planned at Swinging Bridge and Superintendents Bridge; and along the northern riverbank from Ahwahnee Bridge to Sugar Pine Bridge. In the short-term, these projects would have a local, moderate, adverse impact on the visitor experience due to construction impacts, restricted access to the areas of the river where riprap is being removed, noise and dust caused by equipment use and trucks, and increased congestion caused by trucks used to haul riprap from the project area. In the long term, this project would greatly improve the natural character and hydrologic function of the river and therefore improve the quality of the visitor experience by reducing the flood hazard, and restoring meadows and the riparian environment which is visually pleasing.

Removal of the abandoned gauging station at Pohono Bridge; and removal of former Happy Isles footbridge footings and gauge station are two additional projects that are Common to Alternatives 2-6 in Segment 2. These two projects would have a short term adverse effect on the visitor experience due to construction impacts and possible closure of Pohono Bridge. The latter action would eliminate circulation involving this bridge until construction is completed. In the long term, this project would greatly improve the natural character and hydrologic function of the river and therefore improve the quality of the visitor experience by reducing the flood hazard, and restoring meadows and the riparian environment which is visually pleasing.

Placement of eight constructed log jams in the channel between Clark's and Sentinel Bridges would have a short term adverse impact on the visitor experience due to construction impacts including closure of this stretch of the river for up to 12 weeks and noise, compaction, and dust from heavy equipment and trucks used to transport logs and place and secure the log jams. In the long term, this project would improve hydrologic function of this stretch of the river which would lessen scouring and river widening, improving natural conditions and the visitor experience in part by removing obstacles to boating,

A final project Common to Alternatives 2-6 in Segment 2 is the restoration of 8.7 acres of riparian ecosystem at Yosemite Lodge where units were lost during the 1997 flood. This action would have a short-term adverse effect on visitor experience due to construction impacts and closure of this area. Opportunities for education and interpretation of this restoration project during construction would enhance this aspect of the visitor experience. Once complete, this project would improve the natural character and hydrologic function of this area, improving the quality of the visitor experience by reducing the flood hazard, and restoring meadows and the riparian environment which is visually pleasing.

**Cultural Resource Actions.** Programmatic cultural resource actions common to alternatives 2-6 in Segment 2 involve rerouting roads and trails; closure and restoration of informal trails; removal of infrastructure; removal of graffiti; and restoration of traditionally used plant populations. Most of these actions would include some form of education and interpretation that would increase access to

and availability of information and enhance visitor understanding of cultural resources. Rerouting or closing and restoring informal roads and trails and removal of infrastructure and graffiti would also improve natural resources and therefore, the visitor experience. In those areas where cultural resources are also used for climbing, eliminating access to these sites would have a short term local adverse impact on those who use these areas.

There is one cultural resource project in Segment 2 that is common to Alternatives 2-6. This project would fence off access to a large bedrock mortar near Yosemite Lodge, eliminating the non-technical climbing on this feature. Eliminating this recreational activity would be a local, short-term negligible adverse impact. Protection and interpretation of this resource would improve the educational and interpretive component of the visitor experience. Overall this project would have a local, minor, long-term beneficial impact on the visitor experience.

**Scenic Resource Actions.** There are no programmatic scenic resource actions proposed for Segment 2 that are common to Alternatives 2-6.

There are several projects that propose the thinning and removal by mechanical methods of trees greater than 6" dbh in order to improve near and distant views of meadows, waterfalls, and key features such as Half Dome and El Capitan. In the short-term these projects would have local, minor, adverse impacts on the visitor experience as the areas where the tree removal is occurring would likely be inaccessible to visitors; and tree removal projects may create noise and dust. Once complete, these projects would improve access to views and vistas from trails, bridges, picnic areas, roads and buildings in Segment 2. Because viewing the scenery is an important aspect of the visitor experience, these projects would have a local, moderate, long-term beneficial impact on the visitor experience. Many of these projects also involve restoration of the project areas once tree removal is complete. This includes closure and revegetation of informal trails created by visitors in order to access a view; and restoration of meadows and project areas once trees have been removed. These actions would improve the natural resources in those project areas where restoration is proposed which would be a local, moderate, long-term beneficial impact on visitor experience.

### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

**Recreation Facilities.** Recreation activities removed under Alternatives 2-6 would include The Ahwahnee and Yosemite Lodge pools, the Ahwahnee tennis court (currently unused), bike rental facilities at Curry Village and Yosemite Lodge, and the Curry Ice Rink.

The removal of the Yosemite Lodge swimming pool would likely affect a large number of visitors. Currently, both the Yosemite Lodge Pool and the Curry Village Pool are open to the public, while the use of the Ahwahnee pool is limited to hotel guests. The pools are well used in the summer months and provide opportunities for swimming under the supervision of qualified lifeguards during periods when river conditions are not suitable for swimming. Removal of the Yosemite Lodge Pool would leave only the Curry Village Pool to meet the public demand for pool swimming. The Yosemite Lodge pool is larger, with greater capacity than the Curry Village pool, thus its removal is likely to result in crowding at the Curry Village Pool.

All bicycle rental facilities would be removed under Alternatives 2-6, although visitors could still bring their own bikes for riding. The bicycle rental facilities, which are located in Curry Village and Yosemite Lodge also rent bicycles with attached trailers for children, strollers, wheelchairs, electric mobility scooters, hand crank bicycles (recumbent bicycles), and tandem bicycles for use by riders with limited vision. While the actual number of visitors who utilize these services is small in comparison to total valley visitation, the impact of eliminating the service is likely to be significant to those who need accommodation. Eliminating this service would eliminate this activity for all visitors who did not bring their own bicycle or other form of mobility equipment to address special needs. Removing bicycle rentals would reduce the number of visitors able to experience riding throughout the valley; and could increase vehicular congestion and/or shuttle bus crowding as visitors may choose to drive or take a shuttle bus to the various destinations within the valley that were easy to access by bicycle but too spread out for walking.

The Curry Ice Rink is well-used during periods of peak winter visitation. Although the ice rink does not specifically connect visitors to the Merced River, it does provide an outdoor recreation experience surrounded by the natural features of Yosemite Valley. The ice rink also provides an opportunity to engage youth in park experiences.

All commercial stock day rides would be eliminated in Segment 2 under Alternatives 2-6. For those visitors who are unable to walk a great distance, stock rides provide an opportunity to access Mirror Lake and view Vernal Falls without being on foot. It also provides an activity for those visitors who spend several days in the valley and desire different types of experiences. However, elimination of day stock rides would improve trail conditions by eliminating the dust, feces, flies and urine related to stock use on these trails. This would be a benefit to hikers whose visit is negatively affected by such conflicts.

Also common to Alternatives 2–6 would be substantial improvements to Cathedral, Sentinel, and Swinging Bridge picnic areas. These areas are currently affected by overuse. Improvements would increase the overall quality of these areas by improving restrooms and parking, reducing crowding, and directing visitors to specific use areas.

A wide variety of nature-based recreational activities, such as hiking, visiting key destinations, contemplation, and river swimming, would remain under Alternatives 2–6.

**Commercial.** Commercial and visitor services that would be removed from or repurposed to a noncommercial use under Alternatives 2–6 include the Happy Isles and Yosemite Lodge snack stands, the Concessioner Garage building, the Yosemite Lodge Nature Shop, Village Sport Shop (which would become a visitor contact center), the Yosemite Art Center, and the Concessioner General Office. Removal of these facilities would require visitors to find some commercial items elsewhere. In the case of food, many options would remain; however, for visitors needing sporting equipment, the removal/repurposing of the Village Sport Shop would be inconvenient and could alter travel plans if an essential piece of equipment was forgotten. Emergency auto services would still be available as the Concessioner Garage service would be relocated to the Government Utility Building. Removal of the Yosemite Art Center would affect the visitor experience of those familiar with the facility and its

offerings. Over time, visitors would become accustomed to the absence of these facilities and would no longer expect them as a part of their experience in Yosemite.

**Interpretation.** Interpretive and educational activities common to Alternatives 2–6 in Segment 2 would include the addition of an interpretive (nature) walk through the former Lower River Campground. This and other interpretive and educational activities benefit visitors and improve their experience because they are better able to understand river-related natural processes, the park’s ecological restoration work, and how they can protect the river.

**Transportation.** Transportation improvements that would simplify visitor access under Alternatives 2–6 include the addition of shuttle stops at Camp 4 and at El Capitan Meadow. These would provide much needed visitor access to these frequently visited destinations.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in short-term, minor, adverse impacts on visitor experience. Over the long-term, these actions would have moderate beneficial impacts on visitor experience and recreation within Segment 2. Actions to manage user capacities, land use, and facilities would also have local, short-term, minor, adverse impacts. Over the long-term, these actions would have minor beneficial impacts on visitor experience and recreation within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### *Impacts of Actions to Protect and Enhance River Values*

**Biological Resource Actions.** Specific projects to protect and enhance the river’s biological values that would occur within Segment 4 under Alternatives 2-6 include removing asphalt and imported fill from the Abbeville and Trailer Village areas. The project would require the use of a skid steer and dump truck, and take several weeks to complete. The closure of this site, construction disturbance, and resulting noise and dust would have a local, short term, minor, adverse impact on visitor services.

**Hydrologic/Geologic Resource Actions.** Programmatic hydrologic/geologic actions Common to Alternatives 2-6 in Segment 4 include removal of abandoned infrastructure at Cascades Picnic Area and development of mitigation measures for revetment construction and repair. The former action would improve the Cascades Picnic Area which would improve access to this facility and the quality of the visitor experience. This would also improve the natural character and hydrologic function of this area, another benefit to the visitor experience.

**Cultural Resource Actions.** There are three programmatic cultural resource actions in Segment 4 that are Common to Alternatives 2-6. These actions involve removal of abandoned infrastructure, informal trails and roads to protect cultural resource sites. Protection and interpretation of cultural resources would benefit the educational and interpretive component of the visitor experience.

**Scenic Resource Actions.** The Scenic Vista Management Plan in the Merced River Corridor sets forth one project in Segment 3 to remove conifers at the Cascade Falls viewpoint to maintain views of the falls. This project involves the removal by mechanical methods of a maximum of 14 trees greater than 6 inch diameter breast height. In the short-term this project would have local, minor, adverse impact on

the visitor experience at Cascade Falls during tree removal as this area would likely be inaccessible to visitors; and tree removal may create noise and dust. Once complete, this project would improve access to views of Cascade Falls from this viewpoint. Because viewing scenery is an important aspect of the visitor experience, this project would have a local, moderate, long-term beneficial impact on the visitor experience.

### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

**Visitor Facility.** Under Alternatives 2–6, a public restroom would be constructed in El Portal to accommodate visitors traveling to and through the El Portal Administrative Site. Because one does not exist at present, this would improve the experience of recreational visitors.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in long-term, minor, beneficial impacts on visitor experience and recreation within Segment 3. Actions to manage user capacities, land use, and facilities would also have local, long-term, minor, beneficial impacts.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Protect and Enhance River Values***

Actions common to Alternatives 2–6 that are designed to protect and enhance resource values in Segments 5, 6, 7 and 8 include water conservation measures to provide more water for river-dependent species. This would also improve the quality of water-based recreation activities owing to increased flows in the river. Other actions that are designed to improve flow and enhance river function include removal of abandoned infrastructure, removal of a dumpsite adjacent to the South Fork Merced River, and relocation of the Wawona Maintenance Yard away from the river. In each of these cases, the native ecosystem would be restored. As opposed to seeing facilities and infrastructure along the river, visitors would experience a much more natural corridor, which would improve the quality of their experience.

A new operations facility would be constructed, which would improve operational efficiency but would have no direct effect on visitor experience.

River access would be formalized near the Wawona Store, which would greatly improve the condition of the slope in this area. Visitors would be directed to a path that would provide river access while protecting and restoring denuded riverbanks. This would enhance visitor safety by providing a formal route to the river and improving natural resources. Similar improvements would occur at the Wawona Picnic Area along the South Fork Merced River, thus benefitting both natural resources and visitors.

**Hydrologic/Geologic Resource Actions.** Programmatic hydrologic/geologic actions Common to Alternatives 2-6 in Segment 7 include restoration of the Greenemeyer Sandpit and formalizing roadside parking to reduce water quality contamination. The former action would improve natural resource quality and hydrologic function of the river in this Segment and would therefore benefit the visitor experience. Formalizing roadside parking would provide access to removal of abandoned infrastructure at Cascades Picnic Area and development of mitigation measures for revetment

construction and repair. The former action would improve the Cascades Picnic Area which would improve access to this facility and the quality of the visitor experience. This would also improve the natural character and hydrologic function of this area, another benefit to the visitor experience.

**Cultural Resource Actions.** There is one programmatic cultural resource action in Segment 5 and four in Segment 7 that are Common to Alternatives 2-6. These actions involve removal of informal trails and parking, relocation of campsites to protect cultural resource sites from unintentional damage, and preparation of a site management plan for the Wawona hotel to reduce construction and visitor use impacts on cultural resources. Protection and interpretation of cultural resources would benefit the educational and interpretive component of the visitor experience.

### *Impacts of Actions to Manage User Capacity, Land Use and Facilities*

**Visitor Facilities.** Under Alternatives 2–6, the visitor facilities and restrooms at the Wawona Store would be renovated. This action would add additional picnic facilities, seating, and shade and also expand the restroom facilities, which currently are undersized for the number of people served. Visitors waiting in this area for a shuttle would experience a more comfortable, less crowded environment.

The restrooms at Wawona Campground would also be renovated under Alternatives 2–6. The addition of a new, expanded facility would benefit campground visitors and replace an aging system.

Also common to Alternatives 2–6 in Segment 7 is the construction of a new trail across public land on the south side of the South Fork Merced River to access the Wawona Swinging Bridge. Restrooms, waste disposal, and parking would also be added. A formal trail would make it easier for visitors to access various parts of the river without travelling on informal trails across private land. New facilities would enhance the quality of the visitor experience, making it easier to park and spend the day on the river.

Under Alternatives 2–6, wilderness limited boating would be allowed in the South Fork Merced River wilderness (Segments 5 and 8). Boating in Segments 5 and 8 would provide a recreation opportunity and enhance the visitor experience for those visitors who participate in this activity. For those visitors who prefer a pristine wilderness experience with little human-made disturbance, the addition of boating in Segments 5 and 8 would detract from the quality of their visitor experience.

**Segments 5-8 Impact Summary:** Actions to protect and enhance river values would result in long-term, minor, beneficial impacts on visitor experience and recreation within Segments 5-8. Actions to manage user capacities, land use, and facilities would also have local, long-term, minor, beneficial impacts.

### **Summary of Impacts Common to Alternatives 2–6**

Actions common to Alternatives 2–6 serve as a basis for the improvement of biological, scenic, hydrological/geologic and cultural improvement in all alternatives. Actions to manage visitor use and experience would result in the restoration of 166 acres of meadow and riparian habitat areas. Actions to manage facilities and use eliminate many non-resource-based activities and facilities, such as ice

skating, snack stands, and retail facilities; improve restrooms; allow wilderness boating; and construct new trails and access points. With implementation of mitigation measure MM-VEX-1, as appropriate (see Appendix C), actions common to Alternatives 2–6 would have a corridorwide, long-term, moderate, beneficial impact on access to and availability of recreation and visitor services and would improve the overall quality of the visitor experience by reducing development, improving natural resource quality and increasing the natural resource focus of the visitor experience.

### ***Environmental Consequences of Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration***

#### **All River Segments**

##### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Manage User Capacity and Facilities***

Under Alternative 2 in Segment 1, the most notable changes to the visitor experience would be the removal of the Merced Lake High Sierra Camp; all designated camping converted to dispersed camping; and reduced wilderness zone capacities. Reduced capacities and dispersed camping allow for the opportunity for visitors to camp out of sight and sound from other campers.

**Merced Lake High Sierra Camp.** The removal of Merced Lake High Sierra Camp would eliminate overnight lodging in Segment 1. The camp and all related infrastructure would be removed and the camp would be designated as wilderness. This would create an experience where visitors are self-reliant and the landscape is natural and undeveloped. For visitors who desire this type of experience, the removal of the camp would be beneficial; however, there are many visitors for whom the Merced Lake High Sierra Camp defines the quality of their recreational experience. Some have been visiting this and other High Sierra Camps for generations. Others support the potential Historic District designation of the High Sierra Camp, believing it is a cultural resource from the early days of the park. For these visitors, the closure of the Merced Lake High Sierra Camp would have an adverse effect on their experience both in the wilderness and generally in Yosemite.

**Camping.** Overnight camping at designated campsites would be eliminated under Alternative 2 in favor of dispersed camping. Dispersed camping and minimal facilities are in keeping with the undeveloped quality of the wilderness. Visitors seeking a true wilderness experience would benefit from these changes. Visitors who desire less crowding but still appreciate a designated area to camp with provision of minor facilities may have a somewhat less positive visitor experience owing to the increase in dispersed camping and removal of facilities.

**Wilderness Capacity.** Under Alternative 2, the capacity of the Little Yosemite Valley Wilderness Zone would be reduced by 83%, from 150 to 25. Because zone capacity and wilderness permit numbers are related, the number of wilderness permits would also be reduced which would result in even greater difficulty gaining access to the wilderness. However, the reduction in overnight visitors would improve the solitary nature of wilderness camping.

**Visitor Use.** Wilderness Zone capacities in Segment 1 would be reduced from 380 people under Alternative 1 (No Action) to 195 under Alternative 2, a reduction of 47%. The number of day visitors would remain at 350. This decrease in overnight visitors would reduce the number of wilderness encounters and increase the experience of solitude in the wilderness. Some visitors would benefit from the reduction in activity and visitation; others would be less concerned with these issues because they perceive the wilderness as already uncrowded.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, moderate, adverse impacts on visitor experience and recreation within Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve removing buildings from the Yosemite Lodge area, restoring of areas from which Yosemite Lodge development was previously removed due to flood damage, and rerouting and revegetating a portion of the Valley Loop Trail. These actions would likely limit visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities, and the end result of restored natural areas, would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the impacts would be long term and beneficial.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 2 include: rerouting trails at Ahwahnee Meadows; removing and restoring a portion of Northside Drive (900 feet) and rerouting the bike path; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing campsites and infrastructure from the 100-year floodplain and restoring 25.1 acres of floodplain and riparian habitat; and removing informal trails and informal parking at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks.

These projects would have significant short-term impacts on the visitor experience by limiting visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. The larger the project in size and the longer its duration, the greater the impact on the visitor. In certain circumstances, restoration activities, although beneficial to the resource, may alter the visitor's experience by limiting direct interaction with natural resources (e.g. touching versus seeing). Generally, increased visitor use results in greater restrictions in order to protect the resource and therefore would have a short-term, minor, adverse impact on visitor experience. Visitor experience benefits include opportunity for education and interpretation of restoration action. In the long-term, the results of these actions would improve natural resources and hydrologic function and would have moderate beneficial impact on visitor experience.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 2 include: relocating unimproved Camp 6 parking and rerouting a portion of Northside Drive; removing the Stoneman, Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. These actions would likely limit visitor access while these areas are being restored. Construction impacts including truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the projects would be long term and beneficial.

The scale of restoration proposed under Alternative 2, in combination with activities common to Alternatives 2–6, would change the physical appearance of Yosemite Valley. There would be fewer roads, trails, buildings, and bridges, and noticeably more relatively undisturbed natural areas. Because the number of visitors would also be controlled under Alternative 2 (see discussion below), the reduction in roads, trails, and riverbank access under Alternative 2 would not result in crowding on the remaining roads and trails.

The interpretive and educational opportunities associated with this scale of restoration would explain these landscape-level changes to visitors. Education would benefit all visitors but would especially help explain why the appearance of the valley has changed.

#### *Impacts of Actions to Manage User Capacity and Facilities*

**Visitor Use Levels.** Under Alternative 2, visitors would experience much less crowding in Segment 2 because peak day use levels would decrease by 18%, from 8,272 to 6,289 PAOT; while maximum overnight capacity would decrease by 28%, from 6,564 to 4,758 people per night. Access to the East Valley by private vehicle would be managed through a day use parking permit system that would require the purchase of a permit before entry. Alternative 2 would significantly reduce the maximum daily visitation to Yosemite Valley from current levels; however, demand is likely to significantly exceed supply during peak season, resulting in many dissatisfied individuals unable to access parking in the East Valley. Implementing the permit system would benefit those visitors who are able to secure a permit because the valley would be much less crowded during peak season and provide an improved visitor experience.

**Camping and Lodging.** In keeping with the resource-based experience focus of Alternative 2, total camping would be decreased in Segment 2, from the 466 existing campsites to a total of 450 campsites. More notably, lodging would decrease by 46%, from 1,034 rooms to 556 rooms, due to the removal of Yosemite Lodge and Housekeeping Camp. The total overnight capacity would decrease by 38%, from 6,564 to 4,758. The reduction in total overnight accommodations would exacerbate the demand for overnight facilities, which would continue to exceed the supply.

**Parking.** Day parking would decrease by 23% from 2,337 spaces currently to 1,800 spaces and peak day use within these areas would decrease from 8,272 to 5,858. The greater reduction in day visitors,

coupled with other transportation-related improvements and alternatives, would make finding parking much easier and reduce congestion and crowding significantly during peak months.

**Recreation Facilities.** Additional developed facilities removed under Alternative 2, in addition to those common to Alternatives 2–6, would include the Curry Village stables and the visitor-serving retail facilities contained in Yosemite Lodge — the gift shop, and Mountain Room Bar. The removal of the stables would eliminate this type of recreation from the valley. The actions common to Alternatives 2–6 would eliminate many other types of active recreation, including bicycle rentals, tennis, most swimming pools, ice skating, and so forth. Removal of these additional activities would create an environment characterized mostly by nature-based activities, such as hiking, wildlife viewing, limited boating, and swimming at designated beaches. Removal of additional retail, in addition to the actions common to Alternatives 2–6, would make the valley much less commercial, providing mostly for basic needs, with a focus on experiences that are nature based.

Raft rentals would be discontinued under Alternative 2 in favor of private boating, which would be limited to 25 trips per day with designated put-in and take-out locations. This would significantly reduce access to boating in Segment 2 and affect those visitors who come to Yosemite to participate in water activities. The limit on the number of trips per day would further reduce the opportunity to participate in this experience. With limited put-in and take-out locations, which are also day use areas, crowding could increase.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result local, long-term, minor to moderate, beneficial impacts on visitor experience and recreation within Segment 2. Actions to manage user capacities, land use, and facilities would also have minor beneficial impacts on visitor experience and recreation within Segment 2.

### **Segment 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish oak protection areas in the Odgers' fuel storage area and the parking lots adjacent to this area. Parking and new building construction would be prohibited within the oak protection areas. The restoration of this area would improve natural resources and have a local, long-term, negligible beneficial impact on the visitor experience.

#### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

**Boating.** Alternative 2 would implement boating restrictions in Segments 3 and 4, limiting put-in and take-out locations as well as the number of boats per day. This would reduce the ability of visitors to casually boat on the Merced River.

**Parking.** The day parking capacity would be the same under Alternative 2 as under Alternative 1, with 180 spaces in Segment 3 and 214 spaces in Segment 4. Parking is not likely to be an issue for visitors in Segments 3 and 4. Under Alternative 2, the number of visitors passing through Segments 3 and 4 and those recreating in Segment 3 and in Segment 4 are expected to remain constant, with no change from that under Alternative 1.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, negligible, beneficial impacts on visitor experience and recreation within Segment 4. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, adverse impacts on visitor experience and recreation within Segments 3 & 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Manage User Capacity and Facilities***

This area includes wilderness (Segments 5 and 8), the Wawona Impoundment (Segment 6), and Wawona (Segment 7). Segments 5 and 8 are remote and undisturbed, and resource quality is high in these segments due to very low levels of use. There are no developed activities or facilities in Segments 5 and 8. Segment 6, the Wawona Impoundment, is off limits to visitors because of safety and water quality concerns.

**Camping.** In keeping with the restoration theme of Alternative 2, all campsites would be removed from the 100-year floodplain. Visitors who value improved resource conditions would find removal of these campsites beneficial to their experience and in keeping with this restoration-intensive alternative. Removal of these campsites would have a negative impact on the experience of those visitors for whom camping close to the South Fork Merced River is an important part of their experience of Yosemite.

**Recreation Facilities.** To accommodate the increased restoration focus of Alternative 2, visitors would experience a reduction in the number of facilities and services available, including golf, tennis, and riding. Most noticeably, the Wawona Golf Course and golf shop would be removed under Alternative 2 and the site restored. This would eliminate golfing in the South Fork Merced River corridor. This action would negatively affect visitors for whom golf is an important part of their experience. For those visitors who do not golf or feel golf is an inappropriate activity so close to the river, the removal of this facility and the restoration of the site would be a benefit.

Removal of the Wawona tennis courts would eliminate tennis as a recreational activity in the South Fork Merced River corridor. This might prove to be a disappointment to the hotel visitors who seek out tennis as part of their Yosemite experience. However, this likely involves a small number of guests. For most guests, the removal of tennis would have no effect on their experience in Wawona, and in the long run the removal might improve their experience by affording them more nature-based, river-dependent activities.

Removal of the Wawona stables would completely eliminate day rides from Segment 7. For visitors who participate in these activities, this action would negatively affect their visitor experience. However, participation in these activities is limited, so its removal would not affect most visitors to Wawona.

**Boating.** Boating would be allowed in Segment 7, but regulations would limit put-in and take-out sites. This would negatively affect those visitors who are accustomed to unrestricted boating access in Segment 7.

**Parking.** Total parking spaces in Wawona would remain at 290 spaces. This number is currently inadequate during peak times, and visitors would continue to experience crowding and congestion as they search for parking.

**Overnight Accommodations.** The number of overnight lodging units at the Wawona Hotel would remain the same as under Alternative 1. Demand for overnight reservations would continue to exceed demand throughout the season. The removal of 32 campsites from the Wawona Campground would result in a 33% reduction in the number of campsites. Demand frequently exceeds supply at this campground and removal of these sites, coupled with similar visitation levels, would exacerbate this problem.

**Total Visitation.** Peak day use levels (PAOT) would increase over that of Alternative 1, from 1,295 to 1,321, primarily due to increased transit use.

**Segments 5-8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, negligible to minor, beneficial impacts on visitor experience and recreation within Segments 5-8.

### **Summary of Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

Alternative 2 is the most restoration-intensive of all the alternatives, focusing on self-reliant visitor experiences and extensive floodplain restoration. Visitors would experience fewer roads, trails, buildings, and bridges, and noticeably more relatively undisturbed natural areas. Restoration actions would improve the quality of natural resources and thus the overall visitor experience. However, under Alternative 2, the extent of the restoration actions, a total of 347 acres in addition to those restoration actions common to Alternatives 2-6, though highly beneficial to resource conditions and river function, would noticeably reduce access to and availability of recreation and visitor services. Actions under Alternative 2 would generally eliminate recreational activities that are not directly resource based. These actions would include closure of Merced Lake High Sierra Camp; an 87% decrease in Little Yosemite Valley Wilderness Zone capacity and related reduction in wilderness permit quotas; elimination of bicycle rentals, commercial rafting, stock use, golf, tennis, and swimming pools; elimination of most nonriver-related visitor services; a 43% reduction in lodging and 8% reduction in camping; and an overall reduction in peak day use levels (PAOT) within the corridor by 12%. These actions would improve the experience of visitors once they were within the Merced River corridor as a result of less congestion, but would also result in many people being unable to gain access to the East Valley via private vehicle and the experiences it provides. Because there will be a reduction in the total number of visitors, these visitors would overall experience less crowding and enjoy a more natural, restored landscape. Overall, with implementation of mitigation measure MM-VEX-1 and MM-VEX-2, as appropriate (see Appendix C); these actions would result in a corridorwide, long-term, minor beneficial impact on access to and availability of recreation and visitor services and the overall quality of the visitor experience.

## **Cumulative Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

Cumulative effects on visitor experience as it relates to visitor services are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of the actions under Alternative 2. The projects identified below include only those that could affect visitor experience within the Merced River corridor or in the park vicinity.

### ***Past Actions***

*The General Management Plan for Yosemite National Park (1980).* This plan is the basic document for management of Yosemite National Park. The *Merced River Plan/EIS* would amend the *General Management Plan* to meet the mandates of the Wild and Scenic Rivers Act.

*The Concession Services Plan (1992).* This is the 1992 amendment to the General Management Plan that guides the management of concession enterprises such as lodging, food, retail and other commercial services in Yosemite National Park. The plan serves as the basis for contracts between the national Park Service and the park's primary concessioner. The *Merced River Plan/EIS* would amend the *Concession Services Plan* to meet the mandates of the Wild and Scenic Rivers Act.

### ***Present Actions***

Projects currently underway that may have an effect on the visitor facilities and services and the visitor experience include the following plans, projects, and assessments.

- *Yosemite Wilderness Stewardship Plan/EIS.* This plan utilizes direction from the *Merced River Plan* to address the Merced River corridor component of this plan. Alternative 2 removes the Merced Lake High Sierra Camp and wilderness camping areas and facilities that would allow for including the current nonwilderness inholding to be designated as wilderness.
- *Tuolumne Wild and Scenic River Comprehensive Management Plan.* The Tuolumne River Plan would establish long-term guidance for protecting water quality, free-flowing condition, and unique values for the portion of the Tuolumne River that flows through the park.
- *Scenic Vista Management Plan: Environmental Assessment.* This plan protects Yosemite's views and vistas, part of the overall visitor experience. Actions set forth in this plan amend the *Scenic Vista Management Plan*.
- *Mariposa Grove Restoration Plan.* Decisions made in this plan are expected to help manage visitor crowding and congestion in Wawona.
- *Half Dome Trail Stewardship Plan.* This plan addresses wilderness character on this trail and may affect use patterns along trails between Happy Isles and Little Yosemite Valley.
- *Ahwahnee Comprehensive Rehabilitation Plan.* This plan improves visitor facilities and services at The Ahwahnee. Alternative 2 proposes removal of some facilities and services at The Ahwahnee.
- *Ansel Adams Gallery Rehabilitation Plan.* This plan improves a visitor-serving facility.

- *Comprehensive Interpretive Plan.* This plan outlines a comprehensive approach to interpreting park natural and cultural resources and guides interpretive and educational efforts for the next five to 10 years. The significant number of restoration activities and associated interpretation and education actions under Alternative 2 would need to be considered as this plan is further developed.
- *Curry Village Rock Fall Hazard Zone Structures Project.* This plan addresses the structures within this zone. The outcome of this plan would affect lodging in this area. Alternative 2 removes structures from the rock fall hazard zone.
- *Yosemite Environmental Education Campus* NatureBridge and the NPS will be constructing a new education center at Henness Ridge (and restoring the Crane Flat campus to natural conditions)

### **Overall Cumulative Impact from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

The cumulative impacts of Alternative 2 management measures for visitor experience and recreation would generally be beneficial for Segments 1–8. Past and present facilities improvements and upgrades would enhance the visitor experience and reduce demand on park facilities. Visitors would also benefit from past and present habitat restoration and resource management projects and plans. As a result, the cumulative impact of Alternative 2 management measures, in light of past, present, and reasonably foreseeable future projects, would be parkwide, long term, moderate, and beneficial.

### ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

#### **Segmentwide**

##### ***Impacts of Actions to Protect and Enhance River Values***

With the exception of the corridorwide actions common to Alternatives 2–6, there would be no additional corridorwide actions under Alternative 3 to protect and enhance river values.

#### **Segment 1: Merced River Above Nevada Fall**

With the exception of the actions common to Alternatives 2–6, there would be no additional actions under Alternative 3 to protect and enhance river values in Segment 1.

##### ***Impacts of Actions to Manage User Capacity and Facilities***

**Merced Lake High Sierra Camp.** Under Alternative 3, Merced Lake High Sierra Camp would be converted to a temporary outfitter camp providing lodging for 15 people. This would reduce lodging in Segment 1 in Alternative 3 by 75%. The Merced Lake High Sierra Camp and all related infrastructure would be removed and the area would be designated as wilderness. This would create an experience where visitors are self-reliant and the landscape is natural and undeveloped. For visitors who desire this type of experience, changing the camp to a temporary outfitters camp would be

beneficial; however, there are many visitors for whom the Merced Lake High Sierra Camp defines the quality of their recreational experience. Some have been visiting the High Sierra Camps for generations. Others support the potential Historic District designation of the High Sierra Camp, believing it is a cultural resource from the early days of the park. For these visitors, the conversion of the camp to a temporary outfitters camp would have an adverse effect on their experience, both in the wilderness and generally in Yosemite.

**Camping.** Under Alternative 3, all designated camping in Segment 1 would be converted to dispersed camping. With the conversion to dispersed camping, visitors have the opportunity to camp out of sight and sound from other campers. Dispersed camping and minimal facilities are in keeping with the undeveloped quality of the wilderness. Visitors seeking a true wilderness experience would benefit from these changes. Visitors who value less crowded areas, but still appreciate organized camping and minor facilities, may have a somewhat less positive visitor experience owing to the increase in dispersed camping and removal of facilities.

**Wilderness Capacity.** Under Alternative 3, the capacity of the Little Yosemite Valley Wilderness Zone would be reduced from existing levels by 50%, from 150 to 75 overnight visitors per day. This would improve the solitary nature of wilderness camping due to the reduced number of people but because zone capacity and wilderness permit numbers are related, this would result in increased difficulty gaining access to the wilderness.

**Overnight Use.** Wilderness Zone capacities in Segment 1 would be reduced from 380 people under Alternative 1 (No Action) to 260 under Alternative 3, a reduction of 32%. The number of day visitors would remain at 350. This decrease in zone capacity would reduce the number of encounters with other visitors and increase the experience of solitude in the wilderness. The importance of these two factors varies according to visitor. For some, the reduction in activity and visitation would be beneficial; others would be less concerned with these issues because they experience the wilderness as already uncrowded.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, moderate, adverse impacts on visitor experience and recreation within Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Alternative 3 would restore more than 300 acres of meadow and riparian habitat throughout the Merced River corridor. This is not as significant as the restoration of 347 acres under Alternative 2; however, visitors would still notice the improved condition of the natural environment, including the removal of structures and facilities within the floodplain, restoration of riverbanks and meadows, removal of bridges, and an overall improvement in the functioning of the river.

Under Alternative 3, restoration activities would be similar to, but not as extensive as, those proposed under Alternative 2. As under Alternative 2, certain projects, such as restoration of areas from which Yosemite Lodge development was previously removed due to flood damage would proceed. Many

familiar signs of human use and activity would be removed to accommodate floodplain and meadow restoration. Visitor impacts would be similar to Alternative 2; however, campsites would be removed from within 150 feet of the ordinary high-water mark instead of from the 100-year floodplain. This would result in the removal of fewer campsites for restoration purposes. Extensive restoration would have a number of impacts on the visitor experience, and the impacts would differ depending on the perspective of visitors. As under Alternative 2, regardless of the visitor, the scale of restoration proposed under Alternative 3, in combination with the actions common to Alternatives 2–6, would result in a physically altered Yosemite Valley. There would be fewer roads, trails, buildings, and bridges, and noticeably more relatively undisturbed natural areas. Those visitors who value an ecosystem with less human-made features and disturbances would find their experience very positive. Those visitors who have grown accustomed to more development might miss activities in which they have participated in the past, such as stock use, staying at Yosemite Lodge, and camping adjacent to the Merced River. These visitors might also be negatively affected by the diminishments of the relative freedom provided under Alternative 1, in terms of river access and areas to recreate.

The interpretive and educational opportunities associated with this scale of restoration would explain these landscape-level changes to visitors. Education would benefit all visitors but would especially help those who do not understand why the appearance of the valley has changed and who may feel that certain aspects of the Yosemite they used to know and activities in which they had once participated have either disappeared or become less available.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 3 include: rerouting trails at Ahwahnee Meadows; removing and restoring a portion of Northside Drive (900 feet) and rerouting the bike path; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; and removing campsites and infrastructure from the 100-year floodplain and restoring 12 acres of floodplain and riparian habitat; and erecting fencing and signage to redirect visitor traffic, and removing informal trails at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks.

These projects would have significant short-term impacts on the visitor experience by limiting visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. The larger the project in size and the longer its duration, the greater the impact on the visitor. In certain circumstances, restoration activities, although beneficial to the resource, may alter the visitor's experience by limiting direct interaction with natural resources (e.g. touching versus seeing). Generally, increased visitor use results in greater restrictions in order to protect the resource and therefore would have a short-term, minor, adverse impact on visitor experience. Visitor experience benefits include opportunity for education and interpretation of restoration action. In the long-term, the results of these actions would improve natural resources and hydrologic function and would have moderate beneficial impact on visitor experience.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 3 include: relocating unimproved Camp 6 parking; removing the Stoneman, Ahwahnee and Sugar Pine Bridges;

and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. These actions would likely limit visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise, and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the resulting improvements to natural resources would be long term and beneficial.

### ***Impacts of Actions to Manage User Capacity and Facilities***

**Visitor Use Levels.** Under Alternative 3, visitors would experience the least crowding of any alternative, as peak day use levels would decrease by 24%, from 8,272 to 6,289; while maximum overnight capacity would fall 23%, from 6,564 to 5,027. Based on monthly visitation statistics, this projected reduction would be more consistent with current visitation in early summer. As a result the visitors at this time would experience less crowding than is normal today in peak months, although nothing like the winter visitation experience, which has approximately 87% less visitors than the peak.

**Day Use Management.** The day-use management system would have the same impacts on visitors as that under Alternative 2 — a reduction in crowding, congestion and resource damage. However, demand is likely to significantly exceed supply during peak season, resulting in many dissatisfied individuals unable to access the park. Implementing the permit system, among other transportation-related management measures, would benefit the experience of those visitors who are able to secure a permit because the valley would experience much less crowding and traffic congestion during peak season.

**Overnight Accommodations.** Total camping would increase by 2% in Segment 2, from the 466 existing campsites to a total of 477 campsites. Lodging would decrease by 40%, from 1,034 rooms to 621 rooms. Most notable among the overnight accommodations removed would be Housekeeping Camp and 42% of the units at Yosemite Lodge. Demand for both camping and overnight lodging, which currently exceeds supply, would be exacerbated by this reduction and visitors would find it more difficult to secure a place to stay within the park.

**Parking.** Day parking would be reduced from 2,337 spaces to 1,597 spaces, a 32% decrease. The reduction in day visitors, coupled with increased transportation options during peak months, would make finding parking much easier and reduce congestion and crowding significantly.

**Recreation Facilities.** Developed facilities removed under Alternative 3, in addition to those removed under the actions common to Alternatives 2–6, would include all facilities related to Housekeeping Camp. The Curry Village stables and the Yosemite Lodge Gift Shop would be reduced in size. Although not as extensive as the changes to commercial facilities and services proposed in Alternative 2, these reductions would help reduce the commercial nature of the valley and focus on activities and visitor services that are nature based, but would limit access to and availability of a number of types of visitor facilities and services.

**Boating.** Boat rentals would be discontinued under Alternative 3 in favor of private boating, which would be limited to 50 trips per day (twice as many trips as under Alternative 2), with designated put-in and take-out locations. This would significantly reduce access to boating in Segment 2 and affect those

visitors who come to Yosemite regularly to participate in water activities. The limit on the number of trips per day would further reduce the opportunity to participate. With limited put-in and take-out locations, which are also day use areas, there could be some crowding.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result local, long-term, minor to moderate, beneficial impacts on visitor experience and recreation within Segment 2. Actions to manage user capacities, land use, and facilities would also have minor beneficial impacts on visitor experience and recreation within Segment 2.

### **Segment 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

In addition to the actions common to Alternatives 2–6 in Segments 3 and 4, additional actions would improve and protect the oak habitat in Segment 4 which would improve the natural resources in this area and have a local, long-term, negligible beneficial effect on the visitor experience.

#### ***Impacts of Actions to Manage User Capacity and Facilities***

**Boating.** Alternative 3 would implement boating restrictions in Segments 3 and 4, limiting put-in and take-out locations as well as the number of boats per day. This would reduce the ability of visitors to casually boat on the Merced River.

**Parking Capacity.** The day parking capacity would be the same as under Alternative 1 (No Action), with 180 spaces in Segment 3 and 214 spaces in Segment 4. Parking is not likely an issue for visitors in these segments.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, negligible, beneficial impacts on visitor experience and recreation within Segment 4. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, adverse impacts on visitor experience and recreation within Segments 3 & 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Protect and Enhance River Values***

No additional resource protection actions, aside from those described as common to Alternatives 2–6, would occur in Segments 5, 6, 7 and 8 under Alternative 3.

#### ***Impacts of Actions to Manage User Capacity and Facilities***

This area includes wilderness (Segments 5 and 8), the Wawona Impoundment (Segment 6), and Wawona (Segment 7). Segments 5 and 8 are remote and undisturbed, and resource quality is high in these segments due to very low use levels. There are no developed activities or facilities in Segments 5 and 8. Segment 6, the Wawona Impoundment, is off limits to visitors owing to safety and water quality concerns.

In keeping with the restoration theme of Alternative 3, 27 campsites would be removed from within 150-feet of the river, reducing the number of campsites by 28% from under Alternative 1. Visitors who value improved resource conditions would find removal of these campsites beneficial to their experience and in keeping with this restoration-intensive alternative. Removal of these campsites would have an adverse impact on the experience of those visitors for whom camping close to the South Fork Merced River is an important part of their experience of Yosemite.

**Recreation Facilities.** Under Alternative 3, visitors would experience a reduction in the number of facilities and services available to them, including golf, tennis, and riding. Most noticeably, the Wawona Golf Course and golf shop would be removed under Alternative 3 and the site restored. This would eliminate golfing in the South Fork Merced River corridor. This action would negatively affect visitors for whom golf is an important part of their experience. For those visitors who do not golf or feel golf is an inappropriate activity so close to the river, the removal of this facility and the restoration of the site would be a benefit.

Removal of the Wawona tennis courts would eliminate tennis as a recreational activity in the South Fork Merced River corridor. This might prove to be a disappointment to the hotel visitors who seek out tennis as part of their Yosemite experience. However, this likely would involve a small number of guests. For most guests, the removal of tennis would have no effect on their experience in Wawona, and in the long run the removal might improve their experience by affording them more nature-based, river-dependent activities.

Removal of the Wawona stables would completely eliminate this type of recreation activity from Segment 7. For visitors who participate in day rides, this action would negatively affect their experience. However, a limited number of visitors participate in this activity, so its removal would not affect most visitors in Wawona.

**Boating.** Boating would be allowed in Segment 7, but regulations would limit put-in and take-out sites with no limits on the number of rafts. Not limiting the number of rafts would be beneficial to boaters because they would continue to have access to the same level of boating as they would under Alternative 1.

**Overnight Accommodations.** The number of overnight lodging units at the Wawona Hotel would remain the same as under Alternative 1. Demand for overnight reservations would continue to exceed demand throughout the season. The removal of 27 sites from the Wawona Campground would result in a 28% reduction in the number of campsites. Demand frequently exceeds supply at this campground and removal of these sites, coupled with visitation levels that are unchanged from under Alternative 1, would exacerbate this problem.

**Parking.** Total parking spaces in Wawona would remain at 290 spaces. This number is currently inadequate during peak times, and visitors would continue to experience crowding and congestion as they search for parking.

**Total Visitation.** Unlike Yosemite Valley under Alternative 1, which would experience noticeably less visitor use under Alternative 3, this area would still be crowded during peak times, lessening the visitor

experience. Peak day use levels (PAOT) would increase over that of Alternative 1, from 1,295 to 1,321, primarily due to increased transit use.

**Segments 5-8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, negligible to minor, beneficial impacts on visitor experience and recreation within Segments 5-8.

### **Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

The focus of Alternative 3 is on dispersed visitor experiences and extensive riverbank restoration. After Alternative 2, Alternative 3 is the most restoration-intensive of Alternatives 2–6. Visitors would experience fewer roads, trails, buildings, and bridges, and noticeably more relatively undisturbed natural areas. In general, restoration actions improve the quality of natural resources and thus the overall visitor experience. However, under Alternative 3, the extent of the restoration actions, a total of 302 acres in addition to those restoration actions common to Alternatives 2–6, although highly beneficial to resource conditions and river function, would noticeably reduce access to and availability of recreation and visitor services, and the overall visitor experience. Actions under Alternative 3 generally eliminate recreational activities that are not directly resource based including conversion of Merced Lake High Sierra Camp to a temporary pack camp; a capacity reduction of 50% in the Little Yosemite Valley Wilderness Zone and associated reduction in number of wilderness permits issued; elimination of bicycle rentals, commercial rafting, stock use, golf, tennis, and swimming pools; elimination of most nonriver-related visitor services; a 35% reduction in lodging and 3% reduction in camping; and an overall reduction in people in the corridor at one time during peak days by 12%. Parking capacity would be reduced by 19% and, within East Yosemite Valley, private vehicle access managed by a day use permit parking system. These actions would improve the experience of visitors once they were within the Merced River corridor owing to less crowding and congestion, and would also address the demand for more camping in the valley. However, a significant number of visitors would be unable to gain access to the East Valley via private vehicle and the experiences it provides.

Due to the improved condition of natural resources and acreage of restored areas; elimination of a number of non-river-related based activities; a reduced development footprint; an increase in camping and limits on the number of visitors, this alternative would result in a corridorwide, long-term, minor to moderate, beneficial impact on access to and availability of recreation and visitor services and the overall quality of the visitor experience.

These actions would improve the experience of visitors once they were within the Merced River corridor owing to much less crowding and congestion, but would result in many people being unable to gain access to the East Valley via private vehicle and the experiences it provides. Overall, with implementation of mitigation measure MM-VEX-1 and MM-VEX-2, as appropriate (see Appendix C), these actions would result in a corridorwide, long-term, major, adverse impact on access to and availability of recreation and visitor services and the overall quality of the visitor experience.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Cumulative effects on visitor experience as it relates to visitor services are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of the actions under Alternative 3. Cumulatively considerable projects would be the same as those identified for Alternative 2, and include only those that could affect visitor experience within the Merced River corridor or in the park vicinity.

#### ***Overall Cumulative Impact from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

The cumulative impacts of Alternative 3 management measures on visitor experience would generally be beneficial in Segments 1–8. Past and present visitor services improvements and upgrades would enhance visitor experience and reduce the existing stress on visitor facilities. Visitors would also benefit from past and present habitat and riverbank restoration and resource management projects and plans. As a result, the cumulative impact of Alternative 3 management measures, in light of past, present, and reasonably foreseeable future projects, would be parkwide, long term, minor to moderate, and beneficial.

### ***Environmental Consequences of Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

#### ***Corridorwide***

##### ***Impacts of Actions to Protect and Enhance River Values***

With the exception of the corridorwide actions common to Alternatives 2–6, there would be no additional actions corridorwide actions under Alternative 4 to protect and enhance river values.

#### **Segment 1: Merced River above Nevada Fall**

##### ***Impacts of Actions to Protect and Enhance River Values***

With the exception of actions common to Alternatives 2–6, there are no additional actions proposed under Alternative 4 to protect and enhance river values in Segment 1.

##### ***Impacts of Actions to Manage User Capacity and Facilities***

**Merced Lake High Sierra Camp.** The removal of Merced Lake High Sierra Camp would eliminate overnight lodging in Segment 1. The camp and all related infrastructure would be removed and the camp would be designated as wilderness. This would create an experience where visitors are self-reliant and the landscape is natural and undeveloped. For visitors who desire this type of experience, the removal of the camp would be beneficial; however, there are many visitors for whom the Merced Lake High Sierra Camp defines the quality of their recreational experience. Some have been visiting

this High Sierra Camp for generations. Others support the potential Historic District designation of the High Sierra Camp, believing it is a cultural resource from the early days of the park. For these visitors, the closure of the Merced Lake High Sierra Camp would have an adverse effect on their experience, both in the wilderness and generally in Yosemite.

**Camping.** Under Alternative 4, designated camping would remain at Moraine Dome. Designated camping at Merced Lake Backpackers Camping Area would be expanded into the High Sierra Camp site, facilities would be removed, and a composting toilet would be added. At Little Yosemite Valley Backpacker's Camping Area, designated camping would remain, facilities would be removed, and a composting toilet would be added. For those visitors seeking a pristine wilderness experience, the removal of the High Sierra Camp would be beneficial; however, the retention of designated camping may not be in keeping with the wilderness experience they are seeking. The retention of designated camping would benefit those visitors who seek the quiet and solitude of the wilderness but prefer designated camping and toilet facilities.

**Wilderness Capacity.** Wilderness Zone capacities in Segment 1 would be reduced from 380 people under Alternative 1 (No Action) to 270 under Alternative 3, a reduction of 29%. The number of day visitors would remain at 350. This would improve the solitary nature of wilderness camping owing to the reduced number of people but because zone capacity and wilderness permit numbers are related, this would make it increasingly difficult for visitors to gain overnight access to the wilderness.

This decrease in overnight visitors would reduce the number of encounters with other visitors and increase the experience of solitude in the wilderness. The reduction in activity and visitation would be beneficial to some visitors while others would be less concerned with these issues because they experience the wilderness as already uncrowded.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, moderate, adverse impacts on visitor experience and recreation within Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 4, visitors would experience restoration of approximately 223 acres of meadow and riparian habitat in the Merced River corridor. Coupled with the restoration actions common to Alternatives 2–6, these improvements would result in noticeable improvement to the resources over that of Alternative 1. Many of the areas proposed for restoration under Alternatives 2 and 3 would be addressed but with somewhat less intensity. Under Alternative 4, Stoneman Bridge would not be removed but its impact on river flows would be mitigated. Some restoration of Ahwahnee, El Capitan, and Stoneman meadows would occur, but not to the levels proposed in Alternatives 2 and 3. As under Alternative 3, campsites and infrastructure would be removed from within 150 feet of the ordinary high-water mark and these areas restored, as would be the area from which Yosemite Lodge development was previously removed due to flood damage. The present-day Yosemite Lodge would remain under Alternative 4, as would a portion of the units at Housekeeping Camp.

Projects proposed in Segment 2 to protect and enhance river values involve rerouting and revegetating a portion of the Valley Loop Trail. This would likely limit visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the resulting improvements to natural resources would be long term and beneficial.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 4 include: removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing campsites and infrastructure from the 100-year floodplain and restoring 12 acres of floodplain and riparian habitat; and erecting fencing, signage, and boardwalks to redirect visitor traffic, and removing informal trails at El Capitan Meadow. These actions would likely limit visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the resulting improvements to natural resources would be long term and beneficial.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 4 include: relocating unimproved Camp 6 parking; placing large wood and constructed logjams along the base of Stoneman Bridge; removing the Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. These actions would likely limit visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the resulting improvements to natural resources would be long term and beneficial.

### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

**Visitor Use Levels.** Under Alternative 4, visitors would generally experience reduced crowding in Segment 2 because peak day use levels would decrease by 9%, from 8,272 to 7,554 people at one time. However, maximum overnight capacity would increase by 10%, from 6,564 to 7,224 people per night. Visitors would experience less crowding than under Alternative 1 owing to this reduction. Visitor use would be managed through an East Valley day use parking permit system. Once the Yosemite Valley parking capacity was reached, visitors would be directed to remote parking in the Gateway communities and instructed to take public transportation, which would be expanded under Alternative 4 to meet the increase in visitors. As discussed in Alternatives 2 and 3, reducing the number of visitors would improve the visitor experience for those who are able to access the park. For those who cannot gain access, the quality of their experience would be diminished.

**Camping and Lodging.** Camping opportunities in Yosemite Valley would increase 50%, from 466 sites to 701 sites. This is a significant increase in camping and would help to meet the current demand

for camping in the valley. An increase in camping would provide the opportunity for many more visitors to stay overnight in the valley relatively inexpensively. Lodging would decrease 24%, from 1034 units to 823 units. Overall, overnight accommodations would increase 7% under Alternative 4. It is likely that demand for overnight accommodations of all types would continue to exceed supply.

Additional facilities removed under Alternative 4 would include the Curry Village stables; the Nature Shop, and the Housekeeping Camp grocery store. Facilities reduced in size include the Yosemite Lodge Gift Shop. Picnic areas would be added in various locations throughout the valley. Although not as extensive as the changes to commercial facilities and services proposed under Alternatives 2 and 3, these reductions would help reduce the commercial nature of the valley and focus on activities and visitor services that are nature based, but would limit access to and availability of a number of types of visitor facilities and services.

**Boating.** Both private and commercial boating would be allowed in Segment 2. Up to 100 trips per day would be allowed by permit, and put-ins and take-outs would be limited. Commercial boating would be allowed with a staging area at Housekeeping Camp. Commercial trips would be limited to 75 boats at one time or approximately 200 trips per day. The addition of commercial rafting with some restrictions would add a type of activity that is not proposed under Alternatives 2 and 3. Restricting numbers of boats and put-in and take-out locations reduces trampling and erosion and helps protect natural resources.

**Parking.** Day parking would be reduced by 12%, from 2,337 to 2,045 visitor parking spaces available in the valley (a reduction of 292 spaces). Coupled with the day-use management system (which would limit the number of day visitors), expanded bus service, roadway alignment and intersection performance, and new remote parking in El Portal, Alternative 4 would improve the visitor experience by lessening congestion and the time required to look for parking. Visitor/vehicular use conflicts would be mitigated and traffic congestion further reduced with the provision of an underpass at Yosemite Lodge. This would also improve pedestrian safety and the overall visitor experience around Yosemite Lodge.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result local, long-term, minor to moderate, beneficial impacts on visitor experience and recreation within Segment 2. Actions to manage user capacities, land use, and facilities would also have minor beneficial impacts on visitor experience and recreation within Segment 2.

### **Segment 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

In addition to the actions common to Alternatives 2–6 in Segments 3 and 4, additional actions would improve and protect the oak habitat in Segment 3 which would improve the natural resources in this area and have a local, long-term, negligible beneficial effect on the visitor experience.

### ***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

**Boating.** Alternative 4 would implement boating restrictions in Segments 3 and 4, limiting put-in and take-out locations and the number of boats per day to 10 per segment. This would reduce the ability of visitors to casually boat on the river.

**Parking.** The day parking capacity would be the same as under Alternative 1, with 180 spaces in Segment 3 and 214 spaces in Segment 4. Parking is not likely an issue for visitors in these segments. Under Alternative 4, the number of visitors passing through Segments 3 and 4 would decrease from under Alternative 1; however, those recreating in Segment 3 and 4 are expected to remain constant with no change from Alternative 1.

Alternative 4 would add a 200-vehicle parking lot in El Portal, which would provide remote parking for valley visitors. This would be a valuable addition for those visitors who prefer to avoid the lines and permits required to access the valley, but it would not affect those who choose to recreate in Segments 3 and 4.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, negligible, beneficial impacts on visitor experience and recreation within Segment 4. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, adverse impacts on visitor experience and recreation within Segments 3 & 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Protect and Enhance River Values***

In addition to the resource actions common to Alternatives 2–6, 27 sites would be removed from the Wawona Campground to protect cultural resources and the 100-foot riparian buffer. Visitors who value improved resource conditions would find removal of these campsites beneficial to their experience and in keeping with this restoration-intensive alternative. Removal of these campsites would have a negative impact on the experience of those visitors for whom camping close to the South Fork Merced River is an important part of their experience of Yosemite.

#### ***Impacts of Actions to Manage User Capacity and Facilities***

**Recreation Facilities.** The Wawona Golf Course, golf shop, and tennis courts would be retained under Alternative 4. This would be a beneficial decision for the relatively small number of golfers and tennis players, but an adverse impact on those who believe that golf is an inappropriate activity so close to the South Fork Merced River. For most guests, the availability of tennis and golf does not have an effect on their visitor experience. The retention of these facilities is not in keeping with a visitor experience characterized by nature-based, river-dependent activities.

Removal of the Wawona stables would completely eliminate this type of recreation activity from Segment 7. For visitors who participate in day rides, this action would adversely affect their visitor experience. However, a limited number of visitors participate in this activity, so its removal would not affect most visitors to Wawona.

**Boating.** Boating would be allowed in Segment 7, but regulations would limit put-in and take-out sites and the number of boats to five. This would adversely affect those visitors who are accustomed to unrestricted boating access.

**Overnight Accommodations.** The number of overnight lodging units at the Wawona Hotel would remain the same as under Alternative 1. Demand for overnight reservations would continue to exceed demand throughout the season. The removal of 27 sites from the Wawona Campground would result in a 28% reduction in the number of campsites. Demand frequently exceeds supply at this campground and removal of these sites, coupled with visitation levels that are equal to the current levels, would exacerbate this problem.

**Parking.** Total parking spaces in Wawona would remain at 290 spaces. This number is currently inadequate during peak times, and visitors would continue to experience crowding and congestion as they search for parking.

**Total Visitation.** The total number of visitors to Segment 7 under Alternative 4 is expected to be the same as under Alternative 1. Crowding and congestion occur in Wawona and along the river during peak times and this would continue. Peak day use levels (PAOT) would increase over that of Alternative 1, from 1,295 to 1,399, primarily due to increased transit use.

**Segments 5-8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, negligible to minor, beneficial impacts on visitor experience and recreation within Segments 5-8.

### **Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

The focus of Alternative 4 is on resource-based visitor experiences and targeted riverbank restoration. Alternative 4 strikes a balance between restoration and visitor use. Under Alternative 4, the extent of restoration actions would be 223 acres, in addition to those restoration actions common to Alternatives 2–6. Restoration activities would be noticeable to visitors but less extensive than the restoration proposed under Alternatives 2 and 3. In general, restoration actions improve the quality of natural resources and hydrologic function of the river and thus the overall quality visitor experience.

Actions under Alternative 4 generally reduce recreational activities that are not directly resource based. These actions would include removal of Merced Lake High Sierra Camp; a capacity reduction of 33% in the Little Yosemite Valley Wilderness Zone and associated reduction in number of wilderness permits issued; elimination of bicycle rentals, stock use, and swimming pools; elimination of most nonriver-related visitor services; a 20% reduction in lodging and 37% increase in camping; and an overall reduction in peak day use levels (PAOT) within the corridor by 5%. Commercial boating in the valley would be allowed under Alternative 4, a pedestrian underpass would be added at Yosemite Lodge, and a remote parking lot would be added in El Portal to reduce congestion in the valley. Visitor use in Yosemite Valley would be reduced by 17% and access controlled by an East Valley day use parking permit system. Once maximum parking capacity in the valley was reached, access would be limited to overflow parking. These actions would improve the experience of visitors once they were within the Merced River corridor owing to less crowding and congestion, and would also address the

demand for more camping in the valley. However, some visitors would be unable to gain access to the East Valley via private vehicle and the experiences it provides.

Due to the improved condition of natural resources and acreage of restored areas; elimination of a number of non-river-related based activities; a reduced development footprint; an increase in camping and limits on the number of visitors; and with implementation of mitigation measure MM-VEX-1 and MM-VEX-2, as appropriate (see Appendix C), this alternative would result in a corridorwide, long-term, minor to moderate, beneficial impact on access to and availability of recreation and visitor services and the overall quality of the visitor experience.

### **Cumulative Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

Cumulative effects on visitor experience as it relates to visitor services are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of the actions proposed under Alternative 4. Cumulatively considerable projects would be the same as those identified for Alternative 2, and include only those that could affect visitor experience within the Merced River corridor or in the park vicinity.

#### ***Overall Cumulative Impact from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

The cumulative impacts of Alternative 4 management measures on visitor experience would generally be beneficial in Segments 1–8. Past and present visitor services improvements and upgrades would enhance visitor experience and reduce the existing stress on visitor facilities. Visitors would also benefit from past and present habitat and riverbank restoration and resource management projects and plans. As a result, the cumulative impact of Alternative 4 management measures, in light of past, present, and reasonably foreseeable future projects, would be parkwide, long term, minor to moderate, and beneficial.

### ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

#### ***Corridorwide***

#### ***Impacts of Actions to Protect and Enhance River Values***

With the exception of the corridorwide actions common to Alternatives 2–6, there would be no additional actions corridorwide actions under Alternative 5 to protect and enhance river values.

#### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

With the exception of the actions common to Alternatives 2–6, there would be no additional actions under Alternative 5 to protect and enhance river values in Segment 1.

*Impacts of Actions to Manage User Capacity, Land Use and Facilities*

**Merced Lake High Sierra Camp.** Visitors to Segment 1 would continue to have a wilderness-oriented experience, characterized by self-reliance and opportunities for solitude. The Merced Lake High Sierra Camp would be reduced by 40%, from 60 beds to 42. This would make the Camp equal in size to other High Sierra Camps. Composting toilets will be installed in this location. This size reduction would be beneficial to the experience of some visitors as it would retain the historical use and provide a different type of accommodation for visitors. The reduction in the size of the camp and removal of the water treatment plant, although not as desirable as eliminating the entire camp to those who oppose it, would reduce the impact of this developed facility on the wilderness landscape.

**Camping and Lodging.** Little Yosemite Valley Backpacker's, Moraine Dome, and the Merced Lake Backpackers camping areas would remain as designated camping areas under Alternative 5, with maximum overnight visitation set by zone capacity, or 150 for the LYV Zone and 50 for the Merced Lake Zone. Merced Lake Backpacker's Camping Area would replace the existing wastewater system with composting toilets. Little Yosemite Backpacker's Camping Area would retain the existing facilities, including restrooms. Moraine Dome would continue to have no facilities. Backpackers could also continue to camp away from the Merced River in dispersed sites. Some visitors would experience crowding and an unacceptable number of visitor encounters, which would impinge on the solitude they desire in the wilderness. Others would perceive the number of overnight visitors in this Segment 1 as low and benefit from the opportunity to experience camping in the relatively uncrowded wilderness. Retention of designated campsites would be beneficial to those visitors who value minimal facilities as part of their wilderness experience. Some visitors, desiring a more primitive wilderness experience, would experience the designated camping areas and facilities as contrary to the wilderness experience.

**Boating.** Allowed as an activity in Segment 1, under Alternative 5, boating would be limited to five boats per day. This would lessen the visitor experience for those who want to boat in Segment 1 but may improve the experience of those visitors who prefer a wilderness experience with little human-made disturbance.

**Wilderness Capacity.** Wilderness Zone capacities in Segment 1 would be reduced from 380 people under Alternative 1 (No Action) to 362 under Alternative 5, a reduction of 5%. The number of day visitors would remain at 350. As is currently the case, demand for overnight use permits in the wilderness would continue to exceed supply, leaving some visitors unable to secure a permit and thus unable to have the recreational experience they planned at the time they desired. The retention of the existing wilderness capacity would likely have an adverse effect on those individuals who feel the wilderness should be much less crowded, with fewer visitor encounters.

The slight decrease in overnight visitors would reduce the number of encounters with other visitors and increase the experience of solitude in the wilderness. The importance of these two factors varies according to visitor. Some would benefit from the reduction in activity and visitation, while others would be less concerned with these issues, as they experience the wilderness as already uncrowded.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, minor, adverse impacts on visitor experience and recreation within Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 5, visitors would experience restoration of approximately 197 acres of meadow and riparian habitat in the Merced River corridor. Coupled with the restoration actions common to Alternatives 2–6, these improvements would result in noticeable improvements to the resources over that of Alternative 1. Education and interpretation related to the widespread restoration and enhancement activities in Segment 2 would help visitors understand the changes to the natural landscape, the beneficial effects of restoration to the natural environment and the function of the river, and the techniques used to achieve these changes.

Projects proposed in Segment 2 to protect and enhance river values involve restoring areas from which Yosemite Lodge development was previously removed due to flood damage; and rerouting, revegetating, and constructing a boardwalk along a portion of the Valley Loop Trail. These actions would likely limit visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities, and the end result of restored natural areas, would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the impacts would be long term and beneficial.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternatives 5 include: removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; reconfiguring the Curry Orchard parking lot; removing campsites and infrastructure from the 100-year floodplain and restoring 6.5 acres of floodplain and riparian habitat; and erecting fencing, signage, and boardwalks to redirect visitor traffic, and removing informal trails at El Capitan Meadow. These actions would likely limit visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the resulting improvements to natural resources would be long term and beneficial.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 5 include: relocating unimproved Camp 6 parking; removing the Sugar Pine Bridge; placing large wood and constructed logjams along the base of Stoneman Bridge; and improving trail connectivity and routing in the vicinity of the Ahwahnee Bridge. These actions would likely limit visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the resulting improvements to natural resources would be long term and beneficial.

***Impacts of Actions to Manage User Capacity, Land Use and Facilities***

Under Alternative 5, actions to manage visitor use and facilities include a day-use traffic management system; additional parking, camping, and overnight accommodations; and a range of activities designed to complement and respect natural resources. Peak day use levels under Alternative 5 would be 8,954 PAOT, an increase of 8% over existing conditions.

**Parking.** The East Valley day use parking permit system proposed under Alternative 5 would manage private automobile access to the East Valley, thereby reducing crowding and congestion in Segment 2 on peak use days. Both regional transit and valley shuttle options would be expanded, and visitors would be encouraged to park outside of the park and take public transit into the valley. Vehicles driving into the valley would be subject to transportation fees, be directed to overflow parking in the West Yosemite Valley, and ultimately need a parking reservation. For some day visitors, taking a shuttle into the park would improve their experience because they would not be subject to transportation fees, parking in remote lots, or parking reservation requirements. For those who either need their vehicle to access camping or overnight lodging or simply want or need to have their vehicle, the East Valley day use parking permit system should improve the experience of driving in the park on peak days.

Day parking would increase by 5%, from 2,337 to 2,448 visitor parking spaces available in the valley, including the addition of a 100-car overflow parking garage in the West Yosemite Valley. This increase, in addition to the East Valley day use parking permit system, would reduce the number of vehicles circulating through the valley looking for parking. Transportation improvements, including a round-about at the intersection of Sentinel Road and Northside Drive, improved roadway alignment and intersection performance, and a pedestrian underpass at Yosemite Lodge, would result in less congestion and enhance pedestrian safety.

Although the total number of daily visitors to the park is only slightly reduced from existing numbers, the implementation of the East Valley day use parking permit system, additional parking spaces, and transportation system improvements would greatly improve the visitor experience. These improvements would lessen traffic jams; ensure that visitors entering the park have a place to park, thus eliminating unnecessary circling; and allow visitors to participate in scenic driving; and get to their ultimate destination sooner.

**Overnight Accommodations.** The amount of overnight lodging would remain essentially the same as existing conditions under Alternative 5, increasing from 1,034 units to 1,053 units. This increase would not meet the demand for overnight lodging during peak months, and some visitors would not be able to reserve lodging at the times they desire.

**Camping.** The number of campsites would increase from 466 to 739 sites, a 59% increase in the number of campsites in Segment 2. In addition to traditional campsites, new walk-in, RV, and groups sites would broaden camping opportunities for visitors. The overall increase would help meet the current unmet demand for campsites.

**Commercial.** Visitor-serving facilities would be reduced in Segment 2 under Alternative 5 and would be focused on serving immediate visitor needs for food and beverages. Grocery stores and dining

facilities would remain at Curry Village, Yosemite Village, Yosemite Lodge, and The Ahwahnee. The grocery store at Housekeeping Camp and some shopping facilities would also be removed. These actions, coupled with the removal of facilities common to Alternatives 2–6, would result in a visitor experience that is less focused on commercial activities. Some visitors would miss the additional opportunities for shopping, eating, and recreating. Others would see the removal of these facilities and services as an action in keeping with enhancing the natural character of the valley.

**Recreational Activities.** A wide variety of nature-based recreational activities, such as hiking, visiting key destinations, contemplation, rafting, and swimming, would continue as an integral part of the visitor experience. These activities are the reason most visitors come to Yosemite and would continue as popular activities. Because the total number of visitors would not noticeably change under Alternative 5, visitors engaged in these activities would likely experience crowded conditions during certain times of day, especially during the peak season.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result local, long-term, minor to moderate, beneficial impacts on visitor experience and recreation within Segment 2. Actions to manage user capacities, land use, and facilities would also have minor beneficial impacts on visitor experience and recreation within Segment 2.

### **Segment 3 and 4: Merced River Gorge and El Portal**

#### *Impacts of Actions to Protect and Enhance River Values*

In addition to the actions common to Alternatives 2–6 in Segments 3 and 4, additional actions would improve and protect the oak habitat in Segment 3 which would improve the natural resources in this area and have a local, long-term, negligible beneficial effect on the visitor experience.

#### *Impacts of Actions to Manage User Capacity, Land Use and Facilities*

**Boating.** Alternative 5 would implement boating restrictions in Segments 3 and 4, limiting put-in and take-out locations and the number of boats per day to 10 per segment. This would reduce the ability of visitors to casually boat on the river.

**Parking.** The day parking capacity would be the same as under Alternative 1, with 180 spaces in Segment 3 and 214 spaces in Segment 4. Parking is not likely an issue for visitors in these segments.

Alternative 5 would add a 200-vehicle parking lot in El Portal, which would provide remote parking for valley visitors. This would be a valuable addition for those visitors who prefer to avoid the lines and permits required to access the valley but would not affect those who choose to recreate in Segments 3 and 4.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, negligible, beneficial impacts on visitor experience and recreation within Segment 4. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, adverse impacts on visitor experience and recreation within Segments 3 & 4.

## Segments 5, 6, 7, and 8: South Fork Merced River

### *Impacts of Actions to Protect and Enhance River Values*

In addition to the resource actions common to Alternatives 2–6, 27 sites would be removed from the Wawona Campground to protect cultural resources and the 100-foot riparian buffer. Visitors who value improved resource conditions would find removal of these campsites beneficial to their experience and in keeping with this restoration-intensive alternative. Removal of these campsites would have a negative impact on the experience of those visitors for whom camping close to the South Fork Merced River is an important part of their experience of Yosemite.

### *Impacts of Actions to Manage User Capacity and Facilities*

**Recreation Facilities.** The Wawona Golf Course, golf shop, and tennis courts would be retained under Alternative 5. This would be a beneficial decision for the relatively small number of golfers and tennis players, but an adverse impact on those who believe that golf is an inappropriate activity so close to the river. For most guests, tennis and golf do not have an effect on their visitor experience. The retention of these facilities is not in keeping with a visitor experience characterized by nature-based, river-dependent activities.

Removal of the Wawona stables would completely eliminate day rides from Segment 7. For visitors who participate in this activity, this action would negatively affect their visitor experience. However, a limited number of visitors participate in this activity, so its removal would not affect most visitors to Wawona.

**Boating.** Boating would be allowed in Segment 7 but regulations would limit put-in and take-out sites and the number of boats in each segment to five. This would negatively affect those visitors who are accustomed to unrestricted access in this segment.

**Overnight Accommodations.** The number of overnight lodging units at the Wawona Hotel would remain the same as under Alternative 1. Demand for overnight reservations would continue to exceed demand throughout the season. The removal of 13 sites from the Wawona Campground would result in a 14% reduction in the number of campsites. Demand frequently exceeds supply at this campground and removal of these sites, coupled with visitation levels that are equal to the current levels, would exacerbate this problem.

**Parking.** Total parking spaces in Wawona would remain at 290 spaces. This number is currently inadequate during peak times, and visitors would continue to experience crowding and congestion as they search for parking.

**Total Visitation.** Crowding and congestion occur in Wawona and along the South Fork Merced River during peak times and this would continue. Peak day use levels (PAOT) would increase over that of Alternative 1, from 1,295 to 1,606, primarily due to increased transit use.

**Segments 5-8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, negligible to minor, beneficial impacts on visitor experience and recreation within Segments 5-8.

## **Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

The focus of Alternative 5 is on enhanced visitor experiences and essential riverbank restoration. Alternative 5 strikes a balance between restoration and visitor use and would provide a number of methods to manage crowding and congestion and improve the visitor experience. Restoration activities would be noticeable to visitors but less intense than the restoration proposed under Alternatives 2 and 3. In general, restoration actions improve the quality of natural resources and thus the overall visitor experience. Under Alternative 5, the extent of the restoration actions would be 197 acres, in addition to those restoration actions common to Alternatives 2–6. These actions are highly beneficial to resource conditions and river function and somewhat limit access to and availability of recreation and visitor services, and the overall visitor experience. Actions under Alternative 5 reduce recreational activities that are not directly resource based. These actions would reduce Merced Lake High Sierra Camp by 20%; maintain the current capacity of the Little Yosemite Valley wilderness zone and related wilderness permit numbers; eliminate bicycle rentals, commercial boating, stock use, tennis, and swimming pools; eliminate most nonriver-related visitor services; increase lodging 1% and camping 29%; and increase peak day use levels (PAOT) within the corridor by 9%. A traffic circle and a pedestrian underpass in the valley, as well as remote parking lot, would be added in El Portal to reduce congestion in the valley. Parking capacity would be increased by about 3%. These actions would improve the experience of visitors once they were within the Merced River corridor due to less crowding and congestion, and would also address the demand for more camping in the valley. Alternative 5 would allow access to approximately the same number of visitors as current conditions, but with congestion and crowding controls, most visitors would be able to gain access to the East Valley via private vehicle and the experiences it provides. Overall, with implementation of mitigation measure MM-VEX-1 and MM-VEX-2, as appropriate (see Appendix C), these actions would result in a corridorwide, long-term, minor, beneficial impact on access to and availability of recreation and visitor services and the overall quality of the visitor experience.

## **Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Cumulative effects on visitor experience as it relates to visitor services are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of the actions in Alternative 5. Cumulatively considerable projects would be the same as those identified for Alternative 2, and include only those that could affect visitor experience within the Merced River corridor or in the park vicinity.

## ***Overall Cumulative Impact from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

The cumulative impacts of Alternative 5 management measures on visitor experience would generally be beneficial in Segments 1–8. Past and present visitor services improvements and upgrades would enhance visitor experience and reduce the existing stress on visitor facilities. Visitors would also benefit from past and present habitat and riverbank restoration and resource management projects and plans. As a result,

the cumulative impact of Alternative 5 management measures, in light of past, present, and reasonably foreseeable future projects, would be parkwide, long term, minor to moderate, and beneficial.

### ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

#### ***Corridorwide***

##### ***Impacts of Actions to Protect and Enhance River Values***

With the exception of the corridorwide actions common to Alternatives 2–6, there would be no additional actions corridorwide actions under Alternative 6 to protect and enhance river values.

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Protect and Enhance River Values***

With the exception of the actions common to Alternatives 2–6, there would be no additional actions under Alternative 6 to protect and enhance river values in Segment 1.

##### ***Impacts of Actions to Manage Use and Facilities***

Under Alternative 6, actions to manage visitor use and facilities are similar to Alternative 1 (No Action) and include:

- Retain Merced Lake High Sierra Camp with 60 beds;
- Retain Merced Lake Backpacker's Camping Area for designated camping and replace flush toilets with composting toilets;
- Retain designated camping and infrastructure at Little Yosemite Valley Backpacker's Camping Area;
- Retain designated camping at Moraine Dome;
- Little Yosemite Valley wilderness quota remains at 150 overnight visitors; and
- Increase in total daily visitation to Yosemite Valley of 7%.

**Merced Lake High Sierra Camp.** Visitors to Segment 1 would continue to have a wilderness-oriented experience, characterized by self-reliance and opportunities for solitude. The Merced Lake High Sierra Camp would remain at its present size (60 beds), benefitting the visitor whose values this experience. Those visitors who believe the High Sierra Camp site should be returned to wilderness, with little evidence of human-made facilities, would continue to be dissatisfied with the presence of the High Sierra Camp. The removal of the flush toilets and replacement with composting toilets would reduce the impact of this developed facility on the wilderness landscape.

**Camping and Lodging.** Little Yosemite Valley Backpacker's Camping Area would be reduced. Designated camping would remain at Merced Lake Backpackers Camping Area and composting toilets would be installed. Moraine Dome Camping Area would retain its designated sites and would remain without facilities. Backpackers could also continue to camp away from the Merced River in dispersed sites throughout Segment 1. Some visitors would experience crowding and an unacceptable number of visitor encounters, which would impinge on the solitude they desire in the wilderness. Others would perceive the number of overnight visitors in Segment 1 as low. Retention of designated campsites would be beneficial to those visitors who appreciate minimal facilities as part of their wilderness experience. Some visitors, desiring a more primitive wilderness experience, would experience the designated camping areas and facilities as contrary to the wilderness experience.

**Wilderness Capacity.** Wilderness Zone capacities in Segment 1 would remain at 380 people (as under Alternative 1 (No Action)). The number of day visitors would remain at 350. As is currently the case, demand for overnight use permits in the wilderness would continue to exceed supply, leaving some visitors unable to secure a permit and thus unable to have the recreational experience they planned at the time they desired. However, Alternative 6, like Alternative, 1 would provide for the greatest number of wilderness permits and therefore provide wilderness access to the greatest number of visitors. Maintaining the existing wilderness capacity would likely have an adverse effect on those individuals who feel the wilderness should be much less crowded, with fewer visitor encounters. The number of visitor encounters in the wilderness would remain the highest of any action alternative and reduce opportunities for solitude in the wilderness. Crowding in the wilderness would be similar to present day.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities within Segment 1 would have local, long-term, negligible, adverse impacts on visitor experience and recreation within Segment 1.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve removing buildings from the Yosemite Lodge area, and rerouting, revegetating, and constructing a boardwalk along a portion of the Valley Loop Trail. These projects would take several weeks to a few months to complete and would likely close these areas to visitors during this time. These actions would have a short term, local, minor adverse impact on the visitor experience due to construction impacts including noise, temporary resource disturbance.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 6 include: removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; reconfiguring the Curry Orchard Parking lot; removing campsites and infrastructure from the 100-year floodplain and restoring 6.5 acres of floodplain and riparian habitat; and erecting fencing, signage, and boardwalks to redirect visitor traffic, and removing informal trails and selectively removing conifers at El Capitan Meadow. These actions would likely limit visitor access while these

areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the resulting improvements to natural resources would be long term and beneficial.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 6 include: relocating unimproved Camp 6 parking and placing large wood and constructed logjams along the bases of Stoneman, Sugar Pine, and Ahwahnee Bridges. These actions would likely limit visitor access while these areas are being restored. Construction activities resulting in truck congestion, noise and dust would negatively impact the visitor experience. Educating the visitor about ongoing restoration activities would be beneficial to the visitor experience. These actions are local, minor, short-term and adverse. Once these projects are completed, the resulting improvements to natural resources would be long term and beneficial.

### *Impacts of Actions to Manage User Capacity, Land Use and Facilities*

Day use levels and maximum overnight capacities in Segment 2 under Alternative 6 would be the highest of any alternative. Under this alternative, peak day use (PAOT) would increase by 14%, from 8,272 to 9,449; while maximum overnight capacity would increase by 37%, from 6,564 to 9,006 people per night. To help manage this increase in visitation and ease crowding and congestion, a range of transportation management measures, including a possible East Valley day use parking permit system, would be implemented to ease crowding and congestion in Segment 2 on peak use days.

**Transportation.** Both regional transit and valley shuttle options would be expanded and visitors would be encouraged to park outside of the park and take public transit into the valley. Vehicles driving into the valley would be subject to transportation fees, be directed to overflow parking in the West Yosemite Valley, and ultimately require a parking reservation. In Segment 2, there would be a total of 2,598 day use parking spaces, an 11% increase over the spaces currently available. Within the valley, roundabouts would be added to control traffic flow and pedestrian underpasses would be constructed at Camp 6/Yosemite Village and Yosemite Lodge to improve traffic flow and visitor safety. These improvements would lessen traffic jams; assure that visitors entering the park have a place to park, thus eliminating unnecessary circling; and allow visitors to participate in scenic driving free of congestion, and get to their ultimate destination sooner.

For some day visitors, taking a shuttle into the park would improve their experience because they would not be subject to transportation fees, parking in remote lots, or parking reservation requirements. For those who either need their vehicle to access camping or overnight lodging or simply want or need to have their vehicle, the East Valley day use parking permit system would improve the experience of driving in the park on peak days.

**Overnight Accommodations.** The amount of overnight lodging in Segment 2 under Alternative 6 would increase 20% over Alternative 1, from 1,034 units to 1,248 units. This increase would not meet

the demand for overnight lodging during peak months, and some visitors would not be able to reserve lodging at the times they desire.

**Camping.** The number of campsites would increase from 466 to 739 sites, a 59% increase in the number of campsites and the most campsites of any alternative. In addition to traditional campsites, new walk-in, RV, and groups sites would broaden camping opportunities for visitors. The overall increase would help meet the current unmet demand for campsites.

**Commercial.** Visitor-serving facilities would be reduced in Segment 2 under Alternative 6 and would be focused on serving immediate visitor needs for food and beverages. Grocery stores and dining facilities would remain at Curry Village, Yosemite Village, Yosemite Lodge, The Ahwahnee, and Housekeeping Camp. Some retail facilities would also be removed. These actions, coupled with the removal of facilities common to Alternatives 2–6, would result in a visitor experience that is less focused on commercial activities. Some visitors would miss the additional opportunities for shopping, eating, and recreating. Others would see the removal of these facilities and services as an action in keeping with enhancing the natural character of the valley.

**Recreation Facilities.** A wide variety of nature-based recreational activities, such as hiking, visiting key destinations, contemplation, rafting, and swimming, would continue as an integral part of the visitor experience. These activities are the reason most visitors come to Yosemite and would continue to be popular activities. As the total number of visitors increase under Alternative 6, visitors engaged in these activities would likely experience crowded conditions during certain times of day, especially during the peak season.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result local, long-term, minor to moderate, beneficial impacts on visitor experience and recreation within Segment 2. Actions to manage user capacities, land use, and facilities would also have minor beneficial impacts on visitor experience and recreation within Segment 2.

### **Segment 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

In addition to the actions common to Alternatives 2–6 in Segments 3 and 4, additional actions would improve and protect the oak habitat in Segment 3.

#### ***Impacts of Actions to Manage User Capacity and Facilities***

**Boating.** Alternative 6 would implement boating restrictions in Segments 3 and 4, limiting put-in and take-out locations and limiting the number of boats per day to 10 per segment. This would reduce the ability of visitors to casually boat on the Merced River.

**Total Visitors.** Under Alternative 6, the number of visitors passing through Segments 3 and 4 is expected to remain constant with no change from Alternative 1.

**Parking.** The day parking capacity would be the same as under Alternative 1, with 180 spaces in Segment 3 and 214 spaces in Segment 4. Parking is not likely an issue for visitors in these segments. Segments 3 and 4 would continue to be characterized by its scenery, lack of crowds, and variety of water-based recreation opportunities.

Alternative 6 would add a 200-vehicle parking lot in El Portal, which would provide remote parking for valley visitors. This would be a valuable addition for those visitors who prefer to avoid the lines and permits required to access the valley but would not affect those who choose to recreate in Segments 3 and 4.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, long-term, negligible, beneficial impacts on visitor experience and recreation within Segment 4. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, adverse impacts on visitor experience and recreation within Segments 3 & 4.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### *Impacts of Actions to Protect and Enhance River Values*

In addition to the resource actions common to Alternatives 2–6, 13 sites would be removed from the Wawona Campground to protect cultural resources and the 100-foot riparian buffer. Visitors who value improved resource conditions would find removal of these campsites beneficial to their experience and in keeping with this restoration-intensive alternative. Removal of these campsites would have a negative impact on the experience of those visitors for whom camping close to the South Fork Merced River is an important part of their experience of Yosemite.

#### *Impacts of Actions to Manage User Capacity and Facilities*

**Recreation Facilities.** The Wawona Golf Course, golf shop, and tennis courts would be retained under Alternative 6. This is a beneficial decision for the relatively small number of golfers and tennis players, but an adverse impact on those who believe that golf is an inappropriate activity so close to the river. For most guests, tennis and golf do not have an effect on their visitor experience. The retention of these facilities is not in keeping with a visitor experience characterized by nature-based, river-dependent activities.

Removal of the Wawona stables would completely eliminate day rides from Segment 7. For visitors who participate in this activity, this action would negatively affect their visitor experience. However, a limited number of visitors participate in this activity, so its removal would not affect most visitors in Wawona.

**Boating.** Boating would be allowed in Segment 7 but regulations would limit put-in and take-out sites and the number of boats to 10. This would negatively affect those visitors who are accustomed to unrestricted access, though the 10 boat restriction is twice as many boats as allowed under Alternative 5.

**Overnight Accommodations.** The number of overnight lodging units at the Wawona Hotel would remain the same as under Alternative 1. Demand for overnight reservations would continue to exceed

demand throughout the season. The removal of 13 sites from the Wawona Campground would result in a 14% reduction in the number of campsites. Demand frequently exceeds supply at this campground and removal of these sites, coupled with visitation levels that are equal to the current levels, would exacerbate this problem.

**Parking.** Total parking spaces in Wawona would remain at 290 spaces. This number is currently inadequate during peak times, and visitors would continue to experience crowding and congestion as they search for parking.

**Total Visitation.** The total number of visitors to the South Fork Merced River under Alternative 6 is expected to stay the same as under Alternative 1. Crowding and congestion occur in Wawona and along the South Fork Merced River during peak times and this would continue. Peak day use levels (PAOT) would increase over that of Alternative 1, from 1,295 to 1,606, primarily due to increased transit use.

**Segments 5-8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, negligible to minor, beneficial impacts on visitor experience and recreation within Segments 5-8.

### **Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

The focus of Alternative 6 is on diversified visitor experiences and selective riverbank restoration. Alternative 6 would achieve this, but not without having some impacts on visitor use and experience. Like Alternative 5, Alternative 6 also attempts to balance restoration and visitor use and provides a number of methods to manage crowding and congestion and improve the visitor experience. Restoration activities would be noticeable to visitors, but less intense than the restoration proposed under other alternatives. In general, restoration actions improve the quality of natural resources and thus the overall visitor experience. Under Alternative 6, the extent of the restoration actions is 170 acres, in addition to those restoration actions that are common to Alternatives 2–6, and presents the least restoration of any action alternative. These actions are highly beneficial to resource conditions and river function and slightly limit access to and availability of recreation and visitor services, and the overall visitor experience.

Actions under Alternative 6 would reduce recreational activities that are not directly resource-based. Under Alternative 6, Merced Lake High Sierra Camp would be retained; Little Yosemite Valley wilderness zone capacity and overnight wilderness permits would remain as under current conditions; bicycle rentals, commercial stock use, tennis, and swimming pool, and most nonriver-related visitor services would be eliminated; lodging would increase 18% and camping 46%; and peak day use levels (PAOT) would increase throughout the corridor by an average of 12%. A roundabout and two pedestrian underpasses in the valley, as well as remote parking lot in El Portal, would be added to address expanded visitation and reduce congestion in the valley. Total parking capacity would increase by 7%. These actions would improve the experience of visitors once they were within the Merced River corridor due to less congestion, and would also address the demand for more camping in the valley. Because Alternative 6 would increase visitor access and add congestion and crowding

controls, more visitors than under current conditions would be able to gain access to the East Valley via private vehicle and the experiences it provides. Overall, with implementation of mitigation measure MM-VEX-1 and MM-VEX-2, as appropriate (see Appendix C), these actions result in a corridorwide, long-term, moderate, adverse impact on access to and availability of recreation and visitor services and the overall quality of the visitor experience.

### **Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Cumulative effects on visitor experience as it relates to visitor services are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of the actions under Alternative 6. Cumulatively considerable projects would be the same as those identified for Alternative 2, and include only those that could affect visitor experience within the Merced River corridor or in the park vicinity.

### ***Overall Cumulative Impact from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

The cumulative impacts of Alternative 6 management measures on visitor experience would generally be beneficial in Segments 1–8. Past and present visitor services improvements and upgrades would enhance visitor experience and reduce the existing stress on visitor facilities. Visitors would also benefit from past and present habitat and riverbank restoration and resource management projects and plans. As a result, the cumulative impact of Alternative 6 management measures, in light of past, present, and reasonably foreseeable future projects, would be parkwide, long term, minor to moderate, and beneficial.

## Wilderness Character

### *Affected Environment*

#### Regulatory Framework

##### *The Wilderness Act of 1964*

The Wilderness Act of 1964 directed the Secretary of the Interior to study federal lands within the National Wildlife Refuge and National Park Systems, and recommend to the president those lands suitable for inclusion in a National Wilderness Preservation System. The Secretary of Agriculture was similarly directed to study and recommend such lands within the National Forest System. The Wilderness Act, which grants Congress final decision-making authority regarding designations, defines wilderness as including the following characteristics:

*...wilderness, in contrast with those areas where man and his own works dominate the landscape, is hereby recognized as an area where the earth and its community of life are untrammeled by man, where man himself is a visitor who does not remain. An area of wilderness is further defined to mean in this chapter an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions and which (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation...*

The Wilderness Act prohibits certain uses in designated wilderness including motor vehicles, motorized equipment, landing of aircraft, other forms of mechanized transport, and structures or installations except as necessary to meet the minimum requirements for the administration of the area for the purpose of the Act.

##### *The California Wilderness Act of 1984*

With passage of the Wilderness Act of 1984, the majority of Yosemite National Park was designated as wilderness. Certain other lands, some of which involved uses prohibited under the Wilderness Act of 1964, were identified as potential wilderness additions. According to the act, potential wilderness additions would become designated wilderness upon the Secretary of the Interior's publication in the *Federal Register* of a notice that all prohibited uses have ceased.

##### *Management Policies 2006*

The National Park Service (NPS) *Management Policies 2006* provide guidance to park managers on several wilderness-related topics. These policies specify that the NPS will manage wilderness areas for the physical protection of wilderness resources, but also the preservation of the area's wilderness character. In carrying out these objectives, the superintendent of each park containing wilderness is tasked with developing and maintaining a wilderness management plan to guide the preservation, management, and use of wilderness resources. The plan identifies desired future conditions and

thresholds beyond which management actions will be taken to reduce human impacts on wilderness resources. In Yosemite, wilderness areas are managed under the 1989 *Yosemite Wilderness Management Plan* (described below).

#### ***Director's Order 41: Wilderness Preservation and Management***

Director's Order 41 builds on the wilderness-related policies set forth in the *NPS Management Policies 2006*, providing additional detail and instruction regarding the stewardship of NPS lands designated or having the potential to be designated wilderness. To further wilderness preservation and stewardship objectives, Director's Order 41 approved a wilderness guidance manual (*Reference Manual #41*), established a wilderness stewardship steering committee, and set forth a framework for wilderness stewardship responsibility and accountability. Director's Order 41 also identifies and provides guidance on specific wilderness stewardship issues, such as the types of activities that may or may not be authorized under the Wilderness Act's administrative exception to the general use prohibitions (that is, use of motorized equipment, etc.).

#### ***Yosemite Wilderness Management Plan (1989)***

The Yosemite Wilderness was established by the California Wilderness Act of 1984. The committee report accompanying the 1984 act contains recommendations for managing Yosemite Wilderness regarding operational and environmental impacts. The *Yosemite Wilderness Management Plan* responded to those recommendations in addition to a number of objectives identified through condition reports and other research. In the near future, the NPS anticipates development of *The Yosemite Wilderness Stewardship Plan* and *Yosemite Wilderness Stewardship Plan Environmental Impact Statement* (EIS).

### **Wilderness Character**

In 1964 Congress passed the Wilderness Act, creating the National Wilderness Preservation System, which "secure[d] for the American people an enduring resource of wilderness." In 1984 Congress designated 95% of Yosemite National Park as part of that National Wilderness Preservation System. Many Yosemite visitors travel into the wilderness to seek the beauty, solitude, and challenge that Congress sought to protect with wilderness designation.

The California Wilderness Act of 1984 (Public Law [PL] 98-425) directs the NPS to manage areas designated as wilderness according to provisions of the Wilderness Act of 1964. Although many intangible aspects of wilderness character are important, the NPS (Landres et al. 2008) has identified four qualities that are practical and measurable and rooted in the Wilderness Act. They are:

- **Untrammeled** – Wilderness is essentially unhindered and free from modern human control or manipulation. This quality is diminished by modern human activities or actions that control or manipulate the components or processes of ecological systems inside the wilderness.
- **Natural** – Wilderness ecosystems are substantially free from the effects of modern civilization. This quality is diminished by intended or unintended effects of modern people on the ecological systems inside the wilderness since the area was designated.

- **Undeveloped** – The Wilderness Act states that wilderness is “an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation,” “where man himself is a visitor who does not remain” and “with the imprint of man’s work substantially unnoticeable.” This quality is diminished by the presence of structures, installations, and habitations and by the use of motor vehicles, motorized equipment, or mechanical transport that increases people’s ability to occupy or modify the environment. Development in the wilderness such as trails, designated camping areas, composting toilets and bear boxes is intended, not for the convenience of visitors, but to protect the wilderness character.
- **Solitude or Primitive and Unconfined Recreation** – The Wilderness Act states that wilderness has “outstanding opportunities for solitude or a primitive and unconfined type of recreation.” This quality is about the *opportunity* for people to experience wilderness; it is not directly about visitor experiences in itself. This quality is diminished by settings that reduce these opportunities, such as visitor encounters, signs of modern civilization, recreation facilities, and management restrictions on visitor behavior.

## **Yosemite Wilderness**

Bounded by the Emigrant Wilderness to the north, the Hoover Wilderness to the east, and the Ansel Adams Wilderness to the south, the Yosemite Wilderness encompasses an area totaling 706,624 acres, which is approximately 95% of the total park area. Another 927 acres of the park are identified as potential additions to the Yosemite Wilderness.

In comparison to the non-wilderness areas, there is generally less visitor use in wilderness areas. Wilderness visitation in Yosemite is generally concentrated within a few popular locations, campsites, and trails. The majority of wilderness visitor use occurs within less than 30% of the park’s wilderness areas, with most use distributed along approximately 70 miles of the park’s 800-mile wilderness trail system (Newman 2001). The majority of Yosemite’s trails evolved from travel routes created and used by American Indians, cattle and sheep men, the U. S. Cavalry, and the NPS. As the number of people traveling the trails increased, the NPS responded with increased trail maintenance. In contrast, a small number of trails in Yosemite were created specifically for tourism. These include many of the trails that lead out of Yosemite Valley, as well as the trails that lead up the rocky canyons of both the Merced and Tuolumne Rivers. These routes are in steep, rugged terrain and required prodigious efforts to construct. They contain an immense amount of rock work, and some involved significant blasting of bedrock. These trails provide access to areas that would otherwise be very difficult for most hikers to reach without technical rock climbing or canyoneering skills. It is unlikely that such trail construction would have been allowable had the wilderness designation been in place at the time of trail construction.

In Yosemite, overnight access to the wilderness is controlled by a system of permits and the wilderness trailhead quota system based upon wilderness zones. The wilderness is divided into 53 wilderness travel zones. Zone boundaries are generally based on watershed boundaries. In order to limit use and preserve resource integrity, each zone has a designated carrying capacity based on its physical and ecological factors. Based on the capacity of the zones through which the trail travels, each wilderness trailhead is assigned a numeric quota that equals the number of overnight visitors who can depart from

that trailhead each day. Day users are not included in this quota and are not required to have a permit except to climb Half Dome.

A wilderness permit is required for all groups planning an overnight stay in the wilderness. Permits are given to groups of hikers, with a maximum of 15 hikers in a group. Therefore, a trailhead with a 30 people per day quota could be made up of 2 permits for two groups of 15, 6 permits for six groups of 5, or 15 permits for 15 groups of two. **Table 9-146** indicates overnight visitation in the wilderness from 2006 through 2010. In 2010, the average group size in the wilderness, based upon the data in table 9-146, was 2.9 and the average visit duration was 2.7 nights.

**TABLE 9-146: YOSEMITE WILDERNESS OVERNIGHT VISITOR USE**

	2006	2007	2008	2009	2010
Total Overnight Visitors	40,804	43,401	45,907	52,610	53,139
Total Permits Issued (*)	14,141	15,125	15,156	18,777	18,632
Total Overnight Stays	82,484	112,049	124,817	142,623	142,864
(SOURCE: NPS 2012D)					

In addition, to minimize resource impacts, park wilderness and resource management staff identify and restore areas exhibiting visitor use impacts. Restoration measures include removing illegal and/or excessive campsites, reducing in size certain fire rings and removing associated trash and charcoal, obliterating obsolete or informal trails, and using control measures for non-native vegetation growth.

### *Study Area Wilderness*

Approximately 70% of the Merced River in Yosemite flows through designated wilderness. Within the study area, which extends 1.25 miles on either side of the Merced River, there is a total of approximately 95,980 acres of designated wilderness, approximately 14% of the entire Yosemite Wilderness. There are 141 miles of wilderness trails within the study area.

### *River Corridor Wilderness*

Within the river corridor, there are 18,677 acres of wilderness. Along the river's main stem, the wilderness boundary begins approximately 100 feet upstream of Nevada Fall (in Segment 1). Portions of the South Fork Merced River within the park also flow through wilderness beginning below the Wawona impoundment and extending to the park boundary (Segment 5). The entirety of Segment 1 (12,000 acres) and Segment 5 (5,500 acres) are designated wilderness with the exception of the eight-acre area around Merced Lake High Sierra Camp which is a potential wilderness addition because of its current developed state.

**Table 9-147** indicates the number of acres and percentage of wilderness within those segments containing wilderness and indicates the miles of wilderness trails in each segment. Segment 4 does not contain any designated wilderness. Segment 6 contains the Wawona Impoundment which itself is not located in designated wilderness. However, the lands adjacent to the impoundment within the River

**TABLE 9-147: ACRES OF WILDERNESS IN RIVER CORRIDOR BY SEGMENT**

Segment Number	Total Acres in Segment	Acres of Wilderness in Segment	Percent of Segment in Wilderness	Miles of Trails in Wilderness Portion of Segment
1	12,104	12,104	100%	26.0
2	3,648	667	18%	0.8
3	2,240	61	3%	0.1
5	5,507	5,507	100%	4.1
6	17	15	88%	0.8
7	1,446	323	22%	0
<b>River Corridor Total</b>	<b>24,961</b>	<b>18,677</b>		<b>31.8</b>

Corridor are designated wilderness. This accounts for the wilderness acres in this segment. Segment 8 is not located within designated wilderness and is therefore not subject to the requirements of the Wilderness Act. Although not designated wilderness, Segment 8 is a wild segment of the Merced Wild and Scenic River. Wild segments are "...sections of rivers that are free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted."

