The past and reasonably foreseeable future projects would have a long-term, moderate, beneficial effect on Outstandingly Remarkable Values due to the establishment of the *Merced River Plan* Visitor Experience and Resource Protection framework; improved river-related recreation opportunities from Happy Isles to Vernal Falls; and restored riparian habitat and hydrologic processes at the Eagle Creek and Merced River confluence.

For the actions of this alternative, a long-term, moderate, beneficial impact is described for the Outstandingly Remarkable Values, largely due to the removal of facilities that impede flood flow and inhibit the natural meandering of the river; the restoration of substantial areas of high-value resources in the River Protection Overlay and wild and scenic river corridor; the improvement of the scenic interface of river, rock, meadow, and forest; and the maintenance of the diversity of river-related recreational opportunities. The beneficial impact of this alternative is somewhat offset by the adverse impact on the cultural Outstandingly Remarkable Value resulting from the removal of historic structures, as well as the adverse impacts on biological, cultural, and hydrologic processes Outstandingly Remarkable Values associated with the development of the parking facility at Taft Toe. The cumulative projects would have a long-term, moderate, beneficial effect on Outstandingly Remarkable Values due to the establishment of the *Merced River Plan* Visitor Experience and Resource Protection framework; improved river-related recreation opportunities from Happy Isles to Vernal Falls; and restored riparian habitat and hydrologic processes at the Eagle Creek and Merced River confluence. When the impacts of all of the past and reasonably foreseeable future actions described above are considered in combination with the expected impacts on the Outstandingly Remarkable Values from this alternative, long-term, moderate, beneficial effects to the Outstandingly Remarkable Values of this segment would likely result.

Consistency with the Merced River Plan

Similar to Alternative 2, the actions of this alternative in this segment of the Merced Wild and Scenic River would comply with the *Merced River Plan* and are consistent with its management elements. The collective actions are consistent with the classification of this segment because accessibility by road or trail would be essentially unchanged and the amount of development in the watershed and on the shorelines would not substantially change, although development on the shorelines would be reduced through removal of facilities in the River Protection Overlay. The individual actions that are considered to be water resources projects, such as removal of bridges, would be subject to the Section 7 determination process. The River Protection Overlay would be implemented and individual actions would be compatible with the River Protection Overlay prescription, with many facilities being removed from the River Protection Overlay. The individual actions would be consistent with the respective management zones established in the *Merced River Plan*. Some actions, such as the removal of infrastructure from the former Rivers Campgrounds, remove existing facilities or uses that do not conform with the corresponding management zone prescription.

IMPOUNDMENT (SEGMENT 3A) AND GORGE (SEGMENT 3B)

Outstandingly Remarkable Values Impacts

Outstandingly Remarkable Values identified for the recreational impoundment segment of the river are geologic processes/conditions and biological. Outstandingly Remarkable Values identified for the scenic gorge segment of the river are scenic, geologic processes/conditions, recreation, biological, cultural, and hydrologic processes.

The impacts of this alternative to the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2 (see Alternative 2, table 4-40, for details).

Impoundment (Segment 3A) and Gorge (Segment 3B) Conclusion

The impacts of this alternative on the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2. This alternative would have a long-term, moderate to major, beneficial impact on Outstandingly Remarkable Values, largely because the removal of Cascades Diversion Dam and implementation of the River Protection Overlay would substantially improve the free-flowing condition of the river; enhance riparian habitat and rainbow trout movement; and improve views of waterfalls and cliffs. This beneficial impact is somewhat offset by adverse impacts on cultural Outstandingly Remarkable Values associated with the increased risk of damage to historic engineering projects resulting from Cascades Diversion Dam removal, and the removal of Cascades Houses (see Alternative 2 for more details).

Cumulative Impacts

Cumulative impacts under this alternative would be the same as under Alternative 2. For the actions of this alternative, a long-term, moderate to major, beneficial impact is described for these Outstandingly Remarkable Values, largely because the removal of Cascades Diversion Dam and implementation of the River Protection Overlay would substantially improve the free-flowing condition of the river; enhance riparian habitat and rainbow trout movement; and improve views of waterfalls and cliffs. The cumulative projects would have a long-term, minor, adverse impact, largely through introduction of stabilization materials and loss of riparian vegetation. When the impacts of all of the past and present actions described above are considered in combination with the anticipated impacts on the Outstandingly Remarkable Values from this alternative, long-term, moderate, beneficial effects on the Outstandingly Remarkable Values of these segments would likely result (see Alternative 2 for more details).

Consistency with the Merced River Plan

The consistency analysis for this alternative would be the same as under Alternative 2. Similar to Alternative 2, the actions of this alternative in this segment of the Merced Wild and Scenic River comply with the *Merced River Plan* and are consistent with its management elements. The collective actions are consistent with the classification of this segment, because accessibility by road or trail is essentially unchanged, and the amount of development in the watershed and on the shoreline does not substantially change. The removal of the Cascades Diversion Dam is consistent with the recreational classification of the impoundment segment, and would allow this

small segment of river to be classified as scenic. The individual actions that are considered to be water resources projects, such as removal of the Cascades Diversion Dam, would be subject to the Section 7 determination process. The River Protection Overlay is being implemented, and individual actions are compatible with the River Protection Overlay prescription, including the removal of the Cascades Diversion Dam. The individual actions are consistent with the respective management zones established in the *Merced River Plan*.

EL PORTAL (SEGMENT 4)

Outstandingly Remarkable Values identified for this recreational segment of the river are geologic processes/conditions, recreation, biological, cultural, and hydrologic processes.

Outstandingly Remarkable Values Impacts

The impacts of this alternative to the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2 (see Alternative 2, table 4-41, for more details).

El Portal (Segment 4) Conclusion

The impacts of this alternative to the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2. For the actions of this alternative, a long-term, minor, beneficial impact is described for the Outstandingly Remarkable Values of this segment, largely because implementation of the River Protection Overlay would limit development on the riverbank, and contribute to the restoration of sensitive riparian vegetation communities (e.g., at Hennessey's Ranch). In addition, the recreation Outstandingly Remarkable Value would be beneficially affected by improved hiking opportunities along the river. The beneficial impact on Outstandingly Remarkable Values for this segment has been offset by the adverse impacts on the cultural Outstandingly Remarkable Value due to possible loss of historic structures, and possible disturbance of archeological sites (standard cultural resource mitigation measures lessen the magnitude of the cultural resources impacts) (see Alternative 2 for more details).

Cumulative Impacts

Cumulative impacts under this alternative would be the same as under Alternative 2. For the actions of this alternative, a long-term, minor, beneficial impact is described for the Outstandingly Remarkable Values of this segment, largely because implementation of the River Protection Overlay would limit development on the riverbank, and contribute to the restoration of sensitive riparian vegetation communities (e.g., at Hennessey's Ranch). In addition, the recreation Outstandingly Remarkable Value would be beneficially affected by improved hiking opportunities along the river. The past and reasonably foreseeable future projects would have a long-term, minor, adverse effect on Outstandingly Remarkable Values because of adverse impacts on biological and cultural Outstandingly Remarkable Values resulting from the Yosemite View Parcel Land Exchange (NPS), largely due to motel construction in close proximity to the river. The adverse impacts resulting from the loss of riparian vegetation associated with the Yosemite View Parcel Land Exchange would outweigh the potential beneficial impact of this alternative resulting from the enhancement/restoration of existing (albeit degraded) riparian habitat in the River Protection Overlay. Consequently, when the impacts of all of the past and

reasonably foreseeable future actions described above are considered in combination with the expected impacts on the Outstandingly Remarkable Values from this alternative, long-term, negligible, adverse effects on the Outstandingly Remarkable Values of this segment would likely result (see Alternative 2 for more details).

Consistency with the Merced River Plan

The consistency analysis for this alternative would be the same as under Alternative 2. Similar to Alternative 2, the actions of this alternative in this segment of the Merced Wild and Scenic River comply with the *Merced River Plan*, and are consistent with its management elements. The collective actions are consistent with the classification of this segment because accessibility by road or trail is essentially unchanged, and the amount of development in the watershed and on the shorelines does not substantially change. The individual actions that are considered to be water resources projects, such as construction of pedestrian bridges, would be subject to the Section 7 determination process. The River Protection Overlay is being implemented and individual actions are compatible with the River Protection Overlay prescription, including the removal of the Cascades Diversion Dam. The individual actions are consistent with the respective management zones established in the *Merced River Plan*.

W A W O N A (S E G M E N T 7)

Outstandingly Remarkable Values identified for this scenic segment of the river are scenic, recreation, biological, and cultural.

Outstandingly Remarkable Values Impacts

The impacts of this alternative on the Outstandingly Remarkable Values for this segment would be the same as under Alternative 3 (see Alternative 3, table 4-72, for more detail).

Wawona (Segment 7) Conclusion

The impacts of this alternative on the Outstandingly Remarkable Values for this segment would be the same as under Alternative 3. For the actions of this alternative, long-term, minor, beneficial impacts are described for the Outstandingly Remarkable Values of this segment, due to the continuation of trends to restore riparian areas, pursuant to the River Protection Overlay, and the beneficial effects on the biological and scenic Outstandingly Remarkable Values that would result (see Alternative 3 for more detail).

Cumulative Impacts

Cumulative impacts under this alternative would be the same as under Alternative 3. For the actions of this alternative, long-term, minor, beneficial impacts are described for the Outstandingly Remarkable Values of this segment due to the continuation of trends to restore riparian areas, pursuant to the River Protection Overlay, and the beneficial effects on the biological and scenic Outstandingly Remarkable Values that would result. The past and reasonably foreseeable future projects would have a long-term, minor, beneficial impact on the Outstandingly Remarkable Values of this segment due to the implementation of the *Merced River Plan* Visitor Experience and Resource Protection framework; the reduction of development on

the riverbank and restoration of habitat associated with the South Fork Merced River Bridge Replacement (NPS), and the relocation of campsites outside the River Protection Overlay and maintenance of a diversity of river-related recreational activities associated with the Wawona Campground Rehabilitation. When the impacts of all of the past and reasonably foreseeable future actions described above are considered in combination with the expected impacts on the Outstandingly Remarkable Values from this alternative, a long-term, minor, beneficial impact on the Outstandingly Remarkable Values would result (see Alternative 3 for more details).

Consistency with the Merced River Plan

Similar to Alternative 2, the actions of this alternative in this segment of the Merced Wild and Scenic River would comply with the *Merced River Plan* and be consistent with its management elements. The collective actions would be consistent with the classification of this segment because accessibility by road or trail would be essentially unchanged and the amount of development in the watershed and on the shorelines would not substantially change. The individual actions that are considered to be water resources projects would be subject to the Section 7 determination process. The River Protection Overlay would be implemented and individual actions would be compatible with the River Protection Overlay prescription. The individual actions would be consistent with the respective management zones established in the *Merced River Plan*. Some actions, such as the removal of infrastructure from the former Rivers Campgrounds, remove existing facilities or uses that do not conform with the corresponding management zone prescription.

Visitor Experience

Visitor experience is also directly affected by actions influencing natural resources such as, air quality, scenic resources, and cultural resources. Though impacts to these resources are not repeated in the analysis of visitor experience, enhancement or degradation of these resources also enhances or degrades the quality of the visitor experience.

A C C E S S

Access to Yosemite Valley

Access into Yosemite Valley directly by private automobile to parking at Taft Toe would be available only to about 28% of day visitors on a typically busy day (using 1998 visitation levels). Overnight visitors would continue to have the option of driving into the Valley or traveling on existing tour buses or other modes of travel. Day visitors who could not park in the Valley would ride shuttle buses to the Valley from parking areas at Badger Pass, South Landing, and El Portal, or they could ride tour buses or regional transit. These changes would likely have major adverse impacts to the experience of the majority of day visitors, who would have a reduced ability to make spontaneous stops en route to the Valley, resulting in fewer opportunities for spontaneity, extra travel time, and the inconvenience of moving personal items to and from bus stops.

Alternative 4 would provide transportation facilities and services designed to accommodate peak visitation levels on most summer days. Assuming that future visitation is unchanged from 1998, day-visitor demand would be expected to exceed the capacity of the parking areas on 7 days

during the peak season. On these days, some visitors would not be able to find parking in the Valley or at the out-of-Valley parking areas. These visitors would have the option of visiting another part of the park; traveling on regional transit and other alternative transportation modes; or visiting the Valley at a different time of day or on another day. Adequate infrastructure would be in place to accommodate visitor parking in or out of the Valley with a shuttle, in-Valley shuttles, regional transit, and commercial tour buses, as described under Alternatives 2 and 3.

Access to the Valley by private vehicles would be managed through a traveler information and traffic management system. Impacts would be the same as those described under Alternative 2. Overall, the average visitor would experience moderate, adverse impacts (compared to Alternative 1) on the time required to travel to the Valley.

As described for Alternatives 2 and 3, reconstructing the segment of El Portal Road between Pohono Bridge and the intersection with Big Oak Flat Road (the major access to the Valley) would cause short-term, minor, adverse impacts such as traffic delays for many visitors during construction. Short-term, adverse impacts associated with constructing Valley access routes and implementing the traveler information and traffic management system would include detours, having to learn new routes, and having to learn new procedures as they were phased in. Compared to Alternative 1, these impacts would be of negligible intensity.

Circulation within Yosemite Valley

Access by private vehicle to most Valley destinations would be eliminated, as described for Alternatives 2 and 3. Once their vehicles were parked in a day-visitor lot or lodging area, visitors would be encouraged to leave them parked until they left the Valley. Parking would not be provided except at campsites and lodging sites, and under this alternative (as in Alternative 3), at the Taft Toe day-visitor parking facility. Turnouts along Valley roads would be available for short stops only. Compared to Alternative 1, the location of a 550-space day-visitor parking area and visitor/transit center at Taft Toe under this alternative would provide a major, beneficial impact for orientation and trip planning for all day visitors, similar to Alternative 3. However, most day visitors would still need to board shuttle buses to reach desired destinations in the east Valley. The requirement for most day visitors to ride shuttle buses would result in a moderate, adverse impact to day visitors.

Changes in access would affect visitors' ability or willingness to undertake some recreational activities, as described for Alternatives 2 and 3. These changes would affect a majority of day visitors using regional transit, tour buses, and out-of-Valley shuttle buses to access the Valley. Changes to circulation within the Valley would be similar to those described under Alternatives 2 and 3, except under this alternative, there would only be 550 parking spaces at Taft Toe. Access to the mid- and west Valley would be increased for visitors arriving by shuttle or other forms of transit due to extended shuttle bus service to these areas, resulting in a major, beneficial impact, compared to Alternative 1.

Traffic Congestion, Parking and Crowding

Traffic would be reduced throughout the Valley below present levels at all times of the year (unless seasonal displacement appreciably increases traffic during present slow seasons).

The reduction in private vehicle traffic would result in an overall reduction in vehicle miles of travel in the Valley of 57% from the No Action Alternative. This reduction in traffic would have a long-term, major, beneficial impact on the experience for all visitors because there would be greater opportunities for quiet and contemplative recreational experiences. The overall reduction in traffic would result in improved traffic flow and reduced congestion throughout the Valley, including the mid Valley, where Northside Drive would be closed and Southside Drive would be converted to two-way operation.

Under this alternative, 550 parking spaces would be provided for day visitors in the Valley and approximately 1,590 spaces would be provided in out-of-Valley locations (Badger Pass, South Landing, and El Portal). When the Valley area is full, day visitors would have the option of parking in out-of-Valley lots and riding a shuttle to Taft Toe. The traveler information and traffic management system would inform visitors of the parking status prior to their arrival. Overnight visitors would continue to have the option to drive to the Valley. As described for Alternatives 2 and 3, frequent shuttle service would provide access to Valley attractions.

As described for Alternatives 2 and 3, the appearance of crowding in the Valley would be reduced during peak visitation times for all visitors by eliminating roadside parking, substantially reducing traffic volumes, improving traffic flow, and reducing the visual impact of parked vehicles. The Visitor Experience and Resources Protection program would protect the diversity of visitor experiences as in Alternatives 2 and 3. Both would result in major, beneficial impacts.

Traffic congestion could increase west of El Capitan crossover due to possible unauthorized, long-term parking at the remaining turnouts, and the potential for increased pass-through traffic. As described for Alternatives 2 and 3, these would all have a moderate, adverse impact on perceptions of congestion.

Some of the existing automobile traffic would be replaced with buses, having impacts similar to Alternatives 2 and 3. Notably, the movement of visitors in buses could cause some visitors to feel crowded. Most visitors would travel in larger groups because of the emphasis on bus travel. The overall impact of bus traffic and grouping passengers in buses is expected to have a moderate, adverse impact on the visitor experience, as compared to Alternative 1.

Reliability of the Yosemite Valley Transportation System

Similar to Alternative 3, this alternative would help relieve visitor anxiety and reduce the time wasted searching for available parking within the Valley as compared to Alternative 1. This alternative would include a traveler information and traffic management system designed to manage parking areas, and visitors would have convenient and frequent access to expanded shuttle service. The overall impact to visitors would be major and beneficial, from the perspective of their being able to rely on the transportation system.

Access for Visitors with Disabilities

Access and the resulting impacts for visitors with disabilities would be the same as described for Alternatives 2 and 3. Notably, as fully accessible shuttle buses were placed in operation, visitors with disabilities would use the shuttles rather than private vehicles. Some visitors with disabilities would experience a moderate, beneficial impact from the improved accessibility of shuttle

services. However, without their private vehicles, other visitors with disabilities would have greater difficulty in moving about the Valley, creating a moderate, adverse impact. Visitors with mobility impairments would not have easy access to locations not directly served by the shuttle bus system. The prescribed universal programmatic accessibility study plan and its implementation would ultimately result in a major, beneficial impact. New accessible trails at popular destination areas would provide access to areas that are not now easily accessible, resulting in moderate, beneficial impacts.

O R I E N T A T I O N A N D I N T E R P R E T A T I O N

Sense of Arrival

As described for Alternatives 2 and 3, visitor centers and orientation facilities near each principal park entrance would improve the sense of arrival at the park for visitors. As described for Alternative 3, for day visitors parking at Taft Toe, the sense of arrival into the Valley would be indicated by combining parking and access to a visitor/transit center, with increased convenience for orientation and trip planning. However, under this alternative, those visitors parking at out-of-Valley locations would find the arrival experience segmented by having to park, then take a shuttle to the Valley; the first sight of the principal Valley features would still provide a sense of arrival. Their sense of arrival would be similar to what is offered today and to what would occur under Alternative 2: visitors could see significant views en route to the parking facility, but the views would be only marginally interpreted. Impacts of the proposed arrival sequence would affect most visitors, and would be beneficial but negligible in intensity, compared to Alternative 1.

Wayfinding

Improvements to signs and circulation would improve wayfinding for visitors, the same as in Alternatives 2 and 3. Notably, improved and consistent signing at shuttle bus stops would help orient many visitors. Day visitors would not need to navigate the Valley's existing confusing network of roads, and overnight visitors would be directed to their accommodations by improved signs and printed orientation materials. Moderate, beneficial impacts would result for most Yosemite Valley visitors.

Visitor Centers

As described for Alternatives 2 and 3, visitors would have opportunities to find out about park programs, the availability of services and facilities, directions, permits, reservations, trip-planning services, interpretive themes and a stewardship ethic, and regulations at park entrances as they arrive. Under this alternative (as in Alternative 3), the new Taft Toe Visitor/Transit Center would assist visitors in Valley orientation and trip planning, and in the interpretation of Valley themes, resulting in a major, beneficial impact to the majority of park visitors, compared to Alternative 1.

Overnight visitors would also find orientation exhibits at their lodging or campground. Impacts would be beneficial but moderate in intensity (the same as under Alternatives 2 and 3).

Exhibits and Programs

Improvements to exhibits and programs, the Nature Center at Happy Isles, museum collections, and trailside exhibits would be as described under Alternative 3. Museum collections, now split in many locations, would be reorganized and made more accessible to the public. A natural history museum would be developed in the existing NPS Administration Building, and the cultural history museum in the existing Museum/Valley District Building would be expanded. These and other improvements would have a moderate, beneficial impact on the large group of museum-goers and a major, beneficial impact on the small group of researchers.

R E C R E A T I O N

Auto Touring

Impacts on auto touring would be the same as under Alternative 2, except as in Alternative 3, Taft Toe would be the easternmost limit for auto touring by day visitors in the Valley. Visitors would no longer be able to park at most features and facilities for extended periods while exploring. These actions would result in moderate, adverse impacts to a large number of visitors, and major, adverse impacts would occur to the majority of visitors unable to drive their car into the east Valley.

Potential reduced traffic east of Taft Toe could contribute to a sense of more relaxed touring; this could be offset by an increase in the number of buses, resulting in a negligible, beneficial impact. Signs would need to be placed at turnouts throughout the Valley identifying appropriate use (e.g., shuttle bus, Valley Floor Tour, short-term parking); introducing these urban-type elements into the touring experience would have an adverse impact that is negligible in intensity, but would affect most visitors.

Bus Touring

Impacts of sightseeing by shuttle bus, as well as impacts to Valley Floor Tours offered by the concessioner, would be the same as described in Alternative 3 (commercial bus passengers would have to transfer to other touring modes east of Taft Toe), resulting in a major, adverse impact, compared to Alternative 1. Notably, Valley Floor Tours offered by the concessioner would lose the use of two segments of Northside Drive including mid-Valley, and thus access to certain views; however, turnouts would be planned where possible to provide views similar to key Northside Drive views, resulting in a negligible, adverse impact to these users.

Walking and Hiking

More Valley trails away from roads would be available, particularly through the former Upper and Lower River Campgrounds and between Yosemite Lodge and El Capitan crossover on the north side of the river; the experience of trail users would be improved as a result of reduced noise, odors, and glare from passing vehicles. Trails not adjacent to roads, increased use, dispersal and displacement of trail users, new one-way hiking opportunities, and conflicts with other users would be the same as described in Alternative 2. Generally, the same trail segments as described in Alternative 3 would be realigned, potentially affecting a large group of park visitors.

The elimination of private stock use in Yosemite Valley under this alternative would result in a beneficial, moderate impact for the large user-group of hikers and walkers. An impact of this alternative that would be neither adverse nor beneficial would be the potential displacement of day hikers out of the Valley or onto wilderness trails. The following trail segments, among others, would be realigned, potentially affecting a large group of park visitors with negligible to minor, adverse impacts:

- Rerouting the trail walking and hiking segment north of the river at Ahwahnee/Sugar Pine Bridges would result in a slightly different path, loss of traditional views, and the loss of historic elements due to bridge removal.
- Rerouting the multi-use trail across Ahwahnee Bridge, rather than Stoneman Bridge, would lengthen the route between Curry Village and Yosemite Village, with a loss of traditional views and loss of historic elements.
- Removing Housekeeping Bridge would lengthen access to other Valley destinations for Housekeeping Camp guests and would result in the loss of traditional views and the loss of historic elements.
- Removing Superintendent's Bridge would reduce walking trail options in the Yosemite Village area, would move pedestrians wanting a loop trail to the heavily used Sentinel Bridge, and would result in loss of traditional views and loss of historic elements.

Bicycling

Bicycling impacts would be similar to those described for Alternatives 2 and 3 (reduced automobile traffic, but increased bus traffic, potential crowding along multi-use trails, new trails, and increased accident risk due to greater use). Notably, reduction in vehicle noise, smell, and presence would result in a major benefit to bicyclists. Moderate benefits would result from removal of motor vehicles from the area of the multi-use trail through the former Upper and Lower River Campgrounds.

Climbing

The reduction in opportunities for spontaneous access and other aspects of the climbing experience would be similar to Alternative 3. Although changes would not likely reduce climbing on El Capitan, they would adversely affect the experience, resulting in a moderate impact on a moderately sized user group.

Stock Use

Changes in stock trails and facilities, and impacts of those changes, would be essentially the same as under Alternative 2. Notably, compared to Alternative 1, the loss of a complete loop-trip opportunity would result in a moderate, adverse impact. The discontinuance of concession trail rides would be a major, adverse impact to a moderately large group, and the loss of overnight facilities would result in a moderate, adverse impact for a small user group.

Picnicking

The lack of private vehicle access to most picnic sites would result in impacts similar to those described for Alternatives 2 and 3. Similar to Alternative 3, sites at Cathedral Beach near Taft Toe would be expanded, filling a demand for picnicking near the day-visitor parking area and the picnic area at Swinging Bridge would be removed. The Cook's Meadow and North American Wall (at the base of El Capitan) Picnic Areas would provide new opportunities for picnicking in the east and west Valley. Under Alternative 4, new sites with grills and food storage lockers would be developed at Curry Orchard for Curry Village guests and other east Valley users. Together, these would have negligible and neutral impacts to picnickers, compared to Alternative 1. Many picnic areas would be accessible by shuttle bus, and thus be more accessible to those in the Valley without their private vehicles, resulting in a minor, beneficial impact.

River Uses

Changes in raft and kayak access, and resulting impacts, would be the same as under Alternatives 2 and 3. Notably, lack of private vehicle access to locations along the river would require the use of buses, which would result in moderate, adverse impacts to a moderately large group of visitors.

Swimming

Changes in swimming access and availability would be the same as under Alternative 3, resulting in an overall moderate but neutral impact. Swimming would be redirected toward areas able to withstand heavy use, and removal of Housekeeping Bridge would reduce swimming in the area across from Housekeeping Camp.

Fishing

Changes to fishing quality and access to sites would be the same as under Alternatives 2 and 3. Notably, protection of river banks would result in a moderate, beneficial impact for anglers. A moderate, adverse impact would result from decreased river access.

Winter Activities

Changes to winter activities (ice skating and skiing) would be the same as under Alternatives 2 and 3. Increased winter visitation and greater use of the ice rink could result in a negligible, adverse impact compared to that of Alternative 1. Relocation of the ice rink could result in a negligible, beneficial impact.

Photography

Impacts would be the same as described for Alternative 2, except less private vehicle use and an absence of roadside parking east of Taft Toe would result in greater opportunities for photographs without vehicles. This would result in an overall moderate, beneficial impact compared to Alternative 1.

RECREATIONAL ENVIRONMENT

This section covers impacts of Alternative 4 on the overall recreational environment for visitors, including night sky and wilderness experience. Impacts of vehicle-related noise, an important element of the recreational environment, are covered under the Transportation section, and impacts to scenic resources (as viewed by the visitor) are covered under Scenic Resources, and under Wilderness Experience below. Similar to Alternatives 2 and 3, improvements to natural resources under this alternative would provide a more natural appearance to the Valley, a major and beneficial impact for the visitor, relative to Alternative 1.

Night Sky

As described for Alternative 3, the addition of parking at Taft Toe would cause a demand for light in a currently unlit area. (However, the parking area would be smaller than in Alternative 3, resulting in slightly lower light levels.) This action would still have major, adverse impacts compared to Alternative 1.

Changes in the number of lodging units, the rehabilitation of obsolete architectural lighting, and the relocation of facilities would result in minor, beneficial impacts. Under this alternative, impacts at out-of-Valley parking facilities would be similar to those described in Alternative 2; in general such changes would have moderate to major, adverse impacts to these areas.

Wilderness Access and Wilderness Experience

Access to wilderness areas would be facilitated under this alternative, similar to Alternative 2. As described for Alternative 3, wilderness trailheads close to Taft Toe in mid-Valley would see a potential increase in use, while other trails may see less use.

Visual impacts perceived by wilderness visitors would be the same as for Alternatives 2 and 3, although the smaller parking area under this alternative could diminish the obtrusiveness of the Taft Toe facility.

Sound impacts would be minor and adverse, similar to those for Alternatives 2 and 3. Clustering of activities within the Valley would have both beneficial and adverse impacts due to decreased and increased noise levels. Improved access to trailheads would result in a moderate, beneficial impact and increased use of trails would result in a negligible, adverse impact.

VISITOR SERVICES

Camping

Campsite quantity would be appreciably below the present level (441 sites under Alternative 4, compared to 475 sites under Alternative 1, about a 7% decrease). Impacts would be similar to Alternative 3, minor and adverse. Alternative 4 would provide the lowest number of campsites of any alternative, with no new sites at Camp 4 (Sunnyside Campground).

Improvements in campground conditions due to more separation of user types, the redesign of campsites, and riverbank restoration would largely be the same as those for Alternatives 2 and 3. Centralized campground check-in and camper services would be the same as for Alternatives 2 and 3. Notably, campers would receive moderate, beneficial impacts as a result of segregating

camping areas by user type. Moderate, neutral impacts would result from relocating camping areas away from the river, and negligible, neutral impacts would result from relocating the amphitheater.

Lodging

Impacts resulting from reductions in lodging units, accessibility, and actions in individual lodging areas would generally be the same as under Alternative 3. This alternative would provide 982 lodging units, compared to 1,260 units under Alternative 1 (a 22% reduction); this would be a moderate, adverse impact on a large visitor group (25% of summer visitors stay in Valley lodging).

Substantial increases in economy units with private baths would address the high demand for this type of room. Replacing rustic units with economy units would also provide more comfortable and numerous off-season accommodations. Both actions would result in moderate, beneficial impacts for this large visitor group, compared to Alternative 1.

In Yosemite Valley, the ratio of accessible rooms would be greatly improved, giving visitors with disabilities greater access to the kinds of facilities they need, a moderate and beneficial impact on this small to moderately sized user group. New development would include lodging units, parking, and walkways that would incorporate universal design features to improve and provide accessibility to facilities.

Expanding the number of units at Yosemite Lodge (from 245 to 387, or a 58% increase) would place lodging closer to Camp 4 (Sunnyside Campground) and increase the developed character of the Lodge area. This would be a minor, adverse impact to Camp 4 (Sunnyside Campground) campers and Lodge guests, combined, a moderately large group of visitors.

A substantial reduction in the number of units at Housekeeping Camp (from 264 to 52, or 80%) would lead to a much more natural environment, with less overall density. This would have a moderate, beneficial impact to the moderately large group of visitors who choose to use this type of accommodation.

Relocating tent cabins at Curry Village would lead to a more natural environment, with greater privacy and less density. This action would have moderate, beneficial impacts for visitors staying in the remaining cabins, a moderately large group of visitors.

Food and Retail Services

Changes in food and retail services would be substantially the same as those described for Alternative 3. Notably, modifications to the cafeteria at Curry Village would result in a minor, beneficial impact. A negligible, adverse impact would result from discontinued food service in the Happy Isles area. Increases in food facilities and seating at Yosemite Village would result in a moderate, beneficial impact.

C O N C L U S I O N

Alternative 4 would reduce spontaneity of travel to and through Yosemite Valley, similar to Alternatives 2 and 3. Access into Yosemite Valley would be somewhat more cumbersome than

today, with some visitors arriving by car, others by shuttle bus from out-of-Valley parking areas, and still others by commercial and transit buses. Parking in the Valley and at out-of-Valley parking lots would be adequate to meet the needs of day visitors on all but seven days in the summer. With the establishment of a traveler information and traffic management system, visitors would be informed of the status of parking areas at entrance stations and possibly at other sites en route to the park, resulting in a high degree of reliability in the availability of parking. Visitors would not need to search for parking in scattered locations. Once the Taft Toe lot was full, day visitors would be directed to parking at remote lots outside the Valley; these visitors would experience a moderate increase in the time required to travel to the Valley. With a fully developed parking and transit facility at Taft Toe, most visitors would arrive close to principal features and services. Few visitors would be able to walk to destinations in the Valley from Taft Toe. Shuttle services in the Valley would be greatly expanded.

On most days, visitors would find a more tranquil environment, with visitors distributed over a wider area, including the mid-Valley and west Valley. Automobile-based experiences in the Valley would be substantially reduced, while opportunities to experience the Valley without the influence of automobiles would expand. Visitors on foot, bicycle, or horseback would find more places virtually free of motor vehicle traffic, although visitor use of these areas could increase. Opportunities for orientation would be closer to where many visitors seek them, at park entrances and the principal day-visitor parking area, and greater opportunities for participating in interpretive programs in the Valley would be available. Recreation, including touring, would be oriented more toward the shuttle bus system, which would be extended to the west Valley and to out-of-Valley parking facilities, and also to pedestrian and bicycling activities. Opportunities for staying overnight in Yosemite Valley would decrease moderately for camping (to 441 sites, the fewest sites of any alternative) and decrease substantially for lodging (to 982 units, the same as under Alternative 3).

Visitors to Yosemite Valley are varied in their expectations and the individual experiences they seek. Also, the quality of the visitor experience is also dependent on the quality of natural resources, cultural resources, air quality, scenic resources, and other elements of the recreational environment (considered separately in this analysis). Therefore, no determination of a net impact on the visitor experience is attempted here.

CUMULATIVE IMPACTS

Access, Orientation and Interpretation, Recreation, and Recreational Environment

The cumulative impacts described under Alternative 2 for access, orientation and interpretation, recreational opportunities, and recreational environment, would be generally applicable to Alternative 4.

Visitor Services

As described for Alternatives 2 and 3, the January 1997 flood and subsequent cleanup actions resulted in the loss of 265 lodging units and 284 campsites within Yosemite Valley, displacing visitors to campgrounds or lodging elsewhere in the park or in neighboring communities. This alternative would intensify this impact by further reducing lodging units by 278 (the same as

under Alternative 3) and campsites by 34. Proposed new accommodations in the vicinity of the park and campsites outside Yosemite Valley, as described for Alternative 2, could partially alleviate the impact of the reductions. As in Alternative 2, the reductions in lodging in Alternative 4 would continue to adversely affect the many visitors who want to stay in Yosemite Valley. However, the impacts would remain adverse and moderate.

While additional campsites could be provided at the Yosemite Creek and Tamarack Campgrounds and in the region, as described for Alternatives 2 and 3, the use of new regional sites by Yosemite day visitors would not likely be great; thus, the impacts of this alternative on campground users would likely remain adverse and minor.

Transportation

Alternative 4 would provide a 550-space parking facility in the Taft Toe area and about 1,590 spaces in out-of-Valley parking at Badger Pass, South Landing, and El Portal. Similar to Alternatives 2 and 3, this alternative would include a traveler information and traffic management system that would manage access to the Valley. Overnight visitors would continue to have the option of driving to the Valley. Day visitors would travel in private vehicles only to the Taft Toe parking area. When this area was full, day visitors would be directed to out-of-Valley lots and would be able to ride shuttle buses to the transit center at Taft Toe. Few visitors who parked at Taft Toe lot would walk to destinations in the Valley. The Valley shuttle bus system would be expanded, and most visitors would ride shuttle buses to Valley destinations.

CONDITIONS ON STATE HIGHWAYS OUTSIDE YOSEMITE NATIONAL PARK

The impacts of this alternative on state highways outside the park would be the same as those described under Alternative 2.

VISITOR ACCESS TO THE VALLEY

Reconstructing the segment of El Portal Road between Pohono Bridge and the intersection with Big Oak Flat Road would have the same impacts as those described under Alternative 2.

Travel Time

The average time that visitors would spend traveling from entrance stations to the Valley Visitor Center in the peak-season under Alternative 4 would be approximately 63 minutes. This would constitute an increase in Valley access travel time of 21 minutes, as compared to Alternative 1. The resulting short- and long-term impact to travel time would be moderate and adverse to peak-season daily visitors. Table 4-102 presents average travel time to the Valley Visitor Center by corridor; travel times are weighted by access mode and include waiting time at the transit terminal and shuttle bus stops.

Table 4-102 Average Travel Time From Entrance Stations to Valley Visitor Center	
Corridor	Average Weighted Travel Time (min)
North (Highway 120)	64
West (Highway 140)	49
South (Highway 41)	75
Total	63
Difference from Alternative 1	+ 21

Modes of Access

Under Alternative 4 approximately 54% of Valley visitors (72% of day visitors) on typically busy days would access the Valley by transit. The resulting 42% increase in transit access share would constitute a major short- and long-term impact on mode share.

VISITOR CIRCULATION WITHIN THE VALLEY

Traffic Volume and Vehicle Miles Traveled

The Valley roadway network for Alternative 4 would be the same as described for Alternative 3. The main difference between the two alternatives is that the number of parking spaces provided at Taft Toe would be reduced from 1,622 vehicles under Alternative 3 to 550 vehicles under Alternative 4; out-of-Valley shuttle buses would bring many day visitors into the Valley under this alternative. As with the other action alternatives, additional shuttle bus service would encourage travel by alternative travel modes. Overnight guests would be discouraged from driving private vehicles when in the Valley. Providing designated parking, improved signage, and private vehicle management would minimize private vehicle circulation in the Valley. A traveler information and traffic management system would be implemented to assure that vehicles in the east Valley did not exceed the parking supply or capacity of roads. As a result, visitors would not need to circulate in search of parking spaces.

The highest reduction of traffic volume would occur under Alternative 4. This alternative would provide the fewest overnight accommodations; would provide a reduced number of day-visitor parking spaces in the Valley; and would eliminate vehicle trips by day visitors in the east Valley. The day-visitor parking lot would be located at Taft Toe, which would substantially reduce the amount of private vehicle travel within the Valley compared Alternatives 1 and 2. There would be a major long-term beneficial impact with this alternative because daily vehicle miles traveled in the Valley would be reduced by 57% on typically busy days, compared to Alternative 1 (see table 4-103). Bus trips entering the east Valley at Yosemite Chapel would increase by 254 per day.

**Table 4-103
Daily Inbound Vehicle Trips
and Total Vehicle Miles Traveled in the Valley in Summer on Typically Busy Days**

	Inbound Vehicle Trips Passing Yosemite Chapel	Vehicle Miles Traveled
Private Vehicle	1,967	24,941
Bus	331	4,469
Total	2,298	29,410
Percentage Change from Alternative 1		-57%

Modes of Travel

Under Alternative 4, visitors would be allowed to circulate by private automobile west of Taft Toe. However, as with Alternatives 2 and 3, the share of trips within the Valley by transit would be expected to increase substantially. With the exception of west Valley circulation, the only visitor trips made by private vehicle within the Valley would be by overnight visitors either entering or departing the Valley. The resulting impact to Valley visitors is expected to be major in the long term.

Bus Volumes on Roads

Under Alternative 4, bus service would increase in the Valley and shuttle buses would travel from remote parking areas to the transit center at Taft Toe. The planned bus service would result in 4,469 daily bus vehicle miles traveled on Valley roads (see table 4-104) a major increase over Alternative 1.

**Table 4-104
Daily Bus Trips/Vehicle Miles Traveled in the Valley During the Peak Season**

	Round Trips Passing the Chapel	Bus Miles Traveled
Out-of-Valley Shuttle	229	1,099
Valley Shuttle	385	3,215
Commercial Tours	62	155
Total	676	4,469

Level of Service

The Valley road system in Alternative 4 would be modified as described in Alternative 3. Less parking would be provided in Alternative 4 than in Alternative 3 for day visitors near Taft Toe, resulting in less vehicle travel on Valley roads west of El Capitan crossover. As presented in table 4-105, the intersections of Sentinel Drive with Northside Drive and Southside Drive would improve to level of service A during both inbound and outbound peak hours. The level of service on El Portal Road would improve to level of service C during both inbound and outbound peak hours, resulting in a major improvement from level of service E. Traffic operations on Northside Drive also would improve to level of service A in both peak hours compared to level of service E in the outbound peak hours under Alternative 1, a major improvement.

**Table 4-105
Level of Service Summary (Inbound/Outbound)**

Intersections					
	Southside Drive/ Sentinel Road	Northside Drive/ Sentinel Road	Northside Drive/ Camp 6-Village Access	Southside Drive/ Northside Drive	
Alternative 1	C/B	C/E	A/B	B/A	
Alternative 4	A/A	A/A	not an intersection	not an intersection	
Roadway Segments					
	Pohono Bridge	El Capitan Bridge	El Portal Road (between Pohono Bridge and Big Oak Flat Road intersection)	Southside Drive	Northside Drive
Alternative 1	E/E	B/B	E/E	D/C	D/E
Alternative 4	D/C	C/B	C/C	C/C	A/A

The actions under Alternative 4 would create a long-term, major, beneficial impact by improving traffic flow.

C O N C L U S I O N

Under Alternative 4 the average travel time to access the Valley would increase by 29 minutes compared to Alternative 1, which would represent a moderate, long-term, adverse impact to visitors. When the Taft Toe parking area was full, day visitors would be directed to one of three out-of-Valley parking areas and then use shuttle buses to access the Valley. Alternative 4 would be the most effective in reducing vehicle traffic in the Valley. There would be a major decrease in traffic volumes and a major improvement in traffic flow compared to Alternative 1. Traffic volumes on roads would be reduced by 57%. Bus trips entering the east Valley at the Yosemite Chapel would increase by 254 trips per day. Because most buses traveling into the Valley would stop at Taft Toe, the bus vehicle miles traveled for this Alternative would be 4,469 miles per day, still a major increase over Alternative 1. The reduction in traffic congestion at major intersections and roadway segments under Alternative 4 would be the same as under Alternative 3, except there would be a greater improvement in the level of service on El Portal Road and conditions would improve on Pohono Bridge. Overall, there would be a major, long-term, beneficial impact to traffic operations by reducing traffic and improving traffic flow.

C U M U L A T I V E I M P A C T S

The cumulative impacts of Alternative 4 would be the same as those described for Alternative 2.

Noise

V E H I C L E N O I S E

Alternative 4 would change the traffic access to the Valley by implementing out-of-Valley parking in combination with 550 day-visitor parking spaces in the Valley at Taft Toe. The traffic circulation changes and traffic management measures in this alternative would be similar to those in Alternative 3, with the addition of noise impacts at out-of-Valley parking facilities in El Portal, South Landing, and Badger Pass.

Sound Levels

The impacts of this alternative on sound levels associated with vehicles would be similar to those described for Alternative 3 as shown in tables 4-106 and 4-107.

Time of Day	Distance from Centerline of Roadway	Alternative 1 (dBA)	Alternative 4 (dBA)
Inbound Peak Hour	50 feet	61	60
	100 feet	57	57
	200 feet	54	54
	400 feet	51	50
Outbound Peak Hour	50 feet	65	60
	100 feet	62	57
	200 feet	59	54
	400 feet	55	50

Note: These numbers are based on measurements taken between Yosemite Village and Yosemite Lodge on a typically busy day.
dBA = decibel

Time of Day	Distance from Centerline of Roadway	Alternative 1 (dBA)	Alternative 4 (dBA)
Inbound Peak Hour	50 feet	64	65
	100 feet	61	62
	200 feet	57	59
	400 feet	54	55
Outbound Peak Hour	50 feet	63	65
	100 feet	59	62
	200 feet	55	59
	400 feet	52	55

Note: These numbers are based on measurements taken near Yosemite Chapel on a typically busy day.
dBA = decibel

Sound Events

Yosemite Valley

Alternative 4 would have sound impacts similar to Alternative 3, except west of El Capitan crossover, where the introduction of out-of-Valley shuttle buses would increase the sound associated with buses. There would be minor differences from Alternative 3 in the operation of shuttle buses east of El Capitan crossover, but these differences would not change the impact intensity, duration, or type of impact in any location from those of Alternative 3.

West of El Capitan crossover, the noticeable sound events from buses on Northside Drive and Southside Drive would increase from 15 per hour to 35 per hour. The resulting sound impacts would be long-term, major, and adverse.

Out-of-Valley Areas

Very noticeable sound events would increase at the out-of-Valley parking areas as a result of shuttle bus service to and from Yosemite Valley. The number of added sound events during the

peak travel hours on typically busy days would be 10 at El Portal, 10 at Badger Pass, and 20 at South Landing. The impacts from the changes in sound events would be long-term, moderate, and adverse at El Portal and Badger Pass. The impact would be long-term, major, and adverse at South Landing.

Vehicle Noise Conclusion

This alternative would result in sound level reductions throughout most portions of the Valley east of El Capitan crossover. This would result in noticeably lower sound levels along Northside Drive between the Yosemite Lodge and Yosemite Village, a long-term, minor, beneficial impact. Long-term, major, beneficial impacts would occur along sections of Northside Drive that would be closed to vehicle traffic. The introduction of out-of-Valley shuttles would result in an increase in the number of very noticeable sound events west of El Capitan crossover and at out-of-Valley parking areas. The impact would be long-term, major, and adverse in the Valley west of El Capitan crossover. Increases in bus-related sound events would result in long-term, moderate to major, adverse impacts at the out-of-Valley parking areas, with major, adverse impacts occurring at South Landing. Similar to Alternatives 2 and 3, this alternative would result in long-term, major sound reduction benefits along Northside Drive between Yosemite Lodge and El Capitan crossover and between Stoneman Bridge and Yosemite Village.

Cumulative Impacts

The existing shuttle buses are currently being replaced with advanced technology buses that could reduce the intensity of sound events along the shuttle routes. Possible increase in regional transit service by the Yosemite Area Regional Transit System (inter-agency) would possibly cause a larger number of sound events along the same routes. These two actions would have cumulative impacts on sound levels in the Valley similar to those described in Alternative 1 (long-term, beneficial). Alternative 4 would not change the vehicle types or operating characteristics of either the new shuttle buses or the YARTS buses.

NONVEHICLE NOISE

Yosemite Valley

Housing

Housing-related noise impacts would be similar to Alternative 2 (long-term, moderate, beneficial).

National Park Service and Primary Concessioner Operations

The impact of most National Park Service and concession operations would be similar to Alternative 2 (long-term, moderate, beneficial), with the exception of transit operations, which are discussed below.

Transit Center and Day-Visitor Parking

Noise of transit centers and day use parking areas would be similar to Alternative 3, except that the size of the Taft Toe Visitor/Transit Center would be smaller (with less vehicle parking). This

would result in a slight increase in ambient noise levels (compared to the No Action Alternative). However, impacts would be similar to those of Alternative 3 (long-term, moderate, adverse).

Lodging

The impact of lodging-related noise would be similar to Alternative 2 (long-term, moderate, beneficial).

Campgrounds

Campground-related noise would be similar to Alternative 2, except that noise increases at Camp 4 (Sunnyside Campground) would not occur because campground size would remain the same as in Alternative 1. As in Alternative 2, the overall result would be long-term, minor benefits through noise reductions in campgrounds.

Picnic Areas

Noise related to picnic areas would be eliminated at Swinging Bridge Picnic Area. Picnic area-related noise, including sounds associated with social interaction (conversation, laughing, and play), would be introduced at the new picnic areas near El Capitan and Curry Orchard. In sum, a long-term, negligible, adverse impact would be experienced by visitors.

Trails

Impacts of trail-related noise would be the same as under Alternative 2 (long-term, minor, adverse).

Construction Impacts

Construction-related noise impacts would be similar to under Alternative 2, except that activities related to developing transit facilities would be located at Taft Toe. Types of construction noise would be the same. Overall, peak nonvehicle-related noises during construction and deconstruction, would have short-term, major, adverse impacts, affecting both visitors and residents.

Out-of-Valley Areas

El Portal

HOUSING

The types and general locations of housing-related noise would be similar to under Alternative 2, but because of an additional 204 employee beds in El Portal, nonvehicle impacts to ambient noise levels would be greater than under the No Action Alternative, and the highest of the action alternatives. In new housing areas and in amenity sites, such as at Village Center, impacts would be long-term, moderate, and adverse. In existing housing areas, impacts would be long-term, minor, and adverse, affecting primarily residents.

NATIONAL PARK SERVICE AND PRIMARY CONCESSIONER OPERATIONS

Most operations-related noise impacts in El Portal would be similar to Alternative 2 (long-term, moderate, adverse).

OUT-OF-VALLEY PARKING

Noise impacts of the day-visitor parking area would be similar to Alternative 2 (long-term, moderate, adverse).

TRAILS

Trails-related noise impacts would be similar to Alternative 2 (long-term, negligible, adverse).

Wawona

Housing-related noise impacts would be the same as under Alternative 1.

Foresta

Housing- and operations-related noise impacts would be the same as under Alternative 2 (long-term, minor, adverse).

Badger Pass

Out-of-Valley parking – related impacts would be the same as under Alternative 2 (long-term, moderate, adverse).

South Landing

Out-of-Valley parking – related impacts would result in an increase in noise associated with the out-of-Valley parking facility, due to maintenance and visitor activities at the facility. Visitor conversation would represent the most typical nonvehicle noise in this area (60 dB; FICN 1992), and would typically be half as loud as associated vehicle activity. Nonvehicle noise would cause a long-term, moderate, and adverse impact that would be experienced by transit riders. Maintenance activities and associated noise that would be present under Alternative 1 would be displaced, reducing noise levels.

Hazel Green and Henness Ridge

No additional transit or administrative facilities are proposed in these areas. Impacts would be the same as in Alternative 1.

Construction Impacts for Out-of-Valley Locations

Construction-related noises in El Portal and other out-of-Valley locations would include the same types of noises, and with similar effects as described above for Yosemite Valley. During construction, short-term, major, adverse impacts would be experienced by residents and visitors.

Nonvehicle Noise Conclusion

Alternative 4 would be similar to Alternative 1, in that the effects of nonvehicle noise on the human environment would be concentrated primarily around development areas. As in

Alternative 2, Alternative 4 would reduce housing units in Yosemite Valley and result in reductions in ambient noise levels, a moderate benefit. Likewise, increases in housing numbers in El Portal and Foresta would result in minor, adverse impacts. New trails would put typical trail-related noises into new areas, but these impacts would be minor. Reductions in campsite and lodging numbers would result in long-term, moderate and minor, beneficial effects. National Park Service and concession operations in Yosemite Valley would be reduced, but with light maintenance for transit being in the Valley, and with new impacts at Taft Toe, benefits would be minor. Overall, the nonvehicle noises would be reduced in Yosemite Valley, but benefits would be long-term and minor, due to the introduction of adverse impacts into new areas. The greatest increases in noises would be in El Portal, South Landing, and seasonally, Badger Pass, where adverse impacts would be long-term and moderate.

Cumulative Impacts

The projects that would have cumulative impacts would be the same as described in Alternative 2. When considering the overall minor, beneficial impacts of Alternative 4, in combination with the more dominant noises associated with other projects and sources, including vehicles, cumulative impacts of nonvehicle noise in Alternative 4 would remain long-term, minor, and beneficial.

Social and Economic Environments

The social and economic environments, for purposes of this discussion, include characteristics of the affected communities in the region, visitor populations and trends, revenues and expenditures affecting regional economies in connection with employment, visitor expenditures, construction spending, and concessioners and cooperators. Impacts of Alternative 4 on these social and economic environments are discussed below.

LOCAL COMMUNITIES

Potential effects of Alternative 4 on the communities of Yosemite Valley, El Portal, Foresta, Wawona, and Yosemite West are discussed in this section. Factors with the potential to affect the social and economic environments of each of these communities include population, housing location, types and condition of housing, distance of employee commutes from outlying areas, community services, amenities, and infrastructure.

Yosemite Valley

Under this alternative, 588 beds would be removed from Yosemite Valley, as under Alternative 2. Therefore, impacts to the Yosemite Valley social environment would be largely the same as described under Alternative 2.

The proposed relocation of employees from Yosemite Valley to El Portal, including National Park Service and Yosemite Concession Services headquarters and associated employees, would reduce the resident population by almost half, and alter the demographics of the community. Most of the non-management employees moved to El Portal would be year-round employees. Most or all of the employees remaining in Yosemite Valley would be in seasonal positions.

Impacts on social and community services would be as described under Alternative 2, including beneficial impacts to quality of housing and improvements to security, and adverse impacts to the community from increases in commute time, a change in locale of housing, and potential change in school locations.

El Portal

Under this alternative, 588 employees, mostly primary concessioner employees, would be relocated from Yosemite Valley into new housing in El Portal. An additional 259 bed spaces would be constructed to meet the future and currently unmet demand for employee housing. Therefore, an additional 80 El Portal residents currently living at the Trailer Village, Arch Rock, or Cascades, would be relocated into new housing facilities in El Portal. The total net increase in El Portal's residential employee population is projected to be 847 (588 plus 259).

The park's current primary concessioner, Yosemite Concession Services, provided the primary source of employee demographic information. No similar information was available from the other park concessioners or the National Park Service. Nearly 95% of the new housing in El Portal would be occupied by primary concessioner employees; therefore, Yosemite Concession Services employee demographic information has been used to project the demographics for all future park employees who would be housed in El Portal under this alternative.

Based on current demographics of the park employee population, it is estimated that approximately 20% of the permanent employee population would be married. In addition, Yosemite Concession Services staff estimate that approximately 15% of employee spouses are not employed within the park. Therefore under this alternative, an additional 25 spouses are expected to relocate to El Portal ($847 \times 20\% \times 15\% = 26$). Of these 25 spouses, approximately 18 would be relocated from the Valley, and 7 would be married to new employees.

It is estimated that under this alternative, 62 managerial personnel currently living in managerial housing would be relocated from the Valley to El Portal, while 28 would remain in Yosemite Valley. Yosemite Concession Services current managerial population is approximately 210 employees. While a proportion of these staff live outside the park, many managerial staff currently live in non-managerial housing accommodations within the Valley. Yosemite Concession Services managerial staff have an estimated 80 children. Approximately 55 children are expected to be relocated. Of the 259 future new employees, 31 are projected to be managerial staff. Based on current employee demographics, these staff would bring an additional 12 children to El Portal.

Including relocated employees, new employees, spouses, and children, the total increase in El Portal's residential population under this alternative is projected to be 939 ($847 + 25 + 55 + 12$). Approximately 10% of the employees housed in El Portal would be seasonal employees. Therefore, the population in winter would be approximately 845 ($939 \times 90\%$).

The National Park Service estimates that the current summer population of El Portal (from the park boundary to the confluence of the South Fork of the Merced River) is approximately 3,000, and the current winter population is approximately 760. Under this alternative, changes in employee housing would result in about a 31% increase in El Portal's summer population, and a

111% increase in the winter population. Both would cause long-term, major, adverse impacts on El Portal's population, although it is expected that this projected future growth would occur gradually.

This alternative also would increase the number of residents and jobs in the El Portal area and commuters to Yosemite Valley along Highway 140. These impacts and those related to out-of-Valley parking would be the same as described under Alternative 2.

Wawona

The Wawona social environment would not be affected by actions in this alternative and impacts would be the same as described for Alternative 1. The number of employees living in Wawona would not change, and employee travel along the South Entrance Road would not be impacted.

Foresta

This alternative proposes reconstruction of the 14 National Park Service houses that were lost in the A-Rock Fire, and placement of the National Park Service and concessioner stables at McCauley Ranch, for this reason impacts would be long-term minor adverse or the same as described for Alternative 3.

Cascades and Arch Rock

Impacts to the Cascades and Arch Rock communities are expected to be the same as described under Alternative 2, resulting in a long-term, minor, adverse impact.

Yosemite West

This alternative would have long-term minor adverse impacts on the social environment in Yosemite West. The same as described in Alternative 2.

Services and Infrastructure

Schools and Child Care

Impacts to local services and infrastructure under this alternative are expected to be the same as those described under Alternative 2, with the exceptions noted below.

Approximately 55 children of concession employees would be relocated from Yosemite Valley to El Portal. In addition, 12 children are expected to be added to the local population from future growth in managerial staff at the park. This is not expected to change the duration, intensity, or type of impact on local schools and child care facilities. These additional students would not increase demand or impact school bus operations.

Law Enforcement

Relocation of concession employees is expected to increase law enforcement requirements in El Portal. Based on the population shift from Yosemite Valley and future employee growth, it is estimated that approximately 62 arrests could occur in El Portal that would otherwise have been expected to occur within the Valley. Also, the addition of 259 new employees would be expected

to add approximately 27 additional arrests a year. This would have a long-term, moderate, adverse impact to law enforcement services. However, these projections do not consider the beneficial effects that improvements to employee living conditions and the quality of concession employees (attracted by the improved housing) may have in reducing future law enforcement incidents and arrests necessary in El Portal and throughout the park.

The proposed out-of-Valley parking lot in El Portal would be the same as that proposed under Alternative 2, and its impacts on county law enforcement are projected to be the same as described under Alternative 2. Mariposa County law enforcement's role in the future would be the same as described under Alternative 2.

Other Services

Although there could be a minor increase in the fire incidence rate, the impact to fire protection services provided by Mariposa County to the El Portal area would be the same as described under Alternative 2.

Under this alternative, the Yosemite Valley Medical Clinic would remain in the Valley, and the impacts to the National Park Service Emergency Medical Services staff and county ambulance services would be the same as described under Alternative 3.

Effects on public services under this alternative, including utilities, waste collection, and community facilities, would be the same as those described under Alternative 2.

Local Communities Conclusion

Impacts to Yosemite Valley would be as described under Alternative 2. Impacts to El Portal would be as described under Alternative 2, except as described below.

Changes in the employee population residing in El Portal would result in about a 31% increase in El Portal's summer population and a 111% increase in the winter population. Both would cause long-term, major, adverse impacts on El Portal's social environment, although it is expected that this projected future growth would be gradual. Resulting impacts on the El Portal community would depend on expansion of community services and infrastructure to meet the community needs. Impacts on county ambulance services would be the same as described for Alternative 3. Impacts on the social environment of Foresta would be the same as Alternative 3. Impacts on the social environment of Yosemite West would be the same as Alternative 2. There would be no impacts to the social environment of Wawona under this alternative.

CUMULATIVE IMPACTS

The potential cumulative impacts resulting from actions in this alternative are the same as those described under Alternative 2.

VISITOR POPULATION

Day Visitors

Under this alternative, it is projected that on the busiest days in the summer, up to 13,077 day visitors could be accommodated by the proposed parking and transit facilities. This level of

visitation exceeds the 1998 summer season daily visitation, which averaged 10,950 visitors. As discussed in Appendix J, 1998 visitation has been used as the baseline condition for the impact analysis. In addition, for purposes of the analysis, it has also been assumed that future Yosemite visitor demand would not change. This is a conservative assumption that recognizes the uncertainties of future visitation. As a result, under this alternative, no change in future day visitation is projected. Considerable additional day visitor capacity would exist, and future day visitation growth could be accommodated if future visitor demand increases.

Currently, park visitation peaks on weekends during the summer. As a result, it may be possible that during the busiest peak days, the proposed parking and transit facilities would be unable to accommodate all the visitors that otherwise may have entered the park under Alternative 1. In this case, some visitors may be displaced from accessing the parking during typically busy days. However, the adverse impact could be mitigated by existing and future traveler information and traffic management systems. These systems could forewarn potential visitors when day-visitor parking is approaching capacity, and encourage and direct visitors to visit during nonpeak periods. In this case, no net reduction in total visitation would occur since peak-period visitation would theoretically be shifted to less busy days (i.e., weekdays).

Overnight Visitors

Lodging

The lodging changes proposed under this alternative would be the same as those under Alternative 3. As a result, the impacts on park visitors lodging overnight in the valley would be the same as described under Alternative 3: long term, minor, and adverse.

Camping

Under this alternative, 34 campsites would be eliminated, leaving a total of 441 campsites within Yosemite Valley, approximately a 9% decrease from the current 475 Valley campsites. Based on pre-flood visitor demand for Valley campsites, it is estimated that the lost campsites would have an average occupancy rate of nearly 95% for operations between mid-April and mid-October. Accordingly, approximately 5,800 overnight campsite stays would be lost, displacing 23,200 visitors from camping overnight within the Valley annually (assuming an average of four overnight visitors per campsite). This would represent a long-term, major, adverse impact.

Table 4-108 summarizes the overnight visitation changes expected under this alternative. A minor net decrease in overnight park visitation is projected, despite a major net reduction in the park's overnight accommodations of 312 units (based on a net lodging capacity decrease of 279 units and camping capacity decrease of 34 sites). The combined impact of the proposed lodging and campsite changes is estimated to be a net increase in 15,800 room-nights annually. This represents a gain of 24,600 overnight visitor stays within Yosemite Valley annually, which equates to a 1.3% increase from 1998 overnight visitation. This represents a long-term, minor beneficial impact on overnight park visitation.