**Trails.** Within the Merced River corridor, wilderness areas above Nevada Fall (Segment 1) have approximately 26 miles of trail, some of which are heavily used. Primary access to this area is provided by the Mist Trail and John Muir Trail, which originate in Yosemite Valley. Wilderness access along the South Fork Merced River (Segment 5), which includes approximately 4 miles of trail, is more limited and is accessed from U.S. Forest Service trailheads that enter the park at Chiquito Pass and Fernandez Pass.

**Wilderness Zones.** The River Corridor contains portions of 15 wilderness zones as indicated in **table 9-148**. Overnight access to the wilderness is controlled by daily visitor quotas established for each wilderness zone.

Segment 1 includes portions of eight different wilderness zones as indicated in **table 9-149** below. The Mist Trail and John Muir Trail, originating within Yosemite Valley, are most commonly used to access the Merced River corridor. The following trailheads originate in Yosemite Valley and provide access to Segment 1. These trailheads are used by 67% of visitors to access Little Yosemite Valley and by 26% of visitors to access Merced Lake. Other trailheads providing access to these areas include those outside the park on Forest Service land and those upstream such as trailheads in Tuolumne Meadows. Yosemite Valley trailheads and their respective overnight quotas are:

- Happy Isles to Sunrise/Merced Lake Pass Thru (no camping in Little Yosemite Valley) – 10
- Happy Isles to Little Yosemite Valley (first night at Little Yosemite Valley camping area) – 30
- Happy Isles to Illilouette – 10
- Glacier Point to Little Yosemite Valley (first night at Little Yosemite Valley camping area) – 10

**TABLE 9-148: WILDERNESS ZONES WITHIN THE RIVER CORRIDOR**

Wilderness Zone #	Wilderness Zone	Acres within the River Corridor
61	Washburn Lake	5,060
50	South Fork Merced River	3,379
58	Clark Range	2,418
60	Merced Lake	2,026
62	Mount Lyell	1,965
52	Chilnualna Creek	1,169
59	Little Yosemite Valley	1,145
51	Johnson Creek	758
47	Half Dome	282
68	Yosemite Creek	187
55	Bridalveil Creek	121
57	Illilouette Creek	70
56	Buena Vista Creek	69
66	Sunrise Creek	16
67	Snow Creek	14
<b>Total Acres Wilderness</b>		<b>18,679</b>

**TABLE 9-149: SEGMENT 1 – WILDERNESS ZONES WITHIN SEGMENT 1**

Wilderness Zone	Acres of Zone in River Corridor	Miles of Trails in Wilderness Zone in River Corridor
Washburn Lake	5,060	11.70
Merced Lake	2,026	7.12
Mount Lyell	1,965	
Clark Range	1,878	2.53
Little Yosemite Valley	1,145	4.50
Sunrise Creek	16	
Half Dome	10	
Illilouette Creek	4	0.14
<b>Wilderness Total</b>	<b>12,104</b>	<b>25.99</b>

In the mid- to late 1990s, the park reduced the number of overnight wilderness visitors from 125 to 75 per day from the four trailheads that provide access to Segment 1 from Yosemite Valley due to an increase in visitors traveling to Little Yosemite Valley from trailheads outside of Yosemite Valley. This reduction kept the overall use of the area within capacity. Table 9-150 shows average 2010 inbound trail use along the Merced River corridor (i.e., hikers traveling from Little Yosemite Valley toward Merced Lake and the wilderness) and indicates that during the 2010 season, an estimated average of 30 trail users per day departed from Little Yosemite Valley toward Merced Lake, for a total of 2,864 hikers.

**TABLE 9-150: TRAIL USE ABOVE LITTLE YOSEMITE VALLEY TO MERCED LAKE (2010)  
(WILDERNESS-BOUND HIKER TRAFFIC)**

Month	Average Daily Use	Total
July	31	952
August	34	1,063
September	23	677
October <sup>a</sup>	10	117
Total Season (July to September)	30	2,864
NOTE: <sup>a</sup> Use counts were taken from October 1 through October 12. SOURCE: NPS 2011h		

Segment 5 includes portions of eight different wilderness zones as indicated in **table 9-151** below. Wilderness trailhead quotas in Segment 5 are Chilnualna Falls trailhead (40), Alder Creek trailhead (15), and Deer Camp trailhead (25) with the majority of access originating on Forest Service land outside of the park. Wilderness trips originating from Wawona in 2010 constituted just 9% of the park's total for that year. With only limited access along the upper reach (Segment 5) it is expected that only a small fraction of these trips occurred within the river corridor.

**TABLE 9-151: SEGMENT 5 – WILDERNESS ZONES WITHIN SEGMENT 5**

Wilderness Zone	Acres of Zone in River Corridor	Miles of Trails in Wilderness Zone in River Corridor
South Fork Merced River	3,379	3.99
Chilnualna Creek	831	
Johnson Creek	758	0.15
Clark Range	539	
<b>Wilderness Total</b>	<b>5,507</b>	<b>4.14</b>

### *Segment 1: Merced River Above Nevada Fall*

**Untrammelled.** Human activities and actions that control or manipulate the components or processes of ecological systems in Segment 1 include the following:

- hazard tree removal at the designated camping areas, ranger stations, and High Sierra Camp
- restoration projects of all types
- diversion of water for the High Sierra Camp, and
- management of lightning-caused fire.

**Natural Condition.** Effects of modern civilization on the ecosystem in Segment 1 include the following:

- climate change
- airborne contaminants
- vegetation changes due to fire suppression
- vegetation damage and soil loss along trails, in designated camping areas and dispersed campsites due to off-trail use and concentrated use
- unburied human waste
- wildlife accustomed to human use
- vegetation damage from meadow grazing by livestock
- trail and meadow damage from stock use
- livestock manure
- litter
- spread of invasive plant, animal, and fungal species

**Undeveloped.** Permanent/semi-permanent improvements or human habitation in Segment 1 include the following:

- Trail signage at various locations.
- Little Yosemite Valley Ranger Station has three canvas-wall tents, an outdoor roofed cooking area, corral, and storage sheds. At any point in time there are two to four rangers, and two or fewer researchers. There are also occasional trail crews ranging in size from five to 15 people.
- Merced Lake Ranger Station - The three—room cabin, constructed in 1927 was originally constructed for winter service in connection with the acquisition of hydrologic data. At this time, cabins are utilized primarily as staging areas and collection points for park backcountry patrol and maintenance projects.
- Three wilderness camping areas located in:
  - Little Yosemite Valley (can accommodate approximately 150 backpackers and has two fire rings, a composting toilet, and bear-proof boxes).
  - Merced Lake (can accommodate approximately 90 backpackers and has a drinking water fountain, two flush toilets, a septic system, and bear-proof boxes).
  - Moraine Dome (can accommodate approximately 50 backpackers and has bear-proof boxes).
- The Merced Lake High Sierra Camp, which accommodates 60 overnight guests and has 22 tents, a kitchen and dining hall, barn, ice house (used for perishable food storage), toilet building with eight water closets, and separate men's and women's shower houses with eight total shower

stalls and eight sinks. The kitchen, ice house, and toilet building are permanent wooden structures built on concrete slabs. The barn is a wooden structure with wood flooring. Canvas tents are used for the guest quarters, shower houses, and dining hall. These tents are erected with steel poles on concrete slabs at the beginning of each season and dismantled at the end of the season. The guest cabins do not have woodstoves, but there is a woodstove in the dining hall. The sewer system consists of a septic tank, lift station (powered by solar panels), dosing tank, leach field, and associated piping. The water system consists of a chlorinator shed, water pump (powered by solar panels), sand filter, three 1,500-gallon tanks, and associated piping. Worth noting is the designation of this site as a potential wilderness addition; however, its presence is noticeable from adjacent designated wilderness areas. Similarly, maintenance and upkeep of the camp, including frequent stock trips and periodic helicopter deliveries and waste removal, have impacts on the character of adjacent wilderness areas.

**Solitude.** Factors that reduce visitors' ability to experience solitude include:

- Number of visitors
- Length of stay
- Group size
- **Visitor Encounters.** The frequency of encounters with other people or groups along trails is commonly used as a proxy to evaluate opportunities for solitude in wilderness settings. Park staff measure encounter rates through actual trail counts or through surveys that ask visitors to estimate the number of other people/groups encountered during hikes. Increased encounters with other parties in the wilderness can diminish the feeling of solitude. Newman and Manning (2001) found that visitors will tolerate higher numbers of encounters while hiking than while in camp. A 2009 NPS study examined the frequency of wilderness encounters with other hikers at three points in the upper Merced River corridor. The encounter rate findings are shown in table 9-152.

**TABLE 9-152: WILDERNESS ENCOUNTERS OBSERVED IN UPPER MERCED RIVER CORRIDOR (2010)**

Location	Number of Encounters with Other Groups	Number of Encounters with Individuals	Number of Encounters with Stock
Little Yosemite Valley	1.73 parties/hour	4.06 people/hour	1.47 stock/hour
Echo Valley	2.13 parties/hour	5.57 people/hour	unknown
Washburn Lake	0.68 parties/hour	1.58 people/hour	0.09 stock/hour
SOURCE: NPS, 2012d			

The designated wilderness camping areas within Little Yosemite Valley and Merced Lake wilderness zones typically experience heavy use, especially throughout the peak visitation season, between Memorial Day and Labor Day weekends. (Fincher 2010).

**Primitive Recreation.** Factors that reduce the visitors' ability to experience self-reliance and the use traditional skills include:

- Presence of structures and installations
- Use of helicopters and other motorized equipment
- **Recreation Activities.** The majority of types of recreation activities in Segment 1 (hiking, backpacking, fishing and camping) have the dimensions of simplicity, lack of technology, and self-reliance. Photography, swimming, wildlife viewing, and contemplation are also activities that enable wilderness visitors to experience the sense of solitude, self-reliance, exploration, and adventure that contribute to a fulfilling wilderness experience. Guided pack trips and commercial-guided and NPS-guided hiking trips are less primitive (because they are less self-reliant) and less solitary (due to generally larger group sizes) forms of recreation that occur in Segment 1.

**Unconfined Recreation.** Factors influencing unconfined recreation in Segment 1 include:

- Management restrictions on visitor behavior once inside the wilderness including requirements to camp in designated camping areas, requirements where camping is prohibited, regulations prohibiting fires or pets and requiring the use of existing fire rings.

#### *Segment 5: South Fork Merced River Above Wawona*

**Untrammelled.** Human activities and actions that control or manipulate the components or processes of ecological systems are limited in Segment 5 but include restoration activities and suppression of fires caused by lightning.

**Natural Condition.** There are few effects of modern people on the ecosystem in Segment 5. Few studies exist regarding the natural condition of wilderness areas within the South Fork Merced River corridor, and it is generally thought to be in excellent condition. This is due, in part, to its lack of permanent improvements and limited accessibility to wilderness travelers.

Within the overall study area, which includes 1.25 miles on either side of the river corridor, manmade features include a network of small roads in the Sierra National Forest south of the study area, including Iron Creek, Grizzly Creek, and Quartz Mountain Roads.

**Undeveloped.** The only permanent/semipermanent improvements or human habitation in Segment 5 are trails and trail signs. There are no designated camping areas within the wilderness areas of the South Fork Merced River corridor. Horse Thief Camp is an established primitive stock camp occasionally visited by guided pack trip parties. It is one of approximately 50 locations within the park that contains a “drift fence” to contain stock when the camp is in use. Between 2004 and 2010, commercially guided pack trips in Segment 5 averaged 13 stock-use nights, with a high of 50 in 2009. All use occurred at Horse Thief Camp (NPS 2011i).

**Solitude or Primitive and Unconfined Recreation.** Factors that reduce the visitor’s ability to experience the wilderness include visitor encounters and crowding, recreation facilities, and management restrictions. In Segment 5, the following elements affect solitude or primitive and unconfined recreation:

**Visitor Encounters.** Visitation within Segment 5 is considerably lower than in Segment 1. Encounter rates are expected to be low and opportunities for solitude relatively high within the wilderness areas of the South Fork Merced River corridor.

**Recreation.** As with Segment 1, the most common wilderness visitor activities along the South Fork Merced River are primitive in nature. These include hiking and backpacking, with a small amount of private and commercial stock use. Access is via both formal trails and cross country travel. Both day use and dispersed overnight camping occur in this segment.

**Unconfined Recreation.** Management restrictions on visitor behavior once inside the wilderness are limited in Segment 5 as there are no designated camping areas. Wilderness regulations would continue to prohibit pets and camping in certain areas, as well as requiring the use of existing fire rings.

## Wilderness Character

### *Environmental Consequences Methodology*

This analysis evaluates how wilderness character in the Merced River corridor might be altered by the actions described in the alternatives. The elements of wilderness character that are examined are untrammeled, undeveloped, natural character, solitude, primitive, and unconfined recreation.

- **Context.** The context of the impact considers whether the impact would be local, segmentwide, parkwide, or regional. For this analysis, local impacts would be those that occur in a specific area within a segment of the river. This analysis further identifies if there are local impacts in multiple segments. Segmentwide impacts would consist of a number of local impacts within a single segment, or larger-scale impacts that would affect the segment as a whole. Parkwide impacts would extend beyond the river corridor and the study area within Yosemite. Regional impacts would be those that extend to the Yosemite gateway region.
- **Intensity.** The intensity of the impact considers whether the impact on the elements of wilderness character would be negligible, minor, moderate, or major.
  - **Negligible:** There would be no effect or effects would not be measureable. Any effects to wilderness would be slight, short term, and localized to the study area.
  - **Minor:** Effects on wilderness character, including changes in encounter rates, agency imposed restrictions, or natural character, would be detectable.
  - **Moderate:** Effects on wilderness character would be readily apparent, affect the river segment, and possibly extend beyond the river corridor. Mitigation would probably be necessary to offset adverse impacts.
  - **Major:** Effects would be readily apparent and would substantially change wilderness character locally as well as parkwide. Extensive mitigation would likely be necessary to offset adverse impacts and success could not be guaranteed. Major impacts could include adding or removing permanent installations.
- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term. A short-term impact would be temporary in duration, such as impacts associated with construction or restoration activities. A long-term impact would have a

permanent effect on wilderness character, at least within the planning horizon for the Merced River Plan.

- **Type of Impact.** Impacts were evaluated in terms of whether they would be beneficial or adverse to wilderness character. Identification of beneficial and adverse impacts on each of the elements of wilderness character follows:
  - ***Untrammeled.*** The quality of wilderness character protects wilderness areas from modern human control or manipulation of the biophysical environment. An action is considered adverse when there is manipulation of the biophysical environment (such as restoration or controlling fires caused by lightening) and beneficial if it reduces the effects of such manipulation. Generally, an action would only benefit the untrammeled quality if it was a policy change such as no longer suppressing fires in the wilderness.
  - ***Natural.*** This factor considers whether wilderness ecological systems are substantially free from the effects of modern civilization. The effects of an action are considered to be adverse when it increases the effects of modern humans on ecological systems. Effects are considered beneficial when they decrease such effects, through either natural recovery or intentional restoration.
  - ***Undeveloped.*** The Wilderness Act states that wilderness is “an area of undeveloped Federal land . . . without permanent improvements” and “with the imprint of man’s work substantially unnoticeable.” This element considers the amount and type of permanent improvements, structures, installations, and administrative use of motorized tools and mechanized transportation. Improvements in wilderness are generally judged by a number of criteria. Developments in wilderness are generally judged by both number and type. Actions that increase the number of developments or the visual obtrusiveness, permanence, or technological sophistication of the development are considered to be adverse; actions that result in fewer developments or that are less obvious, more temporary, or more primitive are considered beneficial.
  - ***Opportunities for Solitude.*** In wilderness areas, visitor experience is influenced by the number of other groups encountered during a given time period. Actions that increase crowding are considered adverse, while those that reduce crowding are considered beneficial. In high-use wilderness areas such as Segment 1 of the Merced River corridor, solitude is determined to be an area free from crowding. The threshold for crowding is determined in part through visitor surveys that indicate values and attitudes on crowding and congestion. These survey results are compared to encounter rates, people at one time, and/or people per viewshed to determine how visitor-informed thresholds for crowding compare with actual visitor use.
  - ***Primitive Recreation.*** The opportunity for primitive recreation and the quality of primitiveness were considered as having the dimensions of simplicity, lack of technology, and self-reliance (Johnson, Hall, and Cole 2005). Actions that decrease the opportunities for this type of recreation are considered adverse; those that increase such opportunities are considered beneficial.
  - ***Unconfined Recreation.*** This factor considers the difficulty for visitors to travel freely once inside the wilderness and the extent of regulatory requirements placed on them. Actions which increase the managerial control and oversight of wilderness visitors such as requiring visitors to camp in designated areas, are considered adverse, while those that reduce managerial control and oversight are considered beneficial.

## ***Environmental Consequences of Alternative 1 (No Action)***

The following section provides an overview of the types of impacts on wilderness character that could occur within the Merced River corridor under Alternative 1 (No Action). This analysis of impacts is limited to Segments 1 and 5. The entirety of Segments 1 and 5 are designated wilderness.

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

**Untrammeled.** Under Alternative 1 (No Action), current activities and actions that exhibit human control and manipulation of the landscape would continue. These management activities strive to repair visitor impacts and include restoration, removal of non-native vegetation, obliterating informal trails, and removal of illegal campsites, fire rings and trash. Although beneficial to other aspects of wilderness character, these activities would have the effect of further manipulating the natural environment. Because these activities are generally over relatively small areas, the impacts of these activities on the untrammeled character of the wilderness would be local, negligible, long-term, and adverse.

**Natural.** Under Alternative 1 (No Action) the current management activities described above would serve to improve the natural conditions in Segment 1. Removal of non-native vegetation, obliteration of informal trails, educational and enforcement efforts to alter visitor behavior and lessen their impact, and other management activities would allow natural processes to continue with reduced interference from human impacts. The impact of these activities on the natural character of the wilderness would be local, minor, long-term and beneficial.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

**Untrammeled.** Under Alternative 1 (No Action) activities such as hazard tree removal to protect visitors to the Merced Lake High Sierra Camp, would maintain the human control and manipulation of a natural processes. The impacts of this and similar activities on the untrammeled character of the wilderness would be local, minor, long-term, and adverse.

**Undeveloped.** Under Alternative 1 (No Action), the permanent and semi-permanent structures and facilities in Segment 1 would remain as they are currently and be managed and maintained as they are today. These include the structures and infrastructure at Merced Lake High Sierra Camp, the designated camping areas, and the ranger stations. Motorized equipment would remain in use to operate the High Sierra Camp. Occasional helicopter use would continue to be used to transport goods, materials and waste that cannot be transported by stock to and from the High Sierra Camp. There would be no additional development or improvements under Alternative 1 (No Action). The impact of these activities on the undeveloped character of the wilderness would be local, major, long-term, and adverse.

**Natural.** Under Alternative 1 (No Action), most wilderness natural resources and ecosystems would remain intact because of the relationship between resource protection and wilderness quotas. In areas

of more intense visitor use (designated camping areas, Merced Lake High Sierra Camp, and along trail corridors), natural resources would continue to show impacts of human use although some restoration and repair would continue to occur. Wilderness patrols, permit requirements, and educational efforts designed to help visitors understand and protect natural resources by altering their behavior would also benefit the natural component of wilderness character. Degradation of meadows and other sensitive resource areas would continue from stock grazing. The projected increase in day visitors in Little Yosemite Valley due to increased park visitation may increase human impacts on the natural resources in this portion of Segment 1. This increase would be small because day hikers must hike 2.5 miles before reaching the Segment 1 wilderness. (Day hikers (except those climbing Half Dome) do not require a permit to hike into the wilderness). Current activities have both adverse and beneficial impacts on the natural character of the wilderness. Overall however, Alternative 1 (No Action) would have a local, moderate, long-term, adverse impact on the natural character of the wilderness.

**Solitude.** Under Alternative 1 (No Action), wilderness encounter rates closest to Segment 2 would be expected to increase slightly from current rates due to increased visitation to the park. This increase would be small because day hikers must hike 2.5 miles before reaching the Segment 1 wilderness. (Day hikers (except those climbing Half Dome) do not require a permit to hike into the wilderness). Encounter rates would remain at current levels farther into the wilderness as the wilderness zone capacities are not expected to change. The total wilderness zone capacity in Segment 1 would remain at 380 people. Conflicts and encounters between stock and hikers would also continue under Alternative 1 (No Action). Designated camping areas would remain in Alternative 1 and are less conducive to solitude than dispersed camping. Impacts of Alternative 1 (No Action) on solitude would be local, minor, long-term and negligible.

**Primitive.** Under Alternative 1 (No Action), most experiences in the Yosemite Wilderness would remain as they are today— primitive in nature and exhibiting simplicity, self-reliance, and a lack of technology. Predominant activities, which would continue under Alternative 1, are hiking and backpacking. Camping would continue to be a mix of dispersed camping and camping in the three wilderness camping areas in Segment 1 (Merced Lake and Little Yosemite Valley, which have developed facilities including restrooms, and Moraine Dome, which does not have any developed facilities). Fishing would also continue in Segment 1 under this alternative. Boating would continue to be prohibited in designated wilderness. Activities that would continue and are less primitive in nature include overnight concessioner pack trips. Areas that would continue to promote a less primitive experience are the Merced Lake High Sierra Camp, a developed overnight facility with 60 beds, food service, and restrooms. Impacts of Alternative 1 on the primitive quality of the wilderness would be local, major, long-term and adverse.

**Unconfined Recreation.** Under Alternative 1 (No Action), the ability for visitors to travel freely once inside the wilderness and the regulatory requirements placed upon them would remain as they are today. Permit regulations would remain unchanged. Day hikers not going to Half Dome do not need a day-use permit to hike in the wilderness and therefore would continue to have the greatest opportunity for unconfined recreation. Alternative 1 would have a segment-wide, moderate, long-term and adverse impact on the unconfined quality of wilderness.

**Segment 1 Impact Summary:** Implementation of Alternative 1 would result in segmentwide and local, long-term, moderate to major, adverse impacts on wilderness character within Segment 1.

## **Segment 5: South Fork Merced River Above Wawona**

### ***Impacts of Actions to Protect and Enhance River Values***

**Natural.** Under Alternative 1 (No Action), the ecosystem in Segment 5 would continue to function with limited human interference due to the near absence of facilities in this segment and the rugged nature of the landscape.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

**Undeveloped.** There are no developed facilities in Segment 5. Therefore, Alternative 1 (No Action) would have no impact on the undeveloped character of the wilderness.

**Solitude.** Under Alternative 1 (No Action), a wide range of opportunities for solitude would continue. Encounter rates in Segment 5 are not well studied, but this segment is less frequently visited than Segment 1. The total capacity of the wilderness zones in Segment 5 would remain at 15. Alternative 1 (No Action) would have no impact on solitude.

**Primitive.** Under Alternative 1 (No Action), there would be no developed facilities in Segment 5; thus, experiences in this segment would remain primitive in nature and exhibit simplicity, self-reliance, and a lack of technology. Alternative 1 (No Action) would have no impact on the primitive character of wilderness in Segment 5.

**Unconfined Recreation.** Under Alternative 1 (No Action), the wilderness permit system would continue to regulate certain activities while visitors are in the wilderness including the use of existing fire rings and the minimum distance a camp site can be from the water. Alternative 1 would have a segmentwide, negligible, long-term, adverse impact on unconfined recreation in Segment 5.

**Segment 5 Impact Summary:** Implementation of Alternative 1 would result in segmentwide, long-term, negligible, adverse impacts on wilderness experience within Segment 5.

## **Summary of Impacts from Alternative 1 (No Action)**

Under Alternative 1 (No Action), the greatest impacts on the wilderness character in Segment 1 would be from the infrastructure and visitor use associated with the Merced Lake High Sierra Camp and from improvements to and concentrated visitor use of the three wilderness camping areas in this segment— Little Yosemite Valley, Moraine Dome, and Merced Lake. In addition, under Alternative 1, the wilderness permit requirements detract from the character of unconfined recreation. Alternative 1 would have a local, moderate to major, long-term, adverse impact on wilderness character in Segment 1. In Segment 5, the impact of Alternative 1 (No Action) on wilderness character would be negligible.

## Cumulative Impacts of Alternative 1 (No Action)

Cumulative effects on wilderness character are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region. The projects identified below include only those projects that could affect wilderness character within the river corridor or in the study area.

### *Past Actions*

The wilderness permit/trailhead quota system, established in 1974–1976, set limits for the number of people allowed entering the wilderness per day per trailhead. These limits were based on extensive research and monitoring to assess capacity based on ecological and social considerations, and were in response to exceptionally high levels of use in the early to mid-1970s. This system has had beneficial impacts on the wilderness character by protecting natural resources; by contributing to the untrammelled, undeveloped, and natural character of the wilderness; and by providing solitude and primitive and unconfined recreation. In recent years, Yosemite has issued wilderness permits through the use of a trailhead quota system. This limits the number of people camping in the wilderness, thereby enhancing opportunities for experiencing solitude. However, this system represents an agency restriction that affects unconfined recreation in the wilderness.

### *Present Actions*

The wilderness permit/trailhead quota system continues to limit and/or disperse use based on trailhead access. Limiting the number of overnight visitors is likely to protect natural values, and promote solitude but has an adverse impact on the unconfined component of wilderness character.

The Half Dome Interim Permit Program: 2010-2012 manages access to Half Dome to a target of 400 people per day. This permit system is considered the minimum required action to protect and enhance all aspects of wilderness character, particularly opportunities for solitude. The purpose and need for this project was to protect and enhance wilderness character, address safety and risk management concerns, and bring the Half Dome Trail corridor into compliance with the Wilderness Act.

The *Half Dome Trail Stewardship Plan* addresses crowding along the length of the two-mile trail and by doing so, addresses congestion on the final 400 feet of the trail to the summit. The Half Dome trail is outside the Merced River corridor but within the study area.

The Wilderness Restoration Program ecologically restores visitor use impacts to protect and enhance the natural condition and wilderness character.

Several other plans or restoration efforts are in various stages of development and implementation, including the following:

- *Fire Management Action Plan for Wilderness* (U. S. Forest Service [USFS])
- *Sierra Nevada Framework for Conservation and Collaboration* (USFS)

- Management Direction for the John Muir, Ansel Adams and Dinkey Lakes, and Monarch wildernesses (USFS)
- *Pinecrest Basin Forest Plan Amendment* (USFS, Stanislaus National Forest)
- *Tuolumne Wild and Scenic River Comprehensive Management Plan* (NPS)

### ***Reasonably Foreseeable Future Actions and Conditions***

Reasonably foreseeable future actions proposed in the Yosemite region that could have a cumulative beneficial effect on wilderness character are described below:

- The *Yosemite Wilderness Stewardship Plan/EIS* will address land management issues within the Yosemite Wilderness, including visitor use; vegetation associations; air resources; noise issues; watershed; soils; cultural landscapes; and other natural, cultural, and social resource variables. The plan update will also address the use of the five High Sierra Camps in Yosemite.
- Clean Water Act and Health and Food Safety Code regulatory updates could result in required upgrades and improvements to wilderness water and wastewater treatment facilities.

### ***Overall Cumulative Impact***

The past, present, and future actions, when considered with Alternative 1 (No Action), would result in improved protection and enhancement of wilderness resources; continued limits on overnight use; and retention of manmade structures and facilities. The overall cumulative impact of Alternative 1 (No Action) on wilderness character would be local, moderate to major, long term and adverse.

## ***Environmental Consequences of Actions Common to Alternatives 2–6***

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

**Biological Resource Actions.** Programmatic biological resource actions common to all alternatives include:

- Re-route trails out of sensitive habitats through wetlands. New trail routes should avoid wetlands and special status habitat.
- Merced Lakeshore Meadow: Remove informal trails, decompact soils, fill ruts with native soils, and revegetate denuded areas with native plants.
- Relocate sections of trail through wetland in Echo Valley and mineral spring outflow between Merced Lake and Washburn Lake to less sensitive areas. Harden the trail along the wet sections of the Mist Trail to avoid trail widening.
- Reroute the Triple Fork Peak meadow trails to upland where possible.
- Remove and restore informal trails in meadows.

- Relocate or remove all campsites at least 100' away from the ordinary high water mark
- Direct visitor use along river to stable and resilient access points such as sandy beaches and low-angle slopes through delineated trails, maps and brochures. Areas susceptible to erosion—steep riverbanks, and high use areas exhibiting vegetation and soil loss from compaction—will be closed and restored.

**Untrammled.** Biological resource actions, although beneficial to other aspects of wilderness character, would have a local, negligible, long-term, adverse impact on the untrammled quality of wilderness character as restoration involves human manipulation of ecological systems.

**Natural.** Biological resource actions would have a local, minor, long-term beneficial impact on the natural component of wilderness character in Segment 1 as eliminating grazing, removing non-native species and restoration allow ecological processes to recover and lessen some of the evidence of modern civilization on natural areas. Wilderness patrols, permit requirements, and educational efforts designed to help visitors understand and protect natural resources by altering their behavior would also benefit the natural component of wilderness character.

**Unconfined.** Biological resource actions involving closure, rerouting, and revegetation of informal trails would have a local, minor, short-term, adverse impact on unconfined recreation because these actions would limit the visitor's ability to travel freely in the areas being restored.

#### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

There is one programmatic action proposed to manage use and facilities for Segment 1 that is common to Alternatives 2 – 6. This action is to allow private boating in the wilderness. Because of the difficulty of getting any type of boat or raft into the wilderness, it is unlikely that this would become a widespread activity in Segment 1. Because private boating is not a permanent action, it would have no impact on the untrammled, natural, undeveloped, primitive, unconfined, and solitary aspects of wilderness character.

**Segment 1 Impact Summary:** Actions to protect and enhance river values would have local, long-term, minor, beneficial impacts on wilderness experience within Segment 1. Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, adverse impacts on wilderness experience within Segment 1.

#### **Segment 5: South Fork Merced River Above Wawona**

#### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

There are two actions proposed to manage use and facilities in Segment 5 that are common to Alternatives 2–6. These are to allow private boating in the wilderness and remove informal trails and charcoal rings to protect cultural resources. Because of the difficulty of getting any type of boat or raft into the wilderness, it is unlikely that this would become a widespread activity in Segment 5. Because private boating is not a permanent action, it would have no impact on the untrammled, natural, undeveloped, primitive, unconfined, and solitary aspects of wilderness character. The removal of

informal trails and charcoal rings would have a local, long-term, minor, adverse impact on the untrammelled quality of the wilderness due to the manipulation required to remove the trails and fire rings. It would also have a local, long-term, negligible, beneficial impact on the natural character of the wilderness in Segment 5. This action would have no impact on the other aspects of wilderness character.

**Segment 5 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, beneficial impacts on wilderness experience within Segment 5.

### **Summary of Impacts from Alternatives 2–6**

The management actions common to Alternatives 2–6 focus on restoration and repair of natural resources in Segments 1 and 5. Restoration actions could have a local, negligible, long-term, adverse effect on the untrammelled quality of the Merced Lake Shore Meadow and East Meadow and a local, minor, beneficial impact on the natural qualities of the Yosemite Wilderness.

### **Cumulative Impacts Common to Alternatives 2–6**

Cumulative effects on wilderness character are based on consideration of past, present, and reasonably foreseeable future actions in the Yosemite region, in combination with potential effects of measures common to Alternatives 2–6. The projects identified below include only those projects that could affect wilderness character within the Merced River corridor or the study area.

#### ***Past Actions***

The 1980 *Yosemite General Management Plan* is the basic document for management of Yosemite National Park. The *Merced River Plan/EIS* would amend the *Yosemite General Management Plan* to meet the mandates of the WSRA.

The 1989 *Yosemite National Park Wilderness Management Plan* establishes management direction for Yosemite's wilderness areas and includes a trailhead quota system for overnight visitors and a Wilderness Impacts Monitoring System (WIMS) to track and address use-related impacts in wilderness areas.

#### ***Present Actions***

Projects currently underway that may have an effect on wilderness character include:

- The *Yosemite Wilderness Stewardship Plan/EIS* will address land stewardship issues within the Yosemite Wilderness, including visitor use; vegetation associations; air resources; noise issues; watershed; soils; cultural landscapes; and other natural, cultural, and social resource variables. The plan update will also address the use of the five High Sierra Camps in Yosemite. The *Yosemite Wilderness Stewardship Plan/EIS* will use direction from the Merced River Plan in developing its Merced River corridor component. It may prescribe actions that are more restrictive than the Merced River Plan in order to preserve wilderness character. The Wilderness Stewardship Plan cannot prescribe actions that are less restrictive than the Merced River Plan or the actions may fail to protect river values.

- The Half Dome Interim Permit Program: 2010-2012 manages access to Half Dome to a target of 400 people per day. This permit system is considered the minimum required action to protect and enhance all aspects of wilderness character, particularly opportunities for solitude. The purpose and need for this project is to protect and enhance wilderness character, address safety and risk management concerns, and bring the Half Dome trail corridor into compliance with the Wilderness Act.
- The *Half Dome Trail Stewardship Plan* addresses wilderness character on the Half Dome trail and may affect use patterns along trails between Happy Isles and Little Yosemite Valley.
- The Wilderness Restoration Program ecologically restores visitor use impacts to protect and enhance the natural condition and wilderness character.
- The *Yosemite Long-Range Interpretive Plan* outlines a comprehensive approach to interpreting park natural and cultural resources and will guide interpretive and educational efforts for the next 5 to 10 years.

### ***Reasonably Foreseeable Future Actions and Conditions***

The following is a reasonably foreseeable future action proposed in the Yosemite region that could have a cumulative beneficial effect on wilderness character:

The *Yosemite Wilderness Stewardship Plan/EIS* will address land management issues within the Wilderness, including visitor use; vegetation associations; air resources; noise issues; watershed; soils; cultural landscapes; and other natural, cultural, and social resource variables. The plan update will also address the use of the five High Sierra Camps in Yosemite.

### ***Overall Cumulative Impact from Actions Common to Alternatives 2–6***

The cumulative impact of the wilderness management measures common to Alternatives 2–6 in conjunction with past, present, and reasonably foreseeable future projects would be local (in Segments 1 and 5), long term, minor, and beneficial. The management measures common to Alternatives 2–6 for Segment 1 would improve the natural, and undeveloped character of the wilderness by eliminating informal trails. Planned present and future actions would improve wilderness protection and enhancement and limit access to protect wilderness character.

### ***Environmental Consequences of Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration***

#### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

Biological resource actions under Alternative 2 include:

- Remove the Merced Lake East Meadow from grazing permanently. Require all administrative pack stock passing through the Merced Lake area to carry pellet feed.

This action would have no impact on the untrammeled, undeveloped, primitive, or unconfined qualities of the wilderness experience. In general, the presence of cattle is not in keeping with the natural quality of the wilderness. Removal of grazing on Merced Lake East Meadow would benefit the natural quality of the meadow. However, stock would still be present on the trails and in the vicinity of Merced Lake and would continue to have an effect on these less fragile parts of the ecosystem. This action would have a local, minor, long-term, adverse impact on the natural quality of the wilderness in Segment 1.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Under Alternative 2, a number of actions are proposed to manage visitor use and facilities including:

- Discontinue designated camping at Little Yosemite Valley camping area, and remove infrastructure, including composting toilet. Allow dispersed camping in this area.
- Close Merced Lake High Sierra Camp and allow dispersed camping at Merced Lake Backpackers Camping Area into the High Sierra Camp footprint. Convert area to designated Wilderness.
- Discontinue designated camping at the Merced Lake Backpackers Camping Area. Allow dispersed camping in the areas of the former Merced Lake Backpackers Camping Area and the Merced Lake High Sierra Camp; remove flush toilets and waste-water system.
- Discontinue designated camping at Moraine Dome. Allow dispersed camping in this area.
- Manage to a capacity of 25 (83% reduction) in the Little Yosemite Valley Zone using a zone quota or zone pass through system. All other zone capacities within the Merced WSR Corridor remain the same.

Impacts of these actions on wilderness character include:

**Untrammeled.** Under Alternative 2, restoration activities required at Merced Lake High Sierra Camp and in the designated camping areas would have a long-term negligible impact on the untrammeled character of the wilderness due to the control and manipulation required to restore the area.

**Undeveloped.** Under Alternative 2, the removal of the permanent and semi-permanent improvements and infrastructure in Segment 1 and restoration to natural conditions would greatly improve the undeveloped character of the wilderness and would also significantly reduce the use of motorized equipment and eliminate the need for routine helicopter trips. By removing the High Sierra Camp and providing the most dispersed camping of any alternative; Alternative 2 would exhibit the most undeveloped character of any alternative.

**Natural.** Under Alternative 2, the removal of facilities and infrastructure and conversion to dispersed camping, and the reduced number of visitors would improve the natural character of Segment 1. Ecological patterns and processes would be subject to fewer concentrated human impacts and would be allowed to recover. Under Alternative 2, concessioner stock use would be eliminated due to the removal of the Merced Lake High Sierra Camp. Administrative trail crew stock use would be

significantly reduced as trails would require less frequent maintenance due to the removal of the High Sierra Camp. The reduction in stock use would improve the natural character of the wilderness due to reduced introduction of non-native species by stock and reduction of meadow grazing which would improve the natural condition of the meadows. Wilderness patrols, permit requirements, and educational efforts designed to help visitors understand and protect natural resources by altering their behavior would also benefit the natural component of wilderness character.

**Solitude.** Under Alternative 2, wilderness encounter rates would decrease due to the 83% reduction in wilderness zone capacity for the Little Yosemite Valley zone, from 150 to 25 overnight visitors per day. The conversion of all designated camping areas to dispersed camping would also improve the experience of solitude as visitors could camp apart from other campers rather than confined to a designated camping area. These two factors would noticeably improve the experience of solitude for wilderness visitors in Segment 1.

**Primitive.** Under Alternative 2, most of the activities that detract from the primitive nature of the wilderness, which require visitors to be self-reliant, would be removed, including the Merced Lake High Sierra Camp and all infrastructure. In addition, conversion of all of the designated camping areas to dispersed camping and the associated removal of most facilities would also make Segment 1 more primitive in nature and promote activities that exhibit simplicity, self-reliance, and a lack of technology.

**Unconfined Recreation.** Unconfined recreation is affected by management restrictions placed on visitors once they are inside the wilderness. Under Alternative 2, the requirements set forth in the wilderness permits would slightly reduce the ability to “recreate freely in the wilderness” and have a negligible, adverse effect on the quality of unconfined recreation. Day hikers not going to Half Dome do not need a permit and would continue to have the greatest opportunity for unconfined recreation. The conversion of all designated camping areas to dispersed camping would have a beneficial effect on unconfined recreation as visitors would be free to choose where they camp.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, major, beneficial impacts on wilderness experience within Segment 1.

## **Segment 5: South Fork Merced River Above Wawona**

### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

**Undeveloped.** There are no developed facilities in Segment 5.

**Solitude.** Under Alternative 2, a wide range of opportunities for solitude would continue. The total wilderness zone capacity of Segment 5 is currently 15 and would remain so. Encounter rates in Segment 5 are not well studied but these segments are known to be less frequently visited than Segment 1.

**Primitive.** Under Alternative 2, there would be no developed facilities in Segment 5; thus, experiences in this segment would remain primitive in nature and exhibit simplicity, self-reliance, and a lack of technology.

**Unconfined Recreation.** Unconfined recreation is affected by management restrictions placed on visitors once they are inside the wilderness. Under Alternative 2, the requirements set forth in the wilderness permits would reduce the ability to “recreate freely in the wilderness” and have a negligible adverse effect on the quality of unconfined recreation for the limited number of visitors to Segment 5.

**Segment 5 Impact Summary:** Actions to manage user capacities, land use, and facilities would have no impact on the wilderness experience within Segment 5.

### **Summary of Impacts from Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration**

Under Alternative 2, the park would eliminate most of the facilities, infrastructure, and activities that diminish wilderness character; reduce the number of overnight visitors to the Yosemite Wilderness; eliminate overnight stock trips; and close Merced Lake High Sierra Camp, restore the area and designate the area as wilderness. Together, with implementation of mitigation measures MM-NOI-1 through MM-NOI-3 and MM-VEX-1 through MM-VEX-2, as applicable (see Appendix C), these actions would have a segmentwide, long-term, major, beneficial impact on wilderness character in Segment 1. Alternative 2 would have no impact on Segment 5.

### **Cumulative Impacts from Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration**

Cumulative effects on wilderness character are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of the actions under Alternative 2. The projects identified below include only those projects that could affect wilderness character within the Merced River corridor or in the study area.

#### ***Past Actions***

The *1980 Yosemite General Management Plan* is the basic document for management of Yosemite National Park. The *Merced River Plan/EIS* would amend the *Yosemite General Management Plan* to meet the mandates of the WSRA.

The *1989 Yosemite National Park Wilderness Management Plan* establishes management direction for Yosemite’s wilderness areas and includes a trailhead quota system for overnight visitors and a Wilderness Impacts Monitoring System (WIMS) to track and address use-related impacts in wilderness areas.

#### ***Present Actions***

Projects currently underway that may have an effect on wilderness character include:

- The *Yosemite Wilderness Stewardship Plan/EIS* will address land stewardship issues within the Yosemite Wilderness, including visitor use; vegetation associations; air resources; noise issues; watershed; soils; cultural landscapes; and other natural, cultural, and social resource variables. The plan update will also address the use of the five High Sierra Camps in Yosemite. The *Yosemite Wilderness Stewardship Plan/EIS* will use direction from the Merced River Plan in developing its Merced River corridor component. It may prescribe actions that are more restrictive than the Merced River Plan in order to preserve wilderness character. The Wilderness Stewardship Plan cannot prescribe actions that are less restrictive than the Merced River Plan or the actions may fail to protect river values.
- The Half Dome Interim Permit Program: 2010-2012 manages access to Half Dome to a target of 400 people per day. This permit system is considered the minimum required action to protect and enhance all aspects of wilderness character, particularly opportunities for solitude. The purpose and need for this project was to protect and enhance wilderness character, address safety and risk management concerns, and bring the Half Dome trail corridor into compliance with the Wilderness Act.
- The *Half Dome Trail Stewardship Plan* addresses wilderness character on the Half Dome trail and may affect use patterns along trails between Happy Isles and Little Yosemite Valley.
- The Wilderness Restoration Program ecologically restores visitor use impacts to protect and enhance the natural condition and wilderness character.
- The *Yosemite Long-Range Interpretive Plan* outlines a comprehensive approach to interpreting park natural and cultural resources and will guide interpretive and educational efforts for the next 5 to 10 years.

#### ***Reasonably Foreseeable Future Actions and Conditions***

The reasonably foreseeable future action that could have a cumulative beneficial effect on wilderness character in the region is described below:

The *Yosemite Wilderness Stewardship Plan/EIS* will address land stewardship issues within the Yosemite Wilderness, including visitor use; vegetation associations; air resources; noise issues; watershed; soils; cultural landscapes; and other natural, cultural, and social resource variables. The plan update will also address the use of the five High Sierra Camps in Yosemite.

#### ***Overall Cumulative Impact from Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration***

The cumulative impact of the wilderness management measures outlined for Alternative 2 in conjunction with past, present, and reasonably foreseeable future projects would be segmentwide (in Segments 1 and 5), long term, major, and beneficial. Management measures for the wilderness in Alternative 2 would improve the natural, and undeveloped character of the wilderness by removing manmade facilities and stock use. Reducing the number of wilderness visitors and conversion from designated to dispersed camping increases opportunities for solitude. Planned present and future actions would improve wilderness management and limit access to protect wilderness character.

## ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

Biological resource actions under Alternative 2 include:

- Develop preliminary grazing capacities for the Merced Lake East Meadow. When the meadow recovers, allow administrative grazing at established capacities. Monitor annually for five years, adapting use levels as needed.

This action would have no impact on the untrammelled, undeveloped, primitive, or unconfined qualities of the wilderness experience. Initially this action would have the same impact on the natural quality of the wilderness as Alternative 2 – grazing would be removed from the meadow but the cattle would continue to be present in the same numbers on the trails and elsewhere in the Merced Lake area. Generally, the presence of cattle detracts from the natural quality of the wilderness. Allowing the meadow to recover and then monitoring and adapting grazing levels could potentially reduce the number of cattle in the wilderness and have a local, negligible, long-term **beneficial** impact on the natural quality of the wilderness in Segment 1.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Under Alternative 3, a number of actions are proposed to manage visitor use and facilities including:

- Discontinue designated camping at Little Yosemite Valley camping area, and remove infrastructure, and retain composting toilet. Allow dispersed camping in this area.
- Discontinue designated camping at the Merced Lake Backpackers Camping Area. Allow dispersed camping in the areas of the former Merced Lake Backpackers Camping Area and portions of the Merced Lake High Sierra Camp; replace flush toilets with composting toilet and remove waste-water system.
- Convert Merced Lake High Sierra Camp to a temporary pack camp with a maximum of 15 people allowed. Remove all permanent infrastructure. Convert area to designated Wilderness.
- Discontinue designated camping at Moraine Dome. Allow dispersed camping in this area.
- Manage to a capacity of 75 (50% reduction) in the Little Yosemite Valley Zone using a zone quota or zone pass through system. All other zone capacities within the Merced WSR Corridor remain the same.

Impacts of these actions on wilderness character include:

**Untrammelled.** Under Alternative 3, restoration activities, required at Merced Lake High Sierra Camp and in the designated camping areas would have a long-term negligible impact on the untrammelled character of the wilderness due to the control and manipulation required to restore this area.

**Undeveloped.** Under Alternative 3, the removal of most of the permanent and semi-permanent improvements and infrastructure in Segment 1 and restoration to natural conditions would greatly improve the undeveloped character of the wilderness and would also significantly reduce the use of motorized equipment and eliminate the need for routine helicopter trips. The Merced Lake High Sierra Camp area would be designated as wilderness once the character of this potential wilderness addition had been restored. Together these actions would improve the undeveloped quality of Segment 1.

**Natural.** Under Alternative 3, the removal of facilities and infrastructure and conversion of all of the camping areas to dispersed camping, and the reduced number of visitors would improve the natural character of Segment 1. Ecological patterns and processes would be subject to fewer concentrated human impacts and would be allowed to recover. Two composting toilets – one at Merced Lake and the other at Little Yosemite Valley would lessen the impact of human use on the natural environment. Under Alternative 3, concessioner stock use would be eliminated due to the removal of the Merced Lake High Sierra Camp. Administrative trail crew stock use would be significantly reduced as trails would require less frequent maintenance due to the removal of the High Sierra Camp. The reduction in stock use would improve the natural character of the wilderness due to reduced introduction of non-native species by stock and reduction of meadow grazing which would improve the natural condition of the meadows. Wilderness patrols, permit requirements, and educational efforts designed to help visitors understand and protect natural resources by altering their behavior would also benefit the natural component of wilderness character.

**Solitude.** Under Alternative 3, the capacity of the Little Yosemite Valley zone would be reduced by 50%, from 150 to 75 visitors per day. This reduction in the number of visitors would lessen encounter rates and noticeably improve the experience of wilderness solitude. Conversion of all designated camping areas to dispersed camping would allow campers to camp away from other groups and increase the experience of solitude.

**Primitive.** Under Alternative 3 most of the activities that detract from the primitive character of the wilderness would be removed, including the Merced Lake High Sierra Camp and all infrastructure. Designated camping would be removed at all three camping areas in favor of dispersed camping. Flush toilets would be replaced with a composting toilet at Merced Lake Backpackers Camping Area and the composting toilet at Little Yosemite Valley would remain. Composting toilets reduce the experience of simplicity and self-sufficiency somewhat but, as mentioned above, improve the natural quality of the wilderness. Under Alternative 3, Segment 1 would become more primitive in nature and provide for activities that exhibit simplicity, self-reliance, and a lack of technology.

**Unconfined Recreation.** Unconfined recreation is affected by management restrictions placed on visitors once they are inside the wilderness. Under Alternative 3, the requirements set forth in the wilderness permits would reduce the ability to “recreate freely in the wilderness” and have a negligible adverse effect the quality of unconfined recreation. Day hikers not going to Half Dome do not need a permit and would continue to have the greatest opportunity for unconfined recreation.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, moderate, beneficial impacts on wilderness experience within Segment 1.

## **Segment 5: South Fork Merced River Above Wawona**

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

**Undeveloped.** There are no developed facilities in Segment 5.

**Solitude.** Under Alternative 3, a wide range of opportunities for solitude would continue. The total overnight capacity of the wilderness in Segment 5 is currently 15 and would remain so. Encounter rates in Segment 5 are not well studied but these segments are less frequently visited than Segment 1.

**Primitive.** Under Alternative 3, there would be no developed facilities in Segment 5; thus, experiences in this segment would remain primitive in nature and exhibit simplicity, self-reliance, and a lack of technology.

**Unconfined Recreation.** Under Alternative 3, wilderness permit regulations would continue to affect the quality of unconfined recreation in Segment 5.

**Segment 5 Impact Summary:** Actions to manage user capacities, land use, and facilities would have no impact on the wilderness experience within Segment 5.

### **Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Under Alternative 3, the park would eliminate most of the facilities, infrastructure, and activities that affect wilderness character, reduce Little Yosemite Valley wilderness zone capacity by 50%, reduce stock use, and remove the Merced Lake High Sierra Camp, restore the area and designate it as wilderness while providing a temporary pack camp. Together, with implementation of mitigation measures MM-NOI-1 through MM-NOI-3 and MM-VEX-1 through MM-VEX-2, as applicable (see Appendix C), these actions would have a local, long-term, moderate, beneficial impact on wilderness character in Segment 1. Alternative 3 would have no impact on Segment 5.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Cumulative effects on wilderness character are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of the actions under Alternative 3. The projects identified below include only those projects that could affect wilderness character within the Merced River corridor or within the study area in Alternative 3.

#### ***Past Actions***

The 1980 *Yosemite General Management Plan* is the basic document for management of Yosemite National Park. The *Merced River Plan/EIS* would amend the *Yosemite General Management Plan* to meet the mandates of the Wild and Scenic Rivers Act.

The 1989 *Yosemite National Park Wilderness Management Plan* establishes management direction for Yosemite's wilderness areas and includes a trailhead quota system for overnight visitors and a Wilderness Impacts Monitoring System (WIMS) to track and address use-related impacts in wilderness areas.

### ***Present Actions***

Projects currently underway that may have an effect on wilderness character include the following:

- The *Yosemite Wilderness Stewardship Plan/EIS* will use direction from the Merced River Plan in developing its Merced River corridor component.
- The Half Dome Interim Permit Program: 2010-2012 manages access to Half Dome to a target of 400 people per day. This permit system is considered the minimum required action to protect and enhance all aspects of wilderness character, particularly opportunities for solitude. The purpose and need for this project was to protect and enhance wilderness character, address safety and risk management concerns, and bring the Half Dome trail corridor into compliance with the Wilderness Act.
- The *Half Dome Trail Stewardship Plan* addresses wilderness character on the Half Dome trail and may affect use patterns along trails between Happy Isles and Little Yosemite Valley.
- The Wilderness Restoration Program ecologically restores visitor use impacts to protect and enhance the natural condition and wilderness character.
- The *Yosemite Long-Range Interpretive Plan* outlines a comprehensive approach to interpreting park natural and cultural resources and will guide interpretive and educational efforts for the next 5 to 10 years.

### ***Reasonably Foreseeable Future Actions***

The following reasonably foreseeable future action is anticipated to have a net beneficial effect:

- The *Yosemite Wilderness Stewardship Plan/EIS* will address land stewardship issues within the Yosemite Wilderness, including visitor use; vegetation associations; air resources; noise issues; watershed; soils; cultural landscapes; and other natural, cultural, and social resource variables. The plan update will also address the use of the five High Sierra Camps in Yosemite. The *Yosemite Wilderness Stewardship Plan/EIS* will use direction from the Merced River Plan in developing its Merced River corridor component. It may prescribe actions that are more restrictive than the Merced River Plan in order to preserve wilderness character. The Wilderness Stewardship Plan cannot prescribe actions that are less restrictive than the Merced River Plan or the actions may fail to protect river values.

### ***Overall Cumulative Impact from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

The cumulative impact of the wilderness management measures outlined for Alternative 3 in conjunction with past, present, and reasonably foreseeable future projects would be segmentwide (in Segments 1 and 5), long term, moderate, and beneficial. Management measures for the Yosemite wilderness in Alternative 3 would improve the untrammeled, natural, and undeveloped wilderness qualities by removing the Merced Lake High Sierra Camp and infrastructure, converting designated camping areas

to dispersed camping, reducing infrastructure, and reducing stock use. Reducing the number of wilderness visitors increases opportunities for solitude. Planned present and future actions would improve wilderness stewardship and limit access to protect wilderness character.

### ***Environmental Consequences of Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

#### **Segment 1: Merced River Above Nevada Fall**

Biological resource actions under Alternative 4 include:

- Remove the Merced Lake East Meadow from grazing permanently. Require all administrative pack stock passing through the Merced Lake area to carry pellet feed.

This action would have no impact on the untrammelled, undeveloped, primitive, or unconfined qualities of the wilderness experience. In general, the presence of cattle is not in keeping with the natural quality of the wilderness. Removal of grazing on Merced Lake East Meadow would benefit the natural quality of the meadow. However, stock will still be present on the trails and in the vicinity of Merced Lake and would continue to have an effect on these less fragile parts of the ecosystem. This action would have a local, minor, long-term adverse impact on the natural quality of the wilderness in Segment 1.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Under Alternative 4, a number of actions are proposed to manage visitor use and facilities including:

- Decrease the designated camping area at Little Yosemite Valley; retain composting toilet.
- Expand Merced Lake Backpackers Camping Area, which is designated camping, into the area of former Merced Lake High Sierra Camp; replace flush toilets with composting toilet and remove waste-water system.
- Close Merced Lake High Sierra Camp and restore the area to natural conditions. Area would be converted to designated Wilderness.
- Continue designated camping at Moraine Dome.
- Manage to a capacity of 100 in the Little Yosemite Valley Zone using a zone quota or zone pass through system. All other zone capacities within the Merced WSR Corridor remain the same.
- Permits required for private boating. Private use limited to 5 boats per day with backcountry permit.

Impacts of these actions on wilderness character include:

**Untrammelled.** Under Alternative 4, restoration activities required at Merced Lake High Sierra Camp would have a long-term negligible adverse impact on the untrammelled character of the wilderness due to the control and manipulation required to restore this area.

**Undeveloped.** Under Alternative 4, the permanent and semi-permanent improvements in Segment 1, including the concrete foundations and permanent structures at Merced Lake High Sierra Camp, would be removed. Some of the designated campsites and all permanent infrastructure at Little Yosemite Valley camping area would be removed. These actions would improve the undeveloped quality of the wilderness in Segment 1.

**Natural.** Under Alternative 4, the removal of facilities and infrastructure at Merced Lake High Sierra Camp, a small decrease in designated camping, and the reduced number of visitors would improve the natural character of Segment 1. The retention of most designated camping areas would have more concentrated human impacts than Alternatives 2 and 3. However, retaining composting toilets would be beneficial to the natural quality of the wilderness. Under Alternative 4, concessioner stock use would be eliminated due to the removal of the Merced Lake High Sierra Camp. Administrative trail crew stock use would be significantly reduced as trails would require less frequent maintenance due to the removal of the High Sierra Camp. The reduction in stock use would improve the natural character of the wilderness due to reduced introduction of non-native species by stock and reduction of meadow grazing which would improve the natural condition of the meadows. Wilderness patrols, permit requirements, and educational efforts designed to help visitors understand and protect natural resources by altering their behavior would also benefit the natural component of wilderness character.

**Solitude.** Under Alternative 4, the capacity of the Little Yosemite Valley zone would be reduced by 33%, from 150 to 100 visitors per day. This would improve the experience of solitude for wilderness visitors in Segment 1. However, because most of the designated camping areas are being retained, Alternative 4 would be less beneficial to wilderness solitude than Alternatives 2 and 3 due to the greater concentration of visitors in the designated camping areas.

**Primitive.** Under Alternative 4, many of the activities that detract from the primitive nature of the Yosemite Wilderness would be removed, including the Merced Lake High Sierra Camp and all its associated infrastructure. Alternative 4 retains most of the designated camping in this area with the exception of a reduction in designated camping at Little Yosemite Valley camping area. Designated camping is a less primitive experience than dispersed camping as the visitor can be less self-reliant. Composting toilets would be located at Little Yosemite Valley and Merced Lake camping areas. These would detract from the primitive wilderness experience but benefit the natural experience.

**Unconfined Recreation.** Unconfined recreation is affected by management restrictions placed on visitors once they are inside the wilderness. Under Alternative 4, the requirements set forth in the wilderness permits would reduce the ability to “recreate freely in the wilderness” and have a negligible adverse effect on the quality of unconfined recreation. Day hikers not going to Half Dome do not need a permit and would continue to have the greatest opportunity for unconfined recreation.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, moderate, beneficial impacts on wilderness experience within Segment 1.

## **Segment 5: South Fork Merced River Above Wawona**

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

**Undeveloped.** There are no developed facilities in Segment 5.

**Solitude.** Under Alternative 4, a wide range of opportunities for solitude would continue. The total overnight capacity of Segment 5 would continue to be regulated by the wilderness zone system with a capacity of 15 people in Segment 5. Encounter rates in Segment 5 are not well studied but this segment is less frequently visited than Segment 1.

**Primitive.** Under Alternative 4, there would be no developed facilities in Segment 5; thus, experiences in this segment would remain primitive in nature and exhibit simplicity, self-reliance, and a lack of technology.

**Unconfined Recreation.** Under Alternative 4, wilderness permit regulations would continue to affect the quality of unconfined recreation in Segment 5.

**Segment 5 Impact Summary:** Actions to manage user capacities, land use, and facilities would have no impact on the wilderness experience within Segment 5.

### **Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

Under Alternative 4, the park would eliminate most of the facilities, infrastructure, and activities that affect wilderness character, reduce by 33% the capacity of the Little Yosemite Valley zone, and remove all infrastructure and facilities at Merced Lake High Sierra camp restore the area and designate it as wilderness. Together, with implementation of mitigation measures MM-NOI-1 through MM-NOI-3 and MM-VEX-1 through MM-VEX-2, as applicable (see Appendix C), these actions would have a segmentwide, long-term, moderate, beneficial impact on wilderness character in Segment 1. Alternative 4 would have no impact on Segment 5.

### **Cumulative Impact from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

Cumulative effects on wilderness character are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of the actions under Alternative 4. The projects identified below include only those projects that could affect wilderness character within the Merced River corridor or the study area.

### ***Past Actions***

The 1980 *Yosemite General Management Plan* is the basic document for management of Yosemite National Park. The *Merced River Plan/EIS* would amend the *Yosemite General Management Plan* to meet the mandates of the WSRA.

The 1989 *Yosemite National Park Wilderness Management Plan* establishes management direction for Yosemite's wilderness areas and includes a trailhead quota system for overnight visitors and a Wilderness Impacts Monitoring System (WIMS) to track and address use-related impacts in wilderness areas.

### ***Present Actions***

Projects currently underway that may have an effect on wilderness character include the following:

- The *Yosemite Wilderness Stewardship Plan/EIS* will use direction from the Merced River Plan in developing its Merced River corridor component.
- The Half Dome Interim Permit Program: 2010-2012 manages access to Half Dome to a target of 400 people per day. This permit system is considered the minimum required action to protect and enhance all aspects of wilderness character, particularly opportunities for solitude. The purpose and need for this project was to protect and enhance wilderness character, address safety and risk management concerns, and bring the Half Dome trail corridor into compliance with the Wilderness Act.
- The *Half Dome Trail Stewardship Plan* addresses wilderness character on the Half Dome trail and may affect use patterns along trails between Happy Isles and Little Yosemite Valley.
- The Wilderness Restoration Program ecologically restores visitor use impacts to protect and enhance the natural condition and wilderness character.
- The *Yosemite Long-Range Interpretive Plan* outlines a comprehensive approach to interpreting park natural and cultural resources and will guide interpretive and educational efforts for the next 5 to 10 years.

### ***Reasonably Foreseeable Future Actions***

The following reasonably foreseeable future action is anticipated to have a net beneficial effect:

- The *Yosemite Wilderness Stewardship Plan/EIS* will address land stewardship issues within the Yosemite Wilderness, including visitor use; vegetation associations; air resources; noise issues; watershed; soils; cultural landscapes; and other natural, cultural, and social resource variables. The plan update will also address the use of the five High Sierra Camps in Yosemite. The *Yosemite Wilderness Stewardship Plan/EIS* will use direction from the Merced River Plan in developing its Merced River corridor component. It may prescribe actions that are more restrictive than the Merced River Plan in order to preserve wilderness character. The Wilderness Stewardship Plan cannot prescribe actions that are less restrictive than the Merced River Plan or the actions may fail to protect river values.

### ***Overall Cumulative Impact from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

The cumulative impact of the wilderness management measures under Alternative 4 in conjunction with past, present, and reasonably foreseeable future projects would be segmentwide (in Segments 1 and 5), long term, moderate, and beneficial. Management measures for the wilderness in Alternative 4 would improve the natural, and undeveloped wilderness qualities by removing and restoring the Merced Lake High Sierra Camp. The number of wilderness visitors would be reduced, which increases

opportunities for solitude. Planned present and future actions would improve wilderness stewardship and limit access to protect wilderness character.

### ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Protect and Enhance River Values***

Biological resource actions under Alternative 5 include:

- Develop preliminary grazing capacities for the Merced Lake East Meadow. When the meadow recovers, allow administrative grazing at established capacities. Monitor annually for five years, adapting use levels as needed.

This action would have no impact on the untrammelled, undeveloped, primitive, or unconfined qualities of the wilderness experience. Initially this action would have the same impact on the natural quality of the wilderness as Alternative 2 – grazing would be removed from the meadow but the cattle would continue to be present in the same numbers on the trails and elsewhere in the Merced Lake area. Generally, the presence of cattle detracts from the natural quality of the wilderness. Allowing the meadow to recover and then monitoring and adapting grazing levels could potentially reduce the number of cattle in the wilderness and have a local, minor, long-term adverse impact on the natural quality of the wilderness in Segment 1.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Under Alternative 5, actions to manage visitor use and facilities include:

- Continue designated camping at Little Yosemite Valley camping area. Retain infrastructure, such as composting toilet.
- Retain location of the Merced Lake Backpackers Camping Area as a designated camping area. Replace flush toilets with composting toilet.
- Retain the Merced Lake High Sierra Camp, reducing the capacity to 11 units (42 beds). Replace the flush toilets with composting toilet.
- Continue designated camping at Moraine Dome.
- All zone capacities within the Merced WSR Corridor remain the same.
- Private use limited to 10 boats per day with backcountry permit

Impacts of these actions on wilderness character include:

**Untrammeled.** Under Alternative 5, the minor restoration activities due to the reduction in the size of Merced Lake High Sierra Camp would have a long-term negligible impact on the untrammeled character of the wilderness due to the control and manipulation required to restore this area.

**Natural.** Under Alternative 5, the natural character of Segment 1 would be similar to that in Alternative 1 (No Action) due to the retention of most of the manmade facilities in Segment 1.

**Undeveloped.** Under Alternative 5, Merced Lake High Sierra Camp would experience a reduction in the number of beds, from 60 to 42 beds. This could result in removal of approximately four cabins. The amount of needed infrastructure, food, and supplies would also be reduced, thus lessening the number of trips required to stock the camp. Presumably, the footprint of the camp could be reduced and part of the area restored. Retention of the Merced Lake High Sierra Camp would prevent this area from receiving a wilderness designation. This alternative would also require retention of the existing wastewater facilities to support showers and dishwashing. Alternative 5 also retains designated camping and infrastructure at the Little Yosemite Valley and Merced Lake camping areas. Designated camping and infrastructure are generally present in more developed areas. Despite some improvements, Alternative 5 does not improve the overall undeveloped quality of the wilderness in Segment 1.

**Solitude.** Under Alternative 5, the capacity of the Little Yosemite Valley wilderness zone would remain at the current level of 150 visitors per day; designated camping would remain in all three camping areas; and the High Sierra Camp would only be reduced by 18 beds. Opportunities for solitude would not noticeably improve in Segment 1.

**Primitive.** Under Alternative 5, some of the activities that detract from the primitive nature of the wilderness would be reduced but not eliminated. The number of beds at Merced Lake High Sierra Camp would be reduced from 60 to 42 and flush toilets at the camp replaced with composting toilets. Wastewater facilities would remain to support showers and dishwashing. Designated camping would be retained at the three designated camping areas in Segment 1 which would result in a less primitive experience than dispersed camping. Alternative 5 would not noticeably improve the primitive quality of Segment 1.

**Unconfined Recreation.** Unconfined recreation is affected by management restrictions placed on visitors once they are inside the wilderness. Under Alternative 5, the requirements set forth in the wilderness permits would reduce the ability to “recreate freely in the wilderness” and have a negligible adverse effect on the quality of unconfined recreation. Day hikers not going to Half Dome do not need a permit and would continue to have the greatest opportunity for unconfined recreation.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, negligible to minor, beneficial impacts on wilderness experience within Segment 1.

## **Segment 5: South Fork Merced River Above Wawona**

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

**Undeveloped.** There are no developed facilities in Segment 5.

**Solitude.** Under Alternative 5 a wide range of opportunities for solitude would continue. The total overnight capacity of Segment 5 would continue to be regulated by the wilderness zone system with a capacity of 15 people in Segment 5. Encounter rates in Segment 5 are not well studied but this segment is less frequently visited than Segment 1.

**Primitive.** Under Alternative 5, there would be no developed facilities in Segment 5; thus, experiences in this segment would remain primitive in nature and exhibit simplicity, self-reliance, and a lack of technology.

**Unconfined Recreation.** Under Alternative 5, wilderness permit regulations would continue to affect the quality of unconfined recreation in Segment 5.

**Segment 5 Impact Summary:** Actions to manage user capacities, land use, and facilities would have no impact on the wilderness experience within Segment 5.

### **Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Compared with Alternative 1 (No Action), Alternative 5 would include actions that together with implementation of mitigation measures MM-NOI-1 through MM-NOI-3 and MM-VEX-1 through MM-VEX-2, as applicable (see Appendix C), would have a local, long-term, negligible to minor, beneficial impact on the natural, and undeveloped character of the wilderness and opportunities for wilderness solitude and primitive recreation in Segment 1. Alternative 5 actions in Segment 1 would retain all three designated camping areas at their current size and configuration, and reduce the capacity of the Merced Lake High Sierra Camp by 18 beds. Stock use in the wilderness would be retained to serve the High Sierra Camp and maintain the trails, and the capacity of the Little Yosemite Valley zone would remain at 150 visitors per day, thus maintaining current trail quotas for this zone. Under Alternative 5, no actions would affect Segment 5.

### **Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Cumulative effects on wilderness character are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of the actions in Alternative 5. The projects identified below include only those projects that could affect wilderness character within the Merced River corridor or in the study area.

### ***Past Actions***

The 1980 *Yosemite General Management Plan* is the basic document for management of Yosemite. The Merced River Plan/EIS would amend the *Yosemite General Management Plan* to meet the mandates of the WSRA.

The 1989 *Yosemite National Park Wilderness Management Plan* establishes management direction for Yosemite's wilderness areas and includes a trailhead quota system for overnight visitors and a Wilderness Impacts Monitoring System (WIMS) to track and address use-related impacts in wilderness areas.

### ***Present Actions***

Projects currently underway that may have an effect on the wilderness character include the following:

- The *Yosemite Wilderness Stewardship Plan/EIS* will use direction from the Merced River Plan in addressing its Merced River corridor component.
- The Half Dome Interim Permit Program: 2010-2012 manages access to Half Dome to a target of 400 people per day. This permit system is considered the minimum required action to protect and enhance all aspects of wilderness character, particularly opportunities for solitude. The purpose and need for this project was to protect and enhance wilderness character, address safety and risk management concerns, and bring the Half Dome trail corridor into compliance with the Wilderness Act.
- The *Half Dome Trail Stewardship Plan* addresses wilderness character on the Half Dome trail and may affect use patterns along trails between Happy Isles and Little Yosemite Valley.
- The Wilderness Restoration Program ecologically restores visitor use impacts to protect and enhance the natural condition and wilderness character.
- The *Yosemite Long-Range Interpretive Plan* outlines a comprehensive approach to interpreting park natural and cultural resources and will guide interpretive and educational efforts for the next 5 to 10 years.

### ***Reasonably Foreseeable Future Actions and Conditions***

Reasonably foreseeable future actions proposed in the Yosemite region that could have a cumulative beneficial effect on wilderness character are described below:

- The *Yosemite Wilderness Stewardship Plan/EIS* will address land stewardship issues within the Yosemite Wilderness, including visitor use; vegetation associations; air resources; noise issues; watershed; soils; cultural landscapes; and other natural, cultural, and social resource variables. The plan update will also address the use of the five High Sierra Camps in Yosemite. The *Yosemite Wilderness Stewardship Plan/EIS* will use direction from the Merced River Plan in developing its Merced River corridor component. It may prescribe actions that are more restrictive than the Merced River Plan in order to preserve wilderness character. The Wilderness Stewardship Plan cannot prescribe actions that are less restrictive than the Merced River Plan or the actions may fail to protect river values.
- The Clean Water Act and Health and Food Safety Code regulatory updates could result in required upgrades and improvements to wilderness water and wastewater treatment facilities.

### ***Overall Cumulative Impact from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

The cumulative impact of the wilderness management measures under Alternative 5, in conjunction with past, present, and reasonably foreseeable future projects, would be segmentwide (in Segments 1 and 5), long term, negligible to minor, and beneficial. Management measures for the wilderness under Alternative 5 include reducing the Merced Lake High Sierra Camp capacity while maintaining the three existing Segment 1 designated camping areas, stock use, and the current wilderness quotas. Planned present and future actions would improve wilderness stewardship and limit access to protect wilderness character.

### ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Protect and Enhance River Values***

Biological resource actions under Alternative 6 include:

- Develop preliminary grazing capacities for the Merced Lake East Meadow. When the meadow recovers, allow administrative grazing at established capacities. Monitor annually for five years, adapting use levels as needed.

This action would have no impact on the untrammeled, undeveloped, primitive, or unconfined qualities of the wilderness experience. Initially this action would have the same impact on the natural quality of the wilderness as Alternative 2 – grazing would be removed from the meadow but the cattle would continue to be present in the same numbers on the trails and elsewhere in the Merced Lake area. Generally, the presence of cattle detracts from the natural quality of the wilderness. Allowing the meadow to recover and then monitoring and adapting grazing levels could potentially reduce the number of cattle in the wilderness and have a local, minor, long-term adverse impact on the natural quality of the wilderness in Segment 1.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Under Alternative 6, actions to manage visitor use and facilities are similar to Alternative 1 (No Action) and include:

- Continue designated camping at Little Yosemite Valley camping area. Retain infrastructure, such as composting toilet.
- Retain location of the Merced Lake Backpackers Camping Area as a designated camping area. Replace flush toilets with composting toilet.
- Retain the Merced Lake High Sierra Camp, keeping 22 units (60 beds). Replace the flush toilets with composting toilet.

- Continue designated camping at Moraine Dome.
- All zone capacities within the Merced WSR Corridor remain the same.
- Private use limited to 10 boats per day with backcountry permit

Impacts of these actions on wilderness character include:

**Untrammelled.** Under Alternative 6, the effects on the untrammelled quality of Segment 1 are similar to Alternative 1 (No Action).

**Natural.** Under Alternative 6, the natural character of Segment 1 would be similar to that in Alternative 1 (No Action) due to the retention of all of the manmade facilities in Segment 1. There would be no improvement to the natural character of the wilderness in Segment 1 under Alternative 6.

**Undeveloped.** The effects of Alternative 6 on the undeveloped quality of the wilderness are similar to Alternative 1 (No Action). All of the existing facilities, infrastructure, and designated camping areas would be retained resulting in a level of development very similar to what exists today. Wastewater facilities would need to be retained at the High Sierra Camp in order to support showers and dishwashing. The same amount of use of machinery and equipment would be necessary. Retention of the Merced Lake High Sierra Camp would prevent this area from receiving a wilderness designation. Alternative 6 would not improve the undeveloped character of the wilderness in Segment 1.

**Solitude.** Under Alternative 6, the capacity of the Little Yosemite Valley wilderness zone would remain at the current level of 150 overnight visitors per day and all designated camping areas would remain. Under Alternative 6, opportunities for solitude would not improve in Segment 1.

**Primitive.** Under Alternative 6, the primitive nature of Segment 1 would be similar to Alternative 1 (No Action). Retention of the Merced Lake High Sierra Camp, infrastructure, and designated camping areas all detract from the primitive character of the wilderness in Segment 1.

**Unconfined Recreation.** Unconfined recreation is affected by management restrictions placed on visitors once they are inside the wilderness. Under Alternative 6, the requirements set forth in the wilderness permits would reduce the ability to “recreate freely in the wilderness” and have a negligible adverse effect on the quality of unconfined recreation. Day hikers not going to Half Dome do not need a permit and would continue to have the greatest opportunity for unconfined recreation.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities would have local, long-term, negligible, beneficial impacts on wilderness experience within Segment 1.

## **Segment 5: South Fork Merced River Above Wawona**

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

**Undeveloped.** There are no developed facilities in Segment 5.

**Solitude.** Under Alternative 6, a wide range of opportunities for solitude would continue. The total overnight capacity of the Segment 5 wilderness is currently 15 and would remain so. Encounter rates in Segment 5 are not well studied but this segment is less frequently visited than Segment 1.

**Primitive.** Under Alternative 6, there would be no developed facilities in Segment 5; thus, experiences in this segment would remain primitive in nature and exhibit simplicity, self-reliance, and a lack of technology.

**Unconfined Recreation.** Under Alternative 6, wilderness permit regulations would continue to affect the quality of unconfined recreation in Segment 5.

**Segment 5 Impact Summary:** Actions to manage user capacities, land use, and facilities would have no impact on the wilderness experience within Segment 5.

### **Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Under Alternative 6, the wilderness character would remain much the same as it is today. The Merced Lake High Sierra Camp, designated camping areas and supporting infrastructure would be similar to today. The Little Yosemite Valley wilderness zone capacity would remain the same as under Alternative 1 (No Action), and pack stock would continue to access the wilderness. Therefore, Alternative 6 would improve wilderness character slightly but not to the extent it would be improved with Alternatives 2 and 3. Alternative 6 with implementation of mitigation measures MM-NOI-1 through MM-NOI-3 and MM-VEX-1 through MM-VEX-2, as applicable (see Appendix C), would have a local, long-term, negligible, beneficial impact on wilderness character in Segment 1. Alternative 6 would not affect wilderness character in Segment 5.

### **Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Cumulative effects on wilderness character are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region in combination with potential effects of Alternative 6. The projects identified below include only those projects that could affect wilderness character within the Merced River corridor or in the study area.

#### ***Past Actions***

The 1980 *Yosemite General Management Plan* is the basic document for management of Yosemite National Park. The *Merced River Plan/EIS* would amend the *Yosemite General Management Plan* to meet the mandates of the WSRA.

The 1989 *Yosemite National Park Wilderness Management Plan* establishes management direction for Yosemite's wilderness areas and includes a trailhead quota system for overnight visitors and a Wilderness Impacts Monitoring System (WIMS) to track and address use-related impacts in wilderness areas.

### ***Present Actions***

Projects currently underway that may have an effect on wilderness character include the following:

- The *Yosemite Wilderness Stewardship Plan/EIS* will use direction from the Merced River Plan in developing its Merced River corridor component. It may prescribe actions that are more restrictive than the Merced River Plan in order to preserve wilderness character. The Wilderness Stewardship Plan cannot prescribe actions that are less restrictive than the Merced River Plan or the actions may fail to protect river values.
- The Half Dome Interim Permit Program: 2010-2012 manages access to Half Dome to a target of 400 people per day. This permit system is considered the minimum required action to protect and enhance all aspects of wilderness character, particularly opportunities for solitude. The purpose and need for this project was to protect and enhance wilderness character, address safety and risk management concerns, and bring the Half Dome trail corridor into compliance with the Wilderness Act.
- The *Half Dome Trail Stewardship Plan* addresses wilderness character on the Half Dome trail and may affect use patterns along trails between Happy Isles and Little Yosemite Valley.
- The Wilderness Restoration Program ecologically restores visitor use impacts to protect and enhance the natural condition and wilderness character.
- The *Yosemite Long-Range Interpretive Plan* outlines a comprehensive approach to interpreting park natural and cultural resources and will guide interpretive and educational efforts for the next five to 10 years.

### ***Reasonably Foreseeable Future Actions and Conditions***

Reasonably foreseeable future actions proposed in the region that could have a cumulative beneficial effect on wilderness character include:

- The *Yosemite Wilderness Stewardship Plan/EIS* will address land stewardship issues within the Yosemite Wilderness, including visitor use; vegetation associations; air resources; noise issues; watershed, soils; cultural landscapes; and other natural, cultural, and social resource variables. The plan update will also address the use of the five High Sierra Camps in Yosemite.
- Clean Water Act and Health and Food Safety Code regulatory updates could result in required upgrades and improvements to wilderness water and wastewater treatment facilities.

### ***Overall Cumulative Impact from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

The cumulative impact of the wilderness management measures under Alternative 6, in conjunction with past, present, and reasonably foreseeable future projects, would be segmentwise (in Segments 1 and 5), long term, negligible, and beneficial. Management measures for the Wilderness in Alternative 6 would be similar to those that exist currently. The Merced Lake High Sierra Camp, stock use, designated camping areas, and wilderness quotas would not change. Planned present and future actions would improve wilderness stewardship and limit access to protect wilderness character.

## **Park Operations and Facilities**

### ***Affected Environment***

#### **Regulatory Framework**

##### ***Concessions Management Improvement Act of 1998***

The Concessions Management Improvement Act of 1998 instructs the Secretary of the U.S. Department of the Interior to undertake certain actions to ensure the continued operation of the National Park Service (NPS) in a manner that advances the interests of park staff and the visiting public, while ensuring the protection of park resources. With relevance to nearly all aspects of park management, the act includes provisions for employee training, park resource inventory and research, collection of fees and budget development, and expansion of the NPS. In addition, the act provides detailed instruction regarding the award, management, transfer, and duration of concessions contracts.

##### ***Resource Conservation and Recovery Act of 1976***

The Resource Conservation and Recovery Act, as amended, establishes a regulatory structure for the management of solid and hazardous waste from the point of generation to disposal. In particular, applicable provisions include those that address underground storage tanks and sites contaminated with elements identified under Federal and State Resource Conservation and Recovery Act regulations.

##### ***The Architectural Barriers Act of 1968***

The Architectural Barriers Act created a requirement that any building or facility designed, built, altered, or leased with federal funds be accessible to, and usable by, persons with physical disabilities. Official standards for making buildings accessible have been developed and approved over the years, the most current of which is the Architectural Barriers Act Accessibility Standard (ABAAS) (2006). Federal agencies are required to adhere to these standards, and the U.S. Access Board enforces compliance with the law.

##### ***Section 504 of the Rehabilitation Act of 1973, as amended 1978***

Section 504 prohibits discrimination against people with disabilities in all programs, services, and activities conducted by federal agencies or on their behalf.

##### ***Americans with Disabilities Act of 1990***

The Americans with Disabilities Act also sets forth a series of provisions designed to address discrimination against persons with disabilities. The act establishes prohibitions on employer discrimination against those who are or become disabled. Similarly, the act prohibits state and local government agencies and places of public accommodation from discriminating against such persons in their facilities, programs, and activities. It ensures that disabled persons are not denied access to public

accommodations provided by private enterprise, such as hotels, restaurants, and transit systems, and sets forth certain structural accessibility requirements. The act also makes available telecommunications devices and services for the hearing and speech impaired, among numerous other provisions.

### ***National Park Service Management Policies 2006***

The NPS *Management Policies 2006* sets forth the NPS's management principles and establishes a broad policy framework for park management across a wide range of issues, nearly all of which have some connection to park operations and facilities. In addition to providing direction on a diverse range of resource management topics, NPS *Management Policies* also addresses such topics as education and interpretation, law enforcement, park facilities, transportation services, as well as commercial visitor facilities, among many others. This document is updated periodically to reflect changes in NPS policy, new laws and technologies, and improvements in park understanding. These policies supersede those identified in the NPS *Management Policies 2001*.

### **Park Management Divisions and Operations**

Many programs administered by Yosemite National Park are located within or have a direct connection to the Merced River corridor. Park operations are managed under nine basic divisions: Superintendent's Office, Planning, Resources Management and Science, Facility Management, Visitor Protection, Administrative Management, Business and Revenue Management, Project Management, and Interpretation and Education. All of these divisions contribute to making the varied resources of Yosemite available for the public's enjoyment, education, and recreation now and in the future (NPS 2000d). In 2010, these divisions collectively consisted of 1,123 summer employees and 743 winter employees. The park management and operational efforts are complemented by the work of the current primary park concessioner, Delaware North Company (DNC) Parks and Resorts at Yosemite, and several park partners. The following sections outline the roles and responsibilities of the various units that comprise park management and operations.

### ***Management Divisions***

Administrative divisions responsible for park management are described below.

**Superintendent's Office.** The Superintendent's Office is the administrative center of park operations. In addition to overseeing general park business and the work of the various park management divisions, the superintendent's office is also concerned with issues and activities of regional and national public importance that extend beyond the park's boundaries, such as the Hetch Hetchy water and power system, upon which the City of San Francisco depends. Included within the Superintendent's Office are the Superintendent, Deputy Superintendent and Chief of Staff, the Hetch Hetchy Program Manager, Land Resources Program Manager, Public and Legislative Affairs Office, Public Outreach and Engagement Office, and the Safety Office. Facilities necessary to support the Superintendent's operations include office space, meeting space, storage space, vehicle parking, and employee housing.

**Planning.** The Division of Planning interacts with all park management divisions, American Indian tribes, gateway communities, other land management agencies, and the public in comprehensive planning efforts for Yosemite National Park. From wild-and-scenic-rivers planning to transportation and site planning, the division facilitates communication and defines actions that will protect Yosemite's cultural and natural resources while providing quality visitor experiences. Established in 2005, the mission of the division is to ensure that projects are framed and analyzed based on adherence to the laws and statutes guiding the park, as well as those guiding the planning process for environmental and resource protection. The division also seeks to initiate planning efforts that center on transparency and intensive public engagement, where members of the public feel their input is welcomed and valued. Facilities necessary to support the Planning Division operations include office space, meeting space, storage space, and vehicle parking.

**Resources Management and Science.** Resources Management and Science staff is charged with protecting the natural, cultural, and physical resources of the park. They are responsible for resource data collection and monitoring, prescribing natural and cultural resource impacts, mitigation for construction projects, ecological restoration of sensitive areas, and vegetation and wildlife management. The staff in this division has created a monitoring program that tracks the quality of both park resources and visitor experiences. Simply put, the monitoring component serves as a report card to measure how well the park is protecting and enhancing the resource values outlined in the division's User Capacity Management Program. Monitoring results provide park managers with the information they need to make sound, science-based decisions about the impacts associated with human use in the park (NPS 2007f). Facilities necessary to support Resources Management and Science activities and programs include office and storage space, laboratory facilities, vehicle parking, and employee housing.

**Facilities Management.** Facilities Management staff conducts preventive and corrective maintenance on park infrastructure and is responsible for forestry maintenance in conjunction with fire management. The Facilities Management Division is comprised of four branches.

- The Utilities Branch operates and maintains all water and wastewater utility systems – including backcountry utilities (i.e., composting toilets and water systems), operates two wastewater treatment plants within the Merced River corridor, maintains potable water production and the high-voltage electric system parkwide, and performs energy audits on park energy consumption. The Utilities Branch also manages the emergency back-up generators and fuel tanks. Operations are based in El Portal, Yosemite Valley, Wawona, Tuolumne Meadows, and the backcountry.
- The Roads and Trails Branch is responsible for maintaining all park roads, as well as frontcountry and backcountry trails; performing hazard tree removal; operating the Yosemite Valley and Tuolumne Meadows stables; and operating the Sign Shop and the Machine Shop. The Roads and Trails Branch also manages solid waste and explosives. Operations are based in El Portal, Mather, Yosemite Valley, Wawona, and Tuolumne Meadows.
- The Design and Engineering Branch provides engineers, landscape architects, and surveyors and manages project-funding requests.

- The Buildings and Grounds Branch maintains and corrects deficiencies in administrative facilities, employee housing units, and campground facilities. This branch also performs parkwide custodial operations and historic structure preservation. Operations are based in El Portal, Mather, Yosemite Valley, Wawona, and Tuolumne Meadows. In 2000, the park partnered with local agencies to build a composting facility in Mariposa County (NPS 2008g).

Facilities necessary to support Facility Management staff include equipment materials and tools storage, workshop and storage space, warehouse materials storage, office space, archival map storage space, vehicle parking, and employee housing.

**Visitor Protection.** Visitor Protection staff performs various visitor management and resource protection duties, including frontcountry and backcountry wilderness law-enforcement operations, provision of emergency medical services, horse patrol, search and rescue, structural and wildland fire management, transportation and circulation management, and parkwide dispatching services. Protection rangers assist with monitoring natural and cultural resources, perform restoration activities, and provide assistance to park visitors. Facilities necessary to support Visitor Protection activities include the search-and-rescue cache and buildings in Yosemite Valley; wilderness centers and permit kiosks; ranger stations; parking for emergency vehicles and fire engines; incarceration facilities; helicopter landing pads; office, meeting, and storage space; government stock boarding; and employee housing for required occupants. The Little Yosemite Valley Ranger Station and Merced Lake Ranger Station are near the Merced River corridor (Segment 1), and protection rangers regularly travel through these areas to carry out their responsibilities.

**Interpretation and Education.** The purpose of NPS interpretive and education programs is to provide memorable educational and recreational experiences that will (1) help the public understand the meaning and relevance of park resources, and (2) foster development of a sense of stewardship. The programs do this by forging a connection between park resources, visitors, the community, and the NPS (NPS 2006a). Interpretation and education staff is responsible for providing natural, cultural, and physical resource information and interpretive programs throughout the year, consisting of evening programs, ranger-led talks, and open-air tram tours. In addition, staff is responsible for managing the Yosemite Valley and Tuolumne Meadows visitor centers, Pioneer Yosemite History Center, the Indian Village of Ahwahnee, the Yosemite Museum, the Wawona Information Station, and the Nature Center at Happy Isles. The Division of Interpretation and Education includes Curatorial Services, Publications, and the education branch staff. NPS staff recently completed a Comprehensive Interpretive Plan, which outlines a comprehensive approach to interpreting park natural and cultural resources. Facilities necessary to support the Interpretation and Education Division include visitor centers, museums, auditoriums, amphitheaters, office and storage space, vehicle parking, and employee housing.

**Business and Revenue Management.** Business and Revenue Management staff is responsible for overseeing and authorizing special park uses, fee and revenue management, concessions management, the operation and staffing of all park campgrounds and entrance stations, and the Park VIP Program. Additionally, the division manages all contracted concessioner operations, such as lodging, retail, and eating establishments; High Sierra Camp operations; equestrian, rafting, and bicycle rental operations; Badger Pass; the Wawona Golf Course; galleries; and the Yosemite Medical Clinic. The division manages the Incidental Business Permit program, which consists of the regulation of tour buses,

backcountry stock use, commercial tour and recreational guiding services, television and film productions, and weddings. Facilities necessary to support Business and Revenue Management operations include administrative office and storage space, entrance stations, and vehicle parking.

**Administrative Management.** Administrative Management staff is responsible for managing the park's finances and budget, information technology systems, human resources, employee housing, and procurement and contracting. Facilities necessary to support Administrative Management include office and storage space, warehouse facilities, computer operations systems, and vehicle parking.

**Project Management.** Project Management staff is responsible for major land-use planning efforts and facility improvement projects for the park. The division is responsible for estimating design and construction costs, obtaining and managing park project funding, and implementing projects. The Office of Environmental Planning and Compliance branch of Project Management Division completes appropriate NEPA and National Historic Preservation Act compliance for all park projects. Planning facilities necessary to support Project Management include office and storage space and vehicle parking.

### ***Park Partner Operational Areas***

The following paragraphs summarize the various types of operational activities performed by park partners, including the primary park concessioner, throughout the park.

**Primary Park Concessioner.** The current primary park concessioner, DNC Parks and Resorts at Yosemite, provides a variety of support services that complement the work of NPS staff. DNC operates and manages numerous visitor-servicing facilities and operations within the park. These generally include overnight accommodations, food and beverage services, merchandising services, automotive services, visitor activities and other services, and the visitor transportation system. The primary park concessioner operates approximately 386 buildings parkwide (NPS 2012a). As described more fully in the "Visitor Experience" section of this chapter, all of the park lodging is also managed by the primary park concessioner, including The Ahwahnee, Yosemite Lodge, Curry Village, Housekeeping Camp, Wawona Hotel, and the Merced Lake High Sierra Camp. As of 2010, the concessioner-operated Yosemite Valley visitor lodging could accommodate 4,800 people, which is roughly 62% of the valley's total overnight visitor capacity (NPS 2012a). The primary park concessioner is also responsible for the set-up and tear-down of all seasonal concessioner-operated visitor services and seasonal concessioner employee housing in Yosemite Valley and Merced Lake High Sierra Camp. In 2010, the current primary park concessioner employed 1,800 summer and 1,100 winter employees. Concessioner employee housing is discussed under "Park Infrastructure and Facilities," below.

**Concessioner Stock Operations.** Both the NPS and the primary park concessioner use stock to support their operations in the Merced River corridor. As discussed in the "Visitor Experience" section of this chapter, the primary park concessioner uses stock to support the operation of the High Sierra camps and backcountry camping trips. NPS uses stock to support backcountry utilities operations and trail crew camps, to assist with search-and-rescue operations, and for backcountry patrols.

**Other Park Partners.** There are several other park partners operating within the Merced River corridor. Main park partners include the Yosemite Conservancy, Ansel Adams Gallery, and NatureBridge. The activities of each park partner, as they pertain to the corridor, are briefly summarized below.

The Yosemite Conservancy— the nonprofit organization formed by the 2010 merger of the Yosemite Association and the Yosemite Fund — is a philanthropic organization dedicated to the protection and preservation of Yosemite National Park, and the enhancement of visitor experience. The conservancy works to create opportunities for individuals to experience and connect with the park by funding trail repairs, habitat restoration, outdoor programs, volunteer programs, and other programs that may not otherwise happen. The Yosemite Conservancy’s park office is located in the El Portal Administrative Site (NPS 2012e).

The Ansel Adams Gallery is an authorized park concessioner specializing in the work of Ansel Adams. This registered California historic business has been owned and operated by the family of Ansel Adams since 1902. The gallery is located in the heart of Yosemite Valley and offers original artwork, prints, posters, books, calendars, postcards, and DVDs of the artist’s work (NPS 2012e).

NatureBridge is a nonprofit corporation that provides students with hands-on educational adventures in natural settings, including within several national parks. Within Yosemite National Park, NatureBridge offers school and group field-science programs, outdoor educator and wilderness first-responder courses, and field research courses for high school students, among others. The NatureBridge Campus is located at Crane Flat, outside the Merced River corridor. However, the organization also utilizes facilities at Curry Village and Camp Wawona. Field courses are taught in various locations throughout the corridor (NatureBridge 2012).

### **Park Infrastructure and Facilities**

There are 747 National Park Service buildings parkwide, including office buildings, residences, and utility infrastructure located in Yosemite Valley, the El Portal Administrative Site, and along the South Fork Merced River in Wawona (NPS 2012a). Parkwide base operations continue to shift from Yosemite Valley to the El Portal area (NPS 2006b). The El Portal Administrative Site, located adjacent to the park, was established in 1958 and is comprised of both government housing and private employee residences located on federal land. Effective December 2009, a settlement agreement placed a moratorium on El Portal Administrative Site residential and facility construction and expansion. Until July 2013, the settlement agreement imposes constraints on certain types of maintenance and construction activity within the Merced River corridor. In addition, the agreement prohibits new structures that are not considered minor (i.e., small, temporary, not habitable, and not designed to support commercial uses). The agreement notes that existing and future development in the El Portal Administrative Site must protect and enhance the Merced River’s outstandingly remarkable values (NPS 2009).

The following sections summarize the types of park facilities and infrastructure that could be affected by the management actions under consideration in the alternatives analyzed in this EIS. The discussion is divided among administrative facilities, employee housing, and utilities and infrastructure. For

descriptions of trails, camping, lodging, and associated visitor-serving facilities within the Merced River corridor, see the “Visitor Experience” section of this chapter. For descriptions of roads, bridges, tunnels, and parking within the corridor, see the “Transportation” section of this chapter.

### ***Administrative Facilities***

**Segments 1, 5, and 8.** There are no administrative facilities in the wilderness segments of the Merced River corridor.

**Segment 2.** Administrative facilities within the project area are mainly concentrated along the eastern portion of the Yosemite Valley. Within Segment 2, most are located in proximity to the Yosemite Village complex. These include the NPS Administration Building, the Village Post Office, Primary Concession General Office Building and Village Garage complex (garage and fire station), and Wilderness Center. Other administrative facilities in the valley include the Yosemite NPS Volunteer Office and Yosemite Lodge Post Office, both located within the Yosemite Lodge complex.

**Segments 3 and 4.** Administrative facilities within the Merced River gorge include the Arch Rock Entrance Station Kiosk and Administrative Office. Such facilities within the El Portal Administrative Site include the El Portal Maintenance and Administrative Complex.

**Segments 6 and 7.** The Wawona Maintenance Yard complex is the only administrative facility within the South Fork Merced River corridor.

### ***Concessioner Employee Housing***

The Yosemite housing environment is complex and challenging. The park receives nearly four million visitors annually. Yosemite Valley receives more visitors than any other area of the park. As a result, the valley also hosts the largest number of visitor services. The primary park concessioner provides the bulk of visitor services and staffing necessary to accommodate these visitors. However, because the park is located in a remote portion of the Sierra Nevada Mountains, with limited access to only a few gateway communities, concessioner employee housing options outside of the park have historically been quite limited. Other factors limiting concessioner housing outside the park are the flexibility required to staff restaurants and lodges in the early morning and late in the evening, the ability to attract and retain qualified employees for seasonal work, and the desire of communities outside the park in maintaining a rural living environment. As a result, over the years, a considerable amount of concessioner housing has been developed within the Merced River corridor, specifically within the valley. The housing-related management actions described herein mainly concern concessioner employee housing. These management actions would not, however, substantially affect NPS employee housing supply or demand. As such, all subsequent references to employee housing, unless otherwise specified, concern those necessary to support concessioner operations.

**Segment 1.** There is no employee housing located within Segment 1. However, the Merced Lake High Sierra Camp has five beds reserved for administrative staff.

**Segment 2.** Over the years, a considerable amount of that demand for employee housing was met through development of employee housing within the Yosemite Valley. As shown in **table 9-153**, the vast

**TABLE 9-153: EXISTING CONCESSIONER HOUSING WITHIN YOSEMITE VALLEY**

Location	Capacity (beds)
Yosemite Village	431
The Ahwahnee	48
Curry Village	582
Yosemite Lodge	90
<b>Total</b>	<b>1,151</b>

majority of park and concessioner employee housing within the Merced River corridor is found in Yosemite Valley. As the table indicates, housing is concentrated around Yosemite Village, The Ahwahnee, Curry Village, and the Yosemite Lodge. Together these facilities can accommodate approximately 1,151 employees.

Several hundred employee housing units were either destroyed or closed as a result of the 1997 flood and 2008 rockfall, exacerbating an already high demand for employee housing within the valley. Some of that demand has been offset through the development of temporary housing facilities, such as those at Yosemite Lodge, Boys Town, Highland Court, and the Lost Arrow Parking Lot. Nonetheless, the demand for concessioner employee housing within the valley continues to exceed supply by more than 93 units.

**Segments 3 and 4.** Concessioner employee housing within Segments 3 and 4 is largely concentrated within Rancheria and El Portal Village. The number of beds assigned to employees within each area total 107 and 80, respectively. There are also five beds assigned to concessioner employees in the Abbieville area of El Portal.

### *Utilities and Infrastructure*

The following subsections describe the utilities and infrastructure within the Merced River corridor that service park operations and facilities. Electrical and telecommunications infrastructure, which tends to be fairly uniform across the more developed segments of the corridor, are discussed generally for all applicable segments (i.e., Segments 2, 3, 4, and 7). A segment-specific discussion of water and wastewater follows.

NPS purchases power from Pacific Gas & Electric Company (PG&E). Electricity is carried into Yosemite Valley via a 70,000-volt transmission line that runs overhead through El Portal and the Merced River Gorge to the substation at the old Cascades Powerhouse. The powerhouse is no longer active as a hydroelectric generator but is still used as a substation. From the powerhouse, power is stepped down to 12,000 volts. Conductors extend beneath El Portal Road to a substation in Yosemite Village. The Wawona Tunnel and Big Oak Flat Tunnel are served by overhead lines from the powerhouse.

The primary electric distribution system is in generally good condition after upgrades over the last 12 years, although areas in Yosemite Valley still require rehabilitation. End users in Wawona, El Portal, Foresta, and Hodgdon Meadow are served directly by PG&E, whose facilities are within the park in several places. However, in February 2011, the park completed the installation of a 672 kilowatt

photovoltaic system at the El Portal Maintenance and Administrative Complex. The power generated from the project will offset by approximately 12 percent the electricity purchased from the grid (NPS 2011). A ground source heat pump in the Curry Village employee housing utilizes the near-constant temperature of the earth for heating and cooling of the buildings (NPS 2008g). AT&T supplies telephone service into the park and El Portal primarily through microwave transmission. Overhead and underground lines serve various other locations throughout the park and El Portal. Currently, Yosemite relies on aging communication equipment and infrastructure that does not share a single “backbone” technology to transmit information. Many developed areas of the park — Wawona, Crane Flat, Hodgdon Meadows, Hetch Hetchy, and Tuolumne Meadows — are still served by old copper telephone wires which limit staff’s network and internet access. The existing system cannot be upgraded efficiently or effectively and, therefore, Yosemite’s local service provider has limited bandwidth capabilities and no cost-effective way to provide increased bandwidth (NPS 2008h).