Table 4-108 Estimated Potential Overnight Visitation Impacts			
Lodging	Change in Capacity	Projected Change in Room-Nights	Projected Change in Visitor Overnight Stays
Yosemite Lodge	142	47,400	151,200
Curry Village	(208)	200	600
Housekeeping	(212)	(26,000)	(104,000)
Camping	(34)	(5,800)	(23,200)
Total	(312)	15,800	24,600

Note: These are conservative future estimates of overnight visitation demand because they are based on the pre-flood demand for in-park lodging. As a result, they do not assume any visitor demand increases from factors such as reduced vehicle congestion, natural resources restoration, improved lodging facilities, or population growth.

Note: Apparent inconsistencies in the table are a result of replacing seasonal units with year-round units.

Minority and Low-Income Visitors/Environmental Justice

Impacts on minority and low-income populations would be as described under Alternative 2.

Visitor Population Conclusion

Under this alternative, Yosemite Valley's lodging and camping capacity is proposed to decrease by 312 lodging units and camping sites. Due to the increase in the Valley's nonpeak lodging capacity, an annual net increase of 15,800 visitor overnight stays is projected. This is equivalent to a 1.3% increase to 1998 overnight visitation, which represents a long-term, minor, beneficial impact. Due to the limitations of available data and the potential influence of other factors, impacts to day visitors are indeterminable. Furthermore, low-income and minority visitors are not expected to be disproportionately affected by any visitor impacts.

REGIONAL ECONOMIES

Visitor Spending

No changes in Yosemite visitor spending behavior are projected, since this alternative proposes no changes that would alter the type of goods and services available to visitors. Furthermore, no change in the character of the park visitor population is expected. Therefore, visitor spending patterns and estimates based primarily on the 1998 Yosemite Area Transportation System (inter-agency) survey have been used to estimate future visitor spending behavior.

The primary effects on visitor spending within the region would be related to changes in park visitor population projected under this alternative. As discussed in the previous sections, the decrease in overnight visitation within the park is the only quantifiable impact on park visitation associated with this alternative. It is projected that approximately 24,600 overnight visitor stays would be added under this alternative.

It is possible that these additional park over-nighters could be attracted away from lodging in the region outside the park. If these vacated rooms are not occupied by new visitors or day visitors, relocation of these overnight guests from lodging outside the park into the Valley would have no net economic effect on the region's economy, because no new spending would be attracted into the area. However, given the high demand for lodging in the region (especially during the peak season), it is expected that some day visitors would likely choose to stay overnight in the region. As a result, the net economic impact on the regional economy from the additional overnight stays

would be the net increase in daily visitor spending of \$35.76 per capita (\$61.30 – \$25.54, the difference between overnight visitor spending and day-visitor spending) multiplied by the increased overnight visitation (24,600), which would equate to approximately \$0.9 million in visitor spending. This represents a long-term, negligible, beneficial impact to Yosemite visitor spending.

This is a conservative estimate of the beneficial spending impact on the county economy. The additional lodging capacity proposed under this alternative would still be lower than the Valley’s pre-flood levels; therefore, it might be expected that increasing the Valley lodging capacity would bring back overnight visitors to the park who otherwise would remain displaced by the 1997 flood. The analysis has conservatively assumed that the additional overnight visitors would be gained from current day visitors; therefore, no net change in park visitation is expected. However, if new park visitors were instead attracted to stay overnight in the park, there would be an even greater growth in visitor spending.

There would also be potential for future growth in day visitation under this alternative. It is estimated that an additional 66,000 day visitors per month could be accommodated during weekdays in July and August in the Valley. In addition to visitor spending growth based on increased park visitation, the region could also increase visitor spending by encouraging more of the existing park visitors to stay longer or to stay overnight in the region. Increased length of stay would increase visitor spending, which would have a beneficial impact on the region’s economy.

The proposed changes to the Valley’s overnight lodging facilities is projected to increase the future overall overnight visitation within the Valley. This would have a long-term, negligible, beneficial impact on Yosemite visitor spending by increasing the number of visitors (and hence visitor spending) that can be accommodated overnight in the Valley each year.

Table 4-109 presents the estimated visitor spending impacts of lodging facility changes proposed under this alternative. Estimated impacts of this alternative on Yosemite visitor spending would not exceed 1% in any of the five counties within the Yosemite region. This represents a long-term, negligible, beneficial impact. Overall, Yosemite visitor spending within the five-county Yosemite region is expected to increase by about 0.4%, representing a long-term, negligible, beneficial impact on Yosemite visitor spending.

County	Estimated Total Yosemite Visitor Spending (\$millions/yr)	Estimated Impact on Spending (\$millions/yr)	Impact on Spending as a Percentage of Total Yosemite Visitor Spending
Madera	\$38.1	\$0.04	0.1%
Mariposa	\$143.4	\$0.75	0.5%
Merced	\$4.8	\$0.01	0.3%
Mono	\$30.8	\$0.03	0.1%
Tuolumne	\$22.2	\$0.06	0.3%
All	\$239.3	\$0.9	0.4%

Note: All monetary figures are in 1998 constant dollars.

Table 4-110 shows the county-specific output and employment impacts of the changes in Yosemite visitor spending expected under this alternative. The expected change in overnight

capacity and associated visitor spending under this alternative would cause total regional output to increase by approximately \$1.4 million dollars annually. Much of this change would be driven by an approximately \$1.1 million increase in the annual output of Mariposa County. The portion of this spending increase expected to occur in the county's lodging sector would result in an increase of approximately \$43,000, or 0.9%, in the county's recent average annual hotel occupancy tax revenues, a long-term, negligible, beneficial impact.

Table 4-110 further indicates that impacts to employment in Madera, Merced, Mono, and Tuolumne Counties would be negligible. Mariposa County would experience an increase of about 22 jobs, an approximate 0.3% increase in recent countywide employment. This represents a long-term, negligible, beneficial impact to Mariposa County.

County	Estimated Impact on Spending (\$million/yr)	Estimated Spending-Associated Impact on Annual Output (\$million/yr)	Estimated Spending-Associated Impact on Annual Employment (FTE)
Madera	\$0.04	\$0.07	1.5
Mariposa	\$0.75	\$1.13	22.1
Merced	\$0.01	\$0.02	0.4
Mono	\$0.03	\$0.04	0.9
Tuolumne	\$0.06	\$0.10	2.2
All	\$0.9	\$1.36	27.2

Note: All monetary figures are in 1998 constant dollars. Totals may not add up exactly due to rounding.
FTE= Full Time Equivalents

Construction Spending and Employment

Construction proposed under this alternative would total \$441.7 million in 2000 dollars. In 1998 dollars, this cost corresponds to approximately \$416 million. The development cost estimate includes approximately \$21.4 million for a bus fleet in 1998 dollars. This spending is expected to occur outside the affected region. In addition, a considerable portion of the other construction spending will also occur outside of the affected region. As a result, it is estimated that the total expected construction spending within the five-county affected region would be approximately \$255.7 million. Table 4-111 presents the expected average annual construction spending within the five-county affected region by five-year phase. The table also shows the total regional output and employment impacts expected to result from those expenditures.

During the first five-year phase of project implementation, project construction spending would generate an estimated \$32.2 million of additional output per year in the five-county region's construction sector. This is equivalent to a 4.5% increase over recent regional construction-sector output, and represents a short-term, moderate, beneficial impact. During the same period, project construction spending would increase total annual industrial output (direct and secondary) in the region by approximately \$46 million in 1998 dollars (including construction- and nonconstruction sector output). This is equivalent to a 0.36% increase over recent regional industrial output, and represents a short-term, negligible, beneficial impact.

Table 4-111 also shows that during the first five-year phase of project implementation, project construction spending would generate an estimated 373 full time equivalent jobs in the region's

construction sector. This is equivalent to an almost 4.1% increase in recent regional construction-sector employment and represents a short-term, moderate, beneficial impact. During the same period, project construction spending would cause the region's total employment (direct and secondary) to increase by an estimated 573 jobs (including construction- and nonconstruction-sector jobs). This translates to a 0.35% increase in total employment in the region, and represents a short-term, negligible, beneficial impact.

Table 4-111
Estimated Average Annual Construction Spending and Associated Output/Employment Impacts

Period (Years)	Average Annual Construction Spending (\$million/yr)	Direct Construction Sector Output Impacts (\$million/yr)	Total Construction Spending-Associated Output Impacts ¹ (\$million/yr)	Direct Construction Sector Employment Impacts (FTE)	Total Construction Spending-Associated Employment Impacts ² (FTE)
1-5	32.2	32.2	46.0	373	573
6-10	15.7	15.7	22.5	182	307
11-15	3.3	3.3	4.6	38	63
Total	255.7	255.7	365.4		

Note: All monetary figures are in 1998 constant dollars. Totals may not add up exactly due to rounding.

1. Impacts include both direct and indirect spending-related impacts. Cost estimates exclude estimated engineering/planning costs.

2. Total impacts include both direct and indirect spending-related impacts. Employment Impacts expressed in terms of Full Time Equivalents (FTE).

Estimated average annual construction spending for this alternative, and associated output and employment impacts within Mariposa County, are shown in table 4-112. During the first five-year phase of project implementation, project construction spending would generate an estimated \$7.7 million of output per year in Mariposa County's construction sector. This is equivalent to an increase of approximately 20% over recent output in that sector, and represents a short-term, major, beneficial impact. During the same period, project construction spending would cause total annual industrial output (direct and secondary) in the county to increase by approximately \$10.1 million in 1998 dollars. This is equivalent to a 2.0% increase in the county's total industrial output, and represents a short-term, minor, beneficial impact.

Table 4-112 also shows that during the first five-year phase of project implementation, project construction spending would generate an estimated 84 full-time-equivalent jobs in Mariposa County's construction sector. This is equivalent to an almost 18% increase in recent employment in that sector, and represents a short-term, major, beneficial impact. During the same period, project construction spending in the county would cause the county's total employment (direct and secondary) to increase by an estimated 128 jobs. This translates to about a 1.6% increase in total employment in the county, and represents a short-term, minor, beneficial impact.

Output and employment generated would decrease by over 50% during the second five-year construction phase, and 90% during the final five-year construction phase, when compared to the first five-year construction phase. All regional output and employment impacts would end after 15 years.

**Table 4-112
Estimated Average Annual Construction Spending/Associated Output and Potential Employment Impacts (Mariposa County)**

Period (Years)	Average Annual Construction Spending ¹ (\$million/yr)	Direct Construction Sector Output Impacts (\$million/yr)	Total Construction Spending-Associated Output Impacts ¹ (\$million/yr)	Direct Construction Sector Employment Impacts (FTE)	Total Construction Spending-Associated Employment Impacts ² (FTE)
1 - 5	7.0	7.0	10.1	84	128
6 - 10	3.4	3.4	4.9	41	63
11 - 15	0.7	0.7	1.0	9	13
Total	55.7	55.7	80.1		

Note: All monetary figures are in 1998 constant dollars. Totals may not add up exactly due to rounding.
 1. Impacts include both direct and indirect spending-related impacts. Cost estimates exclude estimated engineering/planning costs.
 2. Total impacts include both direct and indirect spending-related impacts. Employment impacts expressed in terms of Full-Time-Equivalents (FTE).

Following implementation of projects proposed under Alternative 4, it is anticipated that approximately \$17.0 million (1998 dollars) a year would be permanently spent within the affected region to operate and maintain the park's new in-Valley visitor transit shuttle system, to meet the staffing requirements of expanded park visitor facilities and employee housing, and to pay for additional operations and maintenance expenses incurred by the concessioner on project-associated new visitor and employee housing facilities. Table 4-113 indicates that this spending would generate about \$25.8 million of output per year and 412 jobs within the affected region. This represents a long-term, negligible, beneficial impact on the region's economy.

**Table 4-113
Estimated Average Annual Park and In-Valley Transit System Operations Spending (1998 Dollars)**

County(s) (In Park)	Annual Park and Transit System Spending ¹ (\$ million/yr)	Total Operation Spending-Associated Output Impacts ² (\$million/yr)	Additional National Park Service Employees (FTE)	Total Operation Spending-Associated Employment Impacts ³ (FTE)
Mariposa	\$7.1	\$11.8	127	231
Yosemite Region	\$17.0	\$25.8	127	412

Note: All monetary figures are in 1998 constant dollars. Totals may not add up exactly due to rounding.
 1. Spending in Mariposa County calculated as the sum of estimated increased project-associated National Park Service operating costs and estimated spending on in-Valley component of transit operations.
 2. Includes direct and secondary output (includes new National Park Service employee spending).
 3. Includes direct and secondary employment (includes new National Park Service employee spending).

The table also indicates that new park-operations-related spending is anticipated to generate \$11.8 million in additional output per year within Mariposa County. This would represent a 2.3% increase over recent county output, a long-term, minor, beneficial impact to the county's economy. Furthermore, park-operations-related employment is expected to increase employment in Mariposa County by 231 jobs (including 127 National Park Service positions), a 2.8% increase over recent county employment levels. This represents a long-term, moderate, beneficial impact to the county's economy.

Other Revenues

Detailed analysis on the retail spending habits of National Park Service and Yosemite Concession Services employees is unavailable; therefore, the quantitative extent of retail trade resulting from

employees living in Yosemite Valley, Wawona, or at the El Portal Administrative Site is not known. However, it is known that many employees do rely on local stores for groceries and other items. It is not known where other trade occurs. Experience indicates that it is likely that employees living in the Valley or El Portal travel either south or west along Highways 140 or 41 to the communities of Mariposa, Oakhurst, Merced, or Fresno to purchase supplies they cannot obtain in the park. Although it is not possible to quantitatively assess how this alternative would affect retail and sales revenues in Mariposa County, some qualitative assessments can be made.

No changes to employees' income are expected to be associated with relocations (except for the additional income from the housing incentives), and no changes in employee spending behavior are expected. However, Mariposa County's economy may experience long-term, minor benefits if: (1) relocated employees shift some of their spending to Mariposa and Merced from Oakhurst and Fresno, (2) there is net growth in the park employee population, and (3) employee spending increases as a result of increased income from housing incentives.

Under this alternative, approximately 966 park employees (including relocated park employees, new employees, and family members) would be relocated from the Valley to El Portal. Although retail facilities in El Portal are limited, most of the relocated employees would continue to work within the Valley and would likely purchase goods there. Employees relocated to El Portal would also be approximately 30 minutes closer to Mariposa and Merced and approximately the same distance from Oakhurst and Fresno. As a result, relocated employees would have comparable access to spending opportunities and may be expected to shift some of their spending to Mariposa. While the magnitude of any such changes in employee spending cannot be estimated, the impacts to Mariposa and Madera Counties are expected to be long-term, negligible, and beneficial.

Under this alternative, additional housing for 254 new park employees would likely increase spending incrementally. In addition, housing for 24 new employees not currently living in the Valley would be developed at Wawona. Spending by these additional park employees, for the most part, would represent new spending income for Mariposa County (although because many would be seasonal employees, the spending benefits to the county would be limited). The primary direct benefit to the county's economy would be from additional sales tax revenues from this employee spending.

The potential financial impacts on Mariposa's economy from the proposed housing changes at Wawona would be negligible. The local spending and tax impacts (such as local sales and real estate taxes) would have a negligible beneficial impact on Mariposa's economy and the tax impacts associated with the relocated housing are expected to be negligible.

Spending by these additional park employees would mostly represent new spending income for Mariposa County (although many would be seasonal employees, so the spending benefits to the county would be limited). The primary direct benefit to the county's economy would be from additional sales tax revenues from this employee spending.

Mariposa County currently assesses a 1.25% tax on all retail and restaurant sales within the county (including the majority of concessioner sales within Yosemite National Park). The average concessioner employee's wages are low, and it is estimated that the annual earnings of the

new additional employees would be approximately \$3.7 million. Of these wages, only a small proportion would be available for purchasing taxable goods and services. For example, if 10% of total gross income was spent on purchasing goods within Mariposa County, the sales tax revenues would be approximately \$4,600, which would have a long-term, negligible, beneficial impact on the county's economy.

The primary concessioner would be expected to pay a total of \$500,000 in housing incentives annually for employees relocating out of the Valley to El Portal. This additional spending also would have a long-term, negligible, beneficial impact on the county's economy.

Overall, the future change in local sales tax revenues is projected to be negligible, because no significant change in local spending by park employees is expected as a result of this alternative.

Mariposa County does not individually tax employees of the park's primary concessioner for possessory interest. Instead, the county assesses Yosemite Concession Services operations annually to determine its possessory tax payment owed to the county. If Yosemite Concession Services' financial situation is impacted adversely by this alternative, then its possessory tax payments to the county are expected to decrease. However, the magnitude of Yosemite Concession Services current possessory tax payments to the county is proprietary information, and the county would not project the magnitude of the likely change to its revenues under this alternative. It is possible, though, that long-term, major, adverse impacts to the county's tax revenues could occur if Yosemite Concession Services operations are significantly affected.

No change in housing demand from park employees currently living in privately owned housing is expected as a result of this alternative. The new employee housing in El Portal and Wawona is planned to primarily accommodate permanent hourly workers who otherwise would be housed in the tent cabins within the Valley. These employees are not likely to be able to afford unsubsidized housing. Any increase in private housing demand would be associated with the small population of middle and upper management Yosemite Concession Services employees. It is expected that only the 90 managerial concessioner employees currently living in the Valley would be able to consider purchasing a home locally. Relocation of Yosemite Concession Services headquarters would reduce the commute time for any concession office staff living in privately owned housing in Mariposa.

Even if a number of concession employees purchase private homes as a result of the proposed employee housing changes, there would only be a net increase in the county's real estate tax revenues if house prices had risen since the property was purchased previously. According to local real estate agents, after a period of appreciation in local home values during the early and mid-1980s, local house prices have not changed much over the last 10 years. As a result, the net tax revenue impact to the county from any house sales would be long-term, negligible, and beneficial.

Regional Economies Conclusion

Economic impacts of this alternative on the affected environment would result primarily from project construction spending. During the first five years of development, \$32.2 million in annual spending would expand the regional economy by approximately \$46 million of output. This would represent a short-term, negligible, beneficial impact. In Mariposa County, however, the

estimated \$10.1 million project-related increase in annual output during the project's first five years of implementation would have a short-term, minor, beneficial impact on the county's overall economy. In addition, during the first five years of development, it is estimated that approximately 573 total jobs would be generated in the affected region. This represents a short-term, negligible, beneficial impact on regional employment. In Mariposa County, however, the estimated 128 jobs generated directly and secondarily by project spending would have a short-term, minor, beneficial impact on that county's employment.

Impacts on employment would occur as new jobs are created from construction spending and visitor spending. Assuming the unemployed labor force in the Yosemite region would fill the majority of these new jobs, unemployment rates would drop significantly under this alternative. This would represent a short-term, major, beneficial impact on the region's economy. Housing impacts would be negligible, based on the assumption that new jobs would be filled by existing residents of the Yosemite region.

Redevelopment of the park's lodging and campsite facilities also would impact the regional economy by changing visitor spending in the region. Completion of these visitor facility changes is expected to occur 10 years after the start of project construction. During this 10-year period, park overnight lodging capacity would not be allowed to fall below current levels. Once full build-out is completed, it is estimated that annual visitor spending would increase by about \$1.4 million in 1998 dollars. The economic impacts on the surrounding county economies would be long-term, negligible, and beneficial. Mariposa County, however, would experience a long-term, minor, beneficial impact to its annual output and employment base.

Regardless of regional efforts to attract Yosemite day visitors following implementation of Alternative 4, it is expected that the negligible, beneficial impacts to the regional economy associated with Yosemite visitors would be more than offset by increased regional output and employment from expanded National Park Service operations and the park's new visitor transit system.

The overall economic impacts of the changes from visitor spending and operational spending to the regional economy would be long-term, negligible, and beneficial. This impact would result primarily from the long-term, negligible, beneficial impact associated with the employment effects from the increased park operations.

For Mariposa County, the overall economic impacts of the changes from visitor spending and operational spending change would be long-term, minor, and beneficial. This overall impact would result from the combined effect of the moderate, beneficial impact to the county from increased park operations, and the minor, beneficial impact from expected overnight park visitor spending increases.

Cumulative Impacts

Although none of the projects identified in Appendix H would be expected to attract additional visitors to the park, these projects would be expected to change the lodging patterns of the visitor population. As described under Alternative 1, the new lodging units identified in Appendix H would be expected to accommodate approximately 525,500 overnight stays per year, and these

stays would be filled by park visitors who would otherwise have been day visitors. Combined with the net increase of 24,600 stays described above, the cumulative impact would be an increase of approximately 550,100 overnight stays per year.

Visitor Spending

In addition to the increase in overnight visitation to the Valley under this alternative there would also be an increase in lodging capacity in the region from the projects identified in Appendix H. As described under Alternative 1, the projects in Appendix H would generate approximately \$18.8 million in direct annual visitor spending in the region. Thus, the total annual change in visitor spending would be approximately \$19.7 million under this alternative.² This represents a long-term, moderate, beneficial impact on the regional economy.

Secondary impacts generated by \$19.7 million in additional visitor spending would be estimated at \$10.5 million. At full build-out, therefore, the total estimated spending-associated impact on annual output under this alternative would be approximately \$30.2 million, a long-term, moderate, beneficial impact on the regional economy. If new visitors are attracted to the region by the increase in lodging capacity, visitor spending would be higher, and the impact would be greater.

Construction Spending

Local construction spending from the projects identified in the cumulative impact scenario is estimated to average \$255.0 million annually. Under this alternative, an additional \$17.0 million per year in local construction spending would occur on average from the proposed renovation of campsites, and the development and relocation of housing, parking, and other structures. Total construction spending on the projects under this alternative and outlined in Appendix H, therefore, would be approximately \$282.2 million per year.

Additional construction spending would generate secondary output impacts as a result of local spending on material inputs and wage spending by project labor. For annual construction spending of \$282.2 million, secondary impacts would be estimated at approximately \$121.1 million. The total change in annual output (direct and secondary) would therefore be \$403.3 million; a short-term, major, beneficial impact on overall industrial output in the region. Of this increase, approximately 87% is associated with housing construction in Merced County.

New park-operations-related spending is expected to generate an additional \$25.8 million in output per year in the Yosemite region.

Employment

The equivalent of up to 641 jobs would be created from the increase in visitor spending in the region.³ In addition, the equivalent of approximately 2,900 to 9,100 full-time jobs would be

² Assuming the proposed changes in Alternative 4 would cause overnight visitor spending to increase by \$0.9 million when all lodging and camping construction/removal is complete.

³ Assuming the proposed action in Alternative 4 would cause the number of jobs created by visitor spending to decrease by 27 Full Time Equivalents when all lodging and camping construction/removal is complete.

supported each year from construction spending under this alternative and projects described in Appendix H, depending on the phase of construction. An additional 412 jobs would be generated by new park-operations-related spending. Much of the general labor and raw materials would probably come from local sources. Unemployed labor (i.e., the available workforce) in the surrounding region (22,180) would considerably outnumber the projected number of new jobs created from construction and visitor spending. A labor shortage is not anticipated because of the large number of unemployed workers in the region. However, employment needs could also be met by residents of counties outside the affected region, such as Fresno, particularly for the large construction projects in Merced County, such as the proposed housing development and University of California campus development. In such a case, the economic benefits identified would instead be gained outside the region.

As discussed under Alternative 1, several other projects would create temporary and full-time employment opportunities within the region in the reasonably foreseeable future. Because the local workforce is expected to fill the new employment opportunities, no significant influx of workers is expected. Therefore, no new housing is projected to be needed to accommodate employment impacts from this alternative, or from projects described in Appendix H.

Overall, impacts on employment would occur as new jobs are created from visitor spending, construction spending, and operations spending. Assuming the unemployed labor force in the Yosemite region would fill the majority of these new jobs, unemployment rates would drop under this alternative. This would represent a short-term, major, beneficial impact on the region's economy. Under the assumption that new jobs would be filled by existing residents of the Yosemite region, there would be no impacts on housing in the region.

CONCESSIONERS AND COOPERATORS

Yosemite Concession Services

The changes to park facilities and operations proposed under this alternative would affect both Yosemite Concession Services operations and its finances. The National Park Service planning staff used detailed information provided by the current concessioner to analyze existing concession operations and the proposed alternatives to estimate future operational and financial impacts on concession operations within the park. The impact analysis assumes that there would be no change in park visitation and visitor spending behavior, to make conservative projections of the concessioner's future operational and financial conditions.

- It is expected that the majority of in-Valley housing would be for seasonal employees. The reduced number of housing units that would remain in Yosemite Valley would have an adverse impact on future concession operations because there would be insufficient housing for a full shift of employees to be based in the Valley. In-Valley employee housing should be sufficient to provide housing for approximately 72% of employees necessary to staff concession operations for one shift. As a result, the concessioner's ability to meet visitor service needs under circumstances such as road closures or other commuting difficulties (such as fire or flood conditions preventing employees from commuting in and

out of the Valley) would be reduced. This would represent a long-term, minor, and adverse impact on the concessioner's future operations.

- It is expected that future out-of-Valley employee housing would be occupied predominantly by year-round employees. These employees also would be required to commute into the Valley using an employee transit system. However, from a visitor service perspective, year-round employees should ideally remain close to the work site for maximum guest service benefit and operational needs. As a result, the concessioner's ability to meet visitor service demand would be reduced, because its best and most reliable employees would be housed in El Portal.
- It is expected that several adverse impacts could remain after proposed employee housing changes were implemented under this alternative. The concessioner's ability to recruit qualified and experienced management may continue to be constrained by the limited availability of housing for management personnel. Because a major proportion of the employee housing would be relocated to El Portal, one of the concessioner's greatest recruiting attractions would be reduced: namely, enabling employees to live, work, and recreate in Yosemite Valley. However, future housing designs would attempt to accommodate future employee housing needs. Furthermore, the quality of all new replacement housing would be improved compared to the current housing facilities. The combined impact of these factors would be expected to have a long-term, minor, adverse impact on the concessioner operations.
- Relocation of the National Park Service and concessioner stables to McCauley Ranch would eliminate the commercial horseback riding service to visitors beginning trips in the Valley. Under this alternative, packhorses would be moved by trailer in and out of the Valley daily to continue support service for the high country camps. This would represent a long-term, minor, adverse impact on the concessioner's future operations.
- Relocation of the Village Garage to El Portal would adversely affect the concessioner's towing service. Disabled vehicles would need to be towed to El Portal and, as a result, would increase the response time for its towing service. Additional heavy-duty tow trucks would have to be purchased, operated and maintained to provide roadside assistance to buses and other large vehicles (e.g., shuttle bus and recreational vehicles) over longer distances. This would represent a long-term, minor, adverse impact on the concessioner's future operations.

Three types of financial impacts are expected under this alternative: (1) changes to the concessioner's gross revenue (sales receipts) and profitability, (2) employee housing and relocation-related cost increases including furniture, fixtures, and equipment (FF&E) expenses, and (3) annual repair and maintenance cost on new facilities. The magnitude of these impacts would depend on whether the impacts occur during the remainder of the current concessioner's contract (i.e., until 2008) or under a subsequent contract. The estimated financial impacts discussed below are expressed in terms of stabilized annual revenues and costs. These impacts are also generally represented as net impacts compared to the concessioner's 1998 financial conditions.

Gross revenue impacts reflect changes to the concessioner's sales resulting from the proposed change to visitor services. The furniture, fixtures, and equipment impact represents the initial cost of outfitting the proposed new facilities to make them operational and the subsequent replacements of the new fixtures and facilities as they wear out (typically after seven years of use).⁴ Maintenance and employee housing cost impacts represent the additional expenditures necessary to operate under the new configuration of facilities. The profit impact clearly shows the financial impacts on the concessioner's business because it includes changes in both annual revenues and costs.

The impact analysis of the concessioner includes an evaluation of whether concessioner profits would be adequate to allow the concession operator to earn a reasonable return relative to its investment and operating risk. To evaluate the *Final Yosemite Valley Plan/SEIS* alternatives' impact on the concessioner, the analysis began by evaluating the concession's current capacity to earn a profit and then considered how each aspect of the *Final Yosemite Valley Plan/SEIS* alternatives would impact that capacity.

The concessioner's profit capacity may be understood as consisting of two components—its present profit plus the amount of its federal contribution. In other words, the concessioner's financial contribution to the federal government represents the amount of money it is able to pay after earning a reasonable return. It is important to note that this judgment is based on the fact that the current Yosemite concessioner obtained the concession contract in a fair market competition in which it presumably is retaining reasonable profits that are neither insufficient nor excessive. If the changes in concession operations induced by the *Yosemite Valley Plan* do not erode all of the concessioner's ability to make financial payments to the government, a reasonable profit would remain available to the concessioner. On the other hand, if the *Yosemite Valley Plan* eliminates the concessioner's ability to make any federal contribution, the concessioner may still earn a reasonable return as long as its profits are not also eroded. However, if the concessioner was unable to make any payments to the federal government and was also unable to earn a reasonable profit, that situation could not be sustained. The concessioner would choose to discontinue operations.

The total profit impact on the next concessioner's operations associated with the proposed alternative is projected to be an annual decrease in its profits of \$8.2 million. This projection is based on the combined profit impacts associated with: (1) changes to the concessioner's gross revenue (sales receipts) and profitability, (2) employee housing and relocation-related cost increases including furniture, fixtures, and equipment, and (3) annual repair and maintenance costs on new facilities.

The changes to visitor services proposed under this alternative are projected to generate additional net operating profits of \$2.6 million annually. These profits would be obtained from annual revenue increases of approximately \$3.9 million. The profit gains would primarily result

⁴The series of periodic future investments in furniture, fixtures, and equipment can be viewed as equivalent to an annual average investment. In this way, the annual impact of the furniture, fixtures, and equipment expense increase can be represented in the concessioner's resulting profit performance. Indeed, if the furniture, fixtures, and equipment purchases are financed with debt, as might be expected, the debt service would be an annual cost

from increasing the highly profitable Yosemite Lodge accommodations and the additional commercial visitor services to be located at the Taft Toe Visitor/Transit Center.

Future employee housing and relocation cost increases are projected to be approximately \$5.0 million per year. These consist primarily of increases in the annual costs for furniture, fixtures, and equipment replacement (\$1.5 million), heat and utilities (\$800,000), employee transportation (\$400,000), insurance (\$500,000), and wage increases to encourage employees to relocate out of the Valley (\$500,000). Additional housing-related staff needs are estimated to cost less than \$200,000. Other associated costs total approximately \$1.1 million. It is estimated that the future average annual cost for repair and maintenance would be approximately \$5.8 million. Therefore, the impact on the next concessioner's resulting total profit is projected to be an annual loss of \$8.2 million (\$2.6 million – \$5.0 million – \$5.8 million = –\$8.2 million).

In summary, based on the analysis of proposed changes under this alternative, future concession operations would be expected to experience a \$8.2 million decrease in annual profits. This loss could be offset by reducing the current or any future concessioner's federal contribution from its current level of \$9.9 million annually to cover the concessioner's projected profit reduction. In this case, it is estimated that the current or any future concessioner would be able to contribute approximately \$1.7 million to the federal government annually. This would represent a long-term, negligible, adverse impact on concession operations.

Table 4-114 shows the projected financial impacts to Yosemite Concession Services under Alternative 4.

The projected revenue impact would represent a 4.5% increase in the concessioner's 1998 revenues, which would be a long-term, moderate, beneficial impact. If the concessioner's governmental contribution were used to offset the projected profit losses from its operations, then this alternative would have a long-term, negligible, adverse impact on the concession operations. However, the annual financial return to the federal government from the concession operations would be reduced from \$9.9 million to \$1.7 million, a reduction of 83%, which would represent a long-term, major, adverse impact to the federal government.

Impact	Alt. 1	Alt. 4	Net Change
Revenue	\$0	\$3.9	\$3.9
Profit from Operations	\$0	\$(8.2)	\$(8.2)
Concessioner's Government Contribution	\$9.9	\$9.9	\$0
Net Profit Impact & Govt. Contribution	\$9.9	\$1.7	\$(8.2)

1. In 1998 Constant Dollars Projected Annual Financial Impacts (\$ Million)

Yosemite Medical Clinic

Under this alternative, Yosemite Medical Clinic would remain in its current location. Also under Alternative 4, it is projected that approximately 15,800 room nights would be gained with a corresponding increase of 24,600 overnight stays within the Valley annually. While this represents an approximate 2.0% increase in park overnight stays, it corresponds to only a 0.8% increase in park visitation (compared to 1998 visitation levels). This would represent a long-term, negligible, beneficial impact to the Clinic.

Although relocation to El Portal might encourage some employees to seek medical attention at other clinics outside the park, the majority of these employees would continue to work in the Valley and may continue to seek medical attention at the Valley Medical Clinic. However, the net effect and future magnitude of these impacts on the concession's future sales cannot be quantified.

The Ansel Adams Gallery

Under this alternative, The Ansel Adams Gallery would remain in its current location. Proposed modifications for the Yosemite Village Area include expansion of fast food facilities at the Village Grill and Degnan's, removal of public parking throughout the Yosemite Village area, and the transformation of the Yosemite Village area as an interpretive hub. A new transit and visitor center would be located at Taft Toe. All day visitors would be required to use the Valley transit system to enter the east end of the Valley and some day visitors would be accessing the Valley by shuttle from remote parking areas.

While the new transit and visitor center is located mid-Valley and visitors may disperse from that point, the Yosemite Village area is expected to continue to be an important part of most park visitors' travel itinerary. It is expected these actions would have a long-term, minor, adverse impact on the Ansel Adams Gallery since potential customers will not be initially directed to the Yosemite Village area. The adverse impact could be decreased if future signage and visitor orientation programs increased public awareness of the Gallery's location, operations, and history.

While the proposed natural resources restoration actions may improve the Valley's visual appearance and enhance overall visitor experience, these changes would not be expected to affect the Gallery's business. However, removal of nearby parking may reduce the Gallery's annual sales because many visitors may be reluctant to make purchases if they must use the shuttle buses to return to their cars or overnight accommodations. In addition, any changes to the park's annual visitation may also be expected to have a corresponding effect on sales by altering the Gallery's customer base. However, the net effect and future magnitude of these impacts on the concessioner's future sales cannot be quantified.

Yosemite Association

Employee housing is the primary issue affecting the Yosemite Association's future operations. The Association currently experiences a shortage of employee housing, and any increase in future employees would increase the problem. This alternative proposes that some housing would be available for Yosemite Association employees; if this occurred it would have a long-term, moderate, beneficial impact on the Association's ability to recruit and retain staff.

The proposed changes to the Valley Visitor Center are expected to produce mainly long-term, moderate, beneficial impacts to the Yosemite Association. Under this alternative, the visitor center would be relocated to the site of the Yosemite Village Store. The existing Yosemite Village Store building would either be rehabilitated or replaced. The new visitor center would also serve as a transit center for park visitors.

As a result, visitor use at the new visitor center may be expected to increase compared to use of the existing visitor center, which is inconveniently located and has limited and poor display space.

Relocation of the visitor center to a larger and more readily accessible site would improve the Association's ability to provide effective information and orientation service as well as retail sales. It is estimated that annual sales at the new visitor center could double from its current revenues of \$0.75 million. This would represent a long-term, major, beneficial impact to the Association. It is also expected that these revenue increases would exceed any decreases in sales that may be associated with any reduction in park visitation (e.g., from lodging reductions).

Under this alternative, the Yosemite Association's Valley office would be converted for use as a natural history museum. This would allow improvement of the existing cultural history museum within the existing museum building. The Yosemite Association expects these changes to have a long-term, moderate, beneficial impact on its finances because it would be able to enlarge and improve the existing Museum Store and open an additional store at the new national history museum.

Increases in Yosemite Association retail sales may require hiring additional retail employees. While the Yosemite Association cannot project the necessary staff increase, it does expect costs to be covered by the increased sales. This would be a long-term, minor, adverse impact. Also, staff increases would exacerbate the housing problems noted above, potentially causing a long-term, minor, adverse impact.

Yosemite Institute

Numerous impacts to the Yosemite Institute are expected due to proposed changes to overnight accommodations, administrative park operations, transportation, research library, archives, and museum.

Overnight Accommodations

The reduction in the number of Curry Village tent cabins and elimination of cabins without baths may affect the Yosemite Institute, which currently occupies approximately 80 units between September and June. Under this alternative, additional economy accommodations are proposed at Curry Village to add 112 units suitable for Yosemite Institute use throughout the winter. As a result, lodging capacity for Yosemite Institute participants is expected to be adequate.

It is expected that Yosemite Institute would be required to pay higher room rates to Yosemite Concession Services for rooms with bath. Based on Yosemite Concession Services current rate structure and depending on the availability of the remaining Curry Village tent cabins for Yosemite Institute's use in September and June, it is estimated that the Institute's average lodging costs would increase between 16% and 25%. This is equivalent to an average lodging cost increase of \$1.80 to \$2.70 per person per night. Based on an average annual total of 40,122 person-nights spent in Yosemite Concession Services accommodations by Yosemite Institute participants, Yosemite Institute's total lodging costs may be expected to increase between \$72,000 to \$108,000 (in 1999 dollars). This would represent a long-term, moderate, adverse impact on Yosemite Institute's program.

Transportation

Proposed transportation plans would have a long-term, negligible, adverse impact on Yosemite Institute's program, because most participants rely on commercial buses for their transportation needs, and all student visitors are overnight visitors. Yosemite Institute employees would welcome the opportunity to use public transportation to and from locations outside the Valley.

Administrative Park Operations

Under this alternative, Yosemite Institute's administrative offices would be relocated outside the Valley into government provided facilities in El Portal. The National Park Service would work with the Yosemite Institute and the primary concessioner to provide adequate facilities for the Institute's field operations that operate in the Valley during the off-season. The purpose of these facilities would be to provide an adequate staging area and base of operations so the Yosemite Institute could provide the essential support necessary for its field operations. Relocation of the Institute's administrative operations would represent a long-term, minor, adverse impact on Yosemite Institute's education programs.

In addition, under this Alternative, Yosemite Institute would be beneficially affected by the new educational opportunities provided by the natural resources restoration in the east end of the Valley, and the improved access to the west end of the Valley.

El Portal Chevron Station

Under this alternative, the overall number of visitors entering along Highway 140 is not expected to change. The majority of day visitors would continue to drive into the park or use the park transit system from the out-of-Valley parking sites. It is expected that there would be a moderate increase in visitors using transit or tour buses to access the Valley. Growth in bus traffic would increase the demand for diesel fuel, which would be expected to have a long-term, minor, beneficial impact on the station's revenues. Correspondingly, the use of transit buses by day visitors parking at the El Portal satellite parking facilities would reduce the number of visitor vehicles using the station. Visitor fuel sales may therefore be expected to decrease; this would have a long-term, minor, adverse impact on the station's annual revenues.

In addition, while the proposed increase in employees living in El Portal would generate a moderate increase in demand for automotive fuel, these gains would likely be offset by the reduction in the number of employees commuting daily into the Valley. Instead, these employees would be required to use the employee transit system. Overall, it is expected that this alternative would have a long-term, minor, adverse impact on the El Portal Chevron concession.

El Portal Market

Under this alternative, the El Portal Market would remain at its current location, and its facilities and operations would be unchanged through the term of the existing contract. The store's primary source of customers is from park visitor traffic along Highway 140. It is expected that the use of transit or tour buses by day visitors would reduce private vehicle traffic and thus potential customers.

Although past population increases have not resulted in increased sales at the market, it is possible that the increase in employee housing at El Portal would result in a minor increase in revenues. Therefore, overall this alternative is expected to have a long-term, negligible, adverse impact on El Portal Market's sales.

Concessioners and Cooperators Conclusion

Under this alternative, the proposed changes to park facilities are expected to have long-term, minor, adverse impacts on the primary concessioner operations (currently Yosemite Concession Services), mainly associated with locating new employee housing outside of the Valley. This action would require many employees to commute into the Valley using the employee transit system, reduce the number of staff available for work during road closures or other commuting difficulties, and may reduce the concessioner's ability to recruit future employees. In addition, relocation of the concessioner stable and primary garage services out of the Valley would require additional staff and equipment for these services.

The future primary concession operations would be expected to experience an \$8.2 million decrease in annual profits. This loss could be offset by reducing the current or any future concessioner's federal contribution from its current level of \$9.9 million annually to cover the concessioner's projected profit reduction. In this case, it is estimated that the current or any future concessioner would be able to realize a reasonable profit and contribute approximately \$1.7 million to the federal government and Valley. In total, this would represent a long-term, negligible, adverse impact on concession operations.

The proposed changes to visitor interpretation facilities are expected to have a long-term, major, beneficial impact on the Yosemite Association by providing improved and increased retail sales opportunities. However, associated increases in employees and the limited employee housing for the Yosemite Association staff may have a long-term, moderate, adverse impact on the organization.

Long-term, moderate impacts to the Yosemite Institute are expected from the proposed changes to overnight accommodations and park facilities. Reductions in Curry Village tent cabins would have a long-term, moderate, adverse impact, because program participants would need to use other newly built but more expensive lodging facilities. Relocation of the program's administrative office out of the Valley is expected to have a long-term, moderate impact.

The proposed changes to visitor access and relocation of employee housing would have a long-term, minor, adverse impact on the El Portal Chevron station, and a negligible adverse impact on the El Portal Market.

The proposed changes in visitor parking and visitation are expected to beneficially affect the Ansel Adams Gallery sales; however, the net impact on the Gallery is undetermined. Changes in the park's visitation are expected to have a long-term, negligible, beneficial effect on Yosemite Medical Clinic's operations. The net effect on the clinic's future operations associated with relocation of employee housing and park safety improvements is undetermined.

Cumulative Impacts

Yosemite Concession Services

The cumulative impacts would be the same as described under Alternative 1. The primary concessioner would be expected to assume costs of future “repair and maintenance” on *existing* park facilities used for its operations, an estimated annual cost of \$1.7 million. As a result, under this alternative, a total cumulative impact would result in no net loss to the concessioner. The \$1.7 million projected federal contribution by the concessioner would be entirely offset by the \$1.7 million repair and maintenance cost on existing park facilities used by the concessioner. This would represent a long-term, negligible, adverse impact on the concessioner because its net profits would be unaffected by the reduction in its future federal contribution.

Other Concessioners and Cooperators

The cumulative impacts would be the same as described under Alternative 1.

Park Operations

NATIONAL PARK SERVICE OPERATIONS

Superintendent's Office

This alternative would have no impact on the superintendent's office staff or its annual funding requirements.

Maintenance Operations

Buildings and Grounds

To provide the levels of service considered necessary, it is estimated that approximately 22 additional building and grounds personnel would be needed under this alternative. This would represent approximately \$825,000 for additional salary and operations costs annually.

Construction of new shuttle bus stops, buildings, housing units, out-of-Valley parking lots, and changes in building functions from administrative to public use would require custodial service and facility maintenance.

The rehabilitation of historic districts would require additional staffing and associated funding.

The traveler information and traffic management system, once implemented, could displace visitors to outlying districts or expand visitation to off-peak seasons. This would cause a long-term, minor, adverse impact on buildings and grounds operations in outlying districts, in that the levels of maintenance and custodial services required for peak season operations would extend throughout a longer period of the year.

Roads and Trails

To provide the levels of service considered necessary, it is estimated that approximately 29 additional roads and trails personnel would be needed. This would represent approximately \$1,087,500 for additional salary and operations costs annually. A new parking lot and transit

center in the west Valley would require additional maintenance (equipment and staffing) for snow removal. Three new parking lots in out-of-Valley locations (two of which are located above the traditional snowline in the spring and fall seasons) would require maintenance equipment and staffing, primarily for snow removal. This would be a long-term commitment of fiscal resources.

An increase in trails in the Valley and El Portal would create new workloads on the trails and forestry operation. Snow removal in the winter and hazard tree removal and trail repairs throughout the year would continue for the life of the new trail system.

If the stable were to move to McCauley Ranch, it would increase the travel time for packers to get to Valley trailheads but would decrease travel times to destinations in the Tioga Road corridor. Additional staff would be required to provide more pack trips or longer work shifts, as a result of the additional travel time for pack trips leaving from Yosemite Valley trail heads.

The demand for trash pickup in the El Portal area and out-of-Valley parking areas would increase due to the relocation of administration functions, the increase in the number of housing units, and visitor-use areas.

Utilities

It is estimated that approximately six additional utilities personnel would be needed to provide appropriate levels of service. This would represent approximately \$225,000 for additional salary and operations costs annually. Moving functions, constructing new buildings, and relocating utilities out of highly valued resource areas would require the installation of new service lines. New service connections and, in the case of the out-of-Valley parking areas and the Taft Toe parking and transit center, entirely new utility systems would require an increase in the annual maintenance and operational costs to provide for additional levels of service and to meet state and federal regulations for public utility systems.

Moving the National Park Service stable to McCauley Ranch would increase the travel time for the backcountry utilities operation to Valley trailheads but would decrease travel times to destinations in the Tioga Road corridor.

The overall impact to maintenance operations would be long-term, moderate, and adverse until funding is provided to meet the need. Once fully funded, the overall impact to maintenance operations would be long-term, negligible, and neutral.

Visitor and Resource Operations

Visitor and Resources Protection

It is estimated that approximately 31 additional visitor protection personnel would be needed to provide appropriate levels of service. This would represent approximately \$1,162,500 in additional salary and operations costs annually. Regular patrols would have to be expanded to serve out-of-Valley parking areas. Removal of the court system and the detention facility and relocating them to El Portal, would require additional time for rangers to be away from their duty stations. During the summer months as many as eight rangers and two corrections officers would be in El Portal on a daily basis, dealing with law enforcement cases.

Relocating the base of operations for Search and Rescue from Yosemite Valley to El Portal would have the potential for long-term, minor, adverse impacts upon incident costs, in that activities in Yosemite Valley, where most complex rescues occur, would have more logistical costs than under Alternative 1. Coordination of Yosemite Valley search and rescue operations would be more difficult, while coordination of activities in other parts of the park would potentially improve.

Overall, Alternative 4 would have a long-term, moderate, adverse impact until operational funding is acquired to fully implement the actions. Once fully funded, impacts would be long-term, negligible, and neutral.

Interpretation

Greatly expanded interpretive and educational facilities and programs would require an increase in staffing for the Interpretation Division. The new museum and library with expanded public access would also require increased staffing. The Interpretation Division would have to operate additional visitor contact facilities and conduct additional interpretive programs. It is estimated that approximately 29 additional interpretive personnel would be needed to provide prescribed levels of service. This would represent approximately \$1,087,500 in additional salary and operations costs annually. The overall impact of this alternative would be long-term, major, and adverse until operational needs are fully funded. Once funded, the impact to the Interpretation Division would be long-term, negligible, and neutral.

Resources Management

Restoration of impacted areas, continued monitoring of restoration efforts, mitigation measures to facilitate restoration resulting from changing visitor-use patterns, and expanded efforts working with American Indian programs would require an increase in staffing. Staffing and funding are also needed to implement the Visitor Experience and Resource Protection (VERP) program. It is estimated that approximately seven additional resources management personnel would be needed to provide prescribed levels of service. This would represent approximately \$262,500 in additional salary and operating costs annually, and would have a long-term, moderate, adverse impact until operational needs are fully funded, the implementation of this alternative on the Resources Management Division would be long-term, negligible, and neutral.

Administration

Valley administrative operations would be shifted to El Portal. Administration support costs would be five positions at \$187,000.

Concessions Management

Management and monitoring of new concession operations and facilities would require one additional staff at \$37,500 annually. Additional costs are needed to increase the level of service necessary to manage revised and refined concession services.

Depending on the location chosen by the park's primary concessioner for its headquarters, coordination and communication would potentially be more difficult than under Alternative 1. However, the adverse impact of communication and coordination difficulties would likely be

moderate over the short term, becoming minor as both operations adjust to the new working environment.

CONCESSIONERS AND COOPERATORS

Impacts on park concessioners are evaluated under the Social and Economic Environments section of this chapter.

TRANSIT OPERATIONS

The annual recurring operations and maintenance cost of the bus fleet for this alternative is estimated to be \$7,366,000. This cost would result in long-term, major, adverse impacts on this operation until fully funded. Once funded, the impacts would be long-term, negligible, and neutral.

CONCLUSION

This alternative would require that approximately 130 additional park personnel be added to current staffing levels in the Maintenance Operations, Protection Operations, Interpretation, Resources Management, and Administration divisions. This would require an additional \$4,875,000 annually (or approximately \$37,500 per person) in additional park funding for salary and operations costs above those discussed under Alternative 1. The cost for the additional park personnel would represent a long-term, moderate, adverse impact, until fully funded. Once funded, the impacts to park operations would be long-term, negligible, and neutral.

CUMULATIVE IMPACTS

Cumulative impacts would result from other park planning projects and regional activities. There could be a moderate increase in the workloads of the Maintenance Operations, Interpretation, and Resources Management divisions as a result of the transit system developed by the Yosemite Area Regional Transit System (inter-agency) due to increased needs in facility maintenance, custodial services, visitor education, and resource monitoring. This would be a long-term, moderate, adverse impact because of these workload increases. There would be a long-term, minor, beneficial impact on Protection Operations as a result of YARTS due to the alleviation of traffic congestion. These effects, in combination with the moderate impacts of implementing in-park and in-Valley transit systems, would result in operational impacts that are long-term, major, and adverse compared to Alternative 1.

The redesign of the South Entrance and Mariposa Grove areas would increase the workload of the Protection Operations, Maintenance Operations, and Resources Management Divisions in the short term during initial planning and implementation. This would cause a short-term, minor, and adverse impact. This project would require a long-term commitment from and create an increased workload for the Interpretation Division. This project would have a major, adverse impact on the workload of the Interpretation Division. The Protection Operations and Maintenance Operations Divisions would achieve long-term moderate benefits when the project is completed due to decreased workloads for their operations. These effects, when considered in combination with the major impact of providing more interpretive services at improved visitor information centers, would result in long-term, moderate, and adverse operational impacts.

Fire Management planning and Wilderness Management planning would require an increase in the workloads of the Protection Operations and Resources Management Divisions. These would have short-term, major, adverse impacts on both divisions. The workload of fire management staff would increase over the long term as a result of this planning effort. This alternative would create the need for planning, design, and program refinement which would also have short-term, major, adverse impacts; cumulative impacts would remain major and adverse, but of a short-term duration.

Numerous proposed residential and commercial developments along each entrance corridor would have no long-term impacts on operations, assuming that a traveler information and traffic management system would be developed and that the park would not provide emergency services to those areas. Should the park be required to provide emergency services to these areas, impacts would be incurred unless cooperative agreements were adopted and financial support was available from the involved county governments. Moderate to major short-term, adverse impacts would be expected during times of construction. Considered in combination with the actions in this alternative, adverse effects upon Protection Operations would remain moderate to major and long term.

A research station for the University of California campus at Merced (UC Merced) would have long-term moderate to major benefits for the park as a whole, resulting from educational and research support and the creation of a viable recruitment pool for new employees.

Many other in-park actions such as major campground rehabilitation, development concept planning, and water treatment plant rehabilitation (including water and wastewater improvements at Tuolumne Meadows and White Wolf), would have short-term, major, adverse impacts on staff availability during times of construction or development. When considered in combination with the actions in this alternative, the cumulative effect of these activities on park operations would remain major and adverse, but of a short-term duration.

Energy Consumption

Under Alternative 4, housing beds would be relocated from Yosemite Valley to El Portal and Foresta, and additional beds would be added to El Portal to accommodate existing unmet needs and potential future growth as a result of operational changes associated with this alternative. No additional beds would be added to Wawona. Table 4-115 shows existing housing and estimated propane consumption for Alternative 1 and provides analogous data for Alternative 4.

Location	Alternative 1		Alternative 4	
	No. of Beds	Propane (gal/yr)	No. of Beds	Propane (gal/yr)
Yosemite Valley	1,277	260,510	689	140,600
El Portal	290	59,160	1,174	239,500
Wawona	112	22,850	112	22,850
Foresta	4	820	14	2,860
Cascades and Arch Rock	12	3,450	0	0
Total	1,695	345,790	1,989	405,810

Under Alternative 4, there would be an increase of about 300% in propane consumption in El Portal, a small increase in Foresta, and a decrease of about 45% in the Valley. However, when combined, the overall propane consumption increase as a result of implementation of Alternative 4 would be 60,020 gallons per year, or 17%, which would represent a minor, long-term, adverse impact on propane consumption.

Table 4-116 lists estimated fuel consumption for visitor-related travel to and from the Valley due to the Alternative 4 transportation plans, and for additional out-of-Valley employee commuting due to the relocation of residences from the Valley to El Portal. By 2015, Alternative 4 would result in a 56% decrease in visitor-related gasoline consumption and a 155% increase in diesel (or alternative) fuel consumption. This increase would be associated with the new shuttle buses operating from out-of-Valley day-visitor parking areas, the expanded in-Valley shuttle service, and the increased number of employees commuting from El Portal to Yosemite Valley.

A 56% decrease in gasoline consumption by the year 2015 represents a savings of 1,380,800 gallons over Alternative 1, whereas the 155% increase in diesel (or alternative) fuel consumption represents an increase of 330,300 gallons over Alternative 1. Overall, Alternative 4 by the year 2015 would yield a combined savings of 1,150,500 gallons of fuel. This is a decrease from Alternative 1 in overall motor fuel consumption of approximately 42% and represents a moderate, long-term, beneficial impact. Similar energy savings are achieved for years 2005 and 2010 as well.

Table 4-116 Vehicle Fuel Consumption			
Alternative	Total (Gal/Yr)		Total Fuel Consumption (Gal/Yr)
	Gasoline	Diesel or Alternative Fuel	
2000			
Alternative 1	2,905,800	230,200	3,136,000
Alternative 4	NA	NA	NA
2005			
Alternative 1	2,696,100	224,500	2,920,600
Alternative 4	1,195,300	569,300	1,764,600
2010			
Alternative 1	2,555,400	219,100	2,774,500
Alternative 4	1,132,900	556,500	1,689,400
2015			
Alternative 1	2,480,800	213,800	2,694,600
Alternative 4	1,100,000	544,100	1,544,100

C O N C L U S I O N

Employee housing space-heating consumption would decrease in the Valley, but would increase at El Portal during the 2000-2015 time frame. Overall, there would be a minor increase in total housing units for Alternative 4 and an associated minor, long-term, adverse impact on home energy consumption.

The reduction in gasoline consumption in 2015 relative to Alternative 1 reflects the shift by park visitors from private vehicles to shuttle buses energy consumption, as well as a fleet turnover to vehicles with improved fuel economy over time. The increase in diesel (or alternative) fuel

consumption would be attributable to the deployment of shuttle buses for visitors. The combined motor fuel savings for Alternative 4 in the years 2005, 2010, and 2015 would represent a moderate, long-term, beneficial impact.

CUMULATIVE IMPACTS

Other actions in the immediate area and greater San Joaquin Valley may have cumulative impacts. The cumulative impact on energy consumption under Alternative 4 would be associated with new housing and lodging developments outside the park. A moderate, long-term, adverse impact would result from these reasonably foreseeable projects in the region, as described for Alternative 2. Alternative 4, however, would represent a minimal contribution to the overall cumulative impact, since the net increase in employee housing for Alternative 4 would be only about 1% of new housing projected for the region.

Alternative 5

*Yosemite Village
and
Out-of-Valley
Parking*

El Portal,

Opportunities for bicyclists to explore the Valley would be expanded under all the action alternatives, which propose new multi-use paved trails separated from roads.

ALTERNATIVE 5

YOSEMITE VILLAGE AND OUT-OF-VALLEY PARKING (EL PORTAL, HENNESS RIDGE, AND FORESTA)

The analysis of potential impacts from actions implemented under Alternative 5, Yosemite Village and out-of-Valley parking (El Portal, Henness Ridge, and Foresta), are presented in this section.

Water Resources

This section analyzes impacts on water resources: hydrology, including floodplain values, and water quality. Impacts to water resources are described by area (i.e., Yosemite Valley, El Portal, Wawona, and out-of-Valley parking locations) and are characterized as long-term alterations or restoration of hydrologic processes (e.g., water flow and flood regime) or water quality (e.g., turbidity, and non-point source pollution from vehicles or recreational use).

YOSEMITE VALLEY HYDROLOGY

Actions to implement the River Protection Overlay include the removal of development within 150 feet of the river. These actions would restore the river to more natural geomorphologic conditions through restoration of stream banks (i.e., stream bank stability) and the 100-year floodplain. The River Protection Overlay would allow natural processes to prevail in the river and floodplain and minimize the alterations of the floodplain due to existing and future facilities. Further, removal of development from the River Protection Overlay would potentially reduce visitor degradation of stream banks and the river channel by concentrating visitor use away from the river. Examples of these areas include Housekeeping Camp, certain meadow roads and turnouts, and campsites immediately adjacent to the river. Removal of facilities from the River Protection Overlay would allow natural floodplain alterations and lateral movement of the river channel (i.e., meandering), and increase opportunities for restoration of riparian vegetation, which would reduce unnatural erosion and deposition. Ultimately, the implementation of the River Protection Overlay would result in a regional, long-term, major, beneficial impact on hydrology and floodplain values.

At Camp 6, the River Protection Overlay would be restored, including oxbows and cut-off channels that once existed in the area. Changes to the existing river dynamics through restoration of oxbows and braided streams could, over time, become more locally pronounced and eventually contribute to restoration of natural stream flow conditions downstream of the Camp 6 area. Restoration actions at Camp 6 would result in localized, long-term, moderate, beneficial impacts on hydrology and the floodplain values.

The Camp 6 parking facility would be situated within a portion of the floodplain that could experience floodwater velocities up to 3 feet per second and floodwater depths exceeding 5 feet in

places, as was observed during the January 1997 flood. These facilities, although in an area of low relief and not likely to divert flood flow due to obstructions, could impede the river's ability to naturally migrate and change course during the extreme flood events. For example, an asphalt pavement surface could hinder the formation of natural flow channels or accelerate surface soil erosion once the asphalt surface and underlying base material is scoured and removed by high-velocity flood waters. A flat-surface parking facility could also reduce the area available to the river for sediment deposition and new bank slope formation. In addition, riverbank stability (soils compaction and vegetation loss) could be reduced due to the radiating impacts associated with the increased concentration of visitors. Overall, development of a parking facility and picnic area in the Camp 6 area could result in localized, long-term, moderate, adverse impacts on hydrology and floodplain values.

The construction of a picnic area at the location of the former Lower River Campground would have a long-term, minor, adverse impact on hydrology due to radiating impacts of increased visitor use to a sensitive stretch of riverbank.

The transit center at Yosemite Village would be constructed outside of the 100-year floodplain, but the concentration of visitors would have radiating impacts to the river and its hydrologic processes. This would be a long-term, minor, adverse impact.

At Yosemite Lodge, Northside Drive would be rerouted to the edge of the 100-year floodplain, and parking would be reconfigured, but would remain in the 100-year floodplain. This would result in a long-term, minor, adverse impact on hydrology because flood flow would be altered.

The removal of three structures at Ahwahnee Row that are located in the 100-year floodplain would have a long-term, localized, minor, beneficial impact on floodplain values by removing impediments on flood flow (particularly pooling in this area).

Restoration areas include the portions of Yosemite Lodge (including motel units that impede flood flow and the former cabins area), Upper and Lower River Campgrounds, and roads from Stoneman and Ahwahnee Meadows that are in the 100-year floodplains. Removal of these facilities and restoration would restore the hydrologic process of flooding, and would be a long-term, moderate, beneficial impact on hydrology.

The presence of a bridge as a fixed structure within a river course can cause alterations in river flow and result in localized morphologic changes to the beds and banks of the river. Morphologic changes attributable to bridge placement, and that are most readily observable, would include scour holes on the downstream side of the abutment, formation of deposition bars downstream of the scour holes, bank instability, unnatural erosion and deposition, changes in flow velocity, and localized channel widening. Removal of these fixed structures would provide for restoration of natural erosion and deposition processes; allow the river to meander and naturally alter course; and reduce flooding potential by removing flow impediments. The impacts of bridge removal would be noticeable as scour holes and downstream deposition bars caused by their in-river abutments diminish and the riverbank is reestablished by natural flow patterns. Bridge removal would continue to improve natural river flow dynamics along extended reaches of the river, and the impacts would be observable for years to come.