**Segment 1.** Utilities within Segment 1 are concentrated around the Merced Lake High Sierra Camp and Merced Lake Backpackers Campground. The former has a septic system and a water purification system. The septic system consists of a septic tank, lift station (run on photovoltaic trackers [PV]), dosing tank, leach field, and associated piping. The water system consists of a chlorinator shed, water pump (run on PV), sand filter, three 1500 gallon tanks, and associated piping. The Merced Lake Backpackers Campground shares the water system with the Merced Lake High Sierra Camp; however, the campground has a separate septic tank and leach field.

Backcountry Utilities (BCU) is responsible for opening and closing the Merced Lake High Sierra Camp’s utilities each season. Using NPS stock, BCU occasionally pack in and out using one to two mules; however, staff also use bicycles to access backcountry utilities for maintenance. The daily operation of the utilities is done by the primary park concessioner. BCU performs maintenance as needed, either coming from Yosemite Valley or from Vogelsang. Each trip is, at minimum, an overnight trip and utilizes only one to two mules when necessary. BCU also opens and closes the Merced Lake Backpackers Campground’s utilities and maintains them once a week during the open season. The primary park concessioner cleans the facilities daily when the High Sierra Camp is open.

The NPS uses helicopters to remove sludge from the High Sierra Camp every three seasons. It does the same for the Merced Lake campground about every six seasons. The former typically requires about 15 flights. For optimal flight utilization, this waste removal is coordinated for efficiency between the High Sierra Camp and the Merced Lake Backpackers Campground.

**Segment 2.** There is an extensive system of water, wastewater, electric, and communications utility systems in Yosemite Valley. Most utility systems in the valley are operating within design capacity. Three wells, a 2.5-million-gallon water storage tank, and several distribution lines supply Yosemite Valley’s users with water. The system has the capacity to produce about 2,800 gallons per minute (gpm). Components of the water system have been replaced and upgraded due to damage sustained in the January 1997 flood and utility realignment for meadow restoration based on other valley plans. These improvements have restored reliability to the system, and allow for remote monitoring and pumping.

Wastewater flows in Yosemite Valley decreased considerably after the flood because several campgrounds and lodging units were damaged or destroyed and subsequently closed. Leakage and

resulting infiltration have been corrected. The Facilities Management Division has made substantial improvements to the sewage collection system in Yosemite Valley, but leakage and infiltration still occur on occasion during high water events. Wastewater in Yosemite Valley is pumped to the west end of Yosemite Valley, where it flows down to the El Portal Wastewater Treatment Plant at Railroad Flat.

**Segments 3 and 4.** El Portal's water supply system consists of six wells adjacent to the Merced River and four tanks with a total storage capacity of 900,000 gallons, for a total production capacity of approximately 220 gpm. The water system in El Portal is marginally sufficient for the current levels of use but does not have adequate capacity to compensate for any component failure or any increased development. However, the facility is expected to be replaced in the near future.

A wastewater line runs between El Portal and Yosemite Valley, beneath El Portal Road on the north side of the Merced River. As noted above, the El Portal Wastewater Treatment Plant at Railroad Flat receives and treats the valley's wastewater. It has a permitted capacity of 1 million gallons per day (gpd) and is located within 0.25 mile of the Merced River.

**Segments 6 and 7.** As with that of El Portal, Wawona's water supply system is marginal, as is the capacity of its wastewater treatment plant. Of the 20 public water systems in the park, Wawona's is one of two that draw solely from surface sources. The Wawona water system takes untreated water directly out of the South Fork Merced River. This system is currently constrained in most years through much of the late summer and early fall because of low flows in the river. The NPS water distribution system in Wawona is supplied by surface water drawn from the South Fork Merced River at a rate of 480 gpm. The potable water is held in four tanks with a total design capacity of 1,250,000 gallons.

In 1987, NPS implemented the *Wawona Water Conservation Plan*, which set the rate of diversion from the Wawona water intake at 288 gpm (NPS 1987). To protect instream flows for aquatic habitat, the plan enacted mandatory water conservation whenever the river reaches flows of less than 6 cubic feet per second. At flows of less than 6 cubic feet per second, diversions are limited to 10% of the river flow. Conservation measures start with banning irrigation use for the Wawona Golf Course and the lawns of homes and other buildings. The NPS is considering other options to increase the reliability of the water system at Wawona, including bringing water into Wawona through a 7-mile pipeline from a spring located in the Big Creek watershed.

A tertiary wastewater treatment plant serves all of the public sources in the town of Wawona, and much of the private residential and commercial development. As with that of El Portal, Wawona's treatment facility is located within 0.25 mile of the river. The Wawona Campground is served by septic tanks and leach fields. When the capacity of the latter is exceeded (or ultimately fails), there is a potential for effluent to migrate into groundwater and the river.

### ***Environmental Consequences Methodology***

The analysis of facilities and operations within this section focuses on administrative facilities, employee housing, utilities and infrastructure, and the operational burden of carrying out the management actions identified under the respective alternatives. The consideration of park facilities in this section is not exhaustive. For example, infrastructure, such as roads, bridges, parking, and shuttle and regional transit,

are addressed in the “Transportation” section of this chapter. Similarly, trails, overnight accommodations, and recreational facilities and services are addressed in the “Visitor Experience” section of this chapter. However, the operational implications of the alternatives, as they pertain to such facilities, are addressed in this section. It is assumed across all alternatives that staffing would remain sufficient to meet visitor needs and carry out regular management and operational duties.

Proposed management actions under the *Merced River Plan/EIS* are evaluated in terms of the context, intensity, and duration of impacts on concessioner and park operations and facilities, and whether the impacts are considered beneficial or adverse.

- **Context.** For the purposes of this analysis, the local, segmentwide, and parkwide implications for operations and facilities are considered. Due to the nature of park operations, unless otherwise specified, all impacts are assumed to be parkwide.
- **Intensity.** The intensity of the impact considers whether the impact would be negligible, minor, moderate, or major. Negligible impacts are effects considered not detectable and would have no discernible effect on operations and facilities. Minor impacts are effects on operations and facilities that would be slightly detectable but not expected to have an overall effect on the ability of the park to provide services and facilities. Moderate impacts would be clearly detectable and could have an appreciable effect on operations and facilities. Major impacts would have a substantial, highly noticeable influence on park operations and facilities and include those impacts that would reduce the ability to provide adequate services and facilities to visitors and staff.
- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term. A short-term impact would be temporary in duration and would be associated with transitional or restoration- or construction-related activities. A long-term impact would have a permanent effect on operations and facilities.
- **Type of Impact.** Impacts are evaluated in terms of whether they would be beneficial or adverse to operations or facilities. Beneficial impacts would improve operations and/or facilities. Adverse impacts would negatively affect operations and/or facilities, or could impede the ability to provide adequate services and facilities to visitors and staff. Beneficial impacts on park operations and facilities include changes to more closely match supply with demand regarding staffing and the inventory of employee housing, administrative facilities, utilities, and infrastructure.

### ***Environmental Consequences of Alternative 1 (No Action)***

The following discussion provides an overview of the types of impacts on park operations and facilities that could occur within each segment of the Merced River corridor from implementation of Alternative 1 (No Action). Under Alternative 1, park operations and facilities within the Merced River and South Fork Merced River corridors would continue to be guided by *NPS Management Policies* and *Superintendent’s Compendium*, among other documents that affect management decisions regarding operations and facilities. Park visitation would be expected to continue growing at the present rate of 3% annually. As a result, the operational burden associated with managing large numbers of park visitors, including those associated with the provision of visitor services; the management of park resources; and the demands on and maintenance of administrative facilities, employee housing, and

utilities; among other aspects of park operations would continue to increase. However, limitations on development activities imposed through the 2009 Settlement Agreement, or restrictions similar thereto, would remain in place for the foreseeable future. Such limitations include prohibitions on the development of any new overnight lodging units or the paving of any park areas or trails that are currently unpaved. In addition, the park would not construct any new structures, except for those that are small, temporary, easily removed, nonhabitable, and designed to support existing uses, systems, and programs (Friends of Yosemite Valley et al. 2009). As such, the administrative facilities and employee housing described in the “Affected Environment” section, above, would be expected to remain in place for the remainder of their useable life. Utilities and infrastructure serving these administrative facilities, employee housing, overnight lodging, and other visitor-serving facilities would also remain in place and be maintained, as necessary, to meet employee and visitor demands.

## Corridorwide Actions

### *Actions to Protect and Enhance River Values*

Under Alternative 1 (No Action), impediments to the free-flowing condition of the Merced River, including riprap, revetments, and abandoned infrastructure, would remain in place. Park staff would continue to undertake measures to ensure a high level of water quality, including regular maintenance of trails and wastewater infrastructure. Ongoing impacts associated with informal trails, conifer encroachment into meadows, and bank erosion associated with high visitation and infrastructure would remain. The park would continue restoration projects in several meadows and on the riverbank in numerous locations (per the Settlement Agreement). As described more fully in the Alternatives chapter, this work would include riparian tree planning, conifer removal, mulching, invasive species control, and the potential use of some heavy equipment (i.e., a bobcat or small excavator). Sensitive cultural resources would continue to experience impacts from informal trails, infrastructure, campgrounds, and parking areas. Park staff would continue to manage cultural resources in accordance with the requirements of the National Historic Preservation Act, and in consultation with the State Historic Preservation Officer and Advisory Council on Historic Preservation. Traffic congestion, vegetation growth, informal trails, and trampled vegetation and riverbanks would continue to affect scenic resources. Park staff would not implement the measures identified in *Scenic Vista Management Plan*. Alternative 1 does not propose any additional measures to address these issues. As such, park staff would experience no short-term impact associated with implementation of Alternative 1. However, the park would continue to experience a negligible to minor, adverse operational impact associated with incremental management of impacts associated with these conditions.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Under Alternative 1, transportation management would continue as under present conditions. During peak summer days, congestion would reach near gridlock levels at park entrances and pinch-points throughout Yosemite Valley. On these days, the number of vehicles entering the valley would exceed the number of available parking spaces, contributing to further congestion and resource impacts associated with the use of existing and newly created informal parking areas. No additional management measures to address these issues would occur under Alternative 1. As such, park staff

would continue to experience a long-term, minor, adverse operational impact associated with traffic and parking management.

### **Segments 1, 5, and 8: Merced River Above Nevada Fall and Merced River Above and Below Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Merced Lake Ranger Station Meadow would continue to experience high levels of bare ground from pack stock grazing and trampling, and informal trails would continue to traverse park meadows. No additional actions would be taken under Alternative 1 to address these issues. The impact on park operations would continue to be long-term, negligible, and adverse.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Wilderness access would continue to be managed by backcountry zone capacities and related trailhead quotas. The quota for Little Yosemite Valley would remain at 150 people. Park staff would continue to incur a negligible to minor, adverse operational impact associated with administration of the trailhead quota system and restoration activities required of visitation at present levels.

Under Alternative 1, the Merced Lake High Sierra Camp would operate at capacity. The camp would continue to host up to 60 guests nightly and provide beds for five employees during summer months. As such, park staff would continue to experience a long-term, negligible to minor, adverse operational impact associated with the seasonal set-up, weekly supply, and daily maintenance of the camp and associated infrastructure (i.e., water supply infrastructure, septic system, leach field, among other features).

The number of designated campsites within the Merced River corridor's wilderness, specifically at Little Yosemite Valley and Moraine Dome Campground, would remain as under present conditions. Dispersed camping would continue at Merced Lake Backpackers Campground. The park would continue to experience a long-term, negligible, adverse operational impact associated with management and maintenance of these facilities.

**Segments 1, 5, and 8 Impact Summary.** Implementation of Alternative 1 would result in parkwide, long-term, negligible, adverse impacts on park operations and facilities.

### **Segment 2: Yosemite Valley**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 1, bridges, elevated roadways, abutments, and abandoned infrastructure and fill would remain within the Merced River corridor and continue to affect the river's free-flowing condition. Water quality within Segment 2 would continue to be affected by human activity in and around the river. Such activities within the corridor would continue to affect the river's biological values within Yosemite Valley. While not prescribed under Alternative 1, park staff would continue to

manage traditionally used plant populations in accordance with the invasive plant management program. No action is proposed under Alternative 1 to address these issues. As a result, park staff would experience no changed short-term, operational burden. However, because protecting river values under these conditions would necessitate ongoing maintenance and restoration activities, the impact on park operations would continue to be long-term, minor, and adverse.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Under Alternative 1, the Yosemite Valley would continue to receive approximately 20,900 visitors daily. Daytime visitation would remain around 14,800, while overnight visitation would continue to approach 6,100. Visitation levels would be expected to increase at a rate of approximately 3% annually, commensurate with trends in overall park visitation. The impact on staffing and other resources required to restore areas affected by high visitor use, manage traffic, and maintain visitor-serving facilities would continue to be long-term, minor, and adverse.

Overnight lodging facilities, including those at Curry Village (400 units), Yosemite Lodge (245 units), Housekeeping Camp (266 units), and Ahwahnee Hotel (123 units), would remain in operation and continue to receive guests at present levels. Lodging units within the valley would continue to total 1,034. The management and maintenance requirements of these facilities would continue to have a long-term, negligible to minor, adverse impact on park operations.

The number of campsites within the valley would remain as under current conditions, including those at Camp 4 (35 sites), Upper Pines Campground (240 sites), Lower Pines Campground (76 sites), North Pines Campground (86 sites), Backpackers Campground (25 sites), and Yellow Pine Campground (4 administrative sites). Thus, the valley would continue to host 466 campsites. Through the continued operation of these facilities, and maintenance and restoration required of high visitation in their vicinity, park staff would continue to incur a long-term, negligible to minor, adverse operational impact.

Concessioner operations within the valley would stay in their present locations and conditions. No new concessioner employee housing would be constructed under Alternative 1. As such, employee housing would continue to be concentrated within Yosemite Village (431 beds), the Ahwahnee Hotel (48 beds), Curry Village (605 beds), and Yosemite Lodge (90 beds). The total number of valley housing units assigned to concessioner employees would therefore remain at 1,151. Under these conditions, housing need would continue to exceed supply. As a result, some concessioner employees who work within the valley would continue to reside in housing outside of the valley and commute daily to their place of employment. The long-term operational impact would continue to be negligible to minor, and adverse.

**Segment 2 Impact Summary:** Implementation of Alternative 1 would result in parkwide, long-term, negligible to minor, adverse impacts on park operations and facilities.

## **Segments 3 and 4: Merced River Gorge and El Portal**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 1, obstructions to the free-flowing condition of the Merced River would remain in the Merced River gorge and El Portal segments, including levees, abandoned infrastructure, riprap, and fill material at the Greenemeyer Sandpit. Within El Portal, vehicles would continue to affect oak trees by parking within their dripline. And water quality would continue to be affected by stormwater runoff from the informal off-street and roadside parking areas between the Merced River and Foresta Road. No actions to address these issues are proposed under Alternative 1. However, park staff would continue to incur a long-term, negligible to minor, adverse impact associated with the incremental management of the impacts stemming from these developments.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segments 3 and 4 would not be expected to change appreciably under Alternative 1. A total of 192 beds would continue to be assigned to concessioner employees, fulfilling existing demand within Segments 3 and 4. There would continue to be no concessioner-operated lodging or campgrounds within these segments. The consequent long-term impact on concessioner operations would be negligible and adverse.

**Segments 3 & 4 Impact Summary:** Implementation of Alternative 1 would result in parkwide, long-term, negligible to minor, adverse impacts on park operations and facilities.

## **Segments 6 and 7: Wawona and Wawona Impoundment**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 1, the current water collection and distribution system at Wawona would remain in place. Impacts on water quality associated with abandoned infrastructure, septic systems, and other development in proximity to the Merced River would continue within Segment 7. While no actions are proposed under Alternative 1 to address these issues, park staff would continue to experience a long-term, negligible, adverse impact associated with the ongoing maintenance of infrastructure, specifically wastewater infrastructure, to avoid or minimize impacts on water supply and quality.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Existing visitor facilities in the Wawona area would remain as under present conditions. Roadside parking between the Wawona Store and Chilnualna Falls Road would remain in place and continue to disturb soil and vegetation near the Merced River. The facilities and layout at the Wawona Maintenance Yard are not optimal for operational efficiency and would continue to affect the riparian corridor. Alternative 1 includes no measures to address these issues. However, long-term management of impacts associated with development near the channel would continue to impose a negligible, adverse operational burden on the park.

**Segments 6 & 7 Impact Summary:** Implementation of Alternative 1 would result in parkwide, long-term, negligible, adverse impacts on park operations and facilities.

### **Summary of Alternative 1 (No Action) Impacts**

Under Alternative 1, the park would continue to receive around 20,900 visitors daily, with the number of visitors expected to increase by approximately 3% annually. As visitation continues to increase, operational demands associated with visitation, including law enforcement, traffic management, cultural and resource protection, among others, would be expected to increase. The park's commercial services and overnight accommodations, including the valley's 1,034 lodging units and 466 campsites, would remain in operation. Alternative 1 proposes no new construction. For these reasons, over the long-term, depending on park visitation trends and staffing, the impact on park operations and facilities could be minor and adverse.

### **Cumulative Impacts of Alternative 1 (No Action)**

Cumulative effects on park operations and facilities discussed herein are based on analysis of past, present, and reasonably foreseeable future actions in the immediate Yosemite region, in combination with potential effects of Alternative 1. The projects identified below include only those that could affect park operations and facilities within or in the vicinity of the Merced River corridor. Each project is described more fully in the Alternatives chapter.

#### ***Past Actions***

The following is a list of cumulatively considerable past actions concerning park operations and facilities.

- Removal of Cascades housing increased housing demand by eliminating five housing units from Segment 1. The project reduced the operational burdens of maintaining the aging structures.
- The construction of 217 new housing units at Curry Village reduced housing demand by replacing units lost during the 1997 flood. The project increased demand for utilities in Yosemite Valley and operational burdens associated with facilities maintenance.
- Construction of temporary housing for 102 employees at the Curry Village Huff House reduced temporarily the sudden increase in demand resulting from closure of Curry Village units due to rockfall hazard.
- Construction of six temporary housing units at Yosemite Valley Lost Arrow reduced temporarily the sudden increase in demand resulting from closure of Curry Village units due to rockfall hazard.
- Construction of 12 temporary employee housing units at The Ahwahnee reduced the sudden increase in demand resulting from closure of Curry Village units due to rockfall hazard.
- Completion of numerous ecological restoration projects reduces the operational burdens of future restoration efforts in these areas.

### ***Present Actions***

The following is a list of cumulatively considerable present actions concerning park operations and facilities.

- Implementation of the *East Yosemite Valley Utilities Improvement Plan/EA* may reduce utilities demand by improving the efficiency and reliability of utility infrastructure. These improvements also reduce the operational burdens associated with the repair and maintenance of aging infrastructure.
- Completion of the *Mariposa County General Plan* Housing Element Update may contribute to the long-term reduction in demand for housing by providing for the expansion of housing opportunities within the county.
- Installation of traffic counters, development of the Integrated Transportation Capacity Assessment, Parkwide Traffic Management and Information System, and Mariposa Grove area transportation planning projects may reduce traffic-related operational burdens by contributing to transportation management solutions within the park.
- Completion of the Parkwide Communication Data Network could improve operational efficiency through faster and more secure network capabilities, while also reducing the demand on existing telecommunications infrastructure.
- Relocation of 40 park staff from offices in El Portal to Mariposa may reduce the demand for administrative facilities and utilities within El Portal.
- Ongoing ecological restoration projects may reduce the operational burdens of future restoration efforts in these areas.
- Restoration activities at Mariposa Grove and the South Entrance Station Kiosk Replacement could benefit transportation flow and parking conditions between the South Entrance and Wawona, thereby reducing the park's overall transportation management burdens.

### ***Reasonably Foreseeable Future Actions***

The following is a list of cumulatively considerable, reasonably foreseeable future actions concerning park operations and facilities:

- Development of the new Concessioner Prospectus could increase or decrease demands for administrative facilities, housing, utilities, and overall operational burden, depending on its terms.
- Completion of the forthcoming *Yosemite Wilderness Stewardship Plan/EIS* would reduce operational burdens by providing clearer and more up-to-date direction with regard to resource and visitor management within wilderness areas of the park.
- Future ecological restoration projects may temporarily increase the operational burdens of restoration efforts in these areas.

### ***Overall Cumulative Impact***

As discussed previously, Alternative 1 does not propose any changes to existing park and concessioner operations and facilities. Past actions have had an overall beneficial, however temporary, effect on housing demand. Present activities have the potential to reduce transportation- and utilities-related operational burdens, and provide for new housing opportunities outside of the park. Reasonably foreseeable actions may mitigate some of the operational burden of increasing visitation through transportation management solutions, updated direction with regard to wilderness management, and a clearer perspective of the future role of the primary park concessioner. The cumulative effect of these actions, when considering those of Alternative 1, would be long-term, negligible, and beneficial.

### ***Environmental Consequences Common to Alternatives 2–6***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Corridorwide actions to protect and enhance river values that would occur across Alternatives 2–6 involve restoration and protection of the channel itself, meadow and riparian habitats, and upland vegetation. These include restoration of six miles of informal trails, removal of abandoned underground infrastructure, improvement of river access points, and the removal of riprap, among other activities. River values would also be protected by increased interpretation and outreach concerning river use and natural and cultural resources. The planning, environmental analysis, design, construction/removal, restoration, and monitoring activities associated with these individual management actions would temporarily disrupt the regular work of park staff, resulting in short-term impacts on parkwide operations ranging from negligible to moderate and adverse. While these measures would reduce or eliminate ongoing and/or future impacts on park resources and infrastructure, the park would still incur a long-term, minor to moderate, adverse impact associated with restoration management and monitoring.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values across all segments under Alternatives 2–6 include removing 3,400 feet of riprap from the river bank and revegetating with riparian species, and replacing an additional 2,300 feet of riprap with bioengineered riverbank stabilization devices. This work would require the use of heavy equipment, including loaders and dump trucks. The removal, transport, disposal, restoration, and monitoring work associated with these actions would require several weeks of park staff time to implement, but would not substantially disrupt other ongoing construction, demolition, and restoration activities in the valley and beyond. As a result, these actions would result in a short-term, parkwide, minor, adverse impact on park operations.

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

The park does not propose any measures to manage visitor use and facilities across Segments 1–8 that would occur across Alternatives 2–6.

## **Segments 1, 5, and 8: Merced River Above Nevada Fall, and Merced River Above and Below Wawona**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternatives 2–6, the park would undertake measures to eliminate impacts on natural and cultural resources in the vicinity of Merced Lake Backpackers Campground and Merced Lake High Sierra Camp (Segment 1) and archaeological resource site CA-MRP-0218 (Segment 5). Such measures would include prohibiting grazing and restoring denuded areas associated with informal trails. These actions, including the planning and follow-up monitoring, would likely require the commitment of several staff from across numerous park divisions and the use of pack stock, for a period of several days to several weeks. However, because these measures are consistent with the types of management activities staff from these divisions typically perform, the short-term impact on park operations would be negligible and adverse. Park staff would experience a long-term, negligible, adverse operational impact associated with maintenance and monitoring of restoration areas.

**Segments 1, 5, and 8 Impact Summary:** Actions to protect and enhance river values would result local, long-term, negligible, adverse impacts on park operations and facilities.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values that would occur in Yosemite Valley under Alternatives 2–6 involve removal of abandoned infrastructure and other development affecting the Merced River’s hydrologic function, extensive meadow restoration, and management of high visitor-use areas to address associated impacts on riparian habitats and sensitive cultural resources. Removal of abandoned or obsolete infrastructures would reduce ongoing impacts on meadow hydrology and lessen channel scour. Upland restoration activities, including removal of informal trails, roadbeds, and parking areas, would improve meadow health. Development of a management plan for archeological sites, preparation of outreach materials, and imposition of use restrictions in sensitive areas would reduce ongoing impacts on cultural resources. The demolition, removal, transport, disposal, restoration, and monitoring work associated with these actions would require a substantial amount of park staff time and resources, and would likely disrupt other ongoing construction, demolition, and restoration activities in the valley and beyond. As a result, these actions would result in a short-term, moderate, adverse impact on park operations. These efforts would reduce the long-term staff burden associated with managing these ongoing impacts. However, the follow-up restoration monitoring and maintenance would continue to impose a long-term, negligible, adverse impact on park operations.

**Biological Resource Actions.** Specific projects to protect and enhance the river’s biological values within Segment 2 under Alternatives 2–6 include: restoring 4.5 acres of riparian habitat in the area of Yosemite Lodge, 20 acres in the area of the western portion of the Former Upper Pines Loop Campground, and removal of infrastructure and restoration of a minimum of 19.7 acres at the Former Upper and Lower Pines campgrounds; restoring impacted areas of Ahwahnee Meadow, including removal of tennis courts; improving access and removing infrastructure from riparian areas at

Cathedral Beach, Housekeeping Camp, and Bridal Veil; constructing a boardwalk extension to reduce Sentinel Meadow trampling; fencing and vegetation management at Stoneman Meadow, restoring floodplain habitat at Devil's Elbow, and filling ditches not serving current operational needs. In addition, the park would remove one and repave five pull-outs along El Portal Road. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, removal, transport, disposal, restoration, and monitoring work associated with these actions would require more than one year of park staff time to implement, and would disrupt other ongoing construction, demolition, and restoration activities in the valley and beyond. As a result, these actions would result in a short-term, parkwide, moderate, adverse impact on park operations.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values within Segment 2 under Alternatives 2-6 include: removing the abandoned gauging station at Pohono Bridge, removing the footings and former river gauge base at Happy Isles, and restoring these areas to natural conditions. This work would involve the use of heavy equipment, including excavators, a skid steer, and dump trucks, and require approximately five weeks of staff time to implement. The resulting impact on park operations would be short-term, parkwide, negligible and adverse.

**Cultural Resource Actions.** Specific projects to protect and enhance the river's cultural values that would occur within Segment 2 under Alternatives 2-6 include fencing and/or restricting access to the archeologically significant large bedrock mortar (pounding rock) next to Yosemite Falls Trail. The majority of this work would be completed through the use of hand tools and require a nominal commitment of staff time. As such, the impact on park operations would be short-term, parkwide, negligible, and adverse.

**Scenic Resource Actions.** Specific projects to protect and enhance the river's scenic values within Segment 2 under Alternatives 2-6 include: selectively thinning conifers and other vegetation in the vicinities of The Ahwahnee and Meadow, Bridal Veil Falls and West Valley, Cooks and Sentinel Meadows, Curry Village, El Capitan, Housekeeping Camp, Yosemite Lodge, and other areas of the valley; restoring grassland and oak habitat in the areas of Bridalveil Straight; repairing riverbank erosion at Clark's Bridge; and addressing informal trails and trampling at the east end of El Capitan Meadow. Much of this work would be accomplished through the use of hand tools, but could also involve heavy equipment for various handling, transport, and restoration activities. This work would occur over the course of several years and may disrupt other restoration activities. As a result, these projects would have a parkwide, short-term, minor to moderate, adverse impact on park operations.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities within Segment 2 that would occur under each action alternative involve changes to campsites, visitor and administrative facilities, employee housing, and transportation. Each of these actions and their impacts on park operations is summarized below. Their implications for overall park visitation, park employees, housing, and utilities are discussed in the context of the respective alternatives in the subsections that follow.

Under each action alternative, the park would remove or repurpose several visitor-serving facilities, such as the Curry Village Ice Rink; Happy Isles Snack Stand; Yosemite Lodge Post Office, Pool, and Snack Stand; and Bank Building. The park would also construct new campsites and remove campsites from the rockfall hazard zone.

Concessioner employee housing within Yosemite Valley would be affected through the removal of temporary units at the Yosemite Lodge (8 beds), Highland Court (82 beds), Huff House (262 beds), and Boys Town (48 beds). New housing developments would be constructed at Huff House (164 beds), Yosemite Lodge (104 beds), and Lost Arrow (50 beds).

Each action alternative includes actions to improve pedestrian wayfinding and access. The park would also undertake a number of transportation and parking management measures; remediation, redesign, and expansion of existing parking areas; and construction of new parking lots in other areas.

These activities, in addition to the facilities removal and construction described previously, would divert considerable staff time and attention away from other ongoing projects. The work associated with these projects, including the planning, demolition, transport, disposal, and reconstruction of housing, would have a substantial impact on park operations. As such, the park would experience a short-term, moderate, adverse operational impact throughout the design, demolition, and reconstruction phases. While the new facilities would introduce a new operational and maintenance burden, these would be more than offset by the removal of existing structures. For these reasons, park staff would likely experience a long-term, negligible to minor, beneficial impact associated with facilities operation and maintenance.

**Curry Village and Campgrounds.** The park would remove the Happy Isles Snack Stand at Curry Village. At The Ahwahnee, the park would remove the swimming pool and tennis courts; redesign, formalize, and improve drainage within the existing parking lot; and construct a new 50 parking space lot east of the current parking area. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, moderate, and adverse. Facilities removal and parking expansion would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Camp 6 and Yosemite Village.** The park would remove from Yosemite Village the Concessioner General Office, Concessioner Garage, and the Arts and Activities Center (Bank Building), and repurpose the Village Sports Shop for public use as a visitor contact station. The park would also construct a new maintenance building near the Government Utility Building. Roadside parking along Sentinel Drive would be removed and Camp 6 parking expanded into the footprint of the Concessioner Garage. To improve visitor access between the Camp 6 area and Village, the park would construct a pathway connecting the new Camp 6 parking lot with the repurposed Village Sports Shop. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, moderate, and adverse. Facilities and roadside parking removal would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**West Yosemite Valley.** The park would remove the NPS Volunteer Office, post office, swimming pool, and snack stand. It would also remove old and temporary employee housing (Thousands Cabins and Highland Court) and replace it with new housing. In addition, the park would relocate the Yosemite Lodge maintenance and housekeeping facilities and repurpose the food court. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, moderate, and adverse. Facilities removal would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would also have parkwide, long-term, negligible to minor, beneficial impacts on park operations and facilities.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

To protect and enhance river values within the Merced River gorge and El Portal, the park would remove informal trails, nonessential roads, fill materials, and abandoned infrastructure throughout Segments 3 and 4. It would also develop best management practices for revetment construction and repair throughout the Merced River corridor. The planning and design; demolition, removal, transport, and disposal of waste materials; and restoration of these areas would result in a short-term, negligible to minor, adverse impact on park operations. These efforts would reduce the long-term staff burden associated with managing these ongoing impacts. However, the follow-up restoration monitoring and maintenance would continue to impose a long-term, negligible, adverse impact on park operations.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values within Segment 4 under Alternatives 2-6 include removing asphalt and imported fill from the Abbieville and Trailer Village areas. The project would require the use of a skid steer and dump truck, and take several weeks to complete. The resulting impact on park operations would be short-term, parkwide, negligible and adverse.

**Scenic Resource Actions.** Specific projects to protect and enhance the river's scenic values within Segment 3 under Alternatives 2-6 include: selectively thinning conifers in the area of the Cascade Falls viewpoint. Much of this work would be accomplished through the use of hand tools, but could also involve heavy equipment for various handling, transport, and restoration activities. This work would occur over the course of a few days and would not be expected to disrupt other restoration activities. As a result, these projects would have a parkwide, short-term, negligible, adverse impact on park operations.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities within Segments 3 and 4 that would occur under each action alternative involve changes to employee housing and visitor facilities. These actions and their impacts on park operations are summarized below. However, their implications for overall park visitation, park employees, housing, and utilities are discussed below, in the context of the respective alternatives.

Under each alternative, the park would construct infill housing in El Portal Village Center. The park would also construct a restroom for visitor use in Old El Portal. Planning and construction activities associated with this work would have a short-term, minor, adverse impact on park operations. The park would experience a long-term, negligible, adverse operational impact associated with the maintenance and operation of these facilities; and the law enforcement and emergency medical services to accommodate the resulting increase in residential occupants.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would impose a parkwide, long-term, negligible, adverse impact on park operations. Actions to manage user capacities, land use, and facilities would have parkwide, long-term, negligible to minor, beneficial impacts on park operations and facilities.

### **Segments 6 and 7: Wawona and Wawona Impoundment**

#### ***Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values that would occur within segments 6 and 7 under Alternatives 2–6 include measures to maintain river flows, manage campground waste, and protect cultural resources.

The park would improve Wawona Campground wastewater and refuse management and facilities, remove abandoned infrastructure, and undertake numerous site-specific management measures to counteract or minimize ongoing impacts on cultural resources. The development and implementation of plans for carrying out these projects would have a short-term, negligible to minor, adverse impact on park operations. These measures would reduce the time and energy park staff spends managing for these impacts. But the park would continue to incur a long-term, negligible to minor, adverse impact associated with associated restoration monitoring and maintenance.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic values within Segment 7 under Alternatives 2–6 include retaining the current water collection and distribution system and implementing the water conservation plan related to the minimum flow analysis for the South Fork Merced River. These actions would be similar to those described under Alternative 1. As such, the impact on park operations would be long-term, parkwide, negligible, and adverse.

**Cultural Resource Actions.** Specific projects to protect and enhance the river's cultural values within Segment 7 under Alternatives 2–6 include removing 7 campsites from Wawona Campground that

cause potential impacts to sensitive archeological resources. This work could require the use of heavy equipment, including an excavator, skid steer, loader, and dump truck. This effort would require approximately one week of staff time to complete. As such, the impact to park operations would be short-term, parkwide, negligible, and adverse.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Actions to manage visitor use and facilities within Segments 6 and 7 that would occur under Alternatives 2–6 involve construction of and improvements to administrative and visitor-serving facilities. These actions and their impacts on park operations are summarized below. However, their implications for overall park visitation, staffing, housing, and utilities are discussed in the context of the respective alternatives in the subsections that follow.

Under Alternatives 2–6, the park would improve river access, restroom, picnic, and bus stops within Wawona. These improvements would have a short-term, negligible to minor, adverse impact on park operations. Over the long-term, park staff would continue to incur a negligible and adverse impact associated with the maintenance and upkeep of these existing and new facilities.

The park would also remove staged materials, abandoned utilities, vehicles, and a parking lot from the riparian buffer at the Wawona Maintenance Yard and restore the area's native ecosystem. It would also remove roadside parking between the Wawona Store and Chilnualna Falls Road. Park operations would incur a short-term, minor, adverse impact associated with the demolition, transportation, disposal, and restoration involved in this effort.

To improve operational efficiency, the park would construct new facilities to house maintenance operations and a new wildland fire station within Segment 7. The planning, design, and construction of these facilities would result in a short-term, minor to moderate, adverse operational impact on park operations. Maintenance of these facilities would impose a long-term, negligible, adverse impact on park staff.

Wawona. The park would redesign the bus stop at the Wawona Store to accommodate increased visitor use. The planning, design, contracting, and monitoring required of this project would have a parkwide, short-term, negligible, adverse impact on park operations.

**Segments 6 & 7 Impact Summary:** Actions to protect and enhance river values would impose a long-term, parkwide, negligible, adverse impact on park operations. Actions to manage user capacities, land use, and facilities would have long-term, parkwide, negligible, adverse impacts on park operations and facilities.

### **Summary of Impacts Common to All Action Alternatives**

Management actions common to Segments 2–6 involve numerous large-scale restoration projects, substantial administrative facilities projects in Yosemite Valley and Wawona, and a considerable change in the valley's supply of temporary employee housing. These actions would improve river values directly through restoration and indirectly through reduced development intensity within the valley. The work associated with these actions would result in a short-term, minor to moderate,

adverse impact on park operations. Such measures would address large-scale problems that, if left to incremental management measures, would otherwise continue to require additional staff time and resources to address. While such actions would reduce operational burdens associated with incremental efforts to address these ongoing impacts, the park would still incur the burdens of restoration area monitoring and maintenance. Nonetheless, the long-term impact of these actions would be negligible to minor and beneficial.

### ***Environmental Consequences of Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 2, the park would implement a day-use parking permit system for the East Yosemite Valley — checked at entrance gates — to regulate the number of vehicles entering Yosemite Valley during the peak season and potentially into the shoulder seasons. Development, implementation, and maintenance of the system would have a short-term, negligible to minor, adverse impact on park operations. Management of the system would require additional staff time and resources. Over the long-term, however, as the park is better able to regulate traffic entering the valley, the operational burdens associated with managing high volumes of traffic in the valley (i.e., public safety, traffic control, parking assistance, and restoration of impacts surrounding informal parking areas) would be reduced. The result would be a long-term, negligible, beneficial impact on park operations.

#### **Segments 1, 5, and 8: Merced River Above Nevada Fall, and Merced River Above and Below Wawona**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segment 1 would be reduced through a decrease in the Little Yosemite Valley trailhead quota (from 150 to 25), removal of the Merced Lake High Sierra Camp, and wilderness campground modifications. The resulting decline in wilderness visitation would reduce the park's operational burden associated with visitation-related wilderness restoration. The long-term impact would be minor and beneficial.

Under Alternative 2, there would be a 100% reduction in the Merced River corridor's wilderness lodging units. All 60 units and associated facilities at the Merced Lake High Sierra Camp would be removed. These actions would have long-term, minor, beneficial impacts on concessioner operations associated with managing and maintaining these facilities.

The park would reduce the total number of designated campsites within the corridor's wilderness. This change would result from the elimination of designated camping at Moraine Dome and conversion of the Little Yosemite Valley Backpackers Campground to dispersed camping. Dispersed camping at the Merced Lake Backpackers Campground would be increased, but facilities would be

reduced. This would result in a long-term, negligible to minor, beneficial impact on park operations associated with management and maintenance of these facilities.

Removal of the Merced Lake High Sierra Camp and the associated visitor services would eliminate the need for employees to operate the camp. Such a reduction would contribute to the long-term, minor, beneficial impact on concessioner staffing operations. These actions would also eliminate the need for and existence of housing associated with the camp's operation. As such, the proposed actions would not have an impact on concessioner employee housing demand within the Merced River corridor's wilderness.

Demand for utilities within Segment 1 would decrease under Alternative 2. The removal of infrastructure and restoration of these areas would require a temporary, yet substantial commitment of park staff time, resources, and equipment. The work would likely require several months to plan and execute, involve staff across several divisions, and require several pack crews and multiple helicopter flights. The short-term impact on park operations would be minor and adverse. However, the operational burden associated with seasonal set-up, weekly maintenance, and ongoing habitat restoration as a result of high visitation at and around camps would be reduced with their conversion and removal. Thus, the long-term impact on park operations would be minor and beneficial.

**Segment 1 Impact Summary.** Actions to manage user capacities, land use, and facilities would have parkwide, long-term, minor, beneficial impacts on park operations and facilities.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve removal of buildings from the Yosemite Lodge area, and rerouting and revegetating a portion of the Valley Loop Trail. The park also proposes to restore 10.9 acres of riparian ecosystem from which cabins were removed after being damaged by the 1997 flood. Undertaking this work would require a considerable amount of park staff time and resources across several management divisions. The work would likely take several weeks to a few months to complete, during which time normal park management activities could be disrupted. The resulting impact to park operations would be short-term, negligible to minor, and adverse. These actions would also benefit parkwide operations because they would lessen the need for future meadow restoration. However, these actions would also increase the need for ongoing monitoring and maintenance of the restoration areas. As such, the proposed actions would have a long-term, negligible, adverse impact on park operations.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values within Segment 2 under Alternative 2 include: rerouting trails at Ahwahnee Meadows; removing and restoring a portion of Northside Drive (900 feet) and rerouting the bike path; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing campsites and infrastructure from the 100-year floodplain and restoring 25.1 acres of floodplain and riparian habitat; and removing informal trails and informal parking at El Capitan Meadow. This work would require the use of heavy equipment, including

excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require approximately 50 weeks of crew and equipment time over a period of three years. As a result, these projects are likely to disrupt other ongoing maintenance and restoration projects in the valley and beyond. The resulting impact on park operations would be short-term, parkwide, moderate, and adverse.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values within Segment 2 under Alternative 2 include: relocating unimproved Camp 6 parking and rerouting a portion of Northside Drive; removing the Stoneman, Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 30 weeks of crew and equipment time, during which time other restoration and maintenance activities would be disrupted. The resulting impact on park operations would be short-term, parkwide, moderate, and adverse.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 2, specifically those concerning vehicle access and number of overnight accommodations, would result in a 33% decrease in daily Yosemite Valley visitation, from approximately 20,900 to 13,900. Daytime visitation would decrease by 5,400 (36%), while overnight visitation would decrease by 1,600 (26%). The resulting impact on staffing and other resources required to restore areas affected by high visitor use, manage traffic, and maintain visitor-serving facilities would be long-term, minor, and beneficial.

Under Alternative 2, there would be a 46% net reduction in valley lodging units. Contributing to this decline would be removal of units from Housekeeping Camp, conversion of the Yosemite Lodge to a day use facility, and an increase in units at Curry Village, such that valley lodging units would total 556. These actions would have a long-term, moderate, beneficial impact on concessioner operations associated with management and maintaining these facilities.

The park would reduce the total number of campsites within the valley to 450 (a decrease of 3%). This change stems largely from campsite removals at Upper Pines, Lower Pines, and North Pines campgrounds, and additions at Yosemite Lodge. This would result in a long-term, negligible, beneficial impact on park operations associated with management and maintenance of these facilities.

Concessioner employee housing within Yosemite Valley would be reduced by 57% — from 1,151 beds to 494 beds. This reduction would have a detrimental effect on the supply of housing within Segment 2. The demand for utilities would decrease with the removal of employee housing, lodging units, and campgrounds, and the decrease in overnight visitation. With the decrease in staffing required for concessioner operations, the demand for valley administrative facilities would also be expected to decrease.

Construction activities under Alternative 2 would include the removal work described above, as well as parking improvements at Curry Village and Camp 6, as well as new camping and parking facilities at Yosemite Lodge. The planning, demolition, design, construction, and restoration activities associated

with this work would impose a short-term, minor to moderate, adverse impact on park operations. The park would also incur long-term, negligible, adverse operational burdens associated with the maintenance and operation of these new facilities.

**Curry Village and Campground.** The park would construct 78 new hard-sided units in Boys Town, bringing the total number of new and retained units at Curry Village to 433. The park would remove campsites from Lower Pines (32), North Pines (86), and Upper Pines (24). In addition, the park would discontinue commercial day rides from the Curry Village Stables. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, minor to moderate, and adverse. Facilities removal and replacement of old guest units would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, outside of the dynamic 10-year floodplain, and install walkways leading to Yosemite Village. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, minor to moderate, and adverse. Increased parking efficiency would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Camp 4 and Yosemite Lodge.** The park would move on-grade pedestrian crossing Camp 4 and Yosemite Lodge. The park would convert the Highland Court area to a walk-in campground; reconfigure pedestrian crossing of Northside Drive and Yosemite Lodge Drive, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, minor, and adverse. Increased parking would have a long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would have parkwide, long-term, minor to moderate, beneficial impacts on park operations and facilities.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish a 2.25-acre oak recruitment zone in the vicinity of Odgers fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. Development

and implementation of such protective measures would have a short-term, negligible, adverse effect on normal staff operations. The consequent long-term impact on park operations associated with enforcement of these restrictions and monitoring the restoration areas would be negligible and adverse.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 3 and 4 involve the development of housing and campsites within Segment 4. These actions, in combination with those that would occur under Alternatives 2–6, would not be expected to have an appreciable impact on park visitation.

New high-density concessioner housing would be constructed in Abbieville and Rancheria, outside the 100-year floodplain. In addition, as previously noted, under “Impacts of Actions Common to All Segments for Alternatives 2–6,” new housing would also be constructed in El Portal Village Center. This would increase the total number of concessioner-assigned housing units within El Portal from 192 to 618. These actions would have a beneficial impact on new and existing employees of El Portal because they would increase housing opportunities in an area of high demand.

Demand for utilities and administrative facilities within segment 4 would increase under Alternative 2. The park would experience a short-term, moderate, adverse operational impact associated with the planning, design, relocation, and construction of the projects described above. These actions would also result in a long-term, minor, adverse impact on park operations associated with management and maintenance of the new facilities; and the law enforcement and emergency medical services to accommodate the resulting increase in residential occupants.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would have parkwide, long-term, minor, adverse impacts on park operations and facilities.

### **Segments 6 and 7: Wawona and Wawona Impoundment**

#### ***Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values within Segment 7 include removal of the Wawona Golf Course. The work associated with this project would noticeably but temporarily disrupt the work of park staff. As such, the undertaking would have a short-term, minor, adverse impact on park operations. While the time and expense associated with maintaining this facility would be reduced with its removal, park staff would still incur a long-term, negligible to minor, adverse operational burden associated with monitoring and maintenance of these restoration areas.

**Biological Resource Actions.** Specific projects to protect and enhance the river’s biological values within Segment 7 under Alternative 2 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew time. The resulting impacts on park operations would be parkwide, short-term, negligible, and adverse.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. These actions, in combination with those that would occur under Alternatives 2–6, would be expected to effect a nominal decrease in overall visitation within this Segment 7.

Implementation of Alternative 2 management actions would reduce the demand for employee housing within Segment 7. Demand for utilities and administrative facilities within Segment 7 would similarly decrease under Alternative 2. Fewer visitors would mean less draw upon the town's utilities. In addition, the new facilities for maintenance and firefighting staff operations proposed for Alternatives 2–6 would be expected to include high-efficiency fixtures, further reducing the demand for utilities. The construction of new facilities would also reduce demand for administrative space within this segment. The park would experience a short-term, minor, adverse operational impact associated with the planning and execution of projects proposed under Alternative 2. These actions would result in a long-term, minor, adverse impact on park operations associated with restoration monitoring and maintenance.

**Wawona Campground:** Under Alternative 2, the park would reduce the size of the Wawona Campground. Thirty-two campsites, or 33% of all campsites within Wawona, would be removed from the floodplain. This would result in a long-term, parkwide, minor, beneficial impact on park operations required to manage and maintain these facilities.

**Segments 6 & 7 Impact Summary:** Actions to protect and enhance river values would result in parkwide, long-term, negligible to minor, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would have parkwide, long-term, minor, adverse impacts on park operations and facilities.

**Summary of Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

Under Alternative 2, park staff would carry out a substantial amount of restoration throughout the Merced River corridor. These actions would considerably reduce the long-term operational burden associated with ongoing incremental resource management and maintenance activities. In addition, the park would undertake a considerable number of actions related to transportation management and commercial services. For example, the park would implement a day-use parking permit system for the East Yosemite Valley to help manage a reduced Yosemite Valley parking supply. In addition, the park would substantially reduce the number of lodging units (-46%) and campsites (-3%) within the valley. These actions would decrease Yosemite Valley visitation by an estimated 33%, with similar decreases in both daytime and overnight visitation. Concessioner-assigned housing would also decrease under Alternative 2, with a substantial shift in housing from the valley to El Portal. Under Alternative 2, demands for administrative space, utilities, and housing would be expected to decrease parkwide. However, with the proposed shift in housing and facilities from the valley to El Portal, the latter would experience a considerable increase in demand for these facilities and services. The long-term impacts on park operations and facilities would be parkwide, minor to moderate, and beneficial.

## **Cumulative Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

Cumulatively considerable projects that could affect park facilities and operations are the same as those identified for Alternative 1, and include past, present, and reasonably foreseeable actions in the Yosemite region.

### ***Overall Cumulative Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration***

The cumulative impacts of Alternative 2 management measures, in combination with those common to Alternatives 2-6, would generally be beneficial. Past and present facilities improvements and upgrades would reduce the operational demands on park staff to maintain these assets. For the same reason, park operations would similarly benefit from past and present habitat restoration and resource management projects and plans. Continued implementation of the *East Yosemite Valley Utilities Improvement Plan/EA* would further reduce demands for park utilities. As a result, the cumulative impact of Alternative 2 management measures, in light of past, present, and reasonably foreseeable future projects, would be long-term, moderate, and beneficial.

## ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 3, the park would implement a day-use parking permit system for East Yosemite Valley, checked on-site at parking areas, to regulate the number of vehicles entering Yosemite Valley during the peak season and potentially into the shoulder seasons. Development, implementation, and maintenance of the system would have a short-term, negligible impact on park operations. While management of the system would require additional staff time and resources; over the long-term, as the park is better able to regulate traffic entering the valley, the operational burdens associated with managing high volumes of traffic in the valley (i.e., public safety, traffic control, parking assistance, and restoration of impacts surrounding informal parking areas) would be reduced. The result would be a long-term, negligible, adverse impact on park operations.

### **Segments 1, 5, and 8: Merced River Above Nevada Fall, and Merced River Above and Below Wawona**

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segment 1 would be reduced through reductions in the Little Yosemite Valley trailhead quota (from 150 to 75), closure of the Merced Lake High Sierra Camp, and wilderness campground modifications. The resulting decline in wilderness visitation would reduce the park's

operational burden associated with visitation-related wilderness restoration. The long-term impact would be negligible to minor and beneficial.

Under Alternative 3, there would be a 100% reduction in the Merced River corridor's wilderness lodging units. All 60 units and associated facilities at the Merced Lake High Sierra Camp would be removed. The area would temporarily be used as a pack camp for up to 15 people. These actions would have a long-term, negligible to minor, beneficial impact on concessioner operations associated with managing and maintaining these facilities.

The park would reduce the total number of designated campsites within the corridor's wilderness. This change would result primarily from the decrease in designated camping in Little Yosemite Valley. This would result in a long-term, negligible, beneficial effect on park operations associated with management and maintenance of these facilities.

Removal of the Merced Lake High Sierra Camp, and the associated visitor services, would eliminate the need for employees to operate the camp. Such a reduction would contribute to the long-term, negligible, beneficial impact on concessioner staffing operations. These actions would also eliminate the need for and existence of housing associated with the camp's operation. As such, the proposed actions would not have an impact on concessioner employee housing demand within the Merced River corridor's wilderness.

The removal of infrastructure and restoration of these camps would require a substantial temporary commitment of park staff time, resources, and equipment. The work would likely require several months to plan and execute, involve staff across several divisions, and require several pack crews and multiple helicopter flights. The short-term impact on park operations would be minor and adverse. However, the operational burden associated with seasonal set-up, weekly maintenance, and ongoing habitat restoration as a result of high visitation at and around these camps would be reduced with their conversion and removal. Thus, the long-term impact on park operations would be negligible to minor and beneficial.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities would have parkwide, long-term, negligible to minor, beneficial impacts on park operations and facilities.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve removal of buildings from the Yosemite Lodge area, and rerouting and revegetating a portion of the valley Loop Trail. The park also proposes to restore 10.9 acres of riparian ecosystem from which cabins were removed after being damaged by the 1997 flood. Undertaking this work would require a considerable amount of park staff time and resources across several management divisions. The work would likely require several weeks to a few months to complete, during which time normal park management activities could be disrupted. The resulting impact to park operations would be short-term, negligible to minor, and adverse. These actions would also benefit parkwide operations because they would lessen the need for future meadow

restoration. However, these actions would also increase the need for ongoing monitoring and maintenance of the restoration areas. As such, the proposed actions would have a long-term, negligible, adverse impact on park operations.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values within Segment 2 under Alternative 3 include: rerouting trails at Ahwahnee Meadows; removing and restoring a portion of Northside Drive (900 feet) and rerouting the bike path; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; and removing campsites and infrastructure from the 100-year floodplain and restoring 12 acres of floodplain and riparian habitat; and erecting fencing and signage to redirect visitor traffic, and removing informal trails at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require approximately 36 weeks of crew and equipment time over a period of two years. As a result, these projects are likely to disrupt other ongoing maintenance and restoration projects in the valley and beyond. The resulting impact on park operations would be short-term, parkwide, moderate, and adverse.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 3 include: relocating unimproved Camp 6 parking; removing the Stoneman, Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 30 weeks of crew and equipment time over a period of two years, during which other restoration and maintenance activities would be disrupted. The resulting impact on park operations would be short-term, parkwide, moderate, and adverse.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 3, specifically those concerning vehicle access and number of overnight accommodations, would result in a 37% decrease in daily Yosemite Valley visitation, from approximately 20,900 to 13,200. Daytime visitation would decrease by 6,300 (43%), while overnight visitation would decrease by 1,400 (23%). The resulting impact on staffing and other resources required to restore areas affected by high visitor use, manage traffic, and maintain visitor-serving facilities would be long-term, minor, and beneficial.

Under Alternative 3, there would be a 40% net reduction in Yosemite Valley lodging units. This is largely due to the removal of units from Housekeeping Camp, Curry Village, and Yosemite Lodge, bringing total valley lodging down to 621 units. These actions would have a long-term, minor to moderate, beneficial impact on concessioner operations associated with managing and maintaining these facilities.

The park would increase the total number of campsites within the valley to 477 (an increase of 2%). This change is largely due to new campsite development east of Camp 4, west of Backpackers Campground, and in the Upper Pines Loop Addition. This increase would result in a long-term,

negligible, adverse operational impact on park staff associated with maintenance and operation of these facilities.

Concessioner employee housing within the valley would be reduced by 20% — from 1,151 beds to 922 beds. Due to the anticipated reduction in need for concessioner employees to staff reduced visitor serving operations, this net reduction would not have a substantial effect on the supply of housing within Segment 2. The demand for utilities would decrease with the removal of employee housing and lodging units, and the decrease in overnight visitation. With relocation of the Concessioner General Office, and the decrease in staffing required for concessioner operations, the demand for valley administrative facilities would also be expected to decrease.

Construction activities under Alternative 3 would include the removal work described above, as well as parking improvements; new housing development; new camping facilities east of Camp 4 and at Upper Pines Campground; and several small transit and pedestrian access improvements. The planning, demolition, design, construction, and restoration activities associated with this work would have a short-term, minor to moderate, adverse impact on park operations. The park would also incur a long-term, negligible, adverse operational burden associated with the maintenance and operation of these new facilities.

**Curry Village and Campground.** The park would retain 355 guest units at Curry Village. The park would remove campsites from Lower Pines (15), North Pines (34), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, minor, and adverse. Facilities removal would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, and install walkways leading to Yosemite Village. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, minor to moderate, and adverse. Increased parking efficiency would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced transportation management burdens.

**Camp 4 and Yosemite Lodge.** The park would move on-grade pedestrian crossing to west of the Northside Drive and Yosemite Lodge Drive, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for three busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, minor, and adverse. The reconfiguration of the

pedestrian crossing and increased parking would have long-term, negligible, beneficial impact on park operations through reduced transportation management burdens.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would have parkwide, long-term, minor to moderate, beneficial impacts on park operations and facilities.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish a 2.25-acre oak recruitment zone in the vicinity of Odgers fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. Development and implementation of such protective measures, including the removal of nonnative fill, decompaction of soils, and replanting the oak tree understories in the vicinity of these zones, would have a short-term, negligible, adverse effect on normal staff operations. The consequent long-term impact on park operations associated with enforcement of these restrictions and monitoring the restoration areas would be negligible and adverse.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 3 and 4 involve the development of housing and campsites within Segment 4. These actions, in combination with those that would occur under Alternatives 2–6, would not be expected to have an appreciable impact on park visitation.

New low- and medium-density housing would be constructed as infill development in Rancheria, outside the 100-year floodplain. As previously noted, under each alternative new housing would also be constructed in El Portal Village Center. This would increase the total number of concessioner-assigned housing units within El Portal from 192 to 223. These actions would have a beneficial impact on new and existing employees of El Portal because they would increase housing opportunities in an area of high demand.

Demand for utilities and administrative space within Segment 4 would increase under Alternative 3. The park would experience a short-term, minor, adverse operational impact associated with the planning, design, relocation, and construction of the projects described above. These actions would also result in a long-term, negligible, adverse impact on park operations associated with management and maintenance of the new facilities; and the law enforcement and emergency medical services to accommodate the resulting increase in residential occupants.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user

capacities, land use, and facilities would have parkwide, long-term, negligible, adverse impacts on park operations and facilities.

## **Segments 6 and 7: Wawona and Wawona Impoundment**

### ***Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values within Segment 7 include removal of the Wawona Golf Course. The work associated with this project, including removal of turf and infrastructure, as well as subsequent decompaction and restoration, would noticeably but temporarily disrupt the work of park staff. As such, the project would have a short-term, minor impact on park operations. While the time and expense associated with maintaining this facility would be reduced with their removal, park staff would still incur a long-term, negligible, adverse operational burden associated with monitoring and maintenance of these restoration areas.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 3 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew time. The resulting impacts on park operations would be parkwide, short-term, negligible, and adverse.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. These actions, in combination with those that would occur under Alternatives 2–6, would be expected to effect a nominal decrease in overall visitation within this Segment 7.

Implementation of Alternative 3 management actions would reduce demand for employee housing within Segment 7. Demand for utilities and administrative facilities within Segment 7 would slightly decrease under Alternative 3. Fewer visitors would mean less draw upon the town's utilities. In addition, the new facilities for maintenance and firefighting staff operations proposed for Alternatives 2–6 would be expected to include high-efficiency fixtures, further reducing the demand for utilities. The construction of new facilities would also reduce demand for administrative space within this segment. The park would experience a short-term, minor, adverse operational impact associated with the planning and execution of projects proposed under Alternative 3. These actions would result in a long-term, negligible, adverse impact on park operations associated with restoration monitoring and maintenance.

**Wawona Campground.** Under Alternative 3, the park would reduce the size of the Wawona Campground. Twenty seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. This would result in a long-term, negligible to minor, beneficial impact on park operations required to manage and maintain these facilities.

**Segments 6 & 7 Impact Summary:** Actions to protect and enhance river values would result in parkwide, long-term, negligible to minor, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would also have parkwide, long-term, minor, adverse impacts on park operations and facilities.

### **Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Under Alternative 3, park staff would carry out a substantial amount of restoration throughout the Merced River corridor. These actions would considerably reduce the long-term operational burden associated with ongoing incremental resource management and maintenance activities. In addition, the park would undertake a considerable number of actions related to transportation management and commercial services. For example, the park would implement a day-use parking permit system for East Yosemite Valley to manage the reduction in Yosemite Valley parking supply. In addition, the park would substantially reduce the number of lodging units (-40%) but increase the number of campsites (2%) within the valley. These actions would decrease valley visitation by an estimated 37%, with similar decreases in both daytime and overnight visitation. Concessioner-assigned housing would also decrease under Alternative 3, with the largest reduction seen in the valley and a slight increase in El Portal. Under Alternative 3, demands for administrative space, utilities, and housing would be expected to decrease parkwide. However, with the proposed shift in housing and facilities from the valley to El Portal, the latter would experience a slight increase in demand for these facilities and services. The long-term impacts on park operations and facilities would be parkwide, minor to moderate, and beneficial.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Cumulatively considerable projects that could affect park facilities and operations are the same as those identified in Alternative 2, and include past, present, and reasonably foreseeable actions in the Yosemite region.

### ***Overall Cumulative Impact from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

The cumulative impacts of Alternative 3 management measures, in combination with actions common to Alternatives 2-6, would generally be beneficial. Past and present facilities improvements and upgrades would reduce the operational demands on park staff to maintain these assets. For the same reason, park operations would similarly benefit from past and present habitat restoration and resource management projects and plans. As previously noted, continued implementation of the *East Yosemite Valley Utilities Improvement Plan/EA* would further reduce demands for park utilities. As a result, the cumulative impact of Alternative 3 management measures, in light of past, present, and reasonably foreseeable future projects, would be long-term, moderate, and beneficial.

## ***Environmental Consequences of Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 4, the park would implement a real-time, adaptive day-use traffic and parking management program, utilizing fee structures, transit service expansion, and managed access and diversions. Development, implementation, and maintenance of the system would have a short-term, minor, adverse impact on park operations. Management of the various components of this system over the long-term would require a long-term commitment of staff time and resources. However, as park staff is better able to manage traffic throughout Yosemite Valley, the operational burdens associated with managing high volumes of traffic in the valley (i.e., public safety, traffic control, parking assistance, restoration of impacts surrounding informal parking areas) would be reduced. The result would be a long-term, negligible to minor, adverse impact on parkwide operations.

### **Segments 1, 5, and 8: Merced River Above Nevada Fall, and Merced River Above and Below Wawona**

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segment 1 would be reduced through reductions in the Little Yosemite Valley trailhead quota (from 150 to 100), closure of the Merced Lake High Sierra Camp, and wilderness campground modifications. The resulting decline in wilderness visitation would reduce the park's operational burden associated with visitation-related wilderness restoration. The long-term impact would be negligible and beneficial.

Under Alternative 4, there would be a 100% reduction in the Merced River corridor's wilderness lodging units. All 60 units and associated facilities at the Merced Lake High Sierra Camp would be removed. These actions would have a long-term, minor, beneficial impact on concessioner operations associated with managing and maintaining these facilities.

The park would reduce the total number of designated campsites within the corridor's wilderness. This change would result primarily from the decrease in designated camping at Little Yosemite Valley Backpackers Campground and removal of bear boxes (composting toilet remains). Designated camping at Moraine Dome would continue and dispersed camping at the Merced Lake Backpackers Campground would be expanded, but facilities would be reduced (i.e., flush toilets and wastewater system would be replaced with composting toilets and bear boxes removed). This would result in a long-term, negligible, beneficial impact on park operations associated with management and maintenance of these facilities.

Removal of the Merced Lake High Sierra Camp, and the visitor services associated therewith, would eliminate the need for employees to operate the camp. Such a reduction would contribute to the long-term, negligible, and beneficial impact on concessioner staffing operations. These actions would also

eliminate the need for and existence of housing associated with the camp's operation. As such, the proposed actions would not have an impact on concessioner employee housing demand within the Merced River corridor's wilderness.

The removal of infrastructure and restoration of these camps would require a temporary, yet substantial commitment of park staff time, resources, and equipment. The work would likely require several months to plan and execute, involve staff across several divisions, and require several pack crews and multiple helicopter flights. The short-term impact on park operations would be minor and adverse. However, the operational burden associated with seasonal set-up, weekly maintenance, and ongoing habitat restoration as a result of high visitation at and around these camps would be reduced with their conversion and removal. Thus, the long-term impact on park operations would be negligible to minor and beneficial.

**Segment 1 Impact Summary.** Actions to manage user capacities, land use, and facilities would have parkwide, long-term, negligible to minor, beneficial impacts on park operations and facilities.

## **Segment 2: Yosemite Valley**

### *Impacts of Actions to Protect and Enhance River Values*

Projects proposed in Segment 2 to protect and enhance river values involve rerouting and revegetating a portion of the valley Loop Trail. The park also proposes to restore 10.9 acres of riparian ecosystem from which cabins were removed after being damaged by the 1997 flood. The work would likely take a few weeks to complete, but would not likely disrupt normal park management activities. The resulting impact to park operations would be short-term, negligible, and adverse. The project would benefit parkwide operations because it would lessen the need for future meadow restoration. However, these actions would also increase the need for ongoing monitoring and maintenance of the restoration areas. As such, the proposed actions would have a long-term, negligible, adverse impact on park operations.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values within Segment 2 under Alternative 4 include: removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing campsites and infrastructure from the 100-year floodplain and restoring 12 acres of floodplain and riparian habitat; and erecting fencing, signage, and boardwalks to redirect visitor traffic, and removing informal trails at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require at least 20 weeks of crew and equipment time over a period of at least two years. As a result, these projects are likely to disrupt other ongoing maintenance and restoration projects in the valley and beyond. The resulting impact on park operations would be short-term, parkwide, minor to moderate, and adverse.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values within Segment 2 under Alternative 4 include: relocating unimproved Camp 6 parking; placing large wood and engineered logjams along the base of Stoneman Bridge;

removing the Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 30 weeks of crew and equipment time over a period of two years, during which other restoration and maintenance activities would be disrupted. The resulting impact on park operations would be short-term, parkwide, moderate, and adverse.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Actions to manage visitor use and facilities under Alternative 4, specifically those concerning vehicle access, would result in a 19% decrease in daily Yosemite Valley visitation, from approximately 20,900 to 17,000. Daytime visitation would decrease by nearly 4,300 (29%). However, due in part to increases in campground facilities, overnight visitation would increase by about 400 (7%). The resulting impact on staffing and other resources required to restore areas affected by high visitor use, manage traffic, and maintain visitor-serving facilities would be long-term, minor, and beneficial.

Under Alternative 4, there would be an 20% net reduction in valley lodging units. This would be achieved through removal of units from Housekeeping Camp and Curry Village, bringing the total number of valley lodging units down to 823. These actions would have a long-term, minor, beneficial impact on concessioner operations associated with operating and maintaining these facilities.

The park would increase the total number of campsites within the valley to 701 (an increase of 50%). This increase would be largely due to the development of new campsites near Yosemite Lodge (west) and Camp 4 (east), as well as at Boys Town, Upper Pines Campground, Curry Village stables, and the former Upper River and Lower River campgrounds. This would result in a long-term, moderate, adverse impact on concessioner operations associated with managing and maintaining these facilities.

Concessioner employee housing within Yosemite Valley would be reduced by 20% — from 1,151 beds under Alternative 1 to 923 beds. This reduction would have a detrimental effect on the supply of housing within Segment 2. The demand for utilities would decrease with removal of employee housing and lodging units. Despite the increase in overnight visitation and addition of campgrounds, the net reduction in visitation would be expected to offset any associated increase in demand. With the decrease in staffing required for concessioner operations, the demand for valley administrative facilities would also be expected to decrease.

Construction activities under Alternative 4 would include the removal work described above, as well as parking improvements, new housing development at Yosemite Lodge, and new campsites at several locations. In addition, the park would undertake numerous actions to improve transit and pedestrian flows. The planning, demolition, design, construction, and restoration activities associated with this work would have a short-term, moderate, adverse impact on park operations. The park would also incur long-term, negligible, adverse operational burdens associated with the maintenance and operation of these facilities.

**Curry Village and Campground.** The park would retain 355 guest units and construct a new 40 site campground at Curry Village. The park would remove campsites from Lower Pines (15), North Pines (34), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the

Curry Village Stables. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, minor, and adverse. Despite the installation of new campsites, facilities removal would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Camp 6 and Yosemite Village.** The park would improve the configuration of and on-grade pedestrian crossing at the Northside Drive-Yosemite Village Drive intersection, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 750 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive to improve traffic flow and alleviate congestion. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, minor to moderate, and adverse. Increased parking and improved intersection performance would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for three busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, moderate, and adverse. Increased parking and improved traffic conditions would have a long-term, negligible, beneficial impact on park operations through reduced transportation management burdens.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would also have parkwide, long-term, minor, beneficial impacts on park operations and facilities.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish a 1-acre oak recruitment zone in the vicinity of Odgers fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. Development and implementation of such protective measures would have a short-term, negligible, adverse impact on normal staff operations. The consequent long-term impact on park operations associated with enforcement of these restrictions and monitoring the restoration areas would be negligible and adverse.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 3 and 4 involve the development of housing and campsites within Segment 4. These actions, in combination with those that would occur under Alternatives 2–6, would not be expected to have an appreciable impact on park visitation.

New high-density concessioner housing would be constructed in Rancheria, outside the 100-year floodplain. In addition, as previously noted, under each alternative new housing would also be constructed in El Portal Village Center. This would increase the total number of concessioner-assigned housing units within El Portal from 192 to 300. These actions would have a beneficial impact on new and existing employees of El Portal because they would increase housing opportunities in an area of high demand.

Demand for utilities and administrative space within Segment 4 would increase under Alternative 4. The park would experience a short-term, minor to moderate, adverse operational impact associated with the planning, design, relocation, and construction of the projects described above. These actions would also result in a long-term, minor, adverse impact on park operations associated with management and maintenance of the new facilities; and the law enforcement and emergency medical services to accommodate the resulting increase in residential occupants.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would have parkwide, long-term, minor, adverse impacts on park operations and facilities.

**Segments 6 and 7: Wawona and Wawona Impoundment*****Impacts of Actions to Protect and Enhance River Values***

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values within Segment 7 under Alternative 4 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew time. The resulting impacts on park operations would be parkwide, short-term, negligible, and adverse.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. These actions, in combination with those that would occur under Alternatives 2–6, would be expected to effect a nominal decrease in overall visitation within Segment 7.

Implementation of Alternative 4 would not be expected to affect demand for employee housing within Segment 7. Demand for utilities and administrative facilities within Segment 7 would slightly decrease under Alternative 4. Fewer visitors would mean less draw upon the town's utilities. In addition, the

new facilities for maintenance and firefighting staff operations proposed for Alternatives 2–6 would be expected to include high-efficiency fixtures, further reducing the demand for utilities. The construction of new facilities would also reduce demand for administrative space within this segment. The park would experience a short-term, negligible to minor, adverse operational burden associated with the planning and execution of projects proposed under Alternative 4. These actions would result in a long-term, negligible, adverse impact on park operations associated with restoration monitoring and maintenance.

**Wawona Campground.** Under Alternative 4, the park would reduce the size of the Wawona Campground. Twenty-seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. This would result in a long-term, negligible to minor, beneficial impact on park operations required to manage and maintain these facilities.

**Segments 6 & 7 Impact Summary:** Actions to protect and enhance river values would result in parkwide, short-term, negligible, adverse impacts on park operations. These actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would also have parkwide, long-term, negligible, adverse impacts on park operations and facilities.

#### **Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

Under Alternative 4, park staff would carry out a substantial amount of restoration throughout the Merced River corridor. These actions would considerably reduce the long-term operational burden associated with ongoing incremental resource management and maintenance activities. In addition, the park would undertake a considerable number of actions related to transportation management and commercial services. For example, the park would implement a real-time traffic and parking management program, and reduce Yosemite Valley parking capacity. In addition, the park would substantially reduce the number of lodging units (-20%) but increase the number of campsites (50%) within the valley. These actions would decrease total Yosemite Valley visitation by an estimated 19%, while overnight visitation would increase. Concessioner-assigned housing would also decrease under Alternative 4, with the largest reduction seen in the valley, and a substantial increase in El Portal. Under Alternative 4, demands for administrative space, utilities, and housing would be expected to decrease parkwide. However, with the proposed shift in housing and facilities from the valley to El Portal, the latter would experience a considerable increase in demand for these facilities and services. The long-term impact on park operations and facilities would be minor, and beneficial.

#### **Cumulative Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

Cumulatively considerable projects that could affect park facilities and operations are the same as those identified in Alternative 2, and include past, present, and reasonably foreseeable actions in the Yosemite region.

### ***Overall Cumulative Impact from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

The cumulative impacts of Alternative 4 management measures, in combination with those common to Alternatives 2-6, would generally be beneficial. Past and present facilities improvements and upgrades would reduce the operational demands on park staff to maintain these assets. For the same reason, park operations would similarly benefit from past and present habitat restoration and resource management projects and plans. As previously noted, continued implementation of the *East Yosemite Valley Utilities Improvement Plan/EA* would further reduce demands for park utilities. As a result, the cumulative impact of Alternative 4 management measures, in light of past, present, and reasonably foreseeable future projects, would be long-term, minor to moderate, and beneficial.

### ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

#### **All River Segments**

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 5, the park would implement a phased-in, adaptive day-use traffic and parking management program, which would utilize permits, fee structures, transit service expansion, and managed access and diversions. Development, implementation, and maintenance of the system would have a long-term, minor to moderate, adverse impact on park operations. Management of the system would require a long-term commitment of staff time and resources. However, once the program was operational, and as park staff was better able to regulate traffic throughout Yosemite Valley, the operational burdens associated with the present practice of managing high volumes of traffic in the valley (i.e., public safety, traffic control, parking assistance, and restoration of impacts surrounding informal parking areas) would be reduced. The result would be a long-term, minor, adverse impact on park operations.

#### **Segments 1, 5, and 8: Merced River Above Nevada Fall, and Merced River Above and Below Wawona**

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segment 1 would not be expected to change appreciably under Alternative 5; wilderness access quotas would remain as under Alternative 1 (No Action) (150) and modifications to overnight accommodations would be nominal. As such, the park's operational burden associated with visitation-related wilderness restoration would remain similar to that of Alternative 1. The long-term impact would be negligible to minor and adverse.

Under Alternative 5, the Merced Lake High Sierra Camp would remain in operation and continue to host overnight guests and through-hikers during the summer months. However, the camp's 60 units would be reduced to 42. The operational burden associated with seasonal set-up, weekly maintenance, and habitat restoration necessary to address impacts of high visitation at and around these camps

would be slightly reduced from that of Alternative 1. The resulting impact would be long-term, negligible to minor, and adverse.

The park would not reduce the total number of designated campsites within the Merced River corridor's wilderness. Designated camping at Moraine Dome and Little Yosemite Valley Backpackers Campground would continue. The Merced Lake Backpackers Campground would remain. The long-term impact associated with maintenance of these new facilities, however reduced, would continue to be negligible and adverse.

The primary park concessioner would continue to experience a long-term, negligible, adverse impact associated with staffing the Merced Lake High Sierra Camp operations. The need for employee housing units for these staffers would also continue. As under Alternative 1, the camp would keep eight concessioner employee beds. As such, implementation of Alternative 5 would not be expected to affect concessioner employee housing demand within the corridor's wilderness segments.

The facilities removal and restoration activities that would occur under Alternative 5 would divert staff time and attention away from other ongoing projects. They would likely take several weeks to months to plan and execute, involve staff across several divisions, and require multiple helicopter flights. The short-term impact on park operations would be negligible to minor and adverse. The long-term operational impact associated with the monitoring and maintenance of these restoration areas would be negligible and adverse.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities would have parkwide, long-term, negligible, adverse impacts on park operations and facilities.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve rerouting, revegetating, and constructing a boardwalk along a portion of the Valley Loop Trail. The park also proposes to restore 10.9 acres of riparian ecosystem from which cabins were removed after being damaged by the 1997 flood. The work would take several weeks to complete, but would not likely disrupt normal park management activities. The resulting impact to park operations would be short-term, and adverse. The project would benefit parkwide operations because it would lessen the need for future meadow restoration. However, these actions would also increase the need for ongoing monitoring and maintenance of the restoration areas. As such, the proposed actions would have a long-term, negligible, adverse impact on park operations.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values within Segment 2 under Alternatives 5 include: removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; reconfiguring the Curry Orchard parking lot; removing campsites and infrastructure from the 100-year floodplain and restoring 6.5 acres of floodplain and riparian habitat; and erecting fencing, signage, and boardwalks to redirect visitor traffic, and removing informal trails at El Capitan Meadow. This work

would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require at least 28 weeks of crew and equipment time over a period of two years. As a result, these projects are likely to disrupt other ongoing maintenance and restoration projects in the valley and beyond. The resulting impact on park operations would be short-term, parkwide, moderate, and adverse.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 5 include: relocating unimproved Camp 6 parking; removing the Sugar Pine Bridge; placing large wood and engineered logjams along the base of Stoneman Bridge; and improving trail connectivity and routing in the vicinity of the Ahwahnee Bridge. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require at least 16 weeks of crew and equipment time over a period of two years, during which other restoration and maintenance activities could be disrupted. The resulting impact on park operations would be short-term, parkwide, minor to moderate, and adverse.

#### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Actions to manage visitor use and facilities under Alternative 5, specifically those concerning vehicle access and overnight accommodations, would result in a 5% decrease in daily Yosemite Valley visitation, from approximately 20,900 under Alternative 1 to 19,900. Daytime visitation would decrease by nearly 2,000 (14%). However, due largely to increases in lodging and campground facilities, overnight visitation would increase by about 1,000 (16%). The resulting impact on staffing and other resources required to restore areas affected by high visitor use, manage traffic, and maintain visitor-serving facilities would be long-term, minor to moderate, and adverse.

Under Alternative 5, there would be a 2% net increase in Yosemite Valley lodging units. This would largely result from the increase in units at Curry Village and removal of units from Housekeeping Camp, such that valley lodging units would increase to 1,053. These actions would have a long-term, negligible to minor, adverse impact on concessioner operations associated with operating and maintaining these facilities.

The park would increase the total number of campsites within the valley to 640 (an increase of 37%). This would result in a long-term, minor, adverse impact on concessioner operations associated with managing and maintaining these facilities.

Concessioner employee housing within the valley would be reduced by 16%—from 1,151 beds to 972 beds. Because additional staff would be required to accommodate increased overnight visitation, removal of these units would have a detrimental effect on the supply of housing within Segment 2. The demand for utilities would increase with the addition of lodging units and campsites, and the increase in visitation. The rise in overnight visitation would be expected to offset any capacity freed up by removal of employee housing. Nonetheless, with the decrease in staffing required for concessioner operations, the demand for valley administrative facilities would be expected to decrease.

Construction activities under Alternative 5 would include the removal work described above, as well as parking improvements, new housing development at Yosemite Lodge, and new camping facilities at several locations. In addition, the park would undertake numerous actions to improve transit and pedestrian flows. The planning, demolition, design, construction, and restoration activities associated with this work would have a short-term, moderate, adverse impact on park operations. The park would also incur long-term negligible adverse operational burdens associated with the maintenance and operation of these facilities.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from Lower Pines (5), North Pines (14), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, minor to moderate, and adverse. Facilities removal and replacement of old guest units would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Camp 6 and Yosemite Village.** The park would construct a traffic circle at the intersection of Northside and Yosemite Village Drives, provide walkways leading to Yosemite Village, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, moderate, and adverse. Increased parking and intersection performance would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced transportation management burdens.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for three busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 300 automobiles and 15 tour busses. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, moderate, and adverse. Increased parking and improved pedestrian crossing would have a long-term, negligible, beneficial impact on park operations through reduced transportation management burdens.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would also have parkwide, long-term, negligible to minor, beneficial impacts on park operations and facilities.

## Segments 3 and 4: Merced River Gorge and El Portal

### *Impacts of Actions to Protect and Enhance River Values*

Within Segment 4, the park would establish a 1-acre oak recruitment zone in the vicinity of Odgers fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. Development and implementation of such protective measures would have a short-term, negligible, adverse impact on normal staff operations. The consequent long-term impact on park operations associated with enforcement of these restrictions and monitoring the restoration areas would be negligible and adverse.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Visitor- and facilities-related actions that would occur within Segments 3 and 4 involve the development of housing and campsites within Segment 4. These actions, in combination with those that would occur under Alternatives 2–6, would not be expected to have an appreciable impact on park visitation.

New low- and medium-density concessioner housing would be constructed as infill development in Rancheria, outside the 100-year floodplain. In addition, as previously noted, under each alternative new housing would also be constructed in El Portal Village Center. This would increase the total number of concessioner-assigned housing units within El Portal from 192 to 288. These actions would have a beneficial impact on new and existing employees of El Portal because they would increase housing opportunities in an area of high demand.

Demand for utilities and administrative space within Segment 4 would increase under Alternative 5. The park would experience a short-term, minor to moderate, adverse operational impact associated with the planning, design, relocation, and construction of the projects described above. These actions would also result in a long-term, minor, adverse impact on park operations associated with management and maintenance of the new facilities; and the law enforcement and emergency medical services to accommodate the resulting increase in residential occupants.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would have parkwide, long-term, minor, adverse impacts on park operations and facilities.

## Segments 6 and 7: Wawona and Wawona Impoundment

### *Impacts of Actions to Protect and Enhance River Values*

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values within Segment 7 under Alternative 3 include the relocation of stock use campsites from sensitive resource areas to the Wawona Maintenance Yard. This work could require the use of heavy

equipment and would require approximately one week of crew time. The resulting impacts on park operations would be parkwide, short-term, negligible, and adverse.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. These actions, in combination with those that would occur under Alternatives 2–6, would be expected to effect a nominal decrease in overall visitation within Segment 7.

Implementation of Alternative 5 would not be expected to affect demand for employee housing within Segment 7. Demand for utilities and administrative facilities within Segment 7 would slightly decrease under Alternative 5. Fewer visitors would mean less draw upon the town's utilities. In addition, the new facilities for maintenance and firefighting staff operations proposed for Alternatives 2–6 would be expected to include high-efficiency fixtures, further reducing the demand for utilities. The construction of new facilities would also reduce demand for administrative space within this segment. The park would experience a short-term, negligible to minor, adverse operational burden associated with the planning and execution of projects proposed under Alternative 5. These actions would result in a long-term, negligible, adverse impact on park operations associated with restoration monitoring and maintenance.

**Wawona Campground.** Under Alternative 5, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. This would result in a long-term, negligible, beneficial impact on park operations required to manage and maintain these facilities.

**Segments 6 & 7 Impact Summary:** Actions to protect and enhance river values would result in parkwide, short-term, negligible, adverse impacts on park operations. These actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would also have parkwide, long-term, negligible, adverse impacts on park operations and facilities.

### **Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Under Alternative 5, park staff would carry out a substantial amount of restoration throughout the Merced River corridor. These actions would considerably reduce the long-term operational burden associated with ongoing incremental resource management and maintenance activities. In addition, the park would undertake a considerable number of actions related to transportation management and commercial services. For example, the park would implement a real-time traffic and parking management program and day-use permit system, and increase Yosemite Valley parking capacity. In addition, the park would increase the number of lodging units (2%) and campsites (37%) within the valley. Nonetheless, overall valley visitation would fall under Alternative 5 by an estimated 5%, while overnight visitation would increase. Concessioner-assigned housing would also increase under Alternative 5, with a considerable shift in housing from the valley to El Portal. Under Alternative 5, demands for administrative space, utilities, and housing would be expected to increase parkwide. With

increased overnight valley visitation and the proposed shift in housing and facilities from the valley to El Portal, both would experience a considerable increase in demand for these facilities and services. Taken together, the actions proposed for Alternative 5 would have long-term, negligible to minor, beneficial impacts on park operations and facilities, mainly due to proactive habitat restoration and facilities management activities.

### **Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Cumulatively considerable projects that could affect park facilities and operations are the same as those identified in Alternative 2, and include past, present, and reasonably foreseeable actions in the Yosemite region.

#### ***Overall Cumulative Impact from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

The cumulative impacts of Alternative 5 management measures, in combination with those common to Alternatives 2-6, would generally be beneficial. Past and present facilities improvements and upgrades would reduce the operational demands on park staff to maintain these assets. For the same reason, park operations would similarly benefit from past and present habitat restoration and resource management projects and plans. As previously noted, continued implementation of the East Yosemite Valley Utilities Improvement Plan/EA would further reduce demands for park utilities. Nonetheless, the burdens of managing for such high levels of visitation would continue to have a detectable impact on park operations. As a result, the cumulative impact of Alternative 5 management measures, in light of past, present, and reasonably foreseeable future projects, would be long-term, minor, and beneficial.

### ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 6, the park would implement a phased, adaptive day-use traffic and parking management program, utilizing fee structures, transit service expansion, managed access and diversions, and eventually through use of a day-use parking permit system for the East Yosemite Valley. Development, implementation, and maintenance of the system would have a long-term, moderate, adverse impact on park operations. Management of the system would require a long-term commitment of staff time and resources. However, once the program is operational, and as park staff is better able to regulate traffic entering and traveling throughout Yosemite Valley, the operational burdens associated with the present practice of managing high volumes of traffic in the valley (i.e., public safety, traffic control, parking assistance, and restoration of impacts surrounding informal parking areas) would be reduced. The result would be a long-term, minor to moderate, adverse impact on park operations.

## **Segments 1, 5, and 8: Merced River Above Nevada Fall, and Merced River Above and Below Wawona**

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitation within Segment 1 would not be expected to change appreciably under Alternative 6; wilderness access quotas would remain as under Alternative 1 (No Action) (150) and modifications to overnight accommodations would be nominal. As such, the park's operational burden associated with visitation-related wilderness restoration would remain similar to that of Alternative 1. The long-term impact would be negligible to minor and adverse.

Under Alternative 6, the Merced Lake High Sierra Camp would remain in operation and continue to host overnight guests and through-hikers during the summer months. The camp's 60 units would remain. The operational burden associated with seasonal set-up, weekly maintenance, and habitat restoration necessary to address impacts of high visitation at and around these camps would continue as under Alternative 1. The resulting impact would be long-term, minor, and adverse.

The park would not reduce the total number of designated campsites within the Merced River corridor's wilderness. The long-term impact associated with maintenance of these new facilities, however reduced, would still be negligible and adverse.

The primary park concessioner would continue to experience a long-term, negligible, adverse impact associated with staffing the Merced Lake High Sierra Camp operations. The need for employee housing units for these staffers would also continue. As under Alternative 1, the camp would keep eight concessioner employee beds. As such, implementation of Alternative 6 would not be expected to affect concessioner employee housing demand within the corridor's wilderness segments.

**Segment 1 Impact Summary:** Actions to manage user capacities, land use, and facilities would have parkwide, long-term, negligible to minor, adverse impacts on park operations and facilities.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Projects proposed in Segment 2 to protect and enhance river values involve removing buildings from the Yosemite Lodge area, and rerouting, revegetating, and constructing a boardwalk along a portion of the Valley Loop Trail. These projects would take several weeks to a few months to complete, during which time normal park management activities could be disrupted. The resulting impact to park operations would be short-term, negligible to minor, and adverse. The project would also benefit parkwide operations because it would lessen the need for future meadow restoration. However, these actions would also increase the need for ongoing monitoring and maintenance of the restoration areas. As such, the proposed actions would have a long-term, negligible to minor, adverse impact on park operations.

Under this alternative, Sugar Pine Bridge would be retained, engineered log jams and large wood installed at its base, and its condition monitored. Should long-term monitoring reveal mitigation

measures are not sufficient, the park may undertake more aggressive management action, including removal of the bridge. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require up to 15 weeks of crew and equipment time over a period of two years, during which other restoration and maintenance activities could be disrupted. The resulting impact on park operations would be short-term, parkwide, minor to moderate, and adverse.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 6 include: removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; reconfiguring the Curry Orchard Parking lot; removing campsites and infrastructure from the 100-year floodplain and restoring 6.5 acres of floodplain and riparian habitat; and erecting fencing, signage, and boardwalks to redirect visitor traffic, and removing informal trails and selectively removing conifers at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require at least 28 weeks of crew and equipment time over a period of at least two years. As a result, these projects are likely to disrupt other ongoing maintenance and restoration projects in the valley and beyond. The resulting impact on park operations would be short-term, parkwide, moderate, and adverse.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values within Segment 2 under Alternative 6 include: relocating unimproved Camp 6 parking and placing large wood and engineered logjams along the bases of riverbanks upstream from Sugar Pine, Ahwahnee, and Stoneman Bridges. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 16 weeks of crew and equipment time over a period of two years, during which other restoration and maintenance activities could be disrupted. The resulting impact on park operations would be short-term, parkwide, minor to moderate, and adverse.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities under Alternative 6, specifically those concerning vehicle access and overnight accommodations, would result in a 4% increase in daily Yosemite Valley visitation, from approximately 20,900 under Alternative 1 to 21,800. Daytime visitation would decrease by nearly 1,100 (7%). However, due largely to increases in lodging and campground facilities, overnight visitation would increase by about 2,000 (33%). The resulting impact on staffing and other resources required to restore areas affected by high visitor use, manage traffic, and maintain visitor serving facilities would be long-term, minor to moderate, and adverse.

Under Alternative 6, there would be a 21% net increase in Yosemite Valley lodging units. This would largely result from the substantial increase in units at Yosemite Lodge and Curry Village, along with a slight reduction in Housekeeping Camp units, such that valley lodging units would increase to 1,248. These actions would have a long-term, minor to moderate, adverse impact on concessioner operations associated with operating and maintaining these facilities.

The park would increase the total number of campsites within the valley to 739 (an increase of 59%). This would result in a long-term, moderate, adverse operational burden to park staff associated with maintenance and operation of these facilities.

Concessioner employee housing within Yosemite Valley would be reduced by 16% — from 1,151 beds to 972 beds. The demand for utilities would increase with the lodging units and campgrounds, and associated increase in overnight visitation. Despite relocation of the Concessioner General Office, the increased staffing necessary to accommodate such an increase in visitation may necessitate additional administrative facilities within the valley. As such, the demand for administrative space within the valley under Alternative 6 would be expected to increase.

Construction activities under Alternative 6 would include the removal activities described above, as well as parking improvements at Curry Village and in the vicinity of Yosemite Lodge;; new housing development at Yosemite Lodge; and new camping facilities at several locations. In addition, the park would undertake numerous actions to improve transit and pedestrian flows. The planning, demolition, design, construction, and restoration activities associated with this work would impose a short-term, moderate, adverse impact on park operations. The park would also incur long-term, minor, adverse operational burdens associated with the maintenance and operation of these facilities.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from Lower Pines (5), North Pines (14), and Upper Pines (2). In addition, the park would discontinue commercial day rides from the Curry Village Stables. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, moderate, and adverse. Facilities removal and replacement of old guest units would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced maintenance and management burdens.

**Camp 6 and Yosemite Village.** The park would construct a pedestrian underpass and two roundabouts, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive to improve traffic flow and alleviate congestion. The Concessioner Maintenance and Warehouse building would be remodeled to accommodate Concessioner General Office functions. The planning, design, contracting, monitoring, restoration, and maintenance associated with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, moderate, and adverse. Increased parking and improved traffic conditions would have a parkwide, long-term, negligible, beneficial impact on park operations through reduced transportation management burdens.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for three busses, and redevelop an area west of Yosemite Lodge, including the area from which cabins were removed after being damaged by the 1997 flood, to provide an additional parking for 300 automobiles and 15 tour busses. The planning, design, contracting, monitoring, restoration, and maintenance associated

with these activities would require the involvement of staff across several park divisions. The resulting impact on park operations would be parkwide, short-term, moderate, and adverse. Increased parking and improved traffic conditions would have a long-term, negligible, beneficial impact on park operations through reduced transportation management burdens.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result parkwide, long-term, negligible to minor, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would also have parkwide, long-term, negligible to minor, adverse impacts on park operations and facilities.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Within Segment 4, the park would establish a 1-acre oak recruitment zone in the vicinity of Odgers fuel storage area and adjacent parking lots. Parking would be prohibited within the trees' drip lines, and new building construction would be prohibited within the oak recruitment zone. Development and implementation of such protective measures, including the removal of nonnative fill, decompaction of soils, and replanting the oak tree understories in the vicinity of these zones, would have a short-term, negligible, adverse impact on normal staff operations. The consequent long-term impact on park operations associated with enforcement of these restrictions and monitoring the restoration areas would be negligible and adverse.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Visitor- and facilities-related actions that would occur within Segments 3 and 4 involve the development of housing and campsites within Segment 4. These actions, in combination with those that would occur under Alternatives 2–6, would not be expected to have an appreciable impact on park visitation.

New high-density concessioner housing would be constructed in Rancheria and Abbieville, outside the 100-year floodplain. In addition, as previously noted, under each alternative new housing would also be constructed in El Portal Village Center. This would increase the total number of concessioner-assigned housing units within El Portal from 192 to 506. These actions would have a beneficial impact on new and existing employees of El Portal because they would increase housing opportunities in an area of high demand.

Demand for utilities and administrative space within Segment 4 would increase under Alternative 6. The park would experience a short-term, moderate, adverse operational impact associated with the planning, design, relocation, and construction of the projects described above. These actions would also result in a long-term, minor, adverse impact on park operations associated with management and maintenance of the new facilities; and the law enforcement and emergency medical services to accommodate the resulting increase in residential occupants.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result parkwide, long-term, negligible, adverse impacts on park operations. Actions to manage user capacities, land use, and facilities would have parkwide, long-term, minor, adverse impacts on park operations and facilities.

## **Segments 6 and 7: Wawona and Wawona Impoundment**

### *Impacts of Actions to Protect and Enhance River Values*

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 6 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew time. The resulting impacts on park operations would be parkwide, short-term, negligible, and adverse.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Visitor- and facilities-related actions that would occur within Segments 6 and 7 involve the removal of campsites, changes to visitor and administrative facilities, and various visitor access and transportation improvements within Segment 7. These actions, in combination with those that would occur under Alternatives 2–6, would be expected to effect a nominal decrease in overall visitation within Segment 7.

Implementation of Alternative 6 would not be expected to affect demand for employee housing within Segment 7. Demand for utilities and administrative facilities within Segment 7 would slightly decrease under Alternative 6. Fewer visitors would mean less draw upon the town's utilities. In addition, the new facilities for maintenance and firefighting staff operations proposed for Alternatives 2–6 would be expected to include high-efficiency fixtures, further reducing the demand for utilities. The construction of new facilities would also reduce demand for administrative space within this segment. The park would experience a short-term, negligible to minor, adverse operational burden associated with the planning and execution of projects proposed under Alternative 6. These actions would result in a long-term, negligible, adverse impact on park operations associated with restoration monitoring and maintenance.

**Wawona Campground.** Under Alternative 6, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. This would result in a long-term, negligible, beneficial impact on park operations required to manage and maintain these facilities.

**Segments 6 & 7 Impact Summary:** Actions to protect and enhance river values would result in parkwide, short-term, negligible, adverse impacts on park operations. These actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would also have parkwide, long-term, negligible, adverse impacts on park operations and facilities.

**Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Under Alternative 6, park staff would carry out a substantial amount of restoration throughout the Merced River corridor. These actions would considerably reduce the long-term operational burden associated with ongoing incremental resource management and maintenance activities. In addition, the park would undertake a considerable number of actions related to transportation management and commercial services. The park also would increase the number of lodging units (21%) and campsites (59%) within Yosemite Valley. These actions would cause overall valley visitation to rise by an estimated 4%, due entirely to a substantial increase in overnight visitation (daytime visitation would continue to fall under Alternative 6). Concessioner-assigned housing would also increase under Alternative 6, with a substantial shift in housing from the valley to El Portal. Demands for administrative space, utilities, and housing would be expected to increase parkwide. However, with increased valley visitation and the proposed shift in housing and facilities from the valley to El Portal, both would experience a substantial increase in demand for these facilities and services. The long-term impacts on park operations and facilities would be negligible to minor, and adverse.

**Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Cumulatively considerable projects that could affect park facilities and operations are the same as those identified in Alternative 2, and include past, present, and reasonably foreseeable actions in the Yosemite region.

***Overall Cumulative Impact from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

The cumulative impacts of Alternative 6 management measures, in combination with those common to Alternatives 2-6, would generally be beneficial. Past and present facilities improvements and upgrades would reduce the operational demands on park staff to maintain these assets. For the same reason, park operations would similarly benefit from past and present habitat restoration and resource management projects and plans. As previously noted, continued implementation of the *East Yosemite Valley Utilities Improvement Plan/EA* would further reduce demands for park utilities. Nonetheless, the burdens of managing for such high levels of visitation would continue to have a detectable impact on park operations. As a result, the cumulative impact of Alternative 6 management measures, in light of past, present, and reasonably foreseeable future projects, would be long-term, negligible and beneficial.

## **Transportation**

### ***Affected Environment***

#### **Regulatory Framework**

##### ***Management Policies 2006***

The National Park Service (NPS) *Management Policies 2006*, the basic service-wide policy document of the NPS, establishes provisions for management of a wide range of activities within the park.

Transportation-related topics addressed include the management of roads, traffic, parking, trails, bicycle paths, and many others. For example:

- Park roads will be well-constructed, sensitive to natural and cultural resources, reflect the highest principles of park design, and enhance the visitor experience. Before roads are chronically at or near capacity, the use of alternative destination points or transportation systems or limitation on use will be considered as alternatives to road expansion.
- All trails and walks will be carefully situated, designed, and managed to
  - reduce conflicts with automobiles and incompatible uses;
  - allow for a satisfying park experience;
  - allow accessibility by the greatest number of people; and
  - protect park resources.
- Parking areas and overlooks will be located to not unacceptably intrude, by sight, sound, or other impact, on park resources or values. When parking areas are deemed necessary, they will be designed to harmoniously accommodate motor vehicles and other appropriate users. Permanent parking areas will not normally be sized for the peak use day, but rather for the use anticipated on the average weekend day during the peak season of use.

##### ***Yosemite General Management Plan***

The 1980 *General Management Plan* for Yosemite National Park establishes general management planning and policy direction for the park. The document sets forth specific management goals, including markedly reducing traffic congestion, among others. In keeping with this vision, the plan sets forth specific measures intended to reduce and ultimately eliminate private automobile use within Yosemite Valley, including the removal of excess day parking spaces, improvement of the shuttle system, creation of opportunities for bicycling throughout the Valley, and enforcement of the park's automobile capacity limitations.

##### ***The Superintendent's Compendium***

The *Superintendent's Compendium* sets forth park policy on a wide range of specific activities within the park, including road closures; parking restrictions; vehicle load, weight, and size limits; speed limits; and bicycling, among many other provisions under the discretionary authority of the

Superintendent. With regard to traffic management, the *Superintendent's Compendium* helps guide park staff decision-making when traffic conditions reach certain threshold conditions. For example, the document states, "Visitors may enter Yosemite Valley until westbound traffic is backed-up from Lower Yosemite Falls to Curry Village Four-Way intersection or all day use parking spaces have been filled, and/or the 18,241-person capacity has been reached" (NPS 2011a). Other traffic management items in the *Superintendent's Compendium* include the following:

- All buses visiting Yosemite Valley, not including vans, are required to unload and pick up their passengers, and park only in areas designated by their commercial bus authorization.
- Establish vehicle load, weight, and size limits, which are more restrictive than state law, for park roads.
- Establish a 35 miles per hour (mph) maximum speed limit on park roads unless posted otherwise; specific lower maximum speed limits are established for roads under chain controls (25 mph) and for approaching or leaving all entrance station areas (20 mph).

The *Superintendent's Compendium* also sets forth park policy and regulations on commercial transportation within the park.

## Roadway System and Traffic Volumes

### Regional Roadway System

California state highways leading into Yosemite National Park (Highways 41, 120, and 140) transition into an internal parkwide road system at the entrance stations. Although the State of California has a road right-of-way for Highway 140 through the El Portal Administrative Site, it has no rights-of-way through the park, so there are no state highways within the park boundaries; however, state highway numbers are used on park signs to help orient visitors. Additional transportation facilities within the park consist of a series of spur roads, access drives, pedestrian trails, bicycle paths, and parking areas leading from the main roads. The park has roughly 200 miles of roads, of which about 30 miles traverse the Yosemite Valley floor. Main points of park entry are shown in **figure 9-40** and include: Arch Rock Entrance (El Portal Road/Highway 140), Big Oak Flat Entrance (Big Oak Flat Road/Highway 120), Hetch Hetchy Entrance (Hetch Hetchy Road), South Entrance (Wawona/Highway 41), and Tioga Pass Entrance (Tioga Road/Highway 120).