Sugar Pine Bridge constricts the river severely, largely because this bend of the river immediately downstream of the Tenaya Creek confluence has always been dynamic. The approach road that connects Ahwahnee Bridge to Sugar Pine Bridge eliminated the numerous small cutoff channels that existed prior to construction in 1929. The loss of the numerous small cutoff channels, combined with the constriction of the river by Sugar Pine Bridge, has forced the creation of a single large cutoff channel immediately adjacent and parallel to the approach road. Removal of Sugar Pine Bridge and the approach road and restoration of the riverbank (vegetation, bank slope, channel width) would be a localized, long-term, major, beneficial impact on the Merced River's hydrology, by reducing unnatural erosion and scouring, reducing unnatural deposition downstream of the bridge, and allowing the river to meander.

Ahwahnee Bridge moderately constricts flood flow, and has two center piers in the river channel that trap logs at high flows. The trapped logs threaten the structure, but are also important components of the hydrologic and biologic processes of the Merced River. Removal of Ahwahnee Bridge and restoration of the riverbank (vegetation, bank slope, and channel width) would be a localized, long-term, moderate, beneficial impact on the Merced River's hydrology by reducing scouring and unnatural erosion, and by allowing large, woody debris to remain in the river.

Removal of these two bridges would also be a localized, long-term, major, beneficial impact on floodplain values by removing impediments to flood flow, particularly large flood events such as the January 1997 flood event. Local, short-term, minor, adverse impacts to hydrology may occur during bridge removal due to construction activities in the main river channel.

The possible reconstruction of Swinging Bridge would have long-term, localized, minor, beneficial impacts to the Merced River's hydrology, because the bridge abutments would be removed from the river channel (although some piers would remain in the river). Local, short-term, minor, adverse impacts to hydrology may occur during reconstruction due to construction activities in the main channel.

At Yosemite Creek, the human built rock rubble pile blocking the western channel would be removed, as would the pedestrian bridge and its abutments immediately upstream of the Yosemite Creek Bridge (vehicle). Removal of these impediments would restore hydrologic processes such as annual spring runoff, particularly restoration of flow to the western channel of the braided stream network, and would be a long-term, minor, beneficial impact on hydrology. Local, short-term, negligible, adverse impacts to hydrology may occur during removal due to construction activities in the western channel during low water.

A new vehicle bridge would be constructed downstream of the existing Yosemite Creek Bridge. The abutments of the new bridge would be outside of normal high water and would minimally impact hydrologic processes. This would result in a long-term, minor, adverse impact on hydrology. Local, short-term, minor, adverse impacts to hydrology may occur during bridge construction due to construction activities in the main channel.

Cascades Diversion Dam was constructed in 1917 to impound water for the intake structure that diverted river flows to a downstream powerhouse. Use of the powerhouse to generate hydroelectric power was discontinued in 1985, as was the diversion of river flows. The dam is

located at a natural breakpoint in the channel gradients: upstream of the dam the gradient is .01 feet/feet; downstream of the dam the gradient is .06 feet/feet. The pool and backwater created by the dam extend upstream from the dam about 550 feet. The dam is in danger of failure: outside of spring snowmelt runoff and rain-on-snow winter floods, water flows under the dam instead of through the spillway or over the dam. Failure of the dam would result in unmitigated release of the sediment trapped behind the dam, and materials that comprise the dam. Removal of the dam would have a localized, long-term, major, beneficial impact on the Merced River's hydrology by preventing the adverse impacts of dam failure and by restoring the free-flowing condition of the river: sediment transport would be unimpeded; natural low-water and flood flow would be restored; and riparian vegetation currently displaced by the pool and backwater would be restored on the riverbanks.

Removal of Cascades Diversion Dam would also be a localized, long-term, major, beneficial impact on floodplain values by removing a substantial impediment to flood flow: both annual spring runoff, and large flood events such as the January 1997 flood event.

Reconstruction of the El Portal Road between the Cascades Diversion Dam and Pohono Bridge could have a beneficial impact on hydrology if the footprint of the existing bank stabilization in the river is reduced, or could have an adverse impact on hydrology if the footprint of the existing bank stabilization in the river is increased. Additional environmental compliance, including a Wild and Scenic River Act Section 7 determination, would be necessary before this segment of road can be reconstructed.

Y O S E M I T E V A L L E Y W A T E R Q U A L I T Y

Actions to implement the River Protection Overlay would remove sources of pollutants and reduce erosion and sedimentation by removing facilities and limiting activities associated with facility use and maintenance. These activities include construction and maintenance of visitor use facilities. Additionally, the possible realignment or relocation of roads, trails, and visitor facilities could reduce the introduction of refuse and bacteria by visitors. The removal of the concessioner stable and Swinging Bridge Picnic Area and restoration to natural conditions would reduce a source of nutrients, coliform, turbidity, and other water pollutants to the Merced River. Overall, actions to implement the River Protection Overlay would result in a regional, long-term, moderate, beneficial impact on water quality by removing development immediately adjacent to the Merced River.

The removal of parking spaces from Curry Orchard, Yosemite Falls, the concessioner stable, Stoneman Meadow, and roadside areas throughout the Yosemite Valley would substantially reduce the potential sources of non-point source pollution that are inherent in areas with heavy, concentrated vehicular use. Vehicles can release pollutants onto pavement, including asbestos, heavy metals, petroleum-based products, and other chemicals such as ethylene glycol. Some fraction of these chemicals can be carried by surface-water runoff to streams, and eventually the Merced River. A formalized parking facility would be established at Camp 6, and a transit facility at Yosemite Village; stormwater pollution controls would be incorporated into the facilities' design (possible treatment methods include sand filters, underground water collection and treatment tanks, or oil/water separators). Replacing the existing parking areas listed above with a

formalized parking facility at the Camp 6 area would reduce non-point source pollution from stormwater runoff from large paved surfaces, resulting in a regional, long-term, moderate, beneficial impact on water quality.

The construction of a gas station in Yosemite Village would be a new source of non-point source pollution. Impacts on water quality would be mitigated through stormwater pollution controls at the facility, and have a localized, long-term, minor, adverse impact on water quality.

The increased use of shuttle buses would reduce the number of vehicle miles traveled in the Valley, and allow the removal of some roads (e.g., roads through Stoneman and Ahwahnee Meadows). This would have a long-term, minor, beneficial impact on water quality by reducing non-point source pollution.

EL PORTAL HYDROLOGY

As a result of a U.S. Army Corps of Engineers study (1998), the flood protection levee (hereafter, "levee") in the Hennessey's Ranch area would need to be raised and extended in order to protect employee housing, the impacts of which would be two-fold.

First, the levee would limit and possibly redirect natural river flow through a localized reach of the river during a 100-year flood event, reducing channel width and increasing flows or eddies depending on floodwater velocity and height. The levee is above the normal high water line and would not affect the river flow during normal spring runoff periods. Increasing the length and height of the levee would be a localized, long-term, minor, adverse impact on the river's hydrology because this reach of river has low susceptibility to bank scour, erosion, and slope instability.

Secondly, any structure intended to prevent flooding has the potential to limit the natural formation and function of that river's floodplain. Most of the Merced River in El Portal confined within a bedrock gorge channel, and the floodplain is narrow due to the river gradient and resistant bedrock. Consequently, the majority of the floodplain is more resilient and less susceptible to adverse impacts of altered river flow. The area at Hennessey's Ranch is one of the few flat, alluvial floodplain sections adjacent to the Merced River at El Portal. The alluviated area was formed through years of river sediment deposition. After construction of the existing flood protection levee, this area was isolated from further sediment deposition because the levee height prevented inundation by large flood flow such as the January 1997 flood event, which was the largest flood event in the 80+ years of stream gauge data at the Pohono gauging station. When compared to the impact of the existing flood protection levee in the No Action Alternative, increasing the length and height of the levee would be a localized, long-term, minor, adverse impact on floodplain values because only flood flow greater than the January 1997 flood event would be affected.

Removal of housing from the River Protection Overlay at Hennessey's Ranch and restoration of the area would have long-term, minor, beneficial impacts on hydrology by restoring river-related communities and hydrologic processes.

Construction of new housing in the 100-year floodplain but outside of the River Protection Overlay would require the modification of the levee (discussed above), and would result in

radiating impacts to the riverbank due to increased employees living in the area. These radiating impacts would have a long-term, minor, adverse impact.

Two pedestrian bridges would be constructed in the vicinity of Hennessey's Ranch. The bridges and their abutments would be designed to not interfere with the free-flowing condition of the river, and the banks of this river reach are relatively stable and resilient. The two pedestrian bridges would have localized, long-term, minor, adverse impacts on the river's hydrology and floodplain values. Local, short-term, minor, adverse impacts on hydrology may occur during construction due to construction activities in the main channel.

EL PORTAL WATER QUALITY

Actions to implement the River Protection Overlay would reduce discharge of non-point source pollutants into the river by providing a buffer area where development is removed (e.g., at Hennessey's Ranch) and future development is constrained (e.g., at Village Center and Railroad Flat). Water quality could be adversely impacted by runoff associated with increased parking spaces for both visitors and employees, although this impact would be mitigated by non-point source pollution controls at large paved areas. The increase in employees living in El Portal would likely result in increased recreational use of the river and subsequent increase in fecal coliform and bacteria levels, resulting in a regional, long-term, minor, adverse impact on water quality. Wastewater from all new buildings (e.g., housing, park headquarters, etc.) would be connected to the existing sanitary sewage system and would meet all applicable water treatment requirements. The impacts of Alternative 5 on water quality in El Portal would be localized, long-term, minor, and adverse, due to increased non-point source pollution resulting from increased development.

WAWONA HYDROLOGY

Construction of employee housing in Wawona would be outside of the 100-year floodplain, approximately 1,000 feet away from the South Fork Merced River. Radiating impacts to the river due to increased numbers of employees accessing the river would reduce bank stability and result in localized, long-term, negligible, adverse impacts on hydrology and floodplain values.

WAWONA WATER QUALITY

Actions to implement the River Protection Overlay would reduce discharge of non-point source pollutants into the river by providing a buffer area where future development is constrained. Water quality could be adversely impacted at the new employee housing by runoff associated with increased parking spaces, although this impact would be mitigated by non-point source pollution controls at large paved areas. Wastewater from all new buildings would be connected to the existing sanitary sewage system and would meet all applicable water treatment requirements. The impacts of Alternative 5 on water quality in Wawona would be localized, long-term, minor, and adverse.

FORESTA HYDROLOGY AND WATER QUALITY

The project site at Foresta is approximately three-quarters of a mile from Crane Creek, but has no rivers, streams, or other hydrologic features, and surface runoff is the only pertinent

hydrologic process. A parking facility, Volunteers-in-Parks campground, 14 houses, and a new National Park Service stable at McCauley Ranch (depending on the outcome of the Wilderness Feasibility Study) would be constructed in the Foresta area. These actions would have a localized, long-term, negligible, adverse impact on hydrology resulting from reduced ground cover and potentially increased runoff. These actions would result in increased non-point source pollution, which would be mitigated through stormwater pollution controls at the parking facility, and have a localized, long-term, minor, adverse impact on water quality.

H E N N E S S R I D G E H Y D R O L O G Y A N D W A T E R Q U A L I T Y

Hennes Ridge has no significant hydrologic features, and surface-water runoff is the only pertinent hydrologic process. The construction of a parking facility would have localized, long-term, minor, adverse impacts on hydrology resulting from reduced ground cover and potentially increased runoff. Construction of a parking facility would increase non-point source pollution, which would be mitigated through stormwater pollution controls, and would have a localized, long-term, minor, and adverse impact on water quality.

B I G O A K F L A T , T I O G A P A S S , A N D S O U T H E N T R A N C E H Y D R O L O G Y A N D W A T E R Q U A L I T Y

The locations of these entrance stations have no major rivers, streams, or other hydrologic features. Surface-water runoff is the only pertinent hydrologic process. A visitor center and associated visitor service facilities would be constructed, resulting in reduced ground cover and potentially increased runoff. These actions would have a localized, long-term, negligible, adverse impact on surface water hydrology. These actions would have a localized, long-term, negligible, adverse impact on water quality resulting from increased non-point source pollution associated with development.

C O N C L U S I O N

The collective actions of this alternative have regional, long-term, moderate, beneficial impacts on hydrology and water quality, largely due to the removal of facilities in Yosemite Valley from the River Protection Overlay and the 100-year floodplain and removal of the bulk fuel storage facility in El Portal. The beneficial impacts of removing two bridges, Cascades Diversion Dam, campsites, Housekeeping Camp units, etc., have been weighed against the adverse impacts on hydrology and water quality in El Portal due to increased development near the river.

C U M U L A T I V E I M P A C T S

This section assesses the impacts of past, present, and reasonably foreseeable future actions to water resources. The actions identified below have generally occurred within the watershed of the Merced River—both main stem and South Fork.

Past Actions

The water resources of the Merced River have been historically affected by a variety of actions within the floodplain since Euro-American settlement. In Yosemite Valley, the transportation network interferes with flooding and surface-water flow, and lodging, campgrounds, and other

structures have been constructed in and immediately adjacent to the river channel. In El Portal, a large portion of the riverbank has been artificially stabilized to protect primary roads and buildings immediately adjacent to the river. Because artificial stabilization of the riverbank began in the 1800s, the Merced River has been separated for decades from substantial portions of its floodplain. During spring runoff floods, this riprap serves to keep the channel from moving, and quickly conveys the water downstream. During winter floods, artificial bank stabilization prevents damage to dwellings and roads in the best-protected sections, but increases bank destruction where there is little or no artificial bank stabilization.

Present Actions

The El Portal Road Improvement Project (NPS) is currently under way from the park boundary to the Cascades Diversion Dam, and affects river-related communities of the Merced River immediately adjacent to the roadway. Natural resources are protected during construction by implementation of a compliance-monitoring program, erosion and sediment controls, hazardous materials controls, revegetation and reclamation, and excluding construction from sensitive habitats. Between El Portal and Yosemite Valley, riprap has been placed in some locations along the north bank of the Merced River to protect the reconstructed El Portal Road, altering the overall flow regime of the river.

Reasonably Foreseeable Future Actions

Reasonably foreseeable future actions proposed in the region are separated below into four general categories: (1) projects expected to have a net beneficial impact; (2) projects expected to have both beneficial and adverse impacts; (3) projects expected to have a net adverse impact; and (4) projects that have no impact relative to the actions of this alternative.

Reasonably foreseeable future projects that could have a net beneficial impact on water resources of the Merced River include:

- The Merced River at Eagle Creek Ecological Restoration Project (NPS)
- Merced Wild and Scenic River Comprehensive Management Plan (NPS)
- Yosemite Wilderness Management Plan Update (NPS), which will address land management issues within the wilderness
- Fire Management Plan Update (NPS)
- Potential Land Use and Management on Lands Adjacent to Yosemite National Park (Sierra Nevada Framework for Conservation and Collaboration).
- Several transportation-related projects (e.g., Yosemite Area Regional Transportation System [YARTS]), which have the general goals of increasing transportation options and reducing reliance on automobiles in the area
- Replacement/Rehabilitation of Yosemite Valley Sewer Line (NPS)
- South Fork Merced River Bridges Replacement (NPS)
- Bridalveil Horse Camp Rehabilitation (NPS)
- Yosemite Creek Campground Restoration (NPS)

- Wawona Campground Rehabilitation (NPS)
- Merced River Canyon Trail Acquisition (BLM)

These projects would have net beneficial impacts on water resources through improved coordination of resource management activities and restoration, although there might be site-specific or short-term, adverse impacts.

Reasonably foreseeable future projects that could have both beneficial and adverse impacts on water resources include:

- Mariposa Grove Roadway Improvement and Giant Sequoia Restoration (NPS), which would remove parking from the Lower Mariposa Grove of Giant Sequoias, restore the area, and realign the intersection at the South Entrance Station.
- Rogge – Ackerson Fire Reforestation (Tuolumne Co.), which would improve slope stability and reduce sedimentation by reforesting 5,000 acres; however, activities could also adversely impact water quality by burning, tilling, and herbicide application.
- A-Rock Reforestation (USFS, Stanislaus), which would improve slope stability and reduce sedimentation by reforesting 4,500 acres; however, activities could also adversely impact water quality by burning, tilling, and herbicide application.

These projects would have beneficial impacts on water resources by removal of facilities, restoration, and slope stabilization, and adverse impacts on water resources through increased non point source water pollution.

Reasonably foreseeable projects that could have a net adverse impact on water resources include:

- The Yosemite View Parcel Land Exchange, El Portal (NPS)
- Merced River Canyon Trail Acquisition (BLM)
- Yosemite Motels Expansion, El Portal (Mariposa Co.)

These projects would have adverse impacts on water resources through increased use and facility development, which could result in stream bank instability and increased non-point source water pollution.

Beneficial impacts on water resources of past, present, and reasonably foreseeable future projects on the Merced River watershed would be related to removal of facilities from the riverbanks and floodplain, restoration of previously developed areas and areas significantly impacted or altered by visitor use, removal of channel obstructions, and reduced human-related impacts. Adverse impacts of these projects on the Merced River watershed would be related to increased use and facility development, which could result in stream bank erosion, soil compaction, loss of vegetation, refuse accumulation, non-point source pollution generation, and degradation of stream characteristics and water quality in the Merced River. Overall, the past, present, and reasonably foreseeable future projects would have a long-term, minor, beneficial impact on water resources. The actions of this alternative would have a long-term, moderate, beneficial impact on water resources. The actions of this alternative, in combination with past, current, and reasonably foreseeable future projects would have a long-term, moderate, beneficial impact on water resources.

Floodplains

This evaluation identifies non-exempted¹ actions within the floodplain that could increase or decrease risk to human life and property by adding or removing housing and facilities from floodplains. The proposed removal and addition of non-exempted facilities from the floodplain are listed below by area and summarized in table 4-117; all impacts would be long-term unless otherwise noted (see plate E for Yosemite Valley flood extent). For related effects on floodplain values and hydrology, see the Water Resources section in this chapter.

Table 4-117 Non-Exempted Facilities in the Floodplain		
Facility Location	Development Change in the Floodplain ¹	Impact Intensity/Type ²
Yosemite Valley		
Cascades Diversion Dam	<ul style="list-style-type: none"> • Remove Cascades Diversion Dam 	<ul style="list-style-type: none"> • Localized, Major, beneficial
Concessioner Stable Area	<ul style="list-style-type: none"> • Remove Stables and associated housing (49 employee beds) and redevelop as campgrounds 	<ul style="list-style-type: none"> • Moderate, beneficial
Housekeeping Camp	<ul style="list-style-type: none"> • Remove 164 lodging units out of the floodplain. Retain 84 lodging units in the floodplain and 16 lodging units out of the floodplain. 	<ul style="list-style-type: none"> • Moderate, beneficial
Yosemite Village	<ul style="list-style-type: none"> • Remove 3 Ahwahnee Row houses (3 employee beds) • Remove Concession Headquarters • Redevelop Concession Headquarters as parking/visitor services • Remove Indian Creek employee housing (14 employee beds) • Redevelop Indian Creek employee housing area as parking/visitor services 	<ul style="list-style-type: none"> • Moderate, beneficial • Moderate, beneficial • Minor, adverse • Moderate, beneficial • Negligible, adverse
Yosemite Lodge Area	<ul style="list-style-type: none"> • Remove the Superintendent's House (Residence 1) and restore area • Remove 5 motel units • Relocate Wellness Center and nearby custodial cabins out of the floodplain • Develop new overnight parking 	<ul style="list-style-type: none"> • Moderate, beneficial • Moderate, beneficial • Minor, beneficial • Negligible, adverse
EI Portal		
Village Center	<ul style="list-style-type: none"> • Redevelop for necessary support facilities and commercial services • Adaptively reuse EI Portal Hotel (remove 12 employee beds) and Yosemite Institute Office • Remove bulk fuel storage facility • Remove EI Portal Motor Inn cabins (remove 24 employee beds) 	<ul style="list-style-type: none"> • Negligible, adverse • Moderate, beneficial • Moderate, beneficial • Moderate, beneficial
Hennessey's Ranch	<ul style="list-style-type: none"> • Add 656 employee beds • Remove 68 employee beds at Trailer Village 	<ul style="list-style-type: none"> • Moderate, adverse • Moderate, beneficial

¹ Development may be in or surrounded by the floodplain

² Impact intensity listed is after implementation of mitigation. All impacts would be long-term unless otherwise noted.

¹ Non-exempted facilities are those that are not exempt from National Park Service *Floodplain Management Guideline*. These include Class I and Class II Actions, such as administrative, residential, warehouse and maintenance buildings, overnight parking facilities, schools, hospitals, fuel storage facilities, and emergency services. Exempted facilities include campgrounds, picnic areas, day-visitor parking, etc.

Cascades Diversion Dam

Dam safety engineers have classified the Cascades Diversion Dam as a “high hazard potential structure” and assigned a Safety of Dams condition of “unsatisfactory.” This classification requires immediate corrective action. The removal of the dam would be a long-term, localized, major, and beneficial impact to human health and safety.

Concessioner Stable Area

A moderate, beneficial impact would result from the removal of houses and tent cabins (49 employee beds) and the concessioner stable from the floodplain. This beneficial impact would be related to reduced risk to both human life and property during a flood event. Although the area would be redeveloped as campgrounds, this type of facility is exempt from National Park Service *Floodplain Management Guideline*. Campgrounds would be located outside the River Protection Overlay and designed to minimize flood flow.

Housekeeping Camp

The removal of 164 housekeeping units and retention of 84 units in the 100-year floodplain would result in a moderate, beneficial impact because overnight lodging within the 100-year floodplain would be reduced, decreasing flood-related risk to both human life and property. Compared to the No Action Alternative, the beneficial effect related to human life is limited, however, because the units are not in use during the winter flood season.

Yosemite Village

Removal of the Concession Headquarters, Indian Creek employee housing (14 employee beds), and removal of three Ahwahnee Row houses (three employee beds) from the floodplain would result in an overall moderate, beneficial impact because fewer people would be living and working within the floodplain and flood hazard related to human safety would be reduced. Redevelopment of this area would minimize placement of structures in the floodplain and include mitigation measures to protect people during flood events. With mitigation, in accordance with National Park Service *Floodplain Management Guideline*, risk to both human safety and property would be a minor, adverse impact.

Yosemite Lodge Area

Removal of the Superintendent’s House (Residence 1) and five motel units from the floodplain would result in a moderate, beneficial impact because overnight lodging within the floodplain and the associated risk to human safety and property would be reduced. Relocation of the Wellness Center and nearby custodial cabins outside the floodplain would also result in a minor, beneficial impact because the number of facilities and people working within the floodplain would be reduced, resulting in a reduction in the flood hazard related to human safety and property. New overnight parking would be developed that incorporates design standards to minimize the effect on flood flow and allow for runoff, resulting in a negligible, adverse impact. Adverse effects in the Yosemite Lodge area would be further reduced by designs that minimize impacts on natural

flood processes and flood damage to structures, and by preparation of evacuation plans and routes (evacuation routes would be located outside the floodplain).

E L P O R T A L

Village Center

Moderate, beneficial impacts at the Village Center would result from the adaptive reuse of El Portal Hotel (removal of 12 employee beds and relocation of Yosemite Institute Office), and the removal of the Motor Inn cabins (24 employee beds) because overnight occupation of the floodplain would be reduced. Removal of the bulk fuel storage facility would result in a moderate, beneficial impact on human safety because the number of people working within the floodplain would be reduced. Adaptive reuse of these facilities would include mitigation consistent with National Park Service *Floodplain Management Guideline* to reduce the risk of property damage due to flooding.

Parts of the Village Center area that would be redesigned to support commercial services and parking would be placed out of the floodplain where possible. For new structures constructed in the floodplain an evacuation and safety plan would be developed. With these mitigation measures in place, there would be a minor adverse impact.

Hennessey's Ranch

The construction of 656 new employee beds at Hennessey's Ranch would be a major, adverse impact on human safety because employee beds would be constructed within the 100-year floodplain. However, because mitigation would be incorporated into the design to protect employees and structures during flood events (e.g., raising and extending the levee, evacuation planning), the overall impact would be reduced to moderate and adverse.

W A W O N A

There would be no impact to the South Fork Merced River floodplain because the employee housing considered for Wawona would be outside the floodplain.

C O N C L U S I O N

Beneficial impacts in Yosemite Valley would include removal from the floodplain of 164 housekeeping lodge units, the kennel, concessioner stables and associated housing (49 employee beds), the Superintendent's House (Residence 1), five Yosemite Lodge motel units, the Wellness Center and nearby custodial cabins, and 14 employee beds at Indian Creek. The Concession Headquarters and Indian Creek employee housing would be redeveloped as parking/visitor services, and new overnight parking would be developed at Yosemite Lodge which would have a minor, adverse impact on the floodplain. Overall, the aggregate impact of these actions in combination with mitigation in Yosemite Valley would be moderate and beneficial, because the flood-related risk to human safety and property would be reduced.

Actions in El Portal would include removal from the floodplain of 36 employee beds (moderate, beneficial) and the bulk fuel facility (moderate, beneficial), removal or adaptive reuse of El Portal

Hotel (employee housing and Yosemite Institute Office; moderate, beneficial), 656 employee beds at Hennessey Ranch (moderate, adverse) and redevelopment of Village Center (minor, adverse). Beneficial impacts would be related to reduction in the flood-related hazard to human safety. Adverse effects to both human safety and property associated with new development or redevelopment/adaptive reuse within the floodplain would be minimized by mitigation (e.g., design and siting specifications, extending and raising existing levees, and a mandatory evacuation plan) resulting in a net minor, adverse impact.

The total net effect of Alternative 5 would be moderate and beneficial, because the number of people working and overnight lodging/housing within the floodplain would be reduced (reducing flood-related risks to human safety), and mitigation would be implemented to reduce adverse effects on human safety and property associated with development/redevelopment within the floodplain.

CUMULATIVE IMPACTS

The impacts of past, present, and reasonably foreseeable future actions to floodplain values discussed herein are based on analysis of past, present, and reasonably foreseeable future actions in the Merced River watershed from its source near the crest of the Sierra Nevada to Briceburg Bridge. The actions identified below include those projects that have the potential to affect the floodplain of the Merced River.

Past Actions

The Merced River has been historically affected by a variety of actions within the floodplain since Euro-American settlement. In El Portal, from the park boundary to Briceburg Bridge, a large portion of the riverbank has been artificially manipulated. Much of this manipulation is riprap used to stabilize the riverbanks by the California Department of Transportation to protect Highway 140. The National Park Service and Yosemite Motels also placed riprap in the Merced River channel to rebuild roads (e.g., Foresta Road) and protect buildings immediately adjacent to the river. Because stabilization of the riverbank began in the 1800s, the Merced River has been separated for decades from substantial portions of the floodplain in the Merced River Canyon. During spring runoff floods, this riprap serves to keep the channel from moving, and quickly conveys the water down to Lake McClure. During winter floods, bank stabilization prevents damage to dwellings and roads in the best-protected sections, but increases bank destruction where there is little or no bank stabilization.

Present Actions

No current actions are increasing or decreasing flood-related risk to human life. Between El Portal and Yosemite Valley, riprap has been placed in some locations along the north bank of the Merced River to protect the reconstructed El Portal Road. This riprap would have essentially no flood-related risk to life or property.

Reasonably Foreseeable Future Actions

Reasonably foreseeable future actions that could have a potential cumulative beneficial or adverse effect on risk to human life and property during flood events are:

- El Portal, Trailer Village Closure (NPS)
- Yosemite Motels Expansion, El Portal (Mariposa County), (approximately 148 new hotel units)
- Yosemite View Parcel Land Exchange (NPS)

Cumulative effects of past, present, and reasonably foreseeable future actions would have both beneficial (e.g., implementation of the Trailer Village Closure Plan) and adverse (i.e., increased development of overnight lodging units and offices within the floodplain at El Portal) impacts on human life and property during flood events. In El Portal, approximately 59 employee trailers with 68 employee beds at Hennessey's Ranch (currently Trailer Village) would continue to be scheduled for removal from the 100-year floodplain. This action which occurs outside the scope of actions considered in the *Final Yosemite Valley Plan/SEIS*, is in accordance with the current provisions of the Trailer Village Closure Plan (NPS 1993b). Cumulative adverse impacts of these potential future projects on the floodplain hazard of the Merced River would be related to increased overnight use and facility development. In El Portal, potential overnight residents and hotel visitors would slowly increase from approximately 1,300 to about 1,600 beds because of the Yosemite Motel's expansion and the Yosemite View parcel land exchange. This represents an increase of approximately 25% in the number of people potentially affected during a flood.

Overall, the past, present, and reasonably foreseeable future actions listed above would have a long-term, moderate, and adverse effect on risk to human life and property due to the amount and type of new development planned within the floodplain. The total net effect of Alternative 5 would be moderate and beneficial, because overnight lodging/housing within the floodplain would be reduced (reducing flood-related risk to human safety), and mitigation would be implemented to reduce adverse effects on human safety and property associated with development/redevelopment within the floodplain. Effects associated with this alternative, in conjunction with other past, present, and reasonably foreseeable future cumulative actions, would be long-term, minor, and adverse, because potential flood-related impacts to human safety and property from cumulative actions outside the scope of the *Final Yosemite Valley Plan/SEIS* (e.g., increased overnight lodging within the floodplain in El Portal would increase flood-related risk to human safety and property) would outweigh the beneficial impacts of this alternative.

Wetlands

In this section, wetlands were evaluated in the following locations: Yosemite Valley, El Portal, Tioga Pass Entrance, South Entrance, and Foresta. The Hennes Ridge, Wawona, and Big Oak Flat Entrance locations have no wetlands and are not discussed below. There are no actions proposed at Badger Pass, South Landing, or Hazel Green in this alternative.

S I Z E

Yosemite Valley

Wetland impacts would take place in the wetland types in Yosemite Valley shown in table 4-118. Acres of impacts are estimated based on geographic information system analysis of meadow and riparian vegetation types from the Yosemite Valley vegetation map (NPS 1994e).

There would be a net gain of 104 acres of wetlands in the Valley. In Yosemite Valley, about 131 acres of wetlands would be restored, 12 acres of new development in wetlands would take place, and 15 acres of redevelopment in potential wetlands would take place under Alternative 5. Overall, this would be a moderate, long-term, beneficial impact on the size of wetlands in Yosemite Valley.

Wetland Types	Restoration (Beneficial Impact) (acres)	New Development (Adverse Impact) (acres)	Redeveloped (Potential Adverse) (acres)
Palustrine Emergent	42	5	5
Palustrine Scrub Shrub	41	0	1
Palustrine Forest	41	7	9
Riverine Upper and Lower Perennial	7	0	0
Total	131	12	15

Restoration would take place primarily at the cabin area at Yosemite Lodge, parts of Upper and Lower River Campgrounds, North Pines Campground, Lower Pines Campground, Backpackers and Group Campgrounds, the River Protection Overlay portion of Housekeeping Camp, Camp 6, and Swinging Bridge Picnic Area.

New development in wetlands could take place on 12 acres. Wetland delineation would be completed prior to the planning and design phase for Curry Village, where potential wetlands have been identified, to maximize the opportunity for wetland avoidance and minimization of adverse impacts. If wetlands are present in the area, adverse impacts would be avoided during site design and minimized through design modifications to the greatest extent practicable. If potential adverse impacts on wetlands are disclosed in subsequent planning efforts, additional compliance documentation would be completed as appropriate.

Potential impacts to wetlands would require a Wetland Statement of Findings to be prepared in accordance with Director’s Order #77-1. Wetlands proposed for restoration by this *Final Yosemite Valley Plan/SEIS* would be counted toward the compensation of wetlands if needed for future compliance. A wetland delineation and a functional analyses would be included in each Statement of Findings. A U.S. Army Corps of Engineers 404 permit would be prepared as required.

Redevelopment in potential wetlands under Alternative 5 would occur on about 15 acres (see table 4-118). The larger areas of redeveloped wetland would occur at Sentinel Beach Picnic Area and Upper Pines Campground. Wetland delineation would be completed prior to the design phase for the proposed Sentinel Beach Picnic Area. Wetland delineation has been completed for Upper Pines Campground (Kleinfelder 1998). Redevelopment within wetland boundaries would be avoided in the Upper Pines Campground area. Redevelopment in areas adjacent to wetlands would occur primarily at Yosemite Lodge, Yosemite Village, and Ahwahnee parking. Redevelopment could have a minor, beneficial effect on neighboring wetlands if water flows that sustain wetlands are improved in the site design.

Redeveloped wetlands may be considered an adverse impact if the sites still qualify as wetlands. Procedural Manual #77-1, Section 5.4 states that “development activities proposed for wetland

sites that have been modified or degraded as a result of human activities” (but still meet the wetland definition) are considered “new actions” subject to Director’s Order #77-1 and other statutes. Consequently, degraded wetlands should not be treated as preferred development sites simply because they are already in an impacted condition.

Out-of-Valley Areas

No impacts on the size of wetlands would occur at Hennes Ridge, El Portal, South Entrance, Tioga Pass Entrance, or Foresta.

I N T E G R I T Y

Yosemite Valley

The integrity of wetlands would be improved by actions proposed in Alternative 5 in terms of the benefits of the River Protection Overlay such as the re-establishment of riverine and palustrine forest wetlands along the Merced River. The restoration of campgrounds to natural conditions would also decrease foot traffic along the Merced River and allow these wetlands to become reestablished.

Under Alternative 5, no transportation-related activities would directly benefit wetlands. Transportation-related activities that could have indirect adverse impacts on wetlands include the realignment of Northside Drive south of Yosemite Lodge and construction of a new bridge across Yosemite Creek. These indirect impacts would include increased runoff and potential changes to wetland hydrology. These impacts would be mitigated through treatment ponds and road design. Direct impacts to riverine and palustrine forest would occur with the new bridge construction across Yosemite Creek; however, this would be a minor, adverse impact because of the existing level of impact that has occurred to these wetlands.

Out-of-Valley Areas

In El Portal, implementation of the River Protection Overlay and protection of existing wetlands at Hennessey’s Ranch would minimize wetland impacts. Rebuilding the levee could adversely affect wetlands within the levee alignment. These impacts would be minimized by restoration of the riverine and palustrine forest wetlands between the levee and the river’s edge. Should parking be constructed near the El Portal Community Hall, site designs would protect the historic river channel. Impacts on wetlands in El Portal are expected to be long term and minor and would not affect the overall viability of wetlands in the area.

In Foresta, a one and one-half acre artificial palustrine scrub shrub wetland (in an old borrow pit) is directly adjacent to the proposed parking site and is expected to be impacted by heavy foot traffic. This would be a long-term, minor, adverse impact on wetlands in Foresta, with implementation of appropriate mitigation measures (see Vol. IA, Chapter 3). Wetlands adjacent to McCauley Ranch would be avoided through site design with relocation of stable operations to Foresta. Radiating impacts from increased nutrients and potential non-native plant species introductions from the stables would be minimized by aggressive management of stock waste and feed.

CONNECTIVITY

Yosemite Valley

The entire riparian corridor in Yosemite Valley along the Merced River would be restored, reconnected, and protected from future degradation by implementation of the River Protection Overlay and removal of campgrounds at Upper and Lower Rivers Campground and other areas. This would be a long-term, major, beneficial impact on palustrine forest wetland connectivity in Yosemite Valley, though benefits to palustrine emergent wetlands would be minor.

Out-of-Valley Areas

No additional adverse impacts on wetland connectivity would take place in El Portal, Foresta, Henness Ridge, or Tioga Pass Entrance beyond those presented in Alternative 1.

CONCLUSION

Under Alternative 5 there would be a 104-acre net gain in the size of wetlands. The implementation of the River Protection Overlay would enhance the integrity of existing wetlands along the Merced River. Wetlands would remain fragmented by campgrounds and roads in Stoneman and Ahwahnee Meadow, parking at Camp 6, and other infrastructure. The actions that are proposed in Alternative 5 would have a long-term, moderate, beneficial impact on the size, integrity, and connectivity of wetlands in Yosemite Valley.

Under Alternative 5 there would be a long-term, minor, adverse impact on wetland integrity in Foresta and El Portal. Henness Ridge would have no wetland impacts. Heavy foot traffic would have minor impacts to wetland integrity at the Tioga Pass Entrance.

CUMULATIVE IMPACTS

Past, present, and reasonably foreseeable future actions that could have a cumulative impact on wetlands are all considered to be long term.

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS); U.S. Forest Service management plans for adjacent wilderness; the Wilderness Management Plan Update (NPS); and the Fire Management Plan Update (NPS) could provide benefits to the size, integrity, and connectivity of wetlands. Cooperation among land management agencies would increase the opportunity to share common objectives and improve resource protection. These plans could also increase knowledge of resources and recreational use; they have the potential to have long-term, moderate, beneficial impacts on wetlands, though the proposed management direction has not been finalized. The Merced Wild and Scenic River Comprehensive Management Plan would affect wetlands through zoning and management designed to protect the river system and adjacent wetlands with long-term, major, and beneficial impacts.

The Tuolumne Meadows Water and Wastewater Improvements (NPS) project and the Mariposa Creek Pedestrian/Bike Path (Mariposa Co.) project are in the early stages of planning. Until the scope and design of these projects is determined, it is not possible to determine the extent of impacts on wetlands in these areas.

Other projects approved or planned for construction that could have beneficial effects on wetlands include erosion mitigation projects in Tamarack, Yosemite Creek, Bridalveil, and Hodgdon Meadows, and the Merced River at Eagle Creek Ecological Restoration Project (Yosemite Valley). Erosion control could enhance and strengthen palustrine forest and palustrine scrub shrub wetlands. The Eagle Creek project would revegetate riverbanks of palustrine forest and palustrine scrub shrub wetland. The erosion control and restoration projects would have long-term, localized, and therefore minor, beneficial impacts on wetlands.

Projects approved or planned for construction that could have adverse effects on wetlands include the Yosemite View Parcel Land Exchange (NPS), University of California, Merced campus (Merced Co.), and the Hazel Green Ranch (Mariposa Co.) project. The Yosemite View Parcel Land Exchange could directly affect existing palustrine forest and palustrine emergent wetlands. A wetland traverses the Hazel Green Ranch site, though proposed new development would not take place within the wetland corridor. The long-term direct impacts on wetlands would be moderate and adverse due to the relative rarity of undeveloped wetlands between the elevations of 1,000 and 3,000 feet and the relative importance of remaining habitat in the Sierra Nevada. Foothill areas below about 3,300 feet appear to have the greatest loss of wetlands of any region in the Sierra Nevada (UC Davis 1996a) and are particularly important in terms of their productivity and diversity.

Large-scale benefits to wetlands could take place as a result of regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and the Merced River Plan. Should substantial or full implementation of the actions included in these plans occur over time, long-term cumulative impacts on wetlands may, on balance, be moderate and beneficial. These regional plans are tempered by adverse impacts that include existing infrastructure to divert water away from wetlands in Yosemite Valley, and projects impacting wetlands outside the park with the potential direct loss of wetland habitat, including at the Yosemite View Parcel Land Exchange (NPS), and University of California Merced campus (Merced Co.) projects.

When the impact of the past, present, and future actions are combined with the actions proposed in Alternative 5, there would be a minor, beneficial impact on wetland size.

Soils

The following discussion identifies and characterizes the soils impacts expected from implementation of Alternative 5. Impact intensities are based on the size, type, and disturbance history of the soil resources impacted. Soil resources are identified as highly valued resources (HVR), resilient (R) or other (O). The primary activities that would affect soil resources are discussed for each of the project areas. Generally, adverse impacts to soils would include a combination of soil removal, profile mixing, compaction, erosion, and contamination. Beneficial impacts would occur as a result of soil restoration. Construction-related impacts (such as compaction from equipment and erosion) would be expected to be short term and temporary, because they would be minimized through the use of Best Management Practices and would occur for a limited time. All other impacts are expected to be long term unless otherwise noted.

YOSEMITE VALLEY

Approximately 228 acres would be affected by actions proposed under Alternative 5 (table 4-119). Highly valued resource soils comprise 122 acres, resilient soil resources comprise 83 acres, and other soils comprise 23 acres. Of the total area affected, 161 acres would be restored, while 67 acres would be associated with new development. Construction-related impacts (short-term) would be negligible to minor because Best Management Practices would be used to minimize erosion and to contain construction activities to the immediate area. Some minor discrepancies between acreages in the text and tables may occur due to rounding, differences in mapping sources, and because impacts less than 1 acre were not mentioned in the text. A summary of affected Valley soils is found in table 4-119.

**Table 4-119
Summary of Soil Types Affected**

Soil Type	Resource Type ¹	Development Limitations ²	Affected Area (acres)	
			Restored	Developed
101 Riverwash, 0-2%	HVR	F (frequent), SBE, HWT	9	-
102 Riverwash, 1-4%	HVR	F (frequent), SBE, HWT	-	-
104 Aquandic Humaquepts, 0-2%	HVR	F (frequent), HWT	4	-
105 Histic Haploaquols	HVR		-	-

900 Rock outcrop	O	B	-	-
Total Area Affected			161	67

1. HVR = Highly valued resource soil, R = Resilient soil, O = Other soil (non-HVR and non-Resilient)

2. F=Flooding, SBE=Stream Bank Erosion, SE=Slope Erosion, HWT=High Water Table, D=Doughty (low water holding capacity), LOS=Loss of Organic Surface, C=Compaction, AC=Active Colluvium, B=Bedrock Out-of-Valley

Source: Soil Survey of Yosemite National Park, Yosemite Valley, California (SCS 1991)

Curry Village

Approximately 22 acres would be affected by actions proposed under Alternative 5: 15 of these acres would be restored (HVR= 9, R= 3, O= 3); and 7 acres would be developed (R= 5, O= 2). The proposed development activities would have a negligible, adverse effect on soil resources because of their small size (7 acres) and focus on resilient soil resources. Overall, Alternative 5 would have a minor, beneficial effect on the soil resources in Curry Village.

Yosemite Lodge

Approximately 49 acres would be affected by actions proposed under Alternative 5: 42 of these acres would be restored (HVR= 18, R= 23, O= 1); and 7 acres would be developed (R= 6, O= 1). Restoration of the floodplain area between Yosemite Lodge and the Merced River would result in major, beneficial impacts to soil resources. Construction activities, such as those required for additional housing units and the new bridge south of the Yosemite Creek Bridge, would have negligible, adverse impacts since these activities are concentrated on resilient soils and the size of the impact would be relatively small. The overall impact to soil resources at Yosemite Lodge would be major and beneficial.

Yosemite Village

Approximately 20 acres would be affected by actions proposed under Alternative 5: 6 of these acres would be restored (HVR= 5, O= 1), and 14 acres would be developed (R= 6, HVR= 8). The adverse impacts would be due to construction activities related to the visitor center, and day-visitor parking. The net effect of the actions proposed at Yosemite Village would be a negligible, adverse effect on soil resources.

West Valley

Approximately 11 acres would be developed by actions proposed under Alternative 5 (R= 7, O= 4). Adverse effects are related primarily to the construction of the North American Wall Picnic Area and the El Capitan crossover. Both activities would occur on previously undisturbed resilient or other soil resources. The overall impact of activities planned for the west Valley would be minor and adverse because of the relatively small impact area and resource type.

Campgrounds

A total of 126 acres would be affected by actions proposed under Alternative 5: 97 of these acres would be restored (HVR= 86, R= 11); and 29 acres would be developed (R= 27, O= 2). Fewer campground areas would be restored under Alternative 5, with a resulting lesser beneficial impact. Campground restoration activities would result in moderate, beneficial effects. Adverse effects would be related to the development of new campground areas. Nearly all of the proposed area for new campgrounds would affect resilient soil resources. Generally, the impacts of campground development would be less disturbing to soil resources than other construction activities. Thus, although the area of impact would be relatively large (29 acres), the actual area of soil disturbance would be much less extensive. Adverse effects due to campground development

are expected to be moderate. The overall impact within the campground area would be moderate and beneficial due to the amount of restoration proposed.

Roads and Trails

Transportation corridors such as multi-use paved trails and roadways have the potential to affect several soil resource types. Generally, trail construction would occur adjacent to existing linear corridors such as roads or utilities, or would be upgrades of existing informal trails. The impact of new trail construction would be adverse; however, the impact would be minor since the impacts would primarily be in linear segments of previously disturbed soils. New trails would be constructed to accommodate surface and subsurface water flow. Additionally, upgrades to existing trails would decrease erosion in high-use areas. Overall, the construction of new roads and trails would have minor, adverse effects.

OUT-OF-VALLEY

Soils information is limited for many of the out-of-Valley locations. The following discussion is based on the available general soils information or extrapolated from other local soil surveys. It is assumed that out-of-Valley impacts would likely occur on resilient soil resources, because the geographic features outside of the Valley tend to be less constricting than those in the Valley. Disturbance to highly valued resource soils would be avoided as practicable, to reduce the likelihood of impacts on highly valued resource soils. General Best Management Practices and design requirements would reduce potential impacts to other soils. Thus, the following discussion is based on the premise that the majority of adverse impacts would occur on resilient soil resources, where feasible.

El Portal

All of the impacts at El Portal would be long-term and adverse. Impacts are related to the construction of parking facilities and employee housing. Soils within the El Portal area tend to be susceptible to mass movement and erosion and have substantial development limitations. Therefore, Best Management Practices and other mitigation measures described in Vol. IA, Chapter 2, Soil Mitigation would be implemented to minimize erosion and soil movement. Due to the size of the proposed activities and the limited space available for construction, this alternative would have a moderate, adverse impact on soil resources in the El Portal area.

Heness Ridge

Under Alternative 5, construction of a parking facility at Henness Ridge would require a relatively small area of development. Generally, the soils at Henness Ridge are suitable for the proposed activity. Impacts are expected to be moderate and adverse.

Foresta

Impacts to soils in Foresta would occur if the National Park Service and concessioner stables are relocated to McCauley Ranch, and as a result of the reconstruction of employee beds destroyed in the 1990 A-Rock fire. However, impacts would be minor and adverse, because soils in these areas tend to be resilient and the area of impact would be relatively small. A day-visitor parking

facility would also be constructed in Foresta, and would result in moderate, adverse impacts to soils.

Wawona

The soils within the Wawona area have mostly minor limitations for structures. Construction of housing facilities would occur on mostly resilient soils that are suitable for this use and would be expected to cause minor and adverse soil impacts.

Entrance Stations

Development or redevelopment of visitor centers near the existing entrance stations would result in adverse impacts to soil resources. The centers would be developed adjacent to existing stations, and generally would be located in areas suitable to the proposed use. The size of impact for each facility would be relatively small in relation to the surrounding soil resources. The impact due to construction of visitor centers would be negligible and adverse.

C O N C L U S I O N

Four out of the five Valley locations would have overall beneficial impacts under this alternative, which proposes restoration of 161 acres and new development of 67 acres. West Valley would have the largest adverse impact. This adverse impact would be offset to a large extent by the restoration of 114 acres of highly valued resource soils, 33 acres of resilient soils, and 14 acres of other soil resources. The proposed developments would be focused on resilient soils (51 acres). Thus, the overall impact of Alternative 5 in the Valley would be minor and beneficial.

The actions under Alternative 5 would affect approximately 80 acres outside of the Valley. Most of this impact would be focused on resilient soil resources. Proper use of engineering controls and mitigation measures would result in an overall moderate, adverse impact on out-of-Valley soils.

Overall, Alternative 5 would have beneficial impacts on 161 acres and adverse impacts on approximately 67 acres. Out-of-Valley development would affect approximately 80 acres of non-highly valued resource soils. Generally, the facilities that would be relocated outside of the park would affect less sensitive resources than are currently being affected in the Valley. Furthermore, facility design and construction would use current technologies and Best Management Practices to minimize impacts. Out-of-Valley impacts would be locally moderate and adverse, but would occur on resilient soil resources at all locations except for El Portal. The overall impact for Alternative 5 would be negligible and beneficial because of the smaller scale restoration and adverse impacts at El Portal, Henness Ridge, and Foresta.

C U M U L A T I V E I M P A C T S

The impacts of past, present, and reasonably foreseeable future areawide projects would be the same as described under Alternative 2, minor and adverse. In relation to the expected impacts resulting from areawide projects, the beneficial impacts related to restoration under this alternative would be substantial because they would be the primary beneficial impacts on soil resources that would occur in the region. Thus, the actions of this alternative would serve to offset some of the adverse cumulative effects of other projects in the vicinity of the park. Therefore, the

cumulative impact of Alternative 5, in conjunction with other areawide projects, would be negligible and beneficial.

Vegetation

All impacts on vegetation are considered long term unless otherwise noted. Short-term impacts would occur during construction or implementation of actions. Based on the mitigation measures to be taken (see Vol. IA, Chapter 2), all short-term impacts are expected to be negligible.

The composition of plant communities found in Yosemite Valley and those in out-of-Valley locations varies considerably. For example, the dominant plant species within a riparian vegetation type in El Portal would not be the same as those found within a riparian vegetation type in the Valley. Therefore, vegetation types in each of the distinct out-of-Valley locations analyzed for this section are described separately from the vegetation types described for the Valley.

YOSEMITE VALLEY

The actions proposed under Alternative 5 would result in a net gain in all plant community types, except upland and other. Table 4-120 summarizes the total areas of each vegetation type that would be adversely and beneficially impacted by this alternative. Minor discrepancies in totals between table and text are due to rounding impacts to the nearest acre. It should be noted that the size of the area affected was only one of the factors used to evaluate impact magnitude. The continuity, productivity, natural structure, and diversity of the vegetation type were also factors considered in this impact analysis.

Table 4-120 Yosemite Valley Vegetation Impacts		
General Vegetation Types	Acres Impacted	
	Beneficial	Adverse
Upland	16	48
California black oak	15	4
Meadow	42	5
Riparian	89	7
Other	0	5
Total	+ 162	- 69
Net Impact	+ 93	

Note: Acreages presented in this table do not include features due to linear features such as roads and trails. These impact types are discussed separately in the text.

Approximately 93 acres of existing developed or disturbed areas within the Valley would be restored to natural vegetation through the restoration actions described below. These actions would have a long-term, major, beneficial impact to the continuity of Yosemite Valley’s plant communities.

Due to their linear nature, transportation corridors (such as multi-use paved trails and roadways), would have the potential to affect multiple vegetation types. Therefore, rather than repeating this discussion under each vegetation type below, road and trail impacts are generally described here. Under Alternative 5, new multi-use paved trail segments would be constructed. Generally, these trails would either parallel existing linear corridors such as roads or utilities, or would be located

within areas that have been previously disturbed by past actions or informal trails. The purpose of these new trail segments would be to provide connections to existing trails, thus improving the overall paved trail network for alternative modes of transportation through the Valley and minimizing the need for cars. The impact of the new trail construction would be adverse to vegetation; however, the impact would be minor given the small amount of vegetation impacted (3 acres). The impacts would occur primarily in previously disturbed uplands (non-highly valued resource), and the trails would be designed to avoid mature trees as much as possible and accommodate surface and subsurface water flow. New paths would increase habitat fragmentation. Similarly, the one segment of realigned roadway and the one widened roadway would also have minor, adverse impacts on vegetation (0.7 acre). The new bridge over Yosemite Creek would have a moderate, adverse impact on a small area of California black oak vegetation (0.5 acre) adjacent to the existing bridge.

Restoration of meadow (0.5 acre) and California black oak (0.5 acre) vegetation would occur as a result of road removal within the turnout lanes at Northside Drive through El Capitan Meadow and Southside Drive through Sentinel Meadow. The impact on these vegetation types would be minor and beneficial since they are both highly valued resource types.

Overall, the road and trail impacts would have a negligible adverse effect on vegetation because any adverse effects would occur on previously disturbed, non-highly valued resource types and the beneficial effects to highly valued resources would be small.

Upland Communities

Uplands comprise the largest vegetation type within Yosemite Valley. Alternative 5 actions would result in the restoration of approximately 15 acres of currently undeveloped upland vegetation in the east Valley, and new development would impact roughly 48 acres of upland. The overall impact of this alternative on uplands would be minor and beneficial due to improved conditions of upland vegetation through the re-introduction of fire (prescribed burning) and decreased community fragmentation.

Beneficial Impacts

The main areas of restoration within upland communities would include the Group and Backpackers Campgrounds (3 acres), the talus slope at Curry Village (6 acres), the Yosemite Lodge area (5 acres), and the Church Bowl Picnic Area.

The beneficial effects of Alternative 5 on the size and continuity of upland vegetation would include the following:

- At the Group and existing Backpackers Campgrounds area, restoration would include small areas of upland mixed in with other high-value vegetation types. This restoration would have a minor impact.
- In the area between the Yosemite Lodge and the Merced River, areas of restoration would provide a continuous California black oak and upland vegetation corridor, linking the upland areas to restored riparian and meadow areas. This impact would be moderate.

- The Church Bowl Picnic Area restoration would have minor impacts on overall upland vegetation continuity.
- In the Ahwahnee utility area (3 acres), the current utility area would be removed and restored to upland vegetation, thus restoring habitat continuity. This impact would be minor.
- In the talus slope zone of Curry Village (6 acres), the continuity of upland stands of canyon live oak would be improved by the removal of housing and restoration of the talus slopes, resulting in a moderate impact.

The beneficial impacts to natural structure, diversity, and productivity of the upland vegetation would include the following:

- The canyon live oak community at Yosemite Village would be made more continuous through the removal of outbuildings and the National Park Service stables in the vicinity of the NPS Operations Building (Fort Yosemite), with restoration of these areas to natural vegetation cover resulting in improved habitat and decreased fragmentation. This impact would be moderate.
- The ability to manage many of the continuous, unnaturally dense stands of incense-cedar and ponderosa pine with fire would be increased. This would help slow or stop the spread of annosus root rot through many of the currently developed areas of the east Valley (such as the Upper and Lower River Campgrounds area) and would improve overall forest health. This impact would be major.
- The need to manage hazard trees within and around developed areas would be reduced because many current upland vegetation areas would be restored. Older individual trees and snags would be retained that provide important wildlife habitat. This impact would be minor.
- The productivity of smaller, more disjunct stands of upland coniferous vegetation would increase as a direct result of prescribed fire, a reduction of stand densities, a reduction in spread of annosus root rot (due to reduction in stand densities), and establishment of understory herbaceous and shrub vegetation. This impact would be major.
- The understory integrity, diversity, and overall productivity of upland vegetation would continue to improve due to the re-establishment of native understory resulting from the reduction of trampling in developed zones in the east Valley. This impact would be moderate.
- The encroachment of upland vegetation into meadows and oak communities would be reversed through fire management. The upland community would be reduced in size under Alternative 5 due to the removal of various developments in the east Valley, which would facilitate the ability of National Park Service staff to manage these areas with prescribed fire and other management tools. This would have a moderate effect on upland communities.

Adverse Impacts

The new development in upland areas would occur within both the east and west Valley and would generally be concentrated in areas that have been previously disturbed. Most of the adverse impacts in the east Valley would be in the area of the new walk-to campground north of Tenaya Creek, walk-in and drive-in campgrounds east of Upper Pines Campground (21 acres), South Camp and Backpackers Campground, the new campground check-in station at the east end of Curry Village, Yosemite Lodge (6 acres) and Curry Village (5 acres). The adverse west Valley impacts would occur mainly at the potential El Capitan crossover checkpoint (10 acres) and the North American Wall Picnic Area (2 acres).

The adverse impacts on upland community size, continuity, natural structure, diversity, and productivity would occur within the following areas:

- At Yosemite Lodge, the addition of lodging into the area north of existing Northside Drive and parking within the area would cause adverse, minor impacts to upland coniferous forest and canyon live oak communities due to establishment of new buildings, paved trails, and the need to trench underground to provide utilities for these structures. This area has been previously disturbed.
- At the Upper and Lower River Campgrounds area, upland communities would also be converted from existing upland back to a mosaic of California black oak, riparian, and meadow communities through the removal of fill material. This would have only a minor impact on upland communities because this area does not have an intact understory and was not originally upland vegetation.
- The new walk-in campgrounds in the Valley would have a moderate impact on upland communities due to trampling of the understory layer.
- The addition of South Camp and the relocated Backpackers Campground would result in moderate upland impacts due to trampling and loss of understory vegetation.
- New lodging at Curry Village would be constructed outside of the talus slope zone near the existing lodging. This impact would be minor because the area is currently impacted by trampling.
- Potential development of a traffic check station (if required) at El Capitan crossover would have a major impact on up to 10 acres of relatively undisturbed upland vegetation because of the additional pavement, utilities, and infrastructure.
- A number of the restoration actions proposed would convert existing upland vegetation types to highly valued resource types (meadow, riparian, California black oak). This would have a minor impact on upland vegetation communities because many areas to be converted were originally highly valued resource vegetation types that have since been modified due to human influences.

California Black Oak Communities

The California black oak vegetation type is considered a highly valued resource because of its transitional character between wet meadows and drier uplands, as well as its links to wildlife and ethnographic resources. Under Alternative 5, the actions proposed would result in approximately

4 acres of adverse impact and about 16 acres of beneficial impacts to this community. The overall impact of this alternative on California black oak would be major and beneficial.

Beneficial Impacts

The restored California black oak areas would primarily be in portions of the Upper and Lower River Campgrounds area, Lower Pines and Backpackers Campgrounds (12 acres), the Yosemite Lodge area (1 acre), the Ahwahnee tennis courts (1 acre), and the Superintendent's House (Residence 1) (1 acre).

The beneficial effects of Alternative 5 on the size and continuity of California black oak vegetation types would include the following:

- The reduction in size of North Pines Campground and its change from a drive-in to a walk-in area would facilitate an improved ecotonal transition from the riparian communities near Tenaya Creek and the Merced River to more California black oak stands to the south and east, thus slightly increasing the size of both vegetation communities as well as reducing some of the habitat fragmentation in this area. This impact would be minor.
- The relocation of the concessioner stable from its current location to one east of Curry Village would facilitate a continuous ecotonal transition from the riparian communities near Tenaya Creek and the Merced River to more California black oak stands to the south and east. This would increase the size of both communities and result in minor, long-term benefits.
- At Yosemite Lodge, adjacent areas of California black oak would be restored, thus creating a larger, more continuous area of potential California black oak woodland. Due to the presence of a large annosus root rot population in the area, landscaping would focus on California black oaks (which are resistant to annosus root rot) rather than conifers, leading to a greater proportion of oaks in this area. Long-term, moderate impacts would result.
- Removal of the Ahwahnee tennis courts and associated non-native vegetation would remove the gap in this otherwise intact oak woodland that surrounds the courts, thus improving the continuity of the oak woodland through the entire area between the Upper and Lower River Campgrounds and Ahwahnee Meadow to The Ahwahnee. This action would result in a moderate impact to the oak woodland community.
- Removal of some fill material at restoration sites (such as the Upper and Lower River Campground area) would remove habitat for upland communities and restore original lower (topographic) layers to California black oak woodland, which would result in long-term, major benefits.
- Restoration at the Superintendent's House (Residence 1) and the Church Bowl Picnic Area would result in minor, beneficial impacts (primarily due to their small size).
- California black oak stands in the east Valley would be minimally fragmented by development, roads, and encroaching conifers due to the enhanced ability of the National Park Service to manage areas with fire, removal of facilities, and restoration of areas such

as the Ahwahnee tennis courts and portions of the Upper and Lower River Campgrounds areas, into a mosaic of oak woodlands, meadows, and riparian areas. Moderate impacts would result.

- The natural structure of California black oak stands in the west Valley would improve due to prescribed burning, with the subsequent reduction in conifer encroachment resulting in a moderate impact. Other components of California black oak communities, such as deer grass (an important ethnographic resource), would significantly increase due to the reintroduction of natural and simulated natural processes (such as fire and corrections in drainages), resulting in a moderate impact.
- The correction of drainage problems associated with roads (potentially on Northside Drive at El Capitan Meadow and Southside Drive in the Bridalveil Fall area) and the removal of roads through Ahwahnee and Stoneman Meadows would improve the condition of California black oak stands in these locations by re-establishing natural drainages. These actions would correct problems associated with the impoundment of water upslope of roads, which keeps soils wetter for longer periods during the summer and encourages armillaria rot to become fully established. These drainage corrections would result in major impacts to vegetation communities.
- The restoration of historic landscaping characteristics at the Yosemite Village Historic District housing area would improve the condition of existing mature California black oaks and facilitate the establishment of younger generations of these trees within the district, thus improving stand structure and increasing the continuity of stands in this portion of the Valley. Moderate impacts would be expected.