**Figure 9-40**  
Park Roadways

Yosemite's road network, outside of Yosemite Valley, is generally characterized by one travel lane in each direction. Destinations throughout the Valley are accessed through a loop, comprised primarily of Southside Drive (inbound) and Northside Drive (outbound). The loop is connected by four crossings of the Merced River, as described below. On average, park road speed limits are around 35 mph, lane widths are approximately 11 to 12 feet, and shoulder widths are roughly 0.5 feet to 2 feet. Major park roadways within the study corridors are described below (by segment), with traffic volume data recorded at fixed counter locations within the park during peak season periods.

### *Traffic Volumes*

Traffic volumes within the park tend to be highest during the months of peak visitation, which are generally between May and September (Memorial Day to Labor Day), with July and August typically being the busiest months. **Table 9-154** provides an overview of peak season traffic volumes in 2011 at the park's entrance stations.

**TABLE 9-154: MONTHLY INBOUND VEHICLE TRAFFIC VOLUMES (IN 2011) AT PARK ENTRANCE STATIONS**

Entrance Station	May		June		July		August		September	
	Total	%	Total	%	Total	%	Total	%	Total	%
Arch Rock	44,950	32	56,213	29	59,327	22	54,471	21	44,896	23
Big Oak Flat	40,870	30	60,856	32	75,667	29	66,429	25	50,263	26
Hetch Hetchy	5,312	4	6,475	3	5,360	2	3,892	1	3,194	2
South	47,396	34	54,693	29	76,212	29	69,499	27	49,486	25
Tioga Pass	0	0	13,200	7	48,050	18	66,650	26	48,000	24
<b>Total</b>	<b>138,528</b>	<b>100</b>	<b>191,437</b>	<b>100</b>	<b>264,616</b>	<b>100</b>	<b>260,941</b>	<b>100</b>	<b>195,839</b>	<b>100</b>
SOURCE: NPS 2011m										

Park traffic is comprised mainly of park visitors, and park employees (many of whom live along the Highway 140 corridor). As is evident from Table 9-154, vehicle entries are generally evenly spread among the entrance stations except for the Hetch Hetchy Entrance, which is the only entrance not directly accessible from a state highway and not connected to the park's broader road network. In 2011, traffic was heaviest in July, with the largest number of vehicles entering through the South Entrance. The Tioga Pass is closed seasonally due to snow, generally from November to May. This explains the absence of Tioga Pass traffic data for May, as well as that month's comparatively low traffic volume.

The vast majority of park visitors arrive by private automobile. A summer of 2007 park visitor survey (White and Aquino 2008) found that 84.4% of respondents arrived by private automobile. Other modes included commercial tour bus (4.8%), recreational vehicle (3.2%), and regional bus transit (1.3%). Among those who entered the park by private vehicle, nearly 87% traveled through the park in their private vehicle at least part of the time. However, more than 60% of these visitors also traveled via the Yosemite Valley Shuttle. Despite the attractiveness of the public transportation system, the prominence of private vehicle use among visitors creates complex traffic management challenges for park staff, especially on busy summer days.

Traffic volumes fluctuate seasonally, daily, and hourly within the park. As noted previously, traffic tends to be heaviest during the summer, between May and September. However, visitation patterns also vary based on day of the week and time of day, with traffic volumes in the park higher during weekends than on weekdays. Similarly, visitor travel to and from the park results in daily traffic peaks beginning in the late morning and lasting through early evening. While these fluctuations are seen throughout the park, their implications for Merced River management tend to be most pronounced within the Yosemite Valley area (Segment 2). Planning for management activities and facilities where peak conditions are significantly different from average typically applies the concept of design conditions, which address typically busy days during the peak season, but not the day with the highest visitation.

The park typically experiences the highest traffic volumes on weekends during the summer, with peak volumes occurring during holiday weekends. During the peak season of 2011 (Memorial Day weekend through Labor Day weekend), an average of 5,749 vehicles entered Yosemite Valley on Southside Drive daily. On the busiest day (June 18), 7,345 vehicles entered the Valley; this represents an increase of 28% when compared to an average day.

Daily traffic volumes recorded at fixed counter locations within the Yosemite Valley indicate a long-term historical trend of growth in traffic. Traffic volumes leveled off and even fell slightly between 2001 and 2006. However, they have once again begun to rise and have approached historic highs (NPS 2011n). Daily traffic volumes during most of the year do not exceed the capacity of any of the major roadways. Similarly, on busy summer days, travelers on most park roads during peak travel hours encounter only minor to moderate congestion. However, at key activity areas (popular attractions, parking areas, and major intersections) within Yosemite Valley, and at the park entrance stations, moderate to major congestion occurs (RSG 2011). Disruptions to traffic flow are often attributed to excessive circulation on roadways by visitors and tour bus drivers seeking parking spaces.

To assist people in planning their trip to Yosemite, the park has a new tool (as of July 2012) to inform travelers of traffic congestion (heavy, moderate or light) in different areas of the park (Yosemite Valley, Tuolumne Meadows, Wawona and Mariposa Grove, and Glacier point). A weekly Traffic Forecast is available at the Yosemite web site's Plan Your Visit page. Travelers can also sign up to receive the forecasts via email.

### **Transit and Tour Bus Services**

Multiple transit services operate within Yosemite, including the Yosemite Area Regional Transit System (YARTS), external tour bus operators, and concessioner-operated in-park shuttle and tour bus services. With the exception of shuttle bus services in Tuolumne Meadows and to the Mariposa Grove from Wawona, nearly all buses travel to and from or within Yosemite Valley. As discussed in the following sections, while bus visitation represents a relatively small proportion of total annual visitation, a large number of visitors to the park rely on transit between destinations within the park. Bus visitation trends are briefly discussed in the following paragraphs, followed by a description of transit services within the park.

### Bus Visitation Overview

The NPS tracks the number of buses entering the park, as well as the number of visitors that arrive by bus. **Figure 9-41** shows the number of visitors arriving by bus along with the number of buses entering the park for the period between 1990 and 2011 (NPS 2011m). As shown in figure 9-41, the number of visitors traveling to the park by bus steadily increased from 1990 (258,412 visitors and 10,784 buses) to 1996 (457,896 visitors and 17,656 buses). Between 1996 through 2003, both the number of visitors arriving by bus and the number of buses dropped by more than 50%. In 2003, 200,818 visitors arrived on 7,021 buses. In the years since, both the number of buses and bus ridership has fluctuated, but generally increased. In 2011, 300,979 visitors arrived by 10,565 buses. With some variation, the pattern of visitors arriving by bus over this period generally follows the pattern for overall park visitation for this same period. In 1996, 14% of visitors to the park arrived by bus. By 2003, that number had declined to 6%. In 2011, visitors arriving by bus comprised slightly more than 7% of total visitation.

**Figure 9-41**  
Bus Visitation to Yosemite National Park and  
Number of Buses, 1990–2011

**Figure 9-42** shows the percentage of annual buses as well bus visitation by month averaged over the 2000 to 2011 period. As shown in the figure, about 15% of the people who visit Yosemite by buses during an average year arrive during the peak months of August and September, respectively, with May, June, and July each accounting for 11% to 13% of annual visits by bus. Visitation by bus is lowest in the off-peak months of November through February, when combined ridership for these months constitutes just 13% of total annual ridership. The monthly patterns of visitation to Yosemite by bus have remained relatively constant over the last decade (NPS 2011m).

Buses providing day tours with no overnight stay arrive at the park in mid- to late morning and depart the park in mid-to late afternoon, with duration of park visit ranging from four to six hours. Buses that bring visitors to the park for overnight stays generally follow the same routine as for day trips, the exception being that when buses arrive at Yosemite Lodge, visitors depart and check into the lodge for

**Figure 9-42**  
Percent of Annual Buses and Bus Visitors by Month  
(Ten-Year Average)

their overnight stay. The bus then departs with tour guests who were brought to the park one day to three days earlier and have checked out of Yosemite Lodge for a return trip back to their point of origin or to another out-of-park destination.

## Regional Bus Transit

### *Yosemite Area Regional Transportation System*

The YARTS was formed in 1999 by a Joint Powers Authority made up of the member counties of Mariposa, Merced, and Mono. YARTS provides regional bus service with four daily runs from Merced to Yosemite Valley, four daily runs from Mariposa to the Valley, and one daily run from Sonora to the Valley. Less service is provided on weekends, and more service is provided in summer, including a daily round-trip from Mammoth and points in Mono County through the Tuolumne Meadows area and connection to Valley buses. Through its connection with Amtrak, YARTS provides public transit services from San Francisco Bay Area airports, including the San Francisco, San Jose and Oakland international airports, and from the Fresno International Airport.

YARTS service began operations in 2000 in order to provide an alternative mode of transportation to and from Yosemite. The service is designed to serve the following traveling patterns:

- visitors staying in the neighboring gateway communities and visiting Yosemite
- employees along the Highway 140 corridor who work in El Portal or Yosemite
- students and employees who travel to Merced for school and/or work
- visitors who travel from Mono County to Yosemite for recreation during the summer only

- In summer 2012, YARTS added daily round trip visitor transportation services between Sonora/Jamestown, Groveland, Buck Meadows and other destinations along Highway 120 west to Yosemite Valley.

Figure 9-43 presents YARTS ridership data for employees, visitors, and others along the Highway 140 corridor from May 2006 through September 2011 (NPS 2011o). During this timeframe, the trend in overall ridership has been consistent, although distinct seasonal patterns have developed.

NOTE: Chart does not reflect Amtrak ridership.  
SOURCE: NPS 2011o.

**Figure 9-43**  
YARTS Ridership along Highway 140  
May 2006 through September 2011

As is evident from the table, employee ridership remains fairly consistent throughout the year, while total ridership fluctuates dramatically based on season. Total ridership tends to be highest during peak summer months (e.g., May through September). Average peak month ridership between 2006 and 2011 ranged from 5,682 (May) to 8,696 (June). Conversely, ridership is lowest during the off-peak months (e.g., November through February). Average off-peak month ridership between 2006 and 2011 ranged from 3,689 (February) to 4,119 (December) (NPS 2011o).

YARTS ridership to the park along the Highway 140 corridor represents a very small percentage of total park visitation. However, the summer 2007 visitor survey found that the YARTS bus service is very important to its riders (White and Aquino 2008). For the years 2006 through 2011, total annual YARTS ridership ranged from a low of 49,924 in 2006 to a high of 77,281 in 2011, representing between 1.5% and 1.9% of total park visitation for the respective years. Visitor ridership closely follows the seasonal visitation numbers for the park, with the four summer months of May through September representing approximately 50% of total visitor ridership for the years 2006 through 2011 (NPS 2011o). It is assumed this trend would continue in the future.

## Parking Areas

Parking supply within the park consists of designated day use and overnight visitor, employee, and resident lots, located throughout the primary developed areas of Yosemite Valley, El Portal Administrative Site, and Wawona. Other designated parking areas include trailhead parking lots and paved turn-outs along park roads. In addition, during peak summer days, motorists rely on an increasing number of informal areas for parking, such as unpaved roadside shoulders. Despite the potential resource impacts associated with use of these informal parking areas, the park depends upon these areas to satisfy parking demand during peak periods. Parking shortages are a substantial contributor to vehicle congestion within some areas of the river corridor, in particular the Yosemite Valley portion of the corridor. Congestion and crowding can degrade the overall visitor experience. The 2005 visitor survey found that parking areas were the most frequently mentioned locations where visitors felt crowded (Littlejohn et al. 2005). The park uses traffic management personnel to actively manage traffic and parking conditions. The number of parking spaces varies depending upon the way visitors configure their vehicles and the types of vehicles in an area. For example, RVs typically take more space than a sedan, and directing RVs to different areas increases the number of spaces available for sedans.

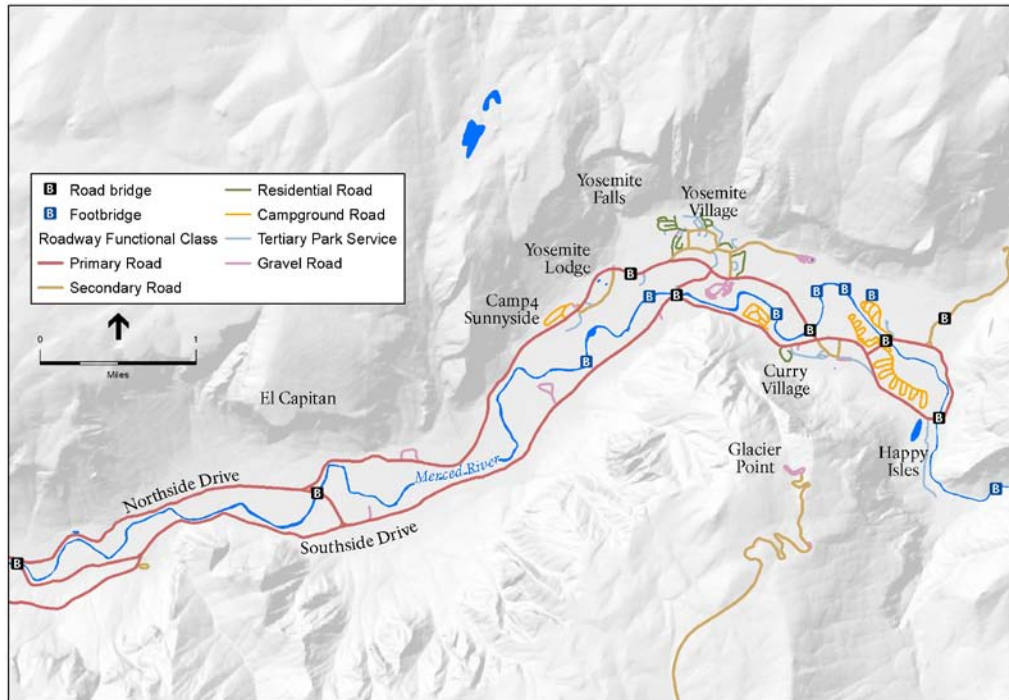

## Segment 2: Yosemite Valley

### *Roadway System*

The Valley Loop Road, shown in **figure 9-44**, is an approximately 12-mile-long combination one-way/two-way loop road that provides primary circulation within Yosemite Valley. It also connects the other major roads, facilitating through-park travel, and is maintained for year-round use. The pavement width is about 21 feet, and there are two travel lanes. Four bridges across the Merced River connect the roadway that runs parallel to the south Valley wall (Southside Drive) with the roadway on the north (Northside Drive). One-way operation is maintained along Southside Drive from Pohono Bridge in the West Valley to Stoneman Bridge near Curry Village in the East Valley. Two segments of one-way travel are maintained on Northside Drive. The first one-way section extends from Stoneman Bridge to Yosemite Village. The second one-way section extends from 100 yards west of Camp 4 to the Pohono Bridge. Two-way traffic is allowed between Camp 4 and Yosemite Village on Northside Drive.

In addition to Pohono and Stoneman bridges, connections between Northside Drive and Southside Drive are provided at El Capitan Bridge and at Sentinel Bridge near the Yosemite Chapel. Average daily traffic volumes in July 2011 were about 6,196 vehicles on Southside Drive and 6,240 vehicles on Northside Drive (NPS 2011n). The discrepancy between inbound and outbound traffic is likely because not every vehicle that enters the Valley leaves the Valley on the same day. Average daily volumes on peak weekends and peak holiday weekends have exceeded the July 2011 daily average in the past. In addition, monthly daily average traffic volumes may vary from those stated above.

**Figure 9-44**  
Yosemite Valley Loop Road

### *Traffic Volumes*

Traffic volumes inbound to Yosemite Valley increase through the early portion of the day, reaching a peak from 10:00 a.m. to about noon. Average inbound traffic volumes on Southside Drive during this period in July 2011 were about 641 vehicles per hour. On the busiest day in 2011, the inbound hourly volume of traffic reached about 648 to 821 vehicles per hour. On these days, the peak travel period generally extends from 10:00 a.m. to about 2:00 p.m. Peak traffic occurs when available parking has reached saturation, resulting in continuous stop-and-go traffic for those two to four hours of peak demand. Inbound traffic is slowed or diverted.

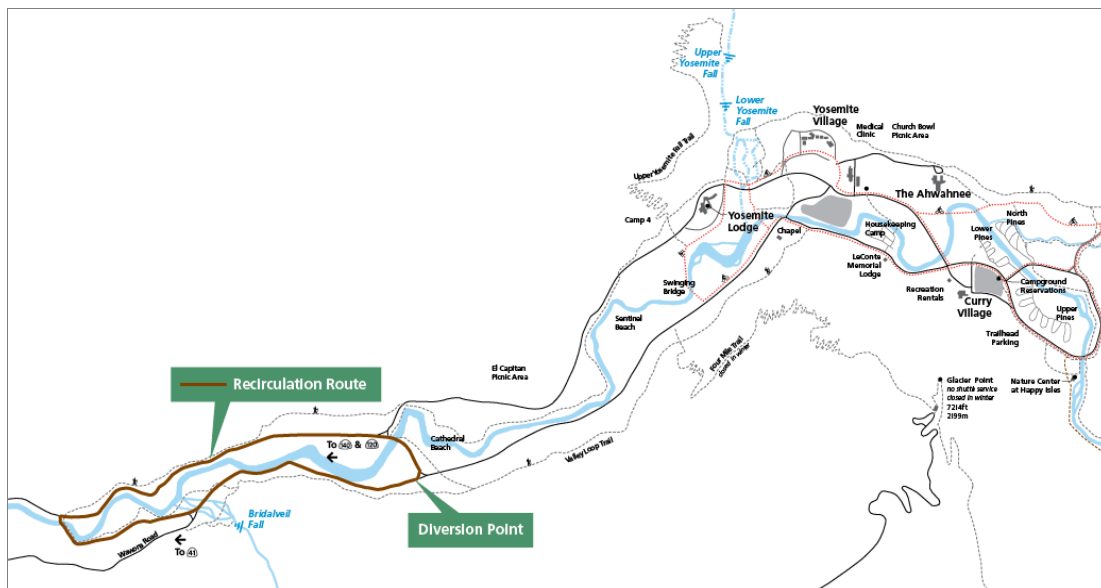

Traffic volumes leaving Yosemite Valley tend to increase towards the later part of the day, peaking between 4:00 p.m. and 6:00 p.m. Average outbound traffic volumes on Northside Drive during this period in July 2011 were about 724 vehicles per hour. Traffic volumes on the average day equal or exceed 500 vehicles per hour on Northside Drive from about 2:00 p.m. to 6:00 p.m. On the busiest day in 2011, the outbound traffic volume peaked at 750 vehicles per hour and exceeded 500 vehicles per hour from 1:00 p.m. to 8:00 p.m. (NPS 2011n).

### *Traffic Flow Conditions*

The roadway system in Yosemite Valley can be confusing to first-time visitors because of the one-way circulation, limited opportunities to cross the Merced River, and circuitous travel routes. Highly congested locations include the intersection of Northside Drive and the Camp 6 parking lot entrance, the intersection of Northside Drive and Sentinel Drive (“Bank Three Way”), and the pedestrian

crossing from Yosemite Lodge to Lower Yosemite Fall. Conflicts between vehicles and pedestrians at these key intersections are a primary factor in causing traffic delays, which are experienced primarily during the afternoon hours during the peak season. Traffic congestion in the Valley can cause frustrating delays to visitors in private vehicles, leads to increased vehicle emissions, and disrupts the operation of the Valley shuttle bus system.

The park employs a traffic management response team to assist with traffic congestion, mainly within the Valley, during peak summer days. The traffic management team helps relieve congestion by providing visitor information, directing vehicles to parking locations, and managing intersections, pedestrian and vehicle traffic. On those occasions when traffic volumes and parking in the East Valley reaches or exceeds capacity, traffic managers will redirect traffic otherwise bound for the East Valley. This diversion measure is commonly known as the “shunt” (see **figure 9-45**) and involves a series of specific management contingencies for managing excess traffic at a rate of 200 to 400 vehicles per hour.

**Figure 9-45**  
East Valley Redirection “Shunt”

### *Commercial Tour Buses*

Approximately 4.8% of visitors arrived at Yosemite by commercial tour bus during the summer of 2007 (RSG 2011). In July 2011, an average of 41 commercial tour buses entered the park each day, which is lower than the Valley historically accommodated in past peak years such as the summer of 1996; tours include day use itineraries and overnight stays. A typical one-day tour to Yosemite Valley includes short 15-minute to 30-minute stops at popular vistas such as Tunnel View and along Southside Drive at the Bridalveil Fall viewing area, then proceeding to Yosemite Lodge for a longer stop of two hours to three hours. At Yosemite Lodge, visitors have a variety of options, such as walking to Lower Yosemite Fall, visiting the Yosemite Lodge gift shop and food court, and/or getting on the Valley shuttle bus for a trip around the Valley floor. While stopped at Yosemite Lodge, buses park in

the 15 designated bus parking spaces adjacent to this facility. The number of buses simultaneously arriving and departing at these locations (i.e., platooning) has led to delays in the park in the past. Currently, there are no regulations that control or prevent platooning. Upon leaving the Valley, buses typically stop along Northside Drive at the El Capitan Meadow for 15–30 minutes to enjoy views of El Capitan and the adjacent El Capitan Meadow.

Buses that bring visitors to the park for overnight stays generally follow the same routine as described above for day trips, except that when buses arrive at Yosemite Lodge, visitors depart and check into the lodge for their overnight stay. The bus then departs with tour guests who were brought to the park one day to three days earlier and have checked out of Yosemite Lodge for a return trip back to their point of origin or to another out-of-park destination.

### ***Yosemite Valley Bus Tours***

Park tours originating within the park take visitors around the Valley floor and beyond. Concessioner-operated open-air trams (towed by a hybrid-diesel-powered truck-tractor) with a capacity of 70 passengers are used in summer to carry visitors along the Valley Loop Road and to Tunnel View on the Wawona Road above the West Valley. The trams are usually at capacity from mid-morning to late afternoon. A variety of tours beyond Yosemite Valley are also offered by the park concessioner. Most park tours originate at the lodging facilities within the Valley. In summer, daily trips from Yosemite Valley include one hikers' bus to Glacier Point and one to Tuolumne Meadows, and a grand tour that includes the Valley floor, the Mariposa Grove of Giant Sequoias, and Glacier Point.

### ***Valley Shuttle Bus System***

The current concessioner-operated shuttle bus system (with a fleet of 18 buses) operates year-round in Yosemite Valley, offering service to the major developed areas in the East Valley. The shuttles run daily from 7:00 a.m. to 10:00 p.m. every 10 to 20 minutes on the main route (an 8-mile loop with 22 stops). Service to Happy Isles and the Mirror Lake Trailhead may stop after a major snowfall. Two other Valley shuttle lines run during the summer only. The first (El Capitan Shuttle) provides service between the Valley Visitor Center and the El Capitan bridge, with stops at Camp 4, El Capitan picnic area, and the Four Mile Trailhead. The second (Express Shuttle) provides direct service between the Yosemite Village day parking area and the Valley Visitor Center. The latter two routes operate daily between 9:00 a.m. and 6:00 p.m. During the winter, when the ski area is operating, separate shuttle service is provided between the Valley and Badger Pass (typically mid-December through March). Two shuttle stops within the Valley (Camp 4 and El Capitan Meadow) lack the physical improvements of a formal bus stop.

Valley shuttle bus system ridership is highest during peak summer months (e.g., May to September). The Summer 2007 visitor survey found that weekday visitors (69%) are more likely than weekend visitors (54%) to use the shuttle bus system (White and Aquino 2008). On average, during the peak season in 2011, daily ridership exceeded 19,000. In July, average daily ridership exceeded 22,000 passengers. During the off-peak winter months of 2011 (e.g., January, February, November, and December), daily ridership averaged 2,154 passengers. Among these months, February had the lowest daily ridership of just 1,649 passengers (DNC 2011b).

High passenger volumes during peak summer months have a number of negative implications for drivers, passengers, and the broader public. A recent report on transportation conditions within the park (RSG 2011) documented park shuttle conditions during multiple summer visits in 2010 and 2011. According to the report, shuttle crowding was observed from mid-morning to late afternoon with standing room only conditions, which resulted in passengers being left behind because of insufficient shuttle capacity. In addition to crowding, challenges for shuttle bus users and drivers are also created by vehicle traffic, pedestrians, and bicyclists.

### *Parking Areas*

Yosemite Valley is the area with the highest concentration of development and the most parking spaces in Yosemite. Because of the extensive use of informal parking areas during periods of high demand and because many such areas are not paved or marked, it is difficult to identify a specific parking supply. However, an inventory of parking used by visitors in the Valley conducted in 2011 identified about 1,614 spaces for day-visitor vehicles in the East Valley, primarily at Camp 6, the Village Store parking lot, Curry Orchard, and at various destinations along the Northside and Southside Drive loop roads, and along Sentinel Drive (NPS 2011p). The 2011 parking inventory identified about 440 day parking spaces in the West Valley (between Yosemite Lodge and Pohono Bridge on Northside Drive, and between Pohono Bridge and the El Capitan crossover). Many of the spaces are informal turnouts and other areas are best suited to short-term use associated with auto touring. Parking for overnight guest vehicles is available at lodging, campground, and wilderness access areas. No designated day parking is available in the Yosemite Lodge area, but day visitors often compete with overnight guests for the available spaces. Designated day parking is permitted in the Camp 4 “overflow” lot (former Chevron Station), with parking regulated by signs noting times of permitted day use, and overnight permit-required information.

On crowded summer days, all formal parking is fully occupied, with parking spilling onto the roadway shoulders throughout the East Valley. This uncontrolled parking leads to pedestrian, bicycle, and vehicle conflicts, damage to vegetation and soils along the road edge, and the formation of informal trails. During these peak times, parking attendants direct day visitors to use the available spaces within the Camp 6 day parking lot as efficiently as possible, and they also direct vehicles to park as efficiently as possible in roadside spaces. Under this directed parking scenario, a maximum capacity of about 1,852 day-visitor vehicles can be achieved for the East Valley.

The demand for parking in the East Valley is primarily affected by day use visitation. Parking demand varies during the day and from day to day as the number of day and overnight visitors and nonresident employees fluctuates. During peak parking events, specific areas of constrained supply become evident. For example, the park has documented parking demand in excess of supply at Camp 6, Yosemite Lodge, Camp 4, Curry Orchard, The Ahwahnee, the Wilderness lot, and various employee and residential parking areas.

In the West Valley, parking lots are available at Bridalveil Fall and Tunnel View, and numerous roadside spaces exist along Southside Drive, Northside Drive, and El Capitan crossover between Pohono Bridge and the East Valley.

## **Segments 3 and 4: Merced River Gorge and El Portal**

### ***Roadway System***

El Portal Road is about 7.5 miles long within the park. At the park boundary, this road connects to Highway 140. The El Portal Road enters the park about two miles east of the El Portal Administrative Site, passes through the Arch Rock Entrance Station, and continues to the Valley Loop Road near Pohono Bridge. It is maintained for year-round access and has been historically called the All-Year Highway. The road is characterized by steep, rocky canyon walls with small river flats and terraces and has a typical pavement width that varies from 19 feet to 22 feet.

Highway 120 enters the park at the Big Oak Flat Entrance Station, and continues through the park to Tioga Pass, exiting eastbound near the summit. Big Oak Flat Road begins at Crane Flat and continues for about 11 miles to its junction with El Portal Road. Big Oak Flat Road may be used as a through route in conjunction with other major park roads and is maintained for year-round access. The topography changes from mountainous on the east end of the road to rolling terrain at the west end. The width paved roadway ranges from 26 to 30 feet.

### ***Traffic Volumes***

Average daily traffic entering the park on El Portal Road (Arch Rock Entrance Station) and on Big Oak Flat Road (Big Oak Flat Entrance Station) in July 2011 (the most recent peak period for which such data are available) was about 1,910 and 2,440 vehicles, respectively (NPS 2012F).

### ***Traffic Flow Conditions***

During busy days, when large numbers of vehicles are entering the park, long queues form at park entrances, where motorists are waiting to pay. As stated above, the park employs a traffic management team that periodically implements traffic restrictions during the busiest summer weekends when congestion in Yosemite Valley is most severe. Congestion is monitored using qualitative factors, such as observations of traffic conditions and the judgment of park supervisory personnel. Because implementation of restricted access measures is labor-intensive, diverts park staff from other operations, and can result in moving congestion impacts into other less-developed park areas, such measures are implemented only when conditions warrant it in the interest of public safety.

### ***Parking Areas***

Parking areas within the Merced River gorge (Segment 3) consists of available roadside parking along the shoulder of El Portal Road; two off-road, paved parking lots; and a paved parking lot next to the Arch Rock Entrance Station. There are 220 day vehicle parking spaces and two bus parking spaces available in Segment 3 between Pohono Bridge and the park boundary. Minimal designated parking is available for exclusive employee and administrative use in this area and does not compete with visitor parking and access.

Park, park concessioner, and park partner employees work and live in the El Portal area and contribute to the parking demand within Segment 4 along with a small number of day visitors. The visitor day

parking consists of 290 spaces (primarily at the El Portal Market and fuel station and along the roadsides). There are 610 parking spaces for administrative uses and 106 residential parking spaces. The off-street and roadside parking areas located between the Merced River and Foresta Road at the El Portal Maintenance facility were not designed or built to prevent water quality contamination from automotive fluids, surface water runoff, or sediment transport. Furthermore, parking at this location often exceeds the supply, and use of informal parking along Foresta Road is necessary.

## **Segment 7: Wawona**

### ***Roadway System***

Wawona Road is about 27 miles long within the park. At the South Entrance, this road connects to Highway 41. Wawona Road is the principal access to Wawona, Mariposa Grove, Badger Pass Ski Area, Glacier Point, and Yosemite Valley and is maintained for year-round access. Throughout its length, the 24-foot-wide road traverses mountainous terrain with steep grades and is surrounded by moderate to dense forest.

### ***Traffic Volumes***

Average daily traffic entering at the South Entrance Station in July 2011 was about 1,940 vehicles (NPS 2012F).

### ***Traffic Flow Conditions***

While the number of vehicles on park roads has increased over the years, traffic volumes generally do not exceed the capacity of the roads. Traffic conditions on Wawona Road are typically acceptable along the South Fork Merced River where Wawona Road crosses and then follows the river. On peak summer days, when the Mariposa Grove parking lots reach capacity, motorists are directed to drive north to Wawona, park in Wawona, and take the shuttle bus back to Mariposa Grove. While this helps relieve pressure on formal and informal parking areas near Mariposa Grove, it exacerbates parking congestion, poor traffic circulation, and pedestrian/motor vehicle conflicts that occur in Wawona during peak summer days (RSG 2011).

### ***Commercial Tour Buses***

Approximately 4.8% of visitors arrived by commercial tour bus during the summer of 2007 (RSG 2011). In July 2011, an average of 41 commercial tour buses entered the park each day, which is lower than the Valley historically accommodated in past peak years such as the summer of 1996; tours include day use itineraries and overnight stays. The tour buses primarily focus on Yosemite Valley (as described for Segment 2 above), but some day tours may also include a stop at the Mariposa Grove of Giant Sequoias if they enter or depart the park through Wawona. The stop at the Mariposa Grove requires a transfer from the tour bus to the Wawona Shuttle because tour buses can negotiate the sharp turns on Mariposa Grove Road.

### ***Wawona Shuttle Bus System***

In the spring through fall, a free shuttle bus service operates between Wawona and Mariposa Grove of Giant Sequoias. The Wawona shuttle is a continuous loop on a 15-minute frequency that picks up and drops off passengers at the Wawona Store, South Entrance, and at the Mariposa Grove Gift Shop. During peak summer days, when the Mariposa Grove parking lots become full, motorists are instructed to drive to Wawona and ride the shuttle back to Mariposa Grove. In 2011, daily roundtrip ridership on the Wawona shuttle averaged 1,782 passengers. July had the highest volume of passengers, with average daily roundtrip ridership exceeding 2,800 passengers. Roundtrip shuttle service between the Wawona Hotel and the Yosemite Lodge is provided once daily. The Yosemite Valley-Wawona shuttle operates from approximately Memorial Day through Labor Day. Despite these formal routes, the Wawona stop lacks the improvements of a designated bus stop. For example, the stop does not have adequate seating and provides no shelter.

### ***Parking Areas***

Parking is provided in Wawona for visitors and employees associated with facilities such as the Wawona Hotel complex, the Wawona Store and Gift Shop, the Pioneer Yosemite History Center, a campground, and two picnic areas. Parking demand varies during the day and from day to day as the number of visitors and employees fluctuates. As noted previously, on peak summer days when the Mariposa Grove parking lots reach capacity, motorists are encouraged to park in Wawona and ride the free shuttle bus back to the Mariposa Grove.

There are approximately 290 day vehicle parking and 8 bus parking spaces around the Wawona Hotel and Golf Course, the Wawona Store, and Pioneer Yosemite History Center, as well as adjacent to Forest Drive and along Chilnualna Falls Road. When visitors are catching the free shuttle bus to Mariposa Grove from Wawona, they often park along the roadside shoulders of Wawona Road and Forest Drive. This uncontrolled parking leads to pedestrian and vehicle conflicts. Parking for administrative functions are located within the land assignments for these uses and do not compete with visitor parking.

### ***Environmental Consequences Methodology***

The focus of this impact assessment was the effect of potential management actions on how well the transportation system would accommodate parking and the associated traffic flow and transportation experience within the Merced River corridor. Conditions were assessed based on potential changes in traffic volumes through the river corridor tied to amounts of visitor use as prescribed by the Merced River Plan, along with associated changes to visitor accommodations and/or parking areas under each alternative.

Changes in parking were evaluated (1) as to how well they would accommodate the demand for parking and (2) for the associated effect on levels of congestion and other factors influencing the transportation experience on the roadway system serving the Merced River corridor. The analysis focuses on Yosemite Valley (Segment 2), Merced River Gorge (Segment 3), El Portal (Segment 4), and Wawona (Segment 7) because there are no actions proposed for Segments 1, 5, 6, and 8 (wilderness segments accessible only by trails, not roads) that would affect transportation conditions.

Day use capacity was determined and expressed as the number of people who would be accommodated in the river corridor at one time. Overnight capacity is expressed as the number of total persons allowed to stay overnight. Because each alternative prescribes these visitor use levels along with the associated parking spaces to accommodate the use levels, this analysis assumes that no more parking would occur beyond that which is prescribed for each alternative. Physical barriers to roadside parking would be a component of each of Alternatives 2–6. Several mechanisms for enforcing parking restrictions, including parking management staffing and a parking permit system, are being explored under the various alternatives. Additionally, it is assumed that day and overnight parking areas would be designated and that the parking management system would ensure that day use visitors did not park in overnight spaces and vice versa. This would ensure that neither day nor overnight visitors would be displaced by one another, and that the day capacities, which would be managed through the availability of day parking, were not exceeded.

Each alternative is evaluated in terms of the context, intensity, and duration of the transportation impacts, and whether the impacts are considered beneficial or adverse to the overall transportation system, parking, traffic flow, and transportation experience.

- **Context.** The context of the impact considers whether the impact would be local, segmentwide, parkwide, or regional. For the purposes of this analysis, local impacts would be those that occur in a specific area within a segment of the river, such as an intersection or parking lot. This analysis further identifies if there are local impacts in multiple segments. Segmentwide impacts would consist of a number of local impacts within a single segment, or larger-scale impacts that would affect the segment as a whole. Parkwide impacts would extend beyond the river corridor and the study area within Yosemite. Regional impacts would be those that extend to the Yosemite gateway region.
- **Intensity.** The intensity of the impact considers whether the impact would be negligible, minor, moderate, or major. Intensity was calculated based on the number of visitors affected by the proposed actions. Negligible impacts would be effects considered not detectable and be those that could have an effect on less than 5% of visitors during the peak season of visitation. Minor impacts would be effects that would be slightly detectable and be those that could have an effect on 5% to 10% of visitors during the peak season of visitation. Moderate impacts would be clearly detectable and those that could have an effect on 10% to 20% of visitors during the peak season of visitation. Major impacts would have a substantial, highly noticeable influence on the transportation system and experience and be those that could have an effect on more than 20% of visitors during the peak season of visitation.
- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term. A short-term impact would be temporary in duration and would be associated with transitional types of activities. A long-term impact would have a permanent effect on the performance of the transportation system, parking, traffic flow, and transportation experience.
- **Type of Impact.** Impacts were evaluated in terms of whether they would be beneficial or adverse to the overall transportation system, parking, traffic flow, and transportation experience. Research completed in Yosemite shows that visitors have their most significant park experiences when they are out of their vehicles (White et al. 2006). Currently, regarding existing transportation conditions, the majority of Yosemite visitors experience high levels of freedom and access and feel they can go “where they want, when they want” (unpublished

author communication related to White 2010). Beneficial impacts would occur when potential actions would accommodate visitor parking needs and improve traffic flow (i.e., decrease congestion), thereby at least maintaining the existing high levels of acceptability of the transportation experience. Adverse impacts would occur when potential actions would not accommodate parking demand, would increase congestion, or would alter the transportation experience (by prolonging time spent traveling in the park in a vehicle).

### ***Environmental Consequences of Alternative 1 (No Action)***

#### **All River Segments<sup>1</sup>**

The NPS would continue to undertake transportation-related maintenance improvements and resource protection measures such as repaving; adding signage; and delineating trail, parking, and roadways. The overall management direction under Alternative 1 (No Action) for the river corridor would be based on the guiding management documents in place as of 2010, as modified by the settlement agreement.

Under Alternative 1 (No Action) there would continue to be an average of 3% annual growth in visitation following recent trends. It is expected that more days during the peak season would receive the visitation currently experienced on the busiest days. Visitation could increase in the off-peak seasons, resulting in this overall annual increase. If this were to occur, then traffic congestion during nonpeak periods (e.g., during months on either side of peak summer months, and on weekdays during peak summer months) could approximate current congestion during peak periods. Increases in visitation during peak periods also could occur, and to the degree that such increases happen, congestion would marginally worsen.

#### **Segment 2: Yosemite Valley**

**Roadway System.** There would be no changes to the roadway system in Segment 2 under Alternative 1 (No Action); therefore, no impacts would occur.

**Traffic Volumes.** It is expected that current trends would continue under Alternative 1 (No Action), and the number of days per year with 6,000 or more vehicles passing Chapel Straight would increase over time. The maximum vehicle volume in the East Valley, however, is expected to remain at about 7,000 vehicles. As a result, Segment 2 would continue to experience segmentwide, long-term, minor, adverse impacts.

**Traffic Flow Conditions.** Segmentwide, long-term, moderate to major, adverse impacts associated with traffic congestion and delays would continue to occur at busy intersections in Yosemite Valley, and likely worsen as visitation levels increase by an average of 3% per year under Alternative 1 (No Action). Parking shortages and poorly performing intersections are a substantial contributor of vehicle congestion within Yosemite Valley. Alternative 1 (No Action) would continue current transportation management practices to address increases in park visitation, increases in traffic

---

<sup>1</sup> There are no transportation facilities in Segments 1, 5, 6, or 8 of the Merced River corridor; therefore, this analysis focuses on the Segments 2, 3, 4, and 7, and those segments are grouped as appropriate.

volumes on the park roadways, intersection performance, and parking demand that exceeds supply. However, in the absence of enhanced transportation management actions, increases in park visitation (and associated increases in traffic volumes and parking demand) would continue to adversely affect the quality of the transportation experience by prolonging time spent traveling in the park in a vehicle. Consistent with current management practices, temporary access restrictions may be implemented at times in the Valley when westbound traffic is backed up from Lower Yosemite Fall to the Curry Village four-way intersection, or when all day use parking spaces have been filled (*Superintendent's Compendium*).

**Charter Buses.** There would be no changes to the management of charter bus access to the park under Alternative 1 (No Action). The demand for charter bus parking currently is not met by the supply. There could be segmentwide, long-term, minor, adverse impacts associated with parking demand continuing to exceed the supply.

**Yosemite Valley Bus Tours.** Under Alternative 1 (No Action), there would be segmentwide, long-term, negligible impacts on Yosemite Valley bus tours. These services would continue to operate as they do currently.

**Valley Shuttle Bus System.** No new shuttle stops would be added under Alternative 1 (No Action). There could be segmentwide, long-term, minor to moderate, adverse impacts associated with continuing crowding on Valley shuttle buses and service delays for those buses as they are slowed by traffic congestion on the Valley Loop Road.

**Parking Areas.** The existing 5,049-space parking capacity for private automobiles and commercial tour buses would remain unchanged, dispersed at sites and turnouts. Camp 6 and the Curry Orchard would continue to serve as the primary day use parking lots in Segment 2 under Alternative 1 (No Action). There could be segmentwide, long-term, minor to moderate, adverse impacts associated with parking demand continuing to exceed supply, likely worsening as visitation levels increase by an average of 3% per year.

**Segment 2 Impact Summary:** There could be segmentwide, long-term, minor to moderate, adverse impacts on transportation conditions in Segment 2 under Alternative 1 (No Action) from the continuation of current transportation management actions to address increases in park visitation, increases in traffic volumes on the park roadways, and increased parking demand that exceeds the parking supply (i.e., a larger parking deficit).

### **Segments 3 and 4: Merced River Gorge and El Portal**

Alternative 1 (No Action) would retain the existing transportation conditions in Segments 3 and 4. Camping, lodging, parking, and circulation facilities would remain in their current locations, in their current conditions, and at their current capacities. Current access to the Merced River gorge would continue to be limited by available roadside parking along the shoulder of El Portal Road; at two off-road, paved parking lots; and at the paved parking lot next to the Arch Rock Entrance Station. Current trends would likely continue under Alternative 1, exacerbating traffic back-ups at the Arch Rock entrance station and reducing performance at the intersection of Highways 140 and 120. Public

transportation routes would not change. For these reasons, there would be local, long-term, minor, adverse impacts associated with transportation conditions (traffic flow and parking for automobiles and charter buses) in certain portions of Segments 3 and 4 under Alternative 1 (No Action).

**Segments 3 & 4 Impact Summary:** There would be local, long-term, minor, adverse impacts associated with transportation conditions (traffic flow and parking for automobiles and charter buses) in Segments 3 and 4 under Alternative 1 (No Action).

### **Segment 7: Wawona**

**Roadway System.** There would be no changes to the roadway system in Segment 7 under Alternative 1 (No Action), and no transportation impacts would occur.

**Traffic Flow Conditions.** As described in the Affected Environment section above, the number of vehicles on park roads has increased over the years, but traffic conditions on Wawona Road are typically acceptable along the South Fork Merced River where Wawona Road crosses and then follows the river. On peak summer days, when the Mariposa Grove parking lots reach capacity, motorists are directed to drive to Wawona and take the shuttle bus back to Mariposa Grove. This relieves pressure on parking areas near Mariposa Grove, but exacerbates congestion and poor traffic circulation in Wawona during peak summer days. Segmentwide, long-term, minor to moderate, adverse impacts would continue to occur at busy intersections in Wawona, and likely worsen as visitation levels increase by an average of 3% per year, under Alternative 1 (No Action).

**Charter Buses.** There would be no changes to the management of charter bus access to the park in Segment 7 under Alternative 1 (No Action). The demand for charter bus parking currently is not met by the supply. There could be segmentwide, long-term, minor, adverse impacts associated with parking demand continuing to exceed the supply.

**Wawona Shuttle Bus System.** No new shuttle stops would be added under Alternative 1 (No Action). There could be segmentwide, long-term, minor, adverse impacts associated with continuing crowding on Wawona shuttle buses, and service delays for those buses, as they are slowed by traffic congestion on area roads.

**Parking Areas.** The existing parking supply for private automobiles (day visitors and employees) and commercial tour buses would remain unchanged in Segment 7 under Alternative 1 (No Action). There could be segmentwide, long-term, minor, adverse impacts associated with parking demand continuing to exceed supply, likely worsening as visitation levels increase by an average of 3% per year.

**Segment 7 Impact Summary:** There could be segmentwide, long-term, minor, adverse impacts on transportation conditions in Segment 7 under Alternative 1 (No Action) from the continuation of current transportation management actions to address increases in park visitation, traffic volumes on the park roadways, and parking demand that exceeds the parking supply (i.e., a larger parking deficit).

### Summary of Impacts from Alternative 1 (No Action)

Overall, with the assumed continuing increases in visitation and associated traffic volumes and parking demand, increased traffic congestion, pedestrian-vehicle conflicts, and inappropriate roadside parking would be clearly detectable (experienced by 10% to 20% of visitors). Therefore, Alternative 1 (No Action) would result in segmentwide, long-term, moderate, adverse impacts on transportation conditions.

### Cumulative Impacts from Alternative 1: No-Action

Cumulative effects to transportation discussed herein are based on analysis of past, present, and reasonably foreseeable actions in the Yosemite region in combination with potential effects of the no-action alternative. The projects identified below include only those projects that could affect transportation within the river corridor or in the park vicinity.

#### *Past Actions*

Past actions have resulted in both adverse and beneficial impacts on transportation. The majority of past projects listed in Appendix B (e.g., Yosemite Valley Loop Road Rehabilitation, completed in 2008, South Entrance Exit Lane Project, completed in 2012, and Wawona Road Rehabilitation Project completed in 2011) had short-term, adverse effects on transportation conditions in the corridor (i.e., associated with construction-related increases in traffic volumes on park roads), which have no net adverse or beneficial effects on current or future transportation conditions. The following past projects had long-term, minor, beneficial effects on transportation conditions, which would continue under Alternative 1:

- The YARTS is a regional transportation system established in 2000, whose intent is to provide an alternative to private vehicles by expanding the range of travel options for visitors to Yosemite Valley and to other primary park destinations, and for employees commuting to work in the park. It also provides a means for visitors to travel to the Valley when restricted access measures are implemented for private vehicles during times of severe congestion. YARTS has a corridorwide, long-term, moderate, beneficial effect by reducing the number of day visitors arriving in private vehicles.
- El Portal Road improvement projects had both adverse (short-term during construction) and beneficial (long-term) effects on transportation. Short-term, construction-related effects included visitor delays and visitor safety through the construction work zone. Those effects were mitigated by implementation of a traffic control plan, with measures such as strict construction timing restrictions, roadway safety procedures, flaggers, and signaling. Safety improvements on El Portal Road facilitate regional transit service on that route, which is a segmentwide, long-term, minor, beneficial impact.
- Housing Projects (i.e., Curry Village Employee Housing, Curry Village Huff House Temporary Housing, Yosemite Valley Lost Arrow Temporary Employee Housing, and Yosemite Valley Ahwahnee Temporary Employee Housing) included the construction of housing and related facilities to accommodate concessioner employees. The housing units replaces concessioner housing lost in the January 1997 flood and the rockfall events at Curry Village in October 2008, and were developed in consultation with litigants as part of a settlement agreement concerning

the *Merced Wild and Scenic River Comprehensive Management Plan/DEIS*. These actions provide temporary lodging for concessioner employees, and were needed to help meet immediate short-term housing needs for the park concessioner until permanent employee housing is available. Construction was completed between 2007 and 2009. These projects have a corridorwide, long-term, moderate, beneficial effect by reducing the number of employee commute trips to and from the park.

- Yosemite Valley Shuttle Bus Stop Improvements consisted of the preparation of preliminary design plans, environmental compliance documents, and construction drawings; the construction of six, 10-foot by 80-foot concrete braking pads, and the rehabilitation or replacement of 94,000 square feet of asphalt road approaches and the construction of bus stop shelters. Construction was completed in 2010. These improvements support shuttle bus service in the Valley, which is a segmentwide, long-term, minor, beneficial impact.

### ***Present Actions***

Present actions proposed in the Yosemite region are separated below into four general categories: (1) projects anticipated to have a net beneficial effect; (2) projects anticipated to have both beneficial and adverse effects; (3) projects anticipated to have adverse effects; and (4) projects anticipated to have a no-net adverse or beneficial effect.

Present projects that could have a cumulative corridorwide, long-term, moderate, beneficial effect on transportation include:

- Increased YARTS services
- Changeable electronic signs in Mariposa, Midpines, and El Portal, alerting drivers of traffic conditions in Yosemite Valley
- Computer-Aided Dispatch / Automatic Vehicle Locator
- Web-based Traffic Forecasts to inform travelers of traffic congestion (heavy, moderate or light) in different areas of the park (Yosemite Valley, Tuolumne Meadows, Wawona and Mariposa Grove, and Glacier point). Travelers can also sign up to receive the forecasts via email. The aforementioned actions would individually, and in combination, encourage travel to the park by alternative (nonprivate vehicle) modes.

Present projects that could have a short-term, adverse effect, but a cumulative long-term, beneficial effect on transportation include:

- South Park Intelligent Transportation System to let visitors know when parking lots are full
- Parking alternative option at the El Portal Administrative Site
- The South Entrance Station Kiosk Replacement
- The Restoration of Mariposa Grove Ecosystem Project
- Parkwide Communication Data Network infrastructure upgrade.

Although the above projects would have some site-specific, short-term, adverse affects (e.g., construction-related transportation effects), the general goal of each of these projects is to improve transportation circulation and safety.

Present projects that could have a short-term, adverse effect on transportation include:

- Ahwahnee Comprehensive Rehabilitation Plan
- East Yosemite Valley Utilities Improvement Plan
- Rehabilitate (pulverize and repave) approximately 25 miles of the Wawona Road between Southside Drive and South Entrance. Only minimal work at turnouts and intersections, which will be within the existing paved footprint.
- The Ahwahnee Hotel Improve Porte Cochère Access Walkways and Fence project, which would replace rotted wooden components along (1) the uncovered wood-plank walkway that runs along the service yard fence to the porte cochère, (2) the service yard fence, and (3) the wood-plank boardwalk in the main entry gallery
- Parkwide pavement preservation program that requires temporary road closures for various segments of roads in the corridor

The adverse effects associated with the projects listed above would be short term and primarily related to construction-generated traffic on roadways serving the project sites. There would be no net, long-term, adverse or beneficial effects on transportation.

Present projects anticipated having no net, long-term or short-term, adverse or beneficial effects on transportation include:

- Commercial Use Authorization for Commercial Activities, to regulate and oversee operations of permit holders involved in conducting commercially-guided day hiking, overnight backpacking, fishing, photography workshops, stock use (pack animal trips and pack support trips for hikers), and Nordic skiing activities in Yosemite.

The continuation of transportation-related maintenance improvements and resource protection measures such as repaving, and trail, parking, and roadway delineation would have short-term, minor, adverse effects on transportation during construction, including visitor delays and visitor safety through the construction work zones. Those effects would be mitigated by implementation of a traffic control plan, with measures such as strict construction timing restrictions, roadway safety procedures, and flaggers.

Restricted access measures would continue to control the volume of incoming vehicles when traffic and parking conditions in Yosemite Valley are over congested. The YARTS would continue to reduce the number of individual vehicles operated within the park. These actions would have segmentwide, long-term, moderate, beneficial effects on transportation.

### ***Reasonably Foreseeable Future Actions***

Similar to past actions, reasonably foreseeable future actions would result in both adverse and beneficial impacts on transportation. Reasonably foreseeable future projects that could have short-term, adverse effects on transportation associated with construction activities include the following:

- **Concessioner Parking Lot Restoration Project.** Concessioner-assigned paved parking areas would be replaced to a maintainable condition and to provide safe access for visitors and staff. Currently, paved parking areas have substantial deterioration from age, construction activities, tree root lift, rodent activity, and extreme weather. Numerous potholes, annual patching, and excessive cracks exist, causing safety and concerns related to Americans with Disabilities Act and Architectural Barriers Act Accessibility Standards requirements. As part of this project, paved areas would be evaluated individually for proper drainage, elevations, curbing, striping, and improved efficiency. The existing parking area footprints would be retained as designated in the concessions contract for concessioner land assignments. This project would not expand any parking areas, nor would it add any parking spaces.
- **Curry Village Rehabilitation of Historic Cabins with Bath Structures** would address a rehabilitation program for the 26 guest cabins with baths that are still being used for guest accommodations on the western side of Curry Village just north of the rockfall hazard zone. This project is currently in the design stage and would be implemented in a multi-year phased project.
- **The Ahwahnee Dormitory Seismic Upgrades** would replace the foundation with a permanent foundation to provide long-term structural stabilization of the dormitory building. The project also will include an evaluation of the existing utilities and components located under the building floor, the building floor structure, structural elements of the building, and soil erosion and drainage issues to determine if these elements should be replaced or rehabilitated as part of the project. This project is tentatively scheduled for 2012.
- **Parkwide pavement preservation program** that requires temporary road closures for various segments of roads in the corridor.

The park anticipates that visitor demand would increase, which could exacerbate traffic congestion on park roads. Reasonably foreseeable future projects that could have a cumulative long-term, beneficial effect on transportation by encouraging travel to the park by alternative (non-private vehicle) modes or improving transportation infrastructure outside of the river corridor include the following:

- **Transit Passenger Information System.** This project will enable improved communication to park visitors on the status of the park's shuttle buses through development of a visitor information system for all the shuttle bus systems in Yosemite Valley, Mariposa Grove/Wawona, Badger Pass, and Tioga Road.

Other beneficial impacts for reasonably foreseeable future actions would be similar to those discussed for past and present actions (i.e., the restricted access measures and increased YARTS services). Reducing traffic congestion and encouraging travel to the park by alternative (non-private vehicle) modes would have segmentwide, long-term, moderate, beneficial effects on transportation.

***Overall Cumulative Impact***

Cumulative projects are not anticipated to affect transportation conditions on Segments 1, 5, 6, and 8 (wilderness segments accessible only by trails, not roads), and therefore, no cumulative impacts would occur. For segments 2, 3, 4 and 7, camping, lodging, parking, and circulation facilities are assumed to remain in their current locations, in their current conditions, and at their current capacities.

Consequently, traffic congestion and delays would continue to occur at busy intersections and could worsen somewhat if visitation levels increase in the future. Congestion and delays would be segment-wide, long-term, minor, adverse impacts on transportation conditions.

***Environmental Consequences of Actions Common to Alternatives 2–6*****All River Segments*****Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values that are common to Alternatives 2–6 would primarily have local, short-term, minor adverse transportation effects associated with restoration activities, but would have no long-term impacts because increased traffic would cease with completion of the restoration work. The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration (protect and enhance) actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

There would be no visitor use or transportation actions common to Alternatives 2–6. However, some form of day use parking permit system would be common to Alternatives 2–6, but the specifics of the system would vary for each alternative. The amount of overnight accommodations and day parking and transit options would vary by alternative, and each alternative would accommodate different levels of peak use demand for visitation in the Valley, as described under each alternative.

**Segment 2: Yosemite Valley*****Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values common to Alternatives 2–6 in Segment 2 would primarily have short-term transportation effects, associated with restoration activities, but would have no long-term impacts because increased traffic would cease with completion of the restoration work. The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration (protect and enhance) actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions common to all alternatives within Segment 2 that are proposed to specifically address transportation conditions include adding a 41-space parking lot for Camp 4 campground, allocating parking spaces for 15 tour buses within the redeveloped day use parking area west of Yosemite Lodge, and constructing a shuttle bus stop near Camp 4. Construction activities may result in minor delays in the short-term, but once operational, these actions would result in segment-wide, long-term, minor beneficial impacts to transportation conditions, as traffic congestion would be somewhat lessened during periods of peak visitor use. In addition, the relocation of the Concessioner Garage service to the Government Utility Building would allow for an expansion of parking areas within Camp 6, also resulting in segment-wide, long-term, minor beneficial impacts. Other actions associated with overnight accommodations and facilities that are common to all alternatives in Segment 2, including actions associated with the Huff House temporary housing area, Curry Village services and facilities, the western expansion of Backpackers Campground, the eastward expansion of Camp 4, and the removal of old and temporary housing at Highland Court and the Thousands Cabins would have a segment-wide, long-term, negligible beneficial impact to transportation conditions.

**Segment 2 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, negligible to minor, beneficial impacts on transportation and circulation within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values common to Alternatives 2–6 in Segments 3 and 4 would primarily have short-term transportation effects, associated with restoration activities, but would have no long-term impacts because increased traffic would cease with completion of the restoration work. The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration (protect and enhance) actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions common to all alternatives associated with visitor use management and facilities within Segments 3 and 4 include constructing infill housing units in vacant lots in old El Portal. Construction activities may result in minor delays in the short-term, but once operational, this action would result in local, long-term, negligible beneficial impact to transportation conditions impacts to transportation as a small amount of traffic is removed from Segment 2.

**Segments 3 & 4 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, negligible, beneficial impacts on transportation and circulation within Segments 3 & 4.

## Segment 7: Wawona

### *Impacts of Actions to Protect and Enhance River Values*

Actions to protect and enhance river values common to Alternatives 2–6 in Segment 7 would primarily have short-term transportation effects, associated with restoration activities, but would have no long-term impacts because increased traffic would cease with completion of the restoration work. The transportation effects of changes to the amount of overnight accommodation (i.e., campsites) as part of the restoration (protect and enhance) actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

There would be no visitor use or transportation actions common to Alternatives 2–6 in Segment 7. The amount of overnight accommodations and day parking and transit options would vary by alternative, and each alternative would accommodate different levels of peak use demand for visitation to Wawona, as described under each alternative.

**Segment 7 Impact Summary:** Impacts of actions common to Alternatives 2–6 would be similar to those of Alternative 1 (No Action), and result in segmentwide, long-term, minor, adverse impacts on transportation conditions in Segment 7.

### Summary of Impacts Common to Alternatives 2–6

Impacts common to all segments under Alternatives 2–6 would result in corridorwide, short-term, negligible to minor, adverse impacts on traffic, transit, and tour bus services and parking areas associated with restoration activities. Operational impacts common to all segments under Alternatives 2–6 would result in corridorwide, long-term, negligible to minor, beneficial impacts on traffic, transit, tour bus services and parking areas with implementation of these actions.

## *Environmental Consequences of Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration*

### All River Segments

#### *Impacts of Actions to Protect and Enhance River Values*

Under Alternative 2, actions to protect and enhance river values would primarily have corridorwide, short-term, minor, adverse transportation effects associated with restoration activities (e.g., removal of Sugar Pine, Ahwahnee, and Stoneman bridges to preserve the free-flowing condition of the Merced River). The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration (protect and enhance) actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 2, actions to manage visitor use and facilities would slightly decrease opportunities for camping in the river corridor and decrease lodging, expand regional bus service, decrease day parking, and improve traffic circulation by a marked reduction in visitor use through a day use parking permit system for the East Yosemite Valley during the peak season. Permit compliance would be checked at park entrance stations and, secondarily, at Yosemite Valley locations or parking areas. These management actions would have corridorwide, moderate, long-term, beneficial impacts on transportation conditions.

### **Segment 2: Yosemite Valley**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 2, in Segment 2, actions to protect and enhance river values would primarily have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities. However, traffic flow and circulation would be improved through the rerouting of Northside Drive south of the Camp 6 parking area (which would be relocated north of the current location, closer to the Yosemite Village). No roundabouts would be necessary under Alternative 2. While a pedestrian undercrossing would not be necessary, Alternative 2 would construct an at-grade pedestrian crossing west of the intersection of Northside Drive and Yosemite Lodge Drive to alleviate pedestrian/vehicle conflicts. Additionally, the intersection at Sentinel Bridge would be redesigned and Southside Drive would switch to a two-way road. The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 2, in Segment 2, actions to manage visitor use and facilities include a traffic and parking management program. About 537 fewer parking spaces would be provided in Yosemite Valley, based on a calculation of the parking needed to accommodate the reduced use levels in the river corridor; no parking would be added in the West Valley. Due to the reductions in the supply of day parking with Alternative 2 as compared to current peak demand, a day use parking permit system would be instituted for East Yosemite Valley. This system would be provided during the peak use season on a mixed first come, first served and advance reservation basis. Permits would be checked at entrance stations and secondarily at Valley locations or parking areas, and day use would be limited to 9,400 visitors per day.

The total number of daily visitors to East Yosemite Valley under Alternative 2 would be 13,900 people, an approximately 33% decrease from existing peak-day conditions. At this level of visitation, there would not be a need for overflow parking during times of peak visitation. The amount of overnight lodging would decrease substantially from existing conditions under Alternative 2 in Segment 2, from 1,034 units to 556 units. The number of campsites in Segment 2 would decrease slightly, from 462 to 450 sites.

Regional bus service into Yosemite Valley would be expanded during the peak summer season under Alternative 2 with new service on the Highway 41 corridor.

Transportation and circulation would be improved due to the day use parking permit system, and the resulting substantially lower use levels. When combined, these actions would have segmentwide, moderate, long-term, beneficial impacts on transportation conditions within Yosemite Valley.

**Segment 2 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, moderate, beneficial impacts on transportation and circulation within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 2, in Segments 3 and 4, actions to protect and enhance river values would have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities as described for Segment 2.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 2, no significant changes to the kinds and amounts of use are proposed in Segment 3, and the only change in Segment 4 would be increased employee housing (added to replace the housing removed from the Valley). The total number of daily visitors to actively recreate in Segments 3 and 4 with Alternative 2 would not change from existing peak-day conditions.

Public transit options along Segments 3 and 4 would be expanded the same as described for Segment 2. Segment 3 is considered a “pass through” segment and, therefore, it does not contain any stops for passengers to enter or depart from transportation services that travel along this corridor. When combined, these actions would have segmentwide, minor, long-term, beneficial impacts on transportation conditions.

**Segments 3 & 4 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, minor, beneficial impacts on transportation and circulation within Segments 3 & 4.

### **Segment 7: Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 2, in Segment 7, actions to protect and enhance river values would have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities, but would have no long-term impacts because increased traffic would cease with completion of the restoration work.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 2, no significant changes to the kinds and amounts of use in Segment 7 are proposed. The total number of daily visitors to Segment 7 under Alternative 2 would increase slightly over Alternative 1 peak-day levels, primarily due to increased transit use.

**Segment 7 Impact Summary:** Impacts of Alternative 2 actions would be similar to those of Alternative 1 (No Action), and result in segmentwide, long-term, minor, adverse impacts on transportation conditions in Segment 7.

### **Summary of Impacts from Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration**

Transportation conditions under Alternative 2 would be improved (reduced crowding and congestion) from management of visitor use to lower levels through the implementation of a day use parking permit system for East Yosemite Valley, expanded regional transit service, improved circulation patterns, and reduced vehicle-pedestrian conflicts. Although the number of parking spaces would be reduced, the lower visitor level would reduce the ratio of visitors to parking spaces, an improvement that would be clearly detectable (by 10% to 20% of visitors traveling in the Merced River corridor) during the peak season of visitation. Overall, with implementation of mitigation measures MM-TRA-1 through MM-TRA-5, as applicable (see Appendix C), Alternative 2 would have corridorwide, moderate, long-term, beneficial impacts on transportation conditions.

### **Cumulative Impacts from Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration**

The past, present, and foreseeable projects that would affect transportation in the river corridor under Alternative 2 would be the same as those under Alternative 1. Alternative 2, in combination with these cumulative projects, would result in a local, short-term, minor, adverse impact on transportation during construction periods. However, the improvements realized through current and reasonably foreseeable projects would further enhance the moderate, long-term, beneficial impacts on transportation that would result from the implementation of Alternative 2.

### ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

#### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 3, actions to protect and enhance river values would primarily have corridorwide, short-term, minor, adverse transportation effects associated with restoration activities (e.g., removal of Sugar Pine, Ahwahnee, and Stoneman bridges to preserve the free-flowing condition of the Merced River). The transportation effects of changes to the amount of overnight accommodation

(i.e., campsites and lodging units) as part of the restoration (protect and enhance) actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Under Alternative 3, actions to manage visitor use and facilities would slightly decrease opportunities for camping in the river corridor and decrease lodging, expand regional bus service, decrease day parking, and improve traffic circulation by a marked reduction in visitor use through a day use parking permit system for the East Yosemite Valley during the peak season. Permit compliance would be checked at on-site parking locations. These management actions would have corridorwide, moderate, long-term, beneficial impacts on transportation conditions.

## **Segment 2: Yosemite Valley**

### *Impacts of Actions to Protect and Enhance River Values*

Under Alternative 3, in Segment 2, actions to protect and enhance river values would primarily have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities. However, traffic flow and circulation would be improved through the rerouting of Northside Drive south of the Camp 6 parking area (which would be relocated north of the current location, closer to the Yosemite Village). No roundabouts would be necessary under Alternative 3. While a pedestrian undercrossing would not be necessary, Alternative 3 would construct an at-grade pedestrian crossing west of the intersection of Northside Drive and Yosemite Lodge Drive to alleviate pedestrian/vehicle conflicts. Additionally, the intersection at Sentinel Bridge would be redesigned and Southside Drive would switch to a two-way road. The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Under Alternative 3, in Segment 2, actions to manage visitor use and facilities include a traffic and parking management program. About 740 fewer parking spaces would be provided in the Valley, based on a calculation of the parking needed to accommodate the reduced use levels in the river corridor; no parking would be added in the West Valley. Due to the reductions in the supply of day parking with Alternative 3 as compared to current peak demand, a day use parking permit system would be instituted for the East Yosemite Valley. This system would be provided during the peak use season on a mixed first come, first served and advance reservation basis. Permits would be checked at on-site parking locations, and day use would be limited to 8,500 visitors per day.

The total number of daily visitors to East Yosemite Valley under Alternative 3 would be 13,200 people, an approximately 37% decrease from existing peak-day conditions. At this level of visitation, there would not be a need for overflow parking during times of peak visitation. The amount of overnight lodging would decrease substantially from existing conditions under Alternative 3 in Segment 2, from 1,034 units to 621 units. The number of campsites in Segment 2 would increase slightly, from 462 to 477 sites.

Regional bus service into Yosemite Valley would be expanded during the peak summer season under Alternative 3 with new service on the Highway 41 corridor.

Transportation and circulation would be improved with substantially lower use levels. When combined, these actions would have segmentwide, moderate, long-term, beneficial impacts on transportation conditions within Yosemite Valley.

**Segment 2 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, moderate, beneficial impacts on transportation and circulation within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### *Impacts of Actions to Protect and Enhance River Values*

Under Alternative 3, in Segments 3 and 4, actions to protect and enhance river values would have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities.

#### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Under Alternative 3, no significant changes to the kinds and amounts of use are proposed in Segment 3, and the only change in Segment 4 would be increased employee housing (added to replace the housing removed from the Valley). The total number of daily visitors to actively recreate in Segments 3 and 4 with Alternative 3 would not change from existing peak-day conditions.

Public transit options along Segments 3 and 4 would be expanded as described for Segment 2 above. Segment 3 is considered a “pass through” segment and therefore it does not contain any stops for passengers to enter or depart from transportation services that travel along this corridor. When combined, these actions would have segmentwide, minor, long-term, beneficial impacts on transportation conditions.

**Segments 3 & 4 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, minor, beneficial impacts on transportation and circulation within Segments 3 & 4.

### **Segment 7: Wawona**

#### *Impacts of Actions to Protect and Enhance River Values*

Under Alternative 3, in Segment 7, actions to protect and enhance river values would have segment, short-term, minor, adverse transportation effects associated with restoration activities, but would have no long-term impacts because increased traffic would cease with completion of the construction work.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 3, no significant changes to the kinds and amounts of in use Segment 7 are proposed. The total number of daily visitors to Segment 7 under Alternative 3 would increase slightly over Alternative 1 peak-day levels, primarily due to increased transit use.

**Segment 7 Impact Summary:** Impacts of Alternative 3 actions would be similar to those of Alternative 1 (No Action), and result in segmentwide, long-term, minor, adverse impacts on transportation conditions in Segment 7.

**Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Transportation conditions under Alternative 3 would be improved (reduced crowding and congestion) by management of visitor use to lower levels through the implementation of a day use parking permit system for the East Yosemite Valley, expanded regional transit service, improved circulation patterns, and reduced vehicle-pedestrian conflicts. Although the number of parking spaces would be reduced, the lower visitor level would reduce the ratio of visitors to parking spaces, an improvement that would be clearly detectable (by 10% to 20% of visitors traveling in the Merced River corridor) during the peak season of visitation. Overall, with implementation of mitigation measures MM-TRA-1 through MM-TRA-5, as applicable (see Appendix C), Alternative 3 would have corridorwide, moderate, long-term, beneficial impacts on transportation conditions.

**Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

The past, present, and foreseeable projects that would affect transportation in the Merced River corridor under Alternative 3 would be the same as those under Alternative 1. Alternative 3, in combination with these cumulative projects, would result in a local, short-term, minor, adverse impact on transportation during construction periods. However, the improvements realized through current and reasonably foreseeable projects would further enhance the moderate, long-term, beneficial impacts on transportation that would result from Alternative 3.

***Environmental Consequences of Alternative 4: Resource-Based Visitor Experiences and Targeted Riverbank Restoration*****All River Segments*****Impacts of Actions to Protect and Enhance River Values***

Under Alternative 4, actions to protect and enhance river values would primarily have corridorwide, short-term, minor, adverse transportation effects associated with restoration activities (e.g., removal of Sugar Pine and Ahwahnee bridges to preserve the free-flowing condition of the Merced River). The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and

lodging units) as part of the restoration (protect and enhance) actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 4, actions to manage visitor use and facilities would slightly decrease opportunities for camping in the river corridor and decrease lodging, expand regional bus service, decrease day parking, and improve traffic circulation through a marked reduction in visitor use. A proactive on-site, day use traffic and parking management program would be implemented to encourage dispersion of visitation to the park's most congested areas. Overflow parking during times of peak visitation would be provided in El Portal at the Abbieville site, with the NPS shuttle system expanded to serve this new location. These management actions would have corridorwide, minor, long-term, beneficial impacts on transportation conditions.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 4, in Segment 2, actions to protect and enhance river values would primarily have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities. Construction activities would include the removal of a portion of Southside Drive through Stoneman Meadow and realignment of the road through the Boys Town area. Northside Drive would be retained in its current configuration, though Northside Drive would be re-aligned at Village Drive to meet standards for a proper four-way intersection and improved performance. No roundabouts would be necessary under Alternative 4. A pedestrian underpass (at Yosemite Lodge/Yosemite Falls crossing) would be constructed. A three-way intersection would be added from Sentinel Drive to the Yosemite Village Day Use Area Parking Lot to improve traffic flow and to alleviate congestion at nearby intersections. The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 4, in Segment 2, actions to manage visitor use and facilities include a traffic and parking management program. About 292 fewer parking spaces would be provided in Yosemite Valley, based on a calculation of the parking needed to accommodate the reduced use levels in the river corridor; no parking would be added in the West Valley. Due to the reductions in the supply of day parking under Alternative 4 as compared to current peak demand, a system of parking fees, and traffic and parking diversions would be instituted. This system would be provided during the peak use season to manage parking for visitors to the East Valley. Visitor orientation and wayfinding would be improved by linking the Camp 6 parking lot to Yosemite Village visitor services via an underpass and pathways. Traffic congestion would be mitigated with the provision of a pedestrian underpass at Yosemite Lodge.

The total number of daily visitors to the East Valley under Alternative 4 would be 17,000 people, an approximate 19% decrease from existing peak-day conditions. The amount of overnight lodging

would decrease slightly from existing conditions under Alternative 4 in Segment 2, from 1,034 units to 823 units. The number of campsites in Segment 2 would increase, from 466 to 701 sites.

Regional bus service into Yosemite Valley would be expanded during the peak summer season under Alternative 4, with new service on the Highway 41 corridor. Additionally, the Valley shuttle would be extended to the West Valley and serve the El Capitan crossover and Bridalveil Fall areas.

Transportation and circulation would be improved due to lower use levels. When combined, these actions would have segmentwide, moderate, long-term, beneficial impacts on transportation conditions within Yosemite Valley.

**Segment 2 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, moderate, beneficial impacts on transportation and circulation within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 4, in Segments 3 and 4, actions to protect and enhance river values would have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 4, no significant changes to the kinds and amounts of use are proposed in Segment 3, and the only changes in Segment 4 would be the development of a new remote parking area and increased employee housing (added to replace the housing removed from Yosemite Valley). The total number of daily visitors to actively recreate in Segments 3 and 4 with Alternative 4 would not change from existing peak-day conditions.

A new remote, 200-space visitor day parking area would be provided at the Abbieville/Trailer Court area in Segment 4, primarily to be used for visitor access to Yosemite Valley. The use associated with this parking area is accounted for in the Valley daily visitation levels reported for Segment 2 above. Public transit options along Segments 3 and 4 would be expanded as described for Segment 2 above. Segment 3 is considered a “pass through” segment, and therefore, it does not contain any stops for passengers to enter or depart from transportation services that travel along the river corridor through the Merced River gorge. Regional transit buses in Segment 4 would stop at the new day parking area. When combined, these actions would have segmentwide, minor, long-term, beneficial impacts on transportation conditions.

**Segments 3 & 4 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, minor, beneficial impacts on transportation and circulation within Segments 3 & 4.

## **Segment 7: Wawona**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 4, in Segment 7, actions to protect and enhance river values would have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities, but would have no long-term impacts because increased traffic would cease with completion of the construction work.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 4, no significant changes to the kinds and amounts of use in Segment 7 are proposed. The total number of daily visitors to Segment 7 under Alternative 4 would increase slightly over Alternative 1 peak-day levels, primarily due to increased transit use.

**Segment 7 Impact Summary:** Impacts of Alternative 4 actions would be similar to those of Alternative 1 (No Action), and result in segmentwide, long-term, minor, adverse impacts on transportation conditions in Segment 7.

## **Summary of Impacts from Alternative 4: Resource-Based Visitor Experiences and Targeted Riverbank Restoration**

Transportation conditions under Alternative 4 would be improved (reduced crowding and congestion) by management of visitor use to lower levels through the implementation of a parking fee, and traffic and parking diversion system, expanded regional transit and Valley shuttle service, improved circulation patterns, and reduced vehicle-pedestrian conflicts. Although the number of parking spaces would be reduced, the lower visitor level would reduce the ratio of visitors to parking spaces, an improvement that would be slightly detectable (by 5% to 10% of visitors traveling in the Merced River corridor) during the peak season of visitation. Overall, with implementation of mitigation measures MM-TRA-1 through MM-TRA-5, as applicable (see Appendix C), Alternative 4 would have corridorwide, minor, long-term, beneficial impacts on transportation conditions.

## **Cumulative Impacts from Alternative 4: Resource-Based Visitor Experiences and Targeted Riverbank Restoration**

The past, present, and foreseeable projects that would affect transportation in the Merced River corridor under Alternative 4 would be the same as those described above for Alternative 2. Alternative 4, in combination with these cumulative projects, would result in a local, short-term, minor, adverse impact on transportation during construction periods. However, the improvements realized through current and reasonably foreseeable project would further enhance the moderate, long-term, beneficial impacts on transportation that would result from the implementation of Alternative 4.

## ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential River Bank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 5, actions to protect and enhance river values would primarily have corridorwide, short-term, minor, adverse transportation effects associated with restoration activities. The transportation effects of changes to the amount of overnight accommodations (i.e., campsites and lodging units) as part of the restoration (protect and enhance) actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 5, actions to manage visitor use and facilities would increase opportunities for camping in the river corridor and slightly increase lodging, expand regional bus service, increase day parking in three primary areas (the West Valley, Yosemite Lodge, and El Portal), and improve traffic circulation with a new traffic circle and a pedestrian underpass in Yosemite Valley. Alternative 5 also would include a traffic and parking management program, which while focused on the Valley, would improve transportation conditions parkwide. Alternative 5 would accommodate current average day use for the summer season. These management actions would have corridorwide, moderate, long-term, beneficial impacts on transportation conditions.

### **Segment 2: Yosemite Valley**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 5, in Segment 2, actions to protect and enhance river values would primarily have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities. Northside Drive would be retained in its current configuration, but a traffic circle (at the Northside Drive / Village Drive [Camp 6] intersection) and a pedestrian underpass (at Yosemite Lodge/Yosemite Falls crossing) would be constructed. A three-way intersection would be added from Sentinel Drive to the Yosemite Village Day Use Area Parking Lot to improve traffic flow and to alleviate congestion at nearby intersections. The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 5, in Segment 2, actions to manage visitor use and facilities include a traffic and parking management program, additional parking, and changes to camping and overnight accommodations. The total number of daily visitors to East Yosemite Valley under Alternative 5 would be 19,900 people, an approximately 5% decrease from existing peak-day conditions.

The day use capacity management system under Alternative 5 would include a phased-in progressive management plan for reducing overall congestion and would reduce crowding and congestion in Segment 2 on peak-use days. This would lead to a day use parking permit system for the East Yosemite Valley if day use visitation to the East Yosemite Valley from private vehicles exceeds the parking availability and formal traffic diversions at El Capitan Crossover are instituted for 14 days or more during the summer season for two consecutive years. Permits would be checked at on-site parking locations, and day use would be limited to 12,800 visitors per day. Both regional transit and Valley shuttle options would be expanded, the latter extended to the West Valley to serve the El Capitan crossover and Bridalveil Fall areas. Vehicles driving into Yosemite Valley on peak-use days would be subject to transportation fees, directed to overflow parking in the West Valley, and ultimately require a parking reservation. The management system would improve transportation conditions in the Valley, particularly on peak days.

Under Alternative 5, the amount of overnight lodging would remain essentially the same as existing conditions in Segment 2, increasing slightly from 1,034 units to 1,053 units. The number of campsites in Segment 2 would increase from 462 to 640 sites, a 39% increase.

In addition to the day use capacity management system, transportation and parking improvements would improve traffic flow and circulation. About 111 parking spaces would be added in Segment 2, a 5% increase over the spaces currently available (including 100 overflow parking spaces in the West Valley), which would reduce vehicles circulating through Yosemite Valley looking for parking. The above-mentioned traffic circle and a pedestrian underpass would result in less congestion and enhanced pedestrian safety.

Regional bus service into Yosemite Valley would be expanded during the peak summer season under Alternative 5. The regional transit service would accommodate both employees and visitors and would add an additional stop at the El Portal remote day use parking area. Additionally, the Valley shuttle would be extended to the West Valley to serve the El Capitan crossover and Bridalveil Fall areas.

Although the total number of daily visitors to East Yosemite Valley would be only slightly reduced from existing peak-day numbers, the implementation of the day use capacity management system, additional parking spaces, and transportation system improvements would lessen traffic jams, and improve the chance that visitors entering Yosemite have a place to park (thus eliminating unnecessary circling). When combined, these actions would have segmentwide, major, long-term, beneficial impacts on transportation conditions within Yosemite Valley.

**Segment 2 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, major, beneficial impacts on transportation and circulation within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 5, in Segments 3 and 4, actions to protect and enhance river values would have segmentwide, minor, adverse short-term transportation effects associated with restoration activities.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 5, no significant changes to the kinds and amounts of use are proposed in Segment 3, and the only changes in Segment 4 would be the development of a new remote parking area and increased employee housing (added to replace the housing removed from the Valley). The total number of daily visitors to actively recreate in Segments 3 and 4 under Alternative 5 would not change from existing peak-day conditions.

A new remote, 200-space visitor day parking area would be provided at the Abbieville/Trailer Court area in Segment 4, primarily to be used for visitor access to Yosemite Valley. The use associated with this parking area is accounted for in the Valley daily visitation levels reported above for Segment 2. Public transit options along Segments 3 and 4 would be expanded as described for Segment 2 above. Segment 3 is considered a “pass through” segment, and therefore, it does not contain any stops for passengers to enter or depart from transportation services that travel along this corridor. Regional transit buses in Segment 4 would stop at the new day parking area. When combined, these actions would have segmentwide, moderate, long-term, beneficial impacts on transportation conditions.

**Segments 3 & 4 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, moderate, beneficial impacts on transportation and circulation within Segments 3 & 4.

**Segment 7: Wawona*****Impacts of Actions to Protect and Enhance River Values***

Under Alternative 5, in Segment 7, actions to protect and enhance river values would have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities, but would have no long-term impacts because increased traffic would cease with completion of the construction work.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 5, in Segment 7, no significant changes to the kinds and amounts of use are proposed. The total number of daily visitors to Segment 7 under Alternative 5 would increase slightly over Alternative 1 peak-day levels, primarily due to increased transit use.

**Segment 7 Impact Summary:** Impacts of Alternative 5 actions would be similar to those of Alternative 1 (No Action), and result in segmentwide, long-term, minor, adverse impacts on transportation conditions in Segment 7.

**Summary of Impacts from Alternative 5: Enhanced Visitor Experience and Essential River Bank Restoration**

Under Alternative 5, the park would increase access to and the availability of parking and camping, and maintain the current levels of overnight lodging. Transportation conditions would be improved

(reduced crowding and congestion) by better management of traffic, improved circulation patterns (i.e., a traffic circle) and parking, expanded regional transit and Valley shuttle service, and reduced vehicle-pedestrian conflicts, which would be highly detectable (by more than 20% of visitors traveling in the Merced River corridor) during the peak season of visitation. Overall, with implementation of mitigation measures MM-TRA-1 through MM-TRA-5, as applicable (see Appendix C), Alternative 5 would have corridorwide, major, long-term, beneficial impacts on transportation conditions.

### **Cumulative Impacts from Alternative 5: Enhanced Visitor Experience and Essential River Bank Restoration**

The past, present, and foreseeable projects that would affect transportation in the Merced River corridor under Alternative 5 would be the same as those described for Alternative 2. Alternative 5, in combination with these cumulative projects, would result in a local, short-term, minor, adverse impact on transportation during construction periods. However, the improvements realized through current and reasonably foreseeable project would further enhance the moderate, long-term, beneficial impacts on transportation that would result from the implementation of Alternative 5.

### ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 6, actions to protect and enhance river values would primarily have corridorwide, short-term, minor, adverse transportation effects associated with restoration activities (e.g., potential removal of Sugar Pine bridge to preserve the free-flowing condition of the Merced River). The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration (protect and enhance) actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 6, actions to manage visitor use and facilities would increase opportunities for camping in the river corridor and increase lodging, expand regional bus service, increase day parking, and improve traffic circulation with new roundabouts and a pedestrian underpass in Yosemite Valley. Alternative 6 also includes a traffic and parking management program, which while focused on the Valley, would improve transportation conditions parkwide. Alternative 6 would provide enough day parking in the river corridor to accommodate current peak use, and at an average 3% growth per year, enough parking to accommodate day use demand for the next five years. These management actions would have corridorwide, moderate, long-term, beneficial impacts on transportation conditions.

## Segment 2: Yosemite Valley

### *Impacts of Actions to Protect and Enhance River Values*

Under Alternative 6, in Segment 2, actions to protect and enhance river values would primarily have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities. Northside Drive would be retained in its current configuration, but roundabouts (at Northside Drive / Village Drive [Camp 6], and Sentinel Drive / Northside Drive [Bank 3-Way]) and a pedestrian underpass (at the Yosemite Lodge/ Yosemite Falls area) would be constructed. A three-way intersection would be added from Sentinel Drive to the Yosemite Village Day Use Area Parking Lot to improve traffic flow and to alleviate congestion at nearby intersections. The transportation effects of changes to the amount of overnight accommodation (i.e., campsites and lodging units) as part of the restoration actions are described below under Impacts of Actions to Manage User Capacity, Land Use, and Facilities.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Under Alternative 6, in Segment 2, actions to manage visitor use and facilities include a traffic and parking management program, and additional parking, camping, and overnight accommodations. The total number of daily visitors to East Yosemite Valley under Alternative 6 would be 21,800 people, an approximately 4% increase from existing peak-day conditions. Overall, Alternative 6 would accommodate the majority of peak use demand for visitation in the Valley.

Alternative 6 would include a phased-in progressive management plan for reducing overall congestion and creating a visitor-friendly traffic management program. This would include the implementation of transportation fees at entrance stations and could ultimately lead to a day use parking permit system for the East Yosemite Valley if day use visitation to the East Yosemite Valley from private vehicles exceeds the parking availability and formal traffic diversions at El Capitan Crossover are instituted for 14 days or more during the summer season for two consecutive years. Permits would be checked at on-site parking locations, and day use would be limited to 13,700 visitors per day. Both regional transit and Valley shuttle options would be expanded, the latter extended to the West Valley to serve the El Capitan crossover and Bridalveil Fall areas.

The amount of overnight lodging would increase from existing conditions under Alternative 6 in Segment 2, from 1,034 units to 1,248 units. The number of campsites in Segment 2 would increase from 462 to 739 sites.

About 261 parking spaces would be added in this segment, an 11% increase over the spaces currently available (including new visitor parking west of Yosemite Lodge [300 spaces] and in the West Valley at the El Capitan crossover [250 spaces]), which would reduce vehicles circulating through the Valley looking for parking. The above-mentioned roundabouts and pedestrian underpasses would result in less congestion and enhanced pedestrian safety.

Regional bus service into Yosemite Valley would be expanded during the peak summer season under Alternative 6. The regional transit service would accommodate both employees and visitors and would

add an additional stop at the El Portal remote day use parking area. Additionally, the Valley shuttle would be extended to the West Valley to serve the El Capitan crossover and Bridalveil Fall areas.

Although the total number of daily visitors to East Yosemite Valley would be slightly higher than existing peak-day numbers, the implementation of the day use capacity management system, additional parking spaces, and transportation system improvements would lessen traffic jams, and ensure that visitors entering the park have a place to park (thus eliminating unnecessary circling). These management actions would have segmentwide, moderate, long-term, beneficial impacts on transportation conditions.

**Segment 2 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, moderate, beneficial impacts on transportation and circulation within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 6, in Segments 3 and 4, actions to protect and enhance river values would have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 6, no significant changes to the kinds and amounts of use are proposed in Segment 3, and the only changes in Segment 4 would be the development of a new remote parking area and increased employee housing (added to replace the housing removed from the Valley). The total number of daily visitors to actively recreate in Segments 3 and 4 with Alternative 6 would not change from existing peak-day conditions.

A new remote 200-space visitor day parking area would be provided at the Abbieville/Trailer Court site in Segment 4, primarily to be used for visitor access to Yosemite Valley. The use associated with this parking area is accounted for in the Valley daily visitation levels reported above for Segment 2. Public transit options along Segments 3 and 4 would be expanded as described for Segment 2. Segment 3 is considered a “pass through” segment, and therefore, it does not contain any stops for passengers to enter or depart from transportation services that travel along this corridor. Regional transit buses in Segment 4 would stop at the new day parking area. These management actions would have corridorwide, moderate, long-term, beneficial impacts on transportation conditions.

**Segments 3 & 4 Impact Summary:** Actions to manage user capacities, land use, and facilities would have segmentwide, long-term, moderate, beneficial impacts on transportation and circulation within Segments 3 & 4.

## **Segment 7: Wawona**

### ***Impacts of Actions to Protect and Enhance River Values***

Under Alternative 6, in Segment 7, actions to protect and enhance river values would have segmentwide, short-term, minor, adverse transportation effects associated with restoration activities, but would have no long-term impacts because increased traffic would cease with completion of the construction work.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under Alternative 6, in Segment 7, no significant changes to the kinds and amounts of use are proposed. The total number of daily visitors to Segment 7 under Alternative 6 would increase slightly over Alternative 1 peak-day levels, primarily due to increased transit use.

**Segment 7 Impact Summary:** Impacts of Alternative 6 actions would be similar to those of Alternative 1 (No Action), and result in segmentwide, long-term, minor, adverse impacts on transportation conditions in Segment 7.

### **Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Transportation conditions under Alternative 6 would be improved (reduced crowding and congestion) by changes to the roadway network (i.e., roundabouts and pedestrian underpasses) to improve traffic flow and reduce pedestrian/vehicle conflicts), visitor and parking management strategies, and expanded regional transit and Valley shuttle service. Alternative 6 would provide enough day parking in the river corridor to accommodate current peak use, and with circulation changes, the improvements would be clearly detectable (by 10% to 20% of visitors traveling in the Merced River corridor) during the peak season of visitation. Overall, with implementation of mitigation measures MM-TRA-1 through MM-TRA-5, as applicable (see Appendix C), Alternative 6 would have corridorwide, moderate, long-term, beneficial impacts on transportation conditions.

### **Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

The past, present, and foreseeable projects that would affect transportation in the Merced River corridor under Alternative 6 would be the same as those presented above for Alternative 2. Alternative 6, in combination with these cumulative projects, would result in a local, short-term, minor, adverse impact on transportation during construction periods. However, the improvements realized through current and reasonably foreseeable projects would further enhance the moderate, long-term, beneficial impacts on transportation that would result from implementation of Alternative 6.

## **Energy Consumption and Climate Change**

### ***Affected Environment***

This discussion is not organized by river segment because impacts related to energy consumption and climate change tend not to be specific to the segments.

### ***Regulatory Framework***

#### **Federal Laws and Policies**

##### ***The Energy Policy Act***

The Energy Policy Act of 2005 contains several provisions designed to reduce energy use by federal agencies. These include annual energy reduction goals, renewable energy purchase targets, reauthorization of Energy Savings Performance Contracts, required federal procurement of Energy Star or similar products, and updates to green building standards with emphasis on energy efficiency, among other measures. The act also contains an incentive program to encourage agencies to reinvest utility cost savings into future energy projects.

##### ***Energy and Independence Security Act and Corporate Average Fuel Economy Standards***

The Energy and Independence Security Act of 2007 amended the Energy Policy and Conservation Act to further reduce fuel consumption and expand production of renewable fuels. The Energy and Independence Security Act's most significant amendment includes a statutory mandate for the National Highway Traffic Safety Administration to set passenger car Corporate Average Fuel Economy standards for each model year at the maximum feasible level. This statutory mandate eliminated the former default standard of 27.5 miles per gallon. The Energy and Independence Security Act requires that standards for model years 2011 through 2020 be set sufficiently high to achieve an industrywide goal of 35 miles per gallon on average for passenger cars and light-duty trucks. The rulemaking for this goal, as requested by President Barack Obama, was divided into two parts. The first part, which was published in the Federal Register in March 2009, included standards for model year 2011 to meet the statutory deadline (i.e., March 30, 2009). The second part of the rulemaking applies to model year 2012 and subsequent years. These would be the maximum standards feasible under the limits of the Energy and Independence Security Act and the Energy Policy and Conservation Act. The National Highway Traffic Safety Administration and U.S. Environmental Protection Agency (EPA) are working in coordination to develop a national program targeting model year 2012 through 2016 passenger cars and light trucks.

##### ***U.S. Environmental Protection Agency Actions***

In response to the issue of climate change, the EPA has taken actions to regulate, monitor, and potentially reduce greenhouse gas (GHG) emissions, as briefly summarized below.

***Proposed Endangerment and Cause or Contribute Findings for Greenhouse Gases under the Clean Air Act***

On April 23, 2009, the EPA published its proposed *Endangerment and Cause or Contribute Findings for Greenhouse Gases* under the Clean Air Act (Endangerment Finding) in the Federal Register. The Endangerment Finding is based on Section 202(a) of the Clean Air Act, which states that the EPA administrator should regulate and develop standards for “emission[s] of air pollution from any class or classes of new motor vehicles or new motor vehicle engines, which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare.” The proposed rule addresses Section 202(a) in two distinct findings. The first deals with whether the concentrations of the six key GHGs (i.e., carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride) in the atmosphere threaten the public health and welfare of current and future generations. The second addresses whether the combined emissions of GHGs from new motor vehicles and motor vehicle engines contribute to atmospheric concentrations of GHGs and thus increase the threat of climate change.

The EPA administrator proposed the finding that atmospheric concentrations of GHG endanger the public health and welfare within the meaning of Section 202(a) of the Clean Air Act. The evidence supporting this finding consists of “high atmospheric levels” of anthropogenic GHG emissions, which are likely responsible for increases in average temperatures and other climatic changes. Furthermore, the observed and projected results of climate change (e.g., higher likelihood of heat waves, wildfires, droughts, sea level rise, higher intensity storms) are a threat to public health and welfare.

The EPA administrator also proposed the finding that GHG emissions from new motor vehicles and motor vehicle engines are contributing to air pollution, which is endangering public health and welfare. The proposed finding states that, in 2006, motor vehicles were the second largest contributor to domestic GHG emissions (24% of the total), behind electricity generation. Furthermore, in 2005, the United States was responsible for 18% of global GHG emissions. Thus, GHG emissions from motor vehicles and motor vehicle engines were found to contribute to air pollution that endangers public health and welfare.

On December 7, 2009, the EPA finalized its decision that GHG emissions from motor vehicles constitute an “endangerment” under the Clean Air Act. This finding allowed for the establishment of GHG emissions standards for new motor vehicles. In June 2009, in a related action, the EPA granted California a waiver under the federal Clean Air Act, allowing the state to impose its own, stricter GHG regulations for vehicles beginning in 2009.

***Notice of Intent for Development of New Greenhouse Gas and Fuel Economy Standards***

In September 2010, the National Highway Traffic Safety Administration, together with the EPA, published a Notice of Intent for the development of new GHG and fuel economy standards for vehicle model years 2017 through 2025. The agencies published a Supplemental Notice of Intent in December 2010, with a final rule due to be adopted in 2012 (NHTSA 2010).

### ***Mandatory Greenhouse Gas Reporting Rule***

On September 22, 2009, the EPA released its final Greenhouse Gas Reporting Rule (Reporting Rule). The Reporting Rule is a response to the fiscal year 2008 Consolidated Appropriations Act (House Rule 2764; Public Law 110-161), which required the EPA to develop “mandatory reporting of Greenhouse Gas above appropriate thresholds in all sectors of the economy.” The Reporting Rule applies to most entities that emit 25,000 metric tons of carbon dioxide equivalent or more per year. Starting in 2010, facility owners were required to submit an annual GHG emissions report with detailed calculations of facility GHG emissions. The Reporting Rule also mandated recordkeeping and administrative requirements so that the EPA could verify annual GHG emissions reports.

### ***Executive Orders***

**Executive order 13423: Strengthening Federal Environmental, Energy, and Transportation Management.** This order calls upon all federal agencies to adopt an Environmental Management System, which is a process developed by the International Organization for Standardization. Furthermore, this order requires the Office of Management and Budget (OMB) Director to issue instructions concerning periodic evaluation, budget matter, and acquisition relating to agency implementation of the Order. OMB issues budget guidance through updates to Circular No. A-11. OMB will also continue to track agencies' progress on EO and EPACT goals through the three management scorecards on environmental stewardship, energy, and transportation.

**Executive Order 13514: Federal Leadership in Environmental, Energy and Economic Performance.** This order directs federal agencies, including the National Park Service (NPS), to measure, report, and reduce their GHG emissions from direct and indirect activities. Pursuant to Executive Order 13514, the NPS has established its Climate Friendly Parks Program. To date, many federal agencies, including the NPS, have developed GHG emission inventories and are in the process of developing emissions reduction plans.

### ***Climate Change Context***

The term *global warming* refers to the increase in the average temperature of the earth's near-surface air and oceans since the mid-20th century. The evidence of global warming is now considered indisputable (Intergovernmental Panel on Climate Change 2007), with global surface temperatures increasing an average of approximately 1.33 degrees Fahrenheit over the past 100 years. Continued warming over the next 100 years is projected to increase the average global temperature between 2 and 11 degrees Fahrenheit.

The causes of this warming have been identified as both natural processes and human activities. The Intergovernmental Panel on Climate Change concluded that variations in natural phenomena, such as solar radiation and volcanoes, produced most of the warming from pre-industrial times to 1950 and had a small cooling effect afterward. However, after 1950, increasing GHG concentrations resulting from human activity, such as fossil fuel burning and deforestation, have been responsible for most of the observed temperature increase. These basic conclusions have been endorsed by more than

45 scientific societies and academies of science, including all of the national academies of science of the major industrialized countries.

Greenhouse gasses naturally trap heat by impeding the exit of solar radiation that has entered the earth's atmosphere. Some GHGs occur naturally and are necessary for keeping the earth's surface inhabitable. However, increases in atmospheric concentrations of these gases during the past 100 years have decreased the amount of solar radiation that is reflected back into space, intensifying the natural greenhouse effect and causing the increase in average global temperature.

The principal GHGs of concern are carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), sulfur hexafluoride (SF<sub>6</sub>), perfluorocarbons (PFCs), and hydrofluorocarbons (HFCs). Each of the principal GHGs has a long atmospheric lifetime (one year to several thousand years). In addition, the potential heat-trapping ability of each gas varies significantly. CH<sub>4</sub> is 23 times as potent as CO<sub>2</sub>, and SF<sub>6</sub> is 22,200 times more potent than CO<sub>2</sub>. Conventionally, GHGs have been reported as CO<sub>2</sub> equivalents (CO<sub>2</sub>e). CO<sub>2</sub>e takes into account the relative potency of non-CO<sub>2</sub> GHGs and converts their quantities to an equivalent amount of CO<sub>2</sub> so that all emissions can be reported as a single quantity.

### **California Climate Trends and Associated Impacts**

Maximum (daytime) and minimum (nighttime) temperatures are increasing almost everywhere in California, though at different rates. The annual minimum temperature averaged over the entire state increased 0.33 degree Fahrenheit per decade during the period 1920 to 2003, and the annual maximum temperature increased an average of 0.1 degree Fahrenheit per decade (Moser et al. 2009).

With respect to California's water resources, the most significant impacts of global warming have been changes to the water cycle and sea level rise. Over the past century, the precipitation mix between snow and rain has shifted in favor of more rainfall and less snow (Mote et al. 2005; Knowles and Cayan 2006), and the snowpack in the Sierra Nevada range is melting earlier in the spring (Kapnick and Hall 2009). The average early-spring snowpack in the Sierra Nevada has decreased by about 10% during the last century — a loss of 1.5 million acre-feet of snowpack storage (DWR 2008). These changes have significant implications for water supply, flooding, aquatic ecosystems, forest health, and recreation, both throughout the state and within Yosemite National Park (NPS 2009H; Lutz et al. 2009; Saunders et al. 2009).

Individual projects contribute to the cumulative effects of climate change by emitting GHGs during the demolition, construction, and operational phases. The primary GHGs associated with land use and development projects are CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O.

### ***Statewide Greenhouse Gas Emissions***

The California Air Resources Board estimated that in 2008 California produced about 478 million gross metric tons (about 525 million U.S. tons) of CO<sub>2</sub>e. The Air Resources Board found that transportation is the source of 37% of the state's GHG emissions, followed by electricity generation (both in-state and out-of-state) at 24% and industrial sources at 19%. Commercial and residential fuel use (primarily for heating) accounted for 9% of GHG emissions (CARB 2011c).