Adverse Impacts

The adverse impacts on California black oaks under Alternative 5 would primarily be a result of new lodging at Curry Village (5 acres) and South Camp (2 acres) and construction of a parking lot east of Curry Village for backpackers (3 acres). The adverse effects of Alternative 5 on the size, continuity, natural structure, diversity, and productivity of California black oaks would include the following:

- The development of additional lodging units adjacent to Stoneman House would result in a direct loss of some mature oak trees and a loss of regenerating saplings, and understory structure and function. In addition, radiating human activities and a lack of prescribed burning would continue encroachment by conifers, thus leading to a gradual shift from a California black oak-dominated community to a mixed conifer, California black oak community that is more common in the Valley. The shift in the dominant vegetation community's composition would result in long-term, moderate impacts.
- The addition of the new South Camp walk-in sites would result in moderate impacts to California black oak due to trampling and loss of understory vegetation.
- Mature California black oak trees would potentially be removed during site grading and development, and additional trees could be lost with root impacts during construction, changes in drainage, and hazard tree removal, thereby resulting in loss of stand structure

and continuity in all areas of proposed development and redevelopment of the east Valley. This impact would be moderate and long term.

Meadow Communities

The meadow vegetation communities within Yosemite Valley are similar in size to the California black oak vegetation communities. The overall impact on meadow vegetation would be moderate and beneficial, with 42 acres of beneficial impacts and 5 acres of adverse impacts.

Beneficial Impacts

The proposed actions under Alternative 5 would have a beneficial impact to 42 acres through restoration. This would include 21 acres in the campgrounds, 20 acres at Yosemite Lodge, 1 acre at Superintendent's House (Residence 1), areas within the River Protection Overlay throughout the Valley, and benefits through improved water flow and a decrease in radiating impacts such as trampling.

The beneficial effects of Alternative 5 on the size and continuity of meadow vegetation types would include:

- The ecological restoration of the entire area south of the proposed new road alignment at Yosemite Lodge (aside from utilities and access near the confluence of the Merced River and Yosemite Creek) would have major, beneficial effects to the ecological function of this section of the Valley, with the potential for increased meadow acreage, enhanced wetlands, and minimal habitat fragmentation of a large low-lying area.
- An area of North Pines Campground within the River Protection Overlay would be restored to meadow; this would be a minor, beneficial impact due to the small area and radiating campground impacts.
- Meadow size (of Ahwahnee and Stoneman Meadows by the removal of the bisecting roads) would increase substantially, with improved natural drainage patterns and continuous meadow cover over large areas of the east Valley. This would result in a major impact.
- Areas of former meadow at the Upper and Lower River Campgrounds area; Ahwahnee Meadow where it is bisected by Northside Drive; former sections of Lower Pines Campground, Southside Drive near Bridalveil Fall, and Cook's Meadow would be restored by unburying meadow soils where fill was added. Hydrology would be restored over time through the restoration of original topographic variations and re-establishment of native herbaceous species due to improved soil and hydrologic conditions. This impact would be major.
- Connectedness of meadows to riparian and wetland areas would be created by removing roads and reconstructing portions of roads to facilitate natural drainage patterns, which would result in a major impact.
- Implementing the River Protection Overlay, with access direct to appropriate sites along the river, would minimize impacts to this critical ecotone and result in a major impact.

- The modification of roads at Bridalveil, El Capitan, and Cook's Meadows to allow drainage would allow for the re-establishment of functioning oxbow and cutoff channels through meadows. These modifications would create a critical link between meadow, riparian, and wetland systems, with increases in native plant establishment (due to wetter conditions), greater native biodiversity, and greater overall productivity due to changes in species, food for wildlife, cover, etc. This action would result in a major impact.

Adverse Impact

The actions proposed under Alternative 5 would result in negligible adverse impacts to the size, continuity, natural structure, diversity, or productivity of meadow vegetation types in Yosemite Valley, with consolidation of day-visitor parking at Yosemite Village/Camp 6 (1 acre) and management of Lamon Orchard for retention of this cultural resource. Impacts to underlying and adjacent meadow vegetation would be increased by these actions.

Adverse impacts to the size and continuity of meadow communities are listed below:

- Construction of new parking in the area of Camp 6 would result in negligible impact to the remaining meadow fragments (the existing meadow is less than an acre in size and severely fragmented by roads, trails, and utility lines).
- Development of a multi-use paved trail between Curry Village and Yosemite Village through Upper and Lower River Campgrounds area, as well as a picnic area in the Lower River Campground area, would not allow for the complete elimination of habitat fragmentation and impacts to existing and potential meadow and riparian zones. Aligning the multi-use paved trail along the utility corridor through the Upper and Lower River Campgrounds area, and construction of the picnic area near Housekeeping Bridge and the paved trail would minimize fragmentation somewhat (by overlapping uses), resulting in a minor impact.
- Development of a vehicle management station (if required) at El Capitan crossover could result in undesired and unplanned parking along road shoulders at El Capitan Meadow, resulting in additional impacts from vehicles, trampling, the continued need to remove hazard trees, and introduction of non-native plant species into the meadow. However, these radiating impacts would be mitigated through restricting parking along the roadway and restricting human use of the meadow, resulting in a minor impact.

Riparian Communities

Alternative 5 actions would result in an adverse impact on an estimated 7 acres of riparian vegetation but would create beneficial impacts on over 89 acres of riparian vegetation. The overall impact of this alternative on riparian vegetation would be major and beneficial.

Beneficial Impacts

Restoration actions would be concentrated in the floodplain areas near Yosemite Lodge (17 acres); the Upper and Lower River, Lower Pines, Group and Backpackers Campgrounds and the dump station (58 acres); Housekeeping Camp (9 acres); and the Swinging Bridge Picnic Area (2 acres) as well as the talus slope zone at Curry Village (3 acres).

The beneficial effects of Alternative 5 on the size and continuity of riparian vegetation types would include the following:

- The removal of Sugar Pine and Ahwahnee Bridges would eliminate the hydrologic alterations that are causing loss of riparian vegetation both upstream and downstream of these bridges. This would allow restoration to create continuous riparian bands along a portion of the Merced River and Tenaya Creek through the east Valley, which currently is almost entirely denuded. This action would result in a major impact.
- The removal of Swinging Bridge Picnic Area would improve habitat condition of the riparian communities in this area, thus promoting the establishment of understory and herbaceous vegetation layers that are currently nonexistent. This action would result in a minor impact.
- Restoration of portions of the Upper and Lower River Campgrounds area, the Upper Pines Campground dump station, a portion of Lower Pines Campground, a portion of Housekeeping Campground within the 150-foot River Protection Overlay, and Group and Backpackers Campgrounds would facilitate re-establishment of riparian corridors (oxbows and cutoff channels) through these sites as well as along the Merced River and Tenaya Creek. This impact would be major.
- Restoration of the riparian corridor within the River Protection Overlay at Camp 6 would improve the continuity of riparian habitat along the Merced River corridor through the East Valley, and would provide a connection between the wetland and meadow communities to the northeast and northwest of the proposed Yosemite Village parking area. The improvements would result in a minor impact.
- Removal of the human-built rock-rubble pile from the western channel of Yosemite Creek would allow this channel to flow for a longer period of time, thus enabling riparian vegetation to become established in this currently barren channel. The action would result in a moderate impact.
- Rehabilitation of bridges over Yosemite Creek in the braided stream channel area would remove impacts associated with these undersized bridges, which have resulted in scouring of the channel banks and loss of riparian vegetation. This would provide a moderate improvement and reduce impacts to riparian vegetation in this area in conjunction with removal of the western channel human-built rock-rubble pile.
- The redesign of portions of Southside Drive in the Bridalveil Fall area would facilitate water flow under the road and enhance the continuity of the riparian community upslope and downslope of the existing road. This impact would be moderate.
- Converting the trail south of the Happy Isles Loop Road between Curry Village and Happy Isles to a multi-use paved trail would result in continued and increased negative impacts to the fen (an alkaline wetland fed from groundwater sources located near Happy Isles) and adjacent riparian vegetation. These impacts would be due to the widening of the current trail to accommodate heavier bicycle traffic, with a long-term loss of more fen habitat. This fen is the only one of its kind in Yosemite National Park, and any impacts would be considered major due to the rarity of this type of vegetation community.

- Repair and construction of the road between the Cascades Diversion Dam and Pohono Bridge would eliminate road-edge parking and the resultant human impacts on riparian vegetation along this section of the Merced River corridor. This impact would be minor.

Adverse Impacts

Adverse impacts on riparian vegetation would occur at the new walk-in campgrounds east of Upper Pines Campground (7 acres) and at the new lodging at Curry Village (4 acres). Additional impacts would occur as a result of radiating use from new and redeveloped sites.

The adverse impacts to the size, continuity, productivity, diversity, and structure of riparian vegetation are listed below:

- At Curry Village, a small area of riparian vegetation would be impacted so that existing lodging can be relocated outside of the talus slope zone. This new lodging development would be designed to minimize impacts to riparian vegetation. This would result in moderate local impacts. In relationship to the overall impacts to riparian vegetation these impacts would be minor.
- Walk-in camp sites would have minor impacts on riparian vegetation due to trampling and localized fill for tent pads.
- Development of a picnic area with restrooms, barbecue grills, and picnic table pads at the Lower River Campground near Housekeeping Bridge could result in moderate, adverse impacts due to trampling and increased radiating human impacts. These impacts would result in a loss of structure and integrity of riparian vegetation, but mitigation would include fencing, signage, and other measures to keep trampling confined to the picnic area. This would result in a minor overall impact.
- Paving or hardening the eastern channel trail at Yosemite Creek for accessibility would directly impact some riparian vegetation because this action would involve widening or relocating the current trail. However, the area of impact would be small, and this site has already had an almost complete loss of herbaceous cover due to undirected foot traffic adjacent to the current access trail to Lower Yosemite Fall Bridge. The resulting impact would be minor.
- Development of a 550-vehicle parking lot in Yosemite Village would have a minor impact on riparian vegetation, from radiating uses to the Merced River. These would be mitigated by directing visitors to resilient areas of the riverbank.

Other Communities

The Alternative 5 actions would result in adverse impacts to about 5 acres of other types of vegetation ground cover. Twenty-five acres of bare ground, orchards, watered lawns, bare areas, and developed open areas would be restored to either upland or highly valued resource vegetation types. The beneficial impacts have been discussed in the upland, California black oak, meadow, and riparian discussions above. They include restoration of much of the Curry Orchard to a mix of meadow, riparian, and California black oak woodlands and restoration of the River Protection Overlay at North Pines Campground to riparian, meadow, and California black oak woodlands.

Adverse impacts would occur in areas where sparsely vegetated lands would be developed, such as the addition of parking at Camp 6 and new housing and lodging at Curry Village. Overall, there would be negligible beneficial impacts on these other vegetation types under Alternative 5.

O U T - O F - V A L L E Y A R E A S

The proposed out-of-Valley day-visitor parking locations would be at Henness Ridge, El Portal, and Foresta. Housing would be developed in Wawona and Foresta and improvements would be made at the South, Big Oak Flat, and Tioga Pass Entrance Station areas. The overall impact of Alternative 5 on out-of-Valley areas would be moderate and adverse.

El Portal

Vegetation in the El Portal area of impact include canyon live oak (a type of upland) and riparian types; however, the plant composition of these types varies from those in the Valley. Meadow and California black oak types are not represented here. The overall impact of this alternative on El Portal area vegetation would be moderate and adverse.

Oak and Upland Communities

ADVERSE IMPACTS

- Existing oak stands would experience moderate, long-term impacts from the development of housing throughout El Portal. A direct loss of trees would occur with the development of housing within areas that are already somewhat impacted by low-density housing, as well as development of new housing sites at Hillside East and Hillside West. These developments would prevent retained trees from reproducing (due to pavement, yard activities, landscaping, trampling, and the presence of structures), resulting in a decrease in the size and continuity of these oak woodlands.
- The natural structure, diversity, and productivity of oak and upland communities would be moderately impacted because of the increased likelihood of non-native plant species and lack of natural fire and fire frequencies.
- Prescribed burning and mechanical treatment of vegetation surrounding El Portal would continue to maintain semi-natural stands of oaks around developed areas. These actions would promote oak regeneration by reducing competing vegetation. Many areas currently managed this way would be developed into housing, parking, and infrastructure, leaving fewer acres of oaks to regenerate, provide habitat, and add to the diversity of this area, which would result in a minor impact.
- The development of a parking area could require the removal of large individual oaks adjacent to the Merced River at Middle Road. The development of housing upslope of this site would eliminate the connectedness of the oak stands on the slopes above El Portal with riparian and flat terrain oak communities. The action would result in a minor impact.

Riparian Communities

ADVERSE IMPACTS

- Riparian areas would receive minor impacts from the development of high-density housing at Hennessey's Ranch (due to their currently impacted condition). Associated increases in human use would cause a decline in the continuity of this vegetation community as social trails develop.
- The size of riparian areas would continue to be impacted by existing developments and new development (at Hennessey's Ranch and Village Center). A continued decline in riparian community size would also occur both in length along the river and width from the water's edge up to the bank edge, resulting in a minor impact.
- An increased human population and an associated increase in landscaping, numbers of vehicles, and foot traffic (and means for seed dispersion), would result in more non-native plant species problems throughout the riparian and oak woodland areas. Increases in non-native species would result in a moderate impact.
- The isolated nature of riparian areas in the El Portal core area (Crane Creek to Foresta Bridge), because of structures and Highway 140 riprap, would continue to inhibit natural exchange of other biological components (mammals, amphibians, and reptiles) as well as wind-dispersed seeds. This would result in lower overall productivity of these areas and a minor impact.

BENEFICIAL IMPACTS

- The removal and restoration of the old treatment plant at Rancheria Flat adjacent to the river would enhance the continuity of riparian vegetation along this bend of the Merced River, with potential increased habitat for rare plant species growing adjacent to the site. This action would result in a major impact to vegetation communities in the area.
- Implementation of the River Protection Overlay and management zoning, prescribed in the *Merced Wild and Scenic River Comprehensive Management Plan*, would help protect the riparian corridor throughout the El Portal Administrative Site.
- Restoration of the sand pit area, with removal of the remaining concrete wing wall and re-establishment of riparian vegetation, would enhance the river corridor and increase potential habitat for Congdon's woolly-sunflower, a state-listed rare plant, resulting in a minor impact.

Foresta

Alternative 5 would not replace Yellow Pine Campground; therefore, no impacts would occur in that area. As under the other alternatives, 14 employee houses would be added, as well as a stable for National Park Service and concessioner administrative use, and a parking facility for 660 vehicles (18 acres). This alternative would therefore have moderate, adverse impacts on vegetation in the Foresta area.

- Use of the Foresta area, and specifically Big Meadow, would likely increase substantially due to the development of a parking facility above the meadow. This would reduce the

size and continuity of vegetation (by paving) and would increase radiating use levels to the riparian and meadow communities in and around Foresta. Impacts would be moderate and adverse.

- Isolated but extreme impacts from the establishment and spread of non-native plant species (including spotted knapweed, yellow star-thistle, and oxeye daisy) would occur at a much more rapid rate from the substantially increased vehicle use of this area with the development of a parking area. Management efforts would continue to attempt to contain and control (and eventually eradicate) existing and new non-native species. This would be a major and adverse impact.
- Development of the National Park Service and concessioner administrative stables at McCauley Ranch in Foresta, with access road widening and rebuilding of a bridge along the access road, would further break up the continuity of the upland and riparian communities that exist along this road corridor. These adverse impacts would be minor since a road and bridge are already present.
- Development in Foresta, would also increase the possibility for the establishment and spread of non-native plant species. Foresta remains fairly susceptible to non-native plant species establishment because of the severe impacts that occurred during the 1990 fires. Stable operations (with constant ground disturbance, the need to maintain road corridor, and the importation of potentially contaminated feed) could increase the chance of additional non-native species becoming established in the vicinity of the road and corral. This would result in moderate impacts.

Hennes Ridge

Development of a 370-vehicle parking area at Hennes Ridge would necessitate removal of a large number of overstory trees as well as the intact shrub and herbaceous layers. This development would result in long-term, moderate, adverse impacts to this somewhat intact mixed coniferous forest (roads and social trails currently exist).

Adverse Impacts

- Installation of utilities and facilities associated with the parking area would require trenching and the expansion of existing infrastructure. Impacts would occur to root systems and riparian zones (due to trenching and the potential need to create an expanded wastewater leach field). Additional radiating impacts would occur on conifers, with the potential for higher stress levels on large sugar pines in the area, thus increasing their susceptibility to white pine blister rust.
- Higher levels of vehicle use and more open areas (disturbed ground) could increase the potential for introduction and establishment of non-native plant species.

Wawona

Construction of housing with associated infrastructure improvements, would have a long-term, moderate, and adverse overall impact on vegetation in Wawona.

Adverse Impacts

- The addition of housing on approximately 8 acres of land would adversely impact the lower mixed conifer forest and stands of California black oak, resulting in a moderate impact. The size of the stand and continuity of the canopy would be broken by the addition of housing units and associated infrastructure.
- Continuity of the surrounding area would be further impacted by the need to manage for hazard trees that could potentially impact the new housing development. The impacts would be minor.
- The overstory, understory, and herbaceous vegetation structure would be adversely impacted by the addition of housing, access roads, and trails, and installation of infrastructure. Some vegetation structure could be maintained through site planning to avoid large trees and concentrate housing to allow for larger blocks of intact vegetation between units. The impacts would be moderate.
- The diversity of native vegetation would decline due to the loss of some layers of the forest (primarily understory and herbaceous) from the developments under the overstory canopy. The diversity decline would result in long-term, moderate impacts.
- The potential for introduction and establishment of non-native plant species would increase due to landscaping and groundskeeping activities in and around the housing area. This could be minimized by aggressive adherence to the landscaping guidelines outlined in the *Vegetation Management Plan*.
- Productivity of the site would decline due to the need to remove hazard trees, resulting in a loss of structure and diversity. These dying and dead trees and snags currently provide habitat for a wide range of wildlife, which would be impacted by their loss at this site. This impact would be long-term, moderate, and adverse.
- Increased ground disturbance during construction and through higher levels of human use would increase the potential for non-native plant species to be established through inadvertent introductions. Since the site is currently not impacted by many non-natives, this would be a short- to long-term, moderate, adverse impact.
- Radiating impacts to surrounding areas (the river to the north and designated Wilderness to the south and east) would directly effect ground cover, thus changing structure of litter and duff (through trampling) and resulting in reduced effectiveness of prescribed fire activities. This would impact the National Park Service's ability to continue managing natural stand structure (and thus productivity) throughout Wawona. However, this could be mitigated through fencing, trails, and linking to established trail systems, and signs to keep people out of sensitive areas, resulting in a minor impact.

Big Oak Flat Entrance

Additional parking and construction of a new visitor contact station (visitor center) would increase the footprint of the existing site by up to 5 acres. Impacts at the Big Oak Flat Entrance would be long-term, minor, and adverse due to the small size of additional impact, the existing

level of habitat fragmentation, and the existing high potential for introduction of non-native plant species.

Impacts to upland vegetation (ponderosa pine forest and mixed conifer forest) may occur depending on the actual site design, which is not known at this time. Impacts would include paving, the removal of trees and groundcover, an increased difficulty in managing fuels and vegetation structure with fire (due to the presence of additional structures requiring fire protection), and trenching impacts to root systems (with potential weakening of health of directly affected trees).

Tioga Pass Entrance

Tioga Pass vegetation is characterized by a mosaic of both wet and dry subalpine meadows (dominated by native perennial grasses, sedges, rushes and forbs), and lodgepole pine forests. Continued degradation of these vegetation types would occur under Alternative 5. The impact resulting from this alternative would be long-term, moderate, and adverse, as there would be loss of vegetation and further degradation of vegetation community structure and diversity within a currently disturbed area.

Adverse Impacts

- Construction of a new visitor center and associated parking (with potential impacts of up to 5 acres) in the vicinity of Tioga Pass would impact lodgepole pine forests and wet and dry subalpine meadows. Dry meadows and lodgepole forests would be affected by paving and the addition of structures, utility lines, and trails, thus reducing both the size and continuity of these vegetation types and resulting in long-term, moderate, and adverse impacts. Wet meadows would receive long-term, moderate, and adverse impacts from radiating uses as a result of increased human activity in the area. Impacts to wet meadows could be mitigated by more clearly defining trails leading to the Mt. Dana cross-country route, and would most likely remain moderate (despite any mitigation) simply as a result of increased levels of human use in the area.
- Paved areas and structures would result in changes in drainage patterns, with moderate adverse impacts. An increased number of visitors because of the new visitor center would increase the likelihood of additional firewood collection (causing a loss of nutrient recycling), more vehicles in the area would increase the chance of non-native plant establishment as a result of more trampling and denuding of soils.

South Entrance

Vegetation at the South Entrance to Yosemite National Park is characterized by dense montane, mixed conifer forest dominated by a white fir overstory with subordinate sugar pine, Douglas-fir, ponderosa pine, and Jeffrey pine. Riparian vegetation occurs along ephemeral and perennial stream channels. Continued degradation of these vegetation types would occur under Alternative 5. The impact of this alternative would be long-term, minor, and adverse because there would be some increase in vegetation loss and degradation as compared to the existing condition.

Adverse Impacts

- Increased parking and structures would further add to the fragmentation of the South Entrance area, with an increased loss of riparian vegetation from the potential filling in of drainages and increased loss of forest cover. The loss of riparian vegetation could be minimized by using existing old road and railroad corridors rather than creating new developed areas, resulting in minor, adverse impacts (due to the small area affected). Forests would be impacted by the loss of up to 5 acres of trees in a currently forested area. Additional impacts would occur from the expansion of the hazard tree management zone along the corridor and around new parking areas.
- An increase in paved areas, how long vehicles are parked, and levels of human use in the South Entrance area would increase the potential for introduction and establishment of non-native species through higher levels of road-edge maintenance, increased introduction of sand with potential weed seeds, and more people with seeds clinging to clothing and cars. Impacts would be moderate and adverse to riparian vegetation and minor to forested areas.
- The increased human population would make reintroduction of fire into the South Entrance area more problematic due to smoke and the presence of structures. These limitations could be minimized by designing the site to concentrate structures in as small an area as possible. Vegetated “islands” would also be minimized to allow management of adjacent vegetation with fire.

C O N C L U S I O N

In Yosemite Valley, minor, beneficial impacts would occur under Alternative 5 to upland communities due to the removal of some facilities. California black oak and meadow vegetation would experience moderate, beneficial impacts due to the relocation of some facilities out of California black oak and potential meadow areas. Riparian areas would experience major, beneficial impacts under Alternative 5 from the removal of some facilities, the consolidation of others out of the Merced River floodplain, and an increased ability to restore some large portions of the Valley to natural conditions.

In El Portal, long-term, moderate, and adverse impacts would occur to the oak and upland communities as a result of new housing and parking development, with a permanent loss of habitat. Riparian areas would also experience moderate, adverse impacts due to the following: (1) radiating uses from increased human presence, (2) an increased likelihood of establishment of non-native plant species, and (3) loss of fire as a management tool to retain natural structure to forests and meadow areas.

Wawona, Foresta, Tioga Pass, and Hennes Ridge would experience moderate, adverse effects. In each of these areas, upland forests and California black oaks would be impacted by new housing; montane forests, lodgepole pine, and riparian areas would be impacted by new parking. Expected radiating impacts would have minor, adverse effects on meadow, riparian, and other adjacent vegetation types due to an increased human presence in the spring and summer.

Long-term, minor, and adverse impacts would occur at Big Oak Flat Entrance and South Entrance due to a slight increase in vegetation habitat fragmentation.

The overall effect of Alternative 5 on vegetation would be minor, long term, and beneficial based on the relatively large areas of highly valued resource vegetation that would be restored in Yosemite Valley, as compared to the majority of adverse impacts outside the Valley that would occur in non-highly valued resource vegetation types (uplands and other) and involve limited amounts of new habitat fragmentation.

C U M U L A T I V E I M P A C T S

The overall cumulative impacts of past, present, and reasonably foreseeable future projects on vegetation would be the same under Alternative 5 as it is described under Alternative 2. The majority of these adverse impacts would occur within non-highly valued resource vegetation types.

Increased human activity and related air quality degradation in the El Portal area and elsewhere could adversely affect ponderosa pine, Jeffrey pine, and other ozone-intolerant species. The National Park Service has operated an ozone monitoring station at Turtleback Dome for more than a decade to identify ozone trends in the Valley. Although cleaner burning vehicles and fuels should reduce the amount of ozone in the atmosphere in the future, cumulative effects to such species are expected to continue.

Other cumulative impacts to vegetation under Alternative 5 would include community fragmentation resulting from increased land development and potential continued introduction of non-native plant species. Cumulative impacts to riparian vegetation would also be expected due to development and other pressures along the narrow Valley floor adjacent to the Merced River.

Adverse impacts to upland vegetation communities under Alternative 5 would occur at Hennes Ridge, El Portal, Foresta, Wawona, and at all entrance stations. These impacts, in conjunction with impacts to upland communities in Yosemite Valley from a loss of forests over time to highly valued resource meadow, California black oak, and riparian vegetation types, would constitute minor overall impacts to upland vegetation types. In conjunction with reasonably foreseeable future projects, actions proposed under Alternative 5 would result in a cumulative, minor, adverse impact to upland vegetation due to the abundance of upland vegetation types throughout the Sierra Nevada region.

Some restoration actions are proposed to take place in oak woodlands through the removal of structures, but development of new facilities within oak stands would negate some beneficial impacts. Adverse impacts would also occur to canyon live, blue, black, and valley oaks by the development of housing and parking in El Portal. Site planning would be used to avoid large trees and minimize irrigation impacts, somewhat mitigating these adverse impacts. Talus live oak communities in the Valley would continue to be impacted under this alternative. In conjunction with reasonably foreseeable future projects, there would be cumulative minor, negligible impacts to oaks as a result of this project.

Alternative 5 also calls for the implementation of a River Protection Overlay zone in Yosemite Valley, which would create some long, linear sections of intact riparian vegetation following restoration efforts. The natural links with meadows would be restored by restoring large

continuous meadow areas throughout most of the east Valley. This alternative also prescribes some additional multi-use paved trails, which often follow or cross riparian areas. Impacts could also occur to subalpine meadows at Tioga Pass. Thorough site planning could prevent impacts to riparian and meadow vegetation in these newly developed areas by avoidance, resulting in a cumulative minor, beneficial impacts to riparian and meadow vegetation. Therefore, the overall cumulative impacts of Alternative 5, in conjunction with reasonably foreseeable future projects, would be negligible and beneficial.

Wildlife

This analysis describes impacts to wildlife in terms of changes to habitat, such as habitat loss or gain, degradation or enhancement, fragmentation or connectivity, amount of human disturbance, and potential for increased or decreased conditioning of wildlife to human food. The Vegetation section provides detail (including acreage breakdowns) on the vegetation types that are related to the habitat types covered in this section: upland, California black oak woodland, meadow, riparian, and other. All but the upland and other habitat types are considered highly valued resources by the park because of their value to wildlife combined with other factors, such as scarcity on a regional basis and value as critical components in park ecosystems. General wildlife species associated with these habitat types are discussed in Vol. IA, Chapter 3, Affected Environment, Wildlife; table 3-5 illustrates the connections between vegetation types and wildlife habitats. Special-status wildlife species are discussed in a separate section of this chapter.

Short-term impacts would occur to wildlife during construction or implementation of actions described in this section. Based on the mitigation measures that would be implemented during construction, all expected short-term impacts would be negligible.

Other impacts on wildlife and wildlife habitat generally would be characterized as long term for the actions reviewed under this alternative.

Y O S E M I T E V A L L E Y H A B I T A T S

Habitat restoration would result in approximately 162 acres of restored or enhanced wildlife habitat within the Valley, of which 147 acres would be restored to highly valued resource habitat types. New or relocated development within existing wildlife habitat would result in approximately 69 acres of lost or degraded wildlife habitat, of which 53 acres would occur within upland or “other” habitat types within the Valley.

In restored habitat of all types, the resulting benefit to wildlife is highly dependent upon the size of the area restored and its connection or proximity to other natural or restored areas. Such benefit is also related to the proximity of the restored area to continued human activities and development. Larger restored areas of habitat tend to support a higher abundance and diversity of wildlife species and are less affected by human disturbance from adjacent development and uses. Connections within and among habitat types allow more natural wildlife movement, and access to food, cover, and reproduction sites necessary for all stages the life cycles of various species. Management of human use in areas adjacent to natural or restored areas can minimize disturbance that would degrade habitat quality, especially of sensitive habitats such as meadows and riparian. For example, signs and fencing could keep visitors away from sensitive habitats or

wildlife species, and control of human food sources in developed areas could reduce conditioning of wildlife and minimize human/wildlife conflicts.

In addition, where development is removed and human presence is reduced, management practices required to enhance public safety (at the cost of natural resources) could also be reduced. For example, dead trees (snags) are important habitat features for many wildlife species, but must be removed when they occur in or near roads, developed areas, or other sites of high human use. With the removal of development and the reduction in human use in an area, snags can be allowed to stand and benefit wildlife.

Upland Habitats

Approximately 47 acres of existing upland habitat would be developed under this alternative, approximately 16 acres would be restored, and an additional 78 acres would be restored to highly valued resource habitat types. The beneficial impacts to upland habitats would primarily be the result of increased connectivity of uplands with other habitats as well as enhancement of habitat structure. Adverse impacts to upland habitat would occur primarily as a result of habitat loss.

Beneficial and adverse impacts are generally the same as described for Alternative 2. The primary differences in actions from those described in Alternative 2 are the numerous restorations not included in Alternative 5, such as Yellow Pine Campground and Curry Orchard parking lot. A summary of actions and impact intensities for Alternative 5 are provided in table 4-121.

- A new picnic area with grills would be established at Curry Orchard, causing moderate, adverse effects through creation of a new area for human/wildlife conflicts. The removal of parking from the orchard under this alternative would reduce the conditioning of bears to food in vehicles, and reduce damage to vehicles. Picnicking in the orchard, however, would likely result in dangerous interactions between wildlife and humans, especially when the apple trees are fruiting, attracting large numbers of black bears, deer, and squirrels. This situation would be prolonged by maintenance of the orchard, which could increase the longevity of the trees.
- Development of the Yellow Pine Campground for volunteers and groups would cause moderate, adverse impacts. A small area of forest habitat would be removed to expand the existing development. Increased radiating impacts into adjacent riparian and wetland areas would affect those highly valued resource habitat types and disturb wildlife. The site would become an increased source of human food to wildlife, leading to further conditioning of wildlife and human/wildlife conflicts. Animal-resistant trash cans and food lockers would help limit this problem, but adverse effects on wildlife behavior would still occur.
- Relocation of the concessioner commercial stable to east of Curry Village and continuation of guided trail rides would support a large population of brown-headed cowbirds, with continued effects of nest parasitism on species such as yellow warbler, solitary vireo, and warbling vireo. However, with the removal of the National Park Service and concessioner administrative stables operations from the Valley under this alternative, minor, beneficial effects would occur to songbird populations.
- The use of Northside Drive for motor vehicle traffic would perpetuate the impacts of noise, light, and roadway mortality on wildlife and continue to fragment habitat in Yosemite Valley. There would be no impact from this action, since it is essentially the existing condition.

**Table 4-121
Wildlife Habitat Impacts**

Action	Habitat Impact	Habitat Type	Common to Alternatives	Intensity ¹
Beneficial Impacts				
Implementation of 150-foot River Protection Overlay	Reduction in human disturbance and habitat degradation	All	2, 3, 4, 5	Major
Removal of campgrounds within the River Protection Overlay and ecological restoration of areas	Increase in habitat quantity Improvement in habitat integrity Reduction in habitat fragmentation Reduction of human disturbance	All	2, 3, 4, 5	Major
Removal of campsites at North Pines from highly valued resource habitat types	Increase in habitat quantity Improvement in habitat integrity Reduction in habitat fragmentation Reduction of human disturbance	Riparian	2, 3, 4	Moderate
Removal of campsites at Lower Pines from highly valued resource habitat types	Increase in habitat quantity Improvement in habitat integrity Reduction in habitat fragmentation Reduction in human disturbance	Riparian	2, 3, 4, 5	Major
Restoration of Yosemite Lodge cabin area to natural conditions	Reduction in habitat fragmentation Reduction in human presence Improvement of habitat integrity Increase in habitat quantity	Riparian Meadow	2, 3, 4, 5	Moderate
Removal of 164 Housekeeping units and restoration of area to natural conditions	Increase in habitat quantity Improvement in habitat integrity Reduction in habitat fragmentation Reduction in human disturbance	Riparian	2, 5	Moderate
Removal of 212 Housekeeping units and restoration of area to natural conditions	Increase in habitat quantity Improvement in habitat integrity Reduction in habitat fragmentation Reduction of human disturbance	Riparian	3, 4	Major
Removal of roads through Stoneman and Ahwahnee Meadows and restoration of areas to natural conditions	Restoration of natural hydrology and vegetation Reduction in habitat fragmentation Reduction in human disturbance	Meadow	2, 3, 4	Major
Removal of Bridges: Sugar Pine and Stoneman (if necessary)	Restoration of natural hydrology to allow natural cycles of riparian habitat formation, and improve aquatic habitat	Riparian	2	Major
Removal of Bridges: Sugar Pine, Stoneman, Housekeeping, Superintendent's	Restoration of natural hydrology to allow natural cycles of riparian habitat formation, and improve aquatic habitat	Riparian	3, 4	Major
Removal of Bridges: Sugar Pine and Ahwahnee	Restoration of natural hydrology to allow natural cycles of riparian habitat formation, and improve aquatic habitat	Riparian	5	Major
Removal of Yellow Pine Campground and restoration to natural conditions	Restoration of habitat quality, integrity, and continuity Reduction in human disturbance	Riparian Upland	2, 3	Moderate

**Table 4-121
Wildlife Habitat Impacts**

Action	Habitat Impact	Habitat Type	Common to Alternatives	Intensity¹
Removal and restoration of tennis courts and utility area near The Ahwahnee	Restoration of habitat and reduction in human disturbance	California black oak	2, 3, 4, 5	Moderate
Removal of Swinging Bridge Picnic Area	Restoration of forest understory and riparian habitat Reduction in wildlife feeding	Riparian Upland	2, 3, 4, 5	Moderate
Removal of Church Bowl Picnic Area	Restoration in habitat quantity and continuity Reduction in human disturbance	Upland	2, 5	Minor
Removal of Camp 6 parking from River Protection Overlay	Increase in habitat quantity Improvement in habitat integrity Reduction in habitat fragmentation Reduction in human disturbance	Riparian Meadow	2, 3, 4, 5	Moderate
Removal of Camp 6 parking from River Protection Overlay and highly valued resource areas	Increase in habitat quantity Improvement in habitat integrity Reduction in habitat fragmentation Reduction in human disturbance	Riparian Meadow	3, 4	Major
El Portal Road reconstruction from intersection with Big Oak Flat Road to Pohono Bridge	Reduction in impact to thin strip of riparian habitat from minor road realignment and removal of most turnouts, which would reduce human disturbance of habitats	Riparian	2, 3, 4, 5	Minor
Removal of Cascades Diversion Dam	Restoration of natural hydrology and cycle of riparian habitat formation	Riparian	2, 3, 4, 5	Minor
Removal of Curry Village tent cabins from talus zone	Restoration of habitat Reduction in habitat fragmentation Reduction in human disturbance	Upland Riparian	2, 3, 4, 5	Moderate
Removal of Curry Orchard and restoration to natural conditions	Reduction in human/wildlife conflicts Increase in habitat quantity Improvement in habitat integrity Reduction in habitat fragmentation	Meadow	2, 3	Moderate
Removal of parking from Curry Orchard, but trees allowed to remain	Reduction in human/wildlife conflicts	Other	4, 5	Minor
Removal of all orchards and resoration to natural habitat	Increase in habitat quantity Improvement in habitat integrity Reduction in habitat fragmentation Reduction in human/wildlife conflicts	Upland Meadow	3	Major
Removal of Yosemite Falls parking area and redesign of trails	Restoration of small area of habitats, but with continued high levels of human disturbance in the area	Riparian Upland	2, 3, 4, 5	Minor
Removal of concessioner and NPS stables from Yosemite Valley and restoration of habitat (if operations can be moved to McCauley Ranch)	Increased habitat integrity and continuity Reduced parasitism by brown-headed cowbirds on native bird species	All	2, 3, 4	Moderate
Discontinue private stock use in Yosemite Valley	Reduction in brown-headed cowbird parasitism on native bird species	All	3	Minor

**Table 4-121
Wildlife Habitat Impacts**

Action	Habitat Impact	Habitat Type	Common to Alternatives	Intensity¹
Modification of Northside Drive between Yosemite Lodge and El Capitan crossover to a multi-use (pedestrian/bicycle) paved trail	Reduction in traffic disturbance to habitats and wildlife in a substantial portion of Yosemite Valley Reduction in wildlife killed by vehicles and in habitat fragmentation	Other	2, 3, 4	Major
Removal of Superintendent's House (Residence 1) and restoration of area to natural habitat	Restoration of a small area of a high-value resource type Increased continuity with adjacent habitats	California black oak	2, 3, 5	Moderate
Restoration of the gas station site to natural habitat	Restoration of a small area of highly valued resource habitat Continued human impact from adjacent development	California black oak	2, 3	Minor
Removal of Ahwahnee Row houses and restoration to natural habitat	Restored meadow-forest edge More natural hydrology and habitat associated with Indian Creek	Meadow Riparian California black oak	3, 4, 5	Moderate
Happy Isles: ice cream/snack stand not replaced (temporary stand removed)	Reduction in human food sources to wildlife	Other	3, 4	Minor
Removal of parking along Northside Drive through El Capitan Meadow	Reduced impact to meadow from human trampling Reduced exposure of wildlife to human food, and reduced conditioning of bears to food left in cars overnight	Other	2, 3, 4, 5	Moderate
Reconstruction of roads at El Capitan Meadow and Bridalveil Creek to accommodate natural water flows	Restoration of natural water flows to sustain riparian, wetland, and meadow habitats Reduction in habitat fragmentation	Riparian Meadow	2, 3, 4, 5	Major
Adverse Impacts				
Establishment of new walk-in campsites in Yosemite Valley	Removal of habitat New areas for wildlife to be exposed to human food, leading to human/wildlife conflicts	Upland	2, 3, 4, 5	Moderate
Development of replacement housing and lodging at Curry Village outside of talus slope zone	Removal of habitat Increased human disturbance of adjacent habitats	Upland California black oak Riparian	2, 3, 4, 5	Minor
Redevelopment of area in Yosemite Village for 550 parking spaces	Increased human disturbance in adjacent habitats Increased trampling of vegetation Increased chance for human/wildlife conflicts	Upland	2, 5	Moderate
Development of new lodging at Yosemite Lodge	Loss of habitat (previously disturbed) Increased human presence	Upland	2, 3, 4, 5	Minor
Increased water levels in meadows from restoration	Potential increased bullfrog populations that would prey on native species; eradication is necessary for mitigation	Meadow Riparian	2, 3, 4, 5	Moderate
Establishment of a new picnic area at North American Wall	Loss of upland habitat Increased human disturbance Increased chance of wildlife conditioning to human food	Upland	2, 3, 4, 5	Minor
Development of the El Capitan crossover traffic check station, if required	Loss of habitat Disturbance from traffic and people	Upland	2, 5	Minor

**Table 4-121
Wildlife Habitat Impacts**

Action	Habitat Impact	Habitat Type	Common to Alternatives	Intensity¹
Development of new housing at Wawona	Loss of montane hardwood conifer habitat and increased human disturbance	Upland	2, 5	Moderate
Development of new housing and administrative facilities in El Portal	Loss of habitat Increased human disturbance	Upland Riparian	2, 3, 4, 5	Moderate
Development of parking in El Portal	Loss of habitat Increased human disturbance	Upland California black oak	2, 4, 5	Moderate
Development of parking at Badger Pass on previously paved area	Increased human disturbance Trampling in adjacent habitats Increased human/wildlife conflicts	Upland Meadow	2, 4	Minor
Development of parking at Hazel Green, or at Foresta if Hazel Green is not viable	Loss of habitat Increased human disturbance in the area Increased trampling of vegetation Increased chance of human/wildlife conflicts	Upland	2	Moderate
Construct new visitor centers at or near park entrances	Minor loss of habitat Increased human disturbance	Upland	2, 3, 4, 5	Minor
Construction of a new trail adjacent to Southside Drive from El Capitan Bridge to Swinging Bridge	Loss of habitat Increased need for hazard tree management, reducing snag habitat	All	2, 3, 4	Moderate
Development of new roads and trails from realignments and new connections	Loss of habitat Removal of hazard trees, reducing snag habitat	All	2, 3, 4, 5	Moderate
Relocation of NPS and concessioner stables to McCauley Ranch in Foresta	Impact to meadow and forest habitat Creation of a new area for brown-headed cowbird infestation, affecting native bird species	Upland Meadow	2, 3, 4	Moderate
Widening of Southside Drive, where necessary, to accommodate two-way traffic	Removal of habitat already affected by proximity to existing road	Upland	2, 3, 4	Moderate
Construction of a new vehicle bridge across Yosemite Creek near Yosemite Lodge	Removal of small area of habitat	Riparian	2, 3, 4, 5	Minor
Construction of parking and transit facility at Taft Toe in mid-Yosemite Valley	Removal of approximately 53 acres of forest habitat Increased habitat fragmentation in a relatively intact area Increased human disturbance to surrounding habitats Noise and light disturbance from facility Increased chance of human/wildlife conflicts	Upland	3, 4	Major
Development of a new picnic area at the Curry Orchard	Increased chance for human/wildlife conflicts, especially in fall when apples are ripening and attracting wildlife	Other	3, 4	Moderate
Development of a new picnic area at former site of Superintendent's House (Residence 1)	Destruction of understory habitat Increased human disturbance Inhibited regeneration of oaks Increased exposure of wildlife to human food	California black oak	4	Minor
Development of parking at South Landing	Loss of forest habitat Increased human disturbance in the area Increased chance for human/wildlife conflicts	Upland	4	Moderate

**Table 4-121
Wildlife Habitat Impacts**

Action	Habitat Impact	Habitat Type	Common to Alternatives	Intensity¹
Relocation of concessioner stable to east of Curry Village and continuation of guided rides	Loss of habitat from development of facility Increased local effects of brown-headed cowbird parasitism	Upland	5	Minor
Development of parking at Henness Ridge	Loss of habitat Increased human disturbance in adjacent habitats Increased chance of human/wildlife conflicts	Upland	5	Moderate
Expansion of the Yellow Pine Campground to accommodate volunteers and group campers	Loss of habitat Increased human disturbance in adjacent habitats Increased chance of human/wildlife conflicts	Upland Riparian	5	Moderate

¹. Reasons for impact intensities are described in the text, along with explanations of mitigation measures incorporated into this evaluation. A complete list of mitigation measures is found in Chapter 2, Alternatives, Mitigation Measures Common to All Action Alternatives, Wildlife.

California Black Oak Habitat

Approximately 4 acres of existing California black oak woodland habitat would be developed under this alternative, and approximately 15 acres would be restored to this highly valued resource habitat. The beneficial impacts to California black oak woodland habitats would primarily be the result of increased habitat size and connectivity with other habitats as well as enhancement of habitat structure. The adverse impacts to California black oak woodland habitat would occur primarily as a result of habitat loss.

Beneficial and adverse impacts under Alternative 5 would generally be the same as described under Alternative 2. The primary differences in actions from those described in Alternative 2 are discussed below. A summary of actions and impact intensities for Alternative 5 are provided in table 4-121. Beneficial impacts on California black oak woodland habitat would have corresponding beneficial effects on many species, including mule deer, acorn woodpeckers, squirrels, mice, great-horned owls, and a variety of small birds.

The former gas station site would be restored to California black oak woodland, providing a minor, beneficial impact. However, this area represents a relatively small portion of this habitat type in the Valley and would receive continued impact from human activities at Yosemite Lodge and Camp 4 (Sunnyside Campground), which would reduce its value as wildlife habitat. The former bank building (now the Art Activity Center) would remain.

Riparian and Meadow Habitats

Approximately 12 acres of existing meadow and riparian habitat would be developed under Alternative 5, and approximately 151 acres restored to these highly valued resource habitats. The beneficial impacts to meadow and riparian habitats would primarily be the result of increased habitat size and connectivity with other habitats as well as enhancement of habitat structure. The adverse impacts to meadow and riparian habitat would occur primarily as a result of habitat loss.

Beneficial and adverse impacts to meadow and riparian habitats would generally be similar to those described under Alternative 2. In Alternative 5, Stoneman and Ahwahnee Meadows would not be fully restored, there would be less restoration at North Pines Campground, and Stoneman Bridge would not be removed. A summary of actions and impact intensities for Alternative 5 is provided in table 4-121.

- Ahwahnee Row houses would be removed and the area restored to riparian and some meadow habitat. The meadow edge would be restored, providing high-value transitional habitat for wildlife. Flows from Indian Creek could be allowed to follow a more natural course, leading to improved meadow habitat and the formation of riparian habitats (both highly valued resources). Impacts from domestic pets and non-native plants associated with current housing would be reduced. This restoration would have a moderate, beneficial effect, because the restored habitat would be a relatively thin strip, and continued high levels of human use in adjacent areas would limit the value of this restoration to wildlife by causing disturbance in the area.

- Removal of Stoneman and Ahwahnee Bridges would restore natural hydrology and natural cycles of riparian habitat formation. This would have a major, beneficial effect on wildlife by helping to restore the contiguity of this highly valued resource habitat.
- Outside the River Protection Overlay, the re-establishment of campsites in North Pines Campground (70 sites) and the increase in campsites at Upper Pines (22 sites) would reduce the area of highly valued resource habitats restored relative to Alternative 2. Because these increases in campsites all occur in the same general area, the adverse effect on the extent and contiguity of habitats would be substantial, but would be moderate and adverse in the context of habitat restoration that would occur elsewhere in the Valley. Removal of development from the River Protection Overlay and restoration of natural habitats would still have a major, beneficial impact, but the effect would be diminished by this expansion in the number of campsites.
- Roads through Stoneman and Ahwahnee Meadows would remain, continuing to cause disruption of natural hydrology through the meadows and fragmenting these highly valued resource habitats. No new impacts would occur, because this is the existing condition.
- Curry Orchard would remain and be maintained. This would not allow restoration of the meadow habitat that it occupies, as would occur under Alternative 2. No new impact would occur, since this is the existing condition.

OUT-OF-VALLEY HABITATS

Parking, housing, and administrative facilities would be developed outside of Yosemite Valley to replace those removed from the Valley under this alternative. This would result in largely adverse impacts to wildlife and habitat in those locations where new facilities are established. Most of this impact would be to upland habitats. However, some restoration would occur in El Portal as part of local projects.

The out-of-Valley impacts would generally be related to the development of parking facilities at Hennes Ridge, Foresta, and El Portal that would remove habitat, causing radiating human impacts. More visitor use in these areas would increase exposure of wildlife to human food. Cars parked at these facilities, especially in the early mornings and late evenings, could be damaged by bears (which could become conditioned to this human food source). Standard mitigation measures, such as fencing and signs to keep people out of sensitive habitats, adequate garbage receptacles and collection, and enforcement of regulations regarding wildlife access to human food, would be incorporated into project design to minimize wildlife impacts (see Chapter 2, Alternatives, Mitigation Measures Common to All Action Alternatives).

El Portal

Impacts on wildlife and habitat in this location would be the same as under Alternative 2, except approximately 35 fewer parking spaces would be developed in the Middle Road area, for a total of approximately 335 spaces. Impacts of development in El Portal would remain the same as under Alternative 2 (moderate, adverse) because the area spared development would be relatively small, and the Middle Road area is between two roads and has existing habitat degradation.

Wawona

Impacts in this area on wildlife and habitat would be the same as under Alternative 2 (moderate, adverse) because employee housing would be constructed in an area already affected by adjacent development.

Foresta

Impacts in this location would be essentially the same as under Alternative 2 (moderate, adverse), in which a day-visitor parking facility would be developed in Foresta (if an agreement cannot be reached to develop parking at Hazel Green). Under Alternative 5, however, Foresta is the only option considered for parking along this transportation corridor; Hazel Green is not considered.

Heness Ridge

Development of a parking area for up to 370 spaces would remove an area of Sierra mixed conifer habitats, resulting in moderate, adverse impacts. Radiating impacts from increased visitor concentration are likely to affect surrounding habitats, although proximity to a heavily traveled road and the nearby development of housing and lodging at Yosemite West have likely already degraded these habitats. This development would increase local disturbance of wildlife in adjacent habitats due to traffic flow through the area, increased light and noise, and increased human presence. Trampling and human presence could affect small mammals and ground-nesting birds, and hazard tree management could impact cavity-nesting birds and roosting bats. Availability of human food could lead to conditioning of wildlife. Species potentially affected by habitat alteration include the pileated woodpecker, hermit thrush, northern goshawk, and marten.

Entrance Stations

As described in more detail in Alternative 2, limited expansion of facilities at South Entrance, Big Oak Flat Entrance, and Tioga Pass Entrance and a corresponding increase in human presence in these areas would have a minor, adverse effect, both individually and in total, on wildlife and habitat. The additional area of habitat would be relatively small and is already affected by humans due to its proximity to existing developments. Site design of these facilities would likely avoid any high-valued habitat types in the area, and signs, fencing, and visitor education would be used to minimize impact to adjacent sensitive habitats.

C O N C L U S I O N

Overall impacts on wildlife and habitat under Alternative 5 would be minor and beneficial. Implementation of the River Protection Overlay would enable the restoration of extensive areas of meadow, riparian, and wetland habitats along the Merced River and reduce habitat fragmentation of these highly valued resource types. But increased numbers of campsites relative to Alternative 2 would be developed in potential highly valued resource areas, and roads would be allowed to remain in meadows under Alternative 5. This would substantially affect the overall benefit of habitat restoration to wildlife in the Valley by perpetuating habitat fragmentation and occupation of sensitive habitats by development in some areas. Similar effects would occur from the development of Yellow Pine Campground for groups and volunteers, extending human disturbance westward in the Valley. The use of Northside Drive by motor vehicles would

continue adverse effects on wildlife from noise, light, roadway mortality, and habitat fragmentation.

Outside Yosemite Valley, impacts to wildlife and habitat would remain essentially the same as in Alternative 2.

A decrease of approximately 10% in the number of parking spaces established in El Portal would likely result in less area developed, compared to Alternative 2, but would not appreciably affect the level of impact.

Development of day-visitor parking at Henness Ridge would affect an area of mixed conifer habitat, but the level of impact and the species affected would be similar to what would occur at Hazel Green under Alternative 2.

C U M U L A T I V E I M P A C T S

The beneficial and adverse impacts of past, present, and reasonably foreseeable future projects on wildlife are described under cumulative impacts for Alternative 2. When the expected impacts to wildlife from Alternative 5 are considered in combination with these other projects, minor, beneficial cumulative effects on wildlife habitat and populations in the region would likely result over the long term. Adverse cumulative effects would occur primarily from habitat loss and fragmentation, as well as reduced habitat quality from human disturbance. Beneficial cumulative effects would result from habitat restoration, particularly riparian, meadow, and wetland areas. Future land management planning efforts could also lead to beneficial cumulative impacts to wildlife habitat and populations through habitat protection and restoration.

Alternative 5 would provide restoration of riparian, meadow, and riverine habitats (highly valued resources) through implementation of the River Protection Overlay. Restoration of the Yosemite Lodge cabin area, part of Camp 6, and much of Lower Pines Campground and Housekeeping Camp would help re-establish riparian and meadow habitat connectivity in the east Valley, benefiting wildlife by allowing greater natural movement and increasing habitat availability. These actions would be consistent with the basic goals of land management plans such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and the Merced Wild and Scenic River Comprehensive Management Plan (NPS). However, beneficial impacts would be less than those under Alternative 2 due to continued use of North Pines Campground. Removal of two bridges would help restore riparian and aquatic habitats along those river reaches. Exposure of wildlife to human food would be reduced in the east Valley to some degree as a result of the replacement of numerous tent cabins with hard-sided cabins at Curry Village.

Other actions associated with Alternative 5 would adversely affect areas of upland habitat and its accompanying wildlife, including establishment of new campgrounds north of Tenaya Creek and east of Curry Village. These actions would result in loss of upland habitat, habitat degradation from increased human activity, and additional areas where wildlife could become conditioned to human food. These effects would be in addition to impacts to uplands outside the park from past and present land management practices, such as logging and grazing, that have reduced the availability and quality of food and cover for wildlife. Foreseeable future projects such as the Evergreen Lodge Expansion (Tuolumne Co.), Hardin Flat Lodging and Conference Facilities

(Tuolumne Co.), and the Evergreen Road Improvements (multi-agency, see Appendix H) would cause similar impacts to upland habitats.

Under Alternative 5, development outside of Yosemite Valley would include establishment of additional parking and transit facilities at Henness Ridge, Foresta, and El Portal; employee-related housing at El Portal and Wawona; and visitor centers at or near park entrances. These actions would result in habitat loss and habitat degradation from human activity and would add to impacts of other actions that affect similar habitats. For example, development at Henness Ridge, Wawona, and South Entrance (visitor centers) would adversely affect mixed conifer habitats. These effects (habitat loss and degradation) would be in addition to logging and grazing that have occurred over wide areas of mixed conifer habitat outside the park, as well as to proposed projects such as Yosemite West Rezone of 55 Acres (NPS), Silvertip Resort Village Project (Mariposa Co.), and reforestation projects. The proposed Silvertip Resort Village Project in Fish Camp would have the greatest interaction with the South Entrance visitor facilities proposed under this alternative, due to its proximity to the South Entrance and similarity in habitat.

Adverse impacts associated with the development of employee housing and parking facilities at El Portal would combine with impacts from other development projects proposed in the area, including the Yosemite View Parcel Land Exchange (NPS), Yosemite Motels Expansion, El Portal (Mariposa Co.), and the El Portal Road Improvement Project (NPS) to adversely affect riparian and upland habitats and associated species. However, because much of the area of potential development has been previously disturbed, the adverse impacts are expected to be minimal. Nevertheless, quality of forage and cover for species such as scrub jay, gray fox, and northern alligator lizard could be adversely affected.

The conclusion that cumulative impacts would be minor and beneficial is conservative because it is based on the goals and objectives of ongoing planning efforts (such as the Sierra Nevada Framework for Conservation and Collaboration) that are being undertaken to improve ecosystem management over much of the Sierra Nevada. However, should substantial or full implementation of the actions included in these plans occur over time, long-term cumulative impacts on wildlife may, on balance, be beneficial to a greater degree.

Special-Status Species

W I L D L I F E

A Biological Assessment was prepared in accordance with Section 7 of the Endangered Species Act to assess potential impacts to federal endangered and threatened species (see Appendix K). Specific, action-by-action analysis of impacts on vegetation types and general wildlife habitat is provided in the Vegetation and Wildlife sections of this chapter, respectively. The actions of Alternative 5 that would result in potential wildlife habitat impacts are listed in the Wildlife section. The effect of these habitat impacts on individual special-status species is described below. The impacts identified in this section are generally long term, except where noted.

This analysis covers federal and/or California special-status species. Recent correspondence from the U.S. Fish and Wildlife Service indicates that a number of these species are being considered for elevated federal status; these species also are evaluated in this section. Special-status species

are listed in table 3-6 (see Vol. IA, Chapter 3). The “area” column of table 3-6 indicates the recorded locations of species occurrence or areas that may possess suitable habitat for each species in the vicinity of the location. Identification of a location in the “area” column for a species does not necessarily indicate that the species has been documented to occur in that location.

A total of 46 special-status wildlife species are known to occur, have historically occurred, or are likely to occur in the Yosemite Valley or in the general vicinity of out-of-Valley project areas. One is classified as both federal and California endangered, one is federal threatened and California endangered, two are federal threatened, three are California endangered, and three are state threatened. The remaining 36 wildlife species are federal species of concern and/or California species of special concern. Of these lesser-status species, six are being considered by the U.S. Fish and Wildlife Services for elevation to threatened or endangered status. These species are discussed along with threatened or endangered species. The potential impacts to these species or their primary habitats as a result of this alternative are described below.

Potential Effects on Federal and California Threatened or Endangered Species

Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*)

Status: Federal threatened. The overall impact intensity for this species would be the same as under Alternative 2. Mitigation required by the U.S. Fish and Wildlife Service and the abundance of elderberry plants in surrounding areas would result in minor to moderate, adverse impacts, relative to the No Action Alternative.

Limestone salamander (*Hydromantes brunus*)

Status: Federal species of concern; California threatened. The overall impact intensity for this species would be the same as under Alternative 2 (negligible and adverse). The development in El Portal would not affect suitable habitat, and the occurrence of this species in El Portal is questionable.

California red-legged frog (*Rana aurora draytonii*)

Status: Federal threatened; California species of special concern. Alternative 5 would have minor, beneficial impacts to this species compared to Alternative 1. Although many actions would be similar to Alternative 2, Alternative 5 would increase occupation of potential habitat by campgrounds and the remaining effect of roads through meadows. Parking established at Foresta could affect red-legged frog habitat, but such habitat would be avoided by development and visitor access would be restricted. Impacts on potential habitat, in El Portal and Wawona would be the same as for Alternative 2.

Bald eagle (*Haliaeetus leucocephalus*)

Status: Federal threatened; California endangered. The overall impact intensity for this species would be the same as under Alternative 2 (minor and beneficial). Although less highly valued resource habitat, including riparian, would be restored under Alternative 5, implementation of the River Protection Overlay would still provide substantial benefit to bald eagles, although the species does not breed in the Valley and is rarely seen there.

Peregrine falcon (*Falco peregrinus*)

Status: Recently delisted at federal level; California endangered. The overall impact intensity under this alternative would remain the same as under Alternative 2 (moderate and beneficial). Although more campsites would be established in Yosemite Valley under Alternative 5, the remaining areas restored would provide substantial benefit to this species. Even under existing conditions, two nesting pairs of peregrine falcons use the east end of Yosemite Valley, which is a relatively high density.

Great gray owl (*Strix nebulosa*)

Status: California endangered. Under Alternative 5, the overall impact intensity on great gray owls would be moderate and adverse. Development of parking at Foresta and its impact to great gray owls would be the same as under the Foresta scenario of Alternative 2. The radiating effect of increased human activity on owls using Big Meadow and development of stables at McCauley Ranch would result in moderate, adverse impacts. In Yosemite Valley, roads through meadows would remain, and Northside Drive would continue to be used by motor vehicles. Both of these factors could continue to affect the use of Yosemite Valley by great gray owls. However, the species is seldom seen in this location.

Willow flycatcher (*Empidonax traillii*)

Status: California endangered. Under Alternative 5, beneficial effects on this species would be minor. Roads would be left in Stoneman and Ahwahnee Meadows under Alternative 5 and would continue to affect the ability of these habitats to provide features necessary for this species (e.g., dense willow shrubs). The continuation of commercial stable operations and trail rides would allow nest parasitism by brown-headed cowbirds to continue. Implementation of the River Protection Overlay would still allow substantial restoration of suitable habitat for willow flycatchers.

Sierra Nevada red fox (*Vulpes vulpes necator*)

Status: Federal species of concern; California threatened. The overall impact intensity for this species would be the same as under Alternative 2 (minor and adverse). Increased development and human disturbance would occur at Tioga Pass. The development of day-visitor parking at Henness Ridge could affect potential habitat, but the impacts would be essentially the same as would occur at Hazel Green under Alternative 2. There would be less development at Foresta and less disturbance at Badger Pass under this alternative compared to Alternative 2, but the occurrence of this species at those locations is questionable. The species is thought to now exist only at higher elevations.

California wolverine (*Gulo gulo luteus*)

Status: Federal species of concern; California threatened. The overall impact intensity under Alternative 5 would be the same as under Alternative 2 (minor and adverse). Minor expansion of facilities at Tioga Pass could affect small areas of upland habitat, and increased visitor presence could lead to greater human disturbance in surrounding habitats, which could affect their use by the wolverine.

Sierra Nevada bighorn sheep (*Ovis canadensis sierrae*)

Status: Federal endangered; California endangered. Impacts to this species would remain the same as under Alternative 2: (negligible and adverse). Possible development would occur at Tioga Pass, the only area of potential effect.

Potential Effects on Species That Are Being Considered for Elevated Federal Listing

Yosemite toad (*Bufo canorus*)

Status: Federal species of concern; California species of special concern. The overall impact intensity for Yosemite toads under Alternative 5 would be the same as under Alternative 2 (negligible and adverse) because of potential development and human disturbance at Tioga Pass. Under Alternative 5, Badger Pass would not be used for parking, thus limiting the possibility of disturbance of Yosemite toads in that area to levels similar to those under the No Action Alternative.

Foothill yellow-legged frog (*Rana boylei*)

Status: Federal species of concern; California species of special concern. Beneficial impacts to this species would be minor because of increased occupation of potential habitat by campgrounds and the remaining effects of roads through meadows. Parking established at Foresta could affect foothill yellow-legged frog habitat, but such habitat would be avoided by development and visitor access would be restricted. The impacts in other areas of potential habitat, such as El Portal and Wawona, would be the same as under Alternative 2.

Mountain yellow-legged frog (*Rana muscosa*)

Status: Federal species of concern; California species of special concern. The overall impact intensity for this species under Alternative 5 would be the same as under Alternative 2 (minor to moderate and beneficial). Potential development and human disturbance at Tioga Pass would be the same between the two alternatives. Under Alternative 5, Badger Pass would not be used for parking, thus limiting the possibility of disturbance of mountain yellow-legged frogs in that area to a similar level as under the No Action Alternative.

California spotted owl (*Strix occidentalis occidentalis*)

Status: Federal species of concern; California species of special concern. Under Alternative 5, the beneficial impact to this species would be negligible. The continued use of Northside Drive by motor vehicles would continue the impacts of light, noise, and road-kills along this stretch of road. Development of day-visitor parking at Henness Ridge would occur in the foraging habitat of California spotted owls, but such impacts would be minor and essentially the same as at Hazel Green under Alternative 2. Under Alternative 5, Badger Pass would not be used for parking, thus eliminating the possibility of disturbance of spotted owls in that area.

Marten (*Martes americana*)

Status: Federal species of concern. The overall impact intensity for this species under Alternative 5 would be the same as under Alternative 2 (minor and adverse). Development of day-visitor parking at Henness Ridge would affect marten habitat, but this impact would essentially be the

same as at Hazel Green under Alternative 2. The continued use of Northside Drive by motor vehicles could have an effect on martens, but the relatively low elevation of Yosemite Valley makes it marginal habitat for martens, as reflected by the extreme rarity of observations in this location. Under Alternative 5, Badger Pass would not be used for parking, thus limiting the possibility disturbance to martens in that area to levels similar to that of the No Action Alternative.

Pacific fisher (*Martes pennanti pacifica*)

Status: Federal species of concern; California species of special concern. The overall impact intensity for fishers under Alternative 5 would be moderate and adverse because development at Henness Ridge would occur in an area that is likely prime habitat for the species. Two fishers have been killed on roads near Henness Ridge in the last 10 years. The development would remove foraging habitat and cause increased human disturbance in the area. Under Alternative 5, Badger Pass would not be used for parking as it would under Alternative 2, thus limiting the possibility of disturbance of fishers in that area to levels similar to those of the No Action Alternative.

Potential Effects on Federal Species of Concern and California Species of Special Concern

Merced Canyon shoulderband snail (*Helminthoglypta allynsmithi*)

Status: Federal species of concern. The overall impact intensity for this snail species would be the same as under Alternative 2 (negligible and adverse). It is unlikely that the small increase in parking spaces that would be developed in El Portal, would affect the moist talus habitat of this species.

Mariposa sideband snail (*Monadenia hillebrandi*)

Status: Federal species of concern. The overall impact intensity for this species would be the same as under Alternative 2 (moderate and beneficial). Beneficial effects would occur primarily from restoration of potential habitat in the talus above Curry Village.

Sierra pygmy grasshopper (*Tetrix sierrana*)

Status: Federal species of concern. The overall impact intensity for this grasshopper species would be the same as under Alternative 2 (negligible to minor and adverse). Development in El Portal would probably not occur in riparian areas, the favored habitat of the species.

Wawona riffle beetle (*Atractelmis wawona*)

Status: Federal species of concern. The overall impact intensity for this species would be the same as under Alternative 2 (moderate and beneficial). Large-scale restoration of riparian and wetland habitats would benefit the aquatic habitat of the riffle beetle. The development of additional campsites in Yosemite Valley, which would be the greatest number among the action alternatives, would adversely affect some riparian habitat. However, this additional development would have a negligible effect on the overall impact because campsites would be located outside the River Protection Overlay and not directly affect aquatic habitat.

Bohart's blue butterfly (*Philotiella speciosa bohartorum*)

Status: Federal species of concern. Under this alternative, the overall impact intensity for the Bohart's blue butterfly would be the same as under Alternative 2 (minor and adverse) because development in El Portal would be essentially the same.

Mount Lyell salamander (*Hydromantes platycephalus*)

Status: Federal species of concern; California species of special concern. The overall impact intensity for this species would be the same as under Alternative 2 (minor and beneficial) because actions in the most likely habitat, Tioga Pass and Curry Village in Yosemite Valley, would be the same.

Northwestern pond turtle (*Clemmys marmorata marmorata*) and Southwestern pond turtle (*Clemmys marmorata pallida*)

Status: Federal species of concern; California species of special concern. Under this alternative, the overall impact intensity for this species is expected to be the same as under Alternative 2 (minor and beneficial). The development of additional campsites in Yosemite Valley would affect some riparian habitat, and the retention of roads through Stoneman and Ahwahnee Meadows would continue to affect natural hydrology in these areas. These actions, however, would not change the overall impact on western pond turtles because the actions would have little effect on pond and slow-moving water habitats. These habitats would benefit primarily from implementation of the River Protection Overlay and other restorations of highly valued resource areas. A slightly greater number of parking spaces in Foresta compared to Alternative 2 could increase potential disturbance of breeding and hibernation habitat in upland areas, but the area affected would be relatively small.

Harlequin duck (*Histrionicus histrionicus*)

Status: Federal species of concern; California species of special concern. The overall impact intensity for harlequin ducks under this alternative would be the same as under Alternative 2 (minor and beneficial). Development of additional campsites in Yosemite Valley would affect some areas of riparian habitat, but the area of direct impact would be outside the River Protection Overlay and would be relatively small. Implementation of the River Protection Overlay and other restorations of highly valued resource habitats (e.g., Upper and Lower River Campgrounds) would provide a majority of the benefits to harlequin ducks.

Cooper's hawk (*Accipiter cooperi*)

Status: California species of special concern. The overall impact intensity for Cooper's hawks under this alternative would be essentially the same as under Alternative 2 (minor and beneficial). Although development of additional campsites under Alternative 5 would affect some riparian habitat, implementation of the River Protection Overlay, and other highly valued resource habitat restorations (e.g., River Campgrounds), would provide a majority of the benefit to Cooper's hawks by providing the mix of forested and open habitats favored by this species. Development of parking at Hennes Ridge under Alternative 5 would affect an area of forest habitat, but would have essentially the same effect as similar development at Hazel Green under Alternative 2.

Under Alternative 5, Badger Pass would not be used for parking, limiting the possibility of disturbance of Cooper's hawks in that area to levels similar to that of the No Action Alternative.

Northern goshawk (*Accipiter gentilis*)

Status: Federal species of concern; California species of special concern. The impact intensity to northern goshawks would be minor and adverse. Development at Henness Ridge would have effects on this species similar to those that would occur at Hazel Green under Alternative 2. Under Alternative 5, Badger Pass would not be used for parking, thus limiting the possibility of disturbance to goshawks in that area to levels similar to the No Action Alternative.

Sharp-shinned hawk (*Accipiter striatus*)

Status: California species of special concern. The overall impact intensity on sharp-shinned hawks under this alternative would be the same as under Alternative 2 (minor and beneficial.) Development of additional campsites in Yosemite Valley would adversely affect some riparian habitat. Implementation of the River Protection Overlay, and other restorations of highly valued resource habitats, would provide a majority of the benefit to this species by helping to restore the natural mixture of forest and open areas (especially meadows) that are the sharp-shinned hawk's favored habitat. The development of day-visitor parking at Henness Ridge would remove some forest habitat, but the effect would be similar to that at Hazel Green under Alternative 2.

Golden eagle (*Aquila chrysaetos*)

Status: California species of special concern. Under this alternative, overall impact intensity for golden eagles would be the same as under Alternative 2 (minor and beneficial). Primary benefit to this species would come from restoration of open habitat in Yosemite Valley, which would be essentially the same as Alternative 2. Impacts in potential habitat outside Yosemite Valley would also be essentially the same as under Alternative 2.

Merlin (*Falco columbarius*)

Status: California species of special concern. Under this alternative, the overall impact intensity for merlins would be the same as under Alternative 2 (minor and beneficial). Under Alternative 5, restoration of open habitat in Yosemite Valley would be essentially the same as under Alternative 2.

Prairie falcon (*Falco mexicanus*)

Status: California species of special concern. Under this alternative, the overall impact intensity for prairie falcons would be the same as under Alternative 2 (minor and beneficial), based primarily on restoration of habitats in Yosemite Valley. Parking spaces at Foresta would adversely affect an area of habitat, but the area affected (post-fire regrowth) is not good habitat for the species.

Long-eared owl (*Asio otus*)

Status: California species of special concern. Beneficial impacts on long-eared owls under this alternative would be negligible (a lower impact intensity than under Alternative 2). Additional campsites in Yosemite Valley relative to Alternative 2 would occupy some riparian habitat, which

could adversely affect long-eared owls. The continuation of motor vehicle traffic on Northside Drive would perpetuate noise and light disturbance in a long stretch of the Valley. Implementation of the River Protection Overlay and other restorations of highly valued resource habitats (e.g., Upper and Lower River Campgrounds) would provide benefit to short-eared owls, and would essentially be the same as in Alternative 2. Effects in other areas of potential habitat would be the same as in Alternative 2.

Yellow warbler (*Dendroica petechia*)

Status: California species of special concern. Impacts on yellow warblers under this alternative would be minor to moderate and beneficial. Additional campsites (the greatest number among the action alternatives) would be developed. Some of this development would affect riparian habitats that are favored by yellow warblers. The continuation of commercial stable operations and trail rides would allow nest parasitism by brown-headed cowbirds to continue. Implementation of the River Protection Overlay and other restorations of highly valued resource habitats (e.g., River Campgrounds) would greatly benefit yellow warblers.

Mount Lyell shrew (*Sorex lyelli*)

Status: Federal species of concern. Under this alternative, impacts to this species would be the same as under Alternative 2 (negligible and adverse) because development at Tioga Pass would be the same as under Alternative 2, with a minor expansion of entrance station facilities.

Bat species

Overall impact intensities for all special-status bat species would remain the same as under Alternative 2, as listed below for each species. The development of more campsites and the continued disturbance of Stoneman and Ahwahnee Meadow by roads under Alternative 5 would affect some areas of highly valued resource habitat types that many bat species depend upon. However, implementation of the River Protection Overlay and other restorations of highly valued resource habitats (e.g., Upper and Lower River Campgrounds) would provide the majority of benefit to bat species. Development of parking at Henness Ridge under Alternative 5 would have similar effects as the development at Hazel Green under Alternative 2.

PALLID BAT (*ANTROZOUS PALLIDUS*)

Status: California species of special concern (moderate, beneficial).

TOWNSEND'S BIG-EARED BAT (*CORYNORHINUS TOWNSENDII TOWNSENDII*)

Status: California species of special concern (minor, beneficial).

SPOTTED BAT (*EUDERMA MACULATUM*)

Status: Federal species of concern; California species of special concern (minor, beneficial).

SMALL-FOOTED MYOTIS BAT (*MYOTIS CILIOLABRUM*)

Status: Federal species of concern (minor, beneficial).

LONG-EARED MYOTIS BAT (*MYOTIS EVOTIS*)

Status: Federal species of concern (minor, beneficial).

FRINGED MYOTIS BAT (*MYOTIS THYSANODES*)

Status: Federal species of concern (minor, beneficial).

LONG-LEGGED MYOTIS BAT (*MYOTIS VOLANS*)

Status: Federal species of concern (minor, beneficial).

YUMA MYOTIS BAT (*MYOTIS YUMANENSIS*)

Status: Federal species of concern; California species of special concern (moderate, beneficial).

GREATER WESTERN MASTIFF BAT (*EUMOPS PEROTIS CALIFORNICUS*)

Status: Federal species of concern; California species of special concern (moderate, beneficial).

Sierra Nevada snowshoe hare (*Lepus americanus tahoensis*)

Status: Federal species of concern. The overall impact intensity for snowshoe hares under Alternative 5 would be the same as under Alternative 2 (minor and adverse). Development of parking facilities at Henness Ridge would remove an area of potential habitat and result in radiating human impacts into adjacent areas. Badger Pass would not be used for parking, so no additional impacts would occur there. However, development of parking at Foresta could affect habitat, although the low elevation and questionable suitability of this habitat for snowshoe hares make it doubtful that any snowshoe hares would be affected at this location.

White-tailed hare (*Lepus townsendii*)

Status: California species of special concern. The overall impact intensity for this species under Alternative 5 would be the same as under Alternative 2 (minor and adverse). The possible minor expansion of facilities at Tioga Pass (the only areas with potential occurrence of this species) would be the same for the two alternatives.

Sierra Nevada mountain beaver (*Aplodontia rufa californica*)

Status: Federal species of concern; California species of special concern. Under Alternative 5, adverse effects on mountain beaver would be negligible and adverse. Badger Pass would not be used for transit and parking, which would limit human disturbance and pollution of stream habitat in this area to levels similar to that of the No Action Alternative.

Conclusion

Impacts under Alternative 5 on special-status species would be similar to those under Alternative 2. Some areas of increased development, retention of roads through meadows, and continued use of Northside Drive for motor vehicles would limit overall benefits to special-status species to minor and beneficial. Large blocks of riparian, meadow, and wetland would be restored, thus increasing the size, contiguity, and connections within and among habitat types; this would subsequently increase the availability of food, cover, and reproductive sites for a variety of wildlife

species, including special-status species. These restored blocks of habitat would also help insulate wildlife from human impacts radiating from the adjacent development that would remain.

Under Alternative 5, however, there would be several notable impacts on special-status species. Continued use of Northside Drive by motor vehicles would affect California spotted owls and long-eared owls by perpetuating noise and light disturbance in the north part of the Valley and continuing the risk of road-kills. An increased number of campsites in riparian habitats would have an adverse effect on yellow warblers and long-eared owls. Retention of roads through Stoneman and Ahwahnee Meadows would continue to degrade the hydrology and quality of these habitats, affecting California red-legged frogs, foothill yellow-legged frogs, and willow flycatchers. Retention of the concessioner's commercial stable and trail rides in Yosemite Valley would continue to support brown-headed cowbirds and affect yellow warblers and willow flycatchers through nest parasitism.

For some special-status wildlife species, the magnitude of benefit provided under this alternative would be limited by existing impacts on these species outside of Yosemite National Park that have led to population declines over wide regions of the Sierra Nevada. Such impacts have affected the abundance of some special-status species inside the park, despite the presence of relatively intact habitats (e.g., willow flycatcher).

Relocation of the concessioner stable to east of Curry Village could increase the abundance of brown-headed cowbirds in that area and intensify the adverse impacts on the yellow warbler and willow flycatcher, although relocating the stable would reduce impacts in its current location.

The adverse effect of this alternative on Henness Ridge, Foresta, and El Portal would be minor due to the loss of small areas of habitat within much larger areas of suitable habitat. Comparing the adverse and beneficial impacts of this alternative to the existing condition, the overall impact on rare species would be minor and beneficial, given the moderate increase in acreage of riparian and meadow habitats that are both highly valued resources and the preferred habitat of many of these rare species. These species would also benefit from the enhanced integrity of these habitats and the improved connectivity with other highly valued resource habitats.

Cumulative Impacts

The following sections discuss the potential impacts of other past, present, and foreseeable future projects on special-concern species in conjunction with the impacts of Alternative 5. Appendix H presents other ongoing or future projects in the region that were considered in the cumulative impacts analysis. The analysis assumed that California Environmental Quality Act and Endangered Species Act mitigation requirements would be implemented as part of each foreseeable future project, as applicable.

Potential Cumulative Impacts on Federal and California Threatened or Endangered Species

VALLEY ELDERBERRY LONGHORN BEETLE (*DESMOCERUS CALIFORNICUS DIMORPHUS*)

Status: Federal threatened; California species of special concern. Projects at elevations below 3,000 feet that could affect the abundance of elderberry plants, the Valley elderberry longhorn beetle's host plant, would affect this species and could ultimately affect populations in Yosemite

National Park. The distribution of Valley elderberry longhorn beetles and their host plant in the park is rather small, with the only suitable habitat occurring in the Merced River Canyon in El Portal. Current and reasonably foreseeable future projects in this location would therefore have the greatest potential to affect the park population of Valley elderberry longhorn beetle. Current and reasonably foreseeable future projects in this location with the potential to adversely affect this species include the Yosemite View Parcel Land Exchange (NPS) and the Yosemite Motels Expansion, El Portal (Mariposa Co.). However, the impact would be limited by the high abundance of elderberry plants in the surrounding area and by mitigation that would be required by the U.S. Fish and Wildlife Service. Other projects that could have potential adverse effects on Valley elderberry longhorn beetles include the Mariposa Creek Pedestrian/Bike Path (Mariposa Co.); the Buildout of City of Merced, General Plan; and the Merced River Canyon Trail Acquisition (BLM). Actions under this alternative would also be primarily adverse due to development of housing, parking, and administrative facilities in El Portal.

All of these projects could damage or destroy elderberry plants, which would directly affect local Valley elderberry longhorn beetle populations. However, mitigation requirements established through consultation with the U.S. Fish and Wildlife Service and other agencies would limit these impacts to minor and adverse. Minor, beneficial impacts would be expected from the Fire Management Plan Update (NPS), Sierra Nevada Framework for Conservation and Collaboration (USFS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) because these plans could lead to greater protection of elderberry plants. The combination of beneficial effects from implementation of regional plans that cover wide areas of the Valley elderberry longhorn beetle range, and adverse impacts that would generally affect relatively small numbers of elderberry plants (including from actions under this alternative), would result in an overall minor, beneficial impact on Valley elderberry longhorn beetles. Adverse impacts would be minimized through implementation of mitigation measures prescribed by the U.S. Fish and Wildlife Service to protect the species.

LIMESTONE SALAMANDER (*HYDROMANTES BRUNUS*)

Status: Federal species of concern; California threatened. The limestone salamander has a very restricted distribution. Its habitat is protected by the 120-acre Limestone Salamander Ecological Reserve and the Bureau of Land Management's 1,600-acre Limestone Salamander Area of Critical Environmental Concern. It is only known to occur in the mixed chaparral habitats of the Merced River and its tributaries, in association with limestone outcrops between 800 and 2,500 feet in elevation. Existing features that affect this species include road cuts and water impoundments that alter its habitat. Current and reasonably foreseeable future projects in El Portal (Yosemite View Land Parcel Exchange [NPS] and Yosemite Motels Expansion, El Portal [Mariposa Co.]) are the only projects with potential impacts, but this species has never been found in El Portal. Impact to this species would therefore be negligible. Likewise, projects in El Portal associated with this alternative are unlikely to cause any effect on limestone salamanders. The overall cumulative impact on this species would therefore be negligible.

CALIFORNIA RED-LEGGED FROG (*RANA AURORA DRAYTONII*)

Status: Federal threatened; California endangered. Projects in the vicinity of Yosemite National Park are unlikely to affect any known populations of red-legged frogs. Environmental compliance carried out in association with these projects would require further surveys to evaluate whether unknown populations of red-legged frogs could be affected. Projects that degrade aquatic habitats, however, are likely to adversely affect suitability of such habitats for red-legged frogs, should reintroduction or recolonization of this species become possible.

Current and reasonably foreseeable future projects that could have adverse impacts on aquatic habitats include Rio Mesa Area Plan (Madera Co.); University of California, Merced Campus (Merced Co.); and the Buildout of City of Merced, General Plan. Beneficial impacts to aquatic habitats may result from the Fire Management Plan Update (NPS), Sierra Nevada Framework for Conservation and Collaboration (USFS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS). These beneficial effects would be augmented by restoration of potential habitat in Yosemite Valley under this alternative. The overall cumulative impact would be beneficial, based on potential protection of red-legged frog habitat through implementation of plans that cover wide areas in combination with restoration of suitable habitat that would occur under this alternative. The intensity of this impact would be minor because this species is almost extinct from the Sierra Nevada region, but habitat should nonetheless be protected for potential reintroduction or recolonization of the species. Projects with a possible negative impact on red-legged frogs would affect a relatively small area of habitat compared to projects with potential beneficial impacts, but these projects could have a major, negative impact if they affected an unknown population of red-legged frogs, which could be among the last in the Sierra Nevada. However, site surveys would be completed in compliance with state and federal regulations, as applicable, thus minimizing the potential for adverse effects.

BALD EAGLE (*HALIAEETUS LEUCOCEPHALUS*)

Status: Federal threatened; California endangered. Projects associated with the Merced River could adversely affect habitat that is transiently used by bald eagles, such as at the Yosemite View parcel land exchange (NPS). The Merced Wild and Scenic River Comprehensive Management Plan (NPS) has the potential to benefit eagles by preserving riparian and riverine habitat through implementation of the River Protection Overlay. These beneficial effects would be enhanced by restoration of riparian and river habitats in Yosemite Valley under this alternative. Overall, the cumulative impact would be minor and beneficial.

PEREGRINE FALCON (*FALCO PEREGRINUS*)

Status: California endangered. Because peregrine falcons forage over a wide range of habitat types adjacent to their nesting cliffs, implementation of plans with potential widespread effects would have the greatest impact on this species. These include the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Merced Wild and Scenic River Comprehensive Management Plan (NPS), and the Fire Management Plan Update (NPS), which would have minor, beneficial effects. These plans would complement the beneficial effects of this alternative on peregrine falcons in Yosemite,

where the concentration of the species is among the highest in the Sierra Nevada. No current or reasonably foreseeable future projects are anticipated to have an adverse impact on peregrine falcons cliff nesting habitat or surrounding foraging habitat. Greater regional effects on peregrine falcons that nest in the Sierra Nevada are due to degradation of seasonally used coastal and wetland habitats and pesticide residues in the peregrine falcon's food chain.

Restoration of a diversity of habitat types in Yosemite Valley under this alternative would augment regional beneficial impacts anticipated from current and foreseeable projects outside the park. The overall cumulative impact on peregrine falcons would be minor and beneficial, based primarily upon the effects of wide-reaching plans on Sierra Nevada habitats, but the benefit would be limited by the continued effects of pesticides.

GREAT GRAY OWL (*STRIX NEBULOSA*)

Status: California endangered. The great gray owl nests in mixed conifer and red fir forests near meadows and winters at lower elevations in mixed conifer down to blue oak woodlands. Nearly the entire California population of great gray owls breeds in the Yosemite region, where habitats are relatively intact. Some research suggests that this species is susceptible to human disturbance, which may explain its absence from Yosemite Valley, where great gray owls are rarely seen despite the presence of apparently suitable habitat. The Hazel Green Ranch (Mariposa Co.) project, because of its meadow habitats and proximity to the park, has the greatest potential to impact great gray owls. Past studies and recent surveys, however, indicate the meadows are seldom used by great gray owls and probably only by transient owls moving between wintering and nesting areas (Skiff 1995; Skenfield 1999). Development at Hazel Green Ranch would likely avoid meadow habitats, but increased human disturbance in the area could deter owls from using these areas, resulting in minor, adverse effects. Sites of other reasonably foreseeable future projects have habitats that are unsuitable for great gray owls or have experienced previous impacts that have rendered habitats unsuitable. Current and reasonably foreseeable future development projects are therefore expected to have a minor but adverse effect on great gray owls. Projects that could have a beneficial effect on the species, by preserving or restoring habitat, include the Sierra Nevada Framework for Conservation and Collaboration (USFS), Fire Management Plan Update (NPS), Merced Wild and Scenic River Comprehensive Management Plan (NPS), and Fire Management Action Plan for Wilderness (USFS, Stanislaus). These plans could beneficially affect great gray owls by restoring habitat and limiting future impacts over wide areas of the Sierra Nevada. Under this alternative, restoration of habitats in Yosemite Valley would be beneficial to great gray owls, but development of parking and stables at Foresta could cause adverse effects. The overall cumulative impact on great gray owls resulting from current and reasonably foreseeable future projects, in combination with actions under this alternative, would be moderate and beneficial, based primarily on implementation of regional plans with widespread effects. Adverse effects from development projects would be localized.

WILLOW FLYCATCHER (*EMPIDONAX TRAILLII*)

Status: California endangered. The willow flycatcher was formerly a common Sierra Nevada species in meadows with dense growth of willow shrubs. Likely causes for recent steep declines

in populations include destruction of habitat and nest parasitism by brown-headed cowbirds. Willow flycatchers have not nested in Yosemite Valley for more than 30 years but have been seen in recent years at Wawona Meadow and Hodgdon Meadow. Projects that would cause degradation of meadow habitat or increased abundance of brown-headed cowbirds would adversely affect willow flycatchers through habitat loss and nest parasitism, respectively. The site of the Hazel Green Ranch (Mariposa Co.) project contains meadows that could be directly or indirectly affected. No willow flycatchers were found in this location during recent surveys, and habitat in the meadows appears to be unsuitable for the species. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the willow flycatcher. Implementation of these plans could help restore habitats, control the effects of grazing, and reduce cowbird abundance by reducing fragmentation of forest communities. These regional benefits would be augmented by actions under this alternative that would restore willow flycatcher habitat in Yosemite Valley and reduce cowbird abundance. The overall cumulative impact on willow flycatchers would be minor and beneficial.

SIERRA NEVADA RED FOX (*VULPES VULPES NECATOR*)

Status: Federal species of concern; California threatened. The Sierra Nevada red fox is found mostly above elevations of 7,000 feet in a wide variety of habitat types. The Sierra Nevada red fox is rare, and its population appears to be declining. The cause of this decline is unknown but could be related to human activities that disturb habitat, such as logging and fire suppression. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for red foxes. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for red foxes include Evergreen Lodge Expansion (Tuolumne Co.) and the Hazel Green Ranch (Mariposa Co.) project. These projects would primarily affect forest habitat. In addition, actions under this alternative would have a minor, adverse impact on red foxes, primarily through effects on habitat at Tioga Pass and Henness Ridge.

Overall, there would be a moderate, beneficial impact on Sierra Nevada red foxes, based on the potential protection of suitable habitat through implementation of regional plans. The projects with a possible adverse impact on red foxes, including the actions under this alternative, would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

CALIFORNIA WOLVERINE (*GULO GULO LUTEUS*)

Status: Federal species of concern; California threatened. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS),

U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for California wolverines. These regional plans would have a long-term, moderate, beneficial effect on the California wolverine.

Possible expansion of facilities at Tioga Pass and increased visitor use in that area under this alternative could have an adverse effect on wolverines. However, this impact would be minor, given the apparent scarcity of the species in the Sierra Nevada.

The overall cumulative impact on California wolverines would be moderate and beneficial, based primarily on the implementation of management plans that could protect wide areas of wolverine habitat in the Sierra Nevada, compared to the limited effects of increased human use at Tioga Pass from this alternative.

SIERRA NEVADA BIGHORN SHEEP (*OVIS CANADENSIS SIERRAE*)

Status: Federal endangered; California endangered. Because this species occurs at high elevation, few of the current and reasonably foreseeable future projects would affect it. Implementation of plans that cover wide areas of habitat outside the park, such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and U.S. Forest Service plans for wilderness adjacent to the park, could result in moderate to major beneficial effects on bighorn sheep, depending upon the alternatives selected and the extent of their implementation over time. Such benefit could be substantial if the plans reduce the area grazed by domestic sheep, which would reduce the threat of disease transmission to bighorns and open more areas for reintroduction of the species.

Only the Tioga Inn, Lee Vining (Mono Co.) project could cause adverse effects on bighorn sheep. Historically, some bighorn sheep probably descended to this area during winter, and the area could be used again if the species recovers in abundance. However, existing development has already affected the quality of habitat in the area.

The possible expansion of facilities at Tioga Pass Entrance is the only action under Alternative 5 that could affect bighorn sheep, but this impact would be negligible given the relative inaccessibility of their habitat. The overall cumulative impacts on Sierra Nevada bighorn sheep under this alternative would be moderate and beneficial, based on potential implementation of land management plans that could protect and improve habitat conditions over wide areas of the Sierra Nevada.

Potential Cumulative Impacts on Species that are Being Considered for Elevated Federal Listing

The U.S. Fish and Wildlife Service indicates that the following species of concern may be listed as federal threatened or endangered in the future. Because these species could be listed before the *Final Yosemite Valley Plan/SEIS* is finalized, the potential impacts to these species are also described.

YOSEMITE TOAD (*BUFO CANORUS*)

Status: Federal species of concern; California species of special concern. Projects that would have an appreciable impact on meadow habitats of this high-elevation species are most likely to affect populations of the Yosemite toad. Projects that could have a beneficial impact on the Yosemite toad, due to complementary management objectives, include the Fire Management Plan Update (NPS), the Sierra Nevada Framework for Conservation and Collaboration (USFS), Merced Wild and Scenic River Comprehensive Management Plan (NPS), and U.S. Forest Service plans for adjacent wilderness. Projects that could have an adverse impact on the Yosemite toad include the Tioga Inn, Lee Vining (Mono Co.); Highlands, June Lake (Mono Co.); and Double Eagle Resort Construction at June Lake (Mono Co.) projects. Actions under this alternative that would expand facilities at Tioga Pass Entrance and lead to increased visitor use of Badger Pass could affect Yosemite toads, but such effects would be negligible.

The overall cumulative impact on the Yosemite toad would be moderate and beneficial, based primarily on the potential for protection of habitat and populations resulting from implementation of plans that would affect large, high-elevation areas. Projects with adverse impacts would affect relatively small areas, where the presence of the Yosemite toad is questionable.

MOUNTAIN YELLOW-LEGGED FROG (*RANA MUSCOSA*)

Status: Federal species of concern; California species of special concern. The current and reasonably foreseeable future projects that would have beneficial impacts to aquatic habitats due to complementary management objectives include the Fire Management Plan Update (NPS), Sierra Nevada Framework for Conservation and Collaboration (USFS), Merced Wild and Scenic River Comprehensive Management Plan (NPS), U.S. Forest Service plans for adjacent wilderness, and Fire Management Action Plan for Wilderness (USFS, Stanislaus).

Development that would occur at Badger Pass and Tioga Pass would have a negligible effect on mountain yellow-legged frogs and therefore would not be a factor in cumulative impacts. Current and reasonably foreseeable future projects with potential adverse impacts include the Hazel Green Ranch (Mariposa Co.) project and projects at June Lake (Mono Co.). Overall, the cumulative impact on mountain yellow-legged frogs is expected to be moderate and beneficial, based on the amount of habitat and number of populations that would be affected by implementation of plans designed to better protect Sierra Nevada ecosystems. Projects with negative impacts could affect small areas and relatively few populations (if present).

FOOTHILL YELLOW-LEGGED FROG (*RANA BOYLEI*)

Status: Federal species of concern; California species of special concern. The impact on the foothill yellow-legged frog would be similar to that of the California red-legged frog. The foothill yellow-legged frog is virtually extinct in the Sierra Nevada, and therefore projects in its area of former occurrence would not affect any existing populations. However, projects that affect suitable habitat (e.g., wet meadows and rocky streams) could affect reintroduction or recolonization of this species. Projects that would have beneficial impacts include the Fire Management Plan Update (NPS), Sierra Nevada Framework for Conservation and Collaboration (USFS), Merced Wild and Scenic River Comprehensive Management Plan

(NPS), U.S. Forest Service plans for adjacent wilderness, and Fire Management Action Plan for Wilderness (USFS, Stanislaus).

These beneficial effects would be augmented by restoration of suitable habitat in Yosemite Valley. Overall, the cumulative impact would be minor and beneficial, based on potential protection of foothill yellow-legged frog habitat through implementation of plans that cover wide areas and restoration of potential habitats in Yosemite Valley under this alternative. The intensity of this impact would be minor because this species is almost extinct from the Sierra Nevada, but habitat should nonetheless be protected to allow for reintroduction or recolonization of the species. Projects with a possible adverse impact on foothill yellow-legged frogs, such as the Mariposa Creek Pedestrian/Bike Path (Mariposa Co.), Yosemite View Parcel Land Exchange (NPS), and Merced Canyon Trail Acquisition (BLM) would affect a relatively small area of habitat compared to projects with potential beneficial impacts, but these projects could have a major, adverse negative impact if they affected an unknown population of foothill yellow-legged frogs, which could be among the last in the Sierra Nevada. However, site surveys would be completed, where applicable, as required by the Council on Environmental Quality and the Endangered Species Act(s) prior to disturbance to determine whether this species is present.

CALIFORNIA SPOTTED OWL (*STRIX OCCIDENTALIS OCCIDENTALIS*)

Status: Federal species of concern; California species of special concern. Decline of the California spotted owl in the Sierra Nevada has been linked to degradation of its forest habitats from logging, which affects the size of forested tracts as well as tree density and age. Projects likely to have a beneficial impact on spotted owl habitat, through long-term habitat improvement plans, include the Fire Management Plan Update (NPS), Sierra Nevada Framework for Conservation and Collaboration (USFS), Orange Crush Fuels Treatment Projects (USFS, Stanislaus), A-Rock Reforestation (USFS, Stanislaus), Rogge-Ackerson Fire Reforestation (Tuolumne Co.), and the Fire Management Action Plan for Wilderness (USFS, Stanislaus). In addition, actions under this alternative would restore habitats near known spotted owl nest sites in Yosemite Valley, thus providing beneficial effects. Development outside of Yosemite Valley would affect areas of spotted owls foraging habitat, but such areas are distant from known or suspected nesting areas. Projects with potentially adverse impacts include the Evergreen Lodge Expansion (Tuolumne Co.), the Hazel Green Ranch (Mariposa Co.) project, and Yosemite West Rezone for 55 Acres (Mariposa Co.).

Overall, the cumulative impact on this species would be moderate and beneficial, based primarily on implementation of plans for ecosystem-based management of forest habitats over much of the Sierra Nevada in combination with reforestation projects that would hasten a return of habitat more suitable for spotted owls. Projects with negative impacts would affect relatively small areas, and may impact local owls, but would not have far-ranging impacts on the California spotted owl or habitat restoration that would occur under this alternative.

MARTEN (*MARTES AMERICANA*)

Status: Federal species of concern. This species is dependent upon dense, complex coniferous forests with large trees, snags, and structural complexity near the ground. Projects likely to

have a beneficial impact on marten habitat due to complementary management objectives include the Fire Management Plan Update (NPS), Sierra Nevada Framework for Conservation and Collaboration (USFS), Orange Crush Fuels Treatment Projects (USFS, Stanislaus), A-Rock Reforestation (USFS, Stanislaus), Rogge-Ackerson Fire Reforestation (USFS, Stanislaus), and the Fire Management Action Plan for Wilderness (USFS, Stanislaus). Projects likely to have an adverse impact on marten habitat include the Evergreen Lodge Expansion (Tuolumne Co.), the Hazel Green Ranch (Mariposa Co.) project, and the Yosemite West Rezone for 55 Acres (Mariposa Co.). Effects on martens under this alternative would be primarily adverse due to development of parking facilities and expansion of entrance stations outside of Yosemite Valley.

Overall, the cumulative impact would be moderate and beneficial, based primarily on better protection of forest habitats through implementation of plans that could affect wide areas of the Sierra Nevada. In addition, reforestation projects could hasten the return of forest habitats that are more favorable to marten. In comparison, projects with potential adverse impacts on marten, including this alternative, would affect relatively small areas of forest habitat.

PACIFIC FISHER (MARTES PENNANTI PACIFICA)

Status: Federal species of concern; California species of special concern. Fishers in the Sierra Nevada prefer coniferous forests (especially fir) with a high degree of canopy closure and structural complexity. Projects likely to have a beneficial effect on fisher habitat, due to complementary management objectives, include the Fire Management Plan Update (NPS), Sierra Nevada Framework for Conservation and Collaboration (USFS), Orange Crush Fuels Treatment Projects (USFS, Stanislaus), A-Rock Reforestation (USFS, Stanislaus), Rogge-Ackerson Fire Reforestation (Tuolumne Co.), and the Fire Management Action Plan for Wilderness (USFS, Stanislaus). Projects likely to have an adverse effect on fisher habitat include the Evergreen Lodge Expansion (Tuolumne Co.), the Hazel Green Ranch (Mariposa Co.) project, and the Yosemite West Rezone for 55 Acres (Mariposa Co.). Effects on fishers under this alternative would be primarily adverse due to development of parking facilities and expansion of entrance stations outside of Yosemite Valley.

Overall, the cumulative impact on the Pacific fisher would be moderate and beneficial, based primarily on better protection of forest habitats through implementation of plans that could affect wide areas of the Sierra Nevada. In addition, reforestation projects could hasten the return of forest habitats more favorable to fisher. In comparison, projects with potential adverse impacts on fishers, including this alternative, would affect relatively small areas of forest.

Potential Cumulative Impacts on Federal Species of Concern and California Species of Special Concern

MERCED CANYON SHOULDERBAND SNAIL (HELMINTHOGLYPTA ALLYNSMITHI)

Status: Federal species of concern. Regional planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Merced Canyon shoulderband snail. These actions could

have long-term, minor, beneficial effects on suitable habitat. The Incline Road Construction, Foresta Road Bridge to South Fork (Mariposa Co.) project could have a detrimental effect on snail habitat, but this impact is expected to be minor because it would occur primarily in previously affected areas. Development that would occur in El Portal under this alternative would cause negligible impacts to this snail species, because no suitable habitat would be affected.

Overall, there would be a minor, beneficial, cumulative impact on the Merced Canyon shoulderband snail, based on the potential protection of suitable habitat resulting from regional plans, whereas actions under this alternative would have a negligible effect.

MARIPOSA SIDEBAND SNAIL (*MONADENIA HILLEBRANDI*)

Status: Federal species of concern. Regional planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Mariposa sideband snail. These actions could have long-term, minor, beneficial effects on suitable habitat. Restoration of potential habitat in Yosemite Valley under this alternative would augment this beneficial effect. Projects with the potential for adverse effects on this species include the El Portal Road Improvement Project (NPS), the Incline Road Construction, Foresta Road Bridge to South Fork (Mariposa Co.) project, and Yosemite Motels Expansion, El Portal (Mariposa Co.). These projects are expected to have a local, minor, adverse effect because they would occur in areas of previous disturbance or in areas that do not contain suitable habitat.

Overall, there would be a minor, beneficial cumulative impact on the Mariposa sideband snail, based on the potential protection of suitable habitat provided by regional plans and restoration of habitats in Yosemite Valley.

SIERRA PYGMY GRASSHOPPER (*TETRIX SIERRANA*)

Status: Federal species of concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Sierra pygmy grasshopper. These actions could have long-term, minor, beneficial effects on suitable habitat. Projects with potential adverse effects include the Incline Road Construction Foresta Road Bridge to South Fork (Mariposa Co.) project and the Yosemite Motels Expansion, El Portal (Mariposa Co.). The effects of these projects would be limited to minor and adverse because they would occur in areas that do not contain suitable habitat or in areas of previous disturbance. Under this alternative, restoration of riparian habitats in Yosemite Valley would beneficially affect this species, while developments in El Portal and South Entrance could have a localized, adverse effect on suitable habitat.

The overall cumulative impact on the Sierra pygmy grasshopper is expected to be minor and beneficial, based on the potential protection of large areas of suitable habitat resulting from implementation of regional plans in combination with mixed effects from this alternative.

WAWONA RIFFLE BEETLE (*ATRACTELMIS WAWONA*)

Status: Federal species of concern. Cumulative effects that could have large-scale benefits to Wawona riffle beetle habitat include regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and the Merced Wild and Scenic River Comprehensive Management Plan (NPS). These beneficial effects would be augmented by restoration of large areas of riparian and meadow habitat in Yosemite Valley that would occur under this alternative. The Yosemite View parcel land exchange (NPS) could affect aquatic habitat for the riffle beetle in the adjacent reach of the Merced River. Overall, there would be a minor, beneficial cumulative effect on the riffle beetle. This is largely due to regional and parkwide planning that would protect wide areas of habitat for the Wawona riffle beetle, coupled with habitat restoration that would occur under this alternative.

BOHART'S BLUE BUTTERFLY (*PHILOTIELLA SPECIOSA BOHARTORUM*)

Status: Federal species of concern. The documented occurrence of the Wawona riffle beetle closest to the park is near Briceburg, west of El Portal. The Sierra Nevada Framework for Conservation and Collaboration (USFS) could improve the size, integrity, and connectivity of suitable habitat for the Bohart's blue butterfly over a wide area of foothill habitat. This action has the potential to have long-term, minor, beneficial effects on suitable habitat. Further surveys found this species in other areas such as Merced, Fresno, and Tulare Counties. Projects in those areas, such as the Rio Mesa Area Plan (Madera Co.) and University of California, Merced Campus (Merced Co.) could have a minor, local effect on Bohart's blue butterfly. These effects would be limited in scale in comparison to the Sierra Nevada Framework for Conservation and Collaboration, which would help protect wide areas of foothill woodland habitat that is declining rapidly. Development of parking, housing, and administrative facilities under this alternative could adversely affect suitable habitat, although the occurrence of the Bohart's blue butterfly in El Portal is questionable.

The overall cumulative impact on the Bohart's blue butterfly would be minor and beneficial, based on the potential protection of wide areas of suitable habitat resulting from the Sierra Nevada Framework, as opposed to potential localized impacts in El Portal that would occur under this alternative.

MOUNT LYELL SALAMANDER (*HYDROMANTES PLATYCEPHALUS*)

Status: Federal species of concern; California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Mount Lyell salamander over a wide area. These actions, augmented by habitat restoration in Yosemite Valley under this alternative, could have long-term, minor, beneficial cumulative effects on suitable habitat, depending on the alternatives chosen and the extent of their implementation over time. No current and reasonably foreseeable future projects are expected to have an adverse effect on Mount Lyell salamanders.

NORTHWESTERN POND TURTLE (*CLEMMYS MARMORATA MARMORATA*) AND SOUTHWESTERN POND TURTLE (*CLEMMYS MARMORATA PALLIDA*)

Status: Federal species of concern; California species of special concern. Cumulative effects that could have large-scale benefits to western pond turtle habitat include regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and the Merced Wild and Scenic River Comprehensive Management Plan (NPS). These beneficial effects would be augmented by restoration of large areas of riparian and wetland habitats in Yosemite Valley under this alternative. The Yosemite View Parcel Land Exchange (NPS) would directly affect a small area of habitat suitable for the western pond turtle. Overall, there would be a minor, beneficial cumulative effect on the western pond turtle. This benefit would largely derive from implementation of regional and parkwide planning that would protect habitat for western pond turtles and restoration of suitable habitat in Yosemite Valley under this alternative.

HARLEQUIN DUCK (*HISTRIONICUS HISTRIONICUS*)

Status: Federal species of concern; California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the harlequin duck. Under this alternative, about 100 acres of suitable riparian and aquatic habitat would be restored or protected. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending on the alternatives chosen and the extent of their implementation over time.

Current and reasonably foreseeable future projects that could have adverse impacts on suitable habitat for the harlequin duck include the Yosemite View Parcel Land Exchange (NPS) and the Incline Road Construction, Foresta Road Bridge to South Fork (Mariposa Co.) project. There are no known populations of the harlequin duck in these areas.

Overall, there would be a moderate, beneficial cumulative impact on the harlequin duck, based on the potential protection of suitable habitat offered by regional plans combined with restoration of suitable habitat provided under this alternative. The projects with possible adverse impacts on harlequin duck habitat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

COOPER'S HAWK (*ACCIPITER COOPERI*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) would improve the size, integrity, and connectivity of suitable habitat for the Cooper's hawk. These regional plans would have a long-term, moderate to major, beneficial effect on the Cooper's hawk, depending on the alternatives chosen and the extent of their implementation over time. These beneficial effects would be augmented by restoration of habitats in Yosemite Valley provided under this

alternative. Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for the Cooper's hawk include the Hazel Green Ranch (Mariposa Co.) project; Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); El Portal Road Improvement Project (NPS); Evergreen Lodge Expansion (Tuolumne Co.); and Yosemite West Rezone for 55 Acres (Mariposa Co.). In addition, development of parking at Henness Ridge, El Portal, and Foresta would affect an area of potential Cooper's hawk habitat, as would development of housing at Wawona, and housing, parking, and administrative facilities at El Portal.

The overall cumulative impact on Cooper's hawks would be moderate and beneficial, based primarily on implementation of wide-ranging plans that would protect large areas of the Sierra Nevada in combination with restoration of habitats in Yosemite Valley under this alternative, compared to localized adverse effects on relatively small areas from individual projects.

NORTHERN GOSHAWK (*ACCIPITER GENTILIS*)

Status: Federal species of concern; California species of special concern. Projects likely to have a beneficial effect on northern goshawk habitat include the Fire Management Plan Update (NPS), the Sierra Nevada Framework for Conservation and Collaboration (USFS), Wilderness Management Plan Update (NPS), and U.S. Forest Service plans for adjacent wilderness. Implementation of these plans would have a moderate to major effect on northern goshawks, depending on the alternatives chosen and the extent of their implementation over time.

Projects that could have an adverse effect on northern goshawk habitat include the Hazel Green Ranch (Mariposa Co.) project, Evergreen Lodge Expansion (Tuolumne Co.), and the Yosemite West Rezone for 55 Acres (Mariposa Co.). Development of parking at Henness Ridge under this alternative would adversely affect an area of forest habitat. These projects, however, would affect relatively small areas of habitat.

Overall, there would be a long-term, moderate, beneficial cumulative impact on the northern goshawk, primarily from the potential protection of wide areas of habitat through implementation of regional land management plans, compared to adverse effects on small, localized areas of habitat from individual projects (including effects from this alternative).

SHARP-SHINNED HAWK (*ACCIPITER STRIATUS*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of wide areas of suitable habitat for the sharp-shinned hawk. A mix of habitats favorable to sharp-shinned hawks would be restored in Yosemite Valley under this alternative. These regional plans, in combination with this alternative, would have a long-term, minor to moderate, beneficial effect on the sharp-shinned hawk, depending on the alternatives chosen and the extent of their implementation over time. The intensity of the effect

would be lower than for other *Accipiter* species because sharp-shinned hawks do not commonly nest in the Sierra Nevada.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for sharp-shinned hawks include the Hazel Green Ranch (Mariposa Co.) project; Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); El Portal Road Improvement (NPS); Evergreen Lodge Expansion (Tuolumne Co.); and Yosemite West Rezone for 55 Acres (Mariposa Co.). Under this alternative, some habitat would be adversely affected, including habitat at Henness Ridge, Foresta, Wawona, and El Portal.

The overall cumulative impact on sharp-shinned hawks would be moderate and beneficial, based primarily on implementation of plans that would protect large areas of the Sierra Nevada and restoration of diverse habitats in Yosemite Valley under this alternative, compared to localized adverse effects on relatively small areas from individual projects.

GOLDEN EAGLE (*AQUILA CHRYSAETOS*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for golden eagles. These regional plans would have a long-term, moderate, beneficial effect on golden eagles. Restoration of habitats in Yosemite Valley under this alternative would also benefit golden eagles.

Current and reasonably foreseeable future projects that could have an adverse effect on golden eagles include the Rio Mesa Area Plan (Madera Co.); University of California, Merced Campus (Merced Co.); Buildout of City of Merced, General Plan; and the Tioga Inn, Lee Vining (Mono Co.). Development of parking in Foresta that could occur under this alternative would affect a small area of potential habitat. These projects, in total, would have a minor, adverse impact on golden eagles because of the limited area they would affect.

The overall cumulative effects on golden eagles would be minor and beneficial, based primarily on the protection of habitat provided by implementation of land management plans that would cover large areas of the Sierra Nevada in combination with restoration of habitats in Yosemite Valley under this alternative. The area of effect would be limited for projects that have an adverse impact on golden eagles, including development in some habitat under this alternative.

MERLIN (*FALCO COLUMBARIUS*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of large areas of suitable habitat for the merlin. These regional plans could have a long-term, minor to moderate, beneficial effect on the merlin, depending on the alternatives chosen and the extent of their implementation over time. Merlin habitat would

be further supplemented by restoration of meadow and riparian habitats in Yosemite Valley under this alternative.

Current and reasonably foreseeable future projects that could have an adverse effect on merlins include the Yosemite View Parcel Land Exchange (NPS); Rio Mesa Area Plan (Madera Co.); Yosemite Motels Expansion, El Portal (Mariposa Co.); University of California, Merced Campus (Merced Co.); and Buildout of City of Merced, General Plan. These projects would have a minor, adverse effect on merlins, depending on the alternatives chosen and the extent of their implementation over time. Under this alternative, habitat could be adversely affected by development in Foresta, Wawona, and El Portal, but the areas affected would be less suitable habitat.

The overall cumulative effects would be moderate and beneficial, based primarily on the implementation of land management plans that could affect large areas of the Sierra Nevada in combination with restoration of habitats in Yosemite Valley that would occur under this alternative.

PRAIRIE FALCON (*FALCO MEXICANUS*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the prairie falcon. These actions could have long-term, moderate to major, beneficial effects on prairie falcon habitat, depending on the alternatives chosen and the extent of their implementation over time. Further benefit to this species would be provided by restoration of habitats in Yosemite Valley that would occur under this alternative.

Current and reasonably foreseeable future projects that could have an adverse effect on prairie falcons include the Rio Mesa Area Plan (Madera Co.); University of California, Merced Campus (Merced Co.); Buildout of City of Merced, General Plan; and Tioga Inn, Lee Vining (Mono Co.). The development of parking in Foresta under this alternative could affect prairie falcons, but the area involved is marginal habitat. In total these projects, would have a minor, adverse effect on prairie falcons because of the limited area they would affect.

The overall cumulative impact on prairie falcons would be moderate and beneficial, based primarily on the protection of habitat provided by implementation of land management plans that would cover large areas of the Sierra Nevada combined with restoration of Yosemite Valley habitats under this alternative. Projects with an adverse impact on prairie falcons would have a limited area of effect.

LONG-EARED OWL (*ASIO OTUS*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the

size, integrity, and connectivity of suitable habitat for long-eared owls. These regional plans would have a long-term, moderate, beneficial effect on long-eared owls, depending on the alternatives chosen and the extent of their implementation over time. Restoration of extensive riparian habitats in Yosemite Valley under this alternative would also benefit long-eared owls.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for long-eared owls include the Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); El Portal Road Improvement Project (NPS); and Evergreen Lodge Expansion (Tuolumne Co.). Development of parking, housing, and administrative facilities in El Portal under this alternative could affect some areas of potential habitat.

The overall cumulative effect on long-eared owls would be minor and beneficial, based primarily on the protection of habitat provided by implementation of wide-ranging land management plans that would cover large areas of the Sierra Nevada, as well as restoration of large areas of riparian habitat in Yosemite Valley under this alternative. There would be a limited area of effect for projects that have an adverse impact on long-eared owls.

YELLOW WARBLER (*DENDROICA PETECHIA*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of large areas of suitable habitat for the yellow warbler. These regional plans would have a long-term, moderate to major, beneficial effect on the yellow warbler, depending on the alternatives chosen and the extent of their implementation over time. Under this alternative, extensive areas of riparian habitat would be restored, thus providing high-quality habitat for yellow warblers. A reduction in stable facilities in Yosemite Valley could reduce brown-headed cowbird abundance and their effects of nest parasitism on yellow warblers.

Current and reasonably foreseeable future projects with potential adverse effects on yellow warblers include the Hazel Green Ranch (Mariposa Co.) project, Yosemite View Parcel Land Exchange (NPS), and the Yosemite West Rezone of 55 Acres (Mariposa Co.). Development in El Portal, Wawona, and Foresta that would occur under this alternative would affect habitat. These projects would have a minor, adverse impact because the affected area is generally lower-quality habitat for yellow warblers and is limited in size, and because large areas of suitable, unaffected habitat would remain in surrounding areas.

The overall cumulative effects on yellow warblers would be moderate and beneficial, based primarily on the protection of high-quality habitat provided by implementation of regional land management plans that would cover large areas of the Sierra Nevada as well as restoration of large areas of high-quality riparian habitat in Yosemite Valley from this alternative. There would be a limited area of impact on lower-quality habitat for projects that would have an adverse effect on yellow warblers.

MOUNT LYELL SHREW (*SOEX LYELLI*)

Status: Federal species of concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), the Wilderness Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Mount Lyell shrew. These regional plans would have a long-term, minor, beneficial effect on suitable habitat for the Mount Lyell shrew. Development at Tioga Pass, the only area of potential effect, would have a negligible impact on Mount Lyell shrews. No current and reasonably foreseeable future projects are expected to have an adverse effect on this species; therefore, the overall impact would be minor and beneficial.

PALLID BAT (*ANTROZOUS PALLIDUS*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the pallid bat. These regional plans would have a long-term, minor to moderate, beneficial effect on the pallid bat, depending on the alternatives chosen and the extent of their implementation over time. Restoration of large areas of riparian, meadow, and California black oak habitats that would occur under this alternative would further benefit pallid bats by providing important foraging habitat.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for the pallid bat include the Hazel Green Ranch (Mariposa Co.) project, Yosemite View Parcel Land Exchange (NPS), Yosemite Motels Expansion (Mariposa Co.), El Portal Road Improvement Project (NPS), Yosemite West Rezone for 55 Acres (Mariposa Co.), and Evergreen Lodge Expansion (Tuolumne Co.). New development that would occur at Henness Ridge, Foresta, El Portal, and Wawona under this alternative could affect pallid bats.

Overall, there would be a minor, beneficial, cumulative impact on the pallid bat, based on the potential protection of suitable habitat resulting from regional plans and restoration of diverse habitats in Yosemite Valley under this alternative. The projects with a possible adverse effect on the pallid bat, including new development under this alternative, would affect a relatively small area of habitat compared to projects with potential beneficial effects.

TOWNSEND'S BIG-EARED BAT (*CORYNORHINUS TOWNSENDII TOWNSENDII*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of large areas of suitable habitat for the Townsend's big-eared bat. These regional plans would have a long-term, minor to moderate, beneficial effect on the Townsend's big-eared bat, depending on the alternatives chosen and the extent of their implementation over time. Such benefits would be augmented by this alternative through

restoration of large areas of riparian, meadow, and California black oak habitats in Yosemite Valley. These areas are important foraging areas for Townsend's big-eared bats.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for Townsend's big-eared bats include the Hazel Green Ranch (Mariposa Co.) project; Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); El Portal Road Improvement Project (NPS); Evergreen Lodge Expansion (Tuolumne Co.); and Yosemite West Rezone for 55 Acres (Mariposa Co.). New development at Henness Ridge, Wawona, El Portal, and Foresta could affect small areas of suitable habitat.

Overall, there would be a minor, beneficial cumulative impact on Townsend's big-eared bat, based on the potential protection of suitable habitat through implementation of regional plans as well as restoration of Yosemite Valley habitats under this alternative. The projects with a possible adverse impact on the Townsend's big-eared bat would affect a relatively small area of marginal habitat compared to projects with potential beneficial effects.

SPOTTED BAT (*EUDERMA MACULATUM*)

Status: Federal species of concern; California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the spotted bat. These actions have the potential for long-term, moderate to major, beneficial effects on suitable habitat, depending on the alternatives chosen for implementation and the extent of their implementation over time. Such beneficial impacts would be augmented by restoration of large areas of riparian and meadow habitats under this alternative. These habitats are important foraging areas for spotted bats.

Projects that could have adverse effects on suitable habitat for the spotted bat include the Yosemite View parcel land exchange (NPS); El Portal Road Improvement Project (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); and Evergreen Lodge Expansion (Tuolumne Co.); Hazel Green Ranch (Mariposa Co.) project; and Yosemite West Rezone for 55 Acres (Mariposa Co.). New development at Henness Ridge, Wawona, El Portal, and Foresta would affect potential habitat. Adverse cumulative impacts on spotted bats would be minor, based on their relatively limited area of effect and the type of habitat affected.

In total, there would be a moderate, beneficial impact on the spotted bat, based primarily on the potential protection of large areas of suitable habitat resulting from regional plans, in combination with restoration of important habitats in Yosemite Valley that would occur under this alternative. The projects with possible adverse impacts on the spotted bat would affect a relatively small area of less-suitable habitat compared to projects with potential beneficial impacts.

SMALL-FOOTED MYOTIS BAT (*MYOTIS CILIOLABRUM*)

Status: Federal species of concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans

for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the small-footed myotis bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending on the alternatives chosen for implementation and the extent of their implementation over time. Further benefit would occur under this alternative from restoration of large areas of riparian and meadow habitats in Yosemite Valley, which are important foraging habitat for the small-footed myotis bat.

Projects that could have adverse effects on suitable habitat for the small-footed myotis bat include the Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion; El Portal (Mariposa Co.); El Portal Road Improvement Project (NPS); Yosemite West Rezone for 55 Acres (Mariposa Co.); and Evergreen Lodge Expansion (Tuolumne Co.). New development at Henness Ridge, El Portal, Wawona, and Foresta under this alternative could affect foraging habitat.

In total, the cumulative impact on the small-footed myotis bat would be moderate and beneficial, based primarily on implementation of large-scale regional plans that could protect wide areas of habitat, and restoration of important habitats in Yosemite Valley under this alternative. In comparison, projects with potential adverse impacts would affect relatively small areas of habitat.

LONG-EARED MYOTIS BAT (*MYOTIS EVOTIS*)

Status: Federal species of concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the long-eared myotis bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending on the alternatives chosen for implementation and the extent of their implementation over time. Further benefit would occur under this alternative from restoration of large areas of riparian and meadow habitats in Yosemite Valley, which are important foraging areas for long-eared myotis bats.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for the long-eared myotis bat include the Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); El Portal Road Improvement Project (NPS); Hazel Green Ranch (Mariposa Co.) project; Yosemite West Rezone for 55 Acres (Mariposa Co.); and Evergreen Lodge Expansion (Tuolumne Co.). Additional adverse impacts would occur from new development at Henness Ridge, El Portal, Wawona, and Foresta under this alternative.

Overall, there would be a moderate, beneficial cumulative impact on long-eared myotis bats, based on the potential protection of suitable habitat from implementation of regional plans, in combination with restoration of important habitats in Yosemite Valley. The projects with possible adverse impacts on the long-eared myotis bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

FRINGED MYOTIS BAT (*MYOTIS THYSANODES*)

Status: Federal species of concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the fringed myotis bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending on the alternatives chosen for implementation and the extent of their implementation over time. Further beneficial effects would result from restoration of large areas of riparian and meadow habitats in Yosemite Valley under this alternative. Such areas are important foraging habitat for fringed myotis bats.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for fringed myotis bats include the Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); El Portal Road Improvement Project (NPS); Hazel Green Ranch (Mariposa Co.) project; Yosemite West Rezone for 55 Acres (Mariposa Co.); and Evergreen Lodge Expansion (Tuolumne Co.). Additional adverse impacts would occur from new development at Henness Ridge, El Portal, Wawona, and Foresta under this alternative.