### ***Parkwide Greenhouse Gas Emissions***

**National Park Service Climate Friendly Parks Program.** Yosemite National Park is a participant in the NPS's Climate Friendly Parks Program. Funded through an interagency agreement between the EPA and the NPS, this program assists national parks in the development of short- and long-term comprehensive strategies for reducing their GHG and criteria air pollutant emissions. The program also includes a public awareness and education component.

**National Park Service Pacific West Region Directive PW-047, October 31, 2006.** This directive provides policies pertaining to renewable energy generated on-site. Specifically, it encourages conversion to renewable sources of energy, and allows for the purchase of green power (including wind, solar, biomass, and geothermal) when on-site renewable energy systems are not feasible. Alternatively, this directive also permits the purchase of green power tags, which are renewable energy certificates from a source that does not directly connect to the local utility that supplies park facilities.

**Yosemite National Park Action Plan, November 2006.** In 2006, Yosemite National Park published its first comprehensive climate action plan. The plan outlines a framework for actions the park will take to further the mission of the Climate Friendly Parks Program. Emission reduction measures identified in the plan include utilizing alternative energy sources, increasing lighting efficiency, promoting and engaging in energy-efficient building design, and optimizing energy use, among others (NPS 2006C). As part of this effort, the park committed to conducting GHG emissions inventories, monitoring progress toward emissions reductions, and to continuing to explore additional emission-reducing actions and incorporating them into subsequent climate action plans.

**NPS Green Parks Plan (GPP).** The GPP, adopted in April 2012, defines a vision and long-term strategic plan for sustainable management of NPS operations. Goals of the GPP related to GHGs include the following:

1. The NPS will reduce Scope 1 and Scope 2 GHG emissions by 35 percent by 2020 from the 2008 baseline. (Scope 1 and Scope 2 emissions are associated with on-site fossil fuel combustion and electricity consumption from the grid, respectively.)
2. The NPS will reduce Scope 3 GHG emissions by 10 percent by 2020 from the 2008 baseline. (Scope 3 emission sources such as commuter travel and off-site wastewater treatment are indirect in nature.)
3. The NPS will develop and implement guidance on adapting the location, structure, or function of park facilities in anticipation of climate change, including severe weather impacts.

**Secretarial Order 3285: Renewable Energy Development by the Department of the Interior.** This Order establishes the development of renewable energy as a priority for the Department of the Interior and establishes a Departmental Task Force on Energy and Climate Change. This Order also amends and clarifies Departmental roles and responsibilities to accomplish this goal.

**Secretarial Order 3289: Addressing the Impacts of Climate Change on America's Water, Land and Other Natural and Cultural Resources.** This Order establishes a department-wide approach for applying scientific tools to increase understanding of climate change and to coordinate an effective

response to its impacts on tribes and on the land, water, ocean, fish and wildlife, and cultural heritage resources that the Department of the Interior manages.

**A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park.** The latest community-wide GHG inventory, depicted in **table 9-155**, presents life-cycle GHG emissions for years 2008 through 2011 and includes Scope 1, 2, and 3 emissions. The largest contribution of GHG emissions comes from the miles traveled by visitors within the park, accounting for an average of 40 percent of the inventory; followed by food consumption at 30 percent; energy (electricity and stationary fuels) at 17 percent; NPS and DNC car usage at 8 percent; waste at 3 percent; waste water at 1.6 percent; and cement at about 0.4 percent. Although fire contributes to total park emissions, wildfires would still occur even in the absence of fire management, resulting in the same level of emissions. Therefore, GHG emissions due to fire are omitted from the estimates shown here (Villalba *et al* 2012a).

**TABLE 9-155: PARK-WIDE GHG EMISSIONS FOR YEARS 2008-2011**

Scope	Source <sup>a</sup>		Year 2008	Year 2009	Year 2010	Year 2011
Scope 1 and 2 In-boundary Emissions (metric tons/yr)	Electricity		8,223	8,207	7,836	7,537
	Transportation Fuels	YNP-PTW	3,798	3,884	3,884	4,032
	Stationary Fuels	Propane	3,400	3,629	3,622	3,748
		Diesel	7,774	8,168	8,276	8,789
	Wastewater		2,114	1,970	1,805	2,036
Scope 3 Upstream and Downstream Emissions to Supplement In- boundary emissions (metric tons/yr)	Electricity		258	238	272	275
	Transportation Fuels	YNP-PTW	903	922	919	944
		Visitors (bus) WTW	949	790	953	924
		Visitors (non- bus rec) WTW	44,136	48,483	50,185	50,718
		Commuting- cars WTW	5,106	5,106	5,106	5,106
		Commuting- buses WTW	228	258	157	151
	Stationary Fuels	Propane	530	565	564	584
		Diesel	1,943	2,042	2,069	2,197
	Solid Waste	Landfill	7,877	8,300	6,775	3,405
		Compost	--	--	200	474
	Cement		275	275	275	275
	Food		38,020	38,324	38,327	38,795
	Scope 1 and 2 Total			25,309	25,858	25,424
Scope 3 Total			100,224	105,303	105,847	103,848
TOTAL (metric tons/yr)			125,533	131,161	131,271	129,990
Visitors			3,431,514	3,737,472	3,901,408	3,951,393
TOTAL GHG per visitor (kg CO <sub>2</sub> e/visitor)			36.58	35.09	33.65	32.90
<sup>a</sup> Notes: YNP = Yosemite National Park; WTP = Well-to-Pump emissions; PTW = Pump-to-Wheel emissions; WTW = Well-to-Wheel emissions or life cycle emissions, which is also the sum of WTP and PTW SOURCE: Villalba <i>et al</i> 2012a.						

A summary of 2008 through 2011 energy consumption within Yosemite Valley is shown in **table 9-156**.

**TABLE 9-156: ENERGY CONSUMPTION TOTALS USED IN THE GHG EMISSIONS INVENTORY 2008-2011**

Source		Total Consumption			
		Year 2008	Year 2009	Year 2010	Year 2011
Electricity (Gigawatt -hours)		23.63	22.00	23.19	22.62
Transportation Fuels	YNP (gallons)	462,500	486,913	471,259	512,985
Stationary Fuels	Propane (gallons)	583,818	623,123	622,049	643,625
	Diesel (gallons)	761,206	799,838	810,438	643,625
SOURCE: Villalba et al 2012b					

As is evident from the table, stationary sources (e.g., lighting, heating) within Yosemite Valley consume electricity, fuel oil and propane. NPS and Delaware North Companies Parks and Resorts at Yosemite (DNC) mobile sources (e.g., motor vehicles) consume gasoline and diesel fuel, and the majority of visitor vehicles operate on gasoline. It should be noted that energy consumption in Yosemite Valley varies from year to year. Measures taken by the park and the park concessioner to reduce energy consumption and GHG emissions include: (1) purchase of 18 hybrid electric-diesel shuttle buses that provide free transit to 2.5 million park visitors within the Valley annually (NPS 2005c), (2) installation of high-efficiency heating and cooling systems in employee housing (NPS 2007g), use of reclaimed water for irrigation (NPS 2008g), and installation at the El Portal Administrative Site of the largest solar energy system in the national park system (NPS 2011q), among other actions.

### ***Environmental Consequences Methodology***

Changes in energy consumption in the Merced River corridor are qualitatively evaluated by assessing changes in housing, park and concessioner facilities, camping, and vehicle fuel use. The climate change analysis evaluates both whether and how each alternative could contribute to climate change. Although there is a broad consensus in the scientific community that human activities are contributing to global warming, there is limited guidance available on how to properly analyze the impact of local development projects with respect to climate change. This is particularly true where the project is unlikely to result in large changes in local or regional emissions. This evaluation considers changes in the amount of energy consumed and related levels of direct and indirect GHG emissions, the alteration of land uses that sequester GHGs, and changes in land uses.

- **Context.** Any change in energy consumption and GHG emissions in the Merced River corridor would be negligible at a statewide and global scale. However, the contribution of each alternative will be evaluated.
- **Intensity.** The intensity of the impact considers whether the impact would be negligible, minor, moderate, or major. Negligible impacts would not be detectable and would have no discernible effect on the amount of energy consumed or the amount of GHG emissions (assumed to be 1% or less of threshold) generated. Minor impacts would be slightly detectable but would not be expected to have an overall effect on those conditions. For GHG emissions, minor impacts are assumed to occur up to 50% of the applicable threshold. Moderate impacts

would be clearly detectable and could have an appreciable effect on energy use or GHG emissions (assumed to occur at emission levels greater than 50% but less than the applicable threshold). Major impacts would have a substantial, highly noticeable influence on and could permanently alter those conditions. For GHG emissions, major impacts are assumed to occur when emissions exceed the applicable threshold.

For this analysis, the EPA Mandatory Reporting Rule level of 25,000 metric tons of CO<sub>2</sub>e per year is used to identify a major source of GHGs.

- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term. A short-term impact would be temporary in duration and would be associated with transitional types of activities. A long-term impact would have a long-lasting or permanent effect on energy use, emissions, or land use.
- **Type of Impact.** Impacts are evaluated for whether they would be beneficial or adverse in terms of energy consumption and climate change. Beneficial impacts would reduce energy consumption, reduce emissions, or change land uses to those that would reduce emissions. Adverse impacts would increase energy consumption, increase emissions, or change land uses to those that would make it more difficult to reduce emissions.

### *Environmental Consequences of Alternative 1 (No Action)*

#### **Impacts Common to Segments 1–8**

Alternative 1 (No Action) assumes a continuation of existing regulations and management practices that govern energy consumption and climate change into the foreseeable future. No new structures would be constructed in the Merced River corridor, except for minor structures that are small temporary, easily removed, and not habitable; designed to support existing uses, systems, and programs; located within the existing building footprint; and not created solely for commercial purposes. Temporary housing for employees displaced by the 2008 rockfall would continue as needed at Huff House, Lost Arrow, Yosemite Lodge, Ahwahnee concessioner employee housing area, Boys Town, and El Portal Trailer Village, and for NatureBridge students at Curry Village. Housing for NPS employees and park partner staff would remain at current levels and locations.

Recent efforts by the park and primary park concessioner to reduce overall energy consumption and GHG emissions include purchasing 18 hybrid electric-diesel shuttle buses; replacing existing park vehicles with alternative-fuel and hybrid vehicles; implementing additional recycling and composting measures; using reclaimed water for irrigation; as well as installing energy-efficient appliances and lighting and passive heating and cooling systems in employee housing, solar panels on park housing units, and the largest solar energy system in the national park system (at the El Portal Administrative Site).

#### **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

Under Alternative 1 (No Action), energy use and emissions in the areas of Segments 1, 5, 6, and 8 would remain similar to those under Alternative 1. No new buildings or facilities would be constructed as part of Alternative 1, so no substantial new sources of energy consumption or emissions would be

introduced. Although park visitation would be expected to increase at a rate of approximately 3% annually, Segments 1, 5, 6, and 8 do not have transportation facilities and are relatively inaccessible, so visitor use in these areas would not likely increase at the same rate as the more developed areas of the park. Alternative 1 would therefore result in a long-term, negligible, and adverse impact with respect to energy and GHG conditions along Segments 1, 5, 6, and 8.

**Segments 1, 5, 6, & 8 Impact Summary.** Implementation of Alternative 1 would result in segmentwide, long-term, negligible, and adverse impacts with respect to energy and GHG conditions along Segments 1, 5, 6, and 8.

### **Segments 2, 3, 4, and 7: Yosemite Valley, Merced River Gorge, El Portal, and Wawona (Nonwilderness)**

Under Alternative 1, it is expected that visitation levels would increase primarily during the current nonpeak periods (i.e., the months on either side of the peak summer months and on weekdays during peak summer months). If this were to occur, then traffic congestion and associated GHG emissions during nonpeak periods could approximate current peak-period levels. Visitation could also increase during peak periods and, to the degree that such increases were to happen, traffic congestion and GHG emissions would marginally worsen. Mobile emissions sources would continue to include automobiles, trucks, and buses and would remain subject to state and federal emissions control standards and programs (including statewide Pavley and Low Carbon Fuel Standards), which are expected to lead to a decrease in GHG emissions in the foreseeable future. Because mobile sources from visitors are the primary source of non-fire related GHGs at the park (according to the latest inventory), and visitation is projected to increase over time, GHG emissions would be expected to increase in the future although at a reduced rate because of regulations governing mobile-source GHGs. Thus, increased traffic and traffic congestion under Alternative 1 would result in a long-term, minor, adverse impact with respect to energy consumption and GHG emissions.

Emissions sources would continue to include energy consumption at existing NPS and concessioner facilities in the Merced River corridor, regular maintenance activities, and campfires. Most of these sources would continue in the same manner and extent as under existing conditions, though some could decrease as a result of sustainability measures and others would increase in relative proportion to visitor-use levels. Daily, routine, and intermittent operational maintenance intended to stabilize and protect park facilities, address visitor health and safety issues, and protect natural and cultural resources would continue as under existing conditions. This includes campground maintenance, road and trail maintenance, building and grounds maintenance, and utility system repair and maintenance throughout Segments 1–8. However, alternative-fuel or hybrid park vehicles would reduce GHG emissions associated with these activities. In addition, energy-efficiency upgrades and green building designs that have been and are currently being implemented by the NPS would continue to reduce energy consumption and associated GHG emissions under Alternative 1. Campfire usage could increase in proportion to the increased visitation, especially during nonpeak periods. Thus, GHG emissions would be expected to increase in the future in rough proportion to the increased usage of campfires under Alternative 1. Overall for these sources, the continuation of NPS climate action plan strategies under Alternative 1 would result in a long-term, moderate, beneficial impact with respect to energy consumption and GHG emissions.

**Segments 1, 5, 6, & 8 Impact Summary.** Implementation of Alternative 1 would result in long-term, moderate beneficial impacts associated with the continuation of NPS climate-action-plan sustainability strategies for Segments 2, 3, 4, and 7; however, because mobile sources generate the vast majority of all GHGs in the park, and visitation is projected to increase, Alternative 1 would result in an overall long-term, minor, adverse impact related to energy and GHGs.

### **Cumulative Impacts for Alternative 1 (No Action)**

The discussion of cumulative impacts related to energy consumption and climate change is based on analysis of past, present, and reasonably foreseeable future actions in the Merced River corridor, in combination with the potential effects of Alternative 1. Past actions have generally resulted in the construction of new facilities to accommodate additional visitors and employees.

#### ***Past Actions***

Past actions have had both adverse and beneficial impacts related to energy and climate change. Temporary constructions activities associated with the majority of past projects listed in Appendix B had short-term adverse effects on energy and climate change (i.e., from fuel usage and GHG emissions related to equipment and motor vehicle exhaust). However, most of these projects have had either no net adverse effects or beneficial effects on current or future energy and climate change conditions. The following past projects had long-term, minor, beneficial impacts on energy and climate change conditions, which would continue under Alternatives 2–6.

The **Yosemite Area Regional Transportation System (YARTS)** was established in 2000 to provide an alternative to private vehicles accessing the park. YARTS was intended to expand the range of travel options for visitors to Yosemite Valley and to other primary park destinations, and for employees commuting to work in the park. It also provides a means for visitors to travel to Yosemite Valley when restricted-access measures are implemented for private vehicles during times of severe congestion. YARTS has had a long-term, beneficial effect by reducing the number of day visitors arriving in private vehicles.

**Housing Projects** (i.e., Curry Village Employee Housing, Curry Village Huff House Temporary Housing, Yosemite Valley Lost Arrow Temporary Employee Housing, and Yosemite Valley Ahwahnee Temporary Employee Housing) involved the construction of housing and related facilities to accommodate concessioner employees. The housing units replaced concessioner housing lost in the January 1997 flood and the rockfall events at Curry Village in October 2008 and were developed in consultation with litigants as part of a settlement agreement concerning the *Merced Wild and Scenic River Comprehensive Management Plan*. These actions provided temporary lodging for concessioner employees, and were needed to help meet immediate short-term housing needs for the park concessioner until permanent employee housing became available. Construction was completed from 2007 to 2009.

**Yosemite Valley Shuttle Bus Stop Improvements** consisted of the preparation of preliminary design plans, environmental compliance documents, and construction drawings; the construction of six 10-foot by 80-foot concrete braking pads; the rehabilitation or replacement of 94,000 square feet of asphalt road approaches; and the construction of bus stop shelters. Construction was completed in 2010. These improvements support shuttle bus service in Yosemite Valley, resulting in a segmentwide, long-term, minor, beneficial impact.

**Hybrid Electric-Diesel Shuttle Bus Procurement** consisted of the purchase of diesel hybrid transit buses by the NPS. Hybrid bus operations result in long-term benefits to fuel usage and GHG emissions in comparison to diesel-only buses.

The **replacement of existing park service vehicles** with alternative fueled or hybrid vehicles has also reduced GHGs.

Installation of the **solar array and rehabilitation of existing facilities** has resulted in sustainable energy generation and reduced energy consumption.

**Habitat Restoration Projects** (i.e., Cook's Meadow Ecological Restoration, DNC Yosemite Valley Ecological Restoration, Fern Springs Restoration, Happy Isles Fen Habitat Restoration, Merced River Ecological Restoration at Eagle Creek, and Red Peak Pass Trail Rehabilitation) included revegetation of affected areas, which resulted in long-term, beneficial effects resulting from CO<sub>2</sub> sequestration.

### ***Present Actions***

Present projects that could have a corridorwide, long-term, beneficial, cumulative effect on energy and climate change include:

- *2004 Fire Management Plan/EIS*
- The following projects, which would individually, and in combination, encourage travel to the park by alternative (nonprivate vehicle) modes, and would manage traffic and parking to reduce congestion and associated fuel usage and GHG emissions:
  - Increased YARTS services
  - Changeable electronic signs in Mariposa, Midpines, and El Portal, alerting drivers to traffic conditions in Yosemite Valley
  - Computer-Aided Dispatch / Automatic Vehicle Locator
  - Software design and purchase to process raw data from vehicle counters to produce useful information for visitors on parking and traffic conditions

Restricted access measures will continue to control the volume of incoming vehicles when traffic and parking conditions in Yosemite Valley are over congested. The YARTS will continue to reduce the number of individual vehicles operated within the park.

Present projects listed immediately below could have a short-term, adverse effect from construction but a long-term, beneficial, cumulative effect on energy and climate change.

- The following transportation projects, could increase atmospheric carbon sequestration within affected areas:
  - Fuels Reductions/Forest Rehabilitation
  - General Ecological Restoration
  - *Vegetation Management Plan*

- The following transportation projects could improve transportation circulation and thereby reduce fuel usage and GHG emissions:
  - South Park Intelligent Transportation System: electronic signs and groundhog automatic vehicle counters at entrance stations and parking lots to know when parking lots are full
  - Parking alternative option at the El Portal Maintenance Facility
  - Parkwide Communication Data Network infrastructure upgrade
- The following energy-related projects could improve facility efficiency and sustainability:
  - *Ahwahnee Comprehensive Rehabilitation Plan*
  - Crane Flat Utilities
  - *East Yosemite Valley Utilities Improvement Plan/EA*

Present projects that could have a short-term adverse effect on energy and climate change include all projects not mentioned above that include some temporary construction activities. There would be no net long-term, adverse or beneficial impacts on energy and climate change from these projects.

#### ***Reasonably Foreseeable Future Actions***

Similar to past actions, reasonably foreseeable future actions would result in both adverse and beneficial energy and climate change impacts. Reasonably foreseeable future projects that could have a long-term, beneficial, cumulative impact related to energy and climate change include the Transit Passenger Information System.

Other beneficial impacts for reasonably foreseeable future actions are similar to those discussed for past and present actions (i.e., the restricted access measures and increased YARTS services). Reducing traffic congestion and encouraging travel to the park by alternative (nonprivate vehicle) modes would have segmentwide, long-term, beneficial impacts on energy and climate change.

Reasonably foreseeable future actions that could have a short-term adverse effect on energy and climate change include all projects that would involve some temporary construction activities. There would be no net long-term, adverse or beneficial impacts on energy and climate change from these projects.

#### ***Overall Cumulative Impact***

Because Alternative 1 would not involve substantial construction projects, it would not be expected to contribute to construction-related GHG impacts. Continued management of traffic, encouragement of alternative forms of transportation, and energy conservation measures would have long-term, beneficial energy and GHG impacts.

There would be long-term, beneficial impacts associated with the continuation of NPS climate-action-plan sustainability strategies. However, because mobile sources generate the substantial majority of all GHGs in the park, and visitation is projected to increase, Alternative 1 would result in an overall long-term, minor, adverse energy and GHG impact.

## ***Environmental Consequences of Actions Common to Alternatives 2–6***

### **Impacts Common to Segments 1–8**

Changes to energy consumption in the Merced River corridor are qualitatively evaluated by assessing changes in housing, park and concessioner facilities, camping, and vehicle fuel usage. The climate change analysis evaluates both whether and how each alternative might contribute to climate change, which could include GHGs generated by short-term construction (i.e., equipment and on-road vehicle exhaust) and long-term operations (i.e., on-road vehicle exhaust, natural gas combustion, campfires, vegetation [sequestration] removal or restoration, and indirect sources from electricity generation).

### ***Impacts of Actions to Protect and Enhance River Values***

In general, the impacts of actions to protect and enhance river values would be associated with short-term construction activities, such as demolition, removal of trees, infrastructure, roads, habitat restoration, or trail development, which would require fuel consumption and would result in temporary emissions of GHGs. Overall construction activities associated with actions to protect and enhance river values would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap. Over the long-term, tree removal would reduce sequestration, whereas habitat restoration would increase sequestration. However, sequestration changes would be negligible overall.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur across all segments under Alternatives 2-6 include removing 3,400 feet of riprap from the river bank and revegetating with riparian species, and replacing an additional 2,300 feet of riprap with bioengineered riverbank stabilization devices. This work would require the use of heavy equipment, including loaders and dump trucks. The removal, transport, disposal, restoration, and monitoring work associated with these actions would require several weeks of park staff time to implement, but would not substantially disrupt other ongoing construction, demolition, and restoration activities in the Valley and beyond. As a result, these actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

In general, the Impacts of Actions to Manage User Capacity, Land Use, and Facilities stem from short-term construction activities requiring fuel consumption and therefore temporary emissions of GHGs. Overall construction activities associated with actions to manage visitor use and facilities would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

Long-term impacts of these actions would primarily be associated with on-road vehicles (visitors and employees) and area pollution sources. Mobile sources would include automobiles, trucks, and buses and would remain subject to regulations governing mobile source GHG controls (including statewide Pavley and Low Carbon Fuel Standards), which are expected to lead to a continuing decrease in emissions per VMT for the foreseeable future. Since visitor on-road vehicular sources are the primary

generator of GHG emissions in the park, the increase or decrease in visitor capacity and VMT would have the greatest impact on total GHGs.

GHG emissions sources would continue to include energy consumption at NPS and concessioner facilities located in the Merced River corridor, regular maintenance activities, and campfires. Actions that would reduce housing, campsites, or lodging would result in a proportional reduction in area source emissions, including emissions from maintenance/landscaping, natural gas combustion for heating/cooling, and campfires. Daily, routine, and intermittent operational maintenance would continue, including campground maintenance, road and trail maintenance, buildings and grounds maintenance, and utility system repair and maintenance throughout the park. However, alternative fuel or hybrid park vehicles would reduce the GHG emissions associated with these activities. In addition, energy-efficient upgrades and green building designs that have been and are currently being implemented by the NPS would continue to reduce energy consumption and associated GHG emissions under Alternatives 2–6. Overall for these sources, the continuation of NPS climate action plan strategies would result in a long-term, moderate, beneficial energy and GHG impact.

Impacts of specific projects are described below for each river segment where appropriate.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Actions to protect and enhance river values that would occur in Yosemite Valley under Alternatives 2–6 involve removal of abandoned infrastructure and other development affecting the Merced River’s hydrologic function, extensive meadow restoration, and management of high visitor-use areas to address associated impacts on riparian habitats and sensitive cultural resources. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, removal, transport, disposal, restoration, and monitoring work associated with these actions would require more than one year of crew and equipment time. As a result, these actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

**Biological Resource Actions.** Specific projects to protect and enhance the river’s biological values that would occur within Segment 2 under Alternatives 2–6 include: restoring 4.5 acres of riparian habitat in the area of Yosemite Lodge and 20 acres in the area of the Former Upper Pines Loop Campground; restoring impacted areas of Ahwahnee Meadow, including through removal of tennis courts; improving access and removing infrastructure from riparian areas at Cathedral Beach, Housekeeping Camp, and Bridalveil; constructing a boardwalk extension to reduce Sentinel Meadow trampling; removing one and formalizing five other traffic pullouts along El Portal Road; and fencing and vegetation management at Stoneman Meadow, restoring floodplain habitat at Devil’s Elbow, and filling ditches not serving current operational needs. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, removal, transport, disposal, restoration, and monitoring work associated with these actions would require more than one year of park staff time to implement. As a result, these actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternatives 2-6 include: placing constructed logjams in the channel between Clarks and Sentinel Bridges; and removing the abandoned gauging station at Pohono Bridge, removing the footings and former river gauge base at Happy Isles, and restoring these areas to natural conditions. This work would involve the use of heavy equipment, including excavators, a skid steer, and dump trucks, and require approximately more than 17 weeks of crew and equipment time to implement. As a result, these actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

**Cultural Resource Actions.** Specific projects to protect and enhance the river's cultural values that would occur within Segment 2 under Alternatives 2-6 include rehabilitation of informal trails and parking in the vicinity rock art and rock shelters in the area of Bridalveil Falls, fencing and/or restricting access to the archeologically significant large bedrock mortar (pounding rock) next to Yosemite Falls Trail, restoration of impacted portions of Ahwahnee Meadow, and removal of abandoned infrastructure from the Bridalveil sewer plant to enhance oak recruitment. With the exception of abandoned infrastructure removal, the majority of this work would be completed through the use of hand tools and require a nominal commitment of staff time. As such, the impact on GHG emissions and energy consumption would be short-term, negligible, and adverse.

**Scenic Resource Actions.** Specific projects to protect and enhance the river's scenic values that would occur within Segment 2 under Alternatives 2-6 include: selectively thinning conifers and other vegetation in the vicinities of The Ahwahnee and Meadow, Bridalveil Falls and West Valley, Cooks and Sentinel Meadows, Curry Village, El Capitan, Housekeeping Camp, Yosemite Lodge, and other areas of the Valley; restoring grassland and oak habitat in the areas of Bridalveil Straight; repairing riverbank erosion at Clark's Bridge; and addressing informal trails and trampling at the east end of El Capitan Meadow. Much of this work would be accomplished through the use of hand tools, but could also involve heavy equipment for various handling, transport, and restoration activities. This work would occur over the course of several years. As a result, these actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Actions to manage visitor use and facilities within Segment 2 that would occur under Alternatives 2-6 involve substantial changes to campsites, visitor and administrative facilities, employee housing, and transportation. The construction, demolition, transport, and disposal activities associated with this work would contribute to a short-term, regional and local, moderate, adverse impact on air quality, even after implementation of Mitigation Measure AQ-MM-2 (see Appendix C). As such, the impact on GHG emissions and energy consumption would be short-term, minor, and adverse, as vehicle traffic and visitation would be reduced as a result.

**Curry Village and Campgrounds.** The park would remove the Happy Isles Snack Stand at Curry Village. At The Ahwahnee, the park would remove the swimming pool and tennis courts; redesign, formalize, and improve drainage within the existing parking lot; and construct a new 50 parking space lot east of the current parking area. This work would require the use of heavy equipment, including excavators and skid steers. As such, the impact on GHG emissions and energy consumption would be short-term, negligible, and adverse.

**Camp 6 and Yosemite Village.** The park would remove from Yosemite Village the Concessioner General Office, Concessioner Garage, and the Arts and Activities Center (Bank Building), and repurpose the Village Sports Shop for public use. It would also construct a new maintenance building near the Government Utility Building. This work would require the use of heavy equipment, including excavators and skid steers. As such, the impact on GHG emissions and energy consumption would be short-term, negligible to minor, and adverse.

**West Yosemite Valley.** The park would remove the NPS Volunteer Office, post office, swimming pool, and snack stand. It would also remove old and temporary employee housing (Thousands Cabins and Highland Court) and replace it with new housing. This work would require the use of heavy equipment, including excavators and skid steers. As such, the impact on GHG emissions and energy consumption would be short-term, negligible to minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segment 2. Actions to manage user capacities, land use, and facilities would have short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segment 2. However, these actions would not be expected to have a long-term impact.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### *Impacts of Actions to Protect and Enhance River Values*

To protect and enhance river values within the Merced River gorge and El Portal, the park would remove informal trails, nonessential roads, fill materials, and abandoned infrastructure throughout Segments 3 and 4. The demolition, removal, transport, and disposal of waste materials; and restoration of these areas would have a short-term, negligible to minor, and adverse impact on GHG emissions and energy consumption.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 4 under Alternatives 2-6 include removing development, asphalt and imported fill from the Abbieville and Trailer Village areas. The project would require the use of a skid steer and dump truck, and take several weeks to complete. Accordingly, the impact on GHG emissions and energy consumption would be short-term, negligible, and adverse.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic resource values include restoring the Greenemeyer Sand Pit to natural conditions. The work would require the use of heavy equipment over a period of several weeks. Accordingly, the impact on GHG and energy consumption would be short-term, negligible, and adverse.

**Scenic Resource Actions.** Specific projects to protect and enhance the river's scenic values that would occur within Segment 3 under Alternatives 2-6 include: selectively thinning conifers in the area of the Cascade Falls viewpoint. Much of this work would be accomplished through the use of hand tools, but could also involve heavy equipment for various handling, transport, and restoration activities. This

work would occur over the course of a few days. Accordingly, the impact on GHG emissions and energy consumption would be short-term, negligible, and adverse.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Under each alternative, the park would construct infill housing in El Portal Village Center. The park would also construct a restroom for visitor use in Old El Portal. The work would require the use of heavy equipment throughout the construction process. As such, the projects would have a short-term, negligible to minor, adverse impact on GHG emissions and energy consumption. Over the long-term, occupation of the new residential units would contribute to a negligible, adverse impact.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segments 3 & 4. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have short-term and long-term, negligible to minor, adverse impacts on energy and GHG conditions within Segments 3 & 4.

#### **Segments 6 and 7: Wawona and Wawona Impoundment**

##### ***Impacts of Actions to Protect and Enhance River Values***

The park would improve Wawona Campground wastewater and refuse management and facilities, remove abandoned infrastructure, and undertake numerous site-specific management measures to counteract or minimize ongoing impacts on cultural resources. These actions would have a short-term, negligible, adverse impact on GHG emissions and energy consumption.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic values that would occur within Segment 7 under Alternatives 2-6 include developing a waste water collection system, including the construction of a pump station above the Wawona Campground. This work would require the use of heavy equipment, including an excavator, skid steer, loader, and dump truck. This effort would require approximately one month of crew time to complete. Accordingly, the impact on GHG emissions and energy consumption would be short-term, negligible, and adverse.

**Cultural Resource Actions.** Specific projects to protect and enhance the river's cultural values that would occur within Segment 7 under Alternatives 2-6 include removing and relocating campsites that cause potential impacts to sensitive archeological resources. This work could require the use of heavy equipment, including an excavator, skid steer, loader, and dump truck. This effort would require approximately one week to complete. Accordingly, the impact on GHG emissions and energy consumption would be short-term, negligible, and adverse. Over the long-term, reduced campsites would result in reduced campfires, which would be a negligible, beneficial impact.

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

To improve operational efficiency, the park would construct new facilities to house maintenance operations and a new wildland fire station within Segment 7. The park would also remove staged

materials, abandoned utilities, vehicles, and a parking lot from the riparian buffer at the Wawona Maintenance Yard and restore the area's native ecosystem, and remove roadside parking between the Wawona Store and Chilnualna Falls Road. The construction and restoration activities associated with these projects would involve the use of heavy equipment and occur over a period of several months. The resulting impact on Segment 7 GHG emissions and energy consumption would be short-term, negligible to minor, and adverse.

**Wawona.** The park would redesign the bus stop at the Wawona Store to accommodate increased visitor use. This project would be carried out primarily through the use of hand and small power tools. The resulting energy and GHG impact would be short-term, negligible, and adverse.

**Segment 7 Impact Summary:** With implementation of mitigation measure MM-AIR-2 (see Appendix C), as applicable, actions to protect and enhance river values would result in local, short-term, negligible, adverse impacts on energy and GHG conditions within Segment 7. Actions to manage user capacities, land use, and facilities would have short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segment 7. However, these actions would not be expected to have a long-term impact.

### **Summary of Impacts Common to Alternatives 2–6**

Alternatives 2–6 would result in energy consumption and GHG emissions associated with short-term construction and long-term operational activities. Overall, more energy consumption and greater emissions of GHGs would occur in nonwilderness portions of the Merced River corridor to a much greater extent than wilderness portions. Stationary sources would continue to be regulated under the applicable air district rules and regulations, some area sources would continue to be subject to park regulations, and mobile sources would continue to be subject to state and federal emissions standards.

### ***Environmental Consequences of Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 2 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to protect and enhance river values would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Impacts associated with implementation of Alternative 2 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to manage visitor use and facilities would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

With regard to long-term impacts associated with visitor capacity under Alternative 2, on-road mobile emissions were quantified using the California Air Resources Board's emission's factors model (EMFAC2007) and compared with the Federal Mandatory Reporting Rule threshold of 25,000 metric tons of CO<sub>2</sub>e per year. Although bus operations are projected to increase under Alternative 2, the reduction in total daily visitor and administrative use and capacity would result in a long-term, minor, beneficial impact owing to reduced on-road vehicles in the park, as depicted in the **table 9-157** below.

**TABLE 9-157: ON-ROAD VEHICLE GHG EMISSIONS (METRIC TONS/YEAR)<sup>a</sup>**

Scenario	CO <sub>2</sub> e
Alternative 2 Emissions	38,278
Alternative 1 (No Action) Emissions	49,619
Incremental Change <sup>b</sup>	(11,341)
Federal Mandatory Reporting Rule Threshold	25,000
Impact Intensity, Type? <sup>c</sup>	Minor, Beneficial
<sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in the Alternatives chapter were totaled for each alternative to determine the regional GHG emissions. Specific assumptions and emission factors incorporated into the calculations are included in Appendix G. <sup>b</sup> Values in (parentheses) are net reductions with respect to Alternative 1 (No Action) emissions. <sup>c</sup> Negligible impacts would not be detectable and would have no discernible effect on GHG emissions (assumed to be 1% or less of threshold). Minor impacts would be those that are present but not expected to have an overall effect on those conditions (assumed to occur up to 50% of applicable threshold). Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on GHG emissions (assumed to occur when emissions exceed applicable threshold).	

### **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

#### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

Under Alternative 2, long-term energy use and emissions in the areas of Segments 1, 5, 6, and 8 would remain similar to those under Alternative 1 (No Action). No new buildings and facilities would be constructed within Segments 1, 5, 6, and 8 as part of Alternative 2, so no substantial new sources of energy consumption or emissions would be introduced. Overnight visitation and total daily use levels would be 26% and 33% less, respectively, than under Alternative 1. With fewer on-road vehicles in the vicinity under Alternative 2, the overall effect on energy consumption and GHGs along Segments 1, 5, 6, and 8 would be long-term, minor, and beneficial.

**Merced Lake High Sierra Camp.** The park would close the Merced Lake High Sierra Camp and remove all associated infrastructure, convert the area to designated Wilderness, and expand dispersed camping at Merced Lake Backpackers Camping Area into the former High Sierra Camp footprint. Closure of the camp would temporarily increase energy consumption and GHG emissions associated

with facilities removal and restoration. The short-term impact would be negligible and adverse. Over the long-term, these actions would reduce the amount of energy (and associated emissions) required to stock, operate, and maintain the facility. The resulting impact would be long-term, negligible to minor, and beneficial.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have long-term, negligible to minor, beneficial impacts on energy and GHG conditions within Segments 1, 5, 6, & 8.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river’s biological values that would occur within Segment 2 under Alternative 2 include: rerouting trails at Ahwahnee Meadows; removing and restoring a portion of Northside Drive (900 feet) and rerouting the bike path; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing development, asphalt, and fill material, and restoring 35.6 acres of floodplain at the former Upper and Lower River campgrounds; removing campsites and infrastructure from the 100-year floodplain and restoring an additional 25.1 acres of floodplain and riparian habitat; and removing informal trails and informal parking at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require approximately 65 weeks of crew and equipment time over a period of three years. These actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river’s hydrologic and geologic values that would occur within Segment 2 under Alternative 2 include: relocating unimproved Camp 6 parking and rerouting a portion of Northside Drive; removing the Stoneman, Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 30 weeks of crew and equipment time. As a result, these actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping, lodging, parking, circulation, employee housing, and service facilities would be similar to those described above for the analysis common to Alternatives 2–6. Reduced housing or lodging would result in a proportional reduction in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion

for heating/cooling) and facility energy usage. Since campsites would be reduced along this segment (estimated at 450 versus 466 for Alternative 1), there would also be a proportional reduction in campfire GHG emissions. With fewer on-road vehicles and potential area sources under Alternative 2, the overall effect on energy consumption and GHGs would be long-term, minor, and beneficial.

**Curry Village and Campground.** The park would construct 78 new hard-sided units in Boys Town, bringing the total number of new and retained units at Curry Village to 433. The park would remove campsites from lower Pines (32), North Pines (86), and Upper Pines (24). Several of these actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting short-term GHG impact would be negligible and adverse.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, and install walkways leading to Yosemite Village. These actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible to minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would convert the Highland Court area to a walk-in campground; reconfigure pedestrian crossing of Northside Drive and Yosemite Lodge Drive, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. These actions would also require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segment 2. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, negligible to minor, beneficial impacts on energy and GHG conditions within Segment 2.

## **Segments 3 and 4: Merced River Gorge and El Portal**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping and employee housing facilities would be similar to those described above for the analysis common to Alternatives 2–6.

With fewer on-road vehicles under Alternative 2, the overall effect on energy consumption and related GHG emissions would be long term, minor, and beneficial. Increased housing would result in a

proportional increase in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling) and in facility energy usage, which would have a long-term, minor, and adverse impact.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segments 3 & 4. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, negligible to minor beneficial impacts on energy and GHG conditions within Segments 3 & 4.

### **Segment 7: Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river’s biological values that would occur within Segment 7 under Alternative 2 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew and equipment time. The resulting impact from construction on GHG emissions and energy consumption would be short-term, negligible, and adverse.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to service facilities would be similar to those described above for the analysis common to Alternatives 2–6.

The removal of the golf course for ecological restoration and the removal of the Wawona stables would have a beneficial effect. Energy consumption and GHGs associated with these facilities (such as maintenance/landscaping and natural gas combustion for heating/cooling) would be reduced, which would result in a long-term, negligible to minor, beneficial impact.

**Wawona Campground.** Under Alternative 2, the park would reduce the size of the Wawona Campground. Thirty-two campsites, or 33% of all campsites within Wawona, would be removed from the floodplain. There would be a proportional reduction in campfire GHG emissions, which would have a long-term, negligible, beneficial impact. This would result in a long-term, negligible, beneficial impact on GHG emissions and energy consumption.

**Segment 7 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible, adverse impacts on energy and GHG conditions within Segment 7. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have short- and long-term, negligible to minor, beneficial impacts on energy and GHG conditions within Segment 7.

## **Summary of Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

Impacts associated with implementation of Alternative 2 would be similar to those described above for the analysis common to Alternatives 2–6. Construction would result in short-term, negligible to minor, adverse impacts. For long-term operations, the overall reduction in accommodations (housing, campsites, and/or lodging) would result in a proportional reduction in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling), in campfire GHG emissions, and in facility energy usage. In addition, reducing the overall visitor capacity and implementation of mitigation measure MM-AIR-2 (see Appendix C) as applicable, Alternative 2 would result in a long-term, minor, beneficial energy and climate change impact.

## **Cumulative Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following cumulative energy and climate change analysis are the same as those identified for Alternative 1.

### ***Overall Cumulative Impact from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration***

Because management actions under Alternative 2 and actions common to Alternatives 2-6 involve substantial construction activity, their associated equipment and on-road vehicle fuel usage and GHG emissions would be expected to result in short-term, negligible to minor adverse energy and climate change impacts. However, with reduced daytime and nighttime visitor capacity, Alternative 2 management actions would also result in a long-term, cumulatively beneficial energy and climate change impact from reduced VMT and facility energy usage. In addition, the continued management of traffic and encouragement of alternative forms of transportation, as well as continuation of NPS climate-action-plan sustainability strategies, would have long-term, beneficial energy and climate change impacts.

## ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 3 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to protect and enhance river values would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Impacts associated with implementation of Alternative 3 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to manage visitor use and facilities would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

With regard to long-term impacts associated with visitor capacity under Alternative 3, on-road mobile emissions were quantified using EMFAC2007 emission factors and compared with the Federal Mandatory Reporting Rule threshold of 25,000 metric tons of CO<sub>2</sub>e per year. Although bus operations are projected to increase under Alternative 3, the reduction in total daily visitor and administrative use and capacity would result in a long-term, minor, beneficial impact owing to reduced on-road vehicles in the park, as depicted in the **table 9-158** below.

**TABLE 9-158: ON-ROAD VEHICLE GHG EMISSIONS (METRIC TONS/YEAR)<sup>a</sup>**

Scenario	CO <sub>2</sub> e
Alternative 3 Emissions	37,286
Alternative 1 (No Action) Emissions	49,619
Incremental Change <sup>b</sup>	(12,333)
Federal Mandatory Reporting Rule Threshold	25,000
Impact Intensity, Type? <sup>c</sup>	Minor, Beneficial
<p><sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in the Alternatives chapter were totaled for each alternative to determine the regional GHG emissions. Specific assumptions and emission factors incorporated into the calculations are included in Appendix G.</p> <p><sup>b</sup> Values in (parentheses) are net reductions with respect to Alternative 1 (No Action) emissions.</p> <p><sup>c</sup> Negligible impacts would not be detectable and would have no discernible effect on GHG emissions (assumed to be 1% or less of threshold). Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on GHG emissions (assumed to occur when emissions exceed applicable threshold).</p>	

**Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment*****Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

Under Alternative 3, long-term energy use and emissions in the areas of Segments 1, 5, 6, and 8 would remain similar to those under Alternative 1 (No Action). No new buildings and facilities would be constructed within Segments 1, 5, 6, and 8 as part of Alternative 3, so no substantial new sources of energy consumption or emissions would be introduced. With fewer on-road vehicles in the vicinity,

the overall effect on energy consumption and GHGs along Segments 1, 5, 6, and 8 would be long term, minor, and beneficial.

**Merced Lake High Sierra Camp.** The park would close the Merced Lake High Sierra Camp and removal all infrastructure, convert the area to designated Wilderness, and use the former camp area for a temporary stock camp. Closure of the camp would temporarily increase energy consumption and GHG emissions associated with facilities removal and restoration. The short-term impact would be negligible and adverse. Over the long-term, these actions would reduce the amount of energy (and associated emissions) required to stock, operate, and maintain the facility. The resulting impact would be long-term, negligible to minor, and beneficial.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have long-term, negligible to minor, beneficial impacts on energy and GHG conditions within Segments 1, 5, 6, & 8.

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 3 include: rerouting trails at Ahwahnee Meadows; removing and restoring a portion of Northside Drive (900 feet) and rerouting the bike path; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing development, asphalt, and fill material, and restoring 35.6 acres of floodplain at the former Upper and Lower River campgrounds; removing campsites and infrastructure from within 150 feet of the river and restoring an additional 12 acres of floodplain and riparian habitat; and removing informal trails and installing signage and fencing to redirect visitor traffic at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require approximately 50 weeks of crew and equipment time over a period of two years. These actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 3 include: relocating unimproved Camp 6 parking; removing the Stoneman, Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 30 weeks of crew and equipment time over a period of two years. These actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping, lodging, parking, circulation, employee housing, and service facilities would be similar to those described above for the analysis common to Alternatives 2–6.

Overnight visitation and total daily use levels would be 23% and 37% less, respectively, than under Alternative 1. Reduced housing or lodging would result in a proportional reduction in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling) in facility energy usage. Since campsites would be increased along this segment (estimated at 477 versus 466 for Alternative 1), there would also be a proportional increase in campfires, which would result in a long-term, negligible, adverse impact for GHG emissions. However, with fewer on-road vehicles and potential area sources under Alternative 3, the overall effect on energy consumption and GHGs would be long term, minor, and beneficial.

**Curry Village and Campground.** The park would retain 355 guest units at Curry Village. The park would remove campsites from lower Pines (15), North Pines (34), and Upper Pines (2). Several of these actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting short-term GHG impact would be negligible and adverse. The reduction in units would decrease energy demand, resulting in a long-term, negligible, beneficial impact.

**Camp 6 and Yosemite Village.** The park would reroute Northside Drive to the south of the Yosemite Village day-use parking area, reconfigure the lot to accommodate a total of 550 parking spaces north of the road, and install walkways leading to Yosemite Village. These actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible to minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would move on-grade pedestrian crossing to west of the Northside Drive and Yosemite Lodge Drive, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for three busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. These actions would also require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segment 2. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would similarly have long-term negligible to minor, beneficial impacts on energy and GHG conditions within Segment 2.

## Segments 3 and 4: Merced River Gorge and El Portal

### *Impacts of Actions to Protect and Enhance River Values*

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Short-term construction activities and impacts associated with changes to camping and employee housing facilities would be similar to those described above for the analysis common to Alternatives 2–6.

With fewer on-road vehicles under Alternative 3, the overall effect on energy consumption and related GHG emissions would be long term, minor, and beneficial.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segments 3 & 4. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have short-term and long-term, negligible to minor, beneficial impacts on energy and GHG conditions within Segments 3 & 4.

## Segment 7: Wawona

### *Impacts of Actions to Protect and Enhance River Values*

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 3 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew and equipment time. The resulting impact from construction on GHG emissions and energy consumption would be short-term, negligible, and adverse.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Short-term construction activities and impacts associated with changes to service facilities would be similar to those described above for the analysis common to Alternatives 2–6. The removal of the golf course for ecological restoration would have a beneficial effect. Energy consumption and GHGs associated with this facility (such as maintenance/landscaping and natural gas combustion for heating/cooling) would be reduced, which would have a long-term, negligible to minor, beneficial impact.

**Wawona Campground.** Under Alternative 3, the park would reduce the size of the Wawona Campground. Twenty seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. There would also be a proportional reduction in campfire GHG emissions. This would result in a long-term, negligible, beneficial impact on GHG emissions and energy consumption.

**Segment 7 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible, adverse impacts on energy and GHG conditions within Segment 7. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have short- and long-term, negligible, beneficial impacts on energy and GHG conditions within Segment 7.

### **Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Impacts associated with implementation of Alternative 3 would be similar to those described above for the analysis common to Alternatives 2–6. Construction would result in short-term, negligible to minor, adverse impacts. For long-term operations, reduced housing and lodging would result in a proportional reduction in area GHG emissions sources, such as maintenance/landscaping, natural gas combustion for heating/cooling, and facility energy usage. In addition, reducing the overall visitor capacity and implementation of mitigation measure MM-AIR-2 (see Appendix C) as applicable, Alternative 3 would result in a long-term, minor to moderate, beneficial energy and climate change impact.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following cumulative energy and climate change analysis are the same as those identified for Alternative 1.

### ***Overall Cumulative Impact from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

Because management actions under Alternative 3 and actions common to Alternatives 2–6 involve substantial construction activity, their associated equipment and on-road vehicle fuel usage and GHG emissions would be expected to result in short-term, negligible to minor adverse energy and climate change impacts. However, with reduced daytime and nighttime visitor capacity, Alternative 3 management actions would also result in a long-term, cumulatively beneficial energy and climate change impact from reduced VMT and facility energy usage. In addition, the continued management of traffic and encouragement of alternative forms of transportation, as well as continuation of NPS climate-action-plan sustainability strategies, would have long-term, beneficial energy and climate change impacts.

### ***Environmental Consequences of Alternative 4: Resource-Based Visitor Experiences and Targeted Riverbank Restoration***

#### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 4 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to protect and

enhance river values would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Impacts associated with implementation of Alternative 4 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to manage visitor use and facilities would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

With regard to long-term impacts associated with visitor capacity under Alternative 4, on-road mobile emissions were quantified using EMFAC2007 emission factors and compared with the Federal Mandatory Reporting Rule threshold of 25,000 metric tons of CO<sub>2</sub>e per year. Although bus operations are projected to increase under Alternative 4, the reduction in total daily visitor and administrative use and capacity would result in a long-term, minor, beneficial impact owing to reduced on-road vehicles in the park, as depicted in the **table 9-159** below.

**TABLE 9-159: ON-ROAD VEHICLE GHG EMISSIONS (METRIC TONS/YEAR)<sup>a</sup>**

Scenario	CO <sub>2</sub> e
Alternative 4 Emissions	43,045
Alternative 1 (No Action) Emissions	49,619
Incremental Change <sup>b</sup>	(6,574)
Federal Mandatory Reporting Rule Threshold	25,000
Impact Intensity, Type? <sup>c</sup>	Minor, Beneficial
<sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in the Alternatives chapter were totaled for each alternative to determine the regional GHG emissions. Specific assumptions and emission factors incorporated into the calculations are included in Appendix G. <sup>b</sup> Values in (parentheses) are net reductions with respect to Alternative 1 (No Action) emissions. <sup>c</sup> Negligible impacts would not be detectable and would have no discernible effect on GHG emissions (assumed to be 1% or less of threshold). Minor impacts would be those that are present but not expected to have an overall effect on those conditions (assumed to occur up to 50% of applicable threshold). Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on GHG emissions (assumed to occur when emissions exceed applicable threshold).	

**Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

Under Alternative 4, long-term energy use and emissions in the areas of Segments 1, 5, 6, and 8 would remain similar to those under Alternative 1 (No Action). No new buildings and facilities would be constructed within these segments as part of Alternative 4, so no substantial new sources of energy consumption or emissions would be introduced. With fewer on-road vehicles in the vicinity under Alternative 4, the overall effect on energy consumption and GHGs along Segments 1, 5, 6, and 8 would be long term, minor, and beneficial.

**Merced Lake High Sierra Camp.** The park would close the Merced Lake High Sierra Camp and removal all infrastructure, convert the area to designated Wilderness, and restoration of the former camp area to natural conditions. Closure of the camp would temporarily increase energy consumption and GHG emissions associated with facilities removal and restoration. The short-term impact would be negligible and adverse. Over the long-term, these actions would reduce the amount of energy (and associated emissions) required to stock, operate, and maintain the facility. The resulting impact would be long-term, negligible to minor, and beneficial.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have long-term, negligible to minor, beneficial impacts on energy and GHG conditions within Segments 1, 5, 6, & 8.

## **Segment 2: Yosemite Valley**

### *Impacts of Actions to Protect and Enhance River Values*

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternative 4 include: removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; removing 1,335 feet of Southside Drive, re-alignment of the road, reconfiguring Curry Orchard parking lot, and extending the Stoneman Meadow boardwalk; removing asphalt and fill material, restoring topography of 19.7 acres of floodplain, and installation of box culverts or other similar design components at the former Upper and Lower River campgrounds; removing campsites and infrastructure from within 150 feet of the river and restoring an additional 12 acres of floodplain and riparian habitat; and erecting fencing, signage, and boardwalks to redirect visitor traffic, and removing informal trails at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require at least 35 weeks of crew and equipment time over a period of at least two years. These actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 4 include: relocating unimproved Camp 6 parking; placing large wood and constructed logjams along the base of Stoneman Bridge; removing the Ahwahnee and Sugar Pine Bridges; and restoring these areas to natural

conditions. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 30 weeks of crew and equipment time over a period of two years. These actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping, lodging, parking, circulation, employee housing, and service facilities would be similar to those described above for the analysis common to Alternatives 2–6.

Overnight visitation and total daily use levels would be 7% greater and 19% less, respectively, than under Alternative 1. Since campsites would be increased along this segment (estimated at 701 versus 466 for Alternative 1), there would also be a proportional increase in campfire GHG emissions, which would be a long-term, negligible to minor, adverse impact. Reduced housing or lodging would result in a proportional reduction in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling) and in facility energy usage. Overall, with fewer on-road vehicles and potential area sources under Alternative 4, the effect on energy consumption and GHGs would be long term, minor, and beneficial.

**Curry Village and Campground.** The park would retain 355 guest units and construct a new 40 site campground at Curry Village. The park would remove campsites from lower Pines (15), North Pines (34), and Upper Pines (2). Several of these actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting short-term GHG impact would be negligible and adverse. The reduction in units would decrease energy demand, resulting in a long-term, negligible, beneficial impact.

**Camp 6 and Yosemite Village.** The park would improve the configuration of and on-grade pedestrian crossing at the Northside Drive-Yosemite Village Drive intersection, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 750 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. These actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible to minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for three busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 150 automobiles and 15 tour busses. These actions would also require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segment 2. However, these actions would not be expected to have a long-term impact. Actions to manage user

capacities, land use, and facilities would similarly have long-term, negligible to minor, beneficial impacts on energy and GHG conditions within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to parking and employee housing facilities would be similar to those described above for the analysis common to Alternatives 2–6.

With fewer on-road vehicles under Alternative 4, the overall effect on energy consumption and related GHG emissions would be long term, minor, and beneficial. Increased housing would result in a proportional increase in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling) and in facility energy usage, which would have a long term, minor, and adverse impact.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segments 3 & 4. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term and long-term, negligible to minor, beneficial impacts on energy and GHG conditions within Segments 3 & 4.

### **Segment 7: Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 4 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew and equipment time. The resulting impact from construction on GHG emissions and energy consumption would be short-term, negligible, and adverse.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Wawona Campground.** Under Alternative 4, the park would reduce the size of the Wawona Campground. Twenty-seven campsites, or 28% of all campsites within Wawona, would be removed from the floodplain. There would be a proportional reduction in campfire GHG emissions. This would result in a long-term, negligible, beneficial impact on GHG emissions and energy consumption.

**Segment 7 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible, adverse impacts on energy and GHG conditions within Segment 7. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, negligible, beneficial impacts on energy and GHG conditions within Segment 7.

### **Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

Impacts associated with implementation of Alternative 4 would be similar to those described above for the analysis common to Alternatives 2–6. Construction would result in short-term, negligible to minor, adverse impacts. For long-term operations, reduced housing and lodging would result in a proportional reduction in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling) and in facility energy usage. In addition, reducing the overall visitor capacity and implementation of mitigation measure MM-AIR-2 (see Appendix C) as applicable, Alternative 4 would result in a long-term, minor, beneficial energy and climate change impact from reduced fuel usage and GHG emissions associated with on-road vehicles. An increased number of overall campsites could result in a greater number of campfires, which would result in a long-term, negligible to minor, adverse impact on GHG emissions.

### **Cumulative Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following cumulative energy and climate change analysis are the same as those identified for Alternative 1.

### ***Overall Cumulative Impact from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

Because management actions under Alternative 4 and actions common to Alternatives 2–6 involve substantial construction activity, their associated equipment and on-road vehicle fuel usage and GHG emissions would be expected to result in short-term, negligible to minor adverse energy and climate change impacts. With reduced overall daily visitor capacity, Alternative 4 would result in a long-term, cumulatively beneficial energy and climate change impact from reduced VMT and associated fuel usage and GHG emissions. However, an increased number of campsites could result in an adverse impact from increased campfire usage and associated GHG emissions. The continued management of traffic and encouragement of alternative forms of transportation, as well as continuation of NPS climate-action-plan sustainability strategies, would have long-term, beneficial energy and climate change impacts.

## ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential River Bank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 5 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to protect and enhance river values would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Impacts associated with implementation of Alternative 5 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to manage visitor use and facilities would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

With regard to long-term impacts associated with the visitor capacity under Alternative 5, on-road mobile emissions were quantified using EMFAC2007 emission factors and compared to the Federal Mandatory Reporting Rule threshold of 25,000 metric tons of CO<sub>2</sub>e per year. Although bus operations are projected to increase under Alternative 5, the reduction in total daily visitor and administrative use and capacity would result in a long-term, minor, beneficial impact owing to reduced on-road vehicles in the park, as depicted in the **table 9-160** below.

**TABLE 9-160: ON-ROAD VEHICLE GHG EMISSIONS (METRIC TONS/YEAR)<sup>a</sup>**

Scenario	CO <sub>2</sub> e
Alternative 5 Emissions	48,082
Alternative 1 (No Action) Emissions	49,619
Incremental Change <sup>b</sup>	(1,537)
Federal Mandatory Reporting Rule Threshold	25,000
Impact Intensity, Type? <sup>c</sup>	Minor, Beneficial
<sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in the Alternatives chapter were totaled for each alternative to determine the regional GHG emissions. Specific assumptions and emission factors incorporated into the calculations are included in Appendix G. <sup>b</sup> Values in (parentheses) are net reductions with respect to Alternative 1 (No Action) emissions. <sup>c</sup> Negligible impacts would not be detectable and would have no discernible effect on GHG emissions (assumed to be 1% or less of threshold). Minor impacts would be those that are present but not expected to have an overall effect on those conditions (assumed to occur up to 50% of applicable threshold). Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on GHG emissions (assumed to occur when emissions exceed applicable threshold).	

## **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

Under Alternative 5, long-term energy use and emissions in the areas of Segments 1, 5, 6, and 8 would remain similar to those under Alternative 1 (No Action). No new buildings and facilities would be constructed within these segments as part of Alternative 5, so no substantial new sources of energy consumption or emissions would be introduced. With fewer on-road vehicles in the vicinity under Alternative 5, the overall effect on energy consumption and GHGs along Segments 1, 5, 6, and 8 would be long term, minor, and beneficial.

**Merced Lake High Sierra Camp.** The park would reduce the capacity of the Merced Lake High Sierra Camp to 42 beds and replace the flush toilets with composting toilets. Facilities replacement would temporarily increase energy consumption and GHG emissions associated with moving equipment and supplies by helicopter. The short-term impact would be negligible and adverse. Over the long-term, capacity changes would reduce the amount of energy (and associated emissions) required to stock, operate, and maintain the facility. The resulting impact would be long-term, negligible, and beneficial.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have long-term, negligible, beneficial impacts on energy and GHG conditions within Segments 1, 5, 6, & 8

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 2 under Alternatives 5 include: removing asphalt and fill material, restoring topography of 35.6 acres of floodplain, and installation of box culverts or other similar design components at the former Upper and Lower River campgrounds; removing campsites and infrastructure from within 100 feet of the river and restoring an additional 6.5 acres of floodplain and riparian habitat; removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows; installing culverts beneath Northside Drive; reconfiguring the Curry Orchard parking lot;; removing informal trails and erecting fencing, signage, and boardwalks to reduce visitor impacts, and selectively remove conifers to improve views redirect visitor traffic at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require at least 40 weeks of crew and

equipment time over a period of two years. These actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 5 include: relocating unimproved Camp 6 parking; removing the Sugar Pine Bridge; placing large wood and constructed logjams along the base of Stoneman Bridge; and improving trail connectivity and routing in the vicinity of the Ahwahnee Bridge. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require at least 16 weeks of crew and equipment time over a period of two years. These actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

### *Impacts of Actions to Manage User Capacity, Land Use, and Facilities*

Short-term construction activities and impacts associated with changes to camping, lodging, parking, circulation, employee housing, and service facilities would be similar to those described above for the analysis common to Alternatives 2–6.

Overnight visitation and total daily use levels would be 16% greater and 5% less, respectively, than under Alternative 1. Since campsites would be increased along this segment (estimated at 640 sites versus 466 sites for Alternative 1), there would also be a proportional increase in campfire GHG emissions, which would have a long-term, negligible to minor, adverse impact. With fewer on-road vehicles under Alternative 5, energy consumption and related GHG emissions would be long term, minor, and beneficial. Increased lodging would result in a proportional increase in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling) and in facility energy usage, which would be a long term, minor, and adverse impact.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from lower Pines (5), North Pines (14), and Upper Pines (2). Several of these actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting short-term GHG impact would be negligible and adverse.

**Camp 6 and Yosemite Village.** The park would construct a pedestrian underpass and a traffic circle at the intersection of Northside and Yosemite Village Drives, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. These actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible to minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for three busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 300 automobiles and 15 tour busses. These actions would also require the use of heavy construction equipment and would

increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segment 2.

However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, negligible to minor, beneficial impacts on energy and GHG conditions within Segment 2.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

#### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to parking and employee housing facilities would be similar to those described above for the analysis common to Alternatives 2–6.

With fewer on-road vehicles under Alternative 5, the overall effect on energy consumption and related GHG emissions would be long term, minor, and beneficial. Increased housing would result in a proportional increase in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling) and in facility energy usage, which would have a long-term, minor, and adverse impact.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segments 3 & 4. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, negligible, beneficial impacts on energy and GHG conditions within Segments 3 & 4.

### **Segment 7: Wawona**

#### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river's biological values that would occur within Segment 7 under Alternative 3 include the relocation of stock use campsites from sensitive resource areas to the Wawona Maintenance Yard. This work could require the use of heavy equipment and would require approximately one week of crew and equipment time. The resulting impact from construction on GHG emissions and energy consumption would be short-term, negligible, and adverse.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping facilities would be similar to those described above for the analysis common to Alternatives 2–6.

**Wawona Campground.** Under Alternative 5, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. There would be a proportional reduction in campfire GHG emissions. This would result in a long-term, negligible, beneficial impact on GHG emissions and energy consumption.

**Segment 7 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible, adverse impacts on energy and GHG conditions within Segment 7. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, negligible, beneficial impacts on energy and GHG conditions within Segment 7.

**Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

Impacts associated with implementation of Alternative 5 would be similar to those described above for the analysis common to Alternatives 2–6. Construction would result in short-term, negligible to minor, adverse effects. For long-term operations, increased housing, campsites, or lodging would result in a proportional increase in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling), in campfire GHG emissions, and in facility energy usage, which would result in a long-term, minor, adverse impact. However, reducing the overall visitor capacity and implementation of mitigation measure MM-AIR-2 (see Appendix C) as applicable, Alternative 5 would result in a long-term, minor, beneficial energy and climate change impact from reduced fuel usage and GHG emissions associated with on-road vehicles.

**Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following cumulative energy and climate change analysis are the same as those identified for Alternative 1.

***Overall Cumulative Impact from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

Because management actions under Alternative 5 and actions common to Alternatives 2–6 involve substantial construction activity, their associated equipment and on-road vehicle fuel usage and GHG emissions would be expected to result in short-term, negligible to minor adverse energy and climate change impacts. With reduced overall visitor capacity, Alternative 5 would result in a long-term, cumulatively beneficial effect on energy and climate change from reduced VMT and associated fuel usage and GHG emissions. However, an increased number of lodging units and campsites would result

in an adverse impact from increased area source GHG emissions. The continued management of traffic and encouragement of alternative forms of transportation, as well as continuation of NPS climate-action-plan sustainability strategies, would have long-term, beneficial energy and climate change impacts.

### ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Impacts associated with implementation of Alternative 6 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to protect and enhance river values would likely result in short-term, negligible to minor, adverse GHG emissions and energy consumption, depending on the year-to-year development and activity overlap.

##### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Impacts associated with implementation of Alternative 6 would be similar to those described above for the analysis common to Alternatives 2–6. Overall construction activities associated with actions to manage visitor use and facilities would likely result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts, depending on the year-to-year development and activity overlap.

With regard to long-term impacts associated with the visitor capacity under Alternative 6, on-road mobile emissions were quantified using EMFAC2007 emission factors and compared to the Federal Mandatory Reporting Rule threshold of 25,000 metric tons of CO<sub>2</sub>e per year. As depicted in the **table 9-161**, below, the increase in total daily visitor and administrative use and capacity and bus operations would result in a long-term, minor, adverse impact owing to increased on-road vehicles in the park.

**TABLE 9-161: ON-ROAD VEHICLE GHG EMISSIONS (METRIC TONS/YEAR)<sup>a</sup>**

Scenario	CO <sub>2</sub> e
Alternative 6 Emissions	50,744
Alternative 1 (No Action) Emissions	49,619
Incremental Change	1,125
Federal Mandatory Reporting Rule Threshold	25,000
Impact Intensity, Type? <sup>c</sup>	Minor, Adverse
<p><sup>a</sup> Emissions were calculated using EMFAC2007 factors and assume 2.4 visitors per car with approximately 22 VMT per vehicle (calibrated based on annual VMT projected for Alternative 1 assuming 240 days/year peak and shoulder seasons) and bus trip VMT from <i>Supporting Information: A Life-Cycle Greenhouse Gas Inventory for Yosemite National Park</i> (Villalba et al 2012b). User capacities included in the Alternatives chapter were totaled for each alternative to determine the regional GHG emissions. Specific assumptions and emission factors incorporated into the calculations are included in Appendix G.</p> <p><sup>b</sup> Negligible impacts would not be detectable and would have no discernible effect on GHG emissions (assumed to be 1% or less of threshold). Minor impacts would be those that are present but not expected to have an overall effect on those conditions (assumed to occur up to 50% of applicable threshold). Moderate impacts are clearly detectable and could have an appreciable effect (assumed to occur at emissions levels greater than 50% but does not exceed the applicable threshold). Major impacts would have a substantial, highly noticeable influence on GHG emissions (assumed to occur when emissions exceed applicable threshold).</p>	

## **Segments 1, 5, 6, and 8: Merced River Above Nevada Fall, South Fork Merced River Above and Below Wawona, and Wawona Impoundment**

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

Under Alternative 6, long-term energy use and emissions in the areas of Segments 1, 5, 6, and 8 would remain similar to that of Alternative 1 (No Action). No new buildings and facilities would be constructed within segments 1, 5, 6, and 8 as part of Alternative 6, so no substantial new sources of energy consumption or emissions would be introduced. With a greater number of on-road vehicles in the vicinity under Alternative 6, the overall effect on energy consumption and GHGs along Segments 1, 5, 6, and 8 would be long term, minor, and adverse.

**Merced Lake High Sierra Camp.** The park would retain the Merced Lake High Sierra Camp and replace the flush toilets with composting toilets. Facilities replacement would temporarily increase energy consumption and GHG emissions associated with moving equipment and supplies by helicopter. The short-term impact would be negligible and adverse. Continued operation of the Camp would not be expected to change energy or GHG consumption from existing conditions. The resulting impact would be long-term, negligible, and adverse.

**Segments 1, 5, 6, & 8 Impact Summary:** Actions to manage user capacities, land use, and facilities would have long-term, negligible, adverse impacts on energy and GHG conditions within Segments 1, 5, 6, & 8

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river’s biological values that would occur within Segment 2 under Alternative 6 include: removing asphalt and fill material, restoring topography of 19.7 acres of floodplain, and installation of box culverts or other similar design components at the former Upper and Lower River campgrounds; removing campsites and infrastructure from within 100 feet of the river and restoring an additional 6.5 acres of floodplain and riparian habitat; removing fill and constructing a boardwalk over meadow and wet areas at Ahwahnee Meadows;; and removing informal trails, installing viewing platforms and boardwalks, and selectively remove conifers to improve views at El Capitan Meadow. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and restoration work would require at least 40weeks of crew and equipment time over a period of at least two years. These actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

**Hydrologic/Geologic Resource Actions.** Specific projects to protect and enhance the river's hydrologic and geologic values that would occur within Segment 2 under Alternative 6 include: relocating unimproved Camp 6 parking and placing large wood and constructed logjams along the bases of Stoneman, Sugar Pine, and Ahwahnee Bridges. This work would require the use of heavy equipment, including excavators, skid steers, loaders, and dump trucks. The demolition, transport, disposal, and revegetation activities associated with this work would require approximately 16 weeks of crew and equipment time over a period of two years. These actions would result in short-term, negligible to minor, adverse GHG emissions and energy-consumption impacts.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping, lodging, parking, circulation, employee housing, and service facilities would be similar to those described above for the analysis common to Alternatives 2–6.

Overnight visitation and total daily use levels would be 33% and 4% greater, respectively, than under Alternative 1. Since campsites would be increased along this segment (estimated at 739 sites versus 466 sites for Alternative 1), there would also be a proportional increase in campfire GHG emissions, which would have a long-term, negligible to minor, adverse impact. Reduced housing would result in a proportional reduction, while increased lodging would contribute to a proportional increase in area GHG emissions sources (such as maintenance/ landscaping, natural gas combustion for heating/cooling) and in facility energy usage. With a greater number of on-road vehicles and potential area sources under Alternative 6, the overall effect on energy consumption and GHGs would be long term, negligible to minor, and adverse.

**Curry Village and Campground.** The park would construct 98 hard-sided units at Boys Town, bringing the total number of new and retained units at Curry Village to 453. The park would remove campsites from lower Pines (5), North Pines (14), and Upper Pines (2). Several of these actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting short-term GHG impact would be negligible and adverse.

**Camp 6 and Yosemite Village.** The park would expand the Concessioner Warehouse Building to accommodate Concessioner General Office functions, construct a pedestrian underpass and two roundabouts, shift the parking area north and redevelop a portion of the former administrative footprint to accommodate 850 parking spaces, and install a new three-way intersection connecting the parking lot to Sentinel Drive. These actions would require the use of heavy construction equipment and would increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible to minor, and adverse.

**Camp 4 and Yosemite Lodge.** The park would design a pedestrian underpass, relocate the existing bus drop-off area to the Highland Court area to accommodate loading/unloading for three busses, and redevelop an area west of Yosemite Lodge to provide an additional parking for 300 automobiles and 15 tour busses. These actions would require the use of heavy construction equipment and would

increase construction-related emissions during project implementation. The resulting impact on GHG conditions would be short-term, negligible to minor, and adverse.

**Segment 2 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segment 2. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, negligible, adverse impacts on energy and GHG conditions within Segment 2.

Segments 3 and 4: Merced River Gorge and El Portal

***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to parking and employee housing facilities would be similar to those described above for the analysis common to Alternatives 2–6.

With greater numbers of on-road vehicles under Alternative 6, the overall effect on energy consumption and related GHG emissions would be long term, negligible, and adverse. Increased housing would result in a proportional increase in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling), in campfire GHG emissions, and in facility energy usage, which would have a long term, minor, and adverse impact.

**Segments 3 & 4 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible to minor, adverse impacts on energy and GHG conditions within Segments 3 & 4. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have short-term and long-term, negligible, adverse impacts on energy and GHG conditions within Segments 3 & 4.

**Segment 7: Wawona**

***Impacts of Actions to Protect and Enhance River Values***

Short-term construction activities and impacts would be similar to those described above for the analysis common to Alternatives 2–6.

**Biological Resource Actions.** Specific projects to protect and enhance the river’s biological values that would occur within Segment 7 under Alternative 6 include the relocation of stock use campsites from sensitive resource areas to Wawona Stables. This work could require the use of heavy equipment and would require approximately one week of crew and equipment time. The resulting impact from construction on GHG emissions and energy consumption would be short-term, negligible, and adverse.

### ***Impacts of Actions to Manage User Capacity, Land Use, and Facilities***

Short-term construction activities and impacts associated with changes to camping facilities would be similar to those described above for the analysis common to Alternatives 2–6.

**Wawona Campground.** Under Alternative 6, the park would reduce the size of the Wawona Campground. Thirteen campsites, or 13% of all campsites within Wawona, would be removed from the floodplain. There would be a proportional reduction in campfire GHG emissions. This would result in a long-term, negligible, beneficial impact on GHG emissions and energy consumption.

**Segment 7 Impact Summary:** Actions to protect and enhance river values would result in local, short-term, negligible, adverse impacts on energy and GHG conditions within Segment 7. However, these actions would not be expected to have a long-term impact. Actions to manage user capacities, land use, and facilities would have long-term, negligible, beneficial impacts on energy and GHG conditions within Segment 7.

### **Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

Impacts associated with implementation of Alternative 6 would be similar to those described above for the analysis common to Alternatives 2–6. Construction would result in short-term, negligible to minor adverse effects. For long-term operations, increased housing, campsites, and lodging would result in a proportional increase in area GHG emissions sources (such as maintenance/landscaping, natural gas combustion for heating/cooling), in campfire GHG emissions, and in facility energy usage. In addition, increasing the overall visitor capacity and implementation of mitigation measure MM-AIR-2, as applicable (see Appendix C), Alternative 6 would result in a long-term, minor, adverse energy and climate change impact from increased fuel usage and GHG emissions associated with on-road vehicles.

### **Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

The past, present, and reasonably foreseeable future actions in the Yosemite region considered for the following cumulative energy and climate change analysis are the same as those identified for Alternative 1.

### ***Overall Cumulative Impact from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

Because management actions under Alternative 6 and actions common to Alternatives 2–6 involve substantial construction activity, it would be expected to contribute to short-term, negligible to minor adverse energy and climate change impacts from equipment and on-road vehicle fuel usage and GHG emissions. With increased overall visitor capacity, Alternative 6 would result in a long-term, cumulatively adverse impact on energy and climate change from increased VMT and associated fuel usage and GHG emissions. An increased number of campsites would result in increased GHG

emissions from wood burning. Similarly, an increase in the number of lodging units would result in an adverse impact from increased area source GHG emissions and facility energy usage. The continued management of traffic and encouragement of alternative forms of transportation, as well as continuation of NPS climate-action-plan sustainability strategies, would have long-term, negligible, beneficial energy and climate change impacts.

## Socioeconomics

### *Affected Environment*

This section evaluates the likely socioeconomic consequences of the specific management actions contained in each alternative and how the alternatives would affect the regional economy. As documented in the “Visitor Experience/Recreation” section of this chapter, there were an estimated 3.9 million annual visitors to Yosemite National Park in 2010 and 3.95 million in 2011, slightly fewer than the all-time record estimate of 4.0 million in 1996. Yosemite visitors spend millions of dollars on entrance fees, campgrounds, hotel lodging, meals, transportation, and other goods and services both inside the park and in gateway communities outside the park. As a result, visitor spending is an important source of income and employment for the park, the primary park concessioner, and the gateway communities. In addition, the National Park Service (NPS) operating budget pays employees and contractors to perform duties and provide services within the park, which, like visitor spending, provides revenue to support the economy of the surrounding region.

The “Socioeconomics” section contains two subsections: regional economy and visitor expenditures. The first section characterizes the regional economy. The region affected by the park includes the four surrounding counties: Madera, Mariposa, Mono, and Tuolumne. Economic and statistical profiles were developed for each county to assess the importance of tourism and NPS spending to the region. The profiles provide an economic baseline with detailed information on the size of each county’s principal economic sectors in terms of economic output, employment, and other relevant economic indicators. Although historical trends and future projections are included for some socioeconomic measures (e.g., population), the primary focus is on 2010, which has been selected as the most recent year for which reliable data are available to use as a baseline for the alternatives analysis to be conducted later in this EIS process.

The second section presents best estimates of baseline visitor spending. The NPS periodically surveys visitors to Yosemite and fortunately conducted a survey in 2009 as part of the Visitor Services Project (VSP). The results of this survey, as reported in the study, *Impacts of Visitor Spending on the Local Economy: Yosemite National Park, 2009*, have been adjusted using the Consumer Price Index to estimate spending patterns for the baseline year of 2010.

### **Regional Economy**

The region evaluated in the socioeconomic analyses below includes all the gateway communities immediately adjacent to Yosemite National Park and the four counties that house them: Madera, Mariposa, Mono, and Tuolumne. This four-county region roughly coincides with the 50-mile radius for which spending was reported in the VSP survey. The four main access roads to the park pass through the four gateway counties; Highway 41 passes through Madera and Mariposa counties, Highway 140 passes through Mariposa County, Highway 120 east passes through Mono County, and Highway 120 west passes through Tuolumne County.

Yosemite National Park is located primarily in Mariposa and Tuolumne counties, with a small southern portion in Madera County. The developed areas along the main river corridor and the

South Fork Merced River, including Yosemite Valley, the El Portal Administrative Site, and Wawona are located within the jurisdiction of Mariposa County. Merced, Stanislaus, San Joaquin, and Fresno Counties were excluded from the affected region because, in these much more populous and urbanized counties, it is difficult to distinguish the portions of the tourist economies that are associated with Yosemite versus other tourist destinations. Also, tourism is a relatively small component of these counties' overall economies.

## Regional Comparison

### *Population*

In 2010 the population of the region of economic study was almost 240,000. **Table 9-162** shows the historical growth rates for this region during the past 40 years. The table also shows the state population and growth rates. The region containing the gateway communities to Yosemite National Park has been growing much more rapidly than the state of California as a whole, though it is important to note that this regional growth percentage is relative to the small baseline of four counties that are largely rural in character. Furthermore, while population at both geographic levels continues to grow, the rates of growth are slowing down.

**TABLE 9-162: HISTORICAL POPULATION BY COUNTY: 1970-2010**

County	1970	1980	1990	2000	2010
Madera	41,519	63,116	88,090	123,109	150,865
Mariposa	6,015	11,108	14,302	17,130	18,251
Mono	4,016	8,577	9,956	12,853	14,202
Tuolumne	22,169	33,928	48,456	54,504	55,368
Total 4-Co. Region	73,719	116,729	160,804	207,596	238,686
10-Year Growth		58%	38%	29%	15%
California	19,953,134	23,667,902	29,760,021	33,873,086	37,253,956
10-Year Growth		19%	26%	14%	10%
SOURCE: U.S. Bureau of the Census 2010]					

**Table 9-163** indicates that substantial growth is projected to continue into the future, both in the region of impact and in the state as a whole. The projections currently available from the California Department of Finance were made before the 2010 Census was available and before the full effects of the current recession were obvious. As a result, the actual 2010 population fell short of the predictions, and future populations are likely to be smaller by a similar proportion.

### Income

**Table 9-164** summarizes several key household demographic and income characteristics for the four-county study area. Incomes in all four of the counties are less than the average for California as a whole. Per-capita incomes are lowest in Madera County, though household sizes tend to be larger;

**TABLE 9-163: PROJECTED POPULATION BY COUNTY: 2000-2050**

County	2000	2010	2020	2030	2040	2050
Madera	124,696	162,114	212,874	273,456	344,455	413,569
Mariposa	17,150	19,108	21,743	23,981	26,169	28,091
Mono	13,013	14,833	18,080	22,894	29,099	36,081
Tuolumne	54,863	58,721	64,161	67,510	70,325	73,291
Total 4-Co. Region	209,722	254,776	316,858	387,841	470,048	551,032
10-Year Growth		21%	24%	22%	21%	17%
California	34,105,437	39,135,676	44,135,923	49,240,891	54,226,115	59,507,876
10-Year Growth		15%	13%	12%	10%	10%
SOURCE: California State Department of Finance 2011						

**TABLE 9-164: HOUSEHOLD INCOME CHARACTERISTICS FOR THE FOUR-COUNTY STUDY AREA**

Key Demographic Characteristics	Madera	Mariposa	Mono	Tuolumne	California
Persons per household, 2006–2010	3.30	2.28	2.61	2.28	2.89
Per-capita money income in past 12 months (2010 dollars)	\$18,724	\$27,064	\$27,321	\$25,483	\$29,188
Median household income 2006–2010	\$46,039	\$49,098	\$55,087	\$47,462	\$60,883
Persons below poverty level, percent, 2006–2010	19.3%	12.5%	12.0%	11.7%	13.7%
SOURCE: U.S. Census Bureau State & County QuickFacts 2010					

therefore, with more potential workers per household, household incomes in Madera are comparable to those in the neighboring counties. The poverty rate is also the highest in Madera County.

### *Employment*

Table 9-165 presents employment figures including all waged, salaried, and self-employed jobs in each county, and both full-time and part-time workers. In 2010 total employment was approximately 102,000 in the four-county area. Madera County, with the largest and most urbanized population, had the largest employment base in the region, accounting for approximately 57% of total employment. Mariposa County, which includes Yosemite Valley, El Portal, and Wawona, accounted for approximately 8% of total employment in the affected region. Table 9-165 provides total employment estimates for the counties by industry sector. The Service sector, which includes most of the businesses most directly impacted by tourism and visitor spending, accounts for 45% of the total region, and 59% of Mariposa County, which includes Yosemite Valley. The figures are used as the baseline for employment conditions.

According to the Local Area Unemployment Statistics program of the U.S. Bureau of Labor Statistics, in 2010 the total civilian labor force in the four-county region was 106,429, of which 90,509 were employed. The statewide unemployment rate in California at the time was 12.4%. Only Mariposa

**TABLE 9-165: 2010 EMPLOYMENT BY COUNTY AND MAJOR INDUSTRY SECTOR**

Industry Sector	Individual Counties				Total
	Madera	Mariposa	Mono	Tuolumne	Study Area
<b>Total</b>	<b>58,309</b>	<b>8,037</b>	<b>10,608</b>	<b>25,319</b>	<b>102,273</b>
Agriculture	12,701	294	105	519	13,619
Mining	88	79	24	118	310
Construction	2,258	478	687	1,692	5,115
Manufacturing	2,990	175	113	764	4,043
Transp. & Utilities	1,468	128	110	368	2,074
Trade	5,593	619	938	3,164	10,314
Service	21,816	4,755	6,493	12,905	45,970
Government	11,393	1,509	2,136	5,789	20,828
SOURCE: Minnesota IMPLAN Group, Inc. data; Land Economics Consultants analysis 2012					

County was slightly better off with an unemployment rate of 12.1%. The other three counties were between 14.0% and 15.6% (with the highest in the most populous county, Madera). The region's average unemployment rate in 2010 was 14.8%.

### *Economic Output*

Economic output is a measure of productivity. Measures of economic output vary, depending on the Industry sector. For the Agricultural and Trade sectors, output is measured by the value of products sold. In the Manufacturing sector, output is a measure of the value added by the manufacturer or the value of shipments. In the Service sector, output is measured as receipts in dollars. In 2010, the estimated total output of goods and services for the four-county region was approximately \$12.5 billion, as presented in **table 9-166**. Madera and Tuolumne counties, which are more urbanized with cities such as Madera and Sonora, produce the majority of the region's economic output. The almost entirely rural counties of Mariposa and Mono contributed only 16% of the output. However, 57% of Mariposa's output was generated in the tourism-heavy services sector.

### *Taxable Retail Sales*

Taxable retail sales are good indicators of annual spending in the Travel Service sectors because these sales represent taxes paid on transactions with consumers. The total taxable retail sales figures from the state Board of Equalization also include the taxes paid by businesses on raw materials and services. In 2010, the total taxable retail sales for the four counties in **table 9-167** were just over \$2.0 billion. The previous years' retail volumes have also been converted to constant 2010 dollars for comparison purposes. In real terms, retail sales were actually greater in 2001 at \$2.1 billion; grew at a healthy rate through 2006; and then declined with the recession, showing the most dramatic drops in 2008 and 2009. The data suggest that retail sales volumes have stabilized recently.

**TABLE 9-166: 2010 ECONOMIC OUTPUT BY COUNTY AND MAJOR INDUSTRY SECTOR (IN CONSTANT 2010 \$1,000,000s)**

Industry Sector	Individual Counties				Total
	Madera	Mariposa	Mono	Tuolumne	Study Area
Total	\$7,699	\$885	\$1,159	\$2,791	\$12,535

## Madera County

According to the California Employment Development Department, almost a quarter of Madera County employment (23%) was on farms in 2010. When the Food Processing, Service, and Trade sectors of the economy are considered as well, agriculture's dominance in Madera County is obvious. The Leisure and Hospitality sector of the economy accounted for a little more than 6% of the jobs. Federal employment amounted to 300 jobs, or approximately 0.7% of county employment. In terms of fiscal resources, the transient occupancy tax only accounts for approximately 1% of Madera County's General Fund.

Madera County reaches from the crest of the Sierra Nevada range to the San Joaquin River on the Central Valley floor. The majority of the county's population and employment are concentrated along the Highway 99 corridor in the Central Valley. None of the developed parts of Yosemite National Park are in Madera County, but the county includes the headwaters of both the South Fork and the main stem of the Merced River in the high country at the southern end of the park. Because of its large

geographic size and diversity of the economy of Madera County, tourism associated with the park is not particularly important to the county as a whole. On the other hand, the eastern communities in the county, specifically Oakhurst and Bass Lake, are much more dependent on Yosemite tourism.

### **Mariposa County**

According to the Employment Development Department, tourism is Mariposa County's main industry and the area's largest employer, with more than a third (37%) of all jobs in the Leisure and Hospitality sector in 2010. The county's primary recreation area/tourist attraction is Yosemite National Park, much of which lies within the county, including the developed areas of Yosemite Valley, Wawona, and El Portal Administrative Site. Other major recreation areas in Mariposa County include Stanislaus National Forest and Sierra National Forest, as well as the U.S. Forest Service/Bureau of Land Management recreation areas along the Merced River. Other recreation resources in Mariposa County include Lake Don Pedro, Lake McSwain, and Lake McClure where camping is available.

Mariposa County's economy is very different than Madera County's. Less than 1% of Mariposa employment is on farms. In contrast, with the national park and forests, federal employment is much more important, accounting for approximately 800 jobs or 16% of county employment in 2010.

From a fiscal standpoint, Mariposa is the most dependent on tourism of the four counties. Almost a quarter of the \$42 million Mariposa County General Fund is derived from the Transient Occupancy Tax (TOT), or approximately \$10 million in the most recent fiscal year. The TOT is levied at the rate of 10% of the room rate and is collected from Bed and Breakfasts and transient rentals (e.g., Vacation Rentals by Owner), as well as from traditional hotels and motels. In addition, there is another 1% tax on transient rooms in the form of a Tourism Business Improvement District Assessment (TBID). All of the accommodations in Yosemite Valley, as well as those in Wawona, contribute to Mariposa's General Fund through the TOT and generate money for the TBID, as well.

Another way to look at it is Mariposa County collects 62% of the entire TOT generated within the four-county region.

### **Mono County**

Mono County is one of the least populated counties in California and is the gateway county for visitors entering through the eastern park entrance. Park access via this entrance is limited in the winter because the entrance is typically closed from November to late May as a result of snowfall. Lodging, food, beverage, and other services are central to Mono County's economy, which is also bolstered by extensive natural resources and recreational opportunities. As home to the Mammoth Mountain Ski Area, Mono County is a significant tourism destination in the winter. During summer, Mono County is a popular destination for such resort communities as Mammoth Lakes and June Lakes and for backcountry visitation to the John Muir and Ansel Adams Wilderness Areas.

According to Employment Development Department data for 2010, the Leisure and Hospitality sector accounted for almost half (49%) of all employment in Mono County. Federal employment constituted approximately 200 jobs or about 3% of all employment.

Mono County only collects about \$2 million per year in Transient Occupancy Taxes, but because it is such a small county, that amount constitutes 7% of the county's General Fund.

## **Tuolumne County**

The Tuolumne River watershed portion of Yosemite National Park is in the southeastern portion of Tuolumne County. The county also contains significant national forest lands and the Emigrant Wilderness, with recreation destinations scattered throughout. In addition to Yosemite, other recreational attractions in Tuolumne County include Columbia State Park, Stanislaus National Forest, Dodge Ridge Ski Area, and Pinecrest Lake.

The bulk of Tuolumne County's economy is clustered on private lands along Highways 49 and 108, as well as centered in the town of Sonora. The primary driver of the Tuolumne County economy is the service sector, which is indicative of a large retirement and second home based population in the surrounding Gold Country area of the foothills. According to the Employment Development Department, the Leisure and Hospitality sector accounted for about 12% of the jobs in Tuolumne County in 2010. Federal employment was approximately 400 jobs at that time, or about 3% of county jobs. The TOT in Tuolumne County generates about \$2 million per year, representing approximately 4% of the General Fund.

## **Trends in Visitation to the Park**

Socioeconomic impacts are highly correlated with overall visitation. **Figure 9-46** shows the trend in estimated total recreational visitation to Yosemite National Park over the last century. According to these estimates, visitation grew explosively at the beginning of the 20th century, only to crash along with the economy in the early 1930s. Then, growth began again, only to be halted by World War II. The post-war era showed strong, long-term growth, peaking in 1996. In 1987, when the Merced was designated a Wild and Scenic River, estimated visitation to the park stood at 3.2 million. The effects of the flood in early 1997, which dramatically reduced the inventory of overnight accommodations in Yosemite Valley, can be seen over the decade subsequent to 1997. The strong growth trend observed prior to 1997 can be seen again in recent years.

## **Visitor Expenditures**

### ***Average Visitor Expenditures***

The NPS's Visitor Services Project (VSP surveys) collected data in 2009 on expenditures of visitor groups inside the park and within 50 miles of the park. This data was analyzed in the February 2011 study, *Impacts of Visitor Spending on the Local Economy: Yosemite National Park, 2009*. Spending averages in 2009 were computed per visitor group per day (or per night) for different market segments defined by the type and location of accommodations used. The observed 2009 spending averages were adjusted using the Consumer Price Index (CPI) to 2010 dollars, as presented in **table 9-168**. On a visitor group per day basis, average spending was \$75 for day trips by local residents, \$87 for day trips by nonlocal visitors, \$371 per night for visitors staying in park lodges or cabins, and \$170 per night for

**Figure 9-46**

Estimated Number of Recreational Visitors to Yosemite National Park

**TABLE 9-168: AVERAGE SPENDING PER DAY/NIGHT FOR VISITOR GROUPS IN 2010 DOLLARS**

Spending Category	Average Spending per Day/Night Visitor Groups in 2010 Dollars <sup>a</sup>						
	Local	Day Trip	Motel-in	Camp-in	Motel-out	Camp-out	Other Overnight
Motel, hotel, cabin, transient rental, or Bed & Breakfast	\$0.00	\$0.00	\$213.91	\$2.52	\$144.52	\$0.00	\$0.00
Camping fees	\$0.00	\$0.00	\$1.67	\$34.49	\$1.31	\$28.59	\$0.00
Restaurants & bars	\$21.99	\$17.04	\$61.09	\$23.18	\$49.04	\$24.46	\$12.12
Groceries & takeout food	\$18.98	\$10.98	\$18.61	\$20.98	\$17.08	\$16.07	\$4.55
Gas & oil	\$17.21	\$16.63	\$18.72	\$30.01	\$26.34	\$31.00	\$9.84
Local transportation	\$0.00	\$3.94	\$9.82	\$0.80	\$31.09	\$4.35	\$1.63
Admission & fees	\$11.71	\$23.68	\$25.35	\$38.26	\$22.51	\$12.94	\$5.79
Souvenirs & other expenses	\$4.74	\$14.43	\$22.02	\$19.79	\$21.07	\$13.40	\$3.61
<b>Total per Visitor Group</b>	<b>\$74.64</b>	<b>\$86.71</b>	<b>\$371.17</b>	<b>\$170.02</b>	<b>\$312.95</b>	<b>\$130.81</b>	<b>\$37.54</b>
<sup>a</sup> Adjusted from the 2009 Visitor Services Project survey results using the Consumer Price Index for All Urban Consumers, by industry category. SOURCE: Cook, Philip S., <i>Impacts of Visitor Spending on the Local Economy: Yosemite National Park, 2009</i> , February, 2011[							

park campers. Visitors staying in motels, cabins, lodges, or bed and breakfasts (B&Bs) outside the park spent an average of \$313 per night during their trips and those camping outside the park spent \$131 per night. The “other overnight” column includes visitors staying in backcountry locations or with friends and relatives, and includes spending within the four-county area as visitors approach and leave the park.

The VSP Survey found that about 47% of visitor groups’ total spending is inside the park and 53% is outside the park. As one would expect, visitor groups staying overnight inside the park spent the majority of their money inside the park, and visitor groups staying outside the park spent most of their money in surrounding communities. A higher percentage of campers’ spending is on groceries, whereas visitor groups staying in lodges, cabins, and motels spend more on restaurant meals.

### ***Total Visitor Expenditures and Economic Impacts***

The total economic impact on the four-county study area from Yosemite National Park visitor spending and the NPS payroll in the baseline year of 2010 was recently calculated as part of an ongoing effort to estimate the economic benefits of national parks to their local communities (Stynes 2011). The summary statistics from this effort are presented in **table 9-169**. For the analysis of alternatives to follow, a model of the four-county economy has been constructed, and the impacts of visitor spending and the NPS payroll are analyzed using IMPLAN and the NPS Money Generation Model (MGM2), as described in the “Environmental Consequences Methodology” section, below. The model was calibrated using the published summary statistics in table 9-166 as control totals.

**TABLE 9-169: TOTAL SPENDING AND ECONOMIC IMPACTS:  
YOSEMITE NATIONAL PARK, 2010**

	Summary Statistics
<b>Public Use Data</b>	
2010 Recreation Visits	3,901,408
2010 Overnight Stays	1,720,909
<b>Visitor Spending 2010</b>	
All Visitors	\$354,689,000
Nonlocal Visitors	\$350,244,000
<b>Impacts of Nonlocal Visitor Spending</b>	
Jobs	4,602
Labor Income	\$132,465,000
Value Added	\$215,932,000

## *Environmental Consequences Methodology*

### **Use of Established Regional Economic Analysis Models**

To quantitatively analyze the alternatives, including the Alternative 1 (No Action), a series of interlinked economic models has been developed that calculate economic impacts within the four-county region containing Yosemite National Park. The methodology for this EIS has been built in consultation with the ongoing providers of analyses of this type to the NPS. The central model for estimating economic impacts is the Money Generation Model 2 (MGM2) developed by Stynes et al. The three main inputs to the MGM2 version used here, and their sources, are

1. annual number of visitors to Yosemite broken down by lodging-based market segments, with a baseline calibrated using 2010 actual totals from NPS Public Use Data
2. spending averages for each lodging-based market segment from the Visitor Services Project, with the most recent survey data having been collected in 2009 and updated to 2010 dollars
3. economic multipliers generated by IMPLAN<sup>1</sup> from the four-county region for 2010

Data for the calendar year 2010 were used for development and calibration of a baseline set of models for this socioeconomic analysis. The year 2010 is the most recent for which IMPLAN multipliers are available. Fortunately, 2010 is also a U.S. Census year and at this time is the most recent year for which historical data are reliably available across a wide variety of socioeconomic measures. In 2010, the number of visitors to the park was approximately equal to the highest recorded numbers, with the previous record set in 1996 before the flood damage in early 1997. The goal of the baseline socioeconomic analysis was to create a series of operable economic models that can reproduce the results of ongoing economic impact estimation conducted for the NPS (as reported in the “Affected Environment” section, above). Having calibrated the operable set of models for the baseline year of 2010, the same models can be used to analyze the Alternative 1 as well as Alternatives 2–6 (the action alternatives) to produce results that can be reliably compared. In essence, the modeling of alternatives will be driven by the levels of annual visitation resulting from the management plans for each alternative as if each were in place today. Based on visitor spending patterns, the total level of economic activity generated in the region can be estimated. Visitor spending impacts are thus estimated in terms of 2010 dollars but for numbers of visitors appropriate to each alternative, compared to the number of visitors under Alternative 1 during the same time frame. Under the no action alternative it is expected that the number of people seeking to visit the park will continue to grow at approximately 3% per year over the next five years.

---

<sup>1</sup> IMPLAN is a proprietary model (IMpact for PLANning) developed originally for the federal government in the 1980s at the University of Minnesota and now vended by MIG, Inc. (formerly the Minnesota IMPLAN Group, Inc.) to estimate the economic impacts of projects or policy changes on specific regions of study. Among other things, the model produces multipliers that facilitate the estimation of major economic impacts from input variables.

## **Economic Modeling Focuses on the Regional Level**

An economic impact analysis that involves IMPLAN modeling is typically concerned with the economic development potential of projects or management plans for a region. Thus, such an analysis typically ignores local spending transfers within the region and focuses only on new income that is derived from outside the region as the measure of “economic impact.” However, this analysis is interested in how alternative management plans might affect the use of the park by local residents of the gateway communities in the surrounding four counties. A less frequent but no less legitimate application of IMPLAN is to estimate total “economic activity,” which is a measure of total economic importance and which includes the economic activity stimulated by the spending of local residents associated with recreation in Yosemite. For the alternatives analyses in this EIS, spending by locals has been included so that changes in their recreation or spending patterns can be considered. Although spending by locals would not be included in a traditional economic impact analysis, the term “economic impact” (rather than “economic activity”) is used throughout this narrative to conform to the expectations of readers of NEPA analyses.

## **Two Primary Economic Drivers: Visitor Spending and NPS Spending**

The majority of the economic activity, including all the direct employment in concessioner-run facilities in the park, is driven by visitors. A minor portion of the economic activity is driven by the payroll and spending of the NPS itself, which will be estimated separately after the visitor-driven impact analysis.

Because socioeconomic analysis is concerned with matters such as job creation and business opportunities, an annual perspective is required (e.g., jobs are created by flows of money sufficient to support living wages and incomes; business viability depends on ongoing revenue potential, including off seasons as well as high seasons, etc.). The NPS’s MGM2 model is built to analyze economic impacts for an entire year of a park’s operation. Furthermore, for this analysis, a parkwide perspective, including all river segments, must be adopted in order to capture all visitor spending. The visitor spending data were collected for the entire park visit, including travel to and from the park, and included spending anywhere within the four-county host region for the park. For example, even visitors staying in backpacking camps in the wilderness depend on purchases made earlier, and visitors’ purchases of supplies in gateway communities, although modest, still contribute to the size of the four-county economy. For these reasons, an estimate of the annual, parkwide visits resulting from each alternative management plan is required as an input to the socioeconomic models.

## **Derivation of the Impact on Visitor Spending**

Table 9-170 presents a means of providing the future annual parkwide visitor estimate required for each alternative, based on the experience of the most recent calendar year, but considering the potential for future growth in demand for visits at approximately 3% per year, and differences in the supply of overnight accommodations and day use facilities in Yosemite Valley under the various management plans. In the analysis of transportation, the number of vehicles was tracked on a daily basis for 2011. Using a factor of 2.9 people per vehicle on the average, it was possible to estimate the number of visits to Yosemite Valley on each day in 2011. Under the No Action Alternative it was

**TABLE 9-170: ANNUAL PARKWIDE VISIT ESTIMATES FOR EACH ALTERNATIVE**

	Alt. 1	Alt. 2	Alt. 3	Alt. 4	Alt. 5	Alt. 6
Estimated Maximum Daily Visitation to the Valley	20,900	13,900	13,200	17,000	19,900	21,800
Number of Days Where Maximum Would Be Exceeded	0	87	91	68	10	1
Estimated Park-Wide Annual Visitation in 2011 <sup>a</sup>	3,951,393	3,951,393	3,951,393	3,951,393	3,951,393	4,192,033
Change from Park-Wide Annual Visitation (People)	0	(306,514)	(365,857)	(74,039)	(2,698)	(1,116)
<b>Estimated Park-Wide Visitation Achievable Within Maximums</b>	<b>3,951,393</b>	<b>3,644,879</b>	<b>3,585,536</b>	<b>3,877,354</b>	<b>3,948,695</b>	<b>4,190,917</b>
<sup>a</sup> 2011 Estimate from National Park Service Public Use Statistics Office for Alts 1 - 5. Alt 6 includes 2 years growth at 3%/year. SOURCE: Estimates by Land Economics Consultants 2012						

estimated the Valley was able to handle a maximum of 20,900 people in a day, which was consistent with a total estimated visitation in the park during 2011 of 3,951,000.