Overall, there would be a moderate, beneficial cumulative impact on the fringed myotis bat, based on the potential protection of suitable habitat resulting from wide-reaching regional plans in combination with actions under this alternative that would restore important habitats in Yosemite Valley. The projects with possible adverse impacts on the fringed myotis bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

LONG-LEGGED MYOTIS BAT (*MYOTIS VOLANS*)

Status: Federal species of concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the long-legged myotis bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending on the alternatives chosen for implementation and the extent of their implementation over time. Further beneficial effects would be provided by restoration of large areas of riparian and meadow habitats in Yosemite Valley that would occur under this alternative. Such areas are important foraging habitat for long-legged myotis bats.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for the long-legged myotis bat include the Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); El Portal Road Improvement Project (NPS); Hazel Green Ranch (Mariposa Co.) project; Yosemite West Rezone for 55 Acres (Mariposa Co.); and Evergreen Lodge Expansion (Tuolumne Co.). Additional adverse impacts would occur from new development at Henness Ridge, El Portal, Wawona, and Foresta under this alternative.

Overall, there would be a moderate, beneficial cumulative impact on the long-legged myotis bat, based on the potential protection of suitable habitat through implementation of regional plans in combination with restoration of important habitats in Yosemite Valley under this alternative. The projects with a possible adverse impact on the spotted bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

YUMA MYOTIS BAT (*MYOTIS YUMANENSIS*)

Status: Federal species of concern; California species of concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Yuma myotis bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending on the alternatives chosen for implementation and the extent of their implementation over time. Actions under this alternative would provide additional benefit to Yuma myotis bats by restoring large areas of meadow and riparian habitats in Yosemite Valley, which are important foraging areas for this species.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for the Yuma myotis bat include the Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); El Portal Road Improvement Project (NPS); Hazel Green Ranch (Mariposa Co.) project; Yosemite West Rezone for 55 Acres (Mariposa Co.); and Evergreen Lodge Expansion (Tuolumne Co.). Additional adverse impacts would occur from new development at Henness Ridge, El Portal, Wawona, and Foresta under this alternative.

Overall, there would be a moderate, beneficial cumulative impact on the Yuma myotis bat, based on the potential protection of suitable habitat from implementation of regional plans, augmented by restoration of important habitats in Yosemite Valley under this alternative. The projects with possible adverse impacts on Yuma myotis bats would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

GREATER WESTERN MASTIFF BAT (*EUMOPS PEROTIS CALIFORNICUS*)

Status: Federal species of concern; California species of concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of large areas of suitable habitat for the greater western mastiff bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat depending on the alternatives chosen for implementation and the extent of their implementation over time. Further benefit would be provided by this alternative through restoration of large areas of meadow and riparian habitats that are important foraging areas for mastiff bats.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for the greater western mastiff bat include the Yosemite View Parcel Land Exchange (NPS); Yosemite Motels Expansion, El Portal (Mariposa Co.); El Portal Road Improvement Project (NPS); Hazel Green Ranch (Mariposa Co.) project; Yosemite West Rezone for 55 Acres (Mariposa Co.); and Evergreen Lodge Expansion (Tuolumne Co.). Additional adverse impacts would occur from new development at Henness Ridge, El Portal, Wawona, and Foresta under this alternative, although no suitable roosting habitat (cliffs) is nearby.

Overall, there would be a moderate, beneficial cumulative impact on the greater western mastiff bat, based on the potential protection of suitable habitat from implementation of regional plans in combination with restoration of important habitats in Yosemite Valley that would occur under this alternative. The projects with possible adverse impacts on the greater western mastiff bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

SIERRA NEVADA SNOWSHOE HARE (*LEPUS AMERICANUS TAHOENSIS*)

Status: Federal species of concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for snowshoe hares. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending on the alternatives chosen for implementation and the extent of their implementation over time.

Current and reasonably foreseeable future projects that could have adverse effects on suitable habitat for snowshoe hares include Evergreen Lodge Expansion (Tuolumne Co) and Hazel Green Ranch (Mariposa Co.). This project would primarily affect forest habitat. Development of parking on Henness Ridge under this alternative could affect snowshoe hare habitat.

Overall, there would be a minor, beneficial impact on snowshoe hares, based on the potential protection of suitable habitat from implementation of regional plans. The projects with possible adverse impacts on snowshoe hares would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

WHITE-TAILED HARE (*LEPUS TOWNSENDII*)

Status: California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the white-tailed hare. These regional plans would have a long-term, moderate, beneficial effect on the white-tailed hare. No reasonably foreseeable future projects are expected to have an adverse effect on white-tailed hare, including minor expansion of Tioga Pass Entrance that could occur under this alternative.

SIERRA NEVADA MOUNTAIN BEAVER (*APLODONTIA RUFA CALIFORNICA*)

Status: Federal species of concern; California species of special concern. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the mountain beaver. These regional plans would have a long-term, moderate, beneficial effect on suitable habitat for the mountain beaver. No foreseeable future projects are expected to have an adverse effect on Sierra Nevada mountain beaver, including the increased visitor use at Badger Pass under this alternative.

Cumulative Impacts Conclusion

Many of the cumulative impact principles given in the conclusion for general wildlife earlier in this alternative also apply to special-status species.

Overall, current and reasonably foreseeable future projects within the cumulative impact assessment area considered in conjunction with the actions under Alternative 5 would have a moderate, beneficial effect on special-status species and their habitats. This is primarily due to the potential effects that would come from implementation of large-scale planning documents that could protect and restore wildlife habitats over much of the Sierra Nevada. These plans would compliment actions under this alternative, which would restore large areas of meadow, riparian, and California black oak habitats that are important to many special-status species.

Under Alternative 5, adverse impacts would affect some special-status species such as Valley elderberry longhorn beetle, great gray owl, and fisher from new development outside of Yosemite Valley, and California spotted owl, yellow warbler, willow flycatcher, and California red-legged frog from new development in the Valley. Development of parking at Henness Ridge would affect an area of prime fisher habitat. Such impacts would add to the adverse effects of some current and reasonably foreseeable future projects. However, these impacts would be of limited severity because of the limited area of habitat affected, and would have little effect on the overall cumulative impacts on special-status species under this alternative, which would be moderate, beneficial.

V E G E T A T I O N

Forty-seven special-status species in Yosemite Valley and other out-of-Valley areas could be affected by Alternative 5 as proposed in the *Final Yosemite Valley Plan/SEIS*. Refer to table 3-7 (Vol. IA, Chapter 3) for this list of species; their state, federal and local status; and their general habitat requirements and locations. The impacts that have been identified in this section are generally long term, except where noted. Out-of-Valley areas affected by this alternative include El Portal, Foresta, Henness Ridge, and Wawona, and the park entrances at Big Oak Flat, Tioga Pass, and South Entrance.

Yosemite Valley

No federal- or state-listed plant species are known to occur in Yosemite Valley. Twelve park rare plant species currently exist in the Valley: sugar stick, round-leaved sundew, stream orchid, fawn-lily, northern bedstraw, Sierra laurel, false pimpernel, azure penstemon, phacelia, wood saxifrage, giant sequoia, and ladies' tresses. Northern bedstraw, false pimpernel, ladies' tresses, round-leaved sundew, phacelia, and Sierra laurel would experience a moderate, beneficial impact from the restoration of large portions of potentially wet meadows and riparian areas (at Yosemite Lodge, former Upper and Lower River and Lower Pines Campgrounds, and a portion of Housekeeping Camp) and from the removal and ecological restoration of the Ahwahnee Row houses. Development of Camp 6 as parking would only allow for a small zone of increased potential habitat within the River Protection Overlay for these species. The stream orchid would continue to occur within concession landscaped areas, but natural habitat at Happy Isles would be affected by replacement of the snack stand near the restroom. Minor, adverse impacts would be anticipated from installation of a new snack stand, as a relatively small area of habitat would be affected in this high traffic area.

Removal of the Ahwahnee tennis courts would have a long-term, major, adverse impact on the planted giant sequoia trees in this area, because these trees would be removed and the site restored to California black oak woodland. Redesign of the Ahwahnee parking lot could have adverse impacts to the planted giant sequoias, depending on final alignment of parking lots and driveways. Removal of the Superintendent's House (Residence 1) and restoration of this area could result in removal of the single planted giant sequoia along the access road. None of these actions would affect overall sustainability of giant sequoias in the park's three naturally occurring groves, with negligible adverse impacts.

The fawn-lily is currently affected by people trampling on and picking its showy flowers. This species would not be further affected under this alternative. The wood saxifrage typically grows on moist cliffs and also would not be affected by the actions of this alternative.

Out-of-Valley

This alternative would have no impacts on rare plant species at Hazel Green Ranch, Badger Pass, or South Landing, given that no actions are proposed within these areas.

El Portal

Currently one federal plant species of concern (Congdon's lomatium), four state-listed rare species (Yosemite onion, Tompkin's sedge, Congdon's woolly-sunflower, and Congdon's lewisia), and six park rare species (Indian paintbrush, collinsia, pitcher sage, Congdon's monkeyflower, Palmer's monkeyflower, and phacelia) occur within the general El Portal area.

Adverse impacts from trampling would continue to occur to all of these species, with the exception of Yosemite onion and Congdon's lomatium, which grow on steep, inaccessible slopes in association with poison oak. Impacts to the remaining species would be increased from current conditions due to a substantial increase in the residential population. Adverse impacts as a result of habitat loss and competition for resources (e.g., light, water, and nutrients) would continue to adversely effect most species because of the continued high degree of non-native species

encroachment expected in this area and the increased potential for new introductions. Potential adverse impacts to Tompkin's sedge, Indian paintbrush, collinsia, pitcher sage, Palmer's and Congdon's monkeyflowers, and phacelia would occur from development of out-of-Valley parking and employee housing. These impacts would be minimized as much as possible through mitigation measures such as avoidance (site selection), plant salvage and replanting, and/or topsoil salvage and reapplication after construction. The restoration of habitat at the old treatment plant at Rancheria Flat and at the sand pit would have moderate beneficial effects on Congdon's woolly-sunflower. Unavoidable losses of habitat with new development would lead to an overall minor, adverse impact in El Portal, despite mitigation efforts.

Foresta

No federal- or state-listed plant species occur in Foresta. Five park rare species are found within the general Foresta area (snapdragon, Small's southern clarkia, goldenaster, inconspicuous and pansy monkeyflowers). All five rare species would experience adverse impacts as a result of increased human activity from the reconstruction of 14 houses, as well as potential development of administrative stables operations for the National Park Service and concessioner, and construction of day-visitor parking in Foresta. Goldenaster and both monkeyflower species would experience moderate, long-term, adverse impacts from the construction of out-of-Valley parking due to loss of habitat. Radiating impacts of visitors would be minor in the parking lot area, as the installation of fences, signs, or other measures would be used to direct visitors away from sensitive habitats. There would be potential moderate, adverse impacts to rare plant habitat because of encroachment of non-native species associated with landscaping activities and increased numbers of residential and day-visitor vehicles, resulting in moderate, adverse overall impacts to rare plants in Foresta under Alternative 4.

Hennes Ridge

No federal-listed, state-listed, or park rare plant species are known to occur at Hennes Ridge; therefore, no impacts to such species would occur.

Wawona

No federal-listed, one state-listed plant species (Yosemite onion) and eight park rare species occur within the Wawona basin (snapdragon, Child's blue-eyed Mary, round-leaved sundew, Sierra sweet-bay, Bolander's skullcap, giant sequoia, trillium, and Hall's wyethia). New housing development would result in loss of a portion of the trillium population, with a moderate, adverse impact on this species. Increased human use in this area during the spring and summer would have potential radiating impacts, such as trampling on all of the Wawona rare species. However, these impacts would be minor with the implementation of specific mitigation measures, including avoidance of habitat or populations of special-status species through site design.

Big Oak Flat Entrance

No impacts to federal-, state-, or park-listed plant species would occur under Alternative 5 because no special-status species are known to occur at the Big Oak Flat Entrance area.

South Entrance

No federal- or state-listed plant species occur in the South Entrance area. One park rare species (Sierra sweet-bay) is located within the riparian areas adjacent to the current road alignment. Expanded parking and visitor center structures in this vicinity would be designed to avoid riparian areas, which would minimize the potential impact on the Sierra sweet-bay. The impacts of Alternative 5 on this species would be minor and adverse as a result of increased visitor use in the South Entrance area as well as the potential loss of a small area of habitat.

Tioga Pass Entrance

One federal species of concern (Tiehm's rock-cress) and thirteen park rare species occur within hiking distance of Tioga Pass. One species, the common juniper, could be directly impacted by construction of a new or expanded entrance/visitor contact station at Tioga Pass. Construction may result in habitat loss or direct loss of individual plants. There could be indirect effects on Tiehm's rock-cress and all 13 park rare species from increased foot traffic and associated trampling and soil compaction in the area. There could be increased hiking on Mt. Dana, which is within a day's hike from the Tioga Pass Entrance Station. The popular hike to the top of Mt. Dana is a cross-country path, without a formal route. Increased hiking on Mt. Dana could have a long-term, moderate, adverse impact on these rare plant species on Mt. Dana.

Conclusion

Forty-seven special-status plant species could be affected under Alternative 5. The proposed actions of this alternative would include mitigation measures to minimize adverse impacts to these species. Radiating impacts from new development (including trampling, picking, and increased non-native plants from increased visitor uses in and out of the Valley) would be limited to negligible to minor by managing uses within these sensitive areas and increasing management efforts to control non-natives.

Adverse impacts as a result of habitat loss would occur in El Portal for two state-listed rare species, for six park rare species, in Wawona for trillium, and in the Valley for the giant sequoia. These impacts would be mitigated by reasonable designs to avoid these species (as identified in site-specific surveys) and for some species, the retention and reuse of salvaged topsoil at the site to encourage re-establishment, resulting in minor, adverse local impacts.

Moderate beneficial impacts to northern bedstraw, false pimpernel, round-leaved sundew, Sierra laurel, phacelia, and ladies' tresses would occur because of restoration of riparian and meadow habitat. Alternative 5 would have minor adverse impacts on the stream orchid and no impacts on the fawn-lily or wood saxifrage.

Restoration of riparian habitat at the old treatment plant at Rancheria Flat and the sand pit would have moderate, beneficial effects by increasing potential habitat for Congdon's woolly-sunflower.

Therefore, the overall impact to park rare or special concern plant species would be minor and adverse, primarily resulting from habitat loss and impacts of trampling in Wawona, Foresta, and El Portal.

Cumulative Impact

The description of the impacts on special-status vegetation from reasonably foreseeable future projects within the cumulative impact assessment area is the same as for Alternative 2. The projects considered in this analysis are listed in Vol. II, Appendix H. These management and planning projects within the cumulative impact assessment area would have regional minor to moderate, beneficial impacts on rare species and their habitats due to similar management objectives. Development projects, such as the Yosemite View parcel land exchange and Yosemite Motels Expansion, El Portal (Mariposa Co.), would have the potential for localized minor to moderate, adverse effects on rare species habitat. However, with the implementation of site-specific surveys and state- and federal-required mitigation measures, these localized adverse impacts would be minor.

As summarized in the conclusions for this alternative, actions proposed under this alternative alone would have minor adverse impacts on rare species because of habitat loss and trampling impacts.

Alternative 5, in conjunction with other regional planning and development activities, would have a minor, adverse cumulative impact on rare plant species, largely due to habitat loss from developments regionally and within the out-of-Valley areas.

Air Quality

VEHICLE-GENERATED EMISSIONS

A summary of the traffic air emissions in Yosemite Valley under Alternative 5 is provided in table 4-122. The emissions data noted in table 4-122 reflect emissions from the following four major vehicle fleet categories:

- Visitor vehicles
- Commercial tour buses
- In-Valley and out-of-Valley shuttle buses (four propulsion/fuel technology options including diesel, propane, compressed natural gas, and fuel cell were analyzed)
- National Park Service and concessioner employee vehicles
- National Park Service and concessioner maintenance and administration road vehicles
- National Park Service and concessioner maintenance and administration non-road vehicles

Compared to air emissions under Alternative 1 in 2015, with the use of diesel fuel in the shuttle bus fleet, volatile organic compounds would decrease by 8%, carbon monoxide would decrease by 36%, nitrogen oxide emissions would increase by 24%, and PM₁₀ would decrease by 36%. A moderate decrease in particulate matter would result from a reduction in vehicle miles traveled and associated road dust.

If compressed natural gas were to be used in the shuttle bus fleet instead of diesel fuel, emissions of carbon monoxide would increase and emissions of all other pollutants would decrease. The use of propane in the shuttle bus fleet would result in increases in emissions of volatile organic compounds and carbon monoxide and decreases in emissions of nitrogen oxides, sulfur dioxide and PM₁₀ compared to the use of diesel fuel. The use of fuel cells in the shuttle bus fleet would reduce emissions of all pollutants compared to the use of diesel fuel.

**Table 4-122
Summary of Annual Air Emissions from Vehicles in Yosemite Valley (Tons/Yr)**

Alter- native	2000				2005				2010				2015			
	Shuttle Bus Fuel Type				Shuttle Bus Fuel Type				Shuttle Bus Fuel Type				Shuttle Bus Fuel Type

1. Assumes that in-Valley shuttle buses are conventional diesel buses that would meet emissions standards in effect in 2000. Shuttle buses in this alternative could employ advanced technologies to lower emissions.

2. No Action

3. NA = Not Applicable; fuel cell scenarios were assumed not be available until the year 2010

Note: Values expressed in tons per year

CNG = compressed natural gas

FC = Fuel Cell

A M B I E N T A I R Q U A L I T Y

Traffic flow was modeled to perform carbon monoxide and PM₁₀ hot-spot analyses for Northside Drive from Yosemite Lodge to park headquarters. For the inbound peak travel hour, the EMFAC model predicted a maximum 1-hour average carbon monoxide concentration of 1.9 parts per million and a carbon monoxide concentration of 1.9 parts per million for the outbound peak travel hour. When added to a background carbon monoxide concentration of 3.0 parts per million, the estimated carbon monoxide concentration of 4.9 parts per million for both inbound and outbound traffic scenarios, respectively, would not exceed the federal or California 1-hour carbon monoxide standards of 35 parts per million and 20 parts per million. The calculated maximum 8-hour average carbon monoxide concentration was 3.43 parts per million, based on traffic in both the inbound and outbound peak travel hour. The carbon monoxide concentrations under Alternative 5 would not exceed the federal or California 8-hour carbon monoxide standard of 9 parts per million. As shown in table 4-123, these carbon monoxide concentrations would represent minor and moderate reductions in ambient carbon monoxide levels for the inbound and outbound peak hours, respectively, when compared to Alternative 1.

Table 4-123 Predicted Maximum Carbon Monoxide Concentrations						
Alternative	Standard		Inbound Peak Hour		Outbound Peak Hour	
	CA	Fed	Maximum (ppm)	Reduction ¹ (%)	Maximum (ppm)	Reduction ¹ (%)
	(ppm)					
1-Hour Concentration						
1	20	35	5.10	NA	6.50	NA
5			4.90	9.5	4.90	45.7
8-Hour Concentration						
1	9	9	3.57	NA	4.55	NA
5			3.43	9.5	3.43	45.7

1. Based on results without background concentrations and relative to the No Action Alternative
NA = Not applicable

For both the inbound and outbound peak travel hour, the maximum 1-hour PM₁₀ concentration would be 43.4 micrograms per cubic meter (µg/m³). The estimated PM₁₀ concentrations for the inbound and the outbound peak hours would not exceed the federal standard of 150 µg/m³ or the California standard of 50 µg/m³. As shown in table 4-124, these carbon monoxide concentrations represent minor and moderate reductions in ambient PM₁₀ levels for the inbound and outbound peak hours, respectively, when compared to Alternative 1.

Table 4-124 Predicted Maximum 24-Hour PM ₁₀ Concentrations						
Alternative	Standard ¹		Inbound Peak Hour		Outbound Peak Hour	
	CA	Fed	Maximum (µg/m ³)	Reduction ¹ (%)	Maximum (µg/m ³)	Reduction ¹ (%)
	(µg/m ³)					
1	50	150	46.2	NA	64.2	NA
5			43.4	11.1	43.4	48.1

1. Based on results without background concentrations and relative to the No Action Alternative
NA = Not applicable

CONSTRUCTION - GENERATED AIR EMISSIONS

Air emissions associated with construction activities proposed for Alternative 5 are summarized in table 4-125. A description of construction-related emissions and the approach used for this analysis are included in the Methodologies and Assumptions section of this chapter. These construction-related emissions would represent minor, adverse impacts to air emission in the short term.

CONCLUSION

Compared with Alternative 1, Alternative 5 would produce moderate, adverse impacts for nitrogen oxide emissions; moderate, beneficial impacts for carbon monoxide and PM₁₀ emissions; and minor, beneficial impacts on volatile organic compounds emissions throughout the time periods of interest with the use of diesel fuel in the shuttle bus fleet. In comparison with the use of diesel fuel under Alternative 5, only the fuel cell scenario would be able to produce lower vehicle traffic emissions for all pollutants by 2015. The fuel cell emission reductions also would be the largest among the three alternative fuel options.

Air emissions associated with construction and demolition projects would be minor, occur only once, and be generated over a relatively short-term period.

**Table 4-125
Air Emissions from Construction Activities**

Construction Activity	Emissions (tons/yr)				
	VOC	CO	NO _x	PM ₁₀	SO ₂
Yosemite Lodge Redevelopment	0.32	1.37	1.75	4.16	0.49
Yosemite Falls Parking Removal and Trails	0.08	0.41	0.40	3.96	0.11

CO = carbon monoxide
 NO_x = nitrogen oxide
 PM₁₀ = particulate matter less than 10 microns in diameter
 SO₂ = sulfur dioxide
 VOC = volatile organic compounds
 NPS = National Park Service

CUMULATIVE IMPACTS

Air quality in Yosemite National Park currently is affected by internal air pollution sources, such as furnaces, boilers, woodstoves, and campfires. Estimates of air emissions from these sources are provided in table 3-12 (see Vol. IA, Chapter 3). For purposes of this analysis, these air pollution sources would continue to exist, with emission levels remaining relatively similar to existing levels. These emission sources are relatively small when compared to vehicle emissions and overall air emissions in the region.

Cumulative impacts on air emissions associated with Alternative 5 would include new housing and lodging developments outside the park. These developments include the construction of new housing in the City of Merced, in the Rio Mesa area in Madera County, and at University of California facilities in Merced. Other factors would include overall population increases in the area that are expected to range from 25% to 30% by 2015. The cumulative impacts for Alternative 5 would be the same as those associated with Alternative 2. Considered with the moderate, adverse impact resulting from the past, present, and reasonably foreseeable future projects in the Yosemite region, the impacts resulting from Alternative 5 in Yosemite National Park would remain moderate and beneficial.

Geologic Hazards

Impacts are described as levels of risk to human life and property and are based on the facility categories defined in the *Yosemite Valley Geologic Hazard Guidelines*, see Vol. II, Appendix C, and the presence or absence of geologic hazards (rockfall), as mapped by the U.S. Geological Survey (USGS 1998).

This impact analysis was completed only for those areas currently within the talus slope zone and the shadow line zone in the Valley. Rockfall hazards would likely be long term and permanent. The potential for rockfall is ongoing, as this natural process continues to occur in Yosemite Valley. With the exception of the Arch Rock Entrance Station, there are no permanent structures planned for the area between Yosemite Valley and El Portal. Also, traffic along the roadway in this area is considered transitory and not a permanent population. The transitory nature of the traffic allows little exposure at any one time to potential geologic hazards. For these reasons, this area was not included in the analysis of geologic hazards for Yosemite Valley. Other out-of-Valley areas were not included in the analysis. The relative risk of rockfall in these areas is negligible due to the lack of evidence of past rockfall events in these areas.

HOUSEKEEPING CAMP AREA

All of the Housekeeping Camp facilities are within the shadow line zone. The LeConte Memorial Lodge is within the talus slope zone. Under this alternative, the density of Housekeeping Camp would be reduced by 164 units. The LeConte Memorial Lodge, a historic structure, and Housekeeping Camp are both standard occupancy facilities, thus the action would be adverse and retain moderate risks. Retaining conditions of this type would be consistent with the *Geologic Hazard Guidelines*, and risks would remain moderate.

CURRY VILLAGE AREA

Numerous visitor and employee facilities are located within Curry Village. This alternative calls for the removal of most tent cabins and many other cabins from the talus slope zone, which would be a beneficial impact. The redevelopment of the guest parking areas in the talus slope and shadow line zones would also reduce risk to life and property, and adhere to the *Geologic Hazard Guidelines* because new miscellaneous structures (parking) may be placed in any area. These facilities are standard occupancy facilities, except the pavilion, which is considered special occupancy. Consequently, these actions would be beneficial, and would reduce levels of risk to minor, except at the pavilion, where adverse risks would remain moderate.

CAMPGROUND AREAS

A majority of the existing, as well as proposed, campground and facilities are located outside of both the talus slope zone and the shadow line zone and have negligible risks. A small portion of Upper Pines Campground is located in the talus slope zone. Campgrounds are miscellaneous occupancy facilities, and the risks associated with those portions of the campgrounds located in the talus slope and shadow line zones would remain. This would be consistent with the *Geologic Hazard Guidelines*, and risks to life and property would remain as they are currently.

THE AHWAHNEE AREA

The Ahwahnee and associated support facilities, which are special occupancy facilities, are within the shadow line zone. A small portion of the hotel parking lot is within the talus slope zone. Retaining existing conditions would be an adverse effect. This action would be consistent with the *Geologic Hazard Guidelines*, and existing risk to life and property would remain adverse and moderate.

YOSEMITE VILLAGE AREA

The entire Yosemite Village is within the shadow line zone, and approximately one-half of the area is within the talus slope zone. This area has a number of structures within the talus slope and shadow line zones that are essential facilities (fire station, law enforcement, jail, court, communication center); special occupancy facilities (visitor center and auditoriums); and one facility in the hazardous facility category (fuel storage). Numerous standard occupancy facilities are located within both the talus slope zone and the shadow line zone (employee housing, maintenance facilities, retail sales, and post office). The fire station would be removed out of a talus slope zone; however, it would be relocated in a shadow line zone. A portion of parking at Yosemite Village would be within the shadow line zone. Under this alternative, no changes would be made, and the risk of adverse impact from rockfall would remain. Risks would be considered adverse and major due to the large concentration of essential, hazardous, and special occupancy facilities within the talus slope zone.

YOSEMITE LODGE AREA

All existing buildings and proposed lodge facilities would remain within the shadow line zone, as delineated in the *Geologic Hazard Guidelines*. Additionally, an employee housing facility would be constructed within the lodge complex. All existing buildings are standard occupancy except for the restaurants, which are considered special occupancy facilities. Camp 4 (Sunnyside Campground) is a miscellaneous structure facility within both the talus slope zone and the shadow line zone. An increase in density within the shadow line zone would be adverse, but risks would remain minor.

Yosemite Falls facilities are also considered miscellaneous and are located in the shadow line zone. Retaining existing conditions would be consistent with the *Geologic Hazard Guidelines*, thus, risk to life and property would remain as they are currently: adverse and moderate.

BRIDALVEIL FALL AREA

Currently, no facilities are located within the talus slope or shadow line zones in this area; consequently, the risk of adverse impacts from rockfall would be negligible.

CONCLUSION

Alternative 5 does not propose to remove or relocate existing facilities or change occupancy categories, but would increase the density of facilities within the shadow line zone. Thus, the current level of risk to life and property would remain the same. Potential impacts from rockfall would always be adverse when individuals and property are involved. Overall, actions would be considered adverse, and risks would remain major because of the high concentration of essential, hazardous, and special occupancy facilities within the talus slope and shadow line zones.

CUMULATIVE IMPACTS

Past, present, and reasonably foreseeable future projects could have a cumulative effect, in conjunction with impacts of Alternative 5, if such projects would affect the characteristics of the geologic resource, specifically the steep granite walls and drainage systems within Yosemite Valley. Risks associated with the Indian Cultural Center cannot be evaluated because the occupancy category has not yet been determined; however, it would be located within the shadow line zone. These buildings are likely to be categorized as standard occupancy, and their placement would be consistent with the *Geologic Hazards Guidelines*. Past and present actions, which at times require the use of explosives for trail maintenance or road work, could trigger rockfall events. This would be an adverse effect. Risk of such effects are evaluated before decisions concerning the type of work to be undertaken is made. There are no reasonably foreseeable future projects (Appendix H, see Vol. II) that would impact or change the geologic structure of the granite walls within Yosemite Valley. The park uses explosives guidelines, and if these guidelines are applied consistently and effects of blasting are monitored, the cumulative impacts would not increase the level of risk at facilities in the Valley.

Scenic Resources

Impacts in this section are considered long term, unless otherwise noted.

YOSEMITE VALLEY

Under this alternative, 130 acres of developed land would be restored to natural conditions, thus improving the scenic quality of Yosemite Valley. Proposed restoration and development (in acres) within each scenic category are found in table 4-126. The primary improvements would be restoration along the Merced River, primarily within the River Protection Overlay. This would result in long-term, moderate, beneficial impacts.

A total of 68 acres of new development would occur. The new development would be principally in the Camp 6 and Curry Village areas, and would have a long-term, moderate, adverse impact. In the west Valley, a traffic check station at El Capitan crossover on Southside Drive would be constructed. This facility would be constructed such that it would not obstruct scenic vistas and vantage points.

This alternative would result in a relatively small amount of restoration, and a small net decrease in development. As a result, this alternative would have an overall impact on scenic resources that is long-term, minor, and beneficial.

Action	A Scenic	B Scenic	C Scenic	Alternative 5 Totals ¹	Alternative 1 Totals
Natural Resource Restoration	109 acres	54 acres	0	130 acres ²	0
Developed ³	82 acres	165 acres	28 acres	275 acres	406 acres
New Development	26 acres	35 acres	7 acres	68 acres	0
Total Development				343 acres	406 acres
Development Difference					-63 acres

1. Totals may differ due to rounding.

2. Of the total 163 acres of natural resource restoration in A, B, and C Scenic areas, only 127 acres currently contain intrusions to scenic views, i.e., developed facilities. Thus, 36 acres of restoration are not included in this analysis of acreage of restored scenery. Because these 36 acres have not been further analyzed to determine their exact locations within A, B, and C Scenic categories, only the total acreage figure reflects the reduction of these 36 acres from the analysis. Also, the total acreage has been increased by the three acres of restoration in areas not classified as either A, B, and C Scenic in the 1980 *General Management Plan*.

3. Developed acres include areas that are redeveloped or that remain unchanged.

Table 4-127 lists the impacts on each vantage point (vantage points are site-specific locations that have either been designed for or provide specific opportunities for visitors to view the scenery). All impacts would be long term in duration.

Vantage Point	Major Impacts of this Alternative	Intensity of Impact	Type of Impact
Tunnel View	None	Negligible	Neutral
Bridalveil Fall turnout along Southside Drive	None	Negligible	Neutral
Valley View	None	Negligible	Neutral
Dewey Point	El Capitan crossover traffic check station may be visible.	Minor	Adverse
Taft Point	El Capitan crossover traffic check station may be visible.	Minor	Adverse
Upper Yosemite Fall	63 acres less development in east Valley; the parking at Yosemite Village would be more visible. Implementation of the River Protection Overlay.	Moderate	Beneficial
Sentinel Dome	None	None	Neutral
Glacier Point	63 acres less development in east Valley; the parking at Yosemite Village would be more visible. Implementation of the River Protection Overlay.	Minor	Beneficial
El Capitan Meadow	Less crowding and the removal of parking	Minor	Beneficial
Sentinel Meadow turnout along Southside Drive	None	Negligible	Neutral
Sentinel Bridge	Parking at Yosemite Village may be visible.	Minor	Adverse
Four Mile Trail	None	Negligible	Neutral
Columbia Point	Removal of the Yosemite Falls parking lot, and less development visible in east Valley.	Moderate	Beneficial
Lower Yosemite Fall View	Improved by removal of adjacent vehicles, reduced traffic, and redesign of area.	Minor	Beneficial
Cook's Meadow	Improved by removal of Superintendent's House (Residence 1).	Minor	Beneficial

Table 4-128 lists the impacts on the 11 most important scenic features within the Valley. All impacts would be long term in duration.

**Table 4-128
Potential Impacts on Scenic Features**

Scenic Feature	Major Impacts of this Alternative	Intensity of Impact	Type of Impact
Yosemite Falls	Crowding and traffic would be reduced; parking along Northside Drive could be eliminated.	Minor	Beneficial
Sentinel Rock	None	Negligible	Neutral
Glacier Point	None	Negligible	Neutral
Half Dome	Camp 6 parking and campground check-in station could be visible.	Minor	Adverse
North Dome	None	Negligible	Neutral
Royal Arches	Vistas near Ahwahnee Meadow would be improved by removal of the tennis courts; foreground restoration of the former Upper and Lower River Campground and the implementation of the River Protection Overlay would improve the scene. Camp 6 parking and campground check-in station could be visible.	Minor	Beneficial
El Capitan	None	None	Neutral
Bridalveil Fall	None	Negligible	Neutral
Cathedral Rock and Spires	The view from the El Capitan crossover could include the traffic check station.	Minor	Adverse
Washington Column	Vistas near Ahwahnee Meadow would be improved by removal of the tennis courts; foreground restoration of the former Upper and Lower River Campground and the implementation of the River Protection Overlay would improve the scene. Camp 6 parking and campground check-in station could be visible.	Minor	Beneficial
Three Brothers	None	Negligible	Neutral

O U T - O F - V A L L E Y

Under this alternative, three out-of-Valley parking facilities (Heness Ridge, El Portal, and Foresta) would be constructed, facilities at each entrance station would be expanded, housing at Wawona would be increased, and housing and administrative facilities in El Portal would be increased. The parking facility at Henness Ridge would have only a long-term, minor, adverse impact, as it would not be visible from the Wawona Road. The development of Foresta as an out-of-Valley parking location would have a long-term, minor, and adverse impact on the landscape when viewing from the Big Meadow overlook on the Big Oak Flat Road, and various locations along the Big Oak Flat Road. Increased housing in the Wawona area would have a long-term, minor, adverse impact because it would be visible only from immediately adjacent areas. The impact of placing relocated parking and administrative facilities in El Portal would be minor, long-term, and adverse because actions would be visible from Highway 140 as the visitor approaches Yosemite National Park. The expansion of entrance station facilities would be mitigated through design, and the impacts would be long-term, minor, and adverse because they would cause imperceptible changes to views at each location.

C O N C L U S I O N

This alternative would have a long-term, minor, beneficial impact on the overall scenic quality of Yosemite Valley. There would be a net decrease of 63 acres in the development footprint within Yosemite Valley. The majority of the areas to be restored are within the A Scenic category, but

the majority of the actions would not result in a substantial improvement of scenic vistas and vantage points, as no large contiguous tract of highly valued resources would be restored.

Yosemite Valley would remain one of the world's premier landscapes. The amount of intrusion into the scenery of Yosemite Valley would be reduced and consolidated in the east Valley.

Additionally, the development of Foresta as an out-of-Valley parking location would have a minor, adverse impact on the landscape when viewing from the Big Meadow overlook on the Big Oak Flat Road, and a long-term, moderate, adverse impact when viewing from within Foresta. No visual intrusions would occur within the Tunnel View vantage point. Collectively, there would be long-term, minor, and adverse impacts in all out-of-Valley locations; however, impacts in these areas contribute directly to the improvement of the scenery within the Valley.

CUMULATIVE IMPACTS

Alternative 5, in conjunction with the impacts of reasonably foreseeable areawide projects, would result in a long-term, minor, beneficial, and cumulative impact, primarily due to the restoration of A Scenic and B Scenic resources in the Valley.

Cultural Resources

ARCHAEOLOGICAL RESOURCES

Impacts to archeological resources are permanent unless otherwise noted.

As described for Alternative 2, every effort would be made to avoid archeological sites through careful project design and subsequent site-specific environmental compliance. If sites could not be avoided, all data recovery to retrieve important information would be done in accordance with the Yosemite Programmatic Agreement (see Vol. II, Appendix D).

Yosemite Valley

Yosemite Lodge and Vicinity

Impacts under this alternative would be the same as for Alternative 2. With data recovery excavations, the resultant impacts would be permanent, minor, and adverse, as well as long-term, minor, and beneficial.

Yosemite Falls

Impacts under this alternative would be the same as for Alternative 2. With data recovery excavation, resultant adverse impacts would be minor or negligible. Beneficial impacts would be minor.

Yosemite Village

Proposed undertakings include redesigning the National Park Service maintenance area; rehabilitating the Yosemite Village housing area; constructing a new fire station; removing picnic areas; and constructing a day-visitor parking lot and a transit facility. These actions would involve grading, trenching, and other earthmoving activities that would potentially disturb portions of two prehistoric/historic American Indian habitation sites. Site data potential ranges from low to

high. Data recovery to retrieve important information, conducted in accordance with the Programmatic Agreement, would reduce the intensity of adverse impacts from moderate to minor. As described for Alternatives 2, 3, and 4, the burial area in Yosemite Village currently paved and used for materials staging would be restored to a natural condition, and protected from future development. All work in the vicinity of the burial area would be designed to avoid disturbing intact deposits, and would be monitored by archeologists and representatives of culturally associated American Indian people.

Surface conditions on a portion of one site would be restored to natural conditions with the implementation of this action. As such, long-term impacts associated with the visitor use would be avoided or reduced. This would ultimately result in a minor and beneficial impact.

The Ahwahnee

Impacts under this alternative would be the same as under Alternatives 2, 3, and 4. With archeological data recovery, the resultant impact would be minor and adverse.

Housekeeping Camp

Under this alternative, removal of some of the units from Housekeeping Camp would involve grading and trenching that would potentially disturb intact deposits at a prehistoric/historic American Indian habitation site with moderate data potential. Careful project design and data recovery to retrieve important information, conducted in accordance with the Programmatic Agreement, would reduce the intensity of adverse impacts from minor to negligible.

Campgrounds

As described for Alternative 2, intact archeological deposits at ten sites would be potentially disturbed by grading, trenching, and other earthmoving activities associated with redeveloping Lower Pines and Upper Pines Campgrounds; constructing a new amphitheater at the location of the concessioner stable parking lot; constructing new walk-in, backpacker, and group campgrounds; and removing the existing Backpacker and Group Campgrounds and restoring these areas to natural conditions. These sites consist of prehistoric and historic American Indian habitation sites and campsites, ranging in data potential from low to high. Careful site design and data recovery to retrieve important information, conducted in accordance with the Programmatic Agreement, would reduce the intensity of adverse impacts from moderate to minor.

Surface conditions at two of these sites and on a portion of a third would be restored to natural conditions with the implementation of this action. As such, long-term impacts associated with visitor use would be reduced, ultimately resulting in minor, beneficial impacts to these resources.

Placement of campground facilities within the immediate vicinity of known archeological resources could result in long term, minor, adverse impacts associated with visitor use, including artifact collection and accelerated soil loss. Given the potential for these impacts, sites subject to these actions would be monitored according to the Visitor Experience and Resource Protections Program as outlined in Chapter 2. Through this monitoring program, threats and disturbances would be noted. Every effort would be made to avoid or reduce adverse impacts through changes

in visitor access, relocation of facilities, or archeological data recovery carried out according to the stipulations of the Programmatic Agreement.

Curry Village

Impacts under this alternative would be the same as for Alternatives 2, 3, and 4. With archeological data recovery, resultant impacts would be negligible.

Merced River Restoration

Removing Sugar Pine and Ahwahnee Bridges under this alternative would involve earthmoving activities that would possibly disturb a prehistoric American Indian habitation site with high data potential. If sites could not be avoided, data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information and reduce the intensity of adverse impacts from moderate to minor.

Meadow Restoration

Depending on final project design, realigning or reconstructing the roads and utilities through Bridalveil, El Capitan, and Cook's Meadows under this alternative would involve grading and trenching that would potentially disturb portions of up to four prehistoric American Indian sites (one with a historic-period American Indian component) and three other historic sites. The data potential of the prehistoric sites ranges from low to high, and the data potential of the historic sites is unknown. Data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information, thereby reducing the intensity of adverse impacts from moderate to minor or negligible.

Circulation Changes

As described for Alternative 2, constructing a vehicle check station near El Capitan crossover would involve grading that would disturb portions of a prehistoric and historic American Indian habitation site with high data potential, including historic-era deposits with unknown data potential. Through careful project design and subsequent site-specific environmental compliance, every effort would be made to avoid known archeological sites. Should this prove impossible, data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information prior to construction and would thereby reduce the intensity of adverse impacts from moderate to minor.

Realigning a portion of Southside Drive at its approach to Sentinel Bridge would involve grading that would impact a portion of a prehistoric American Indian habitation site and historic Euro-American village with moderate data potential. Data recovery, carried out in accordance with stipulations of the Programmatic Agreement, would reduce the intensity of adverse impacts from moderate to minor.

Realigning the multi-use paved trail between Yosemite Village and Mirror Lake, as described for Alternatives 2, 3, and 4, would involve minor grading that would disturb a portion of one prehistoric/historic American Indian site with high data potential. Data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information and reduce the intensity of adverse impacts from moderate to minor.

Establishing a new multi-use paved trail between the northern abutment of Sentinel Bridge and Yosemite Village would involve minor grading that could impact an archeological site exhibiting both prehistoric and historic components with high data potential. The park would strive to avoid adverse impacts by siting the trail in such a way as to avoid impacting the site. However, if such impacts were unavoidable, data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information and reduce the intensity of adverse impacts from minor to negligible.

Establishing a new multi-use paved trail between the Ahwahnee and the existing bicycle path to Mirror Lake would involve minor grading that could impact four archeological sites. All four of these sites contain both prehistoric and historic components. Three of the four have high data potential, while the fourth has moderate data potential. The park would strive to locate the trail in such a way as to avoid impacts on the site. However, if such impacts were unavoidable, data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information, and reduce the intensity of adverse impacts from minor to negligible.

Placement of multi-use paved trails within the immediate vicinity of known archeological resources could result in long-term, minor, adverse impacts associated with visitor use, including artifact collection and accelerated soil loss. Given the potential for these impacts, sites subject to these actions would be monitored according to the Visitor Experience and Resource Protection Program as outlined in Chapter 2. Through this monitoring program, threats and disturbances would be noted. Every effort would be made to avoid or reduce adverse impacts through changes in visitor access, relocation of facilities, or archeological data recovery carried out according to the stipulations of the Programmatic Agreement.

General Valley Actions

Impacts would be the same as under Alternative 2, except no group picnicking facilities would be provided at Sentinel Beach. With data recovery excavations, the resultant impact would be negligible.

In addition, developing Yellow Pine Campground for public use under this alternative would not result in any impacts to archeological resources, because no archeological resources are known in the area. Potential adverse impacts to known sites in Yosemite Valley are shown in table 4-129.

Number of Sites with High Data Potential	Number of Sites with Moderate Data Potential	Number of Sites with Low Data Potential	Number of Sites with Unknown Data Potential
11	12	5	4

Out-of-Valley

El Portal

The following impact analysis is based on general land-use planning actions for El Portal. As described for the other action alternatives, the National Park Service would undertake site-specific design studies and environmental review to evaluate options for new housing and

administrative facilities. These studies would include, as necessary, additional resource surveys (i.e., archeological inventory and testing). The National Park Service would initiate further consultation with the State Historic Preservation Officer, the culturally associated American Indian tribes, and the public, as provided for in the Programmatic Agreement. A complete and detailed assessment of impacts to archeological resources would be presented as part of that review.

As described for Alternatives 2, 3, and 4, several actions at Old El Portal and Village Center (constructing a multi-use paved trail, employee housing, and support facilities) would disturb or destroy portions of up to 14 prehistoric and historic-era archeological sites (11 sites have moderate data potential, one has low data potential, and two have unknown data potential). Through careful project design and subsequent site-specific environmental compliance, every effort would be made to avoid known archeological sites. If these sites could not be avoided, data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information prior to construction, and thereby reduce the intensity of adverse impacts from moderate to minor or negligible.

As described for Alternatives 2, 3, and 4, day-visitor and employee parking would be located in the Middle Road area and would involve major grading and earthmoving activities. These actions would disturb major portions of two archeological sites, one prehistoric American Indian habitation site that also contains historic-era deposits with low data potential, and one historic-era site with unknown data potential. Through careful project design and subsequent site-specific environmental compliance, every effort would be made to avoid known archeological sites. If these sites could not be avoided, data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information prior to construction, and thereby reduce the intensity of adverse impacts from moderate to minor or negligible.

Under this alternative, constructing National Park Service and concessioner administrative facilities, as well as museum collection facilities at Railroad Flat, would involve major grading, trenching, and excavation, which could disturb archeological deposits at portions of one prehistoric/historic American Indian habitation site with low data potential. Data recovery would retrieve important information and reduce the intensity of adverse impacts from minor to negligible (similar to Alternatives 2, 3, and 4).

Constructing housing facilities at Hillside East and West would involve major grading, excavation, and trenching that would destroy major portions of an intact prehistoric/historic American Indian habitation site (with some Euro-American deposits) with high data potential. A site-specific data recovery program, negotiated between the National Park Service, the California State Historic Preservation Officer, and local culturally associated American Indian tribes would recover important information, thereby reducing the intensity of adverse impacts from major to moderate.

Constructing single-family homes and a day care center in Rancheria Flat would entail grading, trenching, and excavation that would potentially disturb intact archeological deposits at two archeological site with moderate data potential. Data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information and reduce the intensity of adverse impacts from moderate to minor.

Constructing high-density housing and support facilities at Hennessey's Ranch would disturb a prehistoric American Indian habitation site and part of a historic-era ranch, both of which were heavily disturbed when the Trailer Village was constructed. Data potential of this site is unknown. Data recovery, carried out in accordance with the Programmatic Agreement, would retrieve important information and reduce the intensity of any adverse impacts.

Removing an abandoned wastewater treatment plant and restoring the area to natural conditions (as described for Alternatives 2, 3, and 4) would be carefully designed to avoid disturbance to intact areas of a prehistoric American Indian habitation site and burial area. These actions would be monitored by archeologists and representatives from culturally associated American Indian tribes, in accordance with the Programmatic Agreement, and negligible impacts to archeological resources would be expected.

Similar to Alternatives 2, 3, and 4, the Johnny Wilson Ranch (Riverside area), previously proposed for high-density housing (NPS 1996a), would not be developed. Instead, these archeological sites and burial area would continue to be relatively inaccessible.

Foresta and McCauley Ranch

As described for Alternatives 2, 3, and 4, grading and trenching associated with construction as replacement for 14 homes destroyed in the 1990 A-Rock Fire at Foresta could possibly disturb intact resources, depending on location. Rehabilitation of the Foresta Campground would also disturb archeological deposits at a portion of an intact American Indian habitation site. Data recovery, carried out in accordance with the Programmatic Agreement, would reduce the intensity of any adverse impacts. Constructing a day-visitor parking lot at Foresta would not impact any known archeological resources.

Constructing National Park Service and concessioner stables, and National Park Service parkwide trails operational facilities to McCauley Ranch would disturb archeological deposits at a portion of a large prehistoric site and historic-era ranch with unknown data potential. Improving access through Foresta to McCauley Ranch and replacing Crane Creek Bridge would possibly disturb five intact prehistoric sites and one historic dump site, all with unknown data potential. If these sites could not be avoided, data recovery, carried out in accordance with the Programmatic Agreement prior to construction, would reduce the intensity of adverse impacts.

Other Out-of-Valley Areas

Establishing day-visitor parking at Hennes Ridge under this alternative would disturb two intact historic linear resources: a logging railroad grade, and a historic road. Data recovery would reduce the intensity of adverse impacts from minor to negligible.

As described for Alternatives 2, 3, and 4, reconstructing El Portal Road between the intersection of El Portal Road/Big Oak Flat Road and Pohono Bridge would involve widening the road corridor, potentially removing or disturbing a portion of a large prehistoric and historic-era American Indian habitation site with high data potential. Data recovery would reduce the intensity of adverse impacts from moderate to minor.

As described for Alternatives 2, 3, and 4, removing residences at Cascades would involve minor grading and trenching that could disturb intact deposits at one prehistoric archeological site with

unknown data potential. However, the project would be carefully designed to avoid ground disturbance in intact areas, and would be monitored by archeologists, as stipulated in the Programmatic Agreement, to ensure site protection. By implementing these measures, negligible impact to archeological resources would result.

Removing the Cascades Diversion Dam would not impact any known archeological resources (the same as under Alternatives 2, 3, and 4). Earthmoving and facility removal would be monitored by an archeologist in the event historic archeological features or artifacts associated with construction and use of the dam were discovered during removal.

As described for Alternatives 2, 3, and 4, since the location and design of visitor centers associated with park entrance stations is unknown at this time, it is not possible to predict the potential for impacts to archeological resources. The park would conduct archeological inventories, site evaluations, and data recovery as necessary, and further environmental review. In accordance with the Programmatic Agreement, the National Park Service would first seek to avoid impacts to any archeological resources, and would retrieve important scientific information at sites that could not be avoided, thereby reducing the intensity of any adverse impacts.

Archeological Resources Conclusion

Proposed project undertakings would have varied impacts on as many as 59 known archeological sites, depending on the potential of the archeological sites to yield significant information regarding prehistoric and historic lifeways, and on the nature and design of proposed development. See Chapter 3, Cultural Resources, for descriptions of low, moderate, and high data potential.

In all instances where identified sites could not be avoided and would be disturbed, the park would carry out data recovery excavations in accordance with the Programmatic Agreement to retrieve important scientific information, thereby reducing the intensity of adverse impacts. For some areas, information regarding the nature and importance of archeological resources is unknown. In these instances, the park would first inventory project areas, test/evaluate the significance of identified sites, and carry out appropriate data recovery excavations as necessary prior to construction disturbance.

Cumulative Impacts

Cumulative impacts would be the same as described under Alternative 2, except this alternative would contribute to the loss of regional archeological resources as a consequence of the disturbance or degradation of as many as 59 known archeological sites. To mitigate adverse impacts, important information contained within these sites would be recovered according to stipulations of the Programmatic Agreement. Therefore, with appropriate mitigation, the cumulative adverse impacts associated with implementation of this alternative, in conjunction with other past, present, and reasonably foreseeable future projects, would be minor.

ETHNOGRAPHIC RESOURCES

Yosemite Valley

Yosemite Lodge and Vicinity

Impacts under this alternative would be the same as for Alternatives 2, 3, and 4. With mitigation, the resultant adverse impacts would be negligible; and beneficial impacts would be long-term and minor.

Lower Yosemite Falls

Impacts under this alternative would be the same as for Alternative 2, 3, and 4. With mitigation, the resultant adverse impacts would be negligible; and beneficial impacts would be permanent and minor.

Yosemite Village

As described for Alternatives 2, 3, and 4, rehabilitating the historic district housing area would improve habitat conditions for California black oak, a traditionally gathered resource, resulting in a negligible impact. Constructing day-visitor parking at Yosemite Village could disturb or destroy two small gathering areas, contributing resources in the Valleywide ethnographic landscape, depending on design. The National Park Service, in consultation with culturally associated American Indian tribes and in keeping with the Programmatic Agreement, would develop appropriate mitigation strategies for impacts to ethnographic resources. Such strategies could include identifying and assisting in providing access to alternative resource-gathering areas; continuing to provide access to traditional use or spiritual areas; and screening new development from traditional use areas, as well as careful site design and data recovery.

Removing facilities at the Church Bowl Picnic Area, as described for Alternative 2, would remove non-historic facilities from a historic village site, resulting in minor beneficial impacts to ethnographic resources. Removing some facilities and redesigning the National Park Service Maintenance area would restore a known burial area to natural conditions, resulting in minor, beneficial impacts to ethnographic resources.

The Ahwahnee

Impacts under this alternative would be the same as for Alternatives 2, 3, and 4. There would be no impact to ethnographic resources.

Housekeeping

Impacts under this alternative would be the same as for Alternatives 2, 3, and 4. There would be negligible impact.

Campgrounds

Redesigning Lower and North Pines Campgrounds would perpetuate development and visitor use in traditional gathering areas. Constructing new Backpacker and Group Campgrounds and a concessioner stable would bring new development to an area figuring in oral traditions as home to spirits, a contributing element of the Valleywide ethnographic landscape. Constructing a new

walk-in campground near Tenaya Creek, as in Alternatives 2, 3, and 4, would disturb or destroy a portion of one traditional gathering area, also a contributing element of the Valley-wide landscape. These actions would result in long-term, moderate, adverse impacts. The National Park Service, in consultation with culturally associated American Indian tribes, and in accordance with the Programmatic Agreement, would develop appropriate mitigation strategies for impacts to ethnographic resources. Such strategies could include identifying and helping provide access to alternative resource gathering areas, continuing to provide access to traditional use or spiritual areas, and screening new development from traditional use areas to reduce the intensity of adverse impacts from moderate to minor or negligible.

Curry Village

Impacts under this alternative would be the same as for Alternatives 2, 3, and 4. Impacts would be negligible.

Merced River Restoration

Removing Ahwahnee and Sugar Pine Bridges, as well as the raised causeway between these bridges, would have minor, beneficial impacts by partly restoring habitat in a traditional gathering area, a contributing element of the ethnographic landscape. This could allow for the recovery of traditionally used plants and enhance their availability for procurement.

Meadow Restoration

Impacts under this alternative would be the same as for Alternatives 2, 3, and 4. Impacts would be long-term, minor, and beneficial.

Circulation Changes

Constructing a traffic check station near El Capitan crossover would have minor, adverse impacts on the ethnographic landscape by disturbing a portion of a historic village area, as described for Alternative 2. Realigning Southside Drive south of Sentinel Bridge would also disturb a portion of a historic village area, as described for Alternatives 2, 3, and 4. These actions would result in minor, adverse impacts to the Valleywide ethnographic landscape. The National Park Service, in consultation with culturally associated American Indian tribes and in accordance with the Programmatic Agreement, would develop appropriate mitigation strategies for impacts to ethnographic resources. Such strategies could include recovering important archeological data, as well as using any other measures identified during consultation, which would reduce the intensity of adverse impacts from minor to negligible.

Actions and related impacts associated with construction of multi-use paved trails in eastern Yosemite Valley would not impact any ethnographic resources.

General Valley Actions

Removing parking lots and constructing multi-use paved trails and some group picnic sites at Sentinel, El Capitan and Cathedral Picnic Areas (the same as for Alternatives 2, 3, and 4) would concentrate visitor use near and possibly disturb part of a traditional site for gathering, which is a contributing element of the Valleywide ethnographic landscape. These actions would result in a

long-term, minor, adverse impact. Establishing a new picnic area in the vicinity of El Capitan would add facilities and increase visitor use in proximity to a historic village site, resulting in permanent, minor, adverse impacts to the Valleywide ethnographic landscape. The National Park Service, in consultation with culturally associated American Indian tribes and in accordance with the Programmatic Agreement, would develop appropriate mitigation strategies to reduce impacts to ethnographic resources. Such strategies could include identifying and helping provide access to alternative resource-gathering areas; continuing to provide access to traditional use areas; careful site designing and screening; recovering important archeological data; and using any other measures identified during consultation. Mitigation would reduce the intensity of adverse impacts from minor to negligible.

Developing Yellow Pine Campground under this alternative for public group campsites would increase development at a traditional use area, potentially resulting in a long-term, minor, adverse impact. The National Park Service, in consultation with culturally associated American Indian tribes and in accordance with the Programmatic Agreement, would develop appropriate mitigation strategies to reduce the intensity of impacts to ethnographic resources, from minor to negligible. Such strategies could include identifying and helping provide access to alternative resource-gathering areas.

Out-of-Valley

El Portal

As described for Alternatives 2, 3, and 4, the following impact analysis is based on general land-use planning actions for El Portal, and is based on incomplete information about the location and significance of ethnographic properties. The National Park Service would undertake site-specific design studies and environmental review to evaluate options for new housing and administrative facilities in El Portal. These studies would include, as necessary, additional resource surveys (ethnographic resources inventory and evaluation). The National Park Service would initiate further consultation with the State Historical Preservation Office, culturally associated American Indian tribes, and the public, as provided for in the Programmatic Agreement. A complete and detailed assessment of impacts to ethnographic resources would be presented as part of that review.

Constructing studio apartments at Hillside West, apartments or studios at Hillside East, and employee housing at Village Center would destroy a large portion of a historic village area, resulting in a permanent, major, adverse impact. The portions of this historic village site that are known to contain human burials would be protected from development. As described in Alternative 2, mitigation would reduce the intensity of adverse impact to moderate. Constructing single-family homes, apartments, and housing support facilities at Rancheria Flat, Hennessey's Ranch, and Old El Portal, as well as administrative and museum collection facilities at Railroad Flat, would disturb or destroy portions of at least three traditional gathering areas, resulting in long-term, minor adverse impacts. With mitigation, the resultant impacts would be negligible. Removing the abandoned wastewater treatment facility would have beneficial impacts on a prehistoric village and burial area by eliminating modern, intrusive development. To ensure protection of intact deposits and burials, this removal would be designed and implemented

carefully, and the work would be monitored by an archeologist and representatives from culturally associated American Indian tribes.

Other Out-of-Valley Areas

The proposed undertakings in Foresta, McCauley Ranch, Wawona, Hennes Ridge, and park entrance stations would have unknown impacts on ethnographic resources, since there is not enough information about the location and significance of ethnographic resources to assess the nature and intensity of impacts. All proposed undertakings would be the subject of future site-specific environmental compliance. The National Park Service, in consultation with culturally associated American Indian tribes and in accordance with the Programmatic Agreement, would develop appropriate mitigating strategies for impacts to ethnographic resources.

As described for Alternatives 2 and 3, the National Park Service consulted with the American Indian Council of Mariposa County, Inc., during planning and preliminary design for the reconstruction of El Portal Road. The proposed reconstruction of the easternmost portion of the road, removal of the Cascades Diversion Dam and greenhouse, and the removal of the four Cascades residences would not impact any known ethnographic resources.

Ethnographic Resources Conclusion

Proposed undertakings would have varied adverse and beneficial impacts (from potentially major to negligible), depending in part on the nature and design of proposed development and the sensitivity of the different traditional use areas. In Yosemite Valley, proposed actions would disturb or destroy parts of up to eight traditional gathering areas; add or expand modern development at eight historic village areas; and add development in at least one area figuring in oral tradition. However, facility removal and ecological restoration would benefit up to five traditional gathering areas by enhancing conditions for plant resources; would remove modern development from three historic village areas; and would re-establish American Indian traditional uses at an individually significant historic village site. In general, actions in Yosemite Valley would have minor, adverse impacts to the Valleywide ethnographic landscape.

In El Portal, proposed actions are designed to maximize administrative, park operations, and residential development. The precise nature and intensity of adverse impacts to ethnographic resources in El Portal, Wawona, Foresta, McCauley, and other out-of-Valley areas is unknown. In El Portal, however, proposed actions would most likely have permanent, moderate to major, adverse impacts by destroying portions of historic villages and traditional gathering areas, and by adding concentrated residential use in some areas that are currently undeveloped. As in Yosemite Valley and other park areas, known burial areas would be protected from disturbance, and modern facilities in burial areas would be removed. The National Park Service would conduct an ethnographic resources inventory and evaluation for El Portal, as well as other out-of-Valley areas, and would continue consulting with culturally associated American Indian tribes to seek ways to avoid, minimize, and mitigate potential adverse impacts to ethnographic resources. These measures could include setting aside some areas for traditional uses; designing new development to avoid the most sensitive areas; screening development from traditional use areas; and directing visitor and residential use away from sensitive areas.

Cumulative Impacts

Cumulative impacts on ethnographic resources would be the same as those described for Alternatives 2, 3, and 4. Minor to moderate cumulative, adverse impacts would result from implementing this alternative, in conjunction with past, present, and reasonably foreseeable future undertakings.