The different plans for infrastructure and facilities for each action alternative would result in a different maximum number of visitors that could be accommodated in the Valley. Under Alternatives 2 through 5, those maximums are smaller than the No Action Alternative, and for each alternative total parkwide visitation is projected to be less than what was observed in 2011 by the number of visitors that would have exceeded the daily maximums in the Valley. For example, for Alternative 3 a combined total of 366,000 visitors would have not been able to visit the Valley during 105 days that the maximum was exceeded. Total parkwide estimated visitation was thus reduced to a projected 3,586,000 for Alternative 3.

The proposed mix of infrastructure and facilities in Alternative 6 would allow for a higher maximum daily visitation to the Valley than under the No Action Alternative. In that case, visitation could continue to grow for two more years at the assumed rate of 3% per year before the same pattern of exceeding maximums on several peak days is experienced. After two years of growth, the maximum would be exceeded on three days, reducing visitation by 1,116, and resulting in an estimate for parkwide visitation at that point of approximately 4,191,000. These estimates on the bottom line of Table 9-113 will be used as inputs to the economic impact analysis of visitor spending in the sections to follow.

In reality, total annual visits to the park will most likely not decrease by as much as the estimates at the bottom of table 9-113 due to two effects commonly observed in economic market systems:

1. A “substitution effect” is possible during high-demand periods. That is, when people are unable to secure their first-choice lodging type, some will likely substitute a second-choice mode of visiting the park. For example, unable to get a reservation for concessioner lodging in the Valley, some people will likely opt for a motel in a gateway community and be repeat day visitors to the park during their stay.

2. A displacement or “time-shift effect” is possible, as well. Unable to secure reservations for their first-choice time period to visit the park, some people will likely change their plans to visit the park during a less popular period, but still contributing to the annual visitation numbers.

Although the extent of these human behaviors is unquantifiable at this time, it is highly likely that some combination of these and other mechanisms for economic adaptation will reduce the severity of adverse economic impacts, and it is possible that adverse impacts would be eliminated altogether. It is also possible that with continued growth in demand into the future, total parkwide annual visitation would continue to grow through these mechanisms, expanding into previously low-demand seasons and thereby continuing to increase visitor spending in the four-county economy. Economic expansion could also occur as Gateway business communities’ market alternative activities and destinations so that people stay in the area longer even though they are not spending the entire time in Yosemite.

To match visitor types with the visitor spending patterns quantified by the 2009 VSP Survey, other results from the visitor survey will be used below for each alternative to first apportion the total annual visits from Table 9-113 into lodging-based market segments and then to convert total number of visitors entering the park into visitor group nights (or days) by taking into account factors for:

- average visitor group size
- length of stay (days or nights)
- re-entry rate (park entries per trip)

The number of visitor group nights will then be multiplied by the spending patterns for each group, and the total impact on the four-county economy will be estimated for each alternative.

### **Derivation of the Impact on NPS Spending**

An additional source of economic expansion within the four-county area is direct NPS spending. Therefore, the impact of NPS employment and operations and maintenance spending must also be estimated for each alternative. **Table 9-171** presents a method for estimating the impact of each management plan on NPS employment and budget for employee compensation. This is a very simple extrapolation of data that correlates with present headcount, provided as an illustration of possible impacts of employee spending in the region. Starting with the estimation of annual visits, NPS employment is also assumed to vary with the annual volume of visitors parkwide. However, employment is subject to separation into fixed and variable costs. An analysis of the last five fiscal years of budgets for the park (2007 through 2011) has shown that 56% of the budget has come from “appropriated funds” and 44% from “revenue funds.” Given that the appropriated funds are relatively fixed, and that the term “revenue funds” implies that they fluctuate somewhat with the number of visitors, table 9-110 assumes that 56% of employment and compensation are fixed (i.e., would remain the same in all alternatives), and that 44% of NPS jobs would vary in proportion to the increase or decrease in visitor volumes.

In the long run, concessioner employment and operations and maintenance costs are funded by the revenues available to the concessioner, which are derived from visitor spending, and thus are already included in the analysis. In other words, the visitor spending profiles estimated total spending by each

**TABLE 9-171: NATIONAL PARK SERVICE DIRECT EMPLOYMENT AND BUDGET FOR EACH ALTERNATIVE**

	Alt. 1	Alt. 2	Alt. 3	Alt. 4	Alt. 5	Alt. 6
Estimated Parkwide Visits Considering Constraints	3,951,393	3,644,879	3,585,536	3,877,354	3,948,695	4,190,917
Difference from Alternative 1 (No Action)	100%	92%	91%	98%	100%	106%
Total National Park Service Direct Employment in 2010 (Jobs) <sup>1</sup>	892					
Portion of Jobs Assumed Fixed	56%					
Portion of Jobs Assumed to Vary With Visitor Volume	44%

Total <b>National Park Service</b> Direct Employee Compensation (2010 \$1,000s) <sup>a</sup>	\$49,406					
Portion Assumed to be Fixed Cost	56%					
Portion Assumed to Vary with Visitor Volume	44%					
<b>Estimated Direct National Park Service Compensation for Each Alternative (2010 \$1,000s)</b>	<b>\$49,406</b>	<b>\$47,720</b>	<b>\$47,393</b>	<b>\$48,999</b>	<b>\$49,391</b>	<b>\$50,724</b>
<sup>a</sup> As reported in Stynes, D.J., <i>Economic Benefits to Local Communities from National Park Visitation and Payroll, 2010</i> , Natural Resource Report NPS/NRSS/EQD/NRR--2011/481. SOURCE: Estimates by Land Economics Consultants 2012						

visitor group both inside and outside the park. For some visitors, spending on lodging supported hotel workers outside the park, for other visitors spending on lodging inside the park supported hotel workers employed by the concessioner.

It is assumed that park partner activities would remain the same under all alternatives.

### One-Time Impacts of NPS Spending on Restoration and Construction Projects

In addition to ongoing spending discussed above that will continue on, year after year, for “in-house” NPS staff and their activities, there is additional work performed every year by contractors on specific restoration projects, major road maintenance and other infrastructure projects, on environmental processing and planning, and for similar activities. The budgets for these activities vary significantly year by year as funding is identified for specific projects. Over the last five years (2007-2011) the total Yosemite National Park budget has ranged from \$70 to \$103 million, and has averaged \$89 million. After deducting the \$49 million in NPS staff costs discussed above, the average budget for contractor activities has been approximately \$40 million per year. The majority of contractor activity, estimated at 80%, is in the construction sector of the economy, with most of the remainder, estimated at 20%, in the professional services sector (e.g., architects, environmental planners, engineers, etc.) Thus, under

the No Action Alternative, approximately \$32 million per year is spent on construction sector projects, and \$8 million per year for the professional services to plan and design those projects.

In addition to the ongoing spending to maintain and repair the park, each action alternative essentially proposes a new plan for infrastructure and facilities that will guide future spending on projects, most of which will be carried out by contractors as described above. There will be one-time spending by NPS on the various project elements required to restore areas and construct facilities to implement each of the action alternatives. Although this spending will be spread out over a number of years during implementation as financial resources are identified, each project element will be built only once. The current estimates for the total implementation cost are as follows:

- Alternative 1 — There would be no additional costs for Alternative 1 (No Action)
- Alternative 2 — \$168,000,000
- Alternative 3 — \$147,000,000
- Alternative 4 — \$168,000,000
- Alternative 5 — \$183,000,000
- Alternative 6 — \$259,000,000

### Characterization of Impacts for NEPA

Proposed management actions under Alternative 1 and for Alternatives 2–6 will be evaluated in terms of the context, intensity, and duration of socioeconomic impacts and whether impacts were considered beneficial or adverse to the socioeconomic environment.

- **Context.** The context of the impact considers whether the impact would be local or regional. Unlike the analysis of most other topic areas, socioeconomics differs in that even “local” impacts are not confined to any one river segment. Although it is true that the largest concentration of commercial facilities within the park is in Yosemite Valley, visitors to the Valley may also make expenditures elsewhere within the region during their visits (e.g., stopping for gasoline in a gateway community). The indirect and induced effects quickly ripple away from the initial point of sale where the direct impact occurs, and total economic impacts are only measurable at the regional level. For purposes of this analysis, local impacts would be those that occur parkwide within Yosemite National Park. Regional impacts would be impacts in the four-county area around the park (Tuolumne, Mono, Mariposa, and Madera), including all gateway communities. Socioeconomic impacts will be discussed under the heading of “All River Segments.”
- **Intensity.** The intensity of the impact considers whether effects would be negligible, minor, moderate, or major.
  - **Negligible** impacts are considered not detectable and are expected to have no discernible effect on the social and economic environment. When the socioeconomic impacts are quantifiable, negligible impacts would generally be expected to correspond to proportional changes of 2.5% or less in the specific economic resource.
  - **Minor** impacts are slightly detectable and are not expected to have an overall effect on the character of the social and economic environment. When the socioeconomic

impacts are quantifiable, minor impacts would generally be expected to correspond to proportional changes between 2.5% and 5% in the specific economic resource.

- **Moderate** impacts are detectable, without question, and could have an appreciable effect on the social and economic environment. Such impacts would have the potential to initiate an increasing influence on the social and economic environment (particularly if other factors have a contributing effect). When the socioeconomic impacts are quantifiable, moderate impacts would generally be expected to correspond to proportional changes between 5% and 10% in the specific economic resource.
- **Major** impacts are considered to have a substantial, highly noticeable influence on the social and economic environment and could be expected to alter that environment over the long run. When the socioeconomic impacts are quantifiable, major impacts would generally be expected to correspond to proportional changes greater than 10% in the specific economic resource.

In addition, impacts are recognized as indeterminate if the intensity of their effects on the social and economic environment could not be readily identified (especially when compared with the potential influence of other social and economic factors and/or when data limitations exist).<sup>2</sup>

- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term. A short-term impact would be temporary and would be associated with transitional types of activities. A long-term impact would have an ongoing effect on the socioeconomic environment.
- **Type of Impact.** Impacts were evaluated in terms of whether they would be beneficial or adverse to the socioeconomic environment. Beneficial socioeconomic impacts would improve the social or economic conditions in the park or in the affected region. Beneficial impacts include mechanisms that attract additional visitors and spending into the region, create new jobs, or promote growth in the size of the regional economy. Adverse socioeconomic impacts would negatively alter social or economic conditions in the park or in the affected region, or would affect low-income populations. Adverse impacts include mechanisms that discourage some visitors from coming and spending money in the region, reductions in the number of jobs, or actions that retard the growth of the economy. Another, more specific, form of socioeconomic impact is the effect actions could have on the budgets of public agencies. Increases in revenues and reductions in costs are beneficial, and the inverse is adverse. Changes in economic activity levels can also stimulate changes in local housing markets. Increasing demand for housing due to economic expansion is generally seen as beneficial by housing providers, but adverse by low-income housing consumers.

---

<sup>2</sup> The extent to which quantified socioeconomic analysis of the alternatives can be performed will depend directly on the degree to which: (1) the no-action alternative is quantitatively characterized; (2) alternatives are quantifiable distinct from the no-action alternative and amongst the action alternatives; and (3) that the action alternatives' effects on future park visitation can be adequately projected.

Differences in the magnitude of future annual visitation will be a potential primary factor resulting in quantifiable effects to local and regional socioeconomic resources. In addition, changes to the type of visitation (e.g., day use versus overnight use, length of stay, visitor activity type and/or location) or the visitor profile (e.g., age and income) could be used to project related socioeconomic impacts. However, given the multitude of factors involved with visitors' recreation decision-making, it may in some cases be too difficult or speculative to project the changes in visitation patterns within the park and future visitor responses resulting from proposed ORV and facility changes.

## ***Environmental Consequences of Alternative 1 (No Action)***

### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

In concept, actions to protect and enhance river values may make visiting the Merced River corridor more or less attractive to recreationists seeking different types of experiences, but in practice it would be the actions that manage visitor use and facilities that primarily would determine the number of people that are able to visit the corridor each year, and all socioeconomic impact analysis will be discussed under that topic heading for each alternative.

#### ***Impacts of Actions to Manage Visitor Use and Facilities***

The number of visitors (as presented in table 9-113 above) and the spending patterns (as presented in table 9-107 above) are both used as inputs to the MGM2 model. To conform to the visitor group per night/day format required by the MGM2 model, the total number of recreation visits counted at the entrances to the park is translated first into “Visits in Party-Days/Nights” in **table 9-172**. The translation of individual visitors to groups takes into account factors for

- each visitor market segment’s share of total entries to the park
- re-entry rate (park entries per trip)
- average visitor group size
- length of stay (days or nights)

The MGM2 model analyzes spending and impacts by visitor market segment, defined as follows:

- Local-Day User: corresponds to people who live within the four-county region who recreate in the park.
- Non-Local-Day User: person living or staying outside the four-county region who is able to visit the park on a day use basis.
- Motel-In: people staying inside the park within any of the types of lodging accommodations available, other than campgrounds.
- Camp-In: people staying overnight inside the park in developed campgrounds.
- Motel-Out: people staying in commercial lodging outside the park, but within the four-county region.
- Camp-Out: people staying in campgrounds outside the park, but within the four-county region.
- Other Overnight: a miscellaneous category used by the model that includes, among other things, people staying in the backcountry.

**TABLE 9-172: ANALYSIS OF TOTAL VISITATION BY MARKET SEGMENT**

<sup>a</sup> Findings from the 2009 Visitor Services Project survey results as reported in Cook, Philip S., <i>Impacts of Visitor Spending on the Local Economy: Yosemite National Park, 2009</i> , February, 2011 SOURCE: As noted, with Land Economics Consultants analysis 2012								

The MGM2 model first calculates total visitor spending as presented in **table 9-173**. Within a 50-mile radius of the park, Yosemite visitors spent over \$381 million measured in 2010 dollars for the baseline visitor year. This is a measure of the most directly observable socioeconomic impact visitors have on the region before estimating multiplier effects.

**TABLE 9-173: VISITOR GROUPS AND THEIR TOTAL SPENDING BY MARKET SEGMENT FOR THE NO ACTION ALTERNATIVE**

Segment	Visits in Party-Days/Nights	Average Spending (\$)	Total Spending in 2010 \$1,000s	Percent of Spending

Table 9-174 presents the output of the MGM2 modeling for Alternative 1. Visitor spending generates over 5,300 jobs and over a quarter billion dollars in value added for the four-county region. Value added is technically the sum of labor income, profits and rents, and indirect business taxes, and serves as the best overall measure of the total socioeconomic significance of visitor spending within the four-county study region.

**TABLE 9-174: TOTAL ECONOMIC ACTIVITY (FOUR COUNTY REGION) DUE TO VISITOR SPENDING FOR ALTERNATIVE 1 (NO ACTION)**

### *Ongoing NPS Spending*

Visitor spending accounts for the majority of economic activity, but direct spending by the NPS, through its operating budget, payroll/staffing, and capital projects, also generates economic activity in the four-county study area. Table 9-175 analyzes the economic effects of the NPS payroll and employment within the four-county region. Although the NPS only supported 892 jobs directly from its payroll in 2010, total job creation within the four-county economic region included another 294 induced jobs, for a total employment impact of almost 1,200. Similarly, the \$49 million NPS payroll generated over \$63 million in economic value to the surrounding economy.

For the No Action Alternative it is also necessary to account for the portion of the Yosemite National Park budget that goes to purposes other than direct employee compensation. As was discussed in the methodology section, over the last five years this spending has averaged approximately \$40 million per year. Table 9-176 presents an analysis of the regional impact of that spending, starting with the

**TABLE 9-175: ECONOMIC IMPACTS OF NATIONAL PARK SERVICE PAYROLL AND EMPLOYMENT**

Yosemite National Park	Direct Effects	Economic Multipliers <sup>a</sup>	Indirect and Induced Effects	Total of Direct, Indirect and Induced Effects

**TABLE 9-176: ECONOMIC IMPACTS OF THE NON-PAYROLL PORTION OF THE NPS BUDGET IN THE NO ACTION ALTERNATIVE**

Spending by Sector	Average Annual Budget		Value Added		Employment	
	Assumed Percent	(Millions \$)	Multiplier <sup>a</sup>	(Millions \$)	Multiplier (Jobs/\$ million) <sup>b</sup>	No. of Jobs
Construction Sector	80%	\$32.0	0.66	\$21.1	10.93	231
Professional Services	20%	\$8.0	0.81	\$6.5	19.42	126
<b>Total</b>	<b>100%</b>	<b>\$40.0</b>		<b>\$27.6</b>		<b>357</b>
<sup>a</sup> Multipliers are averages of IMPLAN sectors 34 and 36, and 369 and 375.						
<sup>b</sup> Employment multipliers are number of jobs per million dollars of value added in the region.						
SOURCES: As noted; Land Economics Consultants analysis						

assumption that approximately 80% goes into the construction sector and 20% into such professional services as architecture, engineering, environmental and other technical consulting services. Not all of the NPS spending on contractor activities is captured within the four-county region because some firms are from beyond this area, resulting in multipliers that are less than 1.00. Including the direct, indirect and induced effects on value added, however, the majority stays within the region and supports the equivalent of approximately 357 additional jobs in the four counties.

It is assumed that a comparable average annual spending of approximately \$40 million will continue to occur in all of the action alternatives in order to maintain the park's facilities and infrastructure over the long run. As such there will be no differential impact between alternatives from this activity. On the other

hand, there will be different one-time costs to modify facilities and infrastructure to implement each alternative, and those impacts will be discussed below for each alternative.

Note that some projects have been undertaken by park partners in the past, which in theory would have added more spending and employment to what is formally in the NPS budget. Future actions of park partners, however, are expected to be independent of which management alternative NPS selects for the Merced River, and thus would be the same for all alternatives. As such, there is no need to treat them further in this analysis.

Also note that all concessioner employment is supported by concessioner revenues derived from visitor spending in concessioner operated facilities. In other words, all concessioner socioeconomic impacts are included in the analysis of visitor spending above.

### **Summary of Impacts Under Alternative 1 (No Action)**

Current trends would be expected to continue under Alternative 1. These trends include full occupancy of lodging and day parking in the park during peak use periods, which implies there is additional demand for visits to the park that is currently being unmet, and would continue to be unmet during peak periods in the future. Some of that unmet demand may increase the demand for visitor services in gateway communities.

Cumulative socioeconomic impacts are derived from changes in the visitor recreation experience and are based on analysis of past, present, and reasonably foreseeable future actions in the Yosemite region (local and regional) in combination with potential effects of each alternative. Actions evaluated include primarily those that could affect the level of visitation parkwide and/or the amount of spending by visitors to Yosemite National Park. In addition, changes to NPS staffing levels, operating budget outlays, or capital projects that could affect the economy in the four-county region containing the park are also evaluated.

### ***Past Actions***

Today's mix of facilities and infrastructure to accommodate visitors in the park and the attractiveness of the recreational activities available has essentially been created by the cumulative effects of past actions. The more people that visit the park, and the longer they stay in the four-county region, the more likely they are to spend money, which benefits the regional economy. Past actions that have generally resulted in beneficial socioeconomic effects are those that enhance the visitor experience or provide better transportation infrastructure. Past actions generating beneficial socioeconomic effects include El Portal Road Improvement Project, Rehabilitate Yosemite Valley Campground Restrooms, Yosemite Valley Shuttle Bus Procurement, Yosemite Valley Shuttle Bus Stop Improvements, Wawona Road Rehabilitation Project, and the Lower Yosemite Fall Project. Such projects help to incrementally accommodate high volumes of visitors, to satisfy strong demand and visitor spending is a resulting consequence.

The *Half Dome Trail Stewardship Plan* is an example of an action that has reduced access for some visitors and improved the experience for other visitors. In economic terms, such actions have the potential to reduce the number of visitors but increase the "willingness to pay" or strength of demand among those who remain.

However, other past actions (or inactions after natural events) have had adverse impacts on the size of the regional economy by reducing overnight lodging and camping facilities in Yosemite Valley. Major examples include:

- *1997 Flood* – The Park sustained heavy impacts to campgrounds, roads, and lodging. The subsequent closure of the Upper & Lower River Campgrounds resulted in the loss of 376 campsites, and approximately one-half of the units at the Yosemite Lodge (there had been 440 units, which decreased to approximately 245). The El Portal Road was under construction for a year (which had regional impacts to Mariposa County from pass through visitors).
- *2000 Yosemite Valley Plan* – The mandatory mass transit element proposed in the YVP to this day causes confusion among potential visitors and may be affecting visitation.
- *2006 Ferguson Rockslide* – This had an adverse effect on parts of the regional economy, primarily the Mariposa area, when Highway 140 was closed for approximately 6 months (during the summer of 2006) for road repairs; however Groveland and Oakhurst benefited from traffic rerouting through those gateways.
- *2008 Rock falls in Curry Village* – Approximately one-third of the overnight accommodations were lost due to the establishment of a rockfall hazard zone. This had an effect on both the concessioner and Mariposa County in terms of TOT. However, a portion of the accommodations were re-established in Boys Town – a.k.a. the “signature tents.”
- *2012 Hanta virus in Curry Village* – Not only has this situation caused a decline in stays at Curry Village, there have been thousands of systemic cancelations parkwide as a result.

Decisions not to immediately replace units lost through natural disasters have exacerbated a shortage of accommodations during periods of high demand and thus reduced the amount of economic activity attainable during peak periods.

### ***Present Actions***

Similar to past actions, some present actions may result in beneficial socioeconomic effects by improving visitor access, providing recreational opportunities, or adding facilities that offer educational and cultural experiences. Specific examples of present actions that have beneficial effects on socioeconomics include the following:

***Improved Facilities:*** Ahwahnee Comprehensive Rehabilitation Plan, Rehabilitate Wawona Road, Tioga Road Rehabilitations, and Tioga Road Corridor Campground Accessibility Improvements

***Opportunities for Unique Recreational Experiences:*** Commercial Use Authorization for Commercial Activities

### ***Reasonably Foreseeable Future Actions***

Future actions could have both beneficial and adverse socioeconomic effects. Parkwide visitation may be affected to some degree by the Tuolumne River Plan once the Record of Decision is reached and the plan implemented. Future natural events may also have an impact, with weather, waterfall volumes, forest fires and other events affecting visitation. Demand for visits to the park will also likely evolve in

the future due to changing demographics of visitors to Yosemite. New facilities planned for the reasonably foreseeable future can also affect visitation and include:

***New Visitor Facilities:*** Wahhoga Indian Cultural Center and Henness Ridge Environmental Education Center

### ***Overall Cumulative Impact***

Future management of Yosemite National Park, particularly areas within or near the Merced River corridor, could result in either beneficial or adverse effects on total economic activity within the four-county region as described above. The socioeconomic impacts of the future management plans embodied in Alternatives 2–6 will be estimated by examining their differences between them and Alternative 1. Except as modified by present and reasonably foreseeable future actions already planned, Alternative 1 would essentially leave conditions as they exist today. Alternative 1 would not meaningfully expand the inventory of camping and overnight lodging opportunities in Yosemite National Park. Although this would not have a cumulatively additive effect compared with current conditions, it would when compared with conditions at the time of designation (1987) and would represent a continued reduction in camping opportunities.

The overall cumulative effect of Alternative 1 would be that visitation is likely to continue to grow at an average rate of approximately 3% per year in the near term (i.e., the next five years). Without new accommodations in Yosemite Valley, growth could occur during peak periods if people substitute accommodations outside the park for preferred in-park camping and lodging. Growth could also occur if the numbers of visitors increases during nonpeak periods. Current total annual visitation is near the historic high of approximately 4 million visitors, though visitor volumes have ranged as low as 3.2 million over the last decade, and the 10-year average is 3.5 million per year. The baseline year in Alternative 1 of 3.95 million is very close to the highest visitation ever experienced. Based on these considerations, the cumulative economic impact of past, present, and reasonably foreseeable future actions, when combined with those of Alternative 1, would be regional, long term, negligible, and beneficial.

### ***Environmental Consequences to Actions Common to Alternatives 2–6***

#### **All River Segments**

##### ***Impacts of Actions to Manage Visitor Use and Facilities***

Changes in management policies can have impacts on the regional economy that will follow effects commonly observed in market economies. A general *qualitative* description of some of the more common effects includes the following:

- For people seeking a visitor experience that includes more than just a daytrip to the park, demand for overnight accommodations tends to focus on Yosemite Valley first and then radiate outwards, filling motels and campgrounds in gateway communities and beyond as those closer fill up. Restriction on supply of accommodations in the park can increase demand outside, and building new campsites or lodging units in the park can decrease demand for accommodations in gateway communities.

- Due to the substitution effect described above, some people seeking an overnight experience in the park but unable to secure accommodations may be willing to substitute a lodging unit in a gateway community for their preferred unit in the Valley, and effectively become repeat day visitors to the park. Their willingness to move to a gateway location would depend in part, however, on their certainty of being able to access the park on a day use basis. A day-use reservation system that assures them that they will have access to the park, even if they are not staying in it, may increase demand for lodging in gateway communities.
- Due to the displacement, or time-shift, effect described above, some people unable to find accommodations in peak seasons may reschedule a planned visit to the park for a lower demand season. But because weather can be less predictable in the shoulder seasons, not all types of accommodations are conducive to this type of time shifting. While hard-sided cabin units may be able to accommodate travelers year round, camping and tent accommodations may not work as well in shoulder seasons.
- The single private business most heavily impacted by Alternatives 2–6 within the park would be the concessioner. A reduction in the inventory of lodging, or in the commercial recreational activities allowed, would decrease concessioner revenues and ultimately reduce the number of concessioner employees needed. With fewer supplies needed and with less employee spending coming out of the park, there would be further reductions through the multiplier effects to the size of the four-county regional economy. But at the same time demand that can no longer be satisfied within the park may shift outside to gateway communities to some extent. This may create new business opportunities there, which would also have multiplier effects that expand the regional economy. The net effects would likely be less dire than the adverse impacts estimated when looking at the concessioner and park alone.
- The existing concessioner is on a short-term extension of an older contract during the study process now underway. Once a management alternative is selected, and the framework for a new concession operation is established, a new concession contract would be executed. The standard NPS process requires that the new agreement represent a viable business, even if it is dramatically different than the business operation that was in place before. In other words, within the park there would be a one-time change to the business model for the concession operation that is agreeable to all parties. To the extent that the new concession business is smaller than what was there before, additional private business opportunities may be created outside the park.
- Each action alternative includes a set of project elements that would restore specific areas or construct and rehabilitate facilities to support visitor use. One-time spending on these capital projects would temporarily employ people in the construction industry within the four-county region. Some specialized construction skills and materials may be imported from beyond the adjacent four counties, but these projects would generate some new income for residents of the region, and the respending of that income would ripple outwards and further expand the economy of the region. The one-time beneficial impacts of construction would subside once the set of projects is fully implemented.

In terms of specific *quantitative* impacts created by the primary drivers of socioeconomics—spending by visitors and the NPS—each action alternative would have a unique impact, and no impacts would be common to all alternatives.

Spending by park partners is assumed to be independent from NPS management decisions and constant across all alternatives. Because the incremental difference between Alternative 1 and Alternatives 2–6 is zero in all cases, park partner activities are not analyzed further below.

### ***Environmental Consequences of Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration***

#### **All River Segments**

#### ***Impacts of Actions to Manage Visitor Use and Facilities***

Alternative 2 would create the greatest reduction in lodging units among Alternatives 2–6, with 43% fewer units than under Alternative 1. Camping spaces in Yosemite Valley would be slightly reduced, by about 3%. The peak day-use parking and transportation infrastructure in Yosemite Valley would be reduced by 37%. As a result, total annual visitation under Alternative 2 would be a reduction to approximately 3.6 million visitors per year. **Table 9-177** applies results of the VSP survey findings to translate that total annual visitation estimate into visitor groups by market segment, which is necessary for input to the economic models.

**TABLE 9-177: ALTERNATIVE 2 — ANALYSIS OF TOTAL VISITATION BY MARKET SEGMENT**

### Summary of Impacts from Alternative 2: Self-reliant Visitor Experiences and Extensive Floodplain Restoration

The measure of Alternative 2's socioeconomic impact is the degree to which it differs from Alternative 1. Employment has been adopted as the single best indicator of relative economic impact. The number of jobs would be roughly proportional to other possible measures of socioeconomic impact, such as the impact on personal income (which is the wage and salary income associated with jobs) or the impact on total value added within the regional economy (which, as described under Alternative 1, is technically the sum of labor income, profits and rents, and indirect business taxes). The difference in jobs supported under Alternative 2 and Alternative 1 is presented in **table 9-181**, with a detailed breakout by industrial sector within the four-county regional economy. Alternative 2, with its mix of reduced overnight lodging facilities and day use infrastructure, would support 517 fewer jobs than Alternative 1.

The adverse impacts of Alternative 2 might not be as intense as indicated by the job reduction calculated above. As described in the "Environmental Consequences Methodology" section, substitution and time-shift effects could offset some of the visitation displaced during peak times and seasons and soften or even negate the economic impact portrayed here. In the context of total employment within the four-county region, Alternative 2 would support 456 fewer jobs than Alternative 1, and because it would be less than 2.5% fewer jobs the impact would be regional, long term, negligible, and adverse (see **table 9-182**).

Job reduction would be more substantial in specific industry sectors within the four-county region, however. In the lodging industry alone, the reduction in jobs resulting from Alternative 2 would be a long-term, minor, adverse impact. However, to the extent that hotel and motel occupancy increases in gateway communities as a result of the Alternative 2 reduction in Yosemite Valley accommodations, some or all of the adverse impact could be compensated. Similarly, to the extent that overnight visitors to Yosemite Valley are displaced but shift their visits to a different time, the adverse impact could be mitigated.

**TABLE 9-181: ALTERNATIVE 2 — IMPACT ON JOBS BY INDUSTRY SECTOR (FOUR COUNTY REGION)**

Sector/Spending Category	Jobs Under Alt. 1 (No Action)	Jobs Under Alt. 2	Difference in Jobs
<b>Direct Effects</b>			
Motel, hotel cabin, or B&B	1,409	1,299	(109)
Camping fees	145	134	(11)

<sup>a</sup> Indirect and induced effects would be spread throughout all the sectors of the economy and would have a negligible impact.					
SOURCE: Minnesota IMPLAN Group, Inc. data; Land Economics Consultants analysis 2012					

For the Restaurant and Bar sector of the regional economy, the long-term, adverse impact on jobs would be negligible in intensity. The intensity could be reduced by substitution and time-shift effects that maintain volumes of visitors and spending.

Within the four-county regional economy, the single business in the Lodging and Restaurant sectors most affected by Alternative 2 would be the concessioner within the park. This would also constitute the one impact felt in the local context of the park, and a 43% reduction in lodging would no doubt be seen as a noticeable adverse impact by the existing concessioner. In the long term, however, a new concession agreement would result from the issuance of a Contract Prospectus describing the business opportunity offered under the *Merced Wild and Scenic River Comprehensive Management Plan* (CMP). Prior to issuing a prospectus to the public, the NPS must determine that a financially feasible business opportunity exists that would mitigate this local impact by realigning the financial performance expectations of the concessioner with the new facilities and infrastructure to support commercial visitor service in the park.

In the Transportation sector of the regional economy, the long-term, adverse impact on jobs would be negligible in intensity. Note, however, that in addition to the potential mitigating substitution and time-shift effects, the more intensive transportation management efforts under Alternative 2 might require additional staffing for regional public transportation systems and for traffic and parking management in the park.

Just as impacts are felt with different intensities in different sectors of the economy, intensities of impacts would also vary geographically within the four-county regional economy. In the smaller counties of Mariposa and Mono, where the Leisure and Hospitality sector comprises a third to half of all jobs, impacts derived from visitor spending would be more noticeable than in the larger and more diversified economies of Madera and Tuolumne counties. Within counties, gateway communities would experience impacts more intensely than larger and more distant cities that have more diversity in their economic support.

Mariposa County, and the gateway community of Mariposa within it, are likely to be the most noticeably impacted geographic areas because they combine both dependency on tourism industry spending and proximity to the park. A fiscal connection also exists because concessioner lodging in Yosemite Valley lies within Mariposa County, which receives the transient occupancy tax revenue collected there. El Portal Administrative Site falls within Mariposa County. Mariposa is further impacted because it is the closest place for park and concessioner employees to live who do not have housing within the park. Changes in the park workforce living in Mariposa County could cause increases or decreases in demand for county services and affect county revenues. Changes in the park workforce could also change school enrollment, affecting both costs and revenues for local schools.

The maximum fiscal impact of Alternative 2 on Mariposa County could include a reduction of \$716,000 in TOT revenue, based on the 10% tax rate and the difference in spending between Alternatives 1 and 2 for all types of lodging, both inside and outside the park. This would be equivalent to a 1.7% reduction in General Fund revenue for the county.

In addition to the ongoing socioeconomic impacts analyzed above, there would be one-time impacts generated by NPS spending on construction and restoration projects to implement Alternative 2, estimated to cost a total of \$168 million. If these implementation projects took place evenly over a five-year period, the \$34 million per year would be equal to a 4.7% increase in Construction sector output within the region (table 9-124). This impact on the Construction sector would be regional, short term, minor, and beneficial. If the implementation were spread evenly over a longer period of 20 years, the intensity of the impact would drop to negligible.

## **Cumulative Impacts from Alternative 2**

### ***Past Actions***

Past actions would affect Alternative 2 to the same degree they affect Alternative 1 for socioeconomic impacts.

### ***Present Actions***

Present actions would affect Alternative 2 to the same degree they affect Alternative 1 for socioeconomic impacts.

### ***Reasonably Foreseeable Future Actions***

For socioeconomic impacts, the cumulatively considerable factors would be the same as those described above for Alternative 1. These would include the effects of private decisions made in the gateway communities and elsewhere in the four-county region, as well as those of public decisions in the region and within the park. Over the long run, one of the most functional features of market economies is that they trend toward self-correction. If public management actions reduce the supply of lodging and other commercial amenities within the park, demand pressures may build to the point that private interests may expand supply in surrounding areas by developing additional lodging, restaurants, and other facilities. These effects are likely to be strongest in areas closest to the park, and due to its proximity Mariposa County could be a beneficiary of this additional market demand. Specific present actions that could facilitate the capture of additional development include

- *Mariposa County General Plan Housing Element Update*
- *Mariposa County General Plan (Update)*

Short of new construction, additional demand may be satisfied by increasing hours and seasons of operations, adding additional staff, and other business operating responses to expand capacities in gateway communities. In the short run, management policies within the park can alter the flow of visitors and shift the mix of overnight and day visitors, but in the long run market adaptations can continue to increase the annual volumes of people visiting the park. Based on these considerations, the cumulative economic impact of past, present, and reasonably foreseeable future actions, when combined with those of Alternative 2, would be regional, long term, negligible, and adverse.

## **Irreversible and Irretrievable Commitment of Resources for Alternative 2**

For the most part, socioeconomic actions are reversible in the sense that markets adapt to changing circumstances and public policies can change strategies over time. On the other hand, the implementation of Alternative 2 would require the one-time expenditure of approximately \$168 million to implement the various actions proposed. Once expended, those financial resources would no longer be available for other possible uses, and relatively permanent changes to facilities and infrastructure in the park would have been made. Physical changes made for Alternative 2 may be reversed in the future, but additional financial resources would be required to do so.

## **Relationship of Short-Term Uses and Long-Term Productivity for Alternative 2**

Construction and restoration projects to implement Alternative 2 would create short-term disruptions to visitor use patterns during construction. There would also be a short-term, one-time change to the business model for the concessioner in the park, with a new concession agreement put in place to be consistent with the objectives and scale of facilities produced by Alternative 2. In the long term, a new pattern of economic flows in the region would emerge that would supply visitor services to meet the new level of visitor demand.

## ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Manage Visitor Use and Facilities***

Alternative 3 would create the second largest reduction in lodging units, with 38% fewer units than under Alternative 1. The inventory of camping spaces in Yosemite Valley would increase slightly, by about 2%. The day use infrastructure in the Valley would see the largest reduction of all the alternatives, by 44%. As a result, total annual visitation under Alternative 3 would be a reduction to 3.6 million visitors per year. **Table 9-183** applies results of the VSP survey findings to translate that total annual visitation estimate into visitor groups by market segment, which is necessary for input to the economic models.

**Table 9-184** summarizes total spending derived from the level of visitation produced by analysis of the full pattern of spending within the MGM2 model. The MGM2 model also estimates total economic activity in terms of job creation, income to workers, and value added to the four-county regional economy, as presented in **table 9-185**. **Table 9-186** calculates economic impacts of NPS spending.

### Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration

The difference in jobs supported under Alternative 3 and Alternative 1 is presented in **table 9-187**, with a detailed breakout by industrial sector within the four-county regional economy. Alternative 3, with its smaller inventory of overnight lodging facilities and reduced day use infrastructure, would support 544 fewer jobs than Alternative 1 (No Action). Similarly to Alternative 2, the adverse impacts of Alternative 3 might not be as intense as indicated by the job reduction calculated above due to substitution and time-shift effects. In the context of total employment within the four-county region, the reduction in jobs resulting from Alternative 3 would be a long-term, adverse impact, but because at -0.5% it is less than the -2.5% threshold for minor, it would be negligible in intensity (see **table 9-188**).

For specific industry sectors within the four-county region, however, the job reduction would be more significant. In the lodging industry alone, the reduction in jobs resulting from Alternative 3 would be a long-term, minor, adverse impact. As noted above, to the extent that hotel and motel occupancies increase in gateway communities as a result of the Alternative 3 reduction in Yosemite Valley accommodations, some or all of the adverse impact could be mitigated. Similarly, to the extent that overnight visitors to the Valley are displaced but shift their visits to a different time, the adverse impact could be mitigated.

In the Restaurant and Bar sector of the regional economy, the long-term, adverse impact on jobs would be negligible in intensity. The intensity could be reduced by substitution and time-shift effects that maintain volumes of visitors and spending.

Within the four-county regional economy, the single business in the Lodging and Restaurant sectors most affected by Alternative 3 would be the concessioner within the park. This would also constitute the one impact felt in the local context of the park, and a 36% reduction in lodging would no doubt be seen as a noticeable adverse impact by the existing concessioner. In the long term, however, a new concession agreement would result from the issuance of a Contract Prospectus describing the business opportunity offered under the CMP. Prior to issuing a Prospectus to the public, the NPS must determine that a financially feasible business opportunity exists that would mitigate this local impact by realigning the financial performance expectations of the concessioner with the new opportunity for commercial visitor service in the park.

In the Transportation sector of the regional economy, the long-term, adverse impact on jobs would be negligible in intensity. Note, however, that in addition to the potential mitigating substitution and time-shift effects, the more intensive transportation management efforts under Alternative 3 might require additional staffing for regional public transportation systems and for traffic and parking management in the park.

Just as impacts are felt with different intensities in different sectors of the economy, intensities of impacts would also vary geographically within the four-county regional economy. In the smaller counties of Mariposa and Mono, where the Leisure and Hospitality sector comprises a third to half of all jobs, impacts derived from visitor spending would be more noticeable than in the larger and more diversified economies of Madera and Tuolumne counties. Within counties, gateway communities would experience impacts more intensely than larger and more distant cities that have more diversity in their economic support.

<sup>a</sup> Indirect and induced effects would be spread throughout all sectors of the economy and would have a negligible impact.					
SOURCE: Minnesota IMPLAN Group, Inc. data; Land Economics Consultants analysis 2012					

Mariposa County, and the gateway community of Mariposa within it, is likely to be the most noticeably impacted geographic areas because they combine both dependency on tourism industry spending and proximity to the park. There is also a fiscal connection in that the concessioner lodging in Yosemite Valley lies within Mariposa County, which receives the transient occupancy tax revenue collected there. El Portal Administrative Site falls within Mariposa County. Mariposa is further impacted because it is the closest place for park and concessioner employees to live who do not have housing within the park. Changes in the park workforce living in Mariposa County could cause increases or decreases in demand for county services and affect county revenues. Changes in park workforce could also change school enrollment, affecting both costs and revenues for local schools.

The maximum fiscal impact of Alternative 3 on Mariposa County could include a reduction of \$855,000 in TOT revenue, based on the 10% tax rate and the difference in spending between Alternatives 1 and 3 for all types of lodging, both inside and outside the park. This would be equivalent to a 2.0% reduction in General Fund revenue for the county.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

#### ***Past Actions***

Past actions would affect Alternative 3 to the same degree they affect Alternative 1 for socioeconomic impacts.

#### ***Present Actions***

Present actions would affect Alternative 3 to the same degree they affect Alternative 1 for socioeconomic impacts.

#### ***Reasonably Foreseeable Future Actions***

For socioeconomic impacts, the cumulatively considerable factors would be the same as those described above for Alternative 1. These would include the effects of private decisions made in the gateway communities and elsewhere in the four-county region, as well as those of public decisions in the region and within the park. Over the long run, one of the most functional features of market economies is that they trend toward self-correction. If public management actions reduce the supply of lodging and other commercial amenities within the park, demand pressures may build to the point that private interests may expand supply in surrounding areas by developing additional lodging, restaurants, and other facilities. These effects are likely to be strongest in areas closest to the park, and due to its proximity Mariposa County could be a beneficiary of this additional market demand. Specific present actions that could facilitate the capture of additional development include

- *Mariposa County General Plan Housing Element Update*
- *Mariposa County General Plan (Update)*

Short of new construction, additional demand may be satisfied by increasing hours and seasons of operations, adding additional staff, and other business operating responses to expand capacities in gateway communities. In the short run, management policies within the park can alter the flow of visitors and shift the mix of overnight and day visitors, but in the long run market adaptations can continue to increase the annual volumes of people visiting the park. Based on these considerations, the cumulative economic impact of past, present, and reasonably foreseeable future actions, when combined with those of Alternative 3, would be regional, long term, negligible, and adverse.

### **Irreversible and Irretrievable Commitment of Resources for Alternative 3**

For the most part, socioeconomic actions are reversible in the sense that markets adapt to changing circumstances and public policies can change strategies over time. On the other hand, the implementation of Alternative 3 would require the one-time expenditure of approximately \$147 million. Once expended, those financial resources would no longer be available for other possible uses, and relatively permanent changes to facilities and infrastructure in the park would have been made. Physical changes made under Alternative 3 may be reversed in the future, but additional financial resources would be required to do so.

### **Relationship of Short-Term Uses and Long-Term Productivity for Alternative 3**

Construction and restoration projects to implement Alternative 3 would create short-term disruptions during construction, but would produce desired changes to the park over the long term. There would also be a short-term, one-time change to the business model for the concessioner in the park, with a new concession agreement put in place to be consistent with the objectives and scale of facilities produced under Alternative 3. In the long term, a new pattern of economic flows in the region would be likely to emerge that would supply visitor services to meet the new level of visitor demand.

## ***Environmental Consequences of Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Manage Visitor Use and Facilities***

Alternative 4 would create a reduction in lodging units, with 20% fewer units than under Alternative 1 (No Action). On the other hand, the inventory of camping spaces in Yosemite Valley would increase by about 50%. The peak day-use infrastructure in the Valley would see a reduction of 29%. As a result, total annual visitation under Alternative 4 was a reduction to approximately 3.88 million visitors per year. **Table 9-189** applies results of the VSP survey findings to translate that total annual visitation estimate into visitor groups by market segment, which is necessary for input to the economic models.

**TABLE 9-189: ALTERNATIVE 4 — ANALYSIS OF TOTAL VISITATION BY MARKET SEGMENT**

### Summary of Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration

The difference in jobs supported under Alternative 4 and Alternative 1 is presented in **table 9-193**, with a detailed breakout by industrial sector within the four-county regional economy. Alternative 4, with its different mix of facilities and infrastructure, would support 110 fewer jobs than Alternative 1.

**TABLE 9-193: ALTERNATIVE 4 — IMPACT ON JOBS BY INDUSTRY SECTOR**

Sector/Spending Category	Jobs Under Alt. 1 (No Action)	Jobs Under Alt. 4	Difference in Jobs
<b>Direct Effects</b>			
Motel, hotel, cabin, or B&B	1,409	1,382	(26)
Camping fees	145	143	(3)
Restaurants & bars	1,098	1,077	(21)
Admissions & fees	705	692	(13)
Local transportation	495	486	(9)
Grocery stores	103	101	(2)
Gas stations	47	46	(1)

<b>National Park Service Total Employment Effects</b>	<b>1,186</b>	<b>1,176</b>	<b>(10)</b>
<b>Total Job Creation in Four Counties</b>	<b>6,543</b>	<b>6,433</b>	<b>(110)</b>
SOURCE: MGM2 model, Land Economics Consultants 2012			

As described for other alternatives, the adverse impacts of Alternative 4 might not be as intense as indicated by the job reduction calculated above due to substitution and time-shift effects. In the context of total employment within the four-county region, the reduction in jobs resulting from Alternative 4 would be a long-term, adverse impact, but it would be negligible in intensity (see **table 9-194**).

For specific industry sectors within the four-county region, however, the job reduction would be more significant in terms of percentage changes within each sector. In the lodging industry, the reduction in jobs resulting from Alternative 4 would be a long-term, negligible, adverse impact. As noted previously, to the extent that hotel and motel occupancies increase in gateway communities as a result of the Alternative 4 reduction in Yosemite Valley accommodations, some or all of the adverse impact could be mitigated. Similarly, to the extent that overnight visitors to the Valley are displaced but shift their visits to a different time, the adverse impact could be mitigated.

**TABLE 9-194: ALTERNATIVE 4 — CHARACTERIZATION OF IMPACT SIGNIFICANCE**

Industry Sector	Total Jobs in 4-County Region	Alt. 4: Net Impact on Jobs	Impact as % of Total	Characterization of Impact Significance	
<b>Total Impacts (including Indirect &amp; Induced Effects)</b>	<b>102,273</b>	<b>(110)</b>	<b>-0.1%</b>	Negligible	Adverse
<b>Direct Impacts on Specific Sectors<sup>a</sup></b>					
Agriculture	13,619	0	0.0%	No Impact	
Mining	310	0	0.0%	No Impact	
Construction	5,115	0	0.0%	No Impact	
Manufacturing	4,043	0	0.0%	No Impact	
Transportation (and Public Utilities)	2,074	(9)	-0.4%	Negligible	Adverse
Retail Stores (and Wholesale Trade)	10,314	(8)	-0.1%	Negligible	Adverse
Lodging Industry	3,637	(29)	-0.8%	Negligible	Adverse
Restaurants and Bars	5,887	(21)	-0.3%	Negligible	Adverse
All Other Service Industries	36,446	(13)	0.0%	Negligible	Adverse
Government (Local, State, & Fed.)	20,828	(10)	0.0%	Negligible	Adverse
<sup>a</sup> Indirect and induced effects would be spread throughout the economy and would have a negligible impact. SOURCE: Minnesota IMPLAN Group, Inc. data; Land Economics Consultants analysis 2012					

In the Restaurant and Bar sector of the regional economy, the long-term, adverse impact on jobs would also be negligible in intensity. The intensity could be reduced by substitution and time-shift effects that maintain volumes of visitors and spending.

Within the four-county regional economy, the single business in the lodging and restaurant sectors most affected by Alternative 4 would be the concessioner within the park. This would also constitute the one impact felt in the local context of the park, and a 20% reduction in lodging would no doubt be seen as a noticeable adverse impact by the existing concessioner. In the long term, however, a new concession agreement would result from the issuance of a Contract Prospectus describing the business opportunity offered under the CMP. Prior to issuing a Prospectus to the public, the NPS must determine that a financially feasible business opportunity exists that would mitigate this local impact by realigning the financial performance expectations of the concessioner with the new opportunity for commercial visitor service in the park.

In the Transportation sector of the regional economy, the long-term, adverse impact on jobs would be negligible in intensity. Note, however, that in addition to the potential mitigating substitution and time-shift effects, the more intensive transportation management efforts under Alternative 4 might require additional staffing for regional public transportation systems and for traffic and parking management in the park.

Just as impacts are felt with different intensities in different sectors of the economy, intensities of impacts would also vary geographically within the four-county regional economy. In the smaller counties of Mariposa and Mono, where the leisure and hospitality sector comprises a third to half of all jobs, impacts derived from visitor spending would be more noticeable than in the larger and more diversified economies of Madera and Tuolumne counties. Within counties, gateway communities

would experience impacts more intensely than larger and more distant cities that have more diversity in their economic support.

Mariposa County, and the gateway community of Mariposa within it, is likely to be the most noticeably impacted geographic areas because they combine both dependency on tourism industry spending and proximity to the park. There is also a fiscal connection in that the concessioner lodging in Yosemite Valley lies within Mariposa County, which receives the transient occupancy tax revenue collected there. El Portal Administrative Site falls within Mariposa County. Mariposa is further impacted because it is the closest place for park and concessioner employees to live who do not have housing within the park. Changes in the park workforce living in Mariposa County could cause increases or decreases in demand for county services and affect county revenues. Changes in park workforce could also change school enrollment, affecting both costs and revenues for local schools.

The maximum fiscal impact of Alternative 4 on Mariposa County could include a reduction of \$173,000 in TOT revenue, based on the 10% tax rate and the difference in spending between Alternatives 1 and 4 for all types of lodging, both inside and outside the park. This would be equivalent to a 0.4% reduction in General Fund revenue for the county.

### **Cumulative Impacts from Alternative 4: Resource-based Visitor Experiences and Targeted Riverbank Restoration**

#### ***Past Actions***

Past actions would affect Alternative 4 to the same degree they affect Alternative 1 for socioeconomic impacts.

#### ***Present Actions***

Present actions would affect Alternative 4 to the same degree they affect Alternative 1 for socioeconomic impacts.

#### ***Reasonably Foreseeable Future Actions***

For socioeconomic impacts, the cumulatively considerable factors would be the same as those described for Alternative 1. These would include the effects of private decisions made in the gateway communities and elsewhere in the four-county region, as well as those of public decisions in the region and within the park. Over the long run, one of the most functional features of market economies is that they trend towards self-correction. If public management actions reduce the supply of lodging and other commercial amenities within the park, demand pressures may build to the point that private interests may expand supply in surrounding areas by developing additional lodging, restaurants, and other facilities. These effects are likely to be strongest in areas closest to the park, and due to its proximity Mariposa County could be a beneficiary of this additional market demand. Specific present actions that could facilitate the capture of additional development include

- *Mariposa County General Plan Housing Element Update*
- *Mariposa County General Plan (Update)*

Short of new construction, additional demand may be satisfied by increasing hours and seasons of operations, adding additional staff, and other business operating responses to expand capacities in gateway communities. In the short run, management policies within the park can alter the flow of visitors and shift the mix of overnight and day visitors, but in the long run market adaptations can continue to increase the annual volumes of people visiting the park. Based on these considerations, the cumulative economic impact of past, present, and reasonably foreseeable future actions, when combined with those of Alternative 4, would be regional, long term, negligible, and adverse.

#### **Irreversible and Irretrievable Commitment of Resources for Alternative 4**

For the most part, socioeconomic actions are reversible in the sense that markets adapt to changing circumstances and public policies can change strategies over time. On the other hand, the implementation of Alternative 4 would require the one-time expenditure of approximately \$168 million. Once expended, those financial resources would no longer be available for other possible uses, and relatively permanent changes to facilities and infrastructure in the park would have been made. Physical changes made under Alternative 4 may be reversed in the future, but additional financial resources would be required to do so.

#### **Relationship of Short-Term Uses and Long-Term Productivity for Alternative 4**

Construction and restoration projects to implement Alternative 4 would create short-term disruptions during construction, but would produce desired changes to the park over the long term.

There would also be a short-term, one-time change to the business model for the concessioner in the park, with a new concession agreement put in place to be consistent with the objectives and scale of facilities produced under Alternative 4. In the long term, a new pattern of economic flows in the region would be likely to emerge that would supply visitor services to meet the new level of visitor demand.

### ***Environmental Consequences of Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Manage Visitor Use and Facilities***

Compared with Alternative 1 (No Action), Alternative 5 would create slightly more lodging units in the park, approximately 2% more. The camping unit inventory in Yosemite Valley would grow more substantially, by approximately 37%. Peak day-use infrastructure in the Valley, on the other hand, would be reduced by approximately 11%. As a result, and as discussed in the “Environmental Consequences Methodology” section above, the scenario for total annual visitation under Alternative 5 maintains the level generally experienced today, approximately 3.95 million visitors per year. Table 9-195 applies results of the VSP survey findings to translate that total annual visitation estimate into visitor groups by market segment, which is necessary for input to the economic models.

**TABLE 9-195: ALTERNATIVE 5 — ANALYSIS OF TOTAL VISITATION BY MARKET SEGMENT**

### Summary of Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration

The difference in jobs supported under Alternative 5 and Alternative 1 is presented in **table 9-199**, with a detailed breakout by industrial sector within the four-county regional economy. Alternative 5 would be essentially the same as Alternative 1 in terms of jobs; it would support the equivalent of four fewer jobs than Alternative 1.

**TABLE 9-199: ALTERNATIVE 5 — IMPACT ON JOBS BY INDUSTRY SECTOR**

Sector/Spending Category	Jobs Under Alt. 1 (No Action)	Jobs Under Alt. 5	Difference in Jobs
<b>Direct Effects</b>			
Motel, hotel, cabin, or B&B	1,409	1,408	(1)
Camping fees	145	145	(0)
Restaurants & bars	1,098	1,097	(1)
Admissions & fees	705	704	(0)
Local transportation	495	494	(0)
Grocery stores	103	103	(0)
Gas stations	47	47	(0)
Other retail	261	261	(0)
Wholesale trade	10	10	(0)
Local Production of goods	1	1	(0)
<b>Total Direct Effects</b>	<b>4,274</b>	<b>4,271</b>	<b>(3)</b>
Indirect and Induced Effects	1,083	1,082	(1)
<b>Total Effects of Visitor Spending</b>	<b>5,357</b>	<b>5,353</b>	<b>(4)</b>
<b>National Park Service Total Employment Effects</b>	<b>1,186</b>	<b>1,186</b>	<b>(0)</b>
<b>Total Job Creation in Four Counties</b>	<b>6,543</b>	<b>6,539</b>	<b>(4)</b>
SOURCE: MGM2 model, Land Economics Consultants 2012			

The long-term, regional, adverse impacts of Alternative 5 would be negligible. In the context of total employment within the four-county region, the support for jobs resulting from Alternative 5 would be almost the same as from Alternative 1 (see **table 9-200**). In the context of specific industry sectors within the four-county region, the long-term economic impacts would be slightly adverse but would also be negligible.

### Cumulative Impacts from Alternative 5: Enhanced Visitor Experiences and Essential Riverbank Restoration

#### *Past Actions*

Past actions would affect Alternative 5 to the same degree they affect Alternative 1 for socioeconomic impacts.

**TABLE 9-200: ALTERNATIVE 5 — CHARACTERIZATION OF IMPACT SIGNIFICANCE**

Industry Sector	Total Jobs in the 4-County Region	Alt. 5: Net Impact on Jobs	Impact as % of Total	Characterization of Impact Significance	
Total Impacts (including Indirect & Induced Effects)	102,273	(4)	-0.0%	Negligible	Adverse
Direct Impacts on Specific Sectors <sup>a</sup>					
Agriculture	13,619	0	0.0%	No Impact	
Mining	310	0	0.0%	No Impact	
Construction	5,115	0	0.0%	No Impact	
Manufacturing	4,043	0	0.0%	No Impact	
Transportation (and Public Utilities)	2,074	(0)	0.0%	No Impact	
Retail Stores (and Wholesale Trade)	10,314	(0)	0.0%	No Impact	
Lodging Industry	3,637	(1)	0.0%	Negligible	Adverse
Restaurants and Bars	5,887	(1)	0.0%	Negligible	Adverse
All Other Service Industries	36,446	(0)	0.0%	No Impact	
Government (Local, State, & Fed.)	20,828	(0)	0.0%	No Impact	
<sup>a</sup> Indirect and induced effects would be spread throughout all sectors of the economy and would have a negligible impact. SOURCE: Minnesota IMPLAN Group, Inc. data; Land Economics Consultants 2012					

### *Present Actions*

Present actions would affect Alternative 5 to the same degree they affect Alternative 1 for socioeconomic impacts.

### *Reasonably Foreseeable Future Actions*

For socioeconomic impacts, the cumulatively considerable factors would be the same as those described above for alternative 1. These will include the effects of private decisions made in the gateway communities and elsewhere in the four-county region, as well as those of public decisions in the region and within the park. Over the long run, one of the most functional features of market economies is that they trend toward self-correction. If public management actions reduce the supply of lodging and other commercial amenities within the park, demand pressures may build to the point that private interests may expand supply in surrounding areas by developing additional lodging, restaurants, and other facilities. Short of new construction, additional demand may be satisfied by increasing hours and seasons of operations, adding additional staff, and other business operating responses to expand capacities in gateway communities. In the short run, management policies within the park can alter the flow of visitors and shift the mix of overnight and day visitors, but in the long run market adaptations can continue to increase the annual volumes of people visiting the park. Based on these considerations, the cumulative economic impact of past, present, and reasonably foreseeable future actions, when combined with those of Alternative 5, would be regional, long term, negligible, and adverse.

### **Irreversible and Irretrievable Commitment of Resources for Alternative 5**

For the most part, socioeconomic actions are reversible in the sense that markets adapt to changing circumstances and public policies can change strategies over time. On the other hand, the implementation of Alternative 5 would require the one-time expenditure of approximately \$183 million. Once expended, those financial resources would no longer be available for other possible uses, and relatively permanent changes to facilities and infrastructure in the park would have been made. Physical changes made for Alternative 5 may be reversed in the future, but additional financial resources would be required to do so.

### **Relationship of Short-Term Uses and Long-Term Productivity for Alternative 5**

Construction and restoration projects to implement Alternative 5 would create short-term disruptions during construction, but would produce desired changes to the park over the long term. There would also be a short-term, one-time change to the business model for the concessioner in the park, with a new concession agreement put in place to be consistent with the objectives and scale of facilities produced under Alternative 5. In the long term, a new pattern of economic flows in the region would be likely to emerge that supplies visitor services to meet the new level of visitor demand.

### ***Environmental Consequences of Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration***

#### **All River Segments**

#### ***Impacts of Actions to Manage Visitor Use and Facilities***

Compared with Alternative 1 (No Action), Alternative 6 would create the largest increase in the number of lodging units in the park, growing by approximately 20%. The camping unit inventory in Yosemite Valley would grow even more proportionately, by approximately 59%. Peak day-use infrastructure in the Valley, on the other hand, would be reduced by approximately 5%. As a result of these actions, the total annual visitor handling facilities and infrastructure of Alternative 6 would be approximately 7% larger than today. This would allow growth to continue at an assumed 3% average rate for another two years before the daily maximum number of visitors would start to be reached on peak days as was described in the methodology section. At that point the annual visitor volume would be approximately 4.19 million. **Table 9-201** applies results of the VSP survey findings to translate that total annual visitation estimate into visitor groups by market segment, which is necessary for input to the economic models.

**TABLE 9-201: ALTERNATIVE 6 — ANALYSIS OF TOTAL VISITATION BY MARKET SEGMENT**

Visitor Market Segment	Visitor Market Segment Share of Park Entries <sup>a</sup>	Calculated Distribution of Visitors	Re-Entry Rate <sup>a</sup>	Visitor Trips to the Park	Ave. Group Size <sup>a</sup>	Visitor Groups	Length of Stay (Nights or Days) <sup>a</sup>	Visits in Party-Days / Nights

<sup>a</sup> Findings from the 2009 Visitor Services Project survey results as reported in Cook, Philip S., <i>Impacts of Visitor Spending on the Local Economy: Yosemite National Park, 2009</i> , February, 2011 SOURCE: As noted, with Land Economics Consultants 2012								

Table 9-202 summarizes total spending derived from the level of visitation produced by analysis of the full pattern of spending within the MGM2 model. The MGM2 model also estimates total economic activity in terms of job creation, income to workers, and value added to the four-county regional economy, as presented in table 9-203. Table 9-204 calculates the economic impacts of NPS spending.

**TABLE 9-202: ALTERNATIVE 6 — VISITOR GROUPS AND TOTAL SPENDING BY MARKET SEGMENT**

Market Segment	Visits in Party-Days/Nights	Average Spending (\$)	Total Spending in 2010 \$000s	Percent of Spending
Local-Day User	69,271	\$74.64	\$5,170	1%
Non-Local-Day User	304,794	\$86.71	\$26,428	7%

## Summary of Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration

The difference in jobs supported under Alternative 6 and Alternative 1 is presented in **table 9-205**, with a detailed breakout by industrial sector within the four-county regional economy. Alternative 6 would support approximately 356 more jobs than Alternative 1

**TABLE 9-205: ALTERNATIVE 6 — IMPACT ON JOBS BY INDUSTRY SECTOR**

Sector/Spending Category	Jobs Under Alt. 1	Jobs Under Alt. 6	Difference in Jobs
<b>Direct Effects</b>			
Motel, hotel cabin, transient rental, or B&B	1,409	1,494	85
Camping fees	145	154	9
Restaurants & bars	1,098	1,164	67
Admissions & fees	705	748	43
Local transportation	495	525	30
Grocery stores	103	109	6
Gas stations	47	50	3
Other retail	261	277	16
Wholesale trade	10	11	1
Local Production of goods	1	1	0
<b>Total Direct Effects</b>	<b>4,274</b>	<b>4,533</b>	<b>259</b>
Indirect and Induced Effects	1,083	1,148	66
<b>Total Effects of Visitor Spending</b>	<b>5,357</b>	<b>5,682</b>	<b>325</b>
<b>National Park Service Total Employment Effects</b>	<b>1,186</b>	<b>1,218</b>	<b>32</b>
<b>Total Job Creation in Four Counties</b>	<b>6,543</b>	<b>6,899</b>	<b>356</b>
SOURCE: MGM2 model, Land Economics Consultants 2012			

The long-term, regional socioeconomic impacts of Alternative 6 would be beneficial, but they would also be negligible. In the context of total employment within the four-county region, the support for jobs resulting from Alternative 6 would be approximately 0.3% larger than Alternative 1 and well within the 0-2.5% categorization for negligible (see **table 9-206**). For specific industry sectors within the four-county region, the beneficial socioeconomic impacts would also be negligible, except in the lodging industry sector where the long-term, regional, beneficial impacts would be minor in intensity.

As was discussed under the other action alternatives, Mariposa County, and the gateway community of Mariposa within it, are likely to be the most noticeably impacted geographic areas because they combine both dependency on tourism industry spending and proximity to the park. There is also a fiscal connection in that the concessioner lodging in Yosemite Valley lies within Mariposa County, which receives the transient occupancy tax revenue collected there. Mariposa is further impacted because it is the closest place for park and concessioner employees to live who do not have housing

**TABLE 9-206: ALTERNATIVE 6 — CHARACTERIZATION OF IMPACT SIGNIFICANCE**

Industry Sector	Total Jobs in the 4-County Region	Alt. 6: Net Impact on Jobs	Impact as % of Total	Characterization of Impact Significance	
<b>Total Impacts (including Indirect &amp; Induced Effects)</b>	<b>102,273</b>	<b>356</b>	<b>0.3%</b>	Negligible	Beneficial
<b>Direct Impacts on Specific Sectors<sup>a</sup></b>					
Agriculture	13,619	0	0.0%	No Impact	
Mining	310	0	0.0%	No Impact	
Construction	5,115	0	0.0%	No Impact	
Manufacturing	4,043	0	0.0%	No Impact	
Transportation (and Public Utilities)	2,074	30	1.4%	Negligible	Beneficial
Retail Stores (and Wholesale Trade)	10,314	26	0.2%	Negligible	Beneficial
Lodging Industry	3,637	94	2.6%	Minor	Beneficial
Restaurants and Bars	5,887	67	1.1%	Negligible	Beneficial
All Other Service Industries	36,446	43	0.1%	Negligible	Beneficial
Government (Local, State, & Fed.)	20,828	32	0.2%	Negligible	Beneficial
<sup>a</sup> Indirect and induced effects would be spread throughout all sectors of the economy and would have a negligible impact. SOURCE: Minnesota IMPLAN Group, Inc. data; Land Economics Consultants 2012					

within the park. Changes in the park workforce living in Mariposa County could cause increases or decreases in demand for county services and affect county revenues. Changes in park workforce could also change school enrollment, affecting both costs and revenues for local schools.

The maximum fiscal impact of Alternative 6 on Mariposa County could include an additional \$560,000 in TOT revenue after two additional years of growth in visitation to the park, and based on the 10% tax rate and the difference in spending between Alternatives 1 and 6 for all types of lodging, both inside and outside the park. This would be equivalent to a 1.3% increase in General Fund revenue for the county.

### **Cumulative Impacts from Alternative 6: Diversified Visitor Experiences and Selective Riverbank Restoration**

#### ***Past Actions***

Past actions would affect Alternative 6 to the same degree they affect Alternative 1 for socioeconomic impacts.

#### ***Present Actions***

Present actions would affect Alternative 6 to the same degree they affect Alternative 1 for socioeconomic impacts.

### ***Reasonably Foreseeable Future Actions***

For socioeconomic impacts, the cumulatively considerable factors would be the same as those described above for Alternative 1. These will include the effects of private decisions made in the gateway communities and elsewhere in the four-county region, as well as those of public decisions within the park. Over the long run, one of the most functional features of market economies is that they trend toward self-correction. If public management actions reduce the supply of lodging and other commercial amenities within the park, demand pressures may build to the point that private interests may expand supply in surrounding areas by developing additional lodging, restaurants, and other facilities. Short of new construction, additional demand may be satisfied by increasing hours and seasons of operations, adding additional staff, and other business operating responses to expand capacities in gateway communities. In the short run, management policies within the park can alter the flow of visitors and shift the mix of overnight and day visitors, but in the long run market adaptations can continue to increase the annual volumes of people visiting the park. Based on these considerations, the cumulative economic impact of past, present, and reasonably foreseeable future actions, when combined with those of Alternative 6, would be regional, long term, negligible, and beneficial.

### **Irreversible and Irretrievable Commitment of Resources for Alternative 6**

For the most part, socioeconomic actions are reversible in the sense that markets adapt to changing circumstances and public policies can change strategies over time. On the other hand, the implementation of Alternative 6 would require the one-time expenditure of approximately \$259 million. Once expended those financial resources would no longer be available for other possible uses, and relatively permanent changes to facilities and infrastructure in the park would have been made. Physical changes made for Alternative 6 may be reversed in the future, but additional financial resources would be required to do so.

### **Relationship of Short-Term Uses and Long-Term Productivity for Alternative 6**

Construction and restoration projects to implement Alternative 6 would create short-term disruptions during construction, but would produce desired changes to the park over the long term. There would also be a short-term, one-time change to the business model for the concessioner in the park, with a new concession agreement put in place to be consistent with the objectives and scale of facilities produced by Alternative 6. In the long term, a new pattern of economic flows in the region is likely to emerge that supplies visitor services to meet the new level of visitor demand.

## HISTORIC PROPERTIES

### Historic Buildings, Structures, and Cultural Landscapes

Comprehensive investigations of historic sites, structures, and cultural landscape resources have been undertaken for Yosemite Valley and El Portal. For other areas, information is taken from overview documents (e.g., Greene 1987) and specific inventories (e.g., the Wilderness Historic Resource Surveys). The types of resources potentially affected by the Merced River Plan include districts, buildings, structures, and landscapes listed in the National Register of Historic Places (NRHP, or National Register) or designated as National Historic Landmarks. These resource types are described below.

- **Districts.** A district is a geographically definable area, urban or rural, possessing a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united by past events or aesthetically by plan or physical development. A district may also comprise individual elements separated geographically but linked by association or history (36 CFR 60.3).
- **Buildings.** A building is a structure created to shelter any form of human activity, such as a house, barn, church, hotel, or similar structure. Building may refer to a historically related complex such as a courthouse and jail or a house and barn (36 CFR 60.3).
- **Structures.** A structure is a work made up of interdependent and interrelated parts in a definite pattern of organization. Constructed by man, it is often an engineering project large in scale (examples are historic trails, bridges, road systems, etc.) (36 CFR 60.3).
- **Cultural Landscapes.** Cultural landscapes are a geographic area, including both cultural and natural resources and the wildlife or domestic animals therein, associated with a historic event, activity, or person or exhibiting other cultural or aesthetic values. Cultural landscapes are the result of the long interaction between people and the land, and the influence of human beliefs and actions over time upon the natural landscape. Shaped through time by historical land use and management practices, as well as politics and property laws, levels of technology, and economic conditions, cultural landscapes provide a living record of an area's past, a visual chronicle of its history. The dynamic nature of modern human life contributes to the continual reshaping of cultural landscapes, making them a good source of information about specific times and places but at the same time rendering their long-term preservation a challenge (NPS *Management Policies* 2006).

**National Historic Landmarks.** National Historic Landmarks (NHL) are nationally significant historic places designated by the Secretary of the Interior because they possess exceptional value or quality in illustrating or interpreting the heritage of the United States. Designation as an NHL affords a property additional protection as the federal government is tasked with avoiding or minimizing any potential adverse effects to the landmark, and monitoring the condition of the property (36 CFR 65)

**National Register of Historic Places Eligibility Criteria.** The criteria of the NRHP provide the basis under which a structure, site, building, district, or object can be considered significant for listing on the National Register. A potential resource needs to meet only one of the four criteria to achieve significance. The criteria include resources that (36 CFR 60.4):

- (A) are associated with events that have made a significant contribution to the broad patterns of history; or
- (B) are associated with the lives of persons significant in our past; or
- (C) embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- (D) have yielded or may likely yield information important in prehistory or history.

## ***Affected Environment***

### **Regulations and Policies**

*Section 106 of National Historic Preservation Act 1966 (as amended).* Section 106 of the National Historic Preservation Act of 1966 (NHPA) (16 USC 470) directs federal agencies to take into account the effects of any undertaking on properties listed in or eligible for listing in the NRHP. The Advisory Council on Historic Preservation (ACHP) has developed implementing regulations (36 CFR 800), which allow agencies to develop agreements for consideration of these historic properties.

*2008 Programmatic Agreement.* The servicewide 2008 programmatic agreement provides coordination between the NPS, ACHP, and National Conference of SHPOs for the section 106 compliance process. The NHPA, 36 CFR 800, and the 2008 programmatic agreement provide the NPS with a roadmap to plan for and carry out undertakings to minimize harm to cultural resources.

*Proposed Merced River Plan Programmatic Agreement.* As a part of the current Merced Wild and Scenic River Comprehensive Management Plan, the Park is proposing, via consultation with the ACHP, SHPO, and traditionally associated American Indian tribes and groups, the development of a programmatic agreement regarding treatment of historic resources under the proposed management plan (Merced River Plan PA) (36 CFR 800.14). Based on the long term nature of plan implementation, a plan specific programmatic agreement will assist in guiding actions in order to avoid or minimize adverse effects to historic resources. This document, while not yet finalized, will provide guidance for the identification, evaluation, treatment, and mitigation of adverse effects for actions affecting historic resources, including potentially eligible historic resources, impacted by the Merced River Plan. A process for identifying and implementing appropriate mitigations measures will be developed through the programmatic agreement. In the event that the programmatic agreement is not completed prior to project initiation, actions will proceed under the guidance of the standard 36 CFR part 800 consultation process.

*Secretary of the Interior's Standards for the Treatment of Historic Properties.* The Secretary of the Interior's Standards for Treatment of Historic Properties (Standards for Treatment of Historic Properties) are prepared under the authority of NHPA Sections 101(f) (g), and (h), and NHPA Section 110 and are intended to promote responsible preservation practices that help protect irreplaceable cultural resources. The Standards for Treatment of Historic Properties are not intended to make decisions about which features of a historic building should be saved and those features that

may be changed; rather, when a treatment is selected, they provide guidance for consistency in the proposed work.

The four treatment approaches are preservation, rehabilitation, restoration, and reconstruction. Preservation places a high premium on the retention of all historic fabric through conservation, maintenance, and repair. Rehabilitation emphasizes the retention and repair of historic materials, but more latitude is provided for replacement because it is intended to provide a compatible use for a property (when the use for which it was originally built is no longer practical or feasible) through repair, alterations or additions. Restoration focuses on the retention of materials from the most significant time in a property's history, while permitting the removal of materials from other periods. Reconstruction establishes limited opportunities to re-create a nonsurviving site, landscape, building, structure, or object in all new materials (Weeks 2001).

*NPS Management Policies 2006.* The *NPS Management Policies 2006* also provide direction regarding the management and preservation of historic properties. In accordance with these policies, the NPS is committed to protecting cultural resources against theft, fire, vandalism, overuse, deterioration, environmental impacts, and other threats without compromising the integrity of the resources. The *NPS Management Policies 2006* also provide guidance on procedures for protection and maintenance of historic properties under lease, among other instruction.

*Director's Order 28-Cultural Resources Management Guideline (1998).* Director's Order-28 guides the NPS to protect and manage cultural resources in its custody through effective research, planning, and stewardship and in accordance with the policies and principles contained in the *NPS Management Policies*. It also ensures that the NPS comply with the substantive and procedural requirements described in the Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation. Additionally, the NPS would comply with the 2008 programmatic agreement with the ACHP on Historic Preservation and the National Conference of SHPOs.

*Yosemite National Park General Management Plan (1980).* The *Yosemite General Management Plan* calls for a reduction in traffic congestion, removal of nonessential buildings and facilities, restoration of large areas of the Valley to their natural conditions, and relocation of visitor and employee accommodations away from environmentally sensitive or dangerous areas.

*Cultural Resources Management Plan (1973).* The *Cultural Resources Management Plan* completed for the *Yosemite General Management Plan* was designed to protect the significant cultural resources of the park through compliance with all cultural resource legislative, executive, and regulatory requirements. The CRMP provides specific policies to guide cultural resources management at Yosemite, including consultation, survey and evaluation, preservation/restoration/reuse, and documentation.

*Concession Services Plan (1992).* The *Concession Services Plan*, which is a 1992 amendment to the *Yosemite General Management Plan*, guides the management of concession enterprises, such as lodging, food, retail, and other commercial services in Yosemite. This plan serves as the basis for contracts between the NPS and the park's primary concessioner.

## Scope of the Analysis

### *Historical Context*

Arguably, the earliest record of non-indigenous presence in Yosemite was Joseph Rutherford Walker's 1833 exploratory party that crossed the Sierra Nevada from east to west, along the divide between the Tuolumne River and Merced River drainages. Walker's party may have been the first non-Indians to see Yosemite Valley. Prior to the 1850s, the U. S. military, which had increased its presence in the Central Valley, responded to raids by local American Indian tribes and conducted the 1851 relocation of the Ahwahnechees, led by Chief Tenaya, to the Fresno River Reservation (Greene 1987). The California Gold Rush, the single largest migration in human history, had profound impacts on the land, people and resources in the Sierra Nevada foothills. This event triggered massive disruption of native cultures and lifeways, brought thousands of people to the lands immediately surrounding Yosemite, and inspired the violent conflicts that lead to these military campaigns. In response to the increased military presence, some American Indians relocated, though many, including Chief Tenaya, left the camp.

During the 1850s and 1860s, tourism drove numbers of visitors to Yosemite Valley. Magazines depicting the scenery of the Valley drew the attention of the nation, and in 1855 James M. Hutchings organized the first tourist excursion to the Valley. Within two years of this trip, entrepreneurs constructed hotels to capitalize on what would become a thriving tourist trade. The community of Wawona, for example, was founded near the site of the log cabin built by Galen Clark in 1857. Clark, originally from New Hampshire, had moved to California during the Gold Rush, and moved to the Valley in 1856 as a homesteader. Clark established a 160-acre homestead and 12-foot-by-16-foot cabin, which was called "Clark's Station" or "Clark's Crossing" (Greene 1987).

Homestead claims were filed, orchards were planted, and Yosemite Valley became a residential base for many families during the 1850s and 1860s. Hutchings became a permanent resident of the Valley in 1864 and constructed several structures, including a sawmill on Yosemite Creek. By 1870, the establishment of visitor hotels in the Valley had created a need for local fresh produce and livestock. James Lamon, the Valley's first non-indigenous homesteader, became one of the largest producers of commercial agricultural products in the Valley (Greene 1987).

In 1864, President Abraham Lincoln and the U.S. Congress set aside the Big Tree Grove (Mariposa Grove) and Yosemite Valley as a public park to preserve the monumental scenic qualities of the area. The act clearly stated that the Valley and Mariposa Grove were to be managed by the governor of California and his eight appointed commissioners, with Frederick Law Olmsted appointed as chairman by the governor and elected by the commission (Greene 1987).

Due to the early conservation movement led by people such as John Muir and Robert Underwood Johnson, Congress passed an act establishing Yosemite National Park in 1890. This act brought protection to the lands and resources within the watersheds of the Tuolumne River and Merced River systems. The park was managed by U.S. Cavalry troops sent from the Presidio in San Francisco. Yosemite was the responsibility of the Department of the Interior (DOI), and army units answered to both DOI and Army. By 1906, the State of California had relinquished their rights of control over the Yosemite Valley and Mariposa Grove grant lands, ceding them to the U.S. government (Greene 1987).

Between 1906 and 1914, Yosemite Valley and the Mariposa Grove were administered by the U.S. Army, which established camp at the site of an American Indian village. Major H.C. Benson, acting superintendent from 1905 until 1908 under the Department of the Army, stated in his 1907 annual report that, “[s]ome definite general plan should be devised for the beautifying of the valley and making it the most beautiful park in the world. All bridges and buildings constructed in the future should conform to a definite plan, suited to existing conditions. All roads should be laid out according to a plan fully worked out by a competent landscape gardener, nothing should be done in the way of expending money which does not tend to carry out these ideas. All small buildings, practically shacks, should be replaced by stone buildings, and all bridges, when replaced, should be either of stone or concrete.” Many bridges and roads were, in fact, built by the U.S. Army Corps of Engineers between 1905 and 1915 (Carr 1998). Bridges such as the Bridalveil Falls bridges in 1913 set the precedent for later Rustic design for bridges established in the Yosemite Bridge Historic District.

In 1916 Congress created the National Park Service with a mandate to conserve the scenery and the natural and historic objects and provide opportunities for the enjoyment of future generations. The advent of automobile culture in the late 1910s and early 1920s changed the management plan for the park. As early as 1919, nearly 75% of visitors to Yosemite entered as auto tourists in their own cars. The demographic shift indicated that the era of the national park as a minimally funded, semiprivate resort had seen its day. After the All-Year Highway (Highway 140) to Yosemite opened in 1926, the annual number of visitors jumped to nearly half a million, up from about 40,000 just 10 years prior. Auto tourists, not reliant on concessioners, were part of a much larger and broader public that required additional facilities at a scale previously absent from the park (NPS 2006d). Rustic-style architecture was a type of design and style of construction used throughout the national parks beginning with the Yosemite Administration Building in 1924, and remains in use through the present. The style expressed the philosophy that buildings should be in harmony with the landscape and in harmony with each other. Oversized stone and logs were used in construction to ensure that the mass of the building appeared to fit within the setting. For example, The Ahwahnee hotel, which opened in 1927, is a six-story steel-framed building, sheathed in textured concrete and stone veneer to simulate rough wood siding and massive stone piers. The Ahwahnee culminated epitomized the tradition of massive, centralized national park lodges built by concessioners to cater to wealthy tourists (NPS 2006d). Yosemite Village Historic District contains a collection of rustic architecture dating from the 1918 through the 1930s.

The primary trails originating in the valley are the Mist Trail, Four Mile Trail, Yosemite Falls Trail, Pohono Trail, and the Valley Loop Trail. The Valley Loop Trail dates from the 1920s and was originally built as a bridle trail, generally aligned along existing circulation routes. Thirteen additional miles were added to the Valley Loop Trail in 1928, requiring the construction of 14 bridges. Today, the Valley Loop Trail includes the entire remaining bridle trail system in the valley and it is approximately 21 miles long.

The Great Depression resulted in a decrease of tourists visiting the Valley, but the initiation of Franklin D. Roosevelt’s New Deal in the spring of 1933 resulted in an unprecedented era of park development and park system expansion. The Public Works Administration and Civilian Conservation Corps (CCC) were responsible for completing a tremendous amount of work in the 1930s. Their extensive range of projects in the Valley included construction of roads, trails, bridges, fire roads, fire buildings, fire lanes, fire trails, comfort stations, campgrounds, and a rock diversion channel at Yosemite Creek (Greene 1987).

Visitation to the Valley further decreased during World War II but increased to unprecedented levels as soon as the war ended. In 1954, over a million park visitors were recorded. However, in 1955, Yosemite experienced the worst flooding ever recorded in the Valley. Facilities that had already been damaged in the floods of 1950 were inundated, along with additional roads, trails, bridges, and other facilities. In 1956, Park Service Director Conrad L. Wirth announced Mission 66 as a major new construction campaign. Intended to improve or replace aging and inadequate national park facilities, Mission 66 was implemented to meet the demand for services created by postwar levels of visitation. This increased funding and visitation, as well as flood damage repair, came together and resulted in major changes to Yosemite Valley. Major Yosemite projects in the Mission 66 program included the Tioga Road middle segment and the El Portal Administrative area housing. The Yosemite Valley visitor center was completed in 1968. In 1970, much of the Valley's road network was made into a one-way loop. The addition of parking lots along with the new concession and visitor use buildings during the Mission 66 period make the public plaza area of the Village one of the most changed areas since 1942 (NPS 2006d).

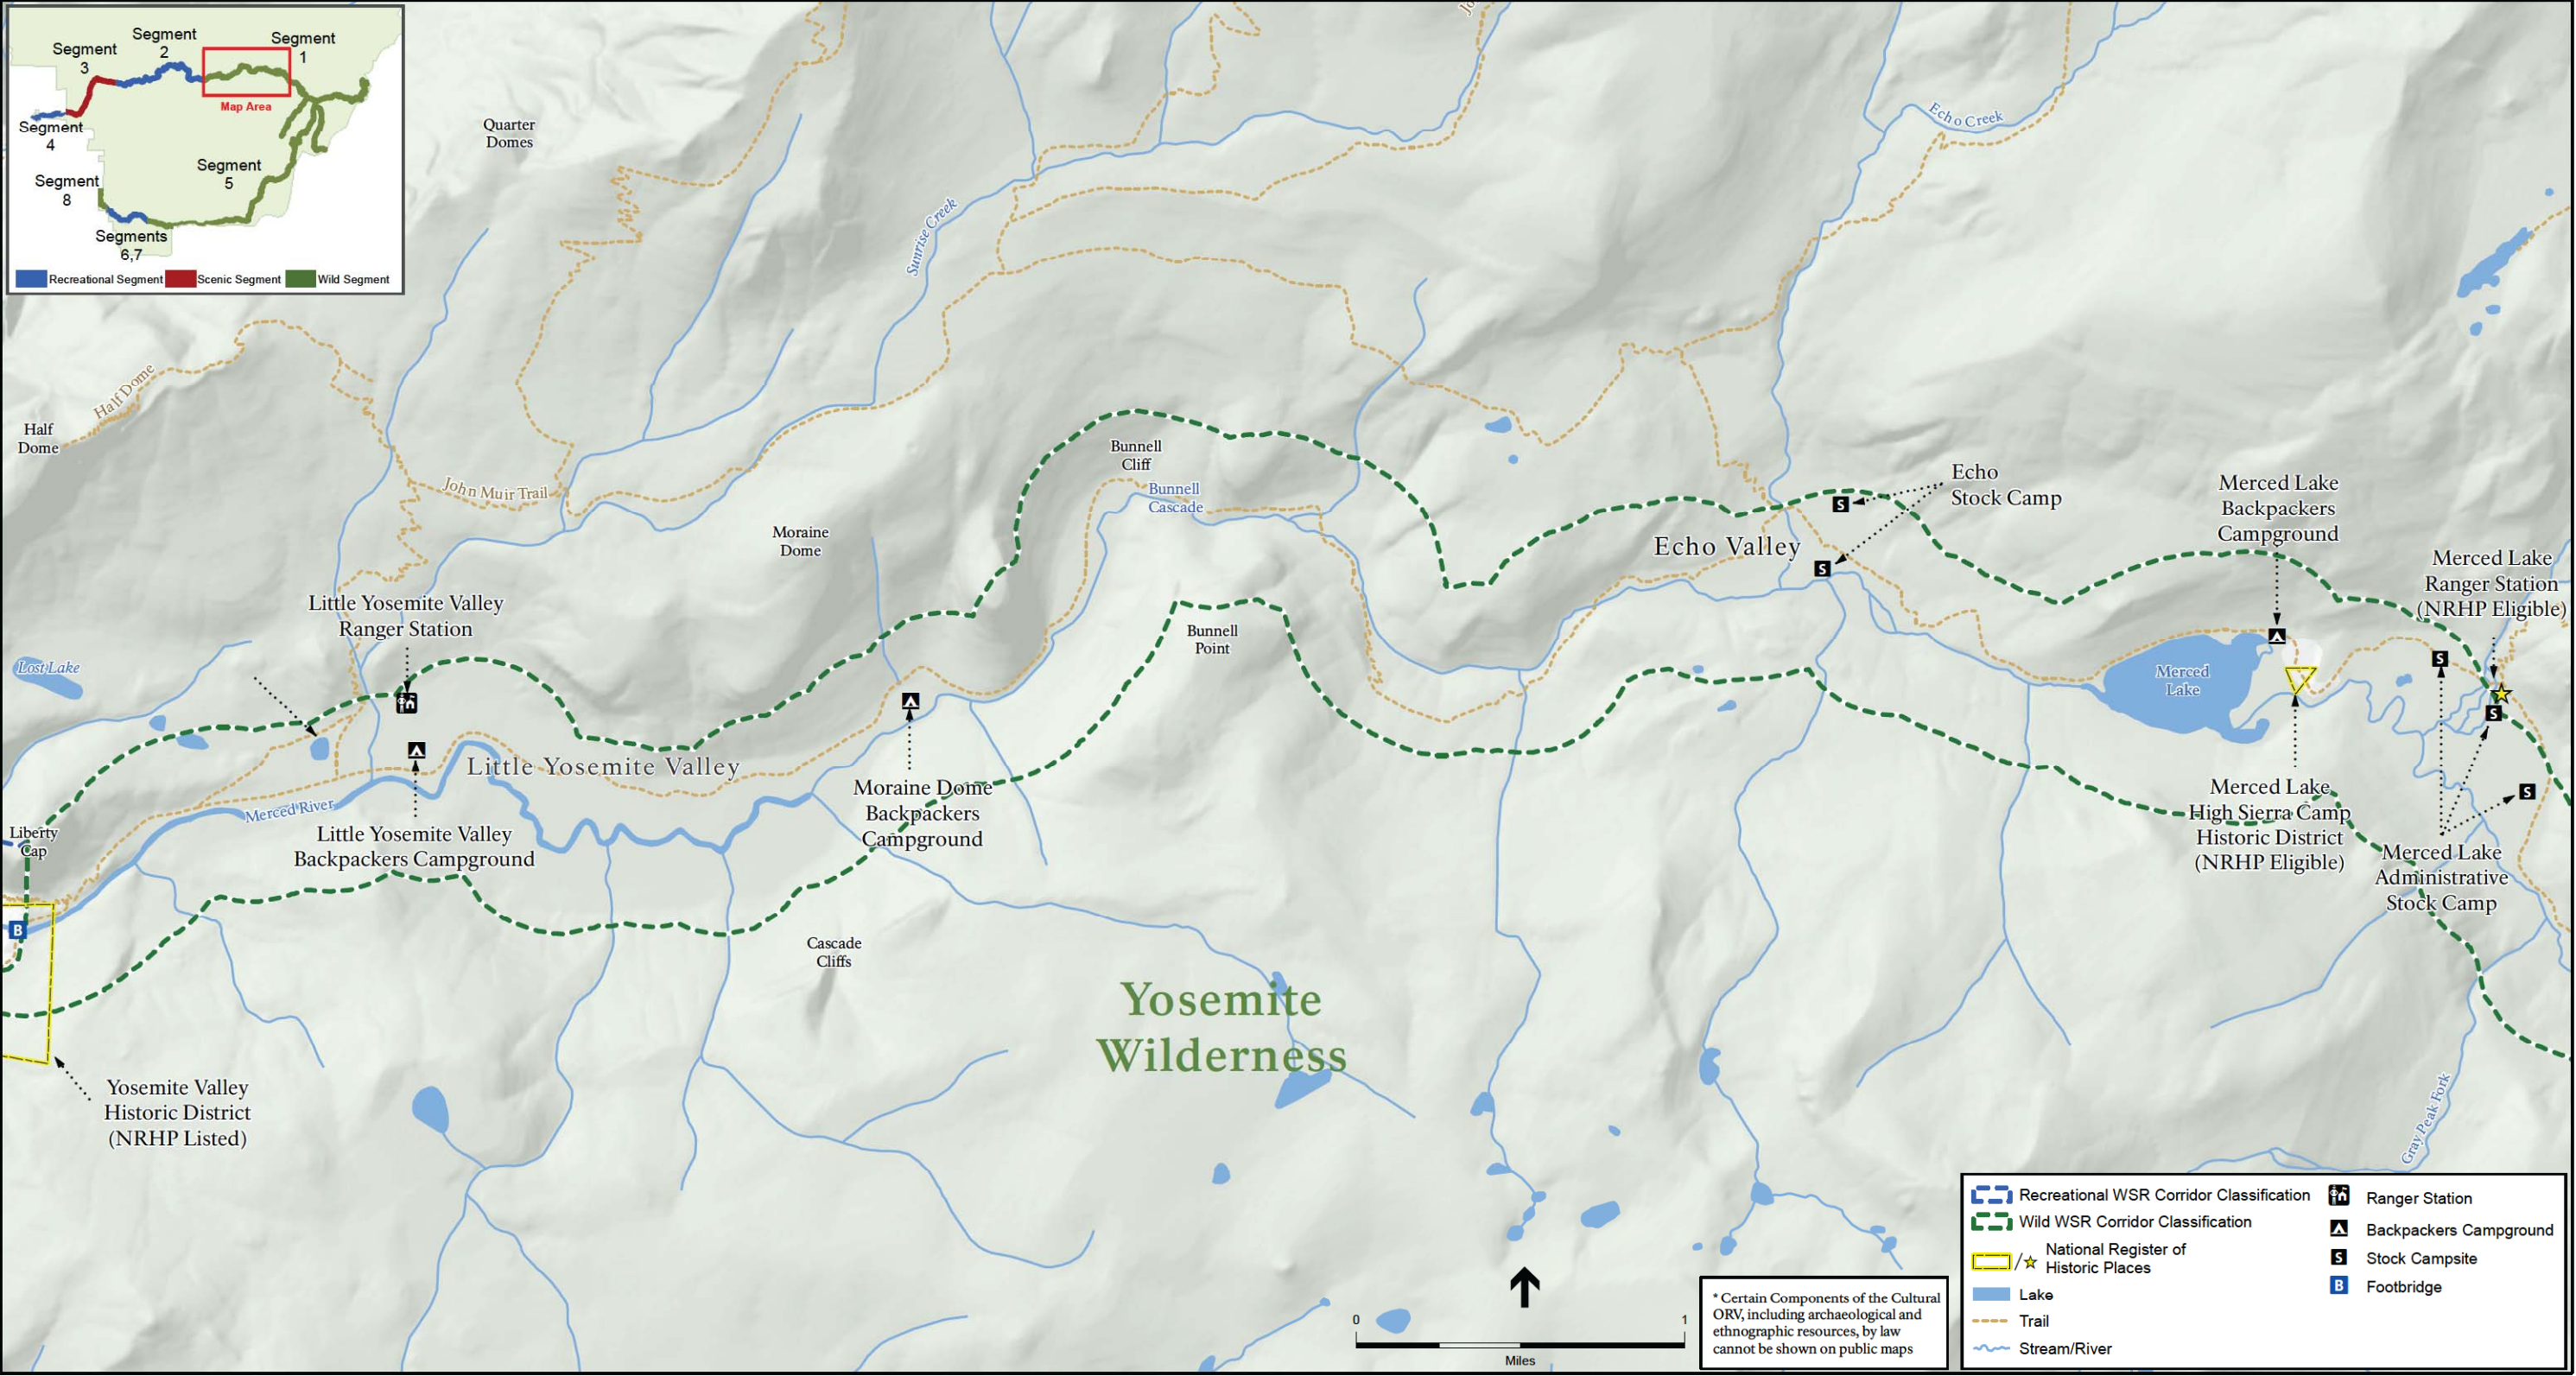

### *Properties Analyzed for this Plan*

Historic properties that could potentially be affected by the Merced River Plan include various National Register-listed historic districts, landscapes, individual historic buildings, structures, trails, and other features in each of the river segments that are eligible or potentially eligible for inclusion in the NRHP. It should be noted that the majority of post-WWII buildings have not been assessed for eligibility and that prior to removal or alteration of these resources, assessments as to their eligibility for listing on the National Register would be completed in order to carry out actions with potential impact to these areas and appropriate mitigations consistent with the proposed Merced River Plan programmatic agreement and consistent with Section 110 of the NHPA. Tables 9-207 through 9-210 provide detail regarding the historic properties within the APE.

### *Historic Period Resources*

**Segment 1: Merced River Above Nevada Falls – Historic Properties.** Known historic resources within Segment 1 consist of the eligible Merced Lake High Sierra Camp Historic District and the eligible Merced Lake Ranger Station. **Table 9-207** and **figure 9-47** describe these resources.

**Segment 2: Yosemite Valley – Historic Properties.** Known historic resources within the APE associated with Segment 2 include four NRHP- listed districts (Camp Curry Historic District, Yosemite Valley Bridges Historic District, Yosemite Valley Historic District, Yosemite Village Historic District), including their associated contributing historic buildings and structures; numerous structures that have been determined to be eligible for listing on the NRHP as well as those that are individually listed; and three National Historic Landmarks (The Ahwahnee, Rangers' Club, and the LeConte Memorial Lodge); In addition, eight granite-faced, concrete arched, two-lane vehicle bridges were constructed along the Valley Loop Road between 1922 and 1933. Six of the bridges (Ahwahnee, Clark's, Pohono, Sugar Pine, Happy Isles, and Stoneman) cross the Merced River, while two others (Yosemite Creek and Tenaya Creek) cross creeks. Each bridge is listed in the NRHP as contributing features to the Yosemite Valley Historic District, as well as a separate Yosemite Valley Bridges Historic District. **Table 9-208** describes these resources.

Merced Lake High Sierra Camp  
Historic Properties

THIS PAGE INTENTIONALLY LEFT BLANK

**TABLE 9-207: KNOWN HISTORIC PROPERTIES WITHIN SEGMENT 1**

National Register Listed or Eligible Properties	Property Type	NR Status	Level of Significance	Significance Summary	Contributing Resources
Merced Lake High Sierra Camp Historic District	District	Eligible	Local	The Merced Lake High Sierra Camp is considered significant in recreation and education as one of seven high country camps whose origin dates back to the earliest days of the NPS.	The NRHP boundary includes all the tents, cooking structures, restrooms and bathhouses, and other miscellaneous structures associated with the High Sierra Camp facilities and the immediate environment.
Merced Lake Ranger Station	Building	Eligible	Local	The Merced Lake snow survey shelter/patrol cabin is considered significant in conservation.	building
SOURCE: NPS 2012h Abbreviations: N/A = not applicable; NPS = National Park Service; NRHP = National Register of Historic Places					

Many historic sites and structures within the Valley have been singled out for their significance and are either National Historic Landmarks or are listed in or have been determined eligible for listing in the NRHP. National Register-listed historic properties in Yosemite were identified in a 2012 consultation letter with SHPO. These resources are described in greater detail in tables 9-207 through 9-210 and figure 9-48.

The geophysical characteristics of Yosemite Valley have shaped patterns of human use since the earliest days of American Indian settlement. As a result, the Valley's cultural landscape is significant for its role in the exploration and settlement of the west, as well as for its architecture, art, landscape architecture, recreation, and conservation. The historical importance of the Valley landscape derives from the fact that countless generations of local tribal groups and, later, millions of park visitors have infused the Valley's natural features with great cultural significance.

**Segments 3 and 4: Merced River Gorge and El Portal – Historic Properties.** Known historic resources within Segments 3 and 4 include the Merced River Travel Corridor, the Yosemite Hydroelectric Power Plant (the Cascades Powerhouse), the Old Coulterville Forestry Department Road and Trail, and designated El Portal Historic Structures. **Table 9-209** describes these resources and **figures 9-49 and 9-50**.

The primary element of the Merced Canyon Travel Corridor is El Portal Road, which was originally constructed as a wagon road in 1905 and was substantially reconstructed in 1925. The road includes hand-laid stone parapet guardwalls and drainage catchment structures. Following consultation with the SHPO and the ACHP, many of these features were removed as part of the El Portal Road Reconstruction Project that was a direct consequence of damage caused by a catastrophic flood in 1997. Other properties within the river corridor include rock quarries, historic trash scatters, sections of pre-1925 roadbed, historic work campsites, and the Arch Rock Entrance Station complex (eligible for the NRHP as an individual property), which consists of a ranger residence/office, entrance kiosk, parking lot, and restroom building (Volpe 1997).

**TABLE 9-208: KNOWN HISTORIC PROPERTIES WITHIN SEGMENT 2**

National Register-Listed or Eligible Properties (Listing Number)	Property Type	NR Status	Level of Significance	Significance Summary	Contributing Resources
The Ahwahnee Hotel (1977000149)	Building	Listed	National	The Ahwahnee, because of its rustic architectural design and unaltered condition, is among the most significant park hotels in the United States. The significance of the hotel lies in the preservation of the exterior of the building and its setting, and in the preservation of the interior, with its original decorative features and furnishings.	The 35-acre site, which includes a number of small structures and landscape features, eight guest cottages, an employee dormitory, two tennis courts, a pond, and two parking lots.
Camp 4(Sunnyside Campground) (2003000056)	Site	Listed	National	Camp 4 has integrity and is listed in the NRHP for its significant association with the growth and development of rock climbing in the Yosemite Valley after World War II.	Entire area, including natural features (boulders, cliffs, vegetation), is considered a contributing resource.
Camp Curry Historic District (1979000315)	District	Listed	Local	This historic district is illustrative of the foundation and early development of the Curry family concession enterprise and their unique contribution to a character of accommodation still available in Yosemite.	Bungalettes, bungalow duplexes and four-plex cabins, Foster Curry Bungalow, Cabin 101 (Nob Hill Cabin), comfort stations, and Terrace Clubhouse (Women's Club).
Glacier Point Road Historic District	District	Eligible	Local	Glacier Point Road exemplifies the naturalistic landscape design aesthetic of the NPS in the 1930s and represents the initial burst of development of automobile roads in the national parks.	Includes 140 contributing features.
Glacier Point Trailside Museum (1978000375)	Building	Listed	Local	This museum, the first permanent teaching instrument of its kind in the NPS, is an integral component of the old Yosemite Museum.	building
LeConte Memorial Lodge (197700148: NHL)	Structure	Listed	National, Regional, local	Originally constructed in 1903, and moved and rebuilt in 1919, the lodge was the principal foothold of the influential Sierra Club in the Sierra Nevada Mountains. It is a transitional building in 20th century architecture, with strong European roots in its Tudor Revival design, combined with an interesting use of building materials found in the work of architects of the Bay Area tradition. An outstanding example of the theory that the materials and site should determine the design of the building.	building
New Big Oak Flat Road	Structure	Eligible	Local	The new Big Oak Flat road tunnels, bridges, and retaining walls are considered significant in transportation as well as landscape architecture and architecture.	Cascade Creek Bridge, Tamarack Creek Bridge, Wildcat Creek Bridge, and three tunnels.

**TABLE 9-208: KNOWN HISTORIC PROPERTIES WITHIN SEGMENT 2 (CONTINUED)**

National Register-Listed or Eligible Properties	Property Type	NR Status	Level of Significance	Significance Summary	Contributing Resources
Old Big Oak Flat Road	Structure	Eligible	Local	The Big Oak Flat Road is significant as one of the earliest transportation routes into Yosemite Valley. It served horse and wagon traffic and it eventually opened the Yosemite Valley to automobiles.	structure
Rangers' Club (1987001414: NHL)	Building	Listed	National, regional	The Rangers' Club in Yosemite Valley is representative of NPS's first director, Stephen T. Mather's commitment to an architectural aesthetic appropriate for the park lands that he was charged to manage. The Rangers' Club is also of regional historical significance in the category of conservation through its connection with the first director of the NPS and through its integrity of function as the residence for unmarried rangers.	building
Substation and Substation Control House No. 1	Building	Eligible	Local	The Substation and Substation Control House #1 is the oldest and only surviving Rustic-style substation control house and substation complex in Yosemite Valley.	building
Wawona Tunnel	Structure	Eligible	National	The Wawona tunnel is considered significant in the fields of transportation, architecture, and landscape architecture. It was built as part of the rerouting of the old Wawona Road between Yosemite Valley and Grouse Creek, where engineers determined that a tunnel was necessary to attain a satisfactory grade. Construction of a tunnel would also be cheaper and require less excavation. Its construction was an innovation in highway design within the National Park System, following the precedent set by the Zion Park highway tunnel. Upon completion, it was the longest vehicle tunnel in the western United States.	Wawona tunnel and the low stone retaining walls around the parking area.
Yosemite Valley Bridges Historic District (1977000160)	District	Listed	National	These Valley bridges are unique for their architectural design and aesthetic considerations. The use of native granite in the form of rough boulders reflects the tenets of the Rustic style.	Yosemite Creek Bridge, Ahwahnee Bridge, Clark's Bridge, Pohono Bridge, Sugar Pine Bridge, Tenaya Creek Bridge, Happy Isles Bridge, Stoneman Bridge.
Yosemite Valley Chapel (1973000256)	Building	Listed	Regional	This chapel, now the oldest building in Yosemite, was erected in 1879 as a chapel and has been used as such since then. It is still used for church services on Sundays. The simple architectural design of the structure represents a particularly fine example of the early chapels constructed in the Sierra Nevada Mountains and is well preserved.	building

**TABLE 9-208: KNOWN HISTORIC PROPERTIES WITHIN SEGMENT 2 (CONTINUED)**

National Register-Listed or Eligible Properties	Property Type	NR Status	Level of Significance	Significance Summary	Contributing Resources
Yosemite Valley Historic District (2004001159)	District	Listed	National	The Valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Since 1864, Yosemite has been an archetype for the preservation of scenic places through their development as public parks.	District consists of 929 buildings and sites, including Yosemite Valley Chapel, LeConte Memorial Lodge, El Capitan Bridge, Ansel Adams Residence, Yosemite Pioneer Cemetery, and The Ahwahnee, located within specific developed areas including the Yosemite Village, Camp Curry, and The Ahwahnee. Additionally, Yosemite Valley Historic District includes resources such as natural systems/features, spatial organization, veg, circulation, land use, vistas, etc. all contribute to the significance of the district.
Yosemite Village Historic District (1978000354)	District	Listed	National	This historic district, through both sites and structures, represents almost the entire range of Yosemite history since 1855, including early homesteading, John Muir's early residence in the park, the development of the national park, the U.S. Army's role in park administration, and the evolution of early NPS administration and interpretation of the resources of Yosemite.	District consists of 44 buildings and sites, including residences, Ansel Adams studio, museum, post office, and park administration building.
<b>National Historic Landmarks</b>					
The Ahwahnee Hotel	Building	Listed	National	The Ahwahnee, because of its Rustic architectural design and unaltered condition, is among the most significant park hotels in the country. The significance of the hotel lies in the preservation of the exterior of the building and its setting, and in the preservation of the interior, with its original decorative features and furnishings.	Included within the boundaries of the nomination are the meadow directly south of the hotel, the stone gatehouse marking the entrance to the property, the parking lots, and the small pond and walkways at the building's entrance, directly north of the porte-cochere.
LeConte Memorial Lodge	Building	Listed	Regional, local	Originally constructed in 1903, and moved and rebuilt in 1919, this lodge was the principal foothold of the influential Sierra Club in the Sierra Nevada Mountains. It is a transitional building in 20th century architecture, with strong European roots in its Tudor Revival design combined, with an interesting use of building materials found in the work of architects of the Bay Area tradition. An outstanding example of the theory that the materials and site should determine the design of the building.	building

<b>National Historic Landmarks (cont.)</b>					
Rangers' Club	Building	Listed	National, regional	The Rangers' Club in Yosemite Valley was donated to the NPS by its first director, Stephen T. Mather. The building is representative of his commitment to an architectural aesthetic appropriate for the park lands that he was charged to manage.	building
SOURCE: NPS 2012h Abbreviations: N/A = not applicable; NHL = National Historic Landmark; NPS = National Park Service					

**TABLE 9-209: KNOWN HISTORIC PROPERTIES WITHIN SEGMENTS 3 AND 4**

National Register-Listed or Eligible Properties	Property Type	NR Status	Level of Significance	Significance Summary	Contributing Resources
Bagby Stationhouse (1979000316)	Building	Listed	Local	Along with the uniquely designed twin water tanks, the stationhouse is illustrative of an important era in Yosemite's history.	This 1-acre historic district includes the Bagby stationhouse, water tanks, and turntable
El Portal Hotel	Building	Eligible	Local	This building qualifies for listing because of its association with the development and expansion of the tourist industry at El Portal. It also qualifies for listing because it embodies architectural characteristics associated with a 1930s-era commercial buildings construction type.	Building
El Portal Historic Structures	District	Eligible	Local	The Village Center and Old El Portal areas appear to qualify for listing in the NRHP as historic districts under Criterion A because they are associated with the development and expansion of the railroad, mining, timber, and tourist industries at El Portal, as well as the town's socioeconomic development and expansion.	Murchison House, Yosemite Research Center Office, three National Lead Company residences, Village Center Store, three Yosemite Valley Railroad residences, school, El Portal Market, El Portal Hotel
El Portal Murchison House	Building	Eligible	Local	This building qualifies for listing because of its association with the significant National Lead Company barium mining operations at El Portal; it embodies the distinctive architectural characteristics associated with mining-related residential and management structures during the late 1920s-early 1930s; and it is associated with Earl H. Murchison, National Lead Company superintendent oat El Portal.	Building
El Portal Old Schoolhouse	Building	Listed	Local	The El Portal Old Schoolhouse is significant as an educational institution that serves as an example of the socioeconomic development of the town of El Portal. Architectural characteristics and building materials associate the Old Schoolhouse with the local El Portal vernacular style during the 1920s and 1930s.	Building
Hetch Hetchy Railroad Engine No. 6 (1978000360)	Structure	Listed	Local, Regional	Hetch Hetchy Railroad Engine No. 6 is the last and heaviest locomotive, and the only one of Shay design, purchased by the Hetch Hetchy Railroad. It contributed in an important way to the history of a railroad as part of a regionally significant engineering project, and later as part of a locally significant lumber industry logging railroad.	structure

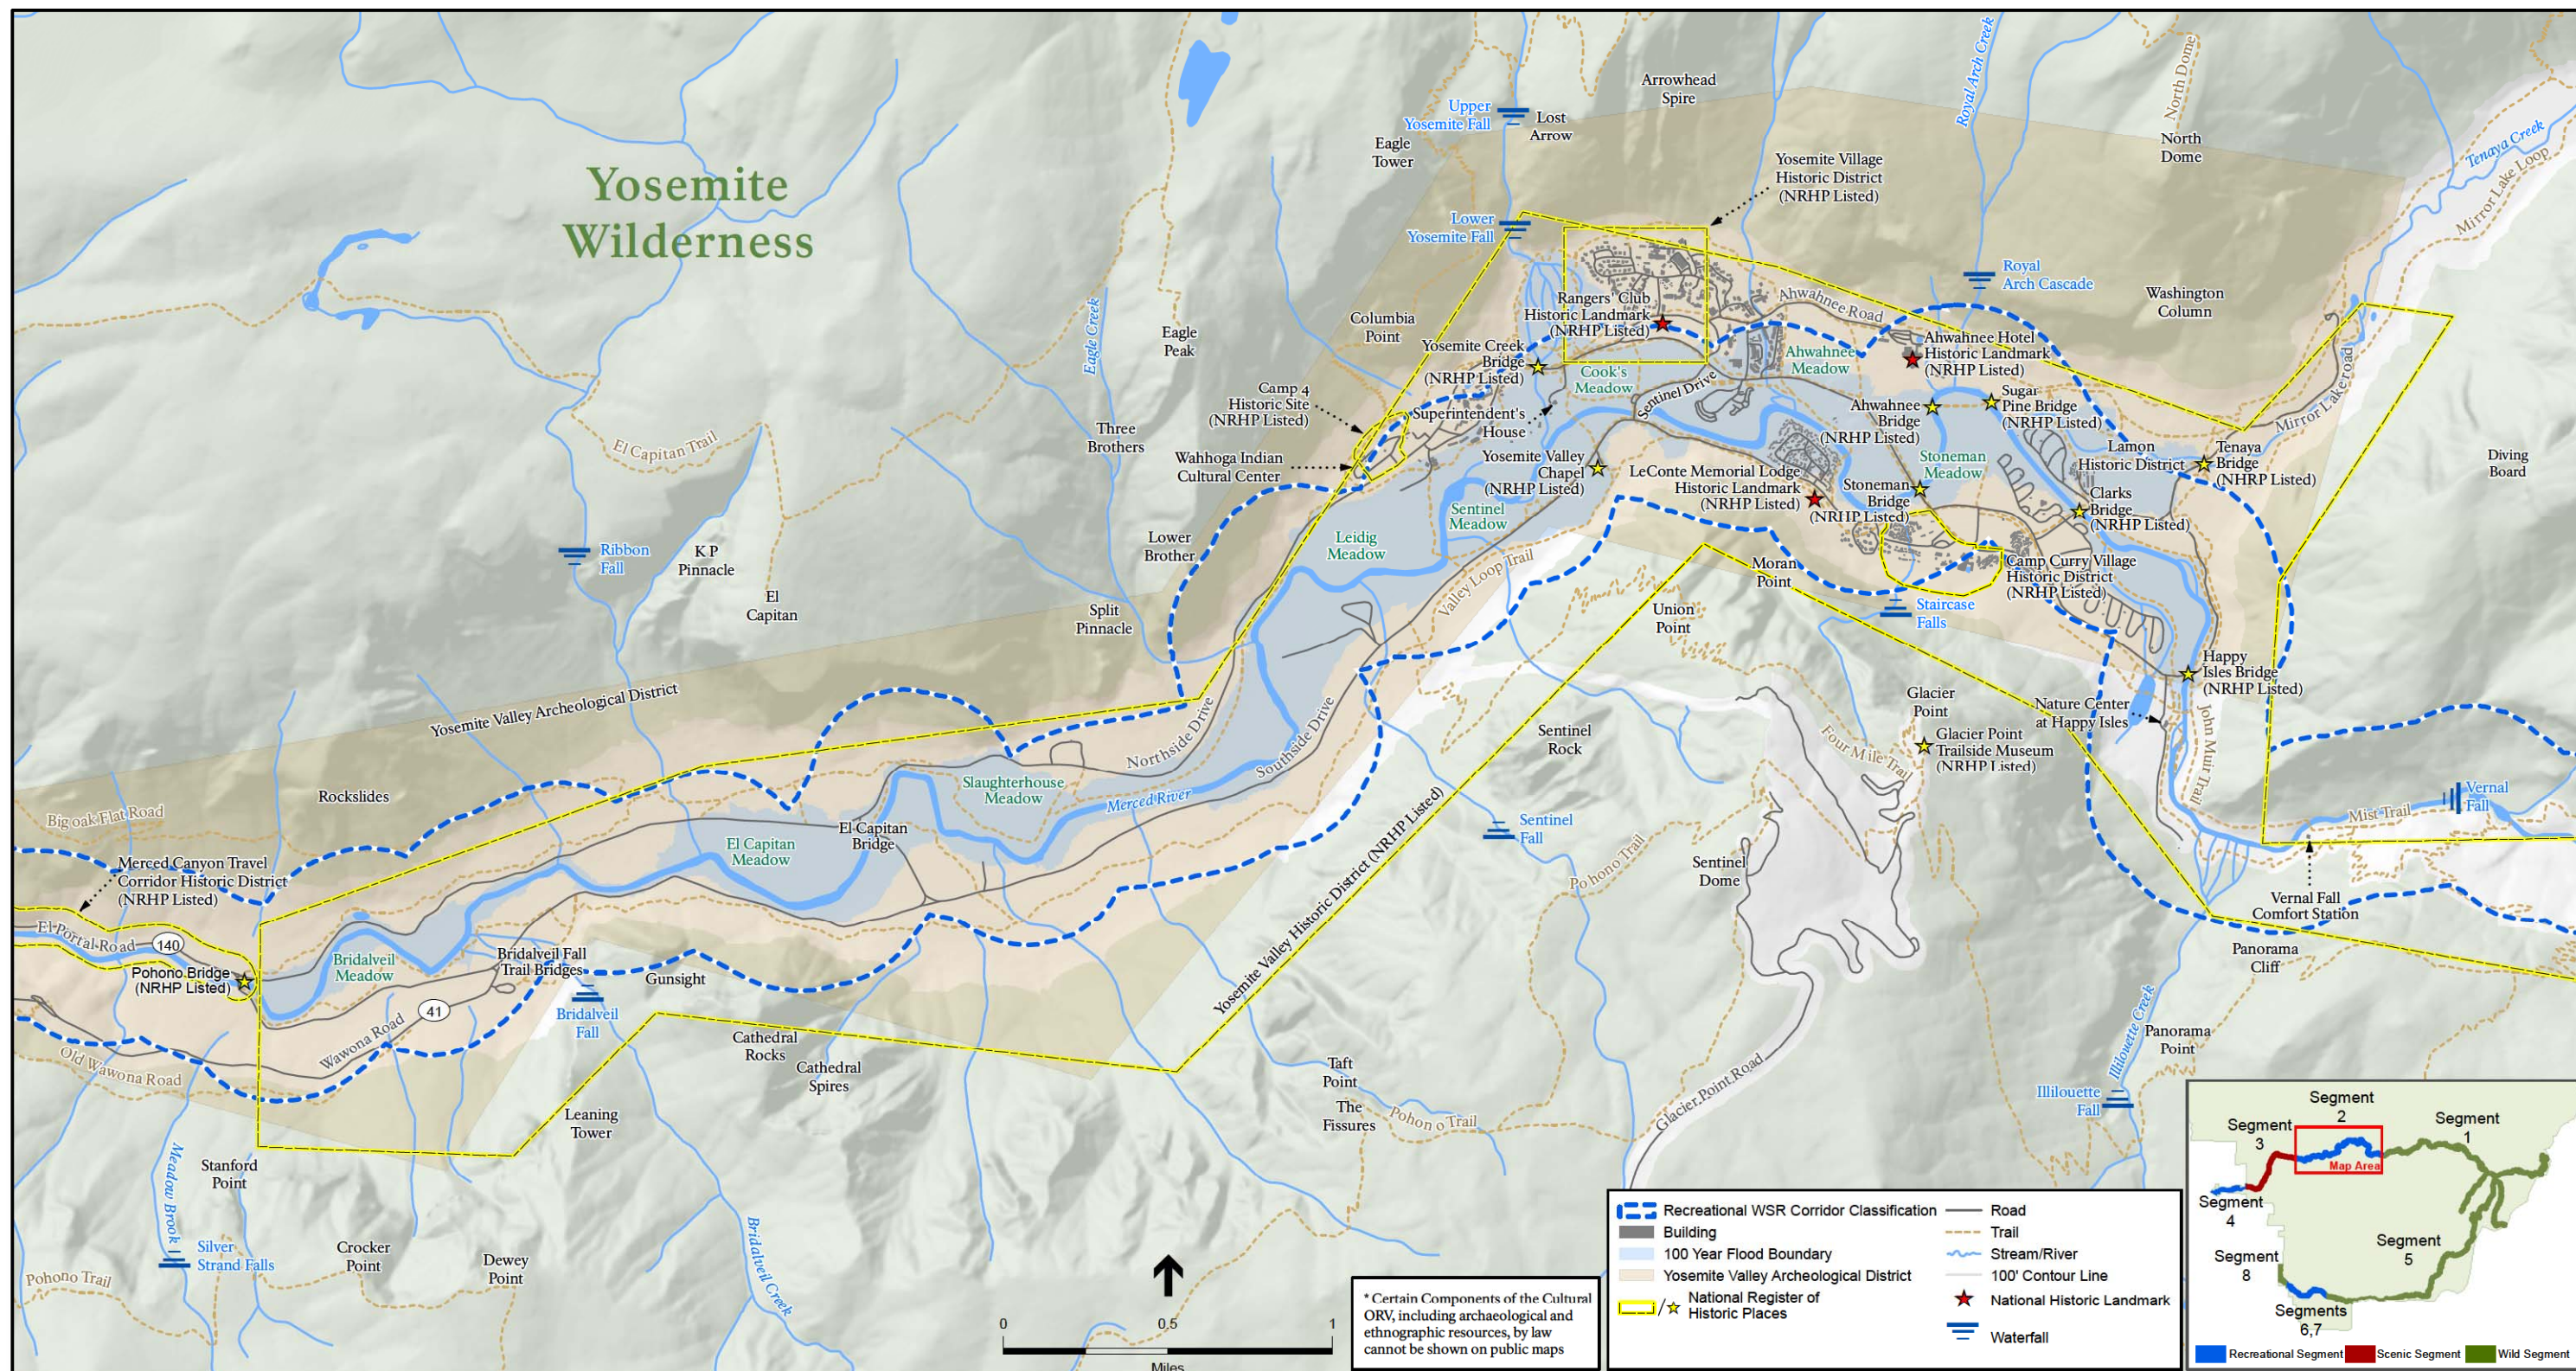

**TABLE 9-209: KNOWN HISTORIC PROPERTIES WITHIN SEGMENTS 3 AND 4 (CONTINUED)**

National Register-Listed or Eligible Properties	Property Type	NR Status	Level of Significance	Significance Summary	Contributing Resources
McCauley and Meyer Barn (1978000353)	Building	Listed	Local	This barn is among the last remaining barns in Yosemite that possess architectural significance and integrity. They also represent some local interest in agriculture through association with pioneering ranches once located within the park boundaries.	Building
Merced Canyon Travel Corridor Historic District	District	Eligible	National, state	This historic district is a unique multiple resource historical property eligible for listing on the NRHP. The travel route from El Portal to Yosemite Valley has been used for at least the past 2,000 years, spanning a myriad of cultural needs satisfied by the natural landscape and its resources.	El Portal Road, historic period sites (trash scatters, Arch Rock Entrance Station, historic road beds, Coulterville Road Blacksmith Shop, aligned rock structure, historic camp area, Cascade Falls Trail, possible privy, CCC camp, Pohono pit, rock quarry), landscape, and prehistoric/historic native American sites.
National Lead Company	Building	Eligible	Local	The district qualifies for listing because of its association with the significant National Lead Company barium mining operations at El Portal; it embodies the distinctive architectural characteristics associated with mining-related residential and management structures during the late 1920s-early 1930s.	Three residences, including Murchison House.
National Lead Company Residence Buildings Nos. 703 704, and 705	Building	Eligible	Local	These buildings qualify for listing because of their association with the significant National Lead Company barium mining operations at El Portal, embodying the distinctive architectural characteristics associated with mining-related residential and management structures during the late 1920s-early 1930s.	Building
Old Coulterville Road and Trail	Structure	Eligible	Local	The Coulterville Road is the first stagecoach road to have reached the floor of Yosemite Valley and is of local significance in transportation and engineering.	structure
Track Bus No. 19 (1978000363)	Object	Listed	Local	Track Bus No. 19 is of local historical significance in the category of transportation. It is one of the few survivors of the gasoline-powered rigs which ran on the Hetch Hetchy Railroad.	object

**TABLE 9-209: KNOWN HISTORIC PROPERTIES WITHIN SEGMENTS 3 AND 4 (CONTINUED)**

National Register-Listed or Eligible Properties	Property Type	NR Status	Level of Significance	Significance Summary	Contributing Resources
Yosemite Hydroelectric Power Plant	Structure	Eligible	State	The Yosemite hydroelectric power plant is a good example of its type and possesses a high level of integrity. Though once commonplace, the type of system used by the power plant is becoming rare, with intact systems even more rare. There are no other known penstock-fed systems in California with their original Pelton wheels (a particular type of turbine), generators, switch boards, and design intact.	Diversion dam, the intake, the screens and screenhouse, the penstock, the surge tank, the powerhouse and equipment, the 11-kilovolt distribution line into the Valley.
Yosemite Valley Railroad Caboose No. 15 (1978000352)	Object	Listed	Local	Yosemite Valley Railroad caboose No. 15 is an object of local historical significance as one of the last surviving cabooses of the historic Yosemite Valley Railroad.	object
Yosemite Valley Railroad Residences	Structures	Eligible	Local	These buildings qualify for listing because of their association with the development of the railroad industry at El Portal, and because they exhibit the architectural characteristics associated with an early 20th-century railroad employee residential building type.	building

Properties in El Portal that are either listed in or are eligible for listing in the NRHP include the Bagby stationhouse (now used as the Yosemite Conservancy headquarters); Yosemite Valley Railroad caboose number 15; El Portal Murchison House; three National Lead Company residences; El Portal Old Schoolhouse; the El Portal Hotel (now used as the NatureBridge headquarters), and two Yosemite Valley Railroad residences, mostly in the Village Center of Old El Portal. Some of these structures are privately owned but located on federal land.

**Segments 5, 6, 7, and 8: South Fork Merced River Wawona – Historic Properties.** Known historic resources within Segments 5, 6, 7, or 8 include the Wawona Hotel and Thomas Hill Studio District NHL Wawona, Wawona Covered Bridge, Hodgdon Homestead Cabin, Chris Jorgensen Studio, Acting Superintendent's Headquarters, and the Pioneer Yosemite History Center. **Table 9-210** and **figure 9-51** describe these resources.

The most significant of the historic structures in Wawona is the Victorian-style Wawona Hotel complex. The hotel complex includes seven structures and is significant for its architectural features as well as for its historical associations with early California commerce and the landscape painter Thomas Hill. The complex includes the Pavilion (former Hill's Studio), Little White (Manager's Cottage), Little Brown (Moore Cottage), Long White (Clark Cottage), Long Brown (Washburn Cottage), the Wawona Hotel, and the annex. The complex was designated a National Historic Landmark on May 28, 1987. The Wawona Golf Course, in operation since 1918, is being evaluated as a contributing resource under the current Cultural Landscape Inventory being completed by the NPS Pacific West Regional Office staff.

The Pioneer Yosemite History Center, which was determined eligible for listing as a historic district by the California SHPO in 2011, contains many structures relocated from other areas of the park to its current location on the bank of the South Fork Merced River. This site consists of 26 contributing features, including Wawona Grey Barn/Washburn Barn; Hodgdon homestead/cabin, Yosemite Transportation Company office/Wells Fargo office, Wells Fargo utility building, Acting Superintendent's Headquarters/Army cabin, Army tack room, Crane Flat ranger cabin/ranger patrol cabin, jail/powder house/morgue, Chris Jorgenson Studio/artist cabin, wagon shelter/wagon shed, Wawona Covered Bridge, Wawona stables, Chinese laundry/laundry/carriage shop; Pioneer Yosemite History Center signs (two); historic circulation system; flagpoles (two); hitching posts (two); retaining walls; stone perimeters; privy; water trough; and split rail perimeter fences (NPS 2011s).

Four of the buildings are also listed as individual resources in the National Register, including the Hodgdon homestead/cabin, Acting Superintendent's Headquarters/Army cabin, Chris Jorgenson Studio/artist cabin, and Wawona Covered Bridge.

Several CCC structures (e.g., the NPS maintenance complex and ranger office) and three residences constructed immediately after the Wawona land purchase in 1932 still exist in this area and are being assessed for eligibility through a cultural landscape inventory being completed by the NPS Pacific West Regional Office for the Wawona Valley.

**TABLE 9-210: KNOWN HISTORIC PROPERTIES WITHIN SEGMENTS 5, 6, 7, AND 8**

National Register-Listed or Eligible Properties (Listing Number)	Property Type	NR Status	Level of Significance	Significance Summary	Contributing Resources
Acting Superintendent's Headquarters (1978000362)	Building	Listed	Local	This building is the sole remaining structure associated with the military tenure in Wawona.	Building
Chris Jorgenson Studio (1979000280)	Building	Listed	Local	Yosemite has been a lodestone for artists since 1856 when lithographer Thomas Ayres accompanied the first tourist party to the Valley. One of the park's most prolific scenic interpreters was the noted California painter Chris Jorgenson, who maintained a seasonal residence and studio in the Valley for 20 years. This studio, now an integral part of the Pioneer Yosemite History Center, is of local significance in art.	Building
Hodgdon Homestead Cabin (1978000356)	Structure	Listed	Local	The Hodgdon homestead cabin possesses local architectural significance as the finest example of a pioneer homestead in Yosemite.	Building
Pioneer Yosemite History Center	District	Eligible	Local	The Pioneer Yosemite History Center is significant under the NRHP criterion A for its association with the development of tourism and outdoor recreation during the Mission 66 period.	Contributing features include Wawona grey barn/Washburn barn; Hodgdon homestead/cabin; Yosemite Transportation Company office/Wells Fargo office; Wells Fargo utility building; Acting Superintendent's Headquarters/Army cabin; Army tack room; Crane Flat ranger cabin/ranger patrol cabin; jail/powder house/morgue; Chris Jorgenson studio/artist cabin; Wagon shelter/wagon shed; Wawona Covered Bridge; Wawona stables; Chinese laundry/laundry/carriage shop; Pioneer Yosemite History Center signs (2); historic circulation system; flagpoles (2); hitching posts (2); retaining walls; stone perimeters; privy; water trough; and split rail perimeter fences.
Wawona Covered Bridge (2006001261)	Structure	Listed	State	The Wawona Covered Bridge is significant at the state level under NRHP criteria A, B, and C for its association within the contexts of transportation, entertainment, and recreation; its association with Galen Clark; and as a unique example of a covered bridge within both California and the western region of the NPS.	structure

**TABLE 9-210: KNOWN HISTORIC PROPERTIES WITHIN SEGMENTS 5, 6, 7, AND 8 (CONTINUED)**

National Register-Listed or Eligible Properties (Listing Number)	Property Type	NR Status	Level of Significance	Significance Summary	Contributing Resources
Wawona Hotel and Pavilion (1975000223: NHL)	District	Listed	National	Wawona's architectural importance to American architecture is the largest existing Victorian-style hotel complex within the boundaries of a national park, and one of the few remaining in the United States with this high level of integrity.	The Clark Cottage, the Wawona Hotel building, the Little White Cottage, the Moore Cottage, the Washburn Cottage, the Pavilion (former Hill's studio), and the Annex.
Yosemite Transportation Company Office (1978000355)	Building	Listed	Local	The Yosemite Transportation Company office (Wells Fargo office) is of local significance in the fields of architecture and transportation, based on the design of the structure and on its use for many years as a transportation facility for visitors to Yosemite Valley.	Building
<b>National Historic Landmarks</b>					
Wawona Hotel and Thomas Hill Studio (1975000223)	District	Listed	National	Wawona's architectural importance to American architecture is as the largest existing Victorian-style hotel complex within the boundaries of a national park, and one of the few remaining in the United States with this high level of integrity.	Clark Cottage, the Wawona Hotel Building, the Little White Cottage, the Moore Cottage, the Washburn Cottage, and the Annex.
Abbreviations: N/A = not applicable; NHL = National Historic Landmark SOURCE: NPS 2012h					

## *Environmental Consequences Methodology*

Historic districts, buildings, structures, and landscapes are considered eligible for inclusion in the NRHP when the properties have significance and retain integrity associated with events that have made a significant contribution to the broad patterns of our history (Criterion A); when they are associated with the lives of persons significant in our past (Criterion B); when they embody the distinctive characteristics of a type, period, or method of construction (Criterion C); or when they have contributed or have the potential to contribute information about the past (Criterion D). An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Adverse effects include those detailed in CFR 800.5 (a)(2)(i-vii), which include physical destruction or damage, alterations inconsistent with the Standards for the Treatment of Historic Properties (36 CFR part 68), relocation of the property, change in character of use, or neglect resulting in deterioration.

## **NEPA Methodology**

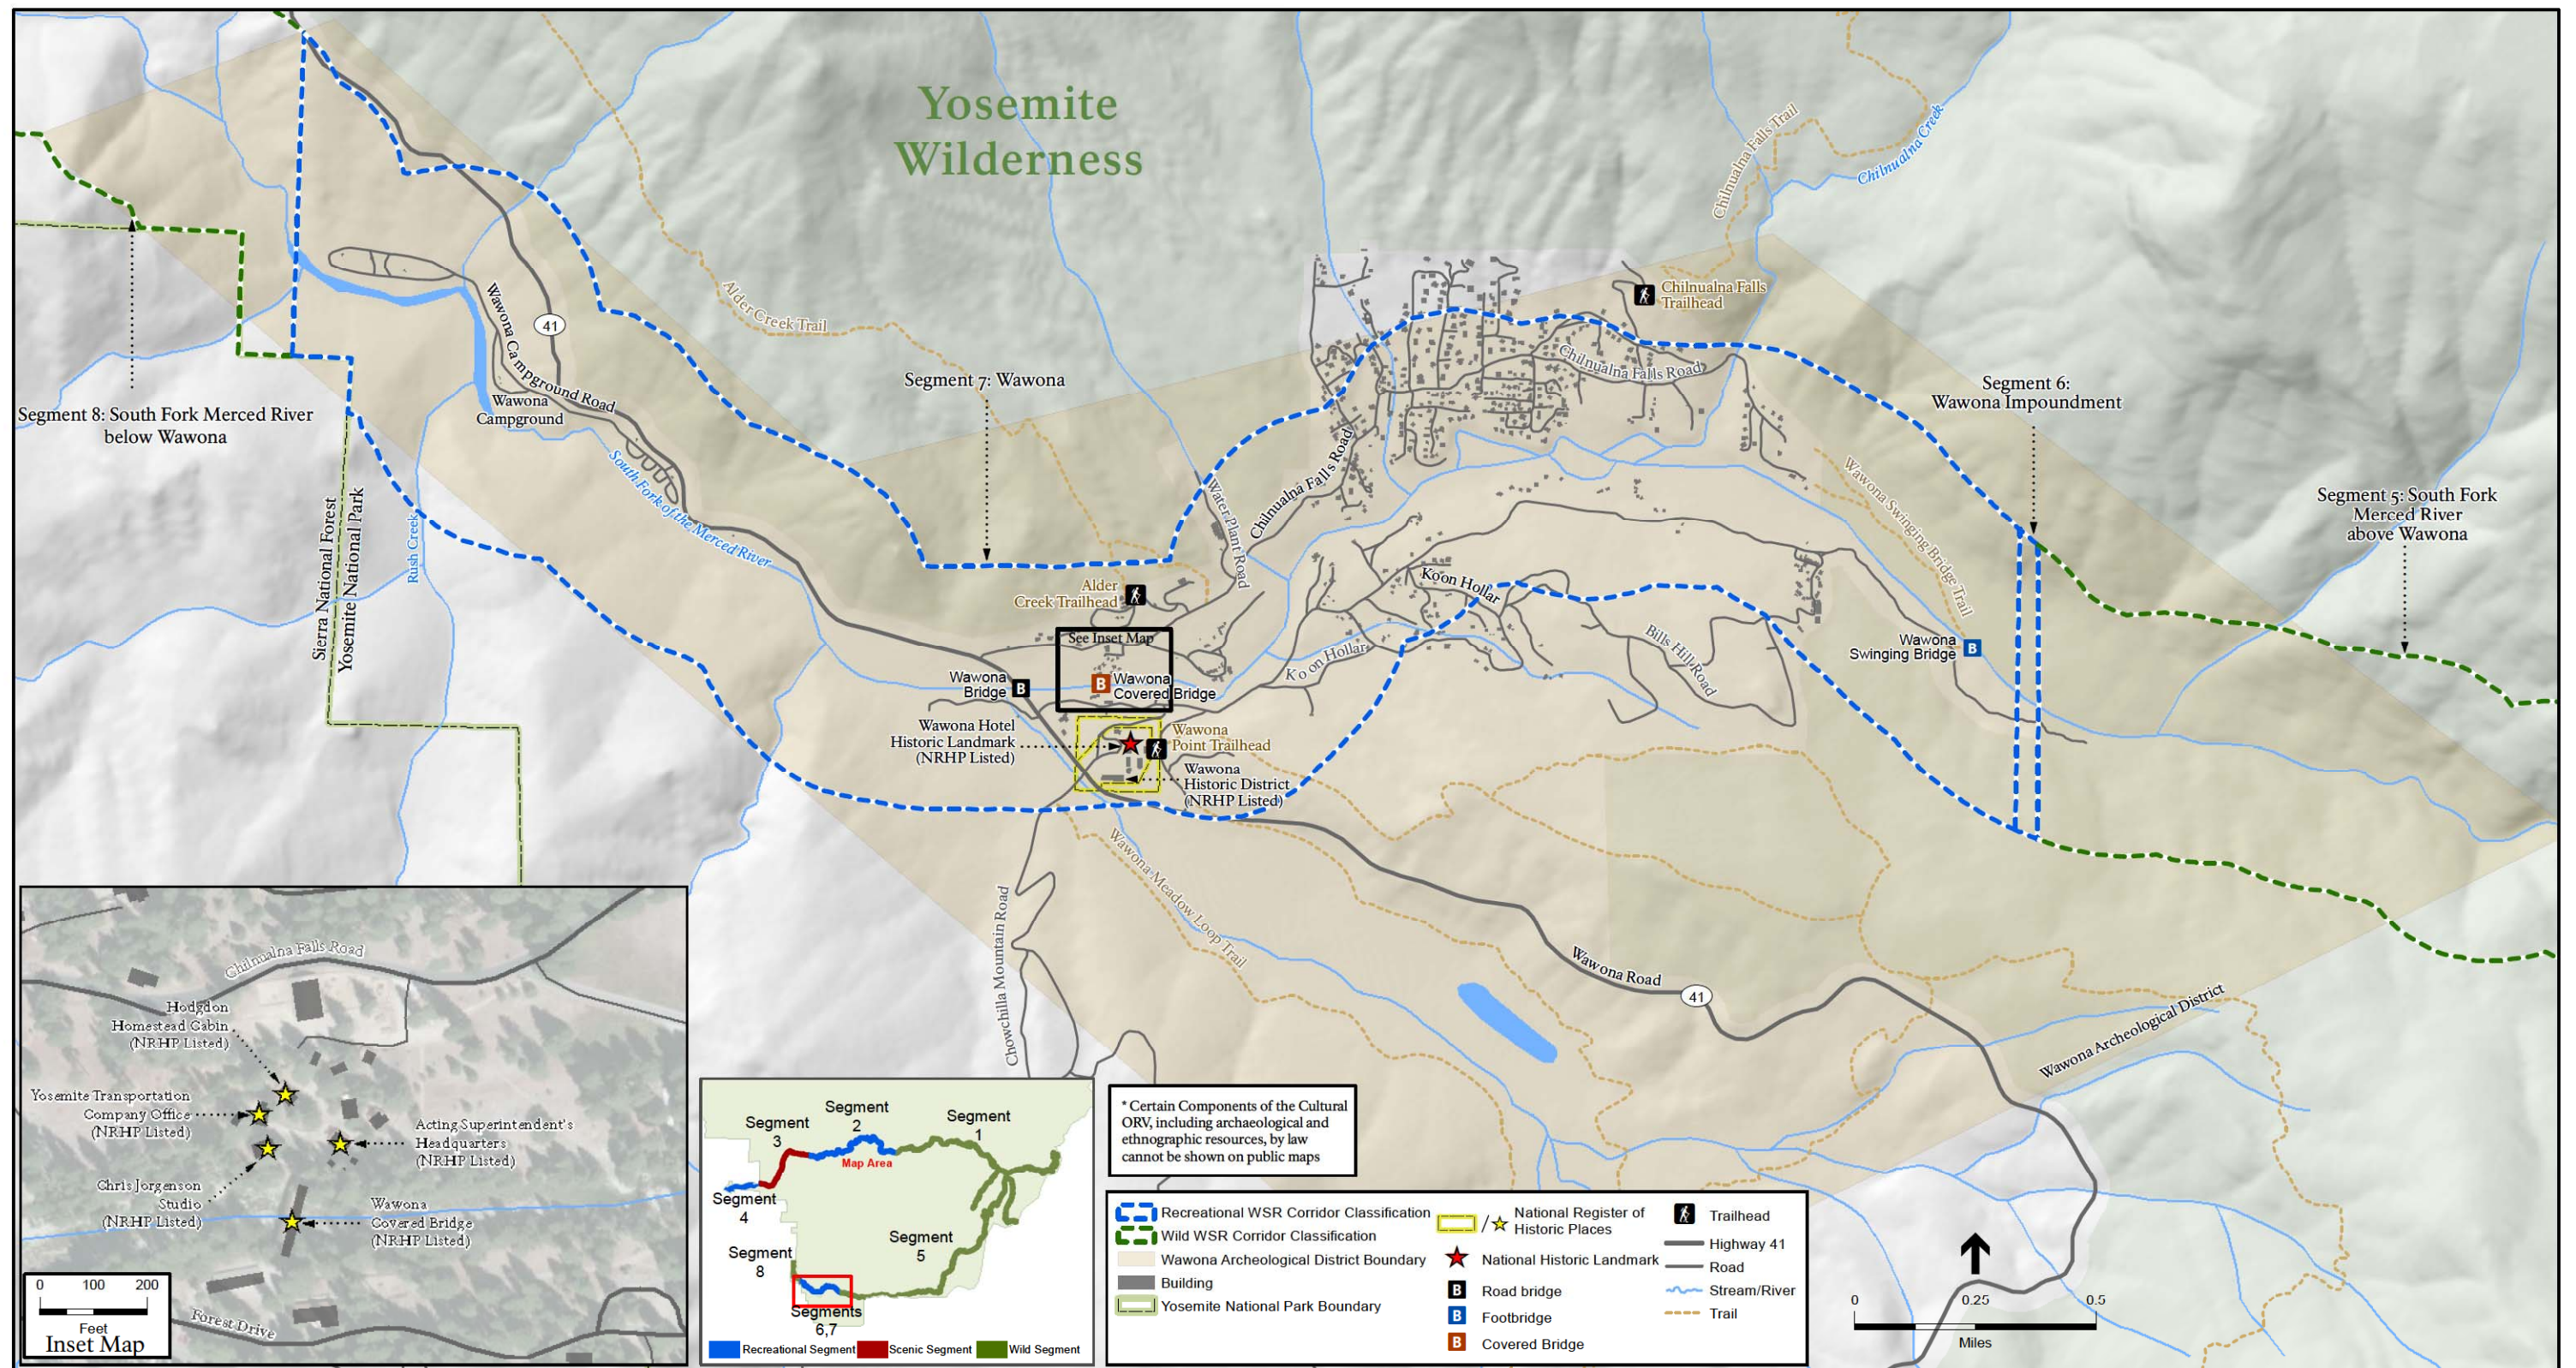

Analyses of impacts on the historic built-environment for the purposes of the NEPA are based on:

- **Context.** The context of the impact considers whether the impact would be local, segmentwide, parkwide, or regional. For this analysis, local impacts would be those that occur in a specific area within a segment of the river. This analysis further identifies whether there are local impacts in multiple segments. Segmentwide impacts would consist of a number of local impacts within a single segment, or larger-scale impacts that would affect the segment as a whole. Parkwide impacts would extend beyond the river corridor and the study area within Yosemite. Regional impacts would be those that extend to the Yosemite gateway region.

**Intensity.** The intensity of impact would depend on the nature, location, and design of the undertaking, measurable change in character-defining features of a historic property, and the number of contributing elements of a historic district that would be affected. Under NEPA criteria, intensity of the impact depends on the eligibility of the resource and considers whether the impact on eligible or listed historic resources would be negligible, minor, moderate, or major, based on the criteria of adverse effect described above.

- **Negligible.** Impact is barely perceptible and not measurable; would be expected to have no discernible effect on historic resources; confined to small areas or a single contributing element of a larger National Register district or historic resource
- **Minor.** Impact is perceptible and measurable; remains localized and not expected to have an overall effect on historic resources.
- **Moderate.** Impact results in clearly detectable changes to a character-defining feature of a historic resource and could have an appreciable effect on historic resources.
- **Major.** Impact results in a substantial and highly noticeable change in character-defining features; could permanently alter historic resources.

SOURCE: NPS, 1997, 2011

Merced River Comprehensive Management Plan and EIS . 210436

**Figure 9-51**  
Segments 6,7,8 - Wawona  
Historic Properties

THIS PAGE INTENTIONALLY LEFT BLANK

- **Duration.** The duration of the impact considers whether the impact would occur in the short term or the long term. A short-term impact would be temporary in duration, such as short-term impacts associated with construction or restoration activities. A long-term impact would have a permanent effect on historic resources.
- **Type of Impact.** The type of impact considers whether the impact would be beneficial or adverse to visitor services. Beneficial impacts would stabilize a historic resource to prevent future degradation, or appropriate active intervention would be performed to preserve the elements of the resource that qualify it for NRHP eligibility.

For the purposes of NEPA, “historic resources” include resources listed in and eligible for the NRHP. Resources that are assessed by park staff as being potentially eligible for listing on the National Register, but have not yet been inventoried, would require additional documentation prior to further planning, design and/or construction consistent with Sections 106 and 110 of the NHPA. In accordance with 36 CFR 800 criteria of effect, historic properties in the Merced River corridor are analyzed qualitatively, based on existing knowledge about values and significant elements and modifications that could be identified to alter character-defining features (features that qualify properties for inclusion in the NRHP). The proposed actions are assessed for the effects they may have on properties within the APE. Actions specific to individual alternatives that would affect these historic properties are described under each alternative.

### **Evaluating Impacts under the National Historic Preservation Act**

Any prehistoric or historic building, structure, object, site, landscape, or district that is included in, or is eligible for inclusion in the National Register, is termed a historic property and is managed for protection under the NHPA.

- ***Non-eligible historic resources.*** These are resources that fail to meet the criteria of the NRHP as described above.
- ***Listed historic resources.*** Listed historic resources are those properties that the Keeper of the National Register has officially added to the National Register of Historic Places.
- ***Eligible historic resources.*** Eligible historic resources are those which meet the criteria for listing on the National Register of Historic Places, and have been determined eligible either in concurrence with the SHPO or the Keeper of the National Register of Historic Places.

Types of historic properties include archeological sites, historic built-environment resources, archeological and historic districts, cultural landscapes, and traditional cultural properties. These resources may also be considered under the Archeological Resources Protection Act, the Native American Graves Protection and Repatriation Act, the American Indian Religious Freedom Act, and EO 13007 (Indian Sacred Sites).

Section 106 of the NHPA requires the federal agency to consider the effects of its undertakings on historic properties and to provide the ACHP a reasonable opportunity to comment. The agency must also identify the appropriate SHPO/Tribal Historic Preservation Officers to consult with during the process. It should also plan to involve the public, and identify other potential consulting parties.

Section 106 also applies to properties not formally determined eligible, but which meet eligibility requirements for the National Register and are therefore treated as eligible until a formal determination can be made.

### *NHPA Determinations of Effect*

Conventional terms used by the NPS to measure the context, duration, intensity, and type of impact as part of NEPA analysis are not valid for assessing effects on historic properties under NHPA standards. Because the effect on a historic property is measured by the status of the historic property's eligibility for listing in the NRHP, the negligible, minor, moderate, and major degrees do not apply. Either a historic property maintains the characteristics making it eligible for listing in the National Register or it does not.

The ACHP has issued regulations for the implementation of section 106, entitled *Protection of Historic Properties* (36 CFR 800). ACHP regulations discuss the following types of effect:

**No Historic Properties Affected:** When there are no historic properties present, or the action would have no effect on historic properties, the action is said to have no effect on historic properties.

**No Adverse Effect:** Occurs when there would be an effect on a historic property, but the action would not alter characteristics that make the property eligible for inclusion in the National Register of Historic Places in a way that would diminish the integrity of the property.

**Adverse Effect:** Occurs when an action would alter, directly or indirectly, any of the characteristics of a historic property that qualify it for inclusion in the National Register of Historic Places in a way that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Adverse effects may include reasonably foreseeable effects caused by the action that may occur later in time, be farther removed in distance, or be cumulative.

The regulations allow an agency, such as the park, to defer both the identification of historic properties (that is, the identification of whether or not a resource is eligible for the NRHP) and the effects assessment through the development of a programmatic agreement. The agreement may also stipulate additional terms, such as consultation, reporting criteria, monitoring, and dispute resolution. Yosemite National Park's section 106 review process is governed by national and park-specific programmatic agreements among the NPS, the ACHP, and the National Council of SHPOs or the California SHPO (NPS, ACHP, and NCSHPO 2008; NPS, SHPO, and ACHP 1999). As described previously, the Park is also proposing, via consultation with the ACHP, SHPO, and traditionally associated American Indian tribes and groups, the creation of a Merced River Plan PA regarding treatment of historic resources under the proposed management plan.

### *Resolving Adverse Effects on Historic Properties*

Adverse effects on built-environment historic properties (aboveground buildings and structures) under section 106 of the NHPA may be resolved with a good-faith effort to consider whether and how to avoid, minimize, or mitigate the effect. This may involve modifying the undertaking, imposing certain mitigation conditions, or implementing other measures negotiated in consultation with the SHPO, ACHP, American Indian tribal governments, and the public.

As requested by the State Historic Preservation Officer, compliance for the Merced River Plan will be in accordance with standard procedures for the protection of historic properties as identified in 36 CFR Part 800 as well as the 2008 Nationwide programmatic agreement between the NPS, ACHP, NCSHPO for compliance with section 106 of the NHPA. The park is committed to completing a plan-specific programmatic agreement per 36 CFR 800.14 prior to completion of the Record of Decision for the Merced River Plan. This programmatic agreement will be developed in coordination with the California State Historic Preservation Office (SHPO) and the Advisory Council for Historic Preservation (ACHP) as well as in consultation with all traditionally associated American Indian tribes and groups affiliated with the park. The public will have the opportunity to review the draft programmatic agreement between the DEIS and FEIS.

All action would comply with guidance of the proposed Merced River Plan programmatic agreement. In the event that the programmatic agreement is not completed prior to project initiation, actions will proceed under the guidance of the standard 36 CFR Part 800 consultation regarding consultation with SHPO.

### ***Special Requirements for Protecting National Historic Landmarks***

The ACHP regulations also discuss special requirements for protecting National Historic Landmarks at 36 CFR § 800.10. The Wawona Hotel and Thomas Hill Studio District NHL, for example, is a National Historic Landmark in Segment 7 of the river corridor that would be subject to this rule. National Historic Landmarks are afforded special consideration in planning efforts to minimize harm. This statutory requirement stems from Section 110(f) of the NHPA.

### ***Area of Potential Effect for this Plan***

As defined under the ACHP regulations at 36 CFR 800.16(d), the area of potential effect means the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties. The proposed APE for the *Merced River Plan/DEIS* is larger than the area encompassed by the Merced River corridor to ensure that the effects of all actions proposed under the plan are thoroughly considered. More specifically, the APE extends out 1.5 miles on each side of the river channel and includes the boundaries of the archeological and historic districts that extend outside the boundaries of the 0.25-mile river corridor (**Figure 9-52**).

### ***Environmental Consequences of Alternative 1 (No Action)***

#### **All River Segments**

Under Alternative 1 (No Action), all cultural landscape resources, historic buildings, and structures would continue to be managed as they are today. Alternative 1 also includes rehabilitation or other historic preservation as defined in existing or future plans that address specific structures, such as the Ahwahnee Comprehensive Rehabilitation. Impacts would occur only as a result of ongoing park operations and programs, such as facilities maintenance and repair. For historic buildings, cultural landscapes, and structures, these activities would be subject to the Secretary of the Interior's Standards

for the Treatment of Historic Properties. Under Alternative 1 (No Action), impacts on these resources would be negligible under NEPA criteria. Alternative 1 would have no adverse effect on Register-listed resources under the NHPA.

### **Segment 1: Merced River Above Nevada Fall**

Known historic resources in Segment 1 include the Merced Lake High Sierra Camp Historic District and the Merced Lake Ranger Station. Other resources may exist in the upper reaches of the Merced River drainage, such as structures associated with early stock men. Under Alternative 1 (No Action), impacts on these resources would be negligible under NEPA criteria. Alternative 1 is expected to have no adverse effect on these National Register-listed historic properties in Segment 1.

### **Segment 2: Yosemite Valley**

The Yosemite Valley Historic District is listed on the NRHP in 2006. Several historic sites, structures, and districts throughout the Valley were nominated for the NRHP prior to the Yosemite Valley Historic District nomination. These properties are significant on their own merits as well as contributing to the Yosemite Valley Historic District. **Table 9-211** describes potential impacts to these resources under the No Action Alternative.

Under Alternative 1 (No Action), impacts on the majority of resources would be negligible under NEPA criteria, although there would be minor, segment-wide, adverse impacts to the Yosemite Valley and Yosemite Village Historic Districts. Alternative 1 is expected to have no adverse effect on the majority of National Register-listed historic properties in Segment 2 under NHPA criteria.

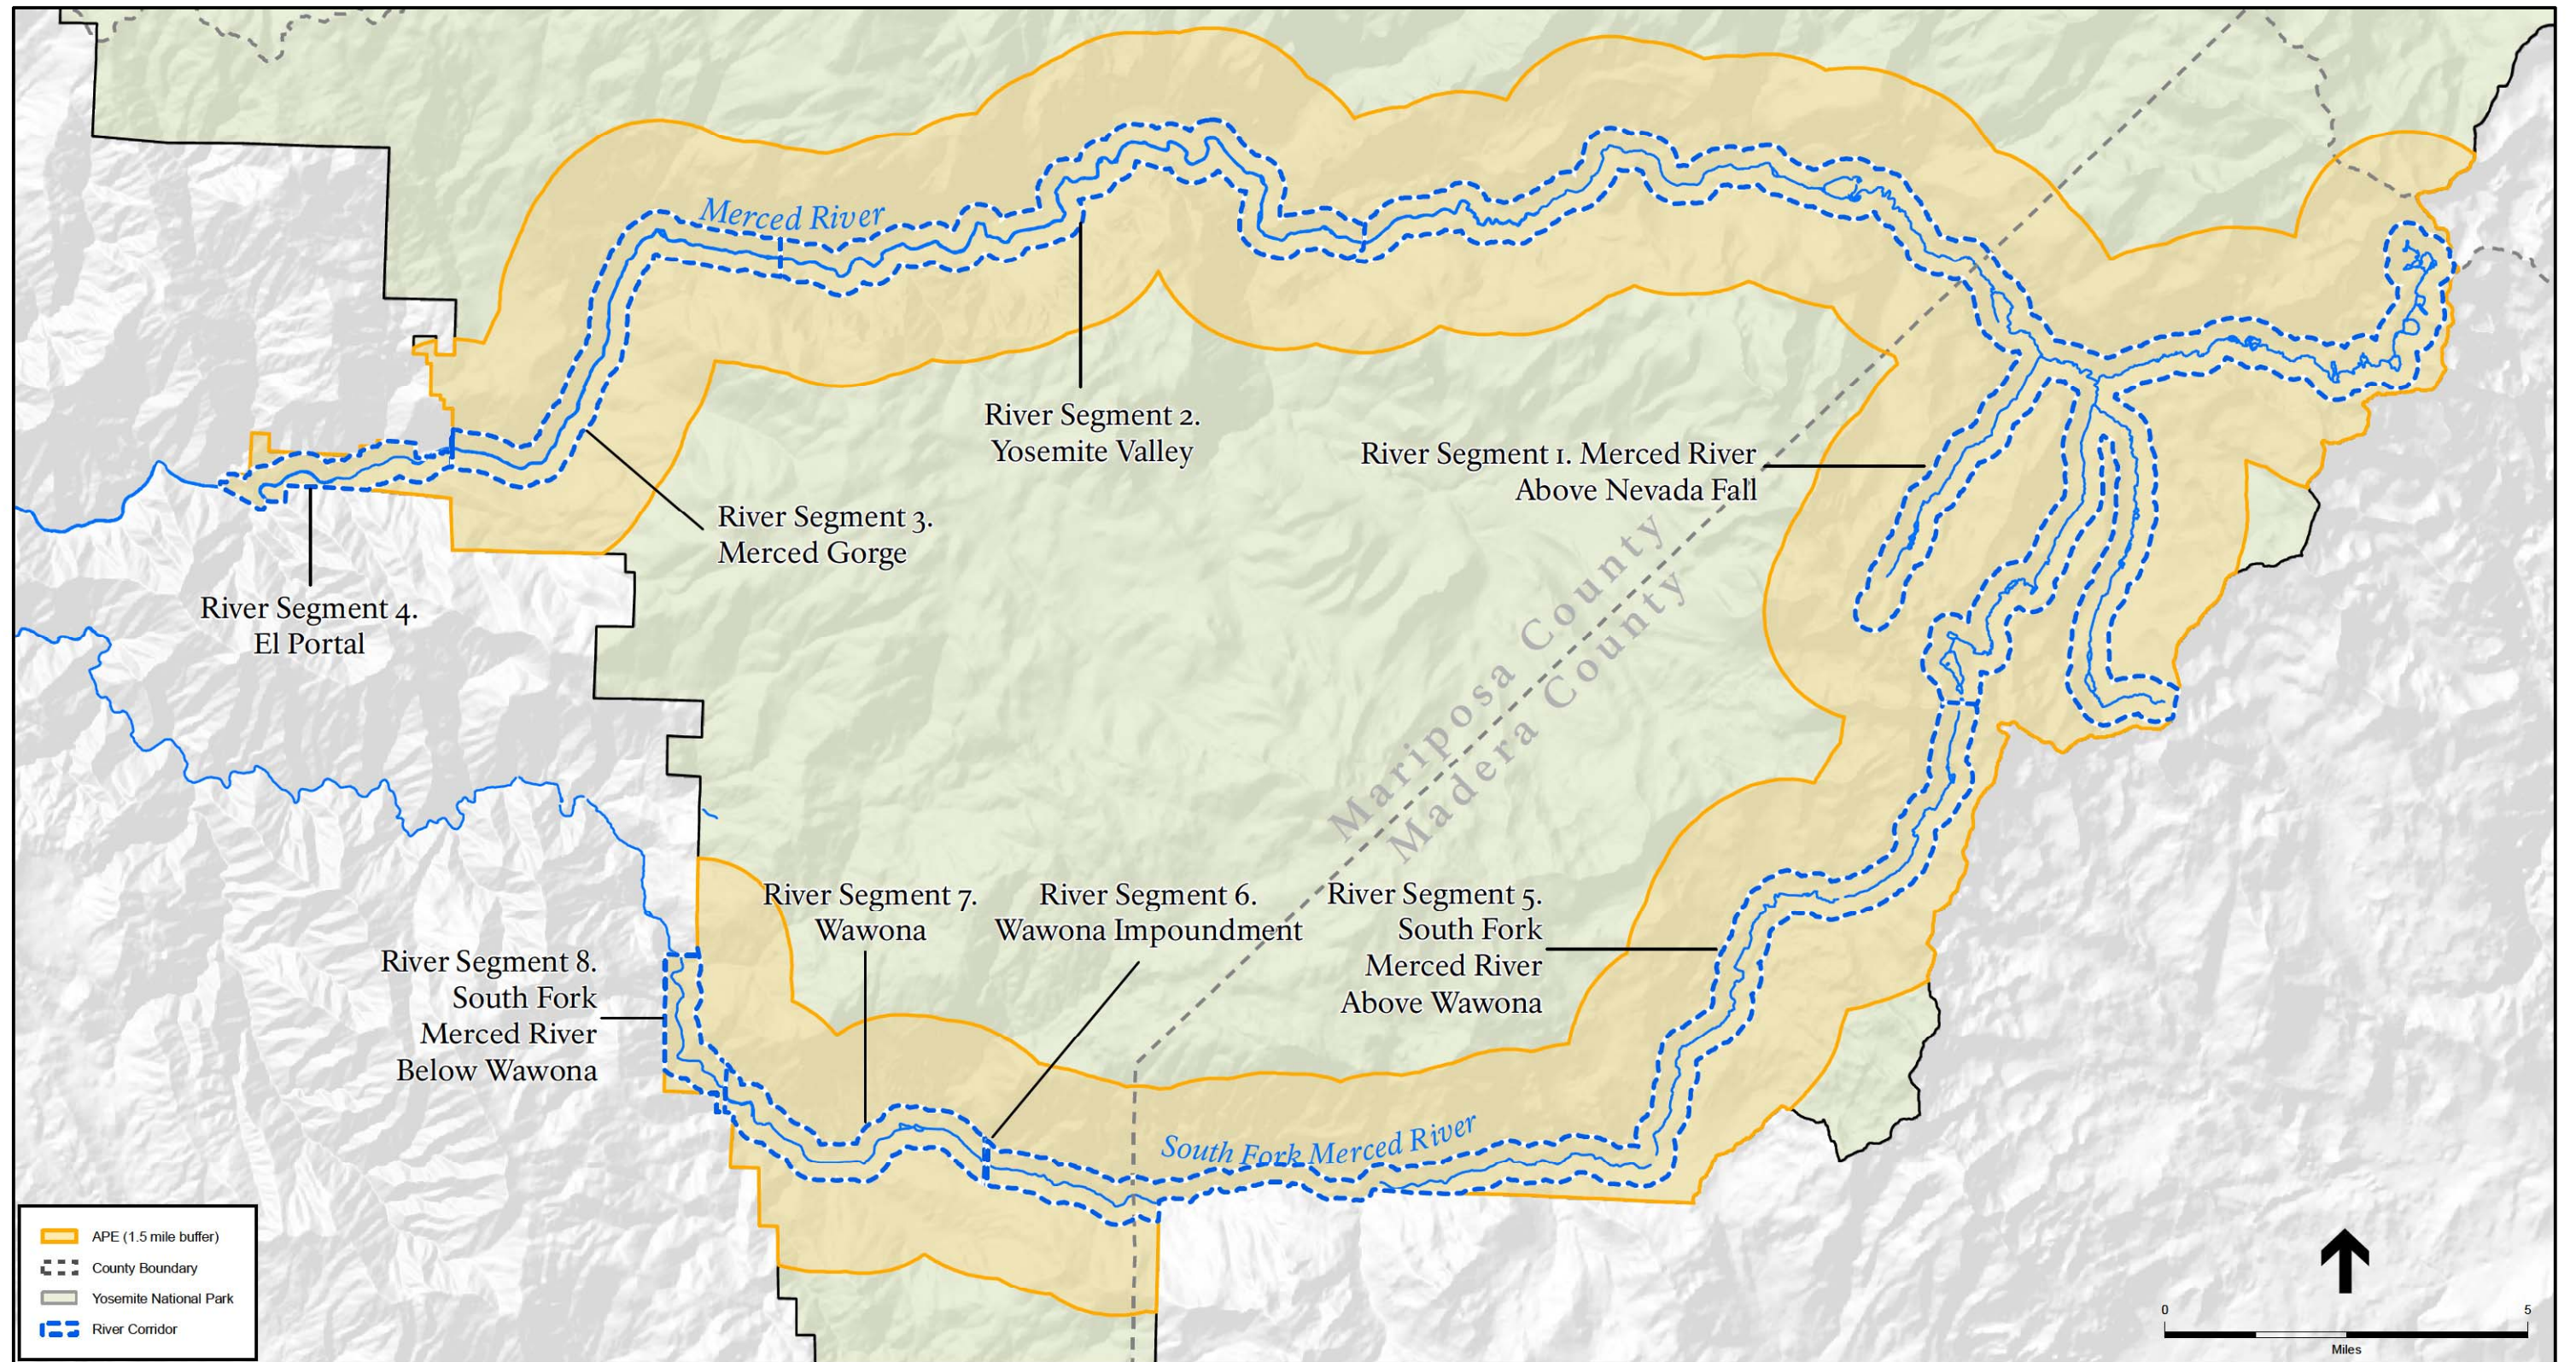

### **Segments 3 and 4: Merced River Gorge and El Portal**

Based on a cultural resources inventory completed in support of the reconstruction of El Portal Road, the NPS, in consultation with the SHPO, determined that the Merced Canyon Travel Corridor is a significant historic resource and is eligible for listing in the NRHP. A preliminary cultural landscape study conducted in El Portal revealed Old El Portal as a potential historic resource within Segment 4, although two other reports have not identified the resource eligible as a district. Both of these segments include several historic sites and structures considered eligible for listing in the NRHP. Under Alternative 1 (No Action), impacts on these resources would be negligible under NEPA criteria. Alternative 1 is expected to have no adverse effect on these National Register-listed historic properties in Segments 3 and 4 under NHPA Criteria.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

Cultural landscape inventories are being conducted for the Wawona area, focusing on Washburn Company holdings (including the Wawona Hotel and Thomas Hill Studio District NHL). This resort complex once encompassed many other facilities necessary to support such a remote facility. The Pioneer Yosemite History Center, on the banks of the South Fork Merced River, contains many structures relocated from other areas of the park. Other structures include the Wawona Covered Bridge, gray barn, slaughterhouse, and laundry, now used as a wagon repair shop. Wilderness areas

Merced River Comprehensive Management Plan and EIS . 210436

**Figure 9-52**  
Area of Potential Effect

THIS PAGE INTENTIONALLY LEFT BLANK

**TABLE 9-211: ALTERNATIVE 1 IMPACTS TO HISTORIC PROPERTIES IN SEGMENT 2**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159) (Contributing meadows to the Yosemite Valley Historic District include Bridalveil Meadow, El Captain, Slaughterhouse, Sentinel, Leidig, Cook's, Ahwahnee, Stoneman, and Lamon Meadows)	The continued encroachment of conifers into contributing meadows within the Yosemite Valley Historic District would have an adverse effect on the setting of these contributors.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. A history of intensive use and management, as well as the iconic significance of the meadows as elements of Yosemite scenery, make the Yosemite meadows contributing sites in the historic district (NPS 2006d).</p> <p>The encroachment of conifers into historic meadow areas in the Yosemite Valley Historic District would impact the historic setting of the meadows, as well as the potential loss of the meadows as contributing resources, resulting in a long term, moderate adverse impact under NEPA.</p> <p>The encroachment of conifers into historic meadow areas in the Yosemite Valley Historic District would alter the character of the contributing resources, and would result in an adverse effect to the historic district under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District, Yosemite Village Historic District	The continued mothballing of the Superintendent's House would result in an adverse effect to both the Yosemite Valley and Yosemite Village Historic Districts.	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). The Superintendent's House is a contributor to the Yosemite Valley Historic District and the Yosemite Village Historic District (Hart, 1978).</p> <p>The Superintendent's Residence and Garage is subject to recurring flooding and subsequent water damage. The building was mothballed following the 1997 floods. The historic interior finishes of the Superintendent's Residence, especially the distinctive plaster work, are in poor condition. Also, structural issues related to settling of the foundation have resulted in displacement of walls and floors. Visitor use in this area has caused radiating informal trails that impact Cook's Meadow. The continued impacts to the Superintendent's House have the potential to diminish the integrity of the Yosemite Valley and Yosemite Village Historic Districts. This action would result in a long term, minor adverse impact to the Yosemite Valley and Yosemite Village Historic Districts under NEPA.</p> <p>While the Superintendent's Residence and Garage was mothballed following the 1997 floods, mothballing does not prevent deterioration. The continued mothballing of Residence 1 would result in an adverse effect to the Yosemite Valley and Yosemite Village Historic Districts under NHPA.</p>

above Wawona contain historic trails. Potential impacts under Alternative 1 (No Action) would include ongoing degradation of resources from visitor and operational use; however, ongoing maintenance and rehabilitation would result in negligible impacts on historic resources. Under Alternative 1, impacts on these resources would be negligible under NEPA criteria. Alternative 1 (No Action) would likely have no adverse effect on these National Register-listed historic properties in Segments 5, 6, 7, and 8 under NHPA Criteria.

### **Summary of Impacts Under No Action Alternative**

Identified historic resources that could be adversely affected by the No Action Alternative include the Yosemite Valley Historic District and the Superintendent's House. These effects include the alteration of character-defining features of these National Register-listed resources through neglect.

### **Cumulative Impacts from Alternative 1 (No-Action)**

#### ***Past Actions***

Past actions have resulted in a range of beneficial and adverse impacts. Beneficial impacts of past actions include extensive actions to preserve and maintain historic resources, including the Camp Curry Historic District (Curry Village Registration Building, Guest Lounge and Amphitheater Rehabilitation), as well as restoration of meadows associated with the Yosemite Valley Historic District (Cook's Meadow). Adverse effects include the removal of the NR eligible Cascades area houses.

#### ***Present Actions***

Present actions contribute to a mixture of beneficial and adverse impacts. These impacts include efforts to restore, preserve, and protect the historic integrity and character-defining features of The Ahwahnee NHL while completing long-term rehabilitation of the building and associated features, construction of the Wawona fire station, Camp 4 relocating eight campsites, and the Ahwahnee Hotel Porte Cochère Access Walkways and Fence project. Additionally, the park has established the Yosemite Valley Rockfall Hazard Zone in Curry Village, which has resulted in the loss of historic structures. These structures are being documented under a separate MOA.

#### ***Future Actions***

Impacts from future actions would be similar to those discussed for past and present actions as a mix of beneficial and adverse impacts to historic resources. The Curry Village Rehabilitation of Historic Cabins with Bath Structures, seismic upgrade to the Ahwahnee Dormitory, and efforts to stabilize the floor of the Ahwahnee Hotel, all consist of potential future actions with the potential to affect historic resources within the park.

### ***Overall Cumulative Impact***

There would be no change in the treatment and management of historic buildings, structures, and cultural landscape resources as a result of Alternative 1 (No Action). The results of the neglect in Segment 2 would contribute towards a moderate adverse cumulative effect.

### ***Environmental Consequences Common to Alternatives 2–6***

While discussed separately, actions and impacts common to Alternatives 2–6 are included in the analysis of each subsequent alternative, in addition to actions specific to the individual alternatives.

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

Table 9-212 describes impacts of actions intended to protect and enhance river values in all river segments under Alternatives 2-6.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Actions intended to manage visitor use and facilities that are common to Alternatives 2–6 and would occur across all segments of the river corridor would not be expected to result in an adverse effect on historic resources because these actions would not affect the character-defining features of a historic building, structure, or district.

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Protect and Enhance River Values***

Actions common to Alternatives 2–6 that are intended to protect and enhance river values and would occur within Segment 1 would not result in an adverse effect on historic resources because these actions would not affect the character-defining features of a historic building, structure, or district.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Actions common to Alternatives 2–6 that are intended to manage visitor use and facilities and would occur in Segment 1 would not result in an adverse effect on historic resources because these actions would not affect the character-defining features of a historic building, structure, or district.

#### **Segment 2: Yosemite Valley**

##### ***Impacts of Actions to Protect and Enhance River Values***

Table 9-213 describes impacts of actions intended to protect and enhance river values in Segment 2 under Alternatives 2-6.

**TABLE 9-212: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN ALL RIVER SEGMENTS UNDER ALTERNATIVES 2-6**

Segment	Action Type	Potential Historic Resource	Action and Impact to Resource	Analysis under NEPA/NHPA
All segments	Actions to Protect and Enhance River Values	Abandoned infrastructure	Throughout the corridor, abandoned underground infrastructure that alters hydrology, including remnants of former sewer treatment facilities, sewer and water line, and manholes, will be removed and the area restored to natural conditions. This may affect historic resources.	Throughout all segments of the Merced Wild and Scenic River corridor, removing abandoned infrastructure has the potential to affect historic resources. These resources have not been previously evaluated for their historic significance, and the loss or demolition of historical resources would be a long term, local, moderate adverse impact, depending on whether the resources are found to be contributors to a historic district or significant in their own right. Park actions to remove abandoned infrastructure throughout the river corridor would be completed subject to the proposed Merced River Plan programmatic agreement (or standard 36 CFR Part 800 consultation) when site-level information is available. Following the determination of site level information, impacts to these properties will be determined per NEPA and NHPA.

**TABLE 9-213: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVES 2-6**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	The Ahwahnee Hotel (1977000149: NHL) ; Yosemite Valley Historic District (2004001159)	Restoring the impacted portion of Ahwahnee Meadow to natural meadow conditions, through removal of tennis courts, irrigation, ditches, and restoration of topography would result in the removal of the tennis courts which are a contributing structure to the Ahwahnee Hotel.	<p>The Ahwahnee, because of its architectural design and pristine condition, is among the most significant park hotels in the country. Its rustic style was designed to reflect its environment, and its significance lies with the preservation of the building and its setting. The Tennis Courts are a contributor to the National Register Ahwahnee Hotel and the Yosemite Valley Historic District, but are located outside the boundary of the National Historic Landmark. The Ahwahnee Meadow is a contributor to the Yosemite Valley Historic District, the National Register listed Ahwahnee Hotel, and the National Historic Landmark Ahwahnee Hotel (Hart 1977; NPS 2006d; Harrison, 1977).</p> <p><i>NEPA:</i> The removal of the tennis courts, a contributing resource to the Yosemite Valley Historic District and Ahwahnee Hotel, would result in to the alteration of the Ahwahnee Hotel and the Yosemite Valley Historic District. The tennis courts and Ahwahnee meadow are parts of the historic setting and landscape of the Ahwahnee Hotel and contribute to its aesthetic and significance. The removal of the tennis courts would, however, result in a beneficial impact through the restoration of an earlier configuration of the historic Ahwahnee Meadow. The action would be taken consistent with mitigation measure HIST-2 and guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The proposed removal of the tennis courts would result in a long term, local, moderate adverse effect to the NR Ahwahnee Hotel and the Yosemite Valley Historic District under NEPA. The restoration of the Ahwahnee Meadow would result in a long term, local, beneficial impact to the NR Ahwahnee Hotel and the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The removal of the tennis courts, a contributing resource to the Yosemite Valley Historic District and Ahwahnee Hotel, would alter both the Yosemite Valley Historic District and NR Ahwahnee Hotel. As described above, the action would be taken consistent with mitigation measure HIST-2 and guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The</p>

**TABLE 9-213: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVES 2-6 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions (cont.)</b>				
Segment 2 (cont.)				removal of the tennis courts will result in the diminishment of integrity of the Yosemite Valley Historic District and the NR Ahwahnee Hotel, and would have an adverse effect on the Yosemite Valley Historic District and NR Ahwahnee Hotel under NHPA. The restoration of the Ahwahnee Meadow would have no adverse effect to the Yosemite Valley Historic District and NR Ahwahnee Hotel under NHPA.
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	Restoration efforts for meadows contributing to Yosemite Valley Historic District (Cook's, Sentinel, Ahwahnee, Stoneman) would result in no adverse effects to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. The Cook's, Sentinel, Ahwahnee, and Stoneman Meadows are contributing sites to the Yosemite Valley Historic District as characteristic landscape features in the Valley (NPS 2006d).</p> <p>NEPA: The restoration of the meadows to their historic setting would result in a long term, segment-wide, beneficial impact to the Yosemite Valley Historic District under NEPA.</p> <p>NHPA: The restoration of the meadows to their historic setting would improve the condition of a resource and would result in no adverse effect to the Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Protect and Enhance River Values	Ditches	Throughout Segment 2, fill 2,155 ' of ditches not serving current operational needs using adjacent berm material or pond and plug techniques.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation (NPS 2006d).</p> <p>The infill of ditches in Segment 2 has the potential to alter historic resources. These ditches have not been previously evaluated as a National Register-eligible resources, and the loss or demolition of historical resources would be a long term, moderate, segment wide, adverse impact, depending on whether the resources are found to be contributors to a historic district or significant in their own right. The Park will complete NHPA section 110 prior to this action, with a DOE completed prior to site planning. Additional consultation (tribal or SHPO) would also be required. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to</p>

**TABLE 9-213: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVES 2-6 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions (cont.)</b>				
Segment 2 (cont.)				ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. Park actions to fill the ditches would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation when site-level information is available.
<b>Scenic Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	The removal of encroaching conifers from meadows contributing to the Yosemite Valley Historic District (Ahwahnee, Bridalveil, Cook's, Sentinel) would result in no adverse effects to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. The Ahwahnee, Bridalveil, Cook's, and Sentinel Meadows are contributing sites to the Yosemite Valley Historic District as characteristic landscape features in the Valley (NPS 2006d).</p> <p><i>NEPA:</i> The removal of encroaching conifers would help restore the meadows to their historic condition, and would result in a long term, segment-wide, beneficial effect to the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The removal of encroaching conifers would help restore the meadows to their historic condition, would improve the condition of a resource and would result in no adverse effect to the Yosemite Valley Historic District under NHPA.</p>

**Biological Resource Actions.** Biological resource actions to protect and enhance river values in Segment 2 under Alternatives 2-6 would result in minor or moderate, local, long term adverse impacts on the listed Yosemite Valley Historic District and Ahwahnee Hotel, as both an individual resource and a contributor to the Yosemite Valley Historic District, under NEPA, and an adverse effect to the Yosemite Valley Historic District and NR Ahwahnee Hotel under NHPA.

**Scenic Resource Actions.** Scenic resource actions to protect and enhance river values in Segment 2 under Alternatives 2-6 would result in long term, segment-wide, beneficial effect to the Yosemite Valley Historic District through restoration of contributing meadows, and no adverse effect to the Yosemite Valley Historic District under NHPA.

***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Table 9-214 describes impacts of actions intended to protect and enhance river values in Segment 2 under Alternatives 2-6.

**Yosemite Village and Housekeeping Camp.** Actions in the Yosemite Village area include the removal of the Ahwahnee tennis courts and pool and redesign and formalization of parking at the Ahwahnee Hotel, redesign of the parking lot and re-routing Northside Drive at Yosemite Village Day-Use Parking area, removal of the Valley Concessioner Garage Building and 4 garages north of Curry Garage, and repurposing of the Yosemite Valley Group Utility Building (Fort Yosemite). As described in table 9-214 below, these actions, other than the Ahwahnee Parking lot redesign, would have a minor to moderate, local, long term adverse impact to the listed Yosemite Valley Historic District under NEPA, and an adverse effect to the Yosemite Valley Historic District, the Yosemite Village Historic District, and the Ahwahnee Hotel under NHPA. The redesign of the Ahwahnee parking lot would have no adverse impact to the Yosemite Valley Historic District or Ahwahnee Hotel under NEPA, and no adverse effect to the Yosemite Valley Historic District or Ahwahnee Hotel under NHPA.

**Yosemite Lodge and Camp 4.** Actions to manage visitor use and facilities in the Yosemite Lodge and Camp 4 areas would include the removal of facilities from the Yosemite Lodge area and construction of a new bus stop, parking area, and campsites near Camp 4. As described in table 9-214 below, Yosemite Lodge was identified as being a non-contributing site within the Yosemite Valley Historic District. However, it has not been evaluated for its post-WWII significance under the 50-year rule for the inventorying of historic properties for the National Register, and a determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning. Impacts to the Yosemite Valley Historic District through the construction of new facilities within the district near Camp 4 would result in a minor, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA, and no adverse effect under NHPA.

**TABLE 9-214: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVES 2-6**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	The Ahwahnee Hotel (1977000149: NHL); Yosemite Valley Historic District (2004001159)	Retaining the existing facilities and services, including bar and food service, dining room, gift shop, and sweet shop would not affect the Ahwahnee Hotel. Removal of the non-contributing pool would not affect the Ahwahnee Hotel. The tennis courts are considered a contributing structure to the Ahwahnee Hotel, and their removal would affect this historic resource.	<p>The Ahwahnee, because of its architectural design and pristine condition, is among the most significant park hotels in the country. Its rustic style was designed to reflect its environment, and its significance lies with the preservation of the building and its setting. The pool is a non-contributor to the Yosemite Valley Historic District, the National Register listed Ahwahnee Hotel, and the National Historic Landmark Ahwahnee Hotel (Harrison, 1977; NPS 2006d).</p> <p><i>NEPA:</i> The retention of existing facilities and removal of the pool would result in no adverse impact to either the NR Ahwahnee Hotel or Yosemite Valley Historic District. The impact of removal of the tennis courts is discussed above in table 9-213. The pool is a non-contributing resource, and its removal would have no effect on the Ahwahnee Hotel or Yosemite Valley Historic District. As described above, the removal of the tennis courts would result in a long term, local, moderate adverse impact to the NR Ahwahnee Hotel and a long term, local, minor adverse impact to the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The retention of existing facilities and the removal of the pool would not alter historic properties. The pool is a non-contributing resource to the Ahwahnee Hotel and Yosemite Valley Historic District, and the continued use of existing facilities would not diminish the integrity of the Ahwahnee Hotel or Yosemite Valley Historic District. The adverse effect of the removal of the tennis courts is described under actions to restore the Ahwahnee Meadow in table 9-213. As described in table 9-213, the removal of the tennis courts would have an adverse effect on the Yosemite Valley Historic District and NR Ahwahnee Hotel through removal of an identified contributing resource.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	The Ahwahnee Hotel (1977000149: NHL); Yosemite Valley Historic District (2004001159)	Redesign and formalize the existing parking lot at the Ahwahnee Hotel, providing for proper drainage to meet hotel needs and replace spaces lost in the rockfall. This would include the construction of a new 50 parking space lot east of the current parking.	<p>The Ahwahnee, because of its architectural design and pristine condition, is among the most significant park hotels in the country. Its rustic style was designed to reflect its environment, and its significance lies with the preservation of the building and its setting. The Ahwahnee Parking area (west) is a contributor to the Yosemite Valley Historic District, and both parking lots are contributors to the National Register listed Ahwahnee Hotel, and the National Historic Landmark Ahwahnee Hotel (Harrison, 1977; NPS 2006d).</p>

**TABLE 9-214: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVES 2-6 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2 (cont.)				<p><i>NEPA:</i> The Ahwahnee parking lots are contributors to the Ahwahnee Hotel as part of the historic setting, but are not architecturally distinct themselves. The alteration of the parking area has the potential to result in changes to the historic circulation and setting of the hotel. Planning and design efforts would follow the Ahwahnee Historic Structures Report (1997) and Ahwahnee Cultural Landscape Report (2010) recommendations for parking lot configuration and gate house restoration. Planning and design efforts would be planned in order to ensure that the park has attempted to avoid any potentially adverse impacts to the historic property. This action would be completed in compliance with the proposed Merced River Plan PA. This action would result in no adverse impact to either the Ahwahnee Hotel NHL or NR, or the Yosemite Valley Historic District under NEPA.</p> <p><i>NEHA:</i> The Ahwahnee parking lots are contributors to the Ahwahnee Hotel as part of the historic setting, but are not architecturally distinct themselves. The alteration of the parking area has the potential to result in changes to the historic circulation and setting of the hotel. Planning and design efforts would follow the Ahwahnee Historic Structures Report (1997) and Ahwahnee Cultural Landscape Report (2010) recommendations for parking lot configuration and gate house restoration. Planning and design efforts would be planned in order to ensure that the park has attempted to avoid any potentially adverse effects to the historic property. This action would be completed in compliance with the proposed Merced River Plan PA. This action would result in no adverse effect to the Ahwahnee Hotel NHL or NR, or the Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	The relocation of parking to the north of the road and re-routing Northside Drive south of the parking at Yosemite Village Day-Use Parking area would affect historic circulation patterns in the Yosemite Valley Historic District.	The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Northside and Southside drives create a framework for circulation around the valley, on either side of the Merced River, and are contributing structures to the Yosemite Valley Historic District. The historic circulation of Yosemite Village is predominantly centered on Village Drive between Northside Drive and Village bike path (NPS 2006d). Northside Drive is not a contributor to the Yosemite Village Historic District (Donahoe 1994).

**TABLE 9-214: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVES 2-6 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2 (cont.)				<p><i>NEPA:</i> The relocation of the parking lot will occur within the existing developed former footprint of the Concessioner General Office and the Concessioner Garage. The relocation of an existing parking lot within the existing developed footprint would not result in a significant change to the historic setting of the Yosemite Valley Historic District. The re-routing of Northside Drive would affect the Yosemite Valley Historic District through alteration of historic circulation patterns and alteration of an identified contributing resource to the Yosemite Valley Historic District. The road realignment will include a small segment of the entire length of Northside Drive. As described above, the action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The road realignment and relocation of the parking lot will have a moderate, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The relocation of the parking lot will occur within the existing developed former footprint of the Concessioner GO and the Concessioner Garage. The relocation of the parking lot to an existing, developed administrative footprint will not alter characteristics that make the Yosemite Valley Historic District eligible for inclusion in the National Register of Historic Places in a way that would diminish the integrity of the district. The relocation of the parking lot will have no adverse effect on the Yosemite Valley Historic District under NHPA. The realignment of Northside Drive would diminish the integrity of the Yosemite Valley Historic District through alteration of historic circulation patterns and alteration of an identified contributing resource to the Yosemite Valley Historic District. The road realignment will include a small segment of the entire length of Northside Drive. As described above, the action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The road realignment will have an adverse effect on the Yosemite Valley Historic District under NHPA.</p>

**TABLE 9-214: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVES 2-6 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159); Yosemite Village Historic District	Removal of the Concessioner Garage Building and 4 garages north of Curry Garage would result in the loss of 5 contributing buildings to the Yosemite Valley Historic District.	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). The Concessioner Garage Building and 4 garages north of Curry Garage are contributors to the Yosemite Valley Historic District and the Yosemite Village Historic District.</p> <p><i>NEPA:</i> The removal of the Concessioner Garage Building and 4 additional garages north of Curry Garage has the potential to affect alter the Yosemite Valley Historic District. Removal of the buildings would result in the loss of 5 contributing buildings to the district (of 302 and 68 resources, respectively). This action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The action would result in a long term, moderate, local adverse impact to Yosemite Valley Historic District and the Yosemite Village Historic District under NEPA.</p> <p><i>NHPA:</i> The removal of the Concessioner Garage Building and 4 additional garages north of Curry Garage has the potential to alter the Yosemite Valley Historic District. Removal of the buildings would result in the loss of 5 contributing buildings to the district. This action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The demolition or loss of these contributing resources would diminish the integrity of the historic districts. The action will have an adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	Repurposing of the Fort Yosemite building would result in the alteration of the physical structure, affecting a contributing resource to the Yosemite Valley Historic District. The proposed rehabilitation of Buildings 516, 518, and 519 would	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). The Yosemite Valley Group Utility Building (Fort Yosemite) is a contributor to the Yosemite Valley Historic District, but not the Yosemite Village Historic District (NPS 2006d).</p> <p><i>NEPA:</i> The repurposing of the Yosemite Valley Group Utility Building, a contributor to the Yosemite Valley Historic District, as the location of the</p>

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2 (cont.)			adhere to the Secretary of the Interior Standards for the treatment of historic properties, and would be accomplished without adverse effects.	<p>Valley Garage has the potential to affect on the Yosemite Valley Historic District. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The physical alteration of the structure would adversely affect the building's integrity of design and infringe upon its ability to convey the historic significance of the district. Major changes to the exterior and interior of the Yosemite Valley Group Utility Building (Fort Yosemite) are proposed, and these changes are likely beyond the allowances of rehabilitation (repairs and alterations for efficient and compatible uses). This will likely result in a long term, moderate, adverse impact on the Yosemite Valley Historic District under NEPA. The following historic buildings are slated for rehabilitation to provide more efficient storage: Building 516 (Yosemite Valley Equipment Area Utility Shed), Building 518 (Yosemite Valley Equipment Area Utility Shed), and Building 519 (Yosemite Valley Equipment Area Utility Shed). Following the Secretary Standards, it may be possible to accomplish this without adverse impacts.</p> <p><i>NHPA:</i> The repurposing of the Yosemite Valley Group Utility Building and three other buildings, all contributors to the Yosemite Valley Historic District, may diminish the integrity of the Yosemite Valley Historic District. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The physical alteration of the structure would adversely affect the building's integrity of design and infringe upon its ability to convey the historic significance of the district. The alteration of the Yosemite Valley Group Utility Building (Fort Yosemite) are likely beyond the allowances of rehabilitation (repairs and alterations for efficient and compatible uses). This will likely result in an adverse effect on the Yosemite Valley Historic District under NHPA. Rehabilitation of Building 516, Building 518, and Building 519 should be undertaken according to the Secretary of the Interior Standards for Rehabilitation. Under these guidelines, the rehabilitation of Buildings 516, 518, and 519 would result in no adverse effect Yosemite Valley Historic District under NHPA.</p>

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Lodge and Camp 4</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Camp 4 (2003000056); Yosemite Valley Historic District (2004001159)	Expansion eastward to provide 40 walk-in sites while retaining 35 campsites at Camp 4 would affect Camp 4 as a historic property as well as its status as a contributing site in the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). Camp 4 is a historically significant site for its association with the growth and development of rock climbing as a recreational activity within the valley. During its period of significance, Camp 4 earned national and international acclaim as the center of modern rock climbing. The approximately 10-acre site served as a place for training, ascent planning, and information and equipment exchange (NPS 2006d; NPS, 2003).</p> <p><i>NEPA:</i> The entirety of the Camp 4 site is considered to be a contributing resource to both the NR site and the Yosemite Valley Historic District, and the expansion of the number of sites has the potential to affect the setting of Camp 4. The site's significance centers on its location as the development of modern rock climbing. While the addition of 40 walk in sites would alter the site's setting, it would not result in an adverse effect to the character defining features and nature of the site. The addition of new facilities within the Yosemite Valley Historic District would be completed under the Yosemite Design Guidelines. The additional sites would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The action would have a long term, minor adverse impact on Camp 4 and the Yosemite Valley Historic District.</p> <p><i>NHPA:</i> The entirety of the Camp 4 site is considered to be a contributing resource to both the NR site and the Yosemite Valley Historic District, and the expansion of the number of sites would alter the setting of Camp 4. The site's significance, however, centers on its location as the development of modern rock climbing. While the addition of 40 walk in sites would alter the site's setting, it would not result in an adverse effect to the character defining features and nature of the site. The addition of new facilities within the Yosemite Valley Historic District would be completed under the Yosemite Design Guidelines. <b>Yosemite Lodge and Camp 4 (cont.)</b>				
Segment 2 (cont.)				not alter characteristics that make this district eligible for inclusion in the National Register of Historic Places in a way that would diminish the integrity of the district. The additional sites would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The action would have no adverse effect on Camp 4 and the Yosemite Valley Historic District.
Segment 2	Actions to Manage Visitor Use and Facilities	Camp 4 (2003000056); Yosemite Valley Historic District (2004001159)	Construction along Northside Drive, including a shuttle bus stop, parking for 41 vehicles, and an overflow parking lot for 25 vehicles, all of which is proposed outside the boundary for Camp 4 but within the Yosemite Valley Historic District, would have an affect on the Yosemite Valley Historic District and the setting it provides for Camp 4.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). Camp 4 is a historically significant site for its association with the growth and development of rock climbing as a recreational activity within the valley. During its period of significance, Camp 4 earned national and international acclaim as the center of modern rock climbing. The approximately 10-acre site served as a place for training, ascent planning, and information and equipment exchange (NPS 2006d; NPS, 2003).</p> <p>NEPA: The construction of both the shuttle bus stop and new parking lots on the south side of Northside Drive would occur outside of the site boundary of Camp 4. As described above, the action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation, and the addition of new facilities within the Yosemite Valley Historic District would be completed under the Yosemite Design Guidelines. The addition of new parking outside of the site boundary would have no adverse effect on Camp 4 and a minor, local, long term adverse impact to the Yosemite Valley Historic District under NEPA.</p> <p>NHPA: The construction of both the shuttle bus stop and new parking lots on the south side of Northside Drive would occur outside of the site boundary of Camp 4. The addition of new facilities within the Yosemite Valley Historic District has the potential to diminish the integrity of setting to the district. As described above, the action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800</p>

**TABLE 9-214: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVES 2-6 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Lodge and Camp 4 (cont.)</b>				
Segment 2 (cont.)				consultation, and the addition of new facilities within the Yosemite Valley Historic District would be completed under the Yosemite Design Guidelines. While the action will have an effect on the Yosemite Valley Historic District, the action would not alter characteristics that make this district eligible for inclusion in the National Register of Historic Places in a way that would diminish the integrity of the district. The addition of new parking outside of the site boundary would have no adverse effect on Camp 4 and the Yosemite Valley Historic District under NHPA.
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District	In Yosemite Lodge area, the removal of the NPS volunteer office, Yosemite Lodge housing (Thousands Cabins), Housing at Highland Court, Yosemite Lodge Post Office, Yosemite Lodge Pool and Snack Stand has the potential to affect historic resources in the Yosemite Lodge area.	In 1956, the Yosemite Lodge was completely rebuilt and most of the old lodge buildings were demolished. The Yosemite Lodge is almost entirely the product of postwar planning and construction, but has not been evaluated for eligibility as a National Register-eligible resource (NPS 2006d).  The removal of existing buildings in the Yosemite Lodge area could affect historic resources. Yosemite Lodge has not been evaluated for NR eligibility as a Mission 66 resource. The park will complete a Determination of Eligibility prior to implementing the selected action. This action would be completed in compliance with the proposed Merced River Plan programmatic agreement. A determination of effect under both NEPA and NHPA would be required to inform the planning/design process after a Determination of Eligibility is completed and concurred upon by the SHPO.
<b>Curry Village</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159); Camp Curry Historic District	Replacement of temporary employee housing at Huff House with 16 permanent buildings would affect the historic setting of this area of the Yosemite Valley Historic District, but not the Camp Curry Historic District.	The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). Huff House is a contributing building to the Yosemite Valley Historic District, but is not within the boundaries of the Camp Curry Historic District (NPS 2006d).

**TABLE 9-214: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVES 2-6 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Curry Village (cont.)</b>				
Segment 2 (cont.)				<p><i>NEPA:</i> The introduction of new permanent buildings has the potential to affect the Yosemite Valley Historic District. As described above, the action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The design and installation of new buildings and facilities would comply with the Yosemite Design Guidelines and NPS cultural resource management guidelines. Any new facilities would be designed to be compatible with the distinctive character of the landscape. These existing guidelines would protect the historic properties by requiring new facilities to be compatible to the maximum extent possible with the historic materials, features, size, scale, proportion, and massing of existing historic resources and Yosemite Valley Historic District as a whole. This action would affect a contributing resource, but would not alter the character-defining feature(s), nor would the action diminish the overall integrity of the historic property. New construction that follows these regulations and guidelines would result in a minor, long term, local adverse impact on the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The introduction of new permanent buildings at Huff House has the potential to alter the Yosemite Valley Historic District. As described above, the action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation, and installation of new buildings and facilities would comply with the Yosemite Design Guidelines and NPS cultural resource management guidelines. This new construction would result in no adverse effect to Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	Removal of services at the ice skating rink at Curry Village would not result in the loss of a contributing element to the Yosemite Valley Historic District.	The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). The ice rink is a

These existing guidelines would protect the historic properties by requiring new facilities to be compatible to the maximum extent possible with the historic materials, features, size, scale, proportion, and massing of existing historic resources and Yosemite Valley Historic District as a whole. New construction that follows these guidelines would result in a no adverse effect to the Yosemite Valley Historic District under NHPA.</p>

**Curry Village.** Project level actions to manage visitor use and facilities in the Curry Village area would include the replacement of temporary housing at Huff House with 16 permanent buildings and the removal of services at the Curry Village Ice Rink. As described in table 9-214 above, actions to remove existing facilities would result in a long term, local, moderate adverse effect to the Yosemite Valley Historic District under NEPA and an adverse effect under NHPA. Construct new permanent housing would result in a long term, local, minor adverse effect to the Yosemite Valley Historic District under NEPA, and the removal of services at the non contributing ice rink would have no impact to the Yosemite Valley Historic District under NEPA. These actions would result in no adverse effect under NHPA.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### *Impacts of Actions to Protect and Enhance River Values*

Actions intended to protect and enhance river values common to Alternatives 2–6 and located within Segments 3 and 4 would not result in adverse effects on historic resources in El Portal because such actions would not affect the character-defining features of a historic building, structure, or district.

#### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Table 9-215 describes impacts of actions intended to manage visitor use and facilities Segments 3 and 4 under Alternatives 2-6.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### *Impacts of Actions to Protect and Enhance River Values*

Actions intended to protect and enhance river values common to Alternatives 2–6 and located within Segments 5, 6, 7, and 8 would not result in adverse effects on historic resources because such actions would not affect the character-defining features of a historic building, structure, or district.

#### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Table 9-216 describes impacts of actions intended to protect and enhance river values in Segments 5, 6, 7, and 8 under Alternatives 2-6.

### **Summary of Impacts Common to Alternatives 2–6**

Identified historic resources that would be affected by actions common to Alternatives 2–6 include potentially eligible trails and roads, the Yosemite Valley Bridges Historic District, Ahwahnee Hotel NHL, Camp 4, Camp Curry Historic District, Yosemite Village Historic District, Yosemite Valley Historic District (specifically impacts to Curry Village), the Wawona Hotel and Pavillion Historic District, and potential historic resources in El Portal and Wawona. These impacts would include the alteration of character-defining features or historic context, or potential demolition of National Register-listed or eligible resources.