CULTURAL LANDSCAPE RESOURCES (INCLUDING INDIVIDUALLY SIGNIFICANT HISTORIC SITES AND STRUCTURES)

Yosemite Valley

Natural Systems and Features

Under Alternative 5, the general pattern of development throughout the Valley and the historic relationship between the natural and built environment would be retained. Portions of the natural landscape, which has influenced the physical development in Yosemite Valley, would be rehabilitated and restored to natural conditions. The major focus of this effort would be the long-term restoration of the Merced River corridor and the rehabilitation of eight meadows that are historically significant and contribute to the Valley-wide cultural landscape. California black oak woodlands would be rehabilitated and restored to natural conditions, and general environmental restoration would enhance the historic vegetative mosaic of coniferous forest, oak woodlands, and open meadows. These actions would collectively result in a long-term, beneficial, impact to the cultural landscape of the Valley.

Historic Land Use Patterns

Historic land use patterns concentrating visitor services and administration in the east Valley would continue. The National Register Historic Districts and properties of Camp Curry, Yosemite Village, The Ahwahnee, and others would remain and continue to function as they did historically. While camping would remain in the Upper and Lower Pines Campgrounds and Camp 4 (Sunnyside Campground), relocating other Valley campgrounds currently situated along the Merced River would be a change in historic land use patterns, resulting in a minor, adverse impact.

Historic Circulation Systems

Proposed changes to circulation systems throughout Yosemite Valley would result in alterations to both Northside and Southside Drives, both contributing structures to the proposed Yosemite Valley Cultural Landscape Historic District. The proposed changes include the realignment of portions of Northside and Southside Drives, and the conversion of portions of both Northside and Southside Drives into a one-lane vehicle route and bicycle lane. A segment of Northside Drive at Yosemite Lodge would be realigned, resulting in a permanent, minor, adverse impact. The segment of Northside Drive between the east end of Yosemite Valley and El Capitan crossover would be converted to a one-lane vehicle route and bicycle lane. Since this would not change the physical road structure there would be no impact. This would not result in any physical changes to this segment of Northside Drive. The portion of Southside Drive segment

near the Yosemite Chapel would be realigned, resulting in a permanent, minor, adverse impact. The portion of Southside Drive between the east end of the Valley and El Capitan crossover would be converted to a one-lane vehicle route and bicycle lane. However, this would not result in any physical changes to this road segment, and there would be no resultant impact. The minor, adverse impacts associated with realigning portions of contributing roadways would be mitigated by documentation, according to the Programmatic Agreement, reducing the intensity of adverse impacts from minor to negligible.

Removing non-contributing roads from Ahwahnee and Stoneman Meadows would have a minor, beneficial, and permanent impact.

In general, changes to physical features and addition of new structures and facilities within the Valleywide cultural landscape would follow design guidelines consistent with the *Secretary of Interior's Standards and Guidelines for Archeology and Historic Preservation (Secretary's Standards, USDO I 1983)*. In this manner, the potential for impacts resulting from addition of non-historic facilities would be reduced.

Historic Structures

Restoration of the Merced River would result in the removal of Sugar Pine and Ahwahnee Bridges, both listed in the National Register of Historic Places. This would result in the loss of two individually significant historic structures, resulting in a permanent, major, adverse impact. Although the physical structures would be lost, these impacts would be mitigated through documentation and salvage of historic materials, thus reducing the intensity of adverse impacts from major to moderate. Documentation of Sugar Pine and Ahwahnee Bridges has been completed, thus preserving a historical record of the resources.

The individually significant Superintendent's House (Residence 1) and its associated garage would be removed. As in Alternative 1, this would result in the loss of the historic structure; therefore there would be no additional adverse impact. However, this action would result in immediate, rather than eventual, loss. The structures and their setting have already been documented; thus, although the physical structures would be removed, a historical record of this resource has been preserved. In addition, the National Park Service would salvage historic materials as stipulated in the Programmatic Agreement.

Other historic structures that are not individually significant but contribute to the Valleywide cultural landscape would be removed. These structures consist of the concessioner stable and its associated structures, three pedestrian bridges at Lower Yosemite Fall, and riprap, wing, and check dams along the Merced River and its tributaries. In addition, four pedestrian bridges at Lower Yosemite Fall would be rehabilitated or rebuilt. These actions would result in the loss or change in contributing elements of the Valleywide landscape, resulting in a permanent, moderate, adverse impact. Although the physical structures would be lost or changed, these impacts would be mitigated through documentation, thus reducing the intensity of adverse impacts from moderate to minor.

Actions at Yosemite Lodge and Housekeeping Camp would not result in the loss of any historic structures or landscape resources, as there are no historic structures or landscape resources in either of these developed areas.

Historic Districts and Developed Areas

Yosemite Village: The historic design and spatial organization of the Yosemite Village area would be rehabilitated, resulting in the preservation of many historic structures, and redevelopment of non-contributing areas within the district. Many non-contributing structures would be removed or redesigned to be more compatible with the historic character of Yosemite Village, based on design guidelines developed in keeping with the *Secretary's Standards* (USDOJ 1983). This would result in a permanent, moderate, beneficial impact. Some existing land uses would change (e.g., removing NPS stable and parkwide administration), but the types of land use historically associated with the village, such as visitor services, education, museum, and employee housing, would remain. In addition, the reestablishment of historic viewsheds from within the village and the protection of the California black oak woodland would enhance the historic character of the developed area, resulting in a permanent, minor, beneficial impact.

Construction of day-visitor parking, a transit center, and a fire station would introduce non-historic facilities adjacent to the Yosemite Village Historic District, and would require the removal of historic structures (Concessioner Headquarters Building, Village Garage and associated apartment, and the Ahwahnee Row houses and apartments) that contribute to the cultural landscape. These actions would result in the loss of historic structures and introduction of non-historic facilities, a permanent, moderate, adverse impact on the cultural landscape and the adjacent Yosemite Village Historic District. The loss of the historic structures would be mitigated by documentation, and salvage of historic materials as stipulated in the Programmatic Agreement. In this manner, a historical record would be preserved even though the structures themselves would cease to exist. In cases where historic structures would be lost, the National Park Service would first consider the possibility of relocation and adaptive reuse in another location within the park. In this manner, the intensity of adverse impacts would be reduced from moderate to minor. The potential impacts associated with introducing non-historic facilities would be reduced or avoided through the use of compatible design, scale, massing, and material, and appropriate screening.

Actions at the National Park Service maintenance area would result in the loss of the National Park Service Operations Building (Fort Yosemite) and thirteen additional historic structures that contribute to the cultural landscape. The loss of these structures would result in a moderate, adverse impact to the Valleywide landscape that would be mitigated through documentation and salvage of historic materials, as stipulated in the Programmatic Agreement. Thus, although the structures themselves would cease to exist, a historical record would be preserved, reducing the intensity of adverse impacts from moderate to minor.

In the Yosemite Village Historic District, individually contributing structures would be retained and some would be rehabilitated for adaptive reuse. The National Park Service Administration Building would be rehabilitated for a new use as a natural history museum. The Museum/Valley District Building would be rehabilitated for use solely as a cultural history museum. Rehabilitation of these structures would follow the *Secretary's Standards* (USDOJ 1983), and thus would have negligible impacts on the historic structures and the district itself.

Curry Village and the Camp Curry Historic District: Actions proposed for the Curry Village developed area and the Camp Curry Historic District would result in the loss of historic

structures as well as construction of new facilities within the historic district; collectively, these actions would result in a permanent, major, adverse impact that would be reduced in intensity as described below.

The historic Curry Orchard, the Curry Orchard parking area, 277 historic guest tent cabins, Tresidder Residence, Huff House, Cabin 90 A/B, and some historic comfort stations would be removed, resulting in a permanent, major, adverse impact to the historic district. The intensity of this impact would be reduced by documentation of historic structures as described in the Programmatic Agreement. In this manner, although the physical structures would be lost, a historical record would be preserved. The resultant intensity of these adverse impacts would therefore be moderate.

Other actions in the Curry Village developed area would result in the rehabilitation and adaptive reuse of several individual historic structures. These structures consist of Mother Curry Bungalow, Stoneman Lodge, the 48 cabins-with-bath, Cottage 819, the Lounge, and the Registration Building. Rehabilitation would be accomplished in keeping with the *Secretary's Standards* (USDOJ 1983); thus, there would be negligible impact to historic structures.

Construction of 204 new cabins-with-bath would add non-historic facilities within the historic district, resulting in a permanent, major, adverse impact. This impact would be partly reduced through the use of compatible design materials, thus potentially reducing the intensity of adverse impacts from major to moderate. Construction of a campground check station and recreational vehicle dump station would introduce non-historic facilities adjacent to the historic district, potentially resulting in a moderate, adverse impact. This impact would be reduced through use of compatible design and appropriate screening, thus reducing the intensity of the impact from moderate to minor.

The Ahwahnee: Removal of the historic Ahwahnee tennis courts and restoration of the California black oak woodland in this area would result in the loss of a contributing element of The Ahwahnee National Register property; a minor adverse impact. This would be partly mitigated by documentation as specified in the Programmatic Agreement, thus reducing the intensity of impact from minor to negligible. Redevelopment of the existing parking lot would result in a negligible impact. Rehabilitation of the employee dormitory would be carried out in keeping with the *Secretary's Standards* (USDOJ 1983), resulting in a negligible impact.

Historic Sites

Actions at Camp 4 (Sunnyside Campground) would result in the loss of five contributing campsites, the addition of five new campsites adjacent to the historic site, and construction of employee housing facilities south of the historic site. These actions will result in a permanent moderate adverse impact. These impacts would be mitigated through documentation of resources to be removed, design of the additional campsites to be compatible with the existing historic site in terms of scale, massing, materials, and orientation, and screening the housing from the historic site. These measures would reduce the intensity of adverse impacts from moderate to minor.

Historic Orchards

The removal of Curry Orchard would result in the loss of this resource, similar to Alternative 1, therefore there would be no additional adverse impact. However, this action would result in this immediate (rather than eventual) loss. The loss of this resource would be mitigated through initiation of a genetic conservation program and documentation of the orchard; thus, a historical record and representative plants would be preserved, although the orchards would cease to exist. Maintaining Lamon and Hutchings Orchards would result in a minor, beneficial impact on the Valleywide cultural landscape.

Out-of-Valley Resources

El Portal

As described for Alternatives 2, 3, and 4, the following impact analysis is based on general land-use planning actions for El Portal area. The National Park Service would undertake site-specific design studies and environmental review to evaluate options for new housing and administrative facilities in El Portal. The National Park Service would initiate further consultation with the State Historical Preservation Office, culturally associated American Indian tribes, and the public, as provided for in the Programmatic Agreement. A complete and detailed assessment of impacts on historic properties would be presented as part of that review.

As described for Alternatives 2, 3, and 4, constructing single-family homes in Old El Portal would not impact any historic resources, nor would constructing housing and a day care center at Rancheria Flat in El Portal (the three historic National Lead Company residences would be retained).

Similar to Alternatives 2, 3, and 4, the construction of apartments at Hillside East and West would not impact any historic resources. Structures built adjacent to El Portal Chapel (the old school) would be designed to be compatible with the historical setting. Constructing high-density housing and support facilities at Hennessey's Ranch would not impact any historic structures. Prior to design, the National Park Service would inventory and evaluate the importance of potential cultural landscape features at this location, remnants of Hennessey's farming operation. If any significant resources could not be avoided in site design, the National Park Service would undertake further environmental review and impact mitigation prior to construction.

The construction of employee and day-visitor parking in the Village Center area, as well as administrative and museum collection facilities at Railroad Flat and a multi-use trail between Rancheria Flat and Village Center (through Hennessey Ranch), would not impact any historic structures (the same as under Alternatives 2, 3, and 4).

Constructing apartments and other community and commercial facilities at El Portal Village Center could impact historic resources (such as the El Portal Market, the Railroad residences, the old El Portal Store, and the El Portal Hotel). The precise nature of impacts on historic resources is unknown, pending the siting and design of the facilities. Every effort would be made to avoid or otherwise mitigate adverse impacts, (e.g., through sensitive, compatible design and the screening of modern development from historic structures). Should avoidance of adverse impacts

be impossible, documentation stipulated in the Programmatic Agreement would reduce the intensity of the adverse impacts.

As described for Alternatives 2, 3, and 4, historic El Portal Hotel would be adaptively rehabilitated or removed. Adaptive rehabilitation would be undertaken in accordance with the *Secretary's Standards* (USDOJ 1983). Because removal of the individually significant historic structure would be a major, adverse impact, the National Park Service would follow stipulations of the Programmatic Agreement to reduce the intensity of the adverse impact from major to moderate.

Foresta and McCauley Ranch

At Foresta, there would be no impact to historic resources as a result of establishing day-visitor parking and constructing single-family homes. Access improvements through Foresta to McCauley Ranch, with possible replacement of the Crane Creek Bridge, could (depending upon location and design) adversely affect potential historic resources (i.e., the Foresta Road and Crane Creek Bridge) as a result of loss or significant alternation. Constructing National Park Service stables, as well as National Park Service wilderness utilities and trails maintenance facilities at McCauley, would have unknown impacts on historic resources. The National Park Service would conduct resource inventory and evaluation studies, according to stipulations of the Programmatic Agreement. The National Park Service would avoid adverse impacts to the extent possible, and would mitigate any potential adverse impacts according to stipulations in the Programmatic Agreement.

Merced River Gorge

Impacts under this alternative would be the same as for Alternatives 2, 3, and 4. With mitigation, the resultant impacts would be permanent, moderate, and adverse.

Other Areas

As described for Alternatives 2, 3, and 4, the construction of new visitor centers at the park entrance stations would have an unknown impact on historic resources. The National Park Service would conduct inventory and evaluation studies, according to stipulations of the Programmatic Agreement. The National Park Service would avoid adverse impacts to the extent possible, and would mitigate any potential adverse impacts according to the stipulations of the Programmatic Agreement.

At Wawona, constructing single-family homes would have no impacts on historic resources because there are no historic structures, sites, or landscape resources in the area proposed for housing construction.

Establishing day-visitor parking at Henness Ridge would disturb two intact historic linear resources: a logging railroad grade, and a historic road. The precise nature of impacts on the historic resources is unknown, pending the siting and design of the facilities, which would be the subject of future, tiered, site-specific environmental compliance. Every effort would be made to avoid or otherwise mitigate adverse impacts (through sensitive, compatible design). If avoidance

of adverse impacts was impossible, documentation stipulated in the Programmatic Agreement would reduce the intensity of the adverse impacts.

Cultural Landscape Resources Conclusion

Undertakings in Alternative 5 would have major to minor, beneficial and adverse impacts to the cultural landscape and historic structural resources in Yosemite Valley. Adverse impacts would result from the removal of historic structures, or from the introduction of modern facilities and development either within or adjacent to historic districts; however, new facilities would be designed to be compatible with historic structures and districts.

Many of the actions proposed in this alternative would result in an overall beneficial impact to the large-scale natural systems that historically defined the Valley floor, the Merced River Corridor, and the pattern of open meadows, California black oak woodlands, and coniferous forests. Beneficial impacts would also result from the rehabilitation of existing developed areas, particularly through rehabilitation of the Yosemite Village Historic District. This rehabilitation would incorporate adaptive use of historic structures, removal of non-contributing structures, and new development based on design guidelines to ensure compatibility with the historic district. In general, adaptively using historic buildings would enhance their long-term preservation and would be carried out in accordance with the *Secretary's Standards* (USDO I 1983).

There would be minor, adverse impacts to the Valleywide historic land use patterns as a result of changes such as relocating the river-related campgrounds from the Merced River corridor to Upper and Lower Pines, and changes within the two historic districts.

Changes proposed to the historic circulation system (minor realignments and conversion of one lane of part of Northside and Southside Drives to multi-use paved trail) in the Valley would result in a minor, adverse impact to the cultural landscape. However, the intensity of this impact would be reduced by the use of design guidelines for compatible treatment based on the *Secretary's Standards* (USDO I 1983).

The loss of individually significant historic structures and historic structures that contribute to the significance of the Valleywide cultural landscape would result in permanent, major, adverse impacts. Carrying out standard mitigation measures (e.g., HABS/HAER documentation and salvage of historic materials) under the Programmatic Agreement would reduce the intensity of adverse impacts. In addition, in some cases where historic structures would be removed, the National Park Service would first consider relocation and adaptive reuse in another location within the park.

For some project areas, the impacts on historic properties are unknown until further site-specific historic resource studies have been undertaken, and project designs have been more fully developed. In these instances, the park would carry out any necessary inventories, and evaluations of National Register significance; consultation with the State Historic Preservation Office and culturally associated American Indian tribes and the public; and treatment/mitigation as stipulated in the Programmatic Agreement prior to any construction disturbance.

Cumulative Impacts

Cumulative impacts on historic resources would be the same as under Alternatives 2, 3, and 4. In Yosemite Valley and a regional context, implementation of this alternative would result in minor, cumulative, adverse impacts in conjunction with other past, present, and reasonably foreseeable future actions.

MUSEUM COLLECTION

Under this alternative, the museum collection, research library, and archives would be moved to a new facility in the El Portal area. This facility would be constructed to meet applicable environmental and security control standards for museum collection preservation. This action would benefit the collection by locating them in one geographic area, making them easier to manage, in a facility specifically designed for collection management and preservation. Access to these materials (including ample study space) would be enhanced specifically for researchers, rather than all park visitors, since this location would be somewhat remote for general park visitors. Professional staff would not be readily available to answer the questions of casual visitors, as they are now available to do. There would be some potential for damage and loss to the collection resulting from movement in and out of storage to exhibit areas in Yosemite Valley. Overall, however, these measures would have moderate to major, beneficial impacts on the collections and public/staff use.

Museum Collection Conclusion

Housing the museum, archival, and library collections in a new, central, rehabilitated facility would have moderate to major, beneficial impacts on the materials and would significantly improve the park's effectiveness in managing and protecting these resources. Access to the materials would be enhanced for researchers, with adequate space to carry out research. The park would be able to achieve compliance with the protection and preservation guidelines and standards prescribed by the National Park Service *Museum Handbook* (NPS 1990a) and *Director's Order 28 – Cultural Resource Management* (NPS 1998l), as well as the *Draft Director's Order 24 - Standards for NPS Museum Collections Management* (NPS 1999e). While in transit from storage to exhibit in Yosemite Valley, the objects would be exposed to risk of damage.

Cumulative Impacts

This alternative would have minor, cumulative, beneficial effects on the museum collection and archival materials in conjunction with other past, present, and reasonably foreseeable future projects. Housing the resources in a central facility with adequate environmental and security control systems would assist their protection and long-term preservation. No adverse impacts to the resources would be expected other than when the objects are in transit. It is not reasonable to compare the Yosemite museum collection with that of other repositories or sites, because of the extent and unique nature of these collections. Facility upgrades and improved management of museum collections and archives within the park would incrementally add to the overall effectiveness of regional curation efforts.

SECTION 106 SUMMARY

As described for Alternatives 2, 3, and 4, under regulations of the Advisory Council on Historic Preservation (36 CFR 800.9), addressing the criteria of effect and adverse effect, undertakings proposed under this alternative have the potential to adversely affect significant historic properties. Ethnographic resources would be disturbed or destroyed by construction occurring in traditional plant-gathering areas, historic village sites, and/or places holding special sacred and spiritual significance to American Indians. Historic sites, structures, districts, and cultural landscape features would also be adversely affected by undertakings entailing substantial facility alteration or removal, or the introduction of modern non-contributing development within or in proximity to historic districts and sensitive landscape areas. To mitigate adverse effects, the park would carry out HABS/HAER documentation; the salvage of historic materials; cooperative agreement provisions for traditional plant gathering; or other suitable mitigation in accordance with the Programmatic Agreement.

Many archeological resources having varied potential to yield prehistoric and historic information would be affected by ground-disturbing activities. To avoid adverse effects to archeological resources, the park would carry out data recovery to retrieve important information, in accordance with the Programmatic Agreement.

No adverse effects to the park's museum collections and archives would result from housing materials in a central facility with adequate environmental and security controls, other than while collections are in transit and are at risk. The rehabilitation and adaptive use of historic buildings, restoration of vegetation contributing to historic settings and the cultural landscape, and the removal of non-contributing structures and landscape elements would also have no adverse effect on historic properties. Rehabilitation would be carried out in accordance with the *Secretary's Standards* (USDOI 1983).

For project areas lacking sufficient cultural resource data or design information to adequately assess effects, the park would carry out inventories; evaluate identified resources for National Register significance; and recommend avoidance or appropriate treatment/standard mitigation measures prior to construction disturbance.

Merced Wild and Scenic River

This assessment is based on the *Merced Wild and Scenic River Comprehensive Management Plan/FEIS (Merced River Plan)*, and the management elements of the *Merced River Plan*. The applicable Merced Wild and Scenic River segments are 2 (Yosemite Valley), 3A and 3B (Impoundment and Gorge), 4 (El Portal), and 7 (Wawona). See Vol. IA, Chapter 3, Affected Environment, for further discussion on the management elements of the *Merced River Plan*.

Alternatives have been assessed within a river segment with regard to their: (1) impacts on the Outstandingly Remarkable Values, the values for which the river was designated by Congress; (2) compatibility with classifications; (3) compatibility with the Wild and Scenic Rivers Act Section 7 determination process; (4) consistency with the River Protection Overlay; and (5) consistency with management zoning. The *Merced River Plan*, which established the River Protection Overlay, management zoning, Wild and Scenic Rivers Act Section 7 determination

process, and the Visitor Experience and Resource Protection framework (within the wild and scenic river boundaries), is discussed as a cumulative project.

Consistency of the *Final Yosemite Valley Plan/SEIS* alternatives with the wild and scenic river boundaries are analyzed through the analysis of *Final Yosemite Valley Plan/SEIS* consistency with the *Merced River Plan* management zoning.

YOSEMITE VALLEY (SEGMENT 2)

Outstandingly Remarkable Values Impacts

Outstandingly Remarkable Values for this segment are scenic, geologic processes/conditions, recreation, biological, cultural, and hydrologic processes. A description of the Outstandingly Remarkable Values are found in Vol. II, Appendix B. Potential impacts of this alternative are shown in table 4-130.

Actions to implement the River Protection Overlay would have beneficial impacts on the scenic, recreation, biological, cultural, and hydrologic processes Outstandingly Remarkable Values. The River Protection Overlay prescription would be an important parameter in implementing the actions listed in table 4-130.

The campground-related actions would have both beneficial and adverse impacts on the Outstandingly Remarkable Values. The campground-related actions would have an overall beneficial effect on the scenic Outstandingly Remarkable Value due to restoration of areas visible from the river. These actions would have a beneficial impact on the recreational Outstandingly Remarkable Value because camping opportunities would be retained. There would be a beneficial impact on the hydrologic processes Outstandingly Remarkable Value because of restoration of riparian areas, and because campsites would be removed from close proximity to the river. New campsites within the 100-year floodplain (e.g., Yellow Pines, North Pines, and Upper Pines Campgrounds) would be located outside of the River Protection Overlay and would have minimal, adverse impacts on the flood regime. There would be a beneficial impact on the biological Outstandingly Remarkable Value because restoration of river-related vegetation would occur within the River Protection Overlay, but also an adverse impact because radiating impacts from the campgrounds would degrade the quality of this habitat, and some river-related vegetation outside the River Protection Overlay would continue to be displaced by campsites.

The Housekeeping Camp-related actions would have a long-term, beneficial effect on the scenic Outstandingly Remarkable Value due to restoration of areas visible from the river. Removal of Housekeeping Camp units could have an adverse effect on cultural Outstandingly Remarkable Values due to potential disturbance of river-related archeological resources. The actions at Housekeeping Camp would have a beneficial impact on the biological and hydrologic processes Outstandingly Remarkable Values because restoration of riparian areas and because Housekeeping Camp lodging units would be removed from close proximity to the river. These actions would not adversely impact the recreational Outstandingly Remarkable Value because Housekeeping Camp lodging units would be retained.

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
Actions to Implement River Protection Overlay					
<ul style="list-style-type: none"> Remove Sugar Pine, Ahwahnee, and Yosemite Creek (pedestrian) bridges 	Scenic	Potentially improves view of waterfalls, cliffs, and forest/meadow interface from the river by encouraging restoration	Long-term	NA	Minor, beneficial
<ul style="list-style-type: none"> Remove campsites, and campground infrastructure from River Protection Overlay at Upper Pines, Lower Pines, North Pines, Upper River, Lower River, and Backpacker's campgrounds 	Biological	Condition of river-related habitats (e.g., riparian areas and meadows) would be monitored and visitor use managed; restoration of damaged habitat is encouraged	Long-term	NA	Moderate, beneficial
<ul style="list-style-type: none"> Remove Housekeeping Units from River Protection Overlay 	Cultural	River Protection Overlay specifically accommodates preservation and protection of significant archeological sites, ethnographic resources, historic structures, and landscape features	Long-term	NA	Minor, beneficial
<ul style="list-style-type: none"> Remove parking from River Protection Overlay at Camp 6 	Hydrologic Processes	Contributes to restoration of natural flood regime; limits unnatural erosion; stabilizes banks (where applicable); allows for the main channel to link with backwater areas, tributaries, and groundwater systems; and allows river to meander more freely (where applicable) by limiting and potentially removing facilities	Long-term	NA	Major, beneficial
<ul style="list-style-type: none"> Remove former Superintendent's House (Residence 1) from River Protection Overlay 					
<ul style="list-style-type: none"> Remove picnic area at Swinging Bridge 					
<ul style="list-style-type: none"> Restore areas where development is removed from the River Protection Overlay 					
<ul style="list-style-type: none"> Restore River Protection Overlay near Yosemite Lodge 					

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
Campgrounds					
<ul style="list-style-type: none"> A portion of North Pines and Lower Pines Campgrounds would be removed and the area restored 	Scenic	Removal, construction, and/or reconstruction of facilities (i.e., construction equipment) would be visible from river	Short-term	None	Minor, adverse
<ul style="list-style-type: none"> North Pines Campground remains (becomes walk-in campground) 	Scenic	Some new walk-in and drive-in sites would be visible from the river	Long-term	None	Minor, adverse
<ul style="list-style-type: none"> Former Group Campground (currently abandoned) area restored to natural conditions 	Scenic	Restoration of these areas to natural conditions enhances scenic interface of river, meadow, and forest	Long-term	NA	Moderate, beneficial
<ul style="list-style-type: none"> Backpacker Campground removed and area is restored 	Biological	Restoration of riparian, meadow, wetland, and river-related vegetation where campgrounds are removed; visitor use of river originating from campgrounds would decrease, resulting in less trampling of riparian habitat	Long-term	NA	Minor, beneficial
<ul style="list-style-type: none"> New walk-in sites constructed at Upper Pines, Camp 4 (Sunnyside Campground), Tenaya Creek, Backpackers/South Camp Campgrounds 	Biological	Removal of facilities (restrooms, lateral sewer lines, etc.) would result in disturbance to vegetation communities	Short-term	Revegetation, trenching guidelines	Negligible, adverse
<ul style="list-style-type: none"> Upper and Lower River Campgrounds restored to natural conditions, except for area of new picnic area 	Biological	River-related vegetation at new campsites would be degraded; impacts associated with visitor use/travel would radiate from new campsites	Long-term	Fence to protect sensitive areas, campsite definition, path definition	Moderate, adverse
<ul style="list-style-type: none"> Yellow Pine remains (becomes Group walk-in campground) 	Cultural	Construction of new campground facilities could result in damage to river-related archeological resources and traditional use areas	Long-term	Archeological excavation & consultation	Minor, adverse
	Cultural	Removal of Upper and Lower River Campgrounds and restoration to natural conditions would improve conditions for traditional gathering	Long-term	NA	Minor, beneficial
	Cultural	Construction of campground facilities could damage traditional use areas	Long-term	Consultation	Minor, adverse
	Hydrologic Processes	Removal and restoration of campgrounds would allow the river to meander more freely; removal of facilities would contribute to restoration of the flood regime	Long-term	NA	Minor, beneficial

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
	Hydrologic Processes	Some new walk-in sites and pathways at North Pines, Upper Pines, and Yellow Pine Campgrounds would be in the floodplain	Long-term	Pathways designed to minimally affect flood flow	Moderate, adverse
	Hydrologic Processes	Density of visitors at the new campsites would have radiating impacts on the riverbanks due to trampling, resulting in bank destabilization and unnatural erosion	Long-term	Fence sensitive areas, campsite definition, path definition	Minor, adverse
Lodging					
<ul style="list-style-type: none"> • Remove Housekeeping Camp units in River Protection Overlay and restore area • Redevelop Yosemite Lodge area • Remove Maple, Juniper, Laurel, Hemlock, and Alder units at Yosemite Lodge from the 100-year floodplain • Area where Yosemite Lodge cabins were removed is restored to natural conditions • Redevelop Curry Village area, including new lodging and parking areas 	Scenic	Construction and deconstruction at Yosemite Lodge, Curry Village, and Housekeeping Camp would be visible from the river	Short-term	None	Minor, adverse
	Scenic	Restored area at Housekeeping Camp and near Yosemite Lodge would be visible from the river, providing enhanced views of interface of river, meadow, and forest	Long-term	NA	Minor, beneficial
	Recreation	The diversity of recreational opportunities is maintained because of varied lodging opportunities	Long-term	None	Minor, beneficial
	Biological	Removal of Housekeeping Camp from the River Protection Overlay would allow restoration of riparian vegetation; visitor use of river originating from Housekeeping Camp would decrease, resulting in less trampling of riparian habitat	Long-term	NA	Moderate, beneficial
	Biological	Retention of Housekeeping Camp units would result in continued radiating impacts to sensitive riparian areas and habitat fragmentation	Long-term	Fence sensitive areas; direct use to more resilient areas	Adverse impacts described in No Action Alternative continue
	Biological	There would be restoration of river-related vegetation at Yosemite Lodge	Long-term	NA	Moderate, beneficial
	Biological	Construction of lodging units would have radiating impacts (associated with visitor use) to the meadow and riparian communities nearby	Long-term	Fence sensitive areas; direct use to more resilient areas	Minor, adverse

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
	Cultural	Construction and demolition activities at Housekeeping Camp, Yosemite Lodge, and Curry Village could result in damage to archeological resources	Long-term	Archeological excavation	Minor, adverse
	Hydrologic Processes	Removal of Yosemite Lodge units from the floodplain would contribute to the restoration of the natural flood regime	Long-term	NA	Major, beneficial
	Hydrologic Processes	Construction of lodging units would have radiating impacts (associated with visitor use) to the riverbanks nearby, including bank destabilization and unnatural erosion	Long-term	Fence sensitive areas; direct use to more resilient areas	Minor, adverse
	Hydrologic Processes	A portion of Housekeeping Camp would continue to impede flood flow	Long-term	None	Adverse impacts described in No Action Alternative continue
Roads					
<ul style="list-style-type: none"> One lane of Northside Drive from Yosemite Lodge to El Capitan crossover closed to vehicles and the other lane converted to a multi-use paved trail 	Scenic	Retained roads, and the vehicles on them, are visible from riverbank and river; meadows are specifically identified in the scenic Outstandingly Remarkable Value, and roads through meadows impact their scenic quality	Long-term	None	Adverse impacts described in No Action Alternative continue
<ul style="list-style-type: none"> One lane of Southside Drive from El Capitan crossover to Swinging Bridge closed to vehicles, and the other lane converted to a multi-use paved trail 	Biological	Construction associated with conversion of one lane of Northside and Southside Drives to multi-use trails would result in disturbance to river-related vegetation communities	Short-term	Revegetation	Minor, adverse
<ul style="list-style-type: none"> Northside Drive rerouted south of Yosemite Lodge 	Biological	Where roads remain, loss of riparian vegetation and river-related habitats would continue; roads interfere with water movement	Long-term	None	Adverse impacts described in No Action Alternative continue
<ul style="list-style-type: none"> Retain roads at: <ul style="list-style-type: none"> - Southside Drive in the Bridalveil Fall Area - Stoneman Meadow - Ahwahnee Meadow - Sentinel Meadow - Cook's Meadow - El Capitan Meadow 	Hydrologic Processes	Existing roads and infrastructure in meadows affect flood flow	Long-term	None	Adverse impacts described in No Action Alternative continue
	Hydrologic Processes	Rerouted Northside Drive would be in 100-year floodplain and would slightly impede flood flow (see Water Resources section of this chapter for more information)	Long-term	None	Minor, adverse

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
EI Portal Road Between Cascades Diversion Dam and Pohono Bridge Reconstructed					
[Note: see Segment 3A/3B for Outstandingly Remarkable Value impacts associated with removal of Cascades Diversion Dam]	Scenic	The road is visible from riverbank and river	Long-term	None	Adverse impacts described in No Action Alternative continue
	Scenic	Construction activities would be visible from the river	Short-term	None	Major, adverse
	Recreation	Improvement of the EI Portal Road would decrease the possibility of its failure, and the loss of recreational opportunity that would result from road failure	Long-term	NA	Moderate, beneficial
[Note: see Segment 3A/3B for Outstandingly Remarkable Value impacts associated with removal of Cascades Diversion Dam]	Recreation	During construction, approximately 1 mile of the river would be closed to recreational use	Short-term	None	Minor, adverse
	Biological	Retention of this road would continue loss of riparian vegetation and river-related habitats	Long-term	None	Adverse impacts described in No Action Alternative continue
	Biological	Construction activities would result in a temporary loss of vegetation at staging areas and construction areas	Short-term	Revegetation of staging areas and construction areas	Minor, adverse
	Biological	Bank stabilization to protect road could result in permanent loss of river-related vegetation	Long-term	Sustainable design that allows riparian vegetation to become largely re-established	Minor, adverse
	Cultural	Reconstruction would result in loss of historic features associated with EI Portal Road, and would potentially result in damage to archeological resources	Long-term	Documentation of features and archeological excavation; pursue designs that maintain road's historic character	Minor, adverse

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
	Hydrologic Processes	Bank stabilization materials that support portions of this road segment are currently in the river channel, and interfere with the free-flowing condition of the river; these materials would remain in the river channel after the road is reconstructed	Long-term	Pursue designs that minimize impacts to the free-flowing condition of the river	Major, adverse
	Hydrologic Processes	Construction activities would result in temporary impediments to river and/or flood flow	Short-term	Construction occur during low flow; banks are stabilized	Minor, adverse
Bridges					
<ul style="list-style-type: none"> • Remove the following bridges: <ul style="list-style-type: none"> - Ahwahnee - Sugar Pine - pedestrian/bicycle bridge north of and parallel to the current Yosemite Creek Bridge • Widen or reconstruct Swinging Bridge • Retain the following bridges: <ul style="list-style-type: none"> - Housekeeping - Stoneman - Sentinel - Superintendent's - El Capitan - Clark's - Happy Isles (vehicle) - Tenaya Creek - Pohono • Convert Yosemite Creek vehicle bridge to multi-use trail bridge • Construct new vehicle bridge at Yosemite Creek (south of existing bridge) 	Biological	Where bridges are retained, loss of riparian vegetation and river-related habitats would continue	Long-term	None	Adverse impacts described in No Action Alternative continue
	Biological	At Sugar Pine and Ahwahnee Bridges, river-related environments and habitats would be restored	Long-term	NA	Moderate, beneficial
	Biological	At the pedestrian/bicycle bridge north of and parallel to the current Yosemite Creek Bridge, river-related environments and habitats would be restored	Long-term	NA	Minor, beneficial
	Biological	Displacement of riparian vegetation would occur during construction, but riparian vegetation would be restored	Short-term	NA	Negligible, beneficial
	Cultural	Removal of Sugar Pine and Ahwahnee Bridges would result in loss of important historic structures, and change in historic circulation patterns	Long-term	Structures would be documented, thus preserving a historical record	Moderate, adverse
	Cultural	Removal of Sugar Pine Bridge may result in damage to archeological resources	Long-term	Archeological documentation	Minor, adverse
	Hydrologic Processes	Reconstruction of Swinging Bridge would improve the hydrologic function at the river by decreasing the footprint in the river at the bridge abutments and pilings	Long-term	NA	Minor, beneficial

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
[Note: See "Water Resources" section of this chapter for additional information on bridges and the different impact of each bridge.]	Hydrologic Processes	At Stoneman, Superintendent's, and Housekeeping Bridges, the river is prevented from meandering; scouring and unnatural channeling continues; flood flow is impeded	Long-term	None	Adverse impacts described in No Action Alternative continue
	Hydrologic Processes	At Sentinel, Clark's, Happy Isles (vehicle), El Capitan, Yosemite Creek, and Tenaya Creek Bridges, the river is prevented from meandering, scouring and unnatural channeling continues, flood flow is impeded	Long-term	None	Adverse impacts described in No Action Alternative continue
	Hydrologic Processes	At Pohono Bridge, the river is prevented from meandering; scouring and unnatural channeling continues; flood flow is impeded	Long-term	None	Adverse impacts described in No Action Alternative continue
	Hydrologic Processes	Removal of Ahwahnee and Sugar Pine Bridges would contribute to the restoration of the natural flood regime, reduce scouring, and allow the river to more freely meander	Long-term	NA	Major, beneficial
	Hydrologic Processes	A new bridge across Yosemite Creek could impact the creek bank and could impede flood flow	Long-term	Design would minimize hydrologic impacts	Minor, adverse
	Hydrologic Processes	During bridge removal or construction, river flows would be affected	Short-term	None	Minor, adverse
Lamon Orchard Remains, is Maintained as a Historic Orchard					
	Cultural	Rehabilitates and maintains important historic site	Long-term	NA	Moderate, beneficial
	Biological	Degradation of meadow and wetland vegetation continues due to filling and ditching	Long-term	None	Adverse impacts described in No Action Alternative continue
	Hydrologic Processes	Orchard is in floodplain, although impact to flood flow is imperceptible	Long-term	None	Adverse impacts described in No Action Alternative continue

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
Stock Use and Facilities					
<ul style="list-style-type: none"> Concessioner stable removed from Merced Wild and Scenic River boundary (relocated to vicinity of Curry Village) Private stock use continues; guided trail rides continue 	Biological	Stock use spreads non-native species invasive plant and contributes to water quality degradation, which impacts riparian vegetation and river-related environments – these impacts would continue; degradation of water quality via introduction of organic matter originating from stock continues	Long-term	None	Adverse impacts described in No Action Alternative continue
	Cultural	Removal of stable would result in a loss of historic structure	Long-term	Structures would be documented	Minor, adverse
	Hydrologic Processes	Facilities removed from floodplain contribute to the restoration of natural flood regime	Long-term	NA	Moderate, beneficial
Historic Superintendent's House (Residence 1) Removed and Area Restored					
	Biological	Removal of buildings and restoration of site would benefit adjacent river-related vegetation	Long-term	NA	Minor, beneficial
	Cultural	Removal would result in the loss of an important river-related historic structure	Long-term	Structures would be documented	Moderate, adverse
	Hydrologic processes	Removal of buildings would contribute to restoration of flood regime	Long-term	NA	Major, beneficial
Picnic Areas (East Yosemite Valley)					
<ul style="list-style-type: none"> Retain Sentinel Picnic Area Remove Swinging Bridge and Church Bowl Picnic Areas Construct new picnic areas at Yosemite Village, Lower River area, and Curry Orchard 	Scenic	Redeveloped Sentinel Picnic Area is visible from the river	Long-term	None	Minor, adverse
	Biological	Degradation of riparian vegetation and river-related habitats would continue at Sentinel Picnic Area	Long-term	None	Adverse impacts described in No Action Alternative continue
	Biological	Construction of new picnic areas at Yosemite Village, Lower River area, and Curry Orchard may result in loss of river-related vegetation and radiating impacts (social trails, etc.), particularly at Lower River given its proximity to the river	Long-term	Fence sensitive areas; direct use to more resilient areas	Minor, adverse
	Biological	Removal and restoration of Swinging Bridge picnic area would benefit river-related environments and habitats	Long term	NA	Moderate, beneficial

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
	Hydrologic Processes	Construction of new picnic area at Lower River may result in bank destabilization due to radiating impacts (soil compaction, loss of riparian vegetation, etc.)	Long-term	Fence sensitive areas; direct use to more resilient areas	Minor, adverse
	Hydrologic Processes	Removal and restoration of Swinging Bridge Picnic Area would stabilize riverbank and restore hydrologic processes by allowing restoration of riparian vegetation	Long-term	NA	Moderate, beneficial
Parking (East Yosemite Valley)					
<ul style="list-style-type: none"> 550 parking spaces are located at Yosemite Village (Camp 6), and area within River Protection Overlay restored to natural conditions 	Scenic	New parking at Camp 6 would be visible from the river	Long-term	Design would minimize visual impacts	Minor, adverse
<ul style="list-style-type: none"> Retain administrative parking at Sentinel Bridge 	Scenic	Some parking would be removed from the River Protection Overlay at Camp 6 and less development would be visible from the river	Long-term	NA	Minor, beneficial
<ul style="list-style-type: none"> Parking for Yosemite Lodge guests constructed in previously disturbed area in floodplain 	Scenic	Sentinel Bridge Parking Area is visible from the riverbank	Long-term	None	Adverse impacts described in No Action Alternative continue
	Biological	Some parking at Camp 6 would be removed from the River Protection Overlay, allowing for restoration of a riparian area	Long-term	NA	Minor, beneficial
	Biological	Parking at Sentinel Bridge would continue to affect riparian area and fragment habitat	Long-term	None	Adverse impacts described in No Action Alternative continue
	Cultural	New parking at Yosemite Lodge would disturb traditional gathering areas	Long-term	Consultation	Minor, adverse
	Hydrologic Processes	New Camp 6 parking would be in 100-year floodplain and would slightly alter flood flow	Long-term	None	Minor, adverse
Hydrologic Processes	Some new parking at Yosemite Lodge would be in 100-year floodplain and would slightly alter flood flow	Long-term	None	Negligible, adverse	
Hydrologic Processes	Removal of Camp 6 parking from close proximity to river would benefit river processes: meandering, and bank stabilization (through restoration of riparian vegetation)	Long-term	NA	Moderate, beneficial	

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

Action	ORV Affected	Impact to Outstandingly Remarkable Value	Impact Duration	Potential Mitigation	Impact Magnitude with Mitigation
	Hydrologic Processes	Parking at Sentinel Bridge is in floodplain and would imperceptibly alter flood flow	Long-term	None	Adverse impacts described in No Action Alternative continue
Yosemite Village					
<ul style="list-style-type: none"> Retain and rehabilitate Valley Visitor Center in existing location Redevelop substantial portion of Yosemite Village 	Scenic	Construction activities at Yosemite Village would be visible from the river	Short-term	None	Minor, adverse
	Biological	As a center of visitor activity, there would be radiating impacts to river-related habitats from visitor use	Long-term	Fence sensitive areas; direct use to more resilient areas	Minor, adverse
	Cultural	Redevelopment of Yosemite Village could disturb river-related archeological resources	Long-term	Archeological excavation	Minor, adverse
	Hydrologic Processes	A small area in Yosemite Village (former location of Concessioner Headquarters) would be redeveloped in the 100-year floodplain, and would slightly alter flood flow	Long-term	None	Minor, adverse
Trails					
<ul style="list-style-type: none"> Construct/realign trails: <ul style="list-style-type: none"> along Sentinel crossover between Southside Drive multi-use trail to Yosemite Village via Sentinel Bridge in Upper and Lower River Campgrounds areas <p>[Note: See also Roads for discussion of multi-use trails at Northside and Southside Drives.]</p>	Biological	Loss of vegetative cover and habitat fragmentation associated with new/realigned trails	Long-term	None	Minor, adverse
	Hydrologic Processes	Segments of new multi-use trail would be within the floodplain, although impact to flood flow would be imperceptible	Long-term		Negligible, adverse

**Table 4-130
Impacts to Outstandingly Remarkable Values for Segment 2 (Yosemite Valley)**

West Valley Development (West Of Yellow Pine)					
(see also River Protection Overlay, Parking, Trails, Traveler Information and Traffic Management System, and El Portal Road) <ul style="list-style-type: none"> • Parking at Bridalveil Fall, Southside Drive in the Bridalveil Fall area, Northside Drive through El Capitan Meadow, and other smaller areas discontinued • Cathedral and El Capitan Picnic Areas redeveloped; new picnic area constructed at base of El Capitan in the vicinity of the North American Wall 	Biological	Redevelopment of Cathedral Picnic Area could disturb riparian vegetation	Long-term	Revegetate	Minor, adverse
	Biological	Loss or degradation of river-related vegetative cover increases at some designated trails, social trails, roads (i.e., radiating impacts)	Long-term	None	Minor, adverse
	Cultural	Constructing picnic area at North American Wall could disturb river-related archeological deposits and historic American Indian village	Long-term	Archeological excavation	Minor, adverse
Traveler Information and Traffic Management System Developed					
<ul style="list-style-type: none"> • Multi-lane traffic check station constructed on Southside Drive near El Capitan crossover, only if required 	Biological	Construction of traffic check station would result in loss of river-related vegetation	Long-term	None	Minor, adverse
	Cultural	Construction of traffic check station would damage river-related archeological deposits and traditional gathering areas	Long-term	Archeological excavation	Moderate, adverse

NA = Not Applicable

Actions at Yosemite Lodge have beneficial and adverse impacts on the Outstandingly Remarkable Values. The removal of Yosemite Lodge units, and restoration of the former cabins area and the area between Yosemite Lodge and the Merced River would have a beneficial impact on the biological and hydrologic processes Outstandingly Remarkable Values. The relocation of Northside Drive and construction of parking would have a minor, adverse impact on the hydrologic processes Outstandingly Remarkable Value because they would be placed in the 100-year floodplain, and would alter the 100-year flood event. Also, an indirect beneficial impact would occur because lodging units (which impede flood flow more than roads and parking lots) can be constructed outside of the boundary. As described in the Water Resources section of this chapter, impacts to hydrologic processes would be minimal because flood flow in this area is low velocity, and is not appreciably affected by parking areas or roads. The construction of lodging units would result in minor, adverse, radiating impacts on the meadow and riparian communities inside the boundary.

At Curry Village, cultural Outstandingly Remarkable Values could be adversely affected due to potential disturbance of river-related archeological resources during Curry Village redevelopment. There would be no impact on the hydrologic processes Outstandingly Remarkable Value, because Curry Village is located outside of the floodplain. There would be minor, adverse radiating impacts on river-related vegetation due to trampling.

Reconstruction of the El Portal Road between Pohono Bridge and Cascades Diversion Dam and removal of Cascades Diversion Dam would have both beneficial and adverse impacts on the Outstandingly Remarkable Values (see discussion of dam removal in Segment 3A/3B). The existing road has localized, adverse impacts on the biological Outstandingly Remarkable Value because it displaces river-related vegetation, and to the hydrologic processes Outstandingly Remarkable Value because riprap that supports the road is partially in the river channel. However, since this road segment provides a critical visitor access link, its reconstruction would also be beneficial to the recreation Outstandingly Remarkable Value by maintaining access to Yosemite Valley. [Note: These two actions span river Segments 2, 3A and 3B.]

Removal of bridges would have both beneficial and adverse impacts on the Outstandingly Remarkable Values. These actions would have beneficial impacts on the biological Outstandingly Remarkable Value because the riverbank can be restored, and substantial, beneficial impacts on the hydrologic processes Outstandingly Remarkable Value because the free-flowing condition of the river would be improved, and the river would have increased ability to meander. These actions would have adverse impacts on the cultural Outstandingly Remarkable Value because they result in the loss of important historic structures, and change historic circulation patterns.

The continuation of parking at Camp 6 would have both beneficial and adverse impacts on the Outstandingly Remarkable Values. Removal of parking from close proximity to the river would result in a beneficial impact on the scenic, biological, and hydrologic processes Outstandingly Remarkable Values. Expansion of parking in an area that is already disturbed would have adverse impacts on the biological and hydrologic processes Outstandingly Remarkable Values.

Actions at Yosemite Village would have adverse effects on scenic Outstandingly Remarkable Values because redevelopment activities would be visible from the river. Hydrologic Outstandingly Remarkable Values would be adversely affected due to redevelopment of a small

area of Yosemite Village (not including Camp 6) in the 100-year floodplain. There would be radiating impacts on river-related vegetation due to density of visitor use in the area.

Development of a traffic check station at Taft Toe would have adverse impacts on the Outstandingly Remarkable Values. Construction of a traffic check station would have an adverse effect on the cultural Outstandingly Remarkable Value, since it would damage river-related archeological deposits and traditional gathering areas.

There would continue to be an absence of major development in west Yosemite Valley. Development would be limited to existing roads and parking areas, trails, and a few picnic areas. As a result, limited adverse effects on Outstandingly Remarkable Values would occur in this area, including loss of vegetation and intrusion of new facilities on scenic views, and potential disturbance of river-related cultural resources.

Yosemite Valley (Segment 2) Conclusion

For the actions of this alternative, a long-term, minor, beneficial impact is described for the Outstandingly Remarkable Values, largely due to the removal of facilities that impede flood flow and inhibit the natural meandering of the river; the restoration of substantial areas of high-value resources in the River Protection Overlay and wild and scenic river corridor; the improvement of the scenic interface of river, rock, meadow, and forest; and the maintenance of the diversity of river-related recreational opportunities. The beneficial impact of this alternative is somewhat offset by the adverse impact on the cultural Outstandingly Remarkable Value resulting from the removal of historic structures and potential disturbance of river-related archeological resources.

Segment-wide, this alternative would have a long-term, minor, beneficial impact on the scenic Outstandingly Remarkable Value because of the removal of many facilities visible from the river or riverbank, and improvement of the scenic interface of river, rock, meadow and forest via restoration, campground removal, and road removal/relocation. However, for facilities that are to remain or be redeveloped, some adverse scenic impacts would continue, although to a lesser degree than under the No Action Alternative.

Segment-wide, there are no impacts to the geologic processes/conditions Outstandingly Remarkable Value, because of the absence of actions affecting the U-shaped valley, and moraines of Yosemite Valley. Impacts related to the meandering river are discussed in the Water Resources section of this chapter.

Segment-wide, there would be a long-term, moderate, beneficial impact on the recreation Outstandingly Remarkable Value because the diversity of river-related recreational opportunities would be maintained.

Segment-wide, there would be a long-term, minor, beneficial impact on the biological Outstandingly Remarkable Value because of the reduction of facilities in general, and the restoration of riparian areas and meadows in particular. Although construction of several new facilities (e.g., campsites, roads, multi-use paths, and picnic areas) would pose some adverse, localized impacts on the biological Outstandingly Remarkable Value, these impacts are outweighed by the substantial restoration actions that would take place throughout this segment.

Segment-wide, there would be long-term, minor to moderate, adverse impact on the cultural Outstandingly Remarkable Value because of the removal of river-related historic structures, and potential disturbance of river-related archeological resources. The historic structures that are being removed, particularly bridges, adversely affect the hydrologic processes Outstandingly Remarkable Value, and their removal would have major, beneficial impacts on the hydrologic processes Outstandingly Remarkable Value, and contribute substantially to the restoration of the free-flowing condition of the river.

Segment-wide, there would be long-term, minor, beneficial impact on the hydrologic processes Outstandingly Remarkable Value because of the removal of structures that impede flood flow or inhibit the natural meandering of the river, and the restoration of areas in the Merced River corridor. Removal of structures would contribute substantially to the restoration of the free-flowing condition of the river, and would further the policy established by Congress in the Wild and Scenic Rivers Act to preserve designated rivers in their free-flowing condition. New facilities within the floodplain would have minimal, adverse impacts on the flood regime.

The National Park Service would exert its best efforts to design and reconstruct the El Portal Road between Cascades Diversion Dam and Pohono Bridge with few, if any, additional impacts on the free-flowing condition of the river. If it proves infeasible to design and construct the road in a manner that would avoid direct and adverse impacts to the values for which the river was designated, the National Park Service would report to Congress in accordance with Section 7 of the Wild and Scenic Rivers Act. In either case, further site-specific environmental compliance, including compliance with Section 7 of the Wild and Scenic Rivers Act, would be undertaken for this project.

Cumulative Impacts

Impacts to the Outstandingly Remarkable Values would occur as a result of other past and reasonably foreseeable future actions (see Vol. II, Appendix H for the list of cumulative projects considered in this analysis).

Past Actions

The Merced Wild and Scenic River Comprehensive Management Plan (NPS) established the River Protection Overlay, management zoning, and the Visitor Experience and Resource Protection framework inside the wild and scenic river boundaries. The River Protection Overlay is implemented through this plan, and its beneficial impacts on the Outstandingly Remarkable Values have been assessed as part of the impacts of this alternative. This project also establishes management zoning, which does not directly impact the Outstandingly Remarkable Values. The Visitor Experience and Resource Protection process was designed to protect resources and the visitor experience, and would have a beneficial impact by focusing on protection of Outstandingly Remarkable Values. The Visitor Experience and Resource Protection framework would have a long-term, moderate, beneficial effect on Outstandingly Remarkable Values in this segment.

In 1991, the U.S. Forest Service and the Bureau of Land Management developed a joint South Fork and Merced Wild and Scenic River Implementation Plan (USFS and BLM) for the segments of the main stem and South Fork of the Merced River that are under their jurisdiction.

The plan is a general management plan with many prescriptive goals and few actions. The South Fork and Merced Wild and Scenic River Implementation Plan does not affect the Outstandingly Remarkable Values of this segment.

Reasonably Foreseeable Future Actions

The National Park Service proposes to reconstruct the trail from Happy Isles to Vernal Falls (NPS). This project would have a beneficial impact on the recreation Outstandingly Remarkable Value due to the provision of an improved trail between Happy Isles and Vernal Falls, which contributes to a spectrum of river-related recreational activities. The net effect of this project would be a long-term, minor, beneficial impact on Outstandingly Remarkable Values.

The Eagle Creek Ecological Restoration project (NPS) would restore the confluence of Eagle Creek with the Merced River, and remove rip-rap at the confluence and along the creek. This project would have a long-term, moderate, beneficial impact on the hydrologic processes and biological Outstandingly Remarkable Values.

The past and reasonably foreseeable future projects would have a long-term, moderate, beneficial effect on Outstandingly Remarkable Values due to the establishment of the *Merced River Plan* Visitor Experience and Resource Protection framework; improved river-related recreation opportunities from Happy Isles to Vernal Falls; and restored riparian habitat and hydrologic processes at the Eagle Creek and Merced River confluence.

For the actions of this alternative, a long-term, minor, beneficial impact is described for the Outstandingly Remarkable Values, largely due to the removal of facilities that impede flood flow and inhibit the natural meandering of the river; the restoration of substantial areas of highly valued resources in the River Protection Overlay and wild and scenic river corridor; the improvement of the scenic interface of river, rock, meadow, and forest; and the maintenance of the diversity of river-related recreational opportunities. The cumulative projects would have a long-term, moderate, beneficial effect on Outstandingly Remarkable Values due to the establishment of the *Merced River Plan* Visitor Experience and Resource Protection framework; improved river-related recreational opportunities from Happy Isles to Vernal Falls; and restored riparian habitat and hydrologic processes at the Eagle Creek and Merced River confluence. When the impacts of all of the past and reasonably foreseeable future actions described above are considered in combination with the expected impacts on the Outstandingly Remarkable Values from this alternative, long-term, moderate, beneficial effects on the Outstandingly Remarkable Values of this segment would likely result.

Consistency with the Merced River Plan

Similar to Alternative 2, the actions of this alternative in this segment of the Merced Wild and Scenic River would comply with the *Merced River Plan* and be consistent with its management elements. The collective actions would be consistent with the classification of this segment because accessibility by road or trail would be essentially unchanged and the amount of development in the watershed and on the shorelines would not substantially change, although development on the shorelines would be reduced through removal of facilities in the River Protection Overlay. The individual actions that are considered to be water resources projects,

such as removal of bridges, would be subject to the Section 7 determination process. The River Protection Overlay would be implemented and individual actions would be compatible with the River Protection Overlay prescription, with many facilities being removed from the River Protection Overlay. The individual actions would be consistent with the respective management zones established in the *Merced River Plan*. Some actions, such as the removal of infrastructure from the former Rivers Campground, remove existing facilities or uses that do not conform with the corresponding management zone prescriptions.

I M P O U N D M E N T (S E G M E N T 3 A) A N D G O R G E (S E G M E N T 3 B)

Outstandingly Remarkable Values Impacts

Outstandingly Remarkable Values identified for the recreational impoundment segment of the river are geologic processes/conditions, and biological. Outstandingly Remarkable Values identified for the scenic gorge segment of the river are scenic, geologic processes/conditions, recreation, biological, cultural, and hydrologic processes. A description of the Outstandingly Remarkable Values is found in Vol. II, Appendix B.

The impacts of this alternative on the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2 (see Alternative 2, table 4-40, for more details).

Impoundment (Segment 3A) and Gorge (Segment 3B) Conclusion

The impacts of this alternative on the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2. This alternative would have a long-term, moderate to major, beneficial impact on Outstandingly Remarkable Values, largely because the removal of Cascades Diversion Dam and implementation of the River Protection Overlay would substantially improve the free-flowing condition of the river; enhance riparian habitat and rainbow trout movement; and improve views of waterfalls and cliffs. This beneficial impact is somewhat offset by adverse impacts on cultural Outstandingly Remarkable Values associated with the increased risk of damage to historic engineering projects resulting from Cascades Diversion Dam removal, and the removal of Cascades Houses (see Alternative 2 for more details).

Cumulative Impacts

Cumulative impacts under this alternative would be the same as under Alternative 2. For the actions of this alternative, a long-term, moderate to major, beneficial impact is described for these Outstandingly Remarkable Values, largely because the removal of Cascades Diversion Dam and implementation of the River Protection Overlay would substantially improve the free-flowing condition of the river; enhance riparian habitat and rainbow trout movement; and improve views of waterfalls and cliffs. The cumulative projects would have a long-term, minor, adverse impact, largely through introduction of stabilization materials and loss of riparian vegetation. When the impacts of all past and present actions described above are considered in combination with the expected impacts on the Outstandingly Remarkable Values from this alternative, long-term, moderate, beneficial effects to the Outstandingly Remarkable Values of these segments would likely result (see Alternative 2 for more details).

Consistency with the Merced River Plan

The consistency analysis for this alternative would be the same as under Alternative 2. Similar to Alternative 2, the actions of this alternative in this segment of the Merced Wild and Scenic River would comply with the *Merced River Plan*, and would be consistent with its management elements. The collective actions are consistent with the classification of this segment because accessibility by road or trail is essentially unchanged, and the amount of development in the watershed and on the shorelines does not substantially change. The removal of the Cascades Diversion Dam is consistent with the recreational classification of the impoundment segment, and would allow this small segment of river to be classified as scenic. The individual actions that are considered to be water resources projects, such as removal of the Cascades Diversion Dam, would be subject to the Section 7 determination process. The River Protection Overlay is being implemented, and individual actions are compatible with the River Protection Overlay prescription, including the removal of the Cascades Diversion Dam. The individual actions are consistent with the respective management zones established in the *Merced River Plan*.

EL PORTAL (SEGMENT 4)

Outstandingly Remarkable Values Impacts

Outstandingly Remarkable Values identified for this recreational segment of the river are geologic processes/conditions, recreation, biological, cultural, and hydrologic processes.

The impacts of this alternative to the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2 (see Alternative 2, table 4-41, for more details).

El Portal (Segment 4) Conclusion

The impacts of this alternative to the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2. For the actions of this alternative, a long-term, minor, beneficial impact is described for the Outstandingly Remarkable Values of this segment, largely because implementation of the River Protection Overlay would limit development on the riverbank, and contribute to the restoration of sensitive riparian vegetation communities (e.g., at Hennessey's Ranch). In addition, the recreation Outstandingly Remarkable Value would be beneficially affected by improved hiking opportunities along the river. The beneficial impact on Outstandingly Remarkable Values for this segment has been offset by the adverse impacts on the cultural Outstandingly Remarkable Value due to possible loss of historic structures, and possible disturbance of archeological sites (standard cultural resource mitigation measures lessen the magnitude of the cultural resources impacts). (See Alternative 2 for more details.)