**TABLE 9-215: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENTS 3 AND 4 UNDER ALTERNATIVES 2-6**

Segment	Action Type	Potential Historic Resource	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 3	Actions to Manage Visitor Use and Facilities	El Portal Historic Structures	The construction of 12 infill housing units in vacant lots in old El Portal to facilitate removal of temporary housing in Yosemite Valley may impact the historic setting of the area.	<p>El Portal is a small community comprised of 1200 acres of land on both the north and south sides of the Merced River and Highway 140. Old El Portal contains several listed and eligible historic resources in the vicinity of the proposed infill (El Portal Chapel, Track Bus No. 19, Bagby Stationhouse, Hetch Hetchy Railroad Engine No. 6, and the Yosemite Valley Railroad Caboose No. 15). Old El Portal has been proposed as a historic district and would be significant under Criterion A due to its role in settlement, industry, and tourism in the Yosemite Region, from 1907-1951. Old El Portal historic district was recommended eligible under Criterion C because of its eclectic assemblage of landscape characteristics, including buildings, structures, land use, spatial organization, cluster arrangements, and circulation (NewFields International, 2005). Additionally, some historic resources in El Portal are considered potentially eligible by the Park, including El Portal Hotel and Motor Inn Historic District, Foresta Road, Rancheria Mission 66 Historic District, and Standard Oil office and bulk fuel storage tanks (NPS 2011r).</p> <p>The construction of new housing in old El Portal has the potential to alter the historic setting of the area. A historic resource study identifying potentially eligible properties in the vicinity of El Portal has been completed by park staff (NPS 2011r). This study provides the park with enough research/information to identify potentially eligible resources that will need further Section 110 inventory/analysis to determine eligibility. A determination of effect under NEPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning.</p> <p>The construction of new housing in old El Portal has the potential to alter the historic setting of the area. A historic resource study identifying potentially eligible properties in the vicinity of El Portal has been completed by park staff (NPS 2011r). This study provides the park with enough research/information to identify potentially eligible resources that will need further Section 110 inventory/analysis to determine eligibility. A determination of effect under NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning.</p>

**TABLE 9-215: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENTS 3 AND 4 UNDER ALTERNATIVES 2-6 (CONTINUED)**

Segment	Action Type	Potential Historic Resource	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 3	Actions to Manage Visitor Use and Facilities	El Portal Historic Structures	The removal or relocation of 36 existing private residences in Abbieville or Trailer Village areas would not impact historic resources in El Portal.	<p>El Portal is a small community comprised of 1200 acres of land on both the north and south sides of the Merced River and Highway 140. The homes in Abbieville were determined unlikely to be individually eligible to be listed on the National Register. The trailer park was built during the Mission 66 era as part of the development intended for transient structures but lacks any distinct qualities to warrant inclusion on the National Register by itself (NPS 2011r).</p> <p>The removal of private residences in Abbieville and Trailer Village would not alter historic resources in the area. These residences were determined unlikely for listing in the National Register, and their removal would result in a no adverse impact under NEPA.</p> <p>The removal of private residences in Abbieville and Trailer Village would not alter historic resources in the area. These residences were determined unlikely for listing in the National Register, and their removal would result in a no adverse effect under NHPA.</p>

**TABLE 9-216: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE FACILITIES IN SEGMENT 7 UNDER ALTERNATIVES 2-6**

Segment	Action Type	Potential Historic Resource	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 7	Actions to Manage Visitor Use and Facilities	Historic Buildings in Wawona	In Wawona Town center, the park plans to construct a 4,500 square foot building and grounds maintenance facility, a 6,800 square foot combined structural and wild land fire station, and a 4,000 square foot roads maintenance facility, and rehabilitate the existing California Conservation Corp (CCC) structures for potential re-use. The construction of new facilities may impact the historic setting of the area, and the reuse of the CCC structures may impact their integrity.	<p>The community of Wawona possesses several historic resources (Hogdon Homestead Cabin, Acting Superintendent's Headquarters, Chris Jorgensen Studio, and Wawona Covered Bridge), all located over .25 miles from the proposed construction site. The CCC structures have not been previously evaluated as a National Register-eligible resources.</p> <p>The construction of new maintenance facilities in Wawona has the potential to alter the historic setting of the area. The installation new facilities and would comply with NPS cultural resource management guidelines and stipulations of the Merced River Plan programmatic agreement or standard 36 CFR Part 800 consultation. Any new facilities design would be compatible with the distinctive character of the landscape and surrounding buildings. These existing and proposed guidelines would protect historic resources by requiring new facilities to be compatible to the maximum extent possible with the historic materials, features, size, scale, proportion, and massing of existing historic properties. New construction that follows these guidelines would minimize adverse impacts on historic resources under NEPA.</p> <p>The CCC structures have not been evaluated for NR eligibility. The park will complete a Determination of Eligibility prior to implementing the selected action. This action would be completed in compliance with the proposed Merced River Plan programmatic agreement. A determination of effect under both NEPA and NHPA would be required to inform the planning/design process after a Determination of Eligibility is completed and concurred upon by the SHPO.</p>
Segment 7	Actions to Manage Visitor Use and Facilities	Community of Wawona	The removal of shoulder and off-road parking would not affect historic resources.	<p>The community of Wawona possesses several National Register listed and eligible historic resources, and is currently being analyzed as a historic district by the Park, although no formal evaluation has been submitted to SHPO.</p> <p>The prohibition of shoulder and off-road parking would have a beneficial impact on historic circulation patterns for Wawona under NEPA and no adverse effect to historic properties under NHPA.</p>
Segment 7	Actions to Manage Visitor Use and Facilities	Community of Wawona	The redesign of the bus stop at Wawona would not affect historic resources.	<p>The community of Wawona possesses several National Register listed and eligible historic resources, and is currently being analyzed as a historic district by the Park, although no formal evaluation has been submitted to SHPO.</p>

**TABLE 9-216: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE FACILITIES IN SEGMENT 7 UNDER ALTERNATIVES 2-6 (CONTINUED)**

Segment	Action Type	Potential Historic Resource	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 7	Actions to Manage Visitor Use and Facilities	Wawona Hotel and Pavillion Historic District	Following the recommendations from the Wawona Hotel Historic Structures Report (2012) to address contributing elements in "poor" condition at Main Hotel, Manager's Cottage, and Annex Building, and Clark Cottage to bring the building to "good" condition would have no adverse effect on historic resources.	<p>The Wawona Hotel and Pavillion Historic District consists of a complex of buildings associated with local and regional significance due to its association with one of the region's earliest settlers, Galen Clark, as well as its connection with the development of transportation routes within the region (Chappell, 1975).</p> <p><i>NEPA:</i> Efforts to follow the recommendations from the Wawona Hotel Historic Structures Report for improving the condition of historic structures associated with the Wawona Hotel will result in a long term, local, beneficial impact to the Wawona Hotel structures under NEPA.</p> <p><i>NHPA:</i> Efforts to follow the recommendations from the Wawona Hotel Historic Structures Report for improving the condition of historic structures associated with the Wawona Hotel will result in a no adverse effect to the Wawona Hotel structures under NHPA.</p> <p>The redesign of the bus stop would comply with Yosemite Design Guidelines. Any new facilities would be designed to be compatible with the distinctive character of the landscape and surrounding buildings. These guidelines would protect historic resources by requiring new facilities to be compatible to the maximum extent possible with the historic materials, features, size, scale, proportion, and massing of existing historic properties. New construction that follows these guidelines would avoid adverse impacts on historic resources under NEPA and result in no adverse effect under NHPA.</p>

## ***Environmental Consequences of Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration***

### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

No actions to protect and enhance river values across all segments that are proposed for Alternative 2 would result in an adverse effect on historic resources. None of the proposed actions would affect the character-defining features of a historic building, structure, or district.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

There are no actions to manage visitor use and facilities across all river segments proposed for Alternative 2 that would result in an adverse effect on historic resources. None of the proposed actions would affect the character-defining features of a historic building, structure, or district.

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

There are no actions to protect and enhance river values within Segment 1 proposed for Alternative 2 that would result in an adverse effect on historic resources; no actions would affect the character-defining features of a historic building, structure, or district.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Table 9-217 describes impacts of actions intended to manage visitor use and facilities in Segment 1 under Alternative 2.

Actions to manage visitor use and facilities in Segment 1 under Alternative 2 would result in a major, long term, local adverse impact on the Merced Lake High Sierra Camp Historic District (Merced Lake High Sierra Camp Historic District) under NEPA and an adverse effect on Merced Lake High Sierra Camp Historic District under NHPA through the removal and delisting the Merced Lake High Sierra Camp Historic District from the National Register. No NHL would be affected.

### **Segment 2: Yosemite Valley**

#### ***Impacts of Actions to Protect and Enhance River Values***

Table 9-218 describes impacts of actions intended to protect and enhance river values in Segment 2 under Alternative 2.

**TABLE 9-217: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 1 UNDER ALTERNATIVE 2**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 1	Actions to Manage Visitor Use and Facilities	Merced Lake High Sierra Camp Historic District	The closure of the Merced Lake High Sierra Camp and conversion of the area to designated wilderness. This would result in the loss of the Merced Lake High Sierra Camp.	<p>The Merced Lake High Sierra Camp is considered significant in recreation and education as one of seven high country camps whose origin dates back to the earliest days of the National Park Service. The Yosemite camp system initially began in 1916 as an effort to attract people into the park's high country. Through the use of organized parties guided by a Yosemite naturalist, the Park Service established a unique pattern of interpretive service in the high country of one of the most populous national parks, which helped acquaint the American public with the conservation objectives of the agency in all natural areas of the system (Criterion A) (Kirk, 2004).</p> <p><i>NEPA:</i> The alteration or removal of historic period buildings and structures in the Merced Lake High Sierra Camp area would affect the Merced Lake High Sierra Camp Historic District. The Merced Lake High Sierra Camp Historic District is one of the few National Register-eligible resources in Segment 1. The demolition of an eligible historic resource represents a substantial and highly noticeable change in character-defining features and the permanent alteration of the historic setting and character of the segment. While the action would be completed consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation), the proposed action would result in a major, long term, local adverse impact on the district under NEPA through the removal and delisting the Merced Lake High Sierra Camp Historic District from the National Register.</p> <p><i>NHPA:</i> The alteration or removal of historic period buildings and structures in the Merced Lake High Sierra Camp area would affect the Merced Lake High Sierra Camp Historic District. The Merced Lake High Sierra Camp Historic District is one of the few National Register-eligible resources in Segment 1. The demolition of an eligible historic resource represents a substantial and highly noticeable change in character-defining features and the permanent alteration of the historic setting and character of the segment. While the action would be completed consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation), the proposed action would result in an adverse effect on Merced Lake High Sierra Camp Historic District under NHPA through the removal and delisting the Merced Lake High Sierra Camp Historic District from the National Register.</p>

**TABLE 9-218: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 2**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159); Yosemite Village Historic District	Removal of historic Ahwahnee Row and Tecoya Housing buildings would result in loss of 21 contributing resources to the Yosemite Valley Historic District and Yosemite Village Historic District	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). Structures in Lower Tecoya include dormitories, apartments and associated laundry rooms, the Ahwahnee Row Houses, small cottages, cabins, and curvilinear roads connects the housing units. The Ahwahnee Row Houses are a group of one-and two-story residences built in the 1920s on the east side of Lower Tecoya, and form a boundary between a densely developed and coniferous Lower Tecoya area and the open Ahwahnee meadow. To the west of the row houses are four three-story wood dormitory buildings and an adjacent kitchen facility. Half of the dormitories in Lower Tecoya were constructed in the late 1920s and significantly altered in the 1930s, while the other half were constructed in the 1930s and remain unchanged.</p> <p><i>NEPA:</i> The Tecoya concessioner housing area and Ahwahnee Row houses are contributors to both the National Register-listed Yosemite Valley and Yosemite Village Historic Districts. These buildings reflect the rustic architecture characteristic of Yosemite Village, and their loss would result in an adverse impact on this historic resource. These buildings constitute 21 of the 302 contributing buildings within the Yosemite Valley Historic district (with 929 total contributing resources) and 68 contributing buildings to the Yosemite Village Historic District. While the action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or 36 CFR 800 consultation), the proposed action would result in a moderate, long term, local, adverse impact to both the Yosemite Valley Historic District and the Yosemite Village Historic District under NEPA.</p> <p><i>NHPA:</i> The Tecoya concessioner housing area and Ahwahnee Row houses are contributors of the National Register-listed Yosemite Valley Historic District, and their removal or demolition would result in an adverse effect on this historic resource. This action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or 36 CFR 800 regulations). The alteration of or demolition of these contributing resources would potentially diminish the integrity of the Yosemite Valley and Yosemite Village Historic Districts. The action would have an adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA.</p>

**TABLE 9-218: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	The restoration of Stoneman Meadow including the re-alignment of Southside Drive would affect historic circulation patterns in the Curry Village Area of the Yosemite Valley Historic District. This action would, however, improve Stoneman Meadow, another contributor to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). The historic circulation of Camp Curry is predominantly pedestrian, with vehicular approaches from the west (Old Village) and northwest (Stoneman Bridge). Today vehicular access is limited mainly to the northwestern approach, and the western approach has been converted to parking and foot trail. Since the original entry was oriented to this entrance, the historic gateway has become somewhat obsolete, at least in the current circulation configuration. Stoneman Meadow is a contributing site to the Yosemite Valley Historic District as a characteristic landscape feature in the Valley, as is Southside Drive (NPS 2006d). Southside Drive is not considered a contributor to the Camp Curry Historic District (Hart, 1979). Boys town is not included in the Camp Curry Historic District nomination.</p> <p><i>NEPA:</i> The realignment of Southside Drive through Boys Town would affect the Yosemite Valley Historic District through alteration of historic circulation patterns in Curry Village and in the Valley. The action will not, however, result in an adverse effect to the historic approach to the Curry Village area, which is the focus of remaining historic vehicular circulation. The road realignment will include a small segment of the entire length of Southside Drive, in an area not out of character with its existing route. Additionally, the restoration of Stoneman Meadow to a more historic setting would have a beneficial effect on the Yosemite Valley Historic District. Finally, the action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action will have a moderate, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA.</p>

**TABLE 9-218: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions (cont.)</b>				
Segment 2 (cont.)				<i>NHPA:</i> The realignment of Southside Drive through Boys Town would affect the Yosemite Valley Historic District through alteration of historic circulation patterns. As described above, the action will not result in an adverse effect to the historic approach to the Curry Village area, but will alter Southside Drive, a contributor to the Yosemite Valley Historic District. The restoration of Stoneman Meadow to a more historic setting would improve the condition of the Yosemite Valley Historic District. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action would result in an adverse effect to the Yosemite Valley Historic District under NHPA.
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	Rerouting the Valley Loop Trail through Slaughterhouse Meadow has the potential to affect both these contributors to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Valley Loop Trail is one of the primary trails originating in the valley. The Valley Loop Trail dates from the 1920s and was originally built as a bridle trail, generally aligned along existing circulation routes. Thirteen additional miles were added to the Valley Loop Trail in 1928, requiring the construction of 14 bridges. Today, the Valley Loop Trail includes the entire remaining bridle trail system in the valley and it is approximately 21 miles long (Criterion A). The Slaughterhouse Meadow is a contributing site to the Yosemite Valley Historic District as a characteristic landscape feature in the Valley (NPS 2006d).</p> <p><i>NEPA:</i> Both the Valley Loop Trail and Slaughterhouse Meadow are contributors to the National Register-listed Yosemite Valley Historic District. Rerouting the Valley Loop Trail could alter both of these resources. Any sections of Valley Loop Trail that would be rerouted would require additional analysis prior to construction or demolition. The action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). A determination of effect under both NEPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning.</p>

**TABLE 9-218: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions (cont.)</b>				
Segment 2 (cont.)				<i>NHPA</i> : Both the Valley Loop Trail and Slaughterhouse Meadow are contributors to the National Register-listed Yosemite Valley Historic District. Rerouting the Valley Loop Trail could alter this historic resource. Any sections of Valley Loop Trail that would be rerouted would require additional analysis prior to construction or demolition. This action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). The alteration of the Valley Loop Trail would alter a contributing resource to the Yosemite Valley Historic District, potentially resulting in the diminishment of the district's integrity. A determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning.
<b>Hydrologic/Geologic Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Bridges Historic District (1977000160); Yosemite Valley Historic District (2004001159)	Removal of Stoneman Bridge, redesign of Sentinel intersection, removal of the Ahwahnee and Sugar Pine Bridges, and restoration to natural conditions would remove contributing structures to the Yosemite Valley Bridges and Yosemite Valley Historic Districts.	<p>Bridges have been a major component of the cultural landscape of the Yosemite Valley from the first years of non-indigenous settlement. The Yosemite Valley Bridges Historic District consists of 8 granite-faced, concrete arch road bridges on the Valley floor, constructed between 1921 and 1933. The Valley bridges are unique for their architectural design and aesthetic considerations, representing an effort to build structures in the national parks which are simple and uniform in design to blend in with the environment (Criterion C) (Wilson, 1977). This bridge is also a contributor to the Yosemite Valley Historic District.</p> <p><i>NEPA</i>: The demolition and removal of Stoneman, Ahwahnee, and Sugar Pine Bridges would affect the Yosemite Valley Historic District and the Yosemite Valley Bridges Historic District. The loss of the bridges would result in the loss of nearly half of the contributing resources in the National Register-listed Yosemite Valley Bridges Historic District. This would also result in the loss of several of the major Merced River crossings affecting the integrity of the historic circulation patterns in the Yosemite Valley Historic District. The action would be implemented with either the proposed Merced River Plan programmatic agreement or standard 36 CFR Part 800 consultation. The proposed actions would result in a major, segment-wide term, local, adverse impact on the Yosemite Valley Bridges</p>

**TABLE 9-218: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Hydrologic/Geologic Resource Actions (cont.)</b>				
Segment 2 (cont.)				<p>Historic District and a moderate, long term, segment-wide, adverse impact the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The demolition and removal of Stoneman, Ahwahnee, and Sugar Pine Bridges would result in the loss of nearly half of the contributing resources in the National Register-listed Yosemite Valley Bridges Historic District and the Yosemite Valley Historic District. This action would be implemented with either the proposed Merced River Plan programmatic agreement or standard 36 CFR Part 800 consultation. The action will result in the loss of contributing resources to both the Yosemite Valley and Yosemite Bridges Historic Districts. The action will have an adverse effect on the Yosemite Valley Historic District and Yosemite Valley Bridges Historic District under NHPA.</p>
<b>Cultural Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159); Yosemite Village Historic District	Rehabilitation of the Superintendent's House per the Secretary of the Interior's Standards for the Treatment of Historic Properties (NPS 1995) would result in an beneficial impact to a contributor to the Yosemite Valley and Yosemite Village Historic Districts.	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). The Superintendent's House is a contributor to the Yosemite Valley Historic District and the Yosemite Village Historic District (Donahoe 1994).</p> <p><i>NEPA:</i> The rehabilitation of the Superintendent's House would be undertaken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation and the Secretary of the Interior's Standards for the Treatment of Historic Properties. The stabilization of the building within the would result in a long term, moderate, local, beneficial impact to the Yosemite Valley and Yosemite Village Historic Districts under NEPA.</p> <p><i>NHPA:</i> The rehabilitation of the Superintendent's House would be undertaken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation and the Secretary of the Interior's Standards for the Treatment of Historic Properties. The action will have no adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA.</p>

**Programmatic Management Actions.** Programmatic resource actions to protect and enhance river values in Segment 2 under Alternative 2 would result in long term, moderate, local, adverse impact to both the Yosemite Valley Historic District and the Yosemite Village Historic District under NEPA through impacts to the contributing resources of Ahwahnee Row Housing and Tecoya Housing buildings, and an adverse effect on both districts under NHPA. No NHL would be affected.

**Biological Resource Actions.** Biological resource actions to protect and enhance river values in Segment 2 under Alternative 2 would result in minor or moderate, local, long term adverse impacts on the listed Yosemite Valley Historic District under NEPA through impacts to the contributing resources of Stoneman Meadow, Southside Drive, Boys Town, Valley Loop Trail, and Slaughterhouse Meadow, and adverse effects to the Yosemite Valley Historic District under NHPA. No NHL would be affected.

**Hydrologic/Geologic Resource Actions.** Hydrologic/geologic resource actions to protect and enhance river values in Segment 2 under Alternative 2 would result in a major, long term, local, adverse impact on both the Yosemite Valley Bridges Historic District and the Yosemite Valley Historic District under NEPA, and an adverse effect on the Yosemite Valley Historic District and Yosemite Valley Bridges Historic District under NHPA through impacts to the contributing resources of Sugar Pine Bridge, Ahwahnee Bridge, Stoneman Bridge. No NHL would be affected.

**Cultural Resource Actions.** Cultural resource actions to protect and enhance river values in Segment 2 under Alternative 2 would result in a moderate, long term, local, beneficial impact on the Yosemite Valley and Yosemite Village Historic Districts under NEPA, and no adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA through impacts resulting from the stabilization of the contributing resource of the Superintendent's House. No NHL would be affected.

#### *Impacts of Actions to Manage User Capacities, Land Use, and Facilities*

Table 9-219 describes impacts of actions intended to manage visitor use and facilities in Segment 2 under Alternative 2.

**Curry Village.** Project level actions to manage visitor use and facilities in the Curry Village area would include the replacement of 90 tent cabins and 14 cabins without baths in Boys Town with 78 new hard-sided units. Programmatic actions to manage visitor use and facilities include the removal and ecological restoration of the Curry Village Stables and the redesign of the Curry Orchard Parking area. As described in table 9-219 below, actions to remove housing would result in a long term, local, major adverse impact to both the Camp Curry Historic District and Yosemite Valley Historic District under NEPA, and actions to remove the stables and redesign the parking area would result in a long term, major, local, adverse impact to the Yosemite Valley Historic District under NEPA. These actions would result in an adverse effect under NHPA.

**Yosemite Lodge and Camp 4.** Project level actions to manage visitor use and facilities in the Yosemite Lodge and Camp 4 areas would include the conversion of Yosemite Lodge from lodging to day use, which would include the redesign of parking areas, removal of existing buildings and facilities, conversion of Highland Court area to walk-in campground, construction of new employee housing, and repurposing of existing buildings. As described in table 9-219 below, Yosemite Lodge was identified as being a non-contributing site within the Yosemite Valley Historic District. However, it

**TABLE 9-219: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 2**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	Construction of additional housing or facilities would result in an alteration to the setting of the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation.</p> <p>The introduction of new permanent buildings, facilities, or additional parking has the potential to alter the setting of the Yosemite Valley Historic District. This includes actions such as increased parking at Lost Arrow and camping at Upper Pines. The Park will complete NHPA section 110 prior to this action, with a DOE completed prior to site planning. Additional consultation (tribal or SHPO) would also be required. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. This action would be completed in compliance with the proposed Merced River Plan PA and a determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO and during future site planning.</p>
<b>Curry Village</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	The replacement of 90 tent cabins and 14 cabins without baths in Boys Town with 78 new hard-sided units (duplex/fourplex) would remove all 73 contributing historic canvas tent cabins (5 to be relocated), 14 (of 16) contributing historic bungalows.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). The tents are contributors due to their style and distribution over the landscape as they contribute to the historic character of the district. While contributors to the Yosemite Valley Historic District, the 16 Boys Town employee tents (and 73 Camp Curry Employee Canvas Cabins) on the north side of the road do not create an important space in the overall organization of the Camp Curry developed area, although it does possess its own, distinctive character (NPS 2006d).</p>

**TABLE 9-219: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Curry Village (cont.)</b>				
Segment 2 (cont.)				<p><i>NEPA:</i> The removal of tent cabins and cabins from Boys Town would affect the Yosemite Valley Historic District. The loss of these buildings would alter the historic setting of Yosemite Valley Historic District. The loss of the cabins would result in the loss of 14 of 302 contributing buildings to the Yosemite Valley Historic District, and 73 of the over 600 contributing structures (of 902 total contributing resources). Mitigation will be consistent with that proposed in the Curry Village Rockfall Hazard MOA, including updating the National Register Nomination forms for both the Yosemite Valley Historic District and the Camp Curry Historic District to reflect changes to the districts, landscape and architectural documentation of Curry Village, salvage of materials where ever possible, and the preparation of interpretive materials. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action would result in a long term, local, major adverse impact to the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The removal of tent cabins and cabins from Boys Town would alter the Yosemite Valley Historic District. The loss of the cabins would result in the loss of 14 of 302 contributing buildings to the Yosemite Valley Historic District, and 73 of the over 600 contributing structures (of 902 total contributing resources). This action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan as well as the Historic Preservation Treatment Procedures outlined in Appendix J. Mitigation will be consistent with that proposed in the Curry Village Rockfall Hazard MOA, including updating the National Register Nomination forms for both the Yosemite Valley Historic District and the Camp Curry Historic District to reflect changes to the districts, landscape and architectural documentation of Curry Village, salvage of materials where ever possible, and the preparation of interpretive materials. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. This action will have an adverse effect on the Yosemite Valley Historic District under NHPA.</p>

**TABLE 9-219: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Curry Village (cont.)</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	The re-design of the Curry Orchard Day Use Parking area and extension of the boardwalk through to Curry Village would result in the removal of historic trees and alteration of a contributor to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). In 1927, the Park addressed a growing problem with parking by converting a nearby apple orchard into a unique parking area for Curry Village. Curry Orchard Day Use Parking area is a contributing site to the Yosemite Valley Historic District, but not the Camp Curry Historic District (NPS 2006d; Hart, 1979).</p> <p><i>NEPA:</i> Efforts to redesign parking within the Curry Orchard parking lot would affect a contributing site to the Yosemite Valley Historic District. All trees will be removed from the parking lot. This action would be completed consistent with management practices outlined in the Orchard Management Guidelines and guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). The proposed action would result in a long term, local, moderate adverse impact to the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> Efforts to redesign parking within the Curry Orchard parking lot would alter a contributing resource to the Yosemite Valley Historic District. All trees will be removed from the parking lot. This action would be completed consistent with management practices outlined in the Orchard Management Guidelines and guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). This action will have an adverse effect on the Yosemite Valley Historic District under NHPA.</p>

**TABLE 9-219: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Curry Village (cont.)</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	Ecologically restoring the Curry Village Stables area and removal of associated housing would result in removal of the following historic buildings and structures: Concessioner Stables Office, Horse Stable, Mule Barn, Linen Building, Tack Building, Harness Shop, Blacksmith Shop, Comfort Station, Pony Tack Shed #1 and #2, Employee Residence, Employee Cabins (5), Corral, Feeders, and Fence.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. In 1927, the massive stable complex known as Kenneyville was removed to make way for the Ahwahnee Hotel, and a new, smaller stable complex was built to replace it. Now located farther east near the Lamon Orchard, today Kenneyville stables (or Concessioner stables) includes a mule barn, horse stable, five associated support buildings, six employee housing units and a comfort station. With the corrals and fencing through the complex, the cluster remains with good integrity (NPS 2006d).</p> <p><i>NEPA:</i> The removal of the concessioner stables and associated buildings would affect the Yosemite Valley Historic District through the removal of 16 contributing buildings out of 302 contributing buildings, and 3 contributing sites out of 611 contributing sites, within the district (with 929 total contributing resources). The concessioner stables are the only contributing historic stables within the Yosemite Valley Historic District. The loss of these buildings would result in a clearly detectable change Yosemite Valley Historic District. This action would comply with the guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action would result in a long term, moderate, local, adverse impact to the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The removal of the concessioner stables and associated buildings would have the potential to alter the Yosemite Valley Historic District through the removal of the only contributing historic stables within the Yosemite Valley Historic District. The removal of the stables would result in the diminishment of the integrity of the Yosemite Valley Historic District. This action would comply with the guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The action will have an adverse effect on the Yosemite Valley Historic District under NHPA.</p>

**TABLE 9-219: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	Removal of the Concessioner Headquarters Building would result in the loss of a contributing element to the Yosemite Valley Historic District.	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). The Concessioner Headquarters Building is a contributor to the Yosemite Valley Historic District, but not the Yosemite Village Historic District (NPS 2006d).</p> <p><i>NEPA:</i> The Concessioner Headquarters Building is a contributor to both the National Register-listed Yosemite Valley Historic District. This building reflects the rustic architecture characteristic of Yosemite Village area, and its loss would result in an effect on the Yosemite Valley Historic District. While the action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan, the proposed action would result in a moderate, long term, local, adverse impact to the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The Concessioner Headquarters Building is a contributor to both the National Register-listed Yosemite Valley Historic District. This building reflects the rustic architecture characteristic of Yosemite Village area, and its loss would alter the Yosemite Valley Historic District. This action would comply guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The loss of this contributing resource to a historic district would result in an adverse effect on the Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	The Ahwahnee Hotel (1977000149: NHL); Yosemite Valley Historic District (2004001159);	Retaining the existing facilities and services, including bar and food service, dining room, gift shop, and sweet shop would not affect the Ahwahnee Hotel Removal of the non-contributing pool would not affect the Ahwahnee Hotel.	<p>The Ahwahnee, because of its architectural design and pristine condition, is among the most significant park hotels in the country. Its rustic style was designed to reflect its environment, and its significance lies with the preservation of the building and its setting. The pool is a non-contributor to the Yosemite Valley Historic District, the National Register listed Ahwahnee Hotel, and the National Historic Landmark Ahwahnee Hotel (Harrison 1977; NPS 2006d).</p> <p><i>NEPA:</i> The pool is a non-contributor to the Yosemite Valley Historic District, the National Register listed Ahwahnee Hotel, and the National</p>

**TABLE 9-219: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2 (cont.)				<p>Historic Landmark Ahwahnee Hotel. The proposed action would result in no impact to the Ahwahnee Hotel under NEPA.</p> <p><i>NHPA:</i> The pool is a non-contributor to the Yosemite Valley Historic District, the National Register listed Ahwahnee Hotel, and the National Historic Landmark Ahwahnee Hotel. The proposed action would result in no adverse effect to the Ahwahnee Hotel under NHPA.</p>
Segment 2	Actions to Protect and Enhance River Values	Housekeeping Camp	Removal of all lodging units at Housekeeping Camp would potentially result in the removal of a historic resource.	<p>The Housekeeping Camp area developed after 1942, and consists of closely sited, rustic cinderblock and canvas tent cabins. Service buildings include a camp store and laundry and shower facilities, all built after 1942. This area has not been evaluated for eligibility as a National Register-eligible resource.</p> <p>The removal of all lodging units at Housekeeping Camp from within the 100-year floodplain could affect historic resources. Housekeeping Camp has not been previously evaluated as a National Register-eligible resource. Removal of the facilities in these locations would potentially result in an adverse effect. The Park will complete NHPA section 110 prior to this action, with a DOE completed prior to site planning. Additional consultation (tribal or SHPO) would also be required. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. This action would be completed in compliance consistent with guidance to be established through development of a programmatic agreement for the proposed Merced River Plan PA and a determination of or standard 36 CFR Part 800 consultation. A determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning.</p>
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159); Yosemite Village Historic District	Relocation of the Superintendent's House and garage to the NPS housing area and restoration of the area to natural conditions would result in an adverse effect to a	Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). the Superintendent's House is a contributor to the Yosemite Valley Historic District and the Yosemite Village Historic District (Donahoe 1994).

**TABLE 9-219: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2 (cont.)			contributor to the Yosemite Valley and Yosemite Village Historic Districts. This will occur in addition to the rehabilitation actions described above.	<p><i>NEPA:</i> The relocation of the Superintendent's House and garage from its historic location has the potential to alter the Yosemite Valley and Yosemite Village Historic Districts. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The relocation of a building from its historic location results in the loss of historic contextual setting, and can result in the delisting of the resource from the National Register. Additionally, the introduction of the Superintendent's House and garage to a new location has the potential to alter the setting of historic resources in that location as well. The relocation of a buildings within the Yosemite Valley and Yosemite Village Historic Districts would result in a long term, major, local, adverse impact.</p> <p><i>NHPA:</i> The relocation of the Superintendent's House and garage from its isolated historic location would alter the Yosemite Valley and Yosemite Village Historic Districts. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The relocation of the buildings would result in the loss of historical setting of the resource, resulting in the building no longer being eligible for the National Register. Additionally, the introduction of the Superintendent's House and garage to a new location would alter the setting of historic resources in that location as well. The action will have an adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA.</p>
<b>Yosemite Lodge and Camp 4</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Lodge	The removal of buildings in the Yosemite Lodge complex from the 100-year floodplain has the potential to affect historic resources in the Yosemite Lodge area.	<p>In 1956, the Yosemite Lodge was completely rebuilt and most of the old lodge buildings were demolished. The Yosemite Lodge is almost entirely the product of postwar planning and construction, but has not been evaluated for eligibility as a National Register-eligible resource (NPS 2006d).</p> <p>The removal of existing buildings in the Yosemite Lodge and repurposing of the site as a day use area could adversely affect historic resources. Yosemite Lodge has not been evaluated for NR eligibility as a Mission 66 resource. The park will complete a Determination of Eligibility prior to</p>

**TABLE 9-219: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Lodge and Camp 4 (cont.)</b>				
Segment 2 (cont.)				implementing the selected action. This action would be completed in compliance with the proposed Merced River Plan programmatic agreement. A determination of effect under both NEPA and NHPA would be required to inform the planning/design process after a Determination of Eligibility is completed and concurred upon by the SHPO.

has not been evaluated for its post-WWII significance under the 50-year rule for the inventorying of historic properties for the National Register, and a determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning. Impacts to the Yosemite Valley Historic District through the construction of new facilities within the district would result in a minor, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA, and an adverse effect under NHPA.

**Yosemite Village and Housekeeping Camp.** Actions in the Yosemite Village area include the relocation and formalization of the parking lot and re-routing Northside Drive at Yosemite Village Day-Use Parking area, and the relocation of the Superintendent's House and ecological restoration of the area. As described in table 9-219 above, these actions would have a minor to moderate, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA, and an adverse effect to the Yosemite Valley Historic District under NHPA.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

No actions to protect and enhance river values within Segments 3 and 4 under Alternative 2 would result in an adverse effect on historic resources. None of the proposed actions would affect the character-defining features of a historic building, structure, or district.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Table 9-220 describes impacts of actions intended to manage visitor use and facilities in Segments 3 and 4 under Alternative 2.

Actions to protect and enhance river values in Segments 3 and 4 under Alternative 2 would result in negligible, long term, local adverse impacts on historic resources in El Portal under NEPA.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Protect and Enhance River Values***

No actions to protect and enhance river values manage Segments 5, 6, 7, and 8 under Alternative 2 would result in an adverse effect on historic resources. None of these actions would affect the character defining features of a historic building, structure, or district.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Table 9-221 describes impacts of actions intended to manage visitor use and facilities in Segments 5, 6, 7 and 8 under Alternative 2.

**TABLE 9-220: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENTS 3 AND 4 UNDER ALTERNATIVE 2**

Segment	Action Type	Potential Historic Resource	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 4	Actions to Manage Visitor Use and Facilities	El Portal	The construction of additional concessioner housing in the Rancheria area of El Portal has the potential to alter the historic setting of potential historic resources in El Portal.	<p>El Portal is a small community comprised of 1200 acres of land on both the north and south sides of the Merced River and Highway 140. In 1961 the National Park Service began building housing in Rancheria Flat, west of El Portal as part of the Mission 66 initiative in the National Park Service. The Rancheria Mission 66 area has been recommended as a historic district as part of a historic resource study identifying potentially eligible properties in El Portal, but has not yet received SHPO concurrence (NPS 2011r).</p> <p>The construction of new housing in the Rancheria area of El Portal has the potential to alter the historic setting of the area and any potential historic resources not currently eligible or listed by the Park. A historic resource study identifying potentially eligible properties in the vicinity of El Portal has been completed by park staff (NPS 2011r). This study provides the park with enough research/information to identify potentially eligible resources that will need further Section 110 inventory/analysis to confirm eligibility before forwarding to the SHPOs office for review and concurrence.</p>

**TABLE 9-221: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENTS 5, 6, 7 AND 8 UNDER ALTERNATIVE 2**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 7	Actions to Manage Visitor Use and Facilities	Pioneer Yosemite History Center; Wawona Hotel and Pavilion District; Wawona Hotel and Thomas Hill Studio National Historic Landmark	The closure of the stables in Wawona, along with the removal of the Wawona Golf Course, would affect contributors to the NR Wawona Hotel and Pavilion Historic District or Wawona Hotel and Pioneer Yosemite History Center.	<p>The Wawona Hotel and Pavilion's architectural importance to American architecture is as the largest existing Victorian hotel complex within the boundaries of a national park, and one of the few remaining in the United States with this high level of integrity (Criterion C). The Wawona Golf Course, in operation since 1918 and golf course is not currently identified as a contributing resource as identified into either the Wawona Hotel Complex Cultural Landscape Report completed in 2012. A Cultural Landscape Inventory completed for the Pioneer Yosemite History Center includes the Wawona Stables as a contributing resource.</p> <p><i>NEPA:</i> The closure of the Wawona stables and removal golf course would alter both the Pioneer Yosemite History Center and the Wawona Hotel and Pavilion Historic District. The golf course and Wawona Meadow are parts of the historic setting and landscape of the Wawona Hotel and Pavilion and contribute to its aesthetic and significance. The removal of the golf course would result in a beneficial impact through the restoration of an earlier configuration of the historic Wawona Meadow. Operations of the Wawona stables would cease, but the structures would remain and the area would be converted to use as the site of the relocated Wawona stock use campground., but would also affect the historic setting of the Wawona Hotel and Thomas Hill Studio National Historic Landmark. A DOE is currently underway through a Cultural Landscape Inventory for the region. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The actions would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The proposed action would result in a long term, local, moderate adverse effect to the Wawona Hotel and Pavilion Historic District and a long term, local, minor adverse effect Pioneer Yosemite History Center under NEPA.</p>

**TABLE 9-221: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENTS 5, 6, 7 AND 8 UNDER ALTERNATIVE 2 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 7 (cont.)				<i>NHPA</i> : The closure of the Wawona stables and removal golf course would alter both the Pioneer Yosemite History Center and the Wawona Hotel and Pavilion Historic District. The golf course and Wawona Meadow are parts of the historic setting and landscape of the Wawona Hotel and Pavilion and contribute to its aesthetic and significance. The removal of the golf course would result in a beneficial impact through the restoration of an earlier configuration of the historic Wawona Meadow. Operations of the Wawona stables would cease, but the structures would remain and the area would be converted to use as the site of the relocated Wawona stock use campground. The actions would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The action would have an adverse effect on the Wawona Hotel and Pavilion Historic District and no adverse effect on the Pioneer Yosemite History Center under /NHPA.

Actions to protect and enhance river values in Segments 5, 6, 7 and 8 under Alternative 2 would result in moderate, long term, local adverse impacts on the Wawona Hotel and Pavilion Historic District and a negligible, local, adverse effect on the Pioneer Yosemite History Center under NEPA, and an adverse effect on the Wawona Hotel and Pavilion Historic District and no adverse effect on the Pioneer Yosemite History Center under /NHPA.

### **Summary of Impacts from Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration**

Some of the management actions proposed under Alternative 2 would affect known historic resources through demolition, alteration, and relocation related to restoration, construction, and facilities removal. Identified historic resources that would be affected by Alternative 2 include the Merced Lake High Sierra Camp, Camp Curry Historic District, the Yosemite Valley Historic District, the Yosemite Valley Bridges Historic District, the Yosemite Village Historic District, and the Wawona Hotel and Pavilion Historic District. **Table 9-222** summarizes the impacts to these historic resources. These impacts would include altering character-defining features or historic context, or potentially demolishing National Register-listed or eligible resources. These actions could have long-term, negligible to major adverse effects on individual historic buildings and sites, and minor to moderate impacts on historic districts under NEPA. The proposed demolition of the Merced Lake High Sierra Camp Historic District would result in an adverse effect under NHPA, and alteration of contributing resources to the Yosemite Valley, Yosemite Village, Yosemite Bridges, and Camp Curry Historic Districts would potentially diminish the integrity of these resources, resulting in an adverse effect under NHPA.

### **Cumulative Impacts from Alternative 2: Self-Reliant Visitor Experiences and Extensive Floodplain Restoration**

#### ***Past Actions***

Past actions have resulted in a range of beneficial and adverse impacts. Beneficial impacts of past actions include extensive actions to preserve and maintain historic resources, including the Camp Curry Historic District (Curry Village Registration Building, Guest Lounge and Amphitheater Rehabilitation), as well as restoration of meadows associated with the Yosemite Valley Historic District (Cook's Meadow). Adverse effects include the removal of the NR eligible Cascades area houses.

#### ***Present Actions***

Present actions contribute to a mixture of beneficial and adverse impacts. These impacts include efforts to restore, preserve, and protect the historic integrity and character-defining features of The Ahwahnee NHL while completing long-term rehabilitation of the building and associated features, construction of the Wawona fire station, Camp 4 relocating eight campsites, and the Ahwahnee Hotel Porte Cochère Access Walkways and Fence project. Additionally, the park has established the Curry Village Rockfall Hazard Zone, which has resulted in the loss of historic structures. These structures are being documented under a separate MOA.

**TABLE 9-222: IMPACT SUMMARY TO HISTORIC RESOURCES UNDER ALTERNATIVE 2**

Historic District	Types of Impacts	Overall Impact Summary (NEPA)	Overall Impact Summary (NHPA)
Merced Lake High Sierra Camp Historic District	Demolition of contributing resources and potential delisting of the district	long term, major, local, adverse impact	Adverse effect
Camp Curry Historic District	Demolition of contributing buildings.	long term, moderate, local, adverse impact	Adverse effect
NR Ahwahnee Hotel	Removal of contributing resources, addition of new facilities	long term, moderate, local, adverse impact	Adverse effect
Camp 4	Construction of additional campsites, parking, and facilities	long term, minor, local, adverse impact	No adverse effect
Yosemite Valley Historic District	Rerouting of historic roads and trails, removal of historic buildings and facilities, construction of new buildings and facilities,	long term, moderate or major, local, adverse impact	Adverse effect
Yosemite Valley Bridges Historic District	Demolition of historic bridges	long term, major, local, adverse impact	Adverse effect
Yosemite Village Historic District	Relocation and removal of historic buildings	long term, moderate or major, local, adverse impact	Adverse effect
Wawona Hotel and Pavilion Historic District	Removal of contributing resources	long term, moderate, local, adverse impact	Adverse effect
Pioneer Yosemite History Center	Closure of operations at a contributing site	long term, minor, local, adverse impact	No adverse effect

### ***Future Actions***

Impacts from future actions would be similar to those discussed for past and present actions as a mix of beneficial and adverse impacts to historic resources. The Curry Village Rehabilitation of Historic Cabins with Bath Structures, seismic upgrade to the Ahwahnee Dormitory, and efforts to stabilize the floor of the Ahwahnee Hotel, all consist of potential future actions with the potential to affect historic resources within the park.

### ***Overall Cumulative Impact***

Alternative 2 would involve the demolition or alteration of several historic properties (Lake High Sierra Camp Historic District, Camp Curry Historic District, Yosemite Village Historic District, and Yosemite Valley Bridges Historic District). Additionally, actions common to Alternatives 2–6 would involve the relocation or alteration of several National Register-eligible or listed structures (the NR Ahwahnee Hotel, Superintendent’s House [Residence 1], Camp Curry Historic District, and Camp 4 ). The removal of the Merced Lake High Sierra Camp Historic District, relocation of the Superintendent’s House, loss of nearly half of the contributing bridges of the Yosemite Valley Bridges Historic District, and the loss of resources in the Curry Village Area of the Yosemite Valley Historic District would potentially result in a long-term, major, adverse impact on both the individual cultural resources and

the cumulative historic fabric of the Merced River corridor. While all site-specific planning and compliance actions would be accomplished in accordance with stipulations in the park's proposed Merced River Plan programmatic agreement or standard 36 CFR Part 800 consultation, the potential effect on the character-defining features of historic resources within the Merced River corridor would result in a cumulative adverse effect on historic resources.

### ***Environmental Consequences of Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration***

#### **All River Segments**

##### ***Impacts of Actions to Protect and Enhance River Values***

No actions to protect and enhance river values across all segments under Alternative 3 would result in an adverse effect on historic resources. None of the proposed actions would affect the character-defining features of a historic building, structure, or district.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

No actions to manage visitor use and facilities across all segments under Alternative 3 would result in an adverse effect on historic resources. None of the proposed actions would affect the character-defining features of a historic building, structure, or district.

#### **Segment 1: Merced River Above Nevada Fall**

##### ***Impacts of Actions to Protect and Enhance River Values***

No actions to protect and enhance river values within Segment 1 under Alternative 3 would result in an adverse effect on historic resources. None of these actions would affect the character-defining features of a historic building, structure, or district.

##### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Table 9-223 describes impacts of actions intended to manage visitor use and facilities in Segment 1 under Alternative 3.

Actions to manage visitor use and facilities in Segment 1 under Alternative 3 would result in a major, long term, local adverse impact on the Merced Lake High Sierra Camp Historic District under NEPA and an adverse effect on Merced Lake High Sierra Camp Historic District under NHPA through the removal and delisting the Merced Lake High Sierra Camp Historic District from the National Register. No NHL would be affected.

**TABLE 9-223: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 1 UNDER ALTERNATIVE 3**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 1	Actions to Manage Visitor Use and Facilities	Merced Lake High Sierra Camp Historic District	The conversion of the Merced Lake High Sierra Camp to a temporary pack camp and removal of the infrastructure would adversely affect contributors to the Merced Lake High Sierra Camp Historic District.	<p>The Merced Lake High Sierra Camp is considered significant in recreation and education as one of seven high country camps whose origin dates back to the earliest days of the National Park Service. The Yosemite camp system initially began in 1916 as an effort to attract people into the park's high country. Through the use of organized parties guided by a Yosemite naturalist, the Park Service established a unique pattern of interpretive service in the high country of one of the most populous national parks, which helped acquaint the American public with the conservation objectives of the agency in all natural areas of the system (Criterion A, association with historic events) (Kirk, 2004).</p> <p><i>NEPA:</i> The alteration or removal of historic period buildings and structures in the Merced Lake High Sierra Camp area would greatly alter the Merced Lake High Sierra Camp Historic District to the point of delisting the district from the National Register. The Merced Lake High Sierra Camp Historic District is one of the few National Register-eligible resources in Segment 1. The removal of contributing resources of an eligible historic district represents a substantial and highly noticeable change in character-defining features and the permanent alteration of the historic setting and character of the segment. While the action would be completed consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation), the proposed action would result in a major, long term, local adverse impact on the district under NEPA and potential delisting of the district.</p> <p><i>NHPA:</i> The alteration or removal of historic period buildings and structures in the Merced Lake High Sierra Camp area would greatly alter the Merced Lake High Sierra Camp Historic District to the point of delisting the district from the National Register. The Merced Lake High Sierra Camp Historic District is one of the few National Register-eligible resources in Segment 1. The removal of contributing resources of an eligible historic district represents a substantial and highly noticeable change in character-defining features and the permanent alteration of the historic setting and character of the segment. The action would be completed consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action would result in an adverse effect on Merced Lake High Sierra Camp Historic District under NHPA and potential delisting of the district.</p>

## **Segment 2: Yosemite Valley**

### ***Impacts of Actions to Protect and Enhance River Values***

Table 9-224 describes impacts of actions intended to protect and enhance river values in Segment 2 under Alternative 3.

**Biological Resource Actions.** Biological resource actions to protect and enhance river values in Segment 2 under Alternative 3 would result in moderate, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA through impacts to the contributing resources of Southside Drive, Boys Town, Valley Loop Trail, and Slaughterhouse Meadow, and an adverse effect to the Yosemite Valley Historic District under NHPA. No NHL would be affected.

**Hydrologic/Geologic Resource Actions.** Hydrologic/geologic resource actions to protect and enhance river values in Segment 2 under Alternative 3 would result in major, long term, local, adverse impacts on both the Yosemite Valley Bridges Historic District and the Yosemite Valley Historic District under NEPA through impacts to the contributing resources of Sugar Pine Bridge, Ahwahnee Bridge, Stoneman Bridge, and an adverse effect on the Yosemite Valley Historic District and Yosemite Valley Bridges Historic District under NHPA. No NHL would be affected.

**Cultural Resource Actions.** Cultural resource actions to protect and enhance river values in Segment 2 under Alternative 3 would result in a moderate, long term, local, beneficial impact on the Yosemite Valley and Yosemite Village Historic Districts under NEPA, and no adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA through impacts resulting from the stabilization of the contributing resource of the Superintendent's House. No NHL would be affected.

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Table 9-225 describes impacts of actions intended to manage visitor use and facilities in Segment 2 under Alternative 3.

**Curry Village.** Project level actions to manage visitor use and facilities in the Curry Village area would include the re design of the Curry Orchard parking area, and rerouting Southside Drive through Boys Town. Programmatic actions to manage visitor use and facilities include the reduction of the Curry Village Stables. As described in Table 9-225 below, actions to remove housing, reduce the stables, reroute Southside Drive, and alter the Curry Orchard Parking area would result in a long term, local, moderate to minor adverse effect to the Yosemite Valley Historic District under NEPA. These actions would result in an adverse effect to the Yosemite Valley Historic District through alterations to contributing historic properties under NHPA.

**Yosemite Lodge and Camp 4.** Project level actions to manage visitor use and facilities in the Yosemite Lodge and Camp 4 areas would include alterations to Yosemite Lodge, such as the redesign of parking areas, removal of existing buildings and facilities, construction of new employee housing, and repurposing of existing buildings. As described in table 9-225 below, Yosemite Lodge was identified as being a non-contributing site within the Yosemite Valley Historic District. However, it has not been evaluated for its post-WWII significance under the 50-year rule for the inventorying of historic

**TABLE 9-224: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 3**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	The restoration of Stoneman Meadow including the re-alignment of Southside Drive would affect historic circulation patterns in the Curry Village Area of the Yosemite Valley Historic District. This action would, however, improve Stoneman Meadow, another contributor to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). The historic circulation of Camp Curry is predominantly pedestrian, with vehicular approaches from the west (Old Village) and northwest (Stoneman Bridge). Today vehicular access is limited mainly to the northwestern approach, and the western approach has been converted to parking and foot trail. Since the original entry was oriented to this entrance, the historic gateway has become somewhat obsolete, at least in the current circulation configuration. Stoneman Meadow is a contributing site to the Yosemite Valley Historic District as a characteristic landscape feature in the Valley, as is Southside Drive (NPS 2006d). Southside Drive is not considered a contributor to the Camp Curry Historic District (Hart, 1979).</p> <p><i>NEPA:</i> The realignment of Southside Drive through Boys Town would affect the Yosemite Valley Historic District through alteration of historic circulation patterns in Curry Village and in the Valley. The action will not, however, result in an adverse impact to the historic approach to the Curry Village area, which is the focus of remaining historic vehicular circulation. The road realignment will include a small segment of the entire length of Southside Drive, in an area not out of character with its existing route. Additionally, the restoration of Stoneman Meadow to a more historic setting would have a beneficial impact on the Yosemite Valley Historic District. Finally, the action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action will have a moderate, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA.</p>

**TABLE 9-224: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions (cont.)</b>				
Segment 2 (cont.)				<i>NHPA:</i> The realignment of Southside Drive through Boys Town would alter the Yosemite Valley Historic District through changes to historic circulation patterns. As described above, the action will not result in an adverse effect to the historic approach to the Curry Village area, but would alter Southside Drive, a contributor to the Yosemite Valley Historic District. The restoration of Stoneman Meadow to a more historic setting would improve the condition of the Yosemite Valley Historic District. These actions would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed actions would result in an adverse effect to the Yosemite Valley Historic District under NHPA.
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	Rerouting the Valley Loop Trail through Slaughterhouse Meadow has the potential to affect both these contributors to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Valley Loop Trail is one of the primary trails originating in the valley. The Valley Loop Trail dates from the 1920s and was originally built as a bridle trail, generally aligned along existing circulation routes. Thirteen additional miles were added to the Valley Loop Trail in 1928, requiring the construction of 14 bridges. Today, the Valley Loop Trail includes the entire remaining bridle trail system in the valley and it is approximately 21 miles long (Criterion A). The Slaughterhouse Meadow is a contributing site to the Yosemite Valley Historic District as a characteristic landscape feature in the Valley (NPS 2006d).</p> <p>Both the Valley Loop Trail and Slaughterhouse meadow are contributors to the National Register-listed Yosemite Valley Historic District. Rerouting the Valley Loop Trail could alter both of these resources. Any sections of Valley Loop Trail that would be rerouted would require additional analysis prior to construction or demolition. The action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). A determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning.</p>

**TABLE 9-224: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Hydrologic/Geologic Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Bridges Historic District (1977000160); Yosemite Valley Historic District (2004001159)	Removal of Stoneman Bridge, redesign of Sentinel intersection, removal of the Ahwahnee and Sugar Pine Bridges, and restoration to natural conditions would remove contributing structures to the Yosemite Valley Bridges and Yosemite Valley Historic Districts.	<p>Bridges have been a major component of the cultural landscape of the Yosemite Valley from the first years of non-indigenous settlement. The Yosemite Valley Bridges Historic District consists of 8 granite-faced, concrete arch road bridges on the Valley floor, constructed between 1921 and 1933. The Valley bridges are unique for their architectural design and aesthetic considerations, representing an effort to build structures in the national parks which are simple and uniform in design to blend in with the environment (Criterion C) (Wilson, 1977). This bridge is also a contributor to the Yosemite Valley Historic District.</p> <p><i>NEPA:</i> The demolition and removal of Stoneman, Ahwahnee, and Sugar Pine Bridges would alter the Yosemite Valley Historic District and the Yosemite Valley Bridges Historic District. The loss of the bridges would result in the loss of nearly half of the contributing resources in the National Register-listed Yosemite Valley Bridges Historic District. This would also result in the loss of several of the major Merced River crossings within the Yosemite Valley Historic District. The action would be implemented with either the proposed Merced River Plan programmatic agreement or standard 36 CFR Part 800 consultation. The proposed actions would result in a major, long term, local, adverse impact on the Yosemite Valley Bridges Historic District and the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The demolition and removal of Stoneman, Ahwahnee, and Sugar Pine Bridges would result in the loss of nearly half of the contributing resources in the National Register-listed Yosemite Valley Bridges Historic District and the Yosemite Valley Historic District. This action would be implemented with either the proposed Merced River Plan programmatic agreement or standard 36 CFR Part 800 consultation. The action will result in the loss of contributing resources to both the Yosemite Valley and Yosemite Bridges Historic Districts. The action will have an adverse effect on the Yosemite Valley Historic District and Yosemite Valley Bridges Historic District under NHPA. This action would comply guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The removal of Stoneman Bridge would diminish the integrity of the Yosemite Valley and Yosemite Valley Bridges Historic Districts.</p>

**TABLE 9-224: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Cultural Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159); Yosemite Village Historic District	Rehabilitation of the Superintendent's House per the Secretary of the Interior's Standards for the Treatment of Historic Properties (NPS 1995) would result in an beneficial impact to a contributor to the Yosemite Valley and Yosemite Village Historic Districts.	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). The Superintendent's House is a contributor to the Yosemite Valley Historic District and the Yosemite Village Historic District (Donahoe 1994).</p> <p><i>NEPA:</i> The rehabilitation of the Superintendent's House would be undertaken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation and the Secretary of the Interior's Standards for the Treatment of Historic Properties. The rehabilitation of the building within the would result in a long term, moderate, local, beneficial impact to the Yosemite Valley and Yosemite Village Historic Districts under NEPA.</p> <p><i>NHPA:</i> The rehabilitation of the Superintendent's House would be undertaken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation and the Secretary of the Interior's Standards for the Treatment of Historic Properties. The action will have no adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA.</p>

**TABLE 9-225: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 3**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	Construction of additional housing or facilities would result in an alteration to the setting of the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation.</p> <p>The introduction of new permanent buildings, facilities, or additional parking has the potential to alter the setting of the Yosemite Valley Historic District. This includes actions such as increased parking at Lost Arrow and camping at Upper Pines. The Park will complete NHPA section 110 prior to this action, with a DOE completed prior to site planning. Additional consultation (tribal or SHPO) would also be required. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. This action would be completed in compliance with the proposed Merced River Plan PA and a determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO and during future site planning.</p>
<b>Curry Village</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	The re-design of the Curry Orchard Day Use Parking area and extension of the boardwalk through to Curry Village would result in the removal of historic trees and alteration of a contributor to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). In 1927, the Park addressed a growing problem with parking by converting a nearby apple orchard into a unique parking area for Curry Village. Curry Orchard Day Use Parking area is a contributing site to the Yosemite Valley Historic District, but not the Camp Curry Historic District (NPS 2006d; Hart, 1979).</p>

**TABLE 9-225: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Curry Village (cont.)</b>				
Segment 2 (cont.)				<p>Efforts to redesign parking within the Curry Orchard parking lot would affect historic trees in the Yosemite Valley Historic District. All trees will be removed from the parking lot. This action would be completed consistent with management practices outlined in the Orchard Management Guidelines and guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). The proposed action would result in a long term, local, moderate adverse impact to the Yosemite Valley Historic District under NEPA.</p> <p>Efforts to redesign parking within the Curry Orchard parking lot would alter a contributing resource to the Yosemite Valley Historic District. All trees will be removed from the parking lot. This action would be completed consistent with management practices outlined in the Orchard Management Guidelines and guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). This action will have an adverse effect on the Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	The rerouting of Southside Drive through Boys Town and the restoration of the remaining area would affect the historic circulation of the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). The historic circulation of Camp Curry is predominantly pedestrian paths, with vehicular approaches from the west (Old Village) and northwest (Stoneman Bridge). Today vehicular access is limited mainly to the northwestern approach, and the western approach has been converted to parking and foot trail. Since the original entry was oriented to this entrance, the historic gateway has become somewhat obsolete, at least in the current circulation configuration (NPS 2006d). Southside Drive is not considered a contributor to the Camp Curry Historic District.</p>

**TABLE 9-225: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Curry Village (cont.)</b>				
Segment 2 (cont.)				<p><i>NEPA:</i> The realignment of Southside Drive through Boys Town would affect the Yosemite Valley Historic District through alteration of historic circulation patterns in Curry Village and in the Valley. The action will not, however, result in an adverse effect to the historic approach to the Curry Village area, which is the focus of remaining historic vehicular circulation. The road realignment will include a small segment of the entire length of Southside Drive, in an area not out of character with its existing route. The proposed action does have the potential to affect historic pedestrian circulation patterns through rerouting of pedestrian paths, but this again constitutes a small portion of the total length of pedestrian paths in the Curry Village area. The action would comply with the guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action will have a moderate, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The realignment of Southside Drive through Boys Town would alter the integrity of the Yosemite Valley Historic District through alteration of historic circulation patterns and alteration of a contributing resource to a historic district. As described above, the action will not result in an adverse effect to the historic approach to the Curry Village area. The action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action would result in an adverse effect to the Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	Reduction of the footprint of the Curry Village Stables to provide staging for temporary pack camp operation at Merced Lake High Sierra Camp and overflow parking for campgrounds, eliminating commercial day rides, would affect a contributor to the Yosemite Valley Historic District.	The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. In 1927, the massive stable complex known as Kenneyville was removed to make way for the Ahwahnee Hotel, and a new, smaller stable complex was built to replace it. Now located farther east near the Lamon Orchard, today Kenneyville stables (or Concessioner stables) includes a mule barn, horse stable, five associated support buildings, six employee housing units and a comfort station. With the corrals and fencing through the complex, the cluster remains with good integrity

**TABLE 9-225: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Curry Village (cont.)</b>				
Segment 2 (cont.)				<p>(NPS 2006d). The Curry Village Stables are not considered contributors to the Curry Village Historic District.</p> <p><i>NEPA:</i> The reduction of the footprint of the Curry Village Stables would affect the Yosemite Valley Historic District through the alteration of the setting of contributing resources. The reduction of size of the stables would not result in the loss of any contributing structures associated with the stables. The action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action would result in a minor, long term, local adverse impact to the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The reduction of the footprint of the Curry Village Stables would alter the Yosemite Valley Historic District through the change of the setting of contributing resources. The reduction of size of the stables would not result in the loss of any contributing structures associated with the stables. The action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The action will have no adverse effect on the Yosemite Valley Historic District under NHPA.</p>
<b>Yosemite Village and Housekeeping Camp</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	The relocation and formalization of the parking to the north of the road and re-routing Northside Drive south of the parking at Yosemite Village Day-Use Parking area would affect historic circulation patterns in the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Northside and Southside drives create a framework for circulation around the valley, on either side of the Merced River, and are contributing structures to the Yosemite Valley Historic District. The historic circulation of Yosemite Village is predominantly centered on Village Drive between Northside Drive and Village bike path (NPS 2006d). Northside Drive is not a contributor to the Yosemite Village Historic District (Donahoe 1994).</p> <p><i>NEPA:</i> The formalization of the parking lot will occur within the existing developed former footprint of the Concessioner GO and the Concessioner Garage. The re-routing of Northside Drive would affect the Yosemite</p>

**TABLE 9-225: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2 (cont.)				<p>Valley Historic District through alteration of historic circulation patterns. The road realignment will include a small segment of the entire length of Northside Drive. This action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action will have a moderate, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The formalization of the parking lot will occur within the existing developed former footprint of the Concessioner GO and the Concessioner Garage. The realignment of Northside Drive would alter the Yosemite Valley Historic District through changes to historic circulation patterns and alteration of a contributing resource to the Yosemite Valley Historic District (Northside Drive), although The road realignment will include a small segment of the entire length of Northside Drive. This action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action will alter a contributing resource to a NR historic district. The action will have an adverse effect on the Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159); Yosemite Village Historic District	Relocation of the Superintendent's House to the NPS housing area and restoration of the area to natural conditions would result in an adverse effect to a contributor to the Yosemite Valley and Yosemite Village Historic Districts. This will occur in addition to the rehabilitation actions described above.	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). the Superintendent's House is a contributor to the Yosemite Valley Historic District and the Yosemite Village Historic District (Donahoe 1994).</p> <p><i>NEPA:</i> The relocation of the Superintendent's House from its historic location has the potential to alter the Yosemite Valley and Yosemite Village Historic Districts. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The relocation of a building from its historic location results in the loss of historic contextual setting, and can result in the delisting of the resource from the National Register. Additionally, the introduction of the Superintendent's House to a new location has the potential to alter the setting of historic</p>

**TABLE 9-225: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2 (cont.)				<p>resources in that location as well. The relocation of a building within the Yosemite Valley and Yosemite Village Historic Districts would result in a long term, major, local, adverse impact under NEPA.</p> <p><i>NHPA:</i> The relocation of the Superintendent's House from its isolated historic location would alter the Yosemite Valley and Yosemite Village Historic Districts. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The relocation of the building would result in the loss of historical setting of the resource, resulting in the building no longer being eligible for the National Register. Additionally, the introduction of the Superintendent's House to a new location would alter the setting of historic resources in that location as well. The action will have an adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Housekeeping Camp	Removal of all lodging units at Housekeeping Camp would potentially result in the removal of a historic resource.	<p>The Housekeeping Camp area developed after 1942, and consists of closely sited, rustic cinderblock and canvas tent cabins. Service buildings include a camp store and laundry and shower facilities, all built after 1942. This area has not been evaluated for eligibility as a National Register-eligible resource.</p> <p>The removal of all lodging units at Housekeeping Camp from within the 100-year floodplain could affect historic resources. Housekeeping Camp has not been previously evaluated as a National Register-eligible resource. The Park will complete NHPA section 110 prior to this action, with a DOE completed prior to site planning. Additional consultation (tribal or SHPO) would also be required. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. guidance to be established through development of a Programmatic Agreement for Merced River Plan or standard 36 CFR Part 800 consultation. This action would be completed in compliance with the proposed Merced River Plan PA and a determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO and during future site planning.</p>

**TABLE 9-225: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Lodge and Camp 4</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	Construction of additional housing or facilities would result in an alteration to the setting of the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation.</p> <p>The introduction of new permanent buildings, facilities, or additional parking has the potential to alter the setting of the Yosemite Valley Historic District. This includes actions such as increased parking at Lost Arrow and camping at Upper Pines. The Park will complete NHPA section 110 prior to this action, with a DOE completed prior to site planning. Additional consultation (tribal or SHPO) would also be required. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. This action would be completed in compliance with the proposed Merced River Plan PA and a determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO and during future site planning.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Lodge; Yosemite Valley Historic District	The removal of buildings in the Yosemite Lodge complex from the 100-year floodplain has the potential to affect historic resources in the Yosemite Lodge area.	<p>In 1956, the Yosemite Lodge was completely rebuilt and most of the old lodge buildings were demolished. The Yosemite Lodge is almost entirely the product of postwar planning and construction, but has not been evaluated for eligibility as a National Register-eligible resource (NPS 2006d).</p> <p>The removal of existing buildings in the Yosemite Lodge area could adversely affect historic resources. Yosemite Lodge has not been evaluated for NR eligibility as a Mission 66 resource. The park will complete a Determination of Eligibility prior to implementing the selected action. This action would be completed in compliance with the proposed Merced River Plan programmatic agreement. A determination of effect under both NEPA and NHPA would be required to inform the planning/design process after a Determination of Eligibility is completed and concurred upon by the SHPO.</p>

properties for the National Register, and A determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning. Impacts to the Yosemite Valley Historic District through the construction of new facilities within the district would result in a minor, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA.

**Yosemite Village and Housekeeping Camp.** Actions in the Yosemite Village area include the relocation and formalization of the parking lot and re-routing Northside Drive at Yosemite Village Day-Use Parking area, relocation of the Superintendent’s House and ecological restoration of the area, and removal of facilities from Housekeeping Camp. As described in table 9-225 above, these actions would have a minor to moderate, local, long term adverse impact to the listed Yosemite Valley Historic District under NEPA, and an adverse effect to the Yosemite Valley Historic District under NHPA.

### **Segments 3 and 4: Merced River Gorge and El Portal**

#### ***Impacts of Actions to Protect and Enhance River Values***

No actions intended to protect and enhance river values under Alternative 3 in Segments 3 and 4 are anticipated to result in an adverse effect on historic resources. These actions would not involve activities that would affect the character-defining features of a historic building, structure, or district.

Impacts common to Alternatives 2–6 are discussed earlier in this section under “Environmental Consequences Common to Alternatives 2–6.”

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Table 9-226 describes impacts of actions intended to manage visitor use and facilities in Segments 3 and 4 under Alternative 3.

Actions to manage visitor use and facilities values in Segments 3 and 4 under Alternative 3 would result in negligible, long term, local adverse impacts on historic resources under NEPA in El Portal. No NHL would be affected.

### **Segments 5, 6, 7, and 8: South Fork Merced River**

#### ***Impacts of Actions to Protect and Enhance River Values***

No actions intended to manage protect and enhance river values under Alternative 3 and Segments 5, 6, 7, and 8 are anticipated to result in an adverse effect on historic resources. These actions would not involve activities that would affect the character-defining features of a historic building, structure, or district. Impacts common to Alternatives 2–6 are discussed earlier in this section under “Environmental Consequences Common to Alternatives 2–6.”

**TABLE 9-226: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENTS 3 AND 4 UNDER ALTERNATIVE 3**

Segment	Action Type	Potential Historic Resource	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 4	Actions to Manage Visitor Use and Facilities	El Portal	The construction of additional concessioner housing in the Rancheria area of El Portal has the potential to alter the historic setting of potential historic resources in El Portal.	<p>El Portal is a small community comprised of 1200 acres of land on both the north and south sides of the Merced River and Highway 140. In 1961 the National Park Service began building housing in Rancheria Flat, west of El Portal as part of the Mission 66 initiative in the National Park Service. The Rancheria Mission 66 area has been recommended as a historic district as part of a historic resource study identifying potentially eligible properties in El Portal, but has not yet received SHPO concurrence (NPS 2011r).</p> <p>The construction of new housing in the Rancheria area of El Portal has the potential to alter the historic setting of the area and any potential historic resources not currently eligible or listed by the Park. A historic resource study identifying potentially eligible properties in the vicinity of El Portal has been completed by park staff (NPS 2011r). This study provides the park with enough research/information to identify potentially eligible resources that will need further Section 110 inventory/analysis to confirm eligibility before forwarding to the SHPOs office for review and concurrence.</p>

### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Table 9-227 describes impacts of actions intended to manage visitor use and facilities in Segments 5, 6, 7, and 8 under Alternative 3.

### **Summary of Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

Some of the management actions proposed for Alternative 3 could have adverse effects on known historic resources through demolition, alteration, and relocation related to restoration, construction, and facilities removal. Identified historic resources that would be affected by Alternative 3 include the Merced Lake High Sierra Camp, Camp Curry Historic District, the Yosemite Valley Historic District, Camp 4, the Ahwahnee Hotel, the Yosemite Valley Bridges Historic District, the Pioneer Yosemite History Center, and the Wawona Hotel and Pavilion Historic District. Table 9-228 summarizes the impacts to these historic resources. These actions could have long-term, minor to moderate adverse effects on individual historic buildings and sites, and moderate to major adverse effects on historic districts under NEPA. The proposed demolition of the Merced Lake High Sierra Camp Historic District would result in an adverse effect under NHPA, and actions resulting in the alteration of contributing resources to the Camp Curry Village, Yosemite Bridges, or the Yosemite Valley Historic Districts would diminish the integrity of these districts and result in an adverse effect under NHPA.

### **Cumulative Impacts from Alternative 3: Dispersed Visitor Experiences and Extensive Riverbank Restoration**

#### ***Past Actions***

Past actions have resulted in a range of beneficial and adverse impacts. Beneficial impacts of past actions include extensive actions to preserve and maintain historic resources, including the Camp Curry Historic District (Curry Village Registration Building, Guest Lounge and Amphitheater Rehabilitation), as well as restoration of meadows associated with the Yosemite Valley Historic District (Cook's Meadow). Adverse effects include the removal of the NR eligible Cascades area houses.

#### ***Present Actions***

Present actions contribute to a mixture of beneficial and adverse impacts. These impacts include efforts to restore, preserve, and protect the historic integrity and character-defining features of The Ahwahnee NHL while completing long-term rehabilitation of the building and associated features, construction of the Wawona fire station, Camp 4 relocating eight campsites, and the Ahwahnee Hotel Porte Cochère Access Walkways and Fence project. Additionally, the park has established the Curry Village Rockfall Hazard Zone, which has resulted in the loss of historic structures. These structures are being documented under a separate MOA.

**TABLE 9-227: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENTS 5, 6, 7, AND 8 UNDER ALTERNATIVE 3**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 7	Actions to Protect and Enhance River Values	Wawona Hotel and Pavilion	The removal of the tennis courts would affect potential contributors to the National Register Wawona Hotel and Pavilion District.	<p>The Wawona Hotel and Pavilion's architectural importance to American architecture is as the largest existing Victorian hotel complex within the boundaries of a national park, and one of the few remaining in the United States with this high level of integrity (Criterion C).</p> <p>The removal of the Wawona tennis courts would potentially affect the NR WHPHD. The Wawona tennis courts have not been previously evaluated as a National Register-eligible resource, either contributing or individually. Removal of facilities in this location would result in a potentially adverse effect. The Park will complete NHPA section 110 prior to this action, with a DOE completed prior to site planning. Additional consultation (tribal or SHPO) would also be required. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. This action would be completed in compliance with guidance to be established through development of a Programmatic Agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation), without this above described analysis. A determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning.</p>
Segment 7	Actions to Protect and Enhance River Values	Wawona	The closure of the stables in Wawona, along with the removal of the Wawona Golf Course, would affect contributors to the NR Wawona Hotel and Pavilion Historic District and Pioneer Yosemite History Center.	<p>The Wawona Hotel and Pavilion's architectural importance to American architecture is as the largest existing Victorian hotel complex within the boundaries of a national park, and one of the few remaining in the United States with this high level of integrity (Criterion C). The Wawona Golf Course, in operation since 1918 and a contributing resource as identified in the Wawona Hotel Complex Cultural Landscape Report completed in 2012. A Cultural Landscape Inventory completed for the Pioneer Yosemite History Center includes the Wawona Stables as a contributing resource.</p> <p><i>NEPA:</i> The closure of the Wawona stables and removal golf course would alter both the Pioneer Yosemite History Center and the Wawona Hotel and Pavilion Historic District. The golf course and Wawona Meadow are parts of the historic setting and landscape of the Wawona Hotel and Pavilion and contribute to its aesthetic and significance. The removal of the golf course would result in a beneficial impact through</p>

**TABLE 9-227: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENTS 5, 6, 7, AND 8 UNDER ALTERNATIVE 3 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 7 (cont.)				<p>the restoration of an earlier configuration of the historic Wawona Meadow. Operations of the Wawona stables would cease, but the structures would remain and the area would be converted to use as the site of the relocated Wawona stock use campground. The actions would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The proposed action would result in a long term, local, moderate adverse effect to the Wawona Hotel and Pavilion Historic District and a long term, local, minor adverse effect Pioneer Yosemite History Center under NEPA.</p> <p><i>NHPA:</i> The closure of the Wawona stables and removal golf course would alter both the Pioneer Yosemite History Center and the Wawona Hotel and Pavilion Historic District. The golf course and Wawona Meadow are parts of the historic setting and landscape of the Wawona Hotel and Pavilion and contribute to its aesthetic and significance. The removal of the golf course would result in a beneficial impact through the restoration of an earlier configuration of the historic Wawona Meadow. Operations of the Wawona stables would cease, but the structures would remain and the area would be converted to use as the site of the relocated Wawona stock use campground. The actions would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The action will result in the diminishment of integrity of the Wawona Hotel and Pavilion Historic District and Pioneer Yosemite History Center, and would have an adverse effect on the Wawona Hotel and Pavilion Historic District and no adverse effect on the Pioneer Yosemite History Center under NHPA. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation</p>

**TABLE 9-228: IMPACT SUMMARY TO HISTORIC RESOURCES UNDER ALTERNATIVE 3**

Historic District	Types of Impacts	Overall Impact Summary (NEPA)	Overall Impact Summary (NHPA)
Merced Lake High Sierra Camp Historic District	Removal of contributing buildings and potential delisting of the district	Long term, major, local, adverse impact	Adverse effect
NR Ahwahnee Hotel	Removal of contributing resources	long term, moderate, local, adverse impact	Adverse effect
Camp 4	construction of additional campsites, parking, and facilities	long term, minor, local, adverse impact	No adverse effect
Camp Curry Historic District	Demolition of contributing buildings.	long term, moderate, local, adverse impact	Adverse effect
Yosemite Valley Historic District	Rerouting of historic roads and trails, removal of historic buildings and facilities, construction of new buildings and facilities,	long term, moderate, local, adverse impact	Adverse effect
Yosemite Valley Bridges Historic District	Demolition of historic bridges	long term, moderate, local, adverse impact	Adverse effect
Yosemite Village Historic District	Removal of contributing resources	long term, moderate, local, adverse impact	Adverse effect
Wawona Hotel and Pavilion Historic District	Removal of potential contributing resources	long term, moderate, local, adverse impact	Adverse effect
Pioneer Yosemite History Center	Closure of operations at a contributing site	long term, minor, local, adverse impact	No adverse effect

### ***Future Actions***

Impacts from future actions would be similar to those discussed for past and present actions as a mix of beneficial and adverse impacts to historic resources. The Curry Village Rehabilitation of Historic Cabins with Bath Structures, seismic upgrade to the Ahwahnee Dormitory, and efforts to stabilize the floor of the Ahwahnee Hotel, all consist of potential future actions with the potential to affect historic resources within the park.

### ***Overall Cumulative Impact***

Alternative 3 would involve the demolition or alteration of several National Register-eligible, listed, or National Register structures (Merced Lake High Sierra Camp Historic District, Wawona Hotel and Pavilion Historic District, Yosemite Valley Historic District, and Yosemite Valley Bridges Historic District). Additionally, actions common to Alternatives 2–6 would involve the relocation or alteration of several National Register-eligible or listed structures (the NR Ahwahnee Hotel, Superintendent's House [Residence 1], Camp Curry Historic District, and Camp 4 ). The alteration or removal of these resources would potentially result in a long-term, moderate, adverse impact on both the individual resources and the cumulative historic fabric of the Merced River corridor. While all site-specific planning and compliance actions would be accomplished in accordance with stipulations in the park's proposed Merced River Plan programmatic agreement, the potential effect on the character-defining features of historic resources within the Merced River corridor would result in a long-term, moderate, adverse cumulative impact on historic resources.

## ***Environmental Consequences of Alternative 4: Resource-Based Visitor Experiences and Targeted Riverbank Restoration***

### **All River Segments**

#### ***Impacts of Actions to Protect and Enhance River Values***

No actions to protect and enhance river values across all river segments under Alternative 4 would result in an adverse effect on historic resources. None of the proposed actions would affect the character-defining features of a historic building, structure, or district.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

No actions to manage visitor use and facilities across all river segments under Alternative 4 would result in an adverse effect on historic resources. None of the proposed actions would affect the character-defining features of a historic building, structure, or district.

### **Segment 1: Merced River Above Nevada Fall**

#### ***Impacts of Actions to Protect and Enhance River Values***

No actions to protect and enhance river values within Segment 1 under Alternative 4 would result in an adverse effect on historic resources. None of these actions would affect the character-defining features of a historic building, structure, or district.

#### ***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

Table 9-229 describes impacts of actions intended to manage visitor use and facilities in Segment 1 under Alternative 4.

Actions to manage visitor use and facilities in Segment 1 under Alternative 4 would result in a major, long term, local adverse impact on the Merced Lake High Sierra Camp Historic District (Merced Lake High Sierra Camp Historic District) under NEPA and an adverse effect on Merced Lake High Sierra Camp Historic District under NHPA through the potential removal and delisting the Merced Lake High Sierra Camp Historic District from the National Register. No NHL would be affected.

### **Segment 2: Yosemite Valley**

#### ***Impacts of Actions to Protect and Enhance River Values***

Table 9-230 describes impacts of actions intended to protect and enhance river values in Segment 2 under Alternative 4.

**TABLE 9-229: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 1 UNDER ALTERNATIVE 4**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 1	Actions to Manage Visitor Use and Facilities	Merced Lake High Sierra Camp Historic District	The closure of the Merced Lake High Sierra Camp conversion of the site to its natural condition would adversely affect the Merced Lake High Sierra Camp Historic District.	<p>The Merced Lake High Sierra Camp is considered significant in recreation and education as one of seven high country camps whose origin dates back to the earliest days of the National Park Service. The Yosemite camp system initially began in 1916 as an effort to attract people into the park's high country. Through the use of organized parties guided by a Yosemite naturalist, the Park Service established a unique pattern of interpretive service in the high country of one of the most populous national parks, which helped acquaint the American public with the conservation objectives of the agency in all natural areas of the system (Criterion A, association with historic events) (Kirk, 2004).</p> <p><i>NEPA:</i> The alteration or removal of historic period buildings and structures in the Merced Lake High Sierra Camp area would greatly alter the district to the point of delisting the district from the National Register consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation)local adverse impact. The Merced Lake High Sierra Camp Historic District is one of the few National Register-eligible resources in Segment 1. The removal of contributing resources of an eligible historic district represents a substantial and highly noticeable change in character-defining features and the permanent alteration of the historic setting and character of the segment. While the action would be completed consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation), the proposed action would result in a major, long term, local adverse impact on the district under NEPA and potential delisting of the district.</p> <p><i>NHPA:</i> The alteration or removal of historic period buildings and structures in the Merced Lake High Sierra Camp area would greatly alter the Merced Lake High Sierra Camp Historic District to the point of delisting the district from the National Register. The Merced Lake High Sierra Camp Historic District is one of the few National Register-eligible resources in Segment 1. The removal of contributing resources of an eligible historic district represents a substantial and highly noticeable change in character-defining features and the permanent alteration of the historic setting and character of the segment. The action would be completed consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action would result in an adverse effect on Merced Lake High Sierra Camp Historic District under NHPA and potential delisting of the district.</p>

**TABLE 9-230: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 4**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	Restoration of El Captain Meadow would result in no adverse effect to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. The El Captain Meadow is a contributing site to the Yosemite Valley Historic District as a characteristic landscape feature in the Valley (NPS 2006d).</p> <p><i>NEPA:</i> The restoration of the meadow to its historic setting would result in a long term, local, beneficial effect to the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The restoration of the meadow would improve the condition of a resource and would result in no adverse effect to the Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	The restoration of Stoneman Meadow including the re-alignment of Southside Drive would affect historic circulation patterns in the Curry Village Area of the Yosemite Valley Historic District. This action would, however, improve Stoneman Meadow, another contributor to the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). The historic circulation of Camp Curry is predominantly pedestrian, with vehicular approaches from the west (Old Village) and northwest (Stoneman Bridge). Today vehicular access is limited mainly to the northwestern approach, and the western approach has been converted to parking and foot trail. Since the original entry was oriented to this entrance, the historic gateway has become somewhat obsolete, at least in the current circulation configuration. Stoneman Meadow is a contributing site to the Yosemite Valley Historic District as a characteristic landscape feature in the Valley, as is Southside Drive (NPS 2006d).</p> <p><i>NEPA:</i> The realignment of Southside Drive through Boys Town would affect the Yosemite Valley Historic District through alteration of historic circulation patterns in Curry Village and in the Valley. The action will not,</p>

**TABLE 9-230: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 4 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions (cont.)</b>				
Segment 2 (cont.)				<p>however, result in an adverse effect to the historic approach to the Curry Village area, which is the focus of remaining historic vehicular circulation. The road realignment will include a small segment of the entire length of Southside Drive, in an area not out of character with its existing route. Additionally, the restoration of Stoneman Meadow to a more historic setting would have a beneficial effect on the Yosemite Valley Historic District. Finally, the action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action would have a moderate, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The realignment of Southside Drive through Boys Town would alter the Yosemite Valley Historic District through changes to historic circulation patterns. As described above, the action will not result in an adverse effect to the historic approach to the Curry Village area, but would alter Southside Drive, a contributor to the Yosemite Valley Historic District. The restoration of Stoneman Meadow to a more historic setting would improve the condition of the Yosemite Valley Historic District. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed action would result in an adverse effect to the Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	Rerouting the Valley Loop Trail through Slaughterhouse and Bridalveil Meadows has the potential to affect these contributors to the Yosemite Valley Historic District.	The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Valley Loop Trail is one of the primary trails originating in the valley. The Valley Loop Trail dates from the 1920s and was originally built as a bridle trail, generally aligned along existing circulation routes. Thirteen additional miles were added to the Valley Loop Trail in 1928, requiring the construction of 14 bridges. Today, the Valley Loop Trail includes the entire remaining bridle trail system in the valley and it is approximately 21 miles long (Criterion A). The Slaughterhouse Meadow

**TABLE 9-230: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 4 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Biological Resource Actions (cont.)</b>				
Segment 2 (cont.)				<p>is a contributing site to the Yosemite Valley Historic District as a characteristic landscape feature in the Valley (NPS 2006d).</p> <p>The Valley Loop Trail, Bridalveil and Slaughterhouse meadows are contributors to the National Register-listed Yosemite Valley Historic District. Rerouting the Valley Loop Trail could alter both of these resources. Any sections of Valley Loop Trail that would be rerouted would require additional analysis prior to construction or demolition. The action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation), but without the above described analysis. A determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning.</p>
<b>Hydrologic/Geologic Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Bridges Historic District (1977000160), Yosemite Valley Historic District (2004001159)	In order to address river flow concerns, Stoneman Bridge would be left in place, but engineer solutions, such as installation of large wood or culverts to Northside Drive, would be installed. This would result in an effect to a contributing structure to these historic districts.	<p>Bridges have been a major component of the cultural landscape of the Yosemite Valley from the first years of Non-indigenous settlement. The Yosemite Valley Bridges Historic District consists of 8 granite-faced, concrete arch road bridges on the Valley floor, constructed between 1921 and 1933. The Valley bridges are unique for their architectural design and aesthetic considerations, representing an effort to build structures in the national parks which are simple and uniform in design to blend in with the environment (Criterion C) (Wilson, 1977). This bridge is also a contributor to the Yosemite Valley Historic District.</p> <p><i>NEPA:</i> The installation of engineered solutions in the vicinity of Stoneman Bridge may alter the historic setting of a contributor to the historic Yosemite Valley Bridges Historic District and Yosemite Valley Historic District. If culverts were installed in the vicinity of Stoneman Bridge, the culverts would be installed following Yosemite Design Guidelines and mitigation measure HIST-1, and with guidance to be established through development of a Programmatic Agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation) and should not affect the historic setting of the bridge, resulting in a negligible, long-term, local, adverse impact on the Yosemite Valley Bridges Historic District and Yosemite Valley Historic District under NEPA.</p>

**TABLE 9-230: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 4 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Hydrologic/Geologic Resource Actions (cont.)</b>				
Segment 2 (cont.)				<p><i>NHPA:</i> The installation of engineered solutions in the vicinity of Stoneman Bridge may alter the historic setting of a contributor to the historic Yosemite Valley Bridges Historic District and Yosemite Valley Historic District. If culverts were installed in the vicinity of Stoneman Bridge, the culverts would be installed following Yosemite Design Guidelines and mitigation measure HIST-1, and should not affect the historic setting of the bridge, resulting in no adverse effect to the Yosemite Valley Bridges Historic District or Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Bridges Historic District ((1977000160), Yosemite Valley Historic District (2004001159)	Removal of Ahwahnee and Sugar Pine Bridges and restoration to natural conditions would remove contributing structures to the Yosemite Valley Bridges and Yosemite Valley Historic Districts.	<p>Bridges have been a major component of the cultural landscape of the Yosemite Valley from the first years of Non-indigenous settlement. The Yosemite Valley Bridges Historic District consists of 8 granite-faced, concrete arch road bridges on the Valley floor, constructed between 1921 and 1933. The Valley bridges are unique for their architectural design and aesthetic considerations, representing an effort to build structures in the national parks which are simple and uniform in design to blend in with the environment (Criterion C) (Wilson, 1977). This bridge is also a contributor to the Yosemite Valley Historic District.</p> <p><i>NEPA:</i> The demolition and removal of Ahwahnee and Bridge and Sugar Pine would affect the Yosemite Valley Historic District and the Yosemite Valley Bridges Historic District. The loss of the bridges would result in the loss of nearly a third of the contributing resources in the National Register-listed Yosemite Valley Bridges. This would also result in the loss of several of the major Merced River crossings within the Yosemite Valley Historic District. The action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The proposed actions would result in a major, long term, local, adverse impact on the Yosemite Valley Bridges Historic District and the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The demolition and removal of Ahwahnee Bridge, in combination with the removal of the Stoneman and Sugar Pine Bridges, would result in the loss of nearly a third of the contributing resources in the National Register-listed Yosemite Valley Bridges Historic District, and would affect the Yosemite Valley Historic District. This action would be taken</p>

**TABLE 9-230: IMPACTS OF ACTIONS INTENDED TO PROTECT AND ENHANCE RIVER VALUES IN SEGMENT 2 UNDER ALTERNATIVE 4 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Hydrologic/Geologic Resource Actions (cont.)</b>				
Segment 2 (cont.)				consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or standard 36 CFR Part 800 consultation. The demolition of the bridge would result in the loss of a contributing resource to the Yosemite Valley Historic District. The action will have an adverse effect on the Yosemite Valley Historic District and Yosemite Valley Bridges Historic District under NHPA.
<b>Cultural Resource Actions</b>				
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159); Yosemite Village Historic District	Rehabilitation of the Superintendent's House per the Secretary of the Interior's Standards for the Treatment of Historic Properties (NPS 1995) would result in an beneficial impact to a contributor to the Yosemite Valley and Yosemite Village Historic Districts.	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). The Superintendent's House is a contributor to the Yosemite Valley Historic District and the Yosemite Village Historic District (Donahoe 1994).</p> <p><i>NEPA:</i> The rehabilitation of the Superintendent's House would be undertaken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation and the Secretary of the Interior's Standards for the Treatment of Historic Properties. The rehabilitation of the building within the would result in a long term, moderate, local, beneficial impact to the Yosemite Valley and Yosemite Village Historic Districts under NEPA.</p> <p><i>NHPA:</i> The rehabilitation of the Superintendent's House would be undertaken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation and the Secretary of the Interior's Standards for the Treatment of Historic Properties. The action will have no adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA.</p>

**Biological Resource Actions.** Biological resource actions to protect and enhance river values in Segment 2 under Alternative 2 would result in moderate, local, long term adverse impacts on the listed Yosemite Valley Historic District under NEPA through impacts to the contributing resources of Southside Drive, Boys Town, Stoneman Meadow, Valley Loop Trail, and Slaughterhouse Meadow, and an adverse effect to the Yosemite Valley Historic District under NHPA. No NHL would be affected.

**Hydrologic/Geologic Resource Actions.** Hydrologic/geologic resource actions to protect and enhance river values in Segment 2 under Alternative 2 would result in major long term, local, adverse impact on the Yosemite Valley Bridges Historic District the Yosemite Valley Historic District under NEPA through impacts to the contributing resources of Ahwahnee Bridge and Sugar Pine Bridge, and an adverse effect on the Yosemite Valley Historic District and Yosemite Valley Bridges Historic District under NHPA. No NHL would be affected.

**Cultural Resource Actions.** Cultural resource actions to protect and enhance river values in Segment 2 under Alternative 4 would result in a moderate, long term, local, beneficial impact on the Yosemite Valley and Yosemite Village Historic Districts under NEPA, and no adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA through impacts resulting from the rehabilitation of the contributing resource of the Superintendent's House. No NHL would be affected.

***Impacts of Actions to Manage User Capacities, Land Use, and Facilities***

**Table 9-231** describes impacts of actions intended to manage visitor use and facilities in Segment 2 under Alternative 4.

**Curry Village.** Project level actions to manage visitor use and facilities in the Curry Village area would include the redesign of the Curry Orchard parking area, and rerouting Southside Drive through Boys Town and construction of a 40-site campground. As described in table 9-231 below, actions to remove housing, redesign Curry Orchard Parking area, and reroute Southside Drive would result in a long term, local, moderate adverse impact to the Yosemite Valley Historic District and Camp Curry Historic District under NEPA. These actions would result in an adverse effect to the Yosemite Valley Historic District and Camp Curry Historic District through alterations to contributing historic properties under NHPA.

**Yosemite Lodge and Camp 4.** Project level actions to manage visitor use and facilities in the Yosemite Lodge and Camp 4 areas would include alterations to Yosemite Lodge, such as the redesign of parking areas, removal of existing buildings and facilities, construction of new employee housing, and repurposing of existing buildings. As described in table 9-231 below, Yosemite Lodge was identified as being a non-contributing site within the Yosemite Valley Historic District. However, it has not been evaluated for its post-WWII significance under the 50-year rule for the inventorying of historic properties for the National Register, and a determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO during future site planning, of this action. Impacts to the Yosemite Valley Historic District through the construction of new facilities within the district would result in a minor, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA.

**TABLE 9-231: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 4**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
Segment 2	Actions to Protect and Enhance River Values	Yosemite Valley Historic District (2004001159)	Construction of additional housing or facilities would result in an alteration to the setting of the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation.</p> <p>The introduction of new permanent buildings, facilities, or additional parking has the potential to alter the setting of the Yosemite Valley Historic District. This includes actions such as increased parking at Lost Arrow and camping at Upper Pines and the former Lower River Campground. The Park will complete NHPA section 110 prior to this action, with a DOE completed prior to site planning. Additional consultation (tribal or SHPO) would also be required. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. This action would be completed in compliance with the proposed Merced River Plan PA and a determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO and during future site planning.</p>
<b>Curry Village</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	The re-design of the Curry Orchard Day Use Parking area and extension of the boardwalk through to Curry Village would result in the removal of historic trees and alteration of a contributor to the Yosemite Valley Historic District. Associated restoration of Stoneman Meadow would have no affect on this Yosemite Valley Historic District contributor.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). In 1927, the Park addressed a growing problem with parking by converting a nearby apple orchard into a unique parking area for Curry Village. Curry Orchard Day Use Parking area is a contributing site to the Yosemite Valley Historic District, but not the Camp Curry Historic District (NPS 2006d; Hart, 1979).</p>

**TABLE 9-231: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 4 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Curry Village (cont.)</b>				
Segment 2 (cont.)				<p><i>NEPA:</i> Efforts to redesign parking within the Curry Orchard parking lot would affect historic trees, as well as a contributing resource to the Yosemite Valley Historic District. All trees will be removed from the parking lot. This action would be completed consistent with management practices outlined in the Orchard Management Guidelines and guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). The proposed action would result in a long term, local, moderate adverse impact to the Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> Efforts to redesign parking within the Curry Orchard parking lot would alter a contributing resource to the Yosemite Valley Historic District. This action would be completed consistent with management practices outlined in the Orchard Management Guidelines and guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). This action will have an adverse effect on the Yosemite Valley Historic District under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	The rerouting of Southside Drive through Boys Town, and construction of a 40-site campground is constructed would affect the historic circulation and setting of the Yosemite Valley Historic District.	The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Many recreational trends, including sightseeing, camping, auto camping, mountaineering, winter sports, and others began or were significantly advanced at Yosemite (Criterion A). The cultural landscape of Yosemite Valley features nationally significant examples of architecture. Camp Curry is a rare example of a surviving tent cabin complex of the type that was once common in many parks (Criterion C). The historic circulation of Camp Curry is predominantly pedestrian pathways, with vehicular approaches from the west (Old Village) and northwest (Stoneman Bridge). Today vehicular access is limited mainly to the northwestern approach, and the western approach has been converted to parking and foot trail. Since the original entry was oriented to this entrance, the historic gateway has

**TABLE 9-231: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 4 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Curry Village (cont.)</b>				
Segment 2 (cont.)				<p>become somewhat obsolete, at least in the current circulation configuration (NPS 2006d). Southside Drive is not considered a contributor to the Camp Curry Historic District (Hart, 1979).</p> <p><i>NEPA:</i> The realignment of Southside Drive through Boys Town would affect the Yosemite Valley Historic District through alteration of historic circulation patterns in Curry Village and in the Valley. The action will not, however, result in an adverse effect to the historic approach to the Curry Village area, which is the focus of remaining historic vehicular circulation. The road realignment will include a small segment of the entire length of Southside Drive, in an area not out of character with its existing route. The action does have the potential to alter historic pedestrian circulation through the rerouting of pedestrian paths. The conversion of Boys Town to a campground would also result in the removal of historic tent cabins and structures, altering both the Yosemite Valley and Camp Curry Historic Districts. The action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan (or 36 CFR Part 800 consultation). The proposed action will have a major, local, long term impact effect on the listed Yosemite Valley and Camp Curry Historic Districts under NEPA.</p> <p><i>NHPA:</i> The realignment of Southside Drive through Boys Town would affect the Yosemite Valley Historic District through alteration of historic circulation patterns through impacts to contributing Southside Drive. As described above, however, the action will not result in an adverse effect to the historic approach to the Curry Village area. Additionally, the conversion of Boys Town to a campground would diminish the integrity of both the Yosemite Valley and Camp Curry Historic Districts. The action would comply with guidance to be established through development of a Programmatic Agreement for the Merced River Plan, or standard 36 CFR Part 800 consultation. This action will result in the alteration of a contributing resource to a NR historic district, and will have an adverse effect on the Yosemite Valley Historic District under NHPA.</p>

**TABLE 9-231: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 4 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159)	The relocation and formalization of the parking to the north of the road and re-routing Northside Drive south of the parking at Yosemite Village Day-Use Parking area would affect historic circulation patterns in the Yosemite Valley Historic District.	<p>The cultural landscape of Yosemite Valley is nationally significant under National Register criteria A and C. The valley floor landscape as a whole is nationally significant in the themes of outdoor recreation, tourism, and conservation. Northside and Southside drives create a framework for circulation around the valley, on either side of the Merced River, and are contributing structures to the Yosemite Valley Historic District. The historic circulation of Yosemite Village is predominantly centered on Village Drive between Northside Drive and Village bike path (NPS 2006d). Northside Drive is not a contributor to the Yosemite Village Historic District (Donahoe 1994).</p> <p><i>NEPA:</i> The formalization of the parking lot will occur within the existing developed former footprint of the Concessioner GO and the Concessioner Garage. The re-routing of Northside Drive would affect the Yosemite Valley Historic District through alteration of historic circulation patterns as well as alteration of a contributing resource (Northside Drive). The road realignment will include a small segment of the entire length of Northside Drive. This action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). The proposed action will have a moderate, local, long term adverse impact on the listed Yosemite Valley Historic District under NEPA.</p> <p><i>NHPA:</i> The formalization of the parking lot will occur within the existing developed former footprint of the Concessioner GO and the Concessioner Garage. The realignment of Northside Drive would affect the Yosemite Valley Historic District through alteration of historic circulation patterns. The road realignment will include a small segment of the entire length of Northside Drive. This action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan (or standard 36 CFR Part 800 consultation). The alteration of a contributing resource would have an adverse effect on the Yosemite Valley Historic District under NHPA.</p>

**TABLE 9-231: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 4 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2	Actions to Manage Visitor Use and Facilities	Yosemite Valley Historic District (2004001159); Yosemite Village Historic District	Relocation of the Superintendent's House and garage to the NPS housing area and restoration of the area to natural conditions would result in an adverse effect to a contributor to the Yosemite Valley and Yosemite Village Historic Districts. This will occur in addition to the rehabilitation actions described above.	<p>Yosemite Village has one of the largest and most significant collections of NPS Rustic style buildings in the national park system, with both concessioner and NPS buildings representing a range of rustic types and building materials (Criterion 3). The Superintendent's House and garage are contributors to the Yosemite Valley Historic District and the Yosemite Village Historic District (Donahoe 1994).</p> <p><i>NEPA:</i> The relocation of the Superintendent's House and garage from its historic location has the potential to alter the Yosemite Valley and Yosemite Village Historic Districts. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The relocation of a building from its historic location results in the loss of historic contextual setting, and can result in the delisting of the resource from the National Register. Additionally, the introduction of the Superintendent's House and garage to a new location has the potential to alter the setting of historic resources in that location as well. The relocation of a building within the Yosemite Valley and Yosemite Village Historic Districts would result in a long term, moderate, local, adverse impact.</p> <p><i>NHPA:</i> The relocation of the Superintendent's House and garage from its isolated historic location would alter the Yosemite Valley and Yosemite Village Historic Districts. The action would be taken consistent with guidance to be established through development of a programmatic agreement for the Merced River Plan or the standard 36 CFR Part 800 consultation. The relocation of the building would result in the loss of historical setting of the resource, resulting in the building no longer being eligible for the National Register. Additionally, the introduction of the Superintendent's House and garage to a new location would alter the setting of historic resources in that location as well. The action will have an adverse effect on the Yosemite Valley and Yosemite Village Historic Districts under NHPA.</p>
Segment 2	Actions to Manage Visitor Use and Facilities	Housekeeping Camp	Removal of 166 lodging units from the ordinary high water mark at Housekeeping Camp would potentially affect a historic resource.	The Housekeeping Camp area developed after 1942, and consists of closely sited, rustic cinderblock and canvas tent cabins. Service buildings include a camp store and laundry and shower facilities, all built after 1942. This area has not been evaluated for eligibility as a National Register-eligible resource.

**TABLE 9-231: IMPACTS OF ACTIONS INTENDED TO MANAGE VISITOR USE AND FACILITIES IN SEGMENT 2 UNDER ALTERNATIVE 4 (CONTINUED)**

Segment	Action Type	National Register Listed or Eligible Property	Action and Impact to Resource	Analysis under NEPA/NHPA
<b>Yosemite Village and Housekeeping Camp (cont.)</b>				
Segment 2 (cont.)				The removal of 166 lodging units (83 duplex lodging units, 4 restrooms, store and office) and other facilities out of the observed ordinary high water mark could affect historic resources. Housekeeping Camp has not been previously evaluated as a National Register-eligible resource. The Park will complete NHPA section 110 prior to this action, with a DOE completed prior to site planning. Additional consultation (tribal or SHPO) would also be required. In the event that the property is found eligible, planning and design efforts would be reassessed prior to construction in order to ensure that the park has attempted to avoid, minimize or mitigate any potentially adverse impacts to the historic property. This action would be completed in compliance with the proposed Merced River Plan programmatic agreement, and a determination of effect under both NEPA and NHPA would occur after a determination of eligibility is completed and concurred upon by SHPO.
<b>Yosemite Lodge and Camp 4</b>