Cumulative Impacts

Cumulative impacts under this alternative would be the same as under Alternative 2. For the actions of this alternative, a long-term, minor, beneficial impact is described for the Outstandingly Remarkable Values of this segment, largely because implementation of the River Protection Overlay would limit development on the riverbank, and contribute to the restoration of sensitive riparian vegetation communities (e.g., at Hennessey's Ranch). In addition, the recreation Outstandingly Remarkable Value would be beneficially affected by improved hiking

opportunities along the river. The past and reasonably foreseeable future projects would have a long-term, minor, adverse effect on Outstandingly Remarkable Values due to the adverse impacts on biological and cultural Outstandingly Remarkable Values resulting from the Yosemite View Parcel Land Exchange (NPS), largely due to motel construction in close proximity to the river. The adverse impacts resulting from the loss of riparian vegetation associated with the Yosemite View Parcel Land Exchange would outweigh the potential beneficial impact of this alternative resulting from the enhancement/restoration of existing (albeit degraded) riparian habitat in the River Protection Overlay. Consequently, when the impacts of all of the past and reasonably foreseeable future actions described above are considered in combination with the expected impacts on the Outstandingly Remarkable Values from this alternative, long-term, negligible, adverse effects to the Outstandingly Remarkable Values of this segment would likely result (see Alternative 2 for more details).

Consistency with the Merced River Plan

The consistency analysis for this alternative would be the same as under Alternative 2. Similar to Alternative 2, the actions of this alternative in this segment of the Merced Wild and Scenic River comply with the *Merced River Plan*, and would be consistent with its management elements. The collective actions are consistent with the classification of this segment because accessibility by road or trail is essentially unchanged, and the amount of development in the watershed and on the shoreline does not substantially change. The individual actions that are considered to be water resources projects, such as construction of pedestrian bridges, would be subject to the Section 7 determination process. The River Protection Overlay is being implemented, and individual actions are compatible with the River Protection Overlay prescription, including the removal of Cascades Diversion Dam. The individual actions are consistent with the respective management zones established in the *Merced River Plan*. Some actions, such as the removal of infrastructure from the former Rivers Campground, remove existing facilities or uses that do not conform with the corresponding management zone prescriptions.

W A W O N A (S E G M E N T 7)

Outstandingly Remarkable Values Impacts

Outstandingly Remarkable Values identified for this scenic segment of the river are scenic, recreation, biological, and cultural.

The impacts of this alternative on the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2 (see Alternative 2, table 4-42, for more details).

Wawona (Segment 7) Conclusion

The impacts of this alternative on the Outstandingly Remarkable Values for this segment would be the same as under Alternative 2. For the actions of this alternative, a long-term, minor, beneficial impact would result for the Outstandingly Remarkable Values of this segment due to the beneficial effects of implementing the River Protection Overlay, including restoration of damaged riparian habitat; improvement of scenic views of Wawona Dome from the river; enhanced public enjoyment of restored resources; and protection of cultural resources. The

beneficial effects of implementing the River Protection Overlay have been somewhat offset by the adverse effects associated with the construction of new employee housing in Wawona (see Alternative 2 for more details).

Cumulative Impacts

Cumulative impacts under this alternative would be the same as under Alternative 2. For the actions of this alternative, a long-term, minor, beneficial impact would result for the Outstandingly Remarkable Values of this segment due to the beneficial effects of implementing the River Protection Overlay, including restoration of damaged riparian habitat; improvement of scenic views of Wawona Dome from the river; enhanced public enjoyment of restored resources; and protection of cultural resources. The past and reasonably foreseeable future projects would have a long-term, minor, beneficial impact on the Outstandingly Remarkable Values of this segment due to the implementation of the *Merced River Plan* Visitor Experience and Resource Protection framework; the reduction of development on the riverbank and restoration of habitat associated with the South Fork Merced River Bridge Replacement (NPS); and the relocation of campsites outside the River Protection Overlay and maintenance of a diversity of river-related recreational activities associated with the Wawona Campground Rehabilitation (NPS). When the impacts of all of the past and reasonably foreseeable future actions described above are considered in combination with the expected impacts to the Outstandingly Remarkable Values from this alternative, a long-term, minor, beneficial impact on the Outstandingly Remarkable Values would result (see Alternative 2 for more details).

Consistency with the Merced River Plan

Similar to Alternative 2, the actions of this alternative in this segment of the Merced Wild and Scenic River would comply with the *Merced River Plan* and be consistent with its management elements. The collective actions would be consistent with the classification of this segment because accessibility by road or trail would be essentially unchanged and the amount of development in the watershed and on the shorelines would not substantially change. The individual actions that are considered to be water resources projects would be subject to the Section 7 determination process. The River Protection Overlay would be implemented and individual actions would be compatible with the River Protection Overlay prescription. The individual actions would be consistent with the respective management zones established in the *Merced River Plan*.

Visitor Experience

Visitor experience is also directly affected by actions influencing natural resources such as, air quality, scenic resources, and cultural resources. Though impacts to these resources are not repeated in the analysis of visitor experience, enhancement or degradation of these resources also enhances or degrades the quality of the visitor experience.

A C C E S S

Access to Yosemite Valley

Access to Yosemite Valley by private automobile to east Valley parking would be available to only about 30% of day visitors on a typically busy day (using 1998 visitation levels). Overnight visitors would continue to have the option of driving into the Valley or traveling on tour buses or other modes of travel. Under this alternative, day visitors who could not park in the Valley would have the option to ride shuttle buses to the Valley from parking areas at Henness Ridge, Foresta, or El Portal, or they would ride tour buses or regional transit. Major, adverse impacts to the experiences of a majority of day visitors would result from a reduction in the ability to make spontaneous stops en route to the Valley, extra travel time, and the inconvenience of moving personal items to and from bus stops.

Alternative 5 would provide facilities and services designed to accommodate visitation levels on the majority of summer days. However, day-visitor demand would exceed the capacity of the parking areas on 10 days during the peak season. On these days, some visitors would not be able to find parking in the Valley or at the out-of-Valley parking areas. These visitors would have the option of visiting another part of the park; traveling on existing regional transit and other transportation modes; or visiting the Valley at a different time or on another day. Adequate infrastructure would be in place to accommodate visitor parking in the Valley, in-park shuttles, regional transit, and commercial tour buses, as described for Alternatives 2, 3, and 4.

Access to the Valley by private vehicles would be managed through a traveler information and traffic management system. Impacts would be the same as for Alternatives 2, 3, and 4. Overall, the average visitor would experience a minor increase in the time required to travel to the Valley, compared to Alternative 1.

As described for Alternatives 2, 3, and 4, reconstructing the segment of El Portal Road between Pohono Bridge and the intersection with Big Oak Flat Road (the major access to the Valley) would cause short-term, minor, adverse impacts such as traffic delays for many visitors during construction. Short-term, adverse impacts associated with constructing Valley access routes and implementing the traveler information and traffic management system would include detours, having to learn new routes, and having to learn new procedures as they were phased in. Compared to Alternative 1, these impacts would be of negligible intensity.

Circulation within Yosemite Valley

Access by private vehicle to many Valley destinations would be eliminated, as described for Alternatives 2, 3, and 4. Once their vehicles were parked in a day-visitor lot or lodging area, visitors would be encouraged to leave them parked until they left the Valley. Compared to Alternative 1, the location of day-visitor parking and the transit center in Yosemite Village would provide a major, beneficial impact for orientation and trip planning for all day visitors because of its location in the Village. The requirement for most day visitors to ride shuttle buses would result in a moderate, adverse impact to day visitors.

Changes in access would affect visitors' ability or willingness to undertake some recreational activities, as described for Alternatives 2, 3, and 4. These changes would affect a large number of

day visitors using regional transit, tour buses, and shuttle buses to access the Valley. Changes to circulation within the Valley would largely be the same as described for Alternative 2, except Northside Drive and Southside Drive would continue as one-way roads with one lane converted to a multi-use paved trail from El Capitan crossover to Sentinel Bridge and from Yosemite Lodge to the crossover. Access to the west Valley would be increased for visitors arriving by transit and others due to extending shuttle bus service to the west Valley, resulting in a major, beneficial impact, compared to Alternative 1.

Traffic Congestion, Parking and Crowding

Traffic would be reduced below existing levels throughout the Valley at all times of the year (unless seasonal displacement appreciably increases traffic during existing slow seasons). Alternative 5 would reduce the volume of daily vehicle traffic associated with travel into and out of the Valley. On typically busy days, the volume of daily vehicle miles traveled would be reduced by 31% (compared to Alternative 1), a minor, beneficial impact on the experience for all visitors because there would be more opportunities for quiet and contemplative recreational experiences. The overall reduction in traffic would result in somewhat improved traffic flow and moderately reduced congestion throughout most of the Valley. Segments of Northside Drive and Southside Drive in the mid-Valley would be reduced to one lane; therefore, traffic flow would be similar to Alternative 1, but with an improvement on Southside Drive during the inbound peak hour.

Under this alternative, 550 day-visitor parking spaces would be provided in the Valley at Yosemite Village. In addition, up to approximately 1,365 spaces would be provided at out-of-Valley locations (Henness Ridge, Foresta, and El Portal). The traveler information and traffic management system would inform visitors of the parking status prior to their arrival. Overnight visitors would continue to have the option to drive to the Valley. Day visitors would be directed to parking areas in the Valley or to out-of-Valley parking areas and ride a shuttle to the Valley. Visitors would experience a minor increase in the time required to travel to the Valley, since many would need to use shuttle buses. As described for Alternatives 2, 3, and 4, frequent shuttle service would provide access to Valley attractions. Similarly, some visitors would experience decreases in overall time required to travel within the Valley, and shuttles could be delayed by slightly greater numbers of private vehicles, compared to Alternative 1.

Like Alternatives 2, 3, and 4, the appearance of crowding in the Valley would be reduced by eliminating roadside parking. Under this alternative, however, moderately lower traffic volumes, improved traffic flow, and reductions in the visual impact of parked vehicles would have a moderate, beneficial impact on the perceived level of crowding and congestion during peak visitation times for all visitors.

Traffic congestion west of El Capitan crossover could increase due to long-term parking at the remaining turnouts, and the potential for increased pass-through traffic, the same as under Alternatives 2, 3, and 4.

Some existing automobile traffic would be replaced with buses, having the same impacts described in Alternative 2. Notably, the movement of visitors in buses could cause some visitors to feel crowded. Most visitors would travel in larger groups because of the emphasis on bus

travel. The overall impact of bus traffic and grouping passengers in buses is expected to have a moderate, adverse impact on the visitor experience, as compared to Alternative 1.

The Visitor Experience and Resources Protection program would protect the diversity of visitor experiences, as in Alternatives 2 and 3, a major, beneficial impact, compared to Alternative 1.

Reliability of the Yosemite Valley Transportation System

Similar to Alternative 2, this alternative would help relieve visitor anxiety and time wasted searching for available parking within the Valley as compared to Alternative 1. This alternative would include a traveler information and traffic management system designed to manage parking areas, and visitors would have convenient and frequent access to expanded shuttle service. The overall impact to visitors would be major and beneficial, from the perspective of their being able to rely on the transportation system.

Access for Visitors with Disabilities

Access and the resulting impacts for visitors with disabilities would be the same as for Alternatives 2, 3, and 4, except motorized access to Northside Drive would remain available, eliminating a minor, adverse impact of those alternatives. Notably, as fully accessible shuttle buses were placed in operation, visitors with disabilities would use the shuttles rather than private vehicles. Some visitors with disabilities would experience a moderate, beneficial impact from the improved accessibility of shuttle services. However, without their private vehicles, other visitors with disabilities would have greater difficulty in moving about the Valley, creating a moderate, adverse impact. Visitors with mobility impairments would not have easy access to locations not directly served by the shuttle bus system. The prescribed universal programmatic accessibility study plan and its implementation would ultimately result in a major, beneficial impact. New accessible trails at popular destination areas would provide access to areas that are not now easily accessible, resulting in moderate, beneficial impacts.

O R I E N T A T I O N A N D I N T E R P R E T A T I O N

Sense of Arrival

As described for Alternatives 2, 3, and 4, visitor centers and orientation facilities near each principal park entrance would provide some visitors with an improved sense of arrival at the park. For day visitors parking at Yosemite Village under this alternative, the sense of arrival in the Valley would be similar to that offered today, with a moderate walk to reach the visitor center. Visitors parking at out-of-Valley areas would find the arrival experience less well-defined (although views of principal Valley features would provide a sense of arrival). Their sense of arrival in both cases is similar to that offered today—visitors could see significant views en route to the parking facility, but the views would only be marginally interpreted. Impacts of the proposed arrival sequence under Alternative 5 would affect most visitors, and are beneficial but negligible in intensity, compared to Alternative 1.

Wayfinding

Improvements to signs and circulation would improve wayfinding for visitors, the same as under Alternatives 2, 3, and 4. Notably, improved and consistent signing at shuttle bus stops would help orient many visitors. Day visitors would not need to navigate the Valley's existing confusing network of roads, and overnight visitors would be directed to their accommodations by improved signs and printed orientation materials. Moderate, beneficial impacts would result for most Yosemite Valley visitors.

Visitor Centers

As described for Alternatives 2, 3, and 4, visitors would have opportunities to find out about park programs, the availability of services and facilities, directions, permits, reservations, trip-planning services, interpretive themes and a stewardship ethic, and regulations at park entrances as they arrive. Under this alternative, day visitors parking at Yosemite Village would have to walk a moderate distance to the visitor center in Yosemite Village. These impacts would be of major benefit to the majority of park visitors who would like to take advantage of exhibits, museums, trip planning, and other interpretive programs, compared to Alternative 1.

Similar to Alternatives 2, 3, and 4, overnight visitors would find orientation exhibits at their lodging or campground, a beneficial impact, but moderate in intensity.

Exhibits and Programs

Impacts to exhibits and programs, the Nature Center at Happy Isles, museum collections, and trailside exhibits would be similar to those described under Alternatives 2 and 3, except research access to the consolidated museum collection and library would be available in El Portal rather than the Valley, making it less convenient for casual visitors. The present visitor center would be refurbished with new exhibits. Museum collections, now split in many locations, would be reorganized and made more accessible to the public. A natural history museum would be developed in the existing NPS Administration Building, and the cultural history museum in the existing Museum Valley District Building would be expanded. These and other improvements would have a moderate, beneficial impact on the large group of museum-goers and a major, beneficial impact on the small group of researchers.

R E C R E A T I O N

Auto Touring

Sightseeing in the Valley currently takes place by private vehicle for almost 88% of visitors (Gramann 1992). The current auto touring experience would be altered by less ability to make spontaneous stops, by possible reduction in available turnouts, and by reduction of traffic lanes from two to one on segments of Northside and Southside Drives in the mid-Valley, although the current one-way road system would remain in place. Auto touring that involves parking for extended periods while exploring would be eliminated with the removal of parking at most features and facilities. These actions would result in moderate, adverse impacts on most visitors. However, it should be noted that about 80% of all private vehicle users have indicated support for

adopting such measures as means of bringing about benefits discussed elsewhere (for example, reduced traffic and noise; see Gramann 1992).

Reduced traffic east of El Capitan crossover could result in more relaxed touring, which would be offset by the reduction of one-way traffic lanes from two to one on portions of Northside and Southside Drives, and an increase in the number of buses. This would result in a negligible, positive impact for most visitors, compared to Alternative 1. Signs would need to be placed at turnouts throughout the Valley to identify appropriate uses (e.g., shuttle bus, Valley Floor Tour, short-term parking). Compared to Alternative 1, introducing these urban elements into the auto-touring experience would be an adverse impact that is negligible in intensity and affects most visitors.

Bus Touring

Impacts of sightseeing by shuttle bus would be the same as described for Alternative 2, except that Valley Floor Tours offered by the concessioner and commercial bus tours would continue to have access to Northside Drive (but only one lane would be open for vehicle travel between Camp 4 (Sunnyside Campground) and El Capitan crossover, so buses would still be unable to travel slowly or to make spontaneous stops). This would result in major, adverse impacts compared to Alternative 1.

Walking and Hiking

More Valley trails would be available, particularly through the Upper River and Lower River Campgrounds area and adjacent to Northside and Southside Drives in mid-Valley, with impacts similar to those described under Alternative 2. The trail immediately adjacent to Northside and Southside Drive, however, would not be free of direct impacts from automobile traffic. Impacts from potential increased trail usage and dispersal, conflicts with other users, and greater opportunities for one-way hiking trips, would be the same as under Alternative 2, except that trail rides would continue to be offered, resulting in conflicts similar to Alternative 1. Overall, compared to Alternative 1, impacts would be a moderate benefit to a large group of visitors.

Rerouting the trail segment north of the river at Ahwahnee and Sugar Pine bridges would result in a slightly different path, loss of traditional views, and loss of historic elements due to bridge removal (a negligible, adverse impact, for what is likely to be a moderately sized group).

Bicycling

A new multi-use trail using one existing traffic lane on Northside and Southside Drives in mid-Valley would provide greater recreational opportunities for bicyclists, a major and beneficial impact for this moderately large group (currently 11% of park visitors) (Gramann 1992). Reduced private vehicle traffic and increased bus traffic would reduce noise and traffic views; advanced technology buses would be used for shuttle services, when available, potentially further reducing noise and air quality impact of motorized transportation; this would result in a moderate, beneficial impact compared to Alternative 1.

The adverse impacts of potential crowding (moderate) along multi-use trails and increased accident risk (negligible) would be the same as under Alternatives 2, 3, and 4.

Climbing

The reduction in opportunities for spontaneous access and other aspects of the climbing experience, and related impacts, would be the same as under Alternative 2.

Stock Use

The concessioner stable operation would be relocated under this alternative, and guided stock trips would continue, resulting in negligible, neutral impacts to visitors who take trail rides, compared to Alternative 1.

The Valley Loop Trail would be segmented by closing the trail to horse traffic from the Yosemite Lodge to the Mirror Lake Road. This closure would result in the loss of a Valleywide loop trip opportunity, for a moderate and adverse impact for private stock users. Relocating the concessioner stable would result in negligible, adverse impacts on private stock users.

Picnicking

The lack of private vehicle access to most picnic sites (except near Yosemite Village) would result in the same impacts as described under Alternative 2.

The Swinging Bridge and Church Bowl Picnic Areas would be removed and the North American Wall, Curry Village, and Lower River Picnic Areas would provide new opportunities for picnicking, resulting in negligible and neutral impacts.

River Uses

Changes in raft and kayak access and resulting impacts would be the same as under Alternatives 2, 3, and 4. Notably, lack of private vehicle access to locations along the river would require the use of buses, which would result in moderate, adverse impacts to a moderately large group of visitors.

Swimming

Changes in swimming access and availability would be the same as under Alternative 2. Locations for swimming would be reduced with the revegetation of many riverbanks, and swimmers would be redirected to areas more able to withstand heavy use, creating a minor, adverse impact to this large visitor group (25% of summer visitors) (Gramann 1992). Two areas popular with swimmers—Cathedral Beach and Sentinel Beach—are retained as picnic areas and would be serviced by shuttle buses; a moderate and beneficial impact. Shuttle bus access would tend to redistribute swimming activity around the Valley, a negligible and neutral impact.

Fishing

Changes to fishing quality and access to sites would be the same as under Alternatives 2, 3, and 4. Notably, protection of riverbanks would result in a moderate, beneficial impact for anglers. A moderate, adverse impact would result from decreased river access.

Winter Activities

Ice skating would remain largely unchanged from current conditions, since the ice rink would remain in its current location. Increased winter visitation and greater use of the ice rink could result in a negligible, adverse impact compared to that of Alternative 1.

Photography

Impacts to photographers would be the same as described for Alternative 2; less private vehicle use and a reduction of roadside parking would result in greater opportunities for photographs without vehicles. This would result in an overall moderate, beneficial impact, compared with Alternative 1.

RECREATIONAL ENVIRONMENT

This section covers impacts of Alternative 5 on the overall recreational environment for visitors, including night sky and wilderness experience. Impacts of vehicle-related noise, an important element of the recreational environment, are covered in the Noise section of this chapter. Impacts to scenic resources (as viewed by the visitor) are covered under the Scenic Resources section of this chapter. In general, improvements to natural resources under this alternative would provide a more natural appearance to the Valley, a major and beneficial impact for visitors, compared to Alternative 1.

Night Sky

Concentrated parking at Yosemite Village under this alternative would result in increased lighting needs in an area that is currently unlit. These actions would generally have impacts as in Alternative 2, resulting in a moderate impact relative to Alternative 1.

The addition of out-of-Valley parking areas (Heness Ridge, Foresta, and El Portal) would increase the need for lighting in these areas. These actions would generally have adverse impacts that are moderate to major in intensity.

Changes in the number of lodging units would result in minor, beneficial impacts largely the same as under Alternatives 2, 3, and 4. Adding new housing units at Yosemite Lodge, and reducing housing at Curry Village, would result in minor, adverse, and beneficial impacts, respectively, on the night sky in these areas. Other changes in lighting, including the rehabilitation of obsolete architectural lighting and the relocation of facilities, would be similar to those under Alternative 2 and result in minor, beneficial impacts, relative to Alternative 1. Shifts in camping and changes to the concession stable area would result in moderate but neutral impacts. Potentially adding a check station in mid-Valley could have a major, adverse impact there, though this would be much less than the impact caused by the full parking and transit facility at Taft Toe called for in Alternatives 3 and 4.

Wilderness Access and Wilderness Experience

Access to wilderness areas would be facilitated under this alternative, as described under Alternative 2. Visual impacts would be similar to those described in Alternative 2. Sound impacts would be minor and adverse, similar to those for Alternatives 2, 3, and 4. Clustering of activities within the Valley would have both beneficial and adverse impacts due to decreased and increased

noise levels. Improved access to trailheads would result in a moderate, beneficial impact and increased use of trails would result in a negligible, adverse impact.

VISITOR SERVICES

Camping

The number of campsites would be substantially above current levels (585 campsites compared to 475 sites under Alternative 1, about a 23% increase), resulting in a moderate, beneficial impact.

Improvements in campground conditions due to greater separation of user types, the redesign of campsites, and riverbank restoration would result in largely the same minor to moderate, beneficial impacts as for Alternatives 2, 3, and 4. Camper services would be similar to Alternative 2.

Minor, adverse impacts on river access would result from relocating camping areas away from the river, and negligible, adverse impacts would result from relocating the amphitheater.

Lodging

Compared to existing conditions, there would be fewer opportunities for overnight lodging in the Valley (1,012 lodging units, compared to 1,260 units under Alternative 1, a 20% reduction). This reduction would be the least of the action alternatives, resulting in a moderate, adverse impact on this large visitor group (25% of summer visitors typically stay in Valley lodging).

Substantial increases in economy units with private baths would address the high demand for this type of room. Replacing rustic units with economy units would also provide more comfortable and numerous off-season accommodations. Both actions would result in moderate, beneficial impacts, relative to Alternative 1.

Impacts of other actions, including increasing accessibility of units to visitors with disabilities, would be similar to Alternatives 2, 3, and 4.

At Yosemite Lodge, adding 124 beds (from 245 to 369, or an 50% increase) and the continued use of the area for employee housing could place lodging and housing closer to Camp 4 (Sunnyside Campground). An increase in the developed character of the Lodge area would be a minor, adverse impact to campers as well as Lodge visitors, a moderately large group.

Reducing the number of units at Housekeeping Camp from 264 to 100 (or 62%) would lead to a more natural environment. This would be a moderate, beneficial impact for the moderately large group of visitors who would choose to use this type of accommodation.

At Curry Village, reducing the number of cabins would lead to a more natural environment, with greater privacy and less density. This would have moderate, beneficial impacts for visitors staying in the remaining cabins.

Food and Retail Services

Changes in food and retail services would be substantially the same as those described for Alternative 2, except that the Village Store would remain in its current location, a public service station (for gasoline and other automotive needs) would be constructed in Yosemite Village, and a

snack stand would be rebuilt at Happy Isles, resulting in minor, beneficial impacts (relative to Alternative 1) to most park visitors. The addition of lodging would also provide more convenient opportunities to involve more well-known artists in Art Activity Center programs, a beneficial but minor impact on a small visitor group, compared to Alternative 1. Impacts associated with an employee cafeteria would be the same as described in Alternative 2, except it would be located at Yosemite Lodge.

C O N C L U S I O N

Like Alternatives 2, 3, and 4, Alternative 5 would reduce the spontaneity of travel to and through Yosemite Valley. Access into Yosemite Valley would be more cumbersome than today, with some visitors arriving by car, others by park shuttle bus from out-of-Valley parking areas, and still others by tour or regional transit buses. Under this alternative, day visitors would be directed to the Yosemite Village parking area in the Valley; once this lot was filled, visitors would be directed to lots at Henness Ridge, Foresta, and El Portal, and would ride a shuttle to the Valley. Overall, visitors would experience a minor, adverse impact on the time required to travel to the Valley. On 10 days during the summer, the parking in the Valley and at out-of-Valley locations would not be adequate to meet the needs of day visitors. The traveler information and traffic management system would inform visitors of the parking status prior to their arrival. Overnight visitors would continue to drive to the Valley. Visitors would experience a minor increase in the time required to travel to the Valley. With the day visitor parking and transit facility at Yosemite Village, all visitors would arrive in the Valley close to principal features and facilities. As described for Alternatives 2, 3, and 4, frequent shuttle service would provide access to Valley attractions. Some visitors would experience decreases in overall time required to travel within the Valley.

On most days, visitors would find a more tranquil environment, with somewhat fewer visitors in the east Valley and more visitors in the mid-Valley. Automobile-based experiences in the Valley would be reduced. Visitors on foot and bicycle would find more trails, particularly in mid-Valley. Opportunities for orientation at park entrances would be closer to where many visitors seek them, and greater opportunities would be available for visitors to participate in interpretive programs in the Valley. Recreation, including touring, would be oriented more toward the shuttle bus system, which would be extended to mid-Valley and to out-of-Valley parking areas, and pedestrian and bicycling activities. Opportunities for staying overnight in Yosemite Valley would increase moderately for camping (to 585 sites) and decrease for lodging (to 1,012 beds).

Visitors to Yosemite Valley are varied in their expectations and the individual experiences they seek. Also, the quality of the visitor experience is also dependent on the quality of natural resources, cultural resources, air quality, scenic resources, and other elements of the recreational environment (considered separately in this analysis). Therefore, no determination of a net impact on the visitor experience is attempted here.

CUMULATIVE IMPACTS

Access, Orientation and Interpretation, Recreation, and Recreational Environment

The cumulative impacts described under Alternatives 2, 3, and 4 for traffic, congestion, access, orientation and interpretation, recreational opportunities, and recreational environment would be equally applicable to Alternative 5.

Visitor Services

As described for the other alternatives, the January 1997 flood and subsequent cleanup actions resulted in the loss of 265 lodging units and 284 campsites within Yosemite Valley, displacing visitors to campgrounds or lodging elsewhere in the park or in neighboring communities. This alternative would intensify this impact by further reducing lodging by 248 units, but would somewhat alleviate it by restoring 110 campsites to the Yosemite Valley inventory. Proposed new accommodations in the vicinity of the park and campsites outside Yosemite Valley may also partially alleviate the impact of the reductions, as described for the other alternatives. The reductions in lodging in Alternative 5 would have moderate impacts for the many visitors who would want to stay in Yosemite Valley. The benefit of increases in out-of-park lodging would reduce impacts to visitors, but they would remain adverse and moderate.

The number of campsites in the region and at Yosemite Creek and Tamarack Campgrounds is expected to increase, but the use of the new regional sites by Yosemite day visitors would likely not be great. However, because the increase in number of campsites in Yosemite Valley under this alternative would be a moderate benefit to visitors, the cumulative impact on campground users would likely remain moderate and beneficial.

Transportation

Alternative 5 would maintain most existing transportation patterns in Yosemite Valley. A total of 550 parking spaces for day visitors would be provided in Yosemite Village, and a total of approximately 1,365 out-of-Valley parking spaces would be provided at Henness Ridge, Foresta, and El Portal. Traffic volumes and parking would be managed through a traveler information and traffic management system (similar to Alternatives 2, 3, and 4). When the Valley parking area was full, day visitors would have the option of parking at the remote sites and riding shuttle buses to the Valley. Overnight visitors would continue to have the option to drive their vehicles into the Valley. Many day visitors who parked in the Valley would be able to walk to destinations in the Valley. As with the other action alternatives, shuttle bus services in the Valley would be expanded.

CONDITIONS ON STATE HIGHWAYS OUTSIDE YOSEMITE NATIONAL PARK

The impacts of Alternative 5 on conditions on state highways outside the park would be the same as those described under Alternative 2.

VISITOR ACCESS TO THE VALLEY

Reconstructing the segment of El Portal Road between Pohono Bridge and the intersection with Big Oak Flat Road would have the same impacts as those discussed under Alternative 2.

Travel Time

The average time that visitors would spend traveling from entrance stations to the Valley Visitor Center in the peak season under Alternative 5 would be approximately 60 minutes. This would constitute an increase of 19 minutes in Valley access travel time as compared to Alternative 1. The resulting long-term impact to travel time would be minor and adverse. Table 4-131 presents average travel times from entrance stations to the Valley Visitor Center by corridor. These average travel times are weighted by access mode, and include waiting time at the transit terminal and at shuttle bus stops.

Corridor	Average Weighted Travel Time (min)
North (Highway 120)	61
West (Highway 140)	46
South (Highway 41)	73
Overall Average	60
Difference from Alternative 1	19

Modes of Access

Under Alternative 5, approximately 49% of all Valley visitors (70% of day visitors) on typically busy days would access the Valley by transit. This would be a major increase in transit access share of 29%, constituting a long-term impact to access mode share.

VISITOR CIRCULATION WITHIN THE VALLEY

Traffic Volume and Vehicle Miles Traveled

The existing Valley road network and traffic circulation patterns would remain unchanged in Alternative 5, although one traffic lane would be converted to use as a multi-use paved trail on Southside Drive from El Capitan crossover to Swinging Bridge and on Northside Drive from Camp 4 (Sunyside Campground) to El Capitan crossover. Vehicles traveling east of El Capitan crossover would be managed to assure that the number of vehicles did not exceed the capacity of parking and roads. Parking for day visitors (550 spaces) would be provided at Yosemite Village. Day visitors would be directed to the parking area by a new system of directional signs to minimize the amount of circulation on Valley roadways. Visitors would not need to circulate in search of parking spaces. When day visitors and overnight guests park their vehicles, they would be encouraged to walk or use alternative transportation modes, such as the Valley shuttle buses or bicycles to travel within the Valley.

Alternative 5 would result in a moderate, beneficial impact to daily vehicle miles traveled, with a reduction of 31% compared to Alternative 1. Table 4-132 presents daily Valley vehicle miles

traveled by mode and estimated inbound vehicle trips passing the Yosemite Chapel under Alternative 5. Bus trips entering the east Valley at Yosemite Chapel would increase by 239 per day.

	Inbound Trips Passing the Chapel	Vehicle Miles Traveled
Private Vehicle	3,955	42,762
Bus	316	4,583
Total	4,271	47,345
Percentage Change from Alternative 1		-31%

Modes of Travel

Similar to Alternatives 2, 3, and 4, all visitors would be allowed to circulate by private automobile west of the El Capitan crossover under Alternative 5. In addition, some day visitors and all overnight visitors would have the option to drive to parking areas in the east Valley. However, as under Alternative 2, the share of trips within the Valley by transit under this alternative would be substantially higher than under Alternative 1. With the exception of west Valley circulation, the only visitor trips made by private vehicles within the Valley would be those either entering or leaving. The resulting impact to Valley visitors is expected to be major in both the short- and long-term.

Bus Volumes on Roads

Under Alternative 5, bus service within the Valley would be increased and shuttle buses would operate from remote parking areas to a transit center in the Village. The proposed transit service would result in 4,583 bus miles traveled on major Valley road segments (see table 4-133) a major increase over Alternative 1.

	Round Trips	Bus Miles Traveled
Out-of-Valley Shuttle	213	1,610
Valley Shuttle	261	2,601
Commercial Tours	59	372
Total	533	4,583

Level of Service

The primary factor affecting traffic flow for Alternative 5 would be a reduction in vehicle travel from the implementation of the traveler information and traffic management system and the change to one lane for traffic on Northside Drive and Southside Drive in the mid-Valley. The level of service for the intersections of Sentinel Road with Northside Drive and Southside Drive would improve to level of service B in both peak hours (see table 4-134). A major improvement would occur in the outbound peak hours at the Sentinel Drive/Northside Drive intersection. The

other intersections would improve to level of service A in both peak periods. Since the traffic volumes on the roadways would be reduced, the level of service would improve slightly for most roadway segments. Southside Drive would improve to level of service C during the inbound peak hour. Northside Drive would improve to level of service C in both peak periods with a major improvement from level of service E in the outbound peak hour. El Portal Road would improve to level of service D during both peak hours.

Table 4-134 Level of Service Summary (Inbound/Outbound)					
Intersections					
	Southside Drive/Sentinel Road	Northside Drive/Sentinel Road	Northside Drive/Camp 6 - Village Access	Southside Drive/Northside Drive	
Alternative 1	C/B	C/E	A/B	B/A	
Alternative 5	B/B	B/B	A/A	A/A	
Roadway Segments					
	Pohono Bridge	El Capitan Bridge	El Portal Road (between Pohono Bridge and Big Oak Flat Road intersection)	Southside Drive	Northside Drive
Alternative 1	E/E	B/B	E/E	D/C	D/E
Alternative 5	D/D	A/B	D/D	C/C	C/C

Implementing the operational transportation improvements proposed in Alternative 5 would create a long-term, moderate, beneficial impact by improving traffic flow.

C O N C L U S I O N

Under Alternative 5, the average travel time to access the Valley would increase by 19 minutes compared to Alternative 1, resulting in a minor adverse impact to peak season daily visitors. There would be a moderate beneficial impact from a decrease in traffic volumes and a moderate improvement in traffic flow compared to Alternative 1.

Buses entering the Valley would increase to 239 trips per day and there would be a major increase in bus miles traveled per day in the Valley.

C U M U L A T I V E I M P A C T S

The cumulative impacts of Alternative 5 would be similar to those described for Alternative 2.

Noise

V E H I C L E N O I S E

The major transportation actions affecting sound levels and events in this alternative are:

- Parking for 550 day-visitor vehicles at Yosemite Village
- Northside Drive would be converted to one-lane of vehicle traffic and one-lane of multi-use paved trail from Camp 4 (Sunnyside Campground) to El Capitan crossover;

Southside Drive would be converted in a similar manner from El Capitan crossover to Swinging Bridge

- Traffic entering the east Valley would be managed at El Capitan crossover so as not to exceed the capacity of roads and parking
- Out-of-Valley day-visitor parking and shuttle service would be provided at El Portal, Henness Ridge, and Foresta

Traffic patterns would be the same as those in Alternative 1, but out-of-Valley shuttles would travel on the Valley road network as far east as Yosemite Village. It is assumed that these vehicles would produce sound levels similar to tour buses now operated in the Valley. Changes in sound events would occur along Southside Drive and Northside Drive west of El Capitan crossover, Southside Drive west of Sentinel Drive, Sentinel Drive and Yosemite Village, between Yosemite Village and Yosemite Lodge, west of Yosemite Lodge on Northside Drive, between Sentinel Drive and Curry Village on Southside Drive, and along Northside Drive between Stoneman Bridge and Yosemite Village.

Sound Levels

Sound levels from general traffic in the Valley would be reduced because the volume of vehicle traffic would be lower than in the No Action Alternative. While general traffic volumes would decline, the number of long-distance bus trips would increase, offsetting the noise decreases from general traffic with Alternative 5. Overall, noise levels would not change perceptibly in the Valley except that noise levels along Northside Drive between the Lodge and Yosemite Village would increase during the inbound and outbound peak hours, resulting in long-term, minor, adverse impacts. Unlike Alternatives 2, 3, and 4, there would be no areas in the Valley that would experience long-term, major sound level benefits because traffic would not be completely removed from any roadways. Sound level estimates for Northside Drive and Southside Drive are shown in tables 4-135 and 4-136.

**Table 4-135
Equivalent Constant Sound Levels from Traffic Along Northside Drive**

Time of Day	Distance from Centerline of Roadway	Alternative 1 (dBA)	Alternative 5 (dBA)
Inbound Peak Hour	50 feet	61	64
	100 feet	57	61
	200 feet	54	57
	400 feet	51	54
Outbound Peak Hour	50 feet	65	65
	100 feet	62	61
	200 feet	59	57
	400 feet	55	54

Note: These numbers are based on measurements taken between Yosemite Village and Yosemite Lodge on a typically busy day.
dBA = decibel

**Table 4-136
Equivalent Constant Sound Levels from Traffic Along Southside Drive**

Time of Day	Distance from Centerline of Roadway	Alternative 1 (dBA)	Alternative 5 (dBA)
Inbound Peak Hour	50 feet	64	63
	100 feet	61	60
	200 feet	57	57
	400 feet	54	53
Outbound Peak Hour	50 feet	63	63
	100 feet	59	60
	200 feet	55	57
	400 feet	52	53

Note: These numbers are based on measurements taken near Yosemite Chapel on a typically busy day.
dBA = decibel

Sound Events

Yosemite Valley

The introduction of out-of-Valley shuttles would increase the number of noticeable sound events west of El Capitan crossover and west of Sentinel Bridge from 15 per hour to 33 per hour on Southside Drive. On Northside Drive, the same increase as on Southside Drive would occur between Yosemite Lodge and El Capitan crossover and west of El Capitan crossover. The sound impact in these areas would be long-term, major, and adverse.

A greater concentration of transit vehicles also would be found along Sentinel Drive and in the vicinity of Camp 6 and Yosemite Village. The number of noticeable sound events would increase from 15 per hour to 33 per hour. An additional 13 events which have quieter levels also would occur per hour. The impact of transit sound events would be long-term, major, and adverse in this portion of the Valley.

Between Yosemite Village and Yosemite Lodge, the number of noticeable sound events would increase from 11 to 29 per hour. Additionally, 23 more events which have quieter sound levels would occur along this portion of Northside Drive than with Alternative 1. The impacts in this area from transit sound events would be long-term, major, and adverse.

From Sentinel Bridge to Curry Village, the number of noticeable sound events on Southside Drive would remain the same as in Alternative 1, with 10 additional events which have quieter sound levels per hour. The impact in this area would be negligible. The portion of Northside Drive from Stoneman Bridge to Yosemite Village would experience no change in noticeable sound events and it would have an increase of lesser sound events from 10 to 20 events. The impacts of these sound changes would be long-term and negligible.

Out-of-Valley

Very noticeable sound events would increase at the out-of-Valley parking areas as a result of shuttle bus service to and from Yosemite Valley. The number of added sound events during the peak travel hours on typically busy days would be 10 at El Portal, 10 at Hennes Ridge, and 16 at Foresta. The impacts from the changes in sound events would be long-term, moderate, and

adverse at El Portal and Henness Ridge. The impacts would be long-term, major, and adverse at Foresta.

Vehicle Noise Conclusion

This alternative would introduce additional long-distance bus traffic onto the Valley roadway system. Because the existing traffic patterns would be maintained with this alternative, the adverse impacts of the sound of the buses would be heard along all roadways from Yosemite Village to the west. Overall sound levels are expected to remain essentially unchanged, with negligible impacts in the long term. Individual sound events, however, would increase, which would have long-term, major, adverse impacts on the sound environment in most parts of the Valley. Increases in bus-related sound events would result in long-term, moderate to major, and adverse impacts at the out-of-Valley parking areas, with major, adverse impacts occurring at Foresta.

Cumulative Impacts

The existing shuttle buses are currently being replaced with advanced technology buses that could reduce the intensity of sound events along the shuttle routes. Possible increase in regional transit service by the Yosemite Area Regional Transit System (inter-agency) would possibly cause a larger number of sound events along the same routes. These two actions would have cumulative impacts on sound levels along the same routes. These two actions would have cumulative impacts on sound levels in the Valley similar to those described in Alternative 2 (long-term, beneficial). Alternative 5 would not change the vehicle types or operating characteristics of either the new shuttle buses or the YARTS buses.

NONVEHICLE NOISE

Yosemite Valley

Housing

The reduction of 525 beds in the Valley would result in an overall reduction in housing-related ambient noise levels, the least among the action alternatives. Housing-related noise at Curry Village would change in character due to the transition from canvas-sided cabins to hard-sided cabins and improved dining facilities, and would decrease overall due to reduction in total beds. Housing-related noise would be eliminated at the concessioner stable near North Pines. Housing-related noise at Yosemite Lodge would be eliminated due to the removal of the modular housing units. Housing-related noise would remain the same at the Yosemite Village Historic District. Housing related-noise at Yosemite Village and The Ahwahnee would be slightly reduced, due to reductions in employee housing units. Overall, a long-term, moderate, beneficial impact would be experienced by residents and visitors.

National Park Service and Primary Concessioner Operations

The relocation of some operational functions (e.g., parkwide maintenance functions, wildland fire, National Park Service headquarters, concession headquarters, etc.) would result in an overall reduction in operations-related noise. The National Park Service maintenance area would be substantially changed, but ambient noise level would not likely change, due to other activities

moved into the area. The National Park Service stable would remain in its existing location, and ambient noise level would not change. The concessioner stable would be relocated; its ambient noise level would not change but would occur in another location. A long-term, minor, beneficial impact, compared to the No Action Alternative, would be experienced by residents and visitors.

Transit Center and Day-Visitor Parking

There would be a minor increase in nonvehicle noise associated with parking facilities in east Yosemite Valley due to more formalized use of the area facility maintenance, and visitor activities at the facility. Visitor conversation would represent the most typical nonvehicle noise in this area (60 dB; FICN 1992), and would typically be half as loud as associated vehicle activity. A long-term, minor, adverse impact would be experienced primarily by visitors, but also by residents.

Lodging

Lodging-related noise at Housekeeping Camp would decrease due to the reduction of 102 units, possibly a minor benefit. Lodging-related noise at Yosemite Lodge would increase as a result of the addition of 195 lodging units, potentially a moderate, adverse impact. Lodging-related noise at Curry Village would be reduced due to the reduction in number of tent cabins, an impact similar to that of Alternative 2, a moderate benefit. Lodging-related noise at The Ahwahnee would not change. In aggregate, a long-term, negligible, adverse impact would be experienced by visitors.

Campgrounds

Campground-related noise would increase overall, compared to Alternative 1, as a result of the increase of 238 campsites. Campground-related noise would be slightly reduced at Lower Pines and North Pines Campgrounds with the reduction in campsites and would be eliminated at Backpackers Campground with the removal of the campground. Campground-related noise would increase at Upper Pines, with the increase of campsites, and would be reintroduced into the Upper and Lower River areas, with the re-establishment of campsites. Campground-related noise would be introduced at the Tenaya Creek Campground walk-in sites and at South Camp backpacker and group camp, and would remain the same at Camp 4 (Sunnyside Campground). A long-term, moderate, adverse impact would be experienced primarily by visitors, but also by residents.

Picnic Areas

Noise related to picnic areas would be similar to that of Alternative 2, except that an additional picnic area would be established at Curry Orchard. This would result in an additional adverse impact, compared to the No Action Alternative. In sum, a long-term, negligible, adverse impact would be experienced by visitors.

Trails

Trail-related noise would be introduced at the new multi-use paved trails and bike paths in west Yosemite Valley. Although one lane of Northside Drive would be closed to vehicle traffic and designated a multi-use paved trail, peak noise levels along this road would be similar to those in

Alternative 1. The impacts of nonvehicle noise would be negligible. Valleywide, a long-term, minor, adverse impact would be experienced by visitors due to the introduction of new trails.

Construction Impacts

Construction-related noise impacts would be similar to those under Alternative 2, except that activities related to developing a traffic check station would be located at El Capitan Crossover. Types of construction noise would be the same. Overall, peak nonvehicle noises during construction and deconstruction would have short-term, major, adverse impacts, affecting both visitors and residents.

Out-of-Valley Areas

El Portal

HOUSING

Housing-related noise would be the same as under Alternative 2: new housing areas would have long-term, moderate, adverse impacts; existing housing areas would have long-term, minor, and adverse impacts.

NATIONAL PARK SERVICE AND PRIMARY CONCESSIONER OPERATIONS

Operations-related noise would be similar to that of Alternative 2 (long-term, moderate, adverse).

OUT-OF-VALLEY PARKING

An increase in noise would be associated with the out-of-Valley parking facility, similar to that of Alternative 2. Visitor conversation would represent the most typical nonvehicle noise in this area (60 dB; FICN 1992), and would typically be half as loud as associated vehicle activity. However, with only 270 parking spaces, the increase of ambient noise levels would not be quite as great, as under the No Action Alternative. Impacts would be long-term, moderate, and adverse.

TRAILS

Trail-related noise impacts would be similar to Alternative 2 (long-term, negligible, adverse).

Wawona

HOUSING

Housing-related noise impacts would be similar to that of Alternative 2 (long-term, minor, adverse). Operational impacts would be the same as Alternative 1.

Foresta

HOUSING

Housing-related noise impacts would be similar to Alternative 2 (long-term, minor, adverse).

NATIONAL PARK SERVICE AND PRIMARY CONCESSIONER OPERATIONS

Operations-related noise would not change, compared to the No Action Alternative. Noise associated with the existing National Park Service stock operations (e.g., pasture) would continue.

OUT-OF-VALLEY PARKING

Noise associated with the out-of-Valley parking facility would increase due to maintenance and visitor activities at the facility. Visitor conversation would represent the most typical nonvehicle noise in this area (60 dB; FICN 1992), and would typically be half as loud as associated vehicle activity. A long-term, moderate, adverse impact would be experienced by visitors and residents.

Hennes Ridge

OUT-OF-VALLEY PARKING

Noise associated with the out-of-Valley parking facility would increase due to maintenance of the facility and visitor activity at the facility. As in Foresta, visitor conversation would represent the most typical nonvehicle noise in this area (60 dB; FICN 1992) and would typically be half as loud as associated vehicle activity. A long-term, moderate, adverse impact would be experienced by visitors.

South Landing, Badger Pass, and Hazel Green

No additional transit or administrative facilities are proposed in these areas. Therefore, Alternative 5 would have no noise impacts.

Construction Impacts for Out-of-Valley Locations

Construction-related noises in El Portal and other out-of-Valley locations would include the same types of noises, and with similar effects as described above for Yosemite Valley. During construction, short-term, major, adverse impacts would be experienced by residents and visitors.

Nonvehicle Noise Conclusion

Alternative 5 would be similar to Alternative 1, in that the impacts of nonvehicle noise on the human environment would be concentrated primarily around development areas. Much like Alternative 2, Alternative 5 would reduce housing units in Yosemite Valley would result in reductions in ambient noise levels, a moderate benefit. Likewise, increases in housing numbers in El Portal and Wawona would result in minor, adverse impacts. New trails would put typical trail-related noises into new areas, but these impacts would be minor. Increases in campsite and lodging numbers would result in long-term, moderate, adverse effects. National Park Service and concession operations in Yosemite Valley would be reduced, but with light maintenance for transit being in the Valley, benefits would be moderate. Overall, the nonvehicle noises would be reduced in Yosemite Valley, and benefits would be moderate and long-term. The greatest increases in noise would be in El Portal and the other out-of-Valley staging areas in Foresta and Hennes Ridge, where adverse impacts would be moderate and long-term.

Cumulative Impacts

The projects that would have cumulative impacts would be the same as those described in Alternative 2. When considering the overall minor, beneficial impacts of Alternative 5 in combination with the more dominant noises associated with other projects, sources, and vehicles, cumulative impacts of nonvehicle noise in Alternative 5 would remain long-term, minor to moderate, beneficial.

Social and Economic Environments

The social and economic environments, for purposes of this discussion, include characteristics of the affected communities in the region, visitor populations and trends, revenues and expenditures affecting regional economies in connection with employment, visitor expenditures, construction spending, and concessioners and cooperators. Impacts of Alternative 5 on these social and economic environments are discussed below.

LOCAL COMMUNITIES

Potential impacts of Alternative 5 on the communities of Yosemite Valley, El Portal, Foresta, Wawona, and Yosemite West are discussed in this section. Factors with the potential to affect the social and economic environments of each of these communities are population, housing location, types and condition of housing, distance of employee commutes from outlying areas, community services and amenities, and the community infrastructure.

Yosemite Valley

Under this alternative, 525 beds would be removed from Yosemite Valley. Impacts on social and community services would be largely the same as described under Alternative 2.

The proposed relocation of employees from Yosemite Valley to El Portal, including National Park Service and Yosemite Concessions Service headquarters and associated employees, would reduce the resident population by almost half, and alter the character of the remaining residential population. About 50% of upper-level concession management and professional staff would be relocated. Even though the plan does not designate housing occupancy and award criteria, it is projected that most of the employees moved to El Portal and/or Wawona would be year-round employees. As a result, a greater proportion of the employees remaining in Yosemite Valley would be seasonal staff.

El Portal

Under this alternative, 351 employees, mostly primary concessioner employees, would be relocated from Yosemite Valley into new housing in El Portal. An additional 389 bed spaces would be constructed to meet future and currently unmet demand for employee housing. In addition, 80 El Portal residents currently living at the Trailer Village, Arch Rock, or Cascades would be relocated into new housing facilities in El Portal. The total net increase in El Portal's residential employee population would be 740 (351 plus 389).

The park's existing primary concessioner, Yosemite Concession Services, was the primary source of employee demographic information. No similar information was available from the other park

concessioners or the National Park Service. More than 95% of the new housing in El Portal would be occupied by primary concessioner employees. Therefore, Yosemite Concession Services employee demographic information has been used to project the demographics for all future park employees who would be housed in El Portal under this alternative.

Based on current demographics of the park employee population, it is estimated that approximately 20% of the permanent employee population would be married. In addition, approximately 15% of employee spouses are not employed within the park. Therefore under this alternative, an additional 22 spouses would be expected to relocate to El Portal ($740 \times 20\% \times 15\%$). Of these 22 spouses, approximately 10 would be relocated from the Valley, and 12 would be married to new employees.

According to Yosemite Concession Services, under this alternative, 73 managerial personnel currently living in managerial housing would be relocated from the Valley to El Portal, while 17 would remain in Yosemite Valley. Yosemite Concession Services' current managerial population is approximately 210 employees. While a proportion of these staff live outside the park, many managerial staff currently live in non-managerial housing accommodations within the Valley. Yosemite Concession Services managerial staff have an estimated 80 children. Approximately 65 children are expected to be relocated from Yosemite Valley. Of the 389 future new employees, 47 are projected to be managerial staff. Based on the current employee demographics, these staff would bring an additional 18 children to El Portal.

Including relocated employees, new employees, spouses, and children, the total increase in El Portal's residential population under this alternative is projected to be 845 ($740 + 22 + 65 + 18$). It is also expected that 10% of the employees housed in El Portal would be seasonal employees. Therefore, the winter residential population in El Portal would be approximately 761 ($845 \times 90\%$).

The National Park Service estimates that the existing summer population of El Portal (from the park boundary to the confluence of the South Fork of the Merced River) is approximately 3,000, and the existing winter population is approximately 760. Under this alternative, changes in employee housing would result in about a 28% increase in El Portal's summer population, and a 100% increase in the winter population. Both would cause long-term, major, adverse impacts on the El Portal social environment, although it is expected that this projected population growth would occur gradually.

Wawona

Impacts to the Wawona community would be the same as under Alternative 2.

Foresta

The impacts of reconstructing 14 homes lost in the A-Rock fire would be as described in Alternative 2.

The location of approximately 660 parking spaces near Foresta would cause an increase in traffic in the area. However, most traffic would be confined to the road segments located between the Big Oak Flat Road and the Old Coulterville Road. Notwithstanding, Foresta residents would

experience additional traffic congestion in the area. The location of parking would not cause a change to the demographics at Foresta; however, some change to the level of solitude could be expected. These impacts would be the same as described in Alternative 2.

Cascades and Arch Rock

The impacts to the Cascades and Arch Rock communities are expected to be as described under Alternative 2.

Yosemite West

The location of 370 parking spaces at Henness Ridge near Yosemite West would cause an increase in local traffic from transit related shuttle buses and other vehicles. Some congestion may occur during commuting hours; however, length of commute is not expected to increase. Transit related impacts are fully evaluated in the Transportation section of this chapter. The placement of parking at Yosemite West is not expected to affect the demographics of the community or alter the services, amenities, or infrastructure. Therefore, based upon this evaluation, impacts to the social environment of Yosemite West would be long-term, minor (slightly perceptible), and adverse.

Services and Infrastructure

Impacts to services and infrastructure under this alternative are expected to be the same as those described under Alternative 2, with the exceptions noted below.

Schools and Child Care

Approximately 65 children of concession employees would be relocated from Yosemite Valley to El Portal. In addition, 18 children are expected to be added to the local population from the future growth in managerial staff at the park. This variance is not expected to change impact intensity, duration, or type on county schools and local child care facilities.

Law Enforcement

Relocation of concession employees is expected to increase the law enforcement requirements in El Portal, and correspondingly reduce those within Yosemite Valley. Based on the population shift from Yosemite Valley and future employee growth, it is estimated that approximately 37 arrests could occur in El Portal that would otherwise have been expected to occur within the Valley. Also, the addition of 389 new employees also would be expected to add approximately 41 additional arrests a year. This would have a long-term, moderate, adverse impact on law enforcement services. However, these projections do not consider the beneficial impacts that improvements to employee living conditions and/or the quality of concession employees (attracted by the improved housing) may have in reducing future law enforcement incidents and arrests necessary in El Portal and throughout the park.

The proposed satellite parking lot in El Portal would provide day-visitor parking for up to 335 vehicles. Therefore, impacts on county law enforcement are projected to be the same as described under Alternative 2.

The impact on and cost of providing additional law enforcement services would be the same as described under Alternative 2; a long-term, moderate, adverse impact on the county would be expected.

Other Services

Impacts on the county court system would be the same as for Alternative 2, and would be expected to be long-term, moderate, and adverse. Although a minor increase in the fire incidence rate could occur under this alternative (due to the number of new buildings constructed), the impact to fire protection services provided by Mariposa County to the entire El Portal area would be the same as described under Alternative 2.

Local Communities Conclusions

Impacts to Yosemite Valley would be as described under Alternative 2. The impacts to El Portal would be as described under Alternative 2, except as noted below.

Changes in the employee population residing in El Portal would result in about a 28% increase in El Portal's summer population, and a 100% increase in the winter population. Both would cause long-term, major, adverse impacts on the El Portal social environment, although it is expected that this projected population growth would be gradual.

The impact on Wawona would be the same as described under Alternative 2.

Impacts to the social environment in Foresta would be the same as described in Alternative 3.

With 370 parking spaces at Henness Ridge, impacts to the social environment of Yosemite West would be long-term, minor, and adverse.

Cumulative Impacts

The potential cumulative impacts resulting from actions in this alternative are the same as those described under Alternative 2.

VISITOR POPULATION

Day Visitors

Under this alternative, it is projected that on the busiest summer days, up to 12,350 day visitors could be accommodated by the proposed parking and transit facilities. This level of visitation exceeds the 1998 summer season daily visitation, which averaged 10,950 visitors. As discussed in Appendix J, 1998 visitation has been used as the baseline condition for the impact analysis. In addition, for purposes of the analysis, it has also been assumed that future Yosemite visitor demand would not change. This is a conservative assumption that recognizes the uncertainties of future visitation. As a result, under this alternative, no change in future day visitation is projected. Considerable additional day-visitor capacity would exist, and future day visitation growth could be accommodated if future visitor demand increased.

Currently, park visitation peaks on weekends during the summer. As a result, it may be possible that during the busiest peak days, the proposed parking and transit facilities may be unable to

accommodate all the visitors that otherwise may have entered the park under Alternative 1. In this case, some visitors may be displaced from accessing the park during typically busy days. However, this adverse impact could be mitigated by future traveler information and traffic management systems. These systems could forewarn potential visitors when day-visitor parking is approaching capacity, and encourage and direct visitors to visit during nonpeak periods. In this case, no net reduction in total visitation would occur, because peak period visitation would theoretically be shifted to less busy days (i.e. weekdays).

Overnight Visitors

Under this alternative, several changes to the park's lodging facilities are proposed. The total number of Valley lodging units would be reduced from 1,260 to 1,012 units, a decrease of 248 lodging units, which represents a 19.7% decrease in lodging capacity. While a variety of types of lodging would remain, the number of rustic lodging units would decrease by nearly 64%, and the number of economy units would increase by nearly 147%. In addition, 110 new campsites are proposed.

Lodging

YOSEMITE LODGE

The addition of 124 new motel rooms at Yosemite Lodge is proposed, increasing the total number of rooms at the lodge to 369. This total would be less than the 495 rooms that operated at Yosemite Lodge before the 1997 flood (although many of those were rooms without bathrooms).

It is estimated that the additional rooms would have an 92% occupancy rate. This reflects the strong, year-round demand for Yosemite Lodge accommodations and is consistent with past Yosemite Lodge occupancy during 1994, 1996, and 1998. As a result, approximately 39,800 additional room-nights would be gained by the Yosemite Lodge expansion. This increase would allow nearly 126,300 additional visitors to stay overnight in the Valley annually (assuming an average of 3.17 guests per room).

CURRY VILLAGE

Lodging at Curry Village would be the same as described in Alternative 3.

HOUSEKEEPING CAMP

Lodging at Housekeeping Camp would be the same as described in Alternative 2.

CHANGES IN LODGING TYPES

In addition to reducing the Valley's lodging capacity, the lodging changes proposed under this alternative also would alter the mix of lodging styles and prices available to future park visitors. The predominant changes are: (1) a reduction in rustic-style accommodations from 691 to 250 units (at Housekeeping Camp and the Curry Village tent cabins)—a loss of 441 units representing a 63.8% decrease in capacity; (2) growth in economy accommodations from 181 to 447 units at Yosemite Lodge and Curry Village—a gain of 266 units representing a 147%

increase in capacity; and (3) a decrease in mid-scale accommodations from 265 to 192 units—a decrease of 73 units representing a 27.5% decrease in capacity.

The number of visitors expected to be gained or displaced by the proposed lodging changes has been estimated previously by location. In addition, some visitors may be impacted by the changes to the mix of lodging types available in the Valley. Overnight visitors would be impacted if replacement lodging alternatives are different from the lost facilities. However, if replacement lodging units were considered comparable by most overnight guests, then the new facilities would not likely impact their overnight lodging experience.

While many overnight visitors may have a strong preference for the rustic lodging facilities, this alternative would provide several substitutes. For cost-conscious visitors, or those wanting an outdoor experience, the additional 110 Valley camping sites offer a possible alternative. For other overnight visitors (including those displaced by the removal of Curry Village tent cabins), the additional economy units may provide an adequate substitute that provides similar value and experience.

Based on past occupancy levels, rustic-style accommodations have the lowest average annual occupancy of the Valley's lodging facilities. In contrast, Yosemite Lodge generally operates near capacity year-round, and reservations are booked months in advance. This suggests that current visitor demand is comparatively weak for the rustic facilities. Therefore, the removal of the less popular lodging facilities could possibly be more than offset by new replacement facilities that are more popular with the majority of park visitors. This would represent a long-term, minor, beneficial impact.

Camping

Under this alternative, 110 additional campsites would be built, for a total of 585 campsites within Yosemite Valley. This represents a 23% increase over the current 475 Valley campsites. The total number of campsites would still be less than the 806 campsites that existed in the Valley before the 1997 flood.

Based on pre-flood visitor demand for Valley campsites, it is estimated that the new campsites would have an average occupancy rate of nearly 85%, and that they would operate between mid-April and mid-October. Accordingly, it is estimated that approximately 15,800 overnight campsite stays would be gained, which would allow an additional 67,300 visitors to camp overnight within the Valley annually (assuming an average of 4 overnight visitors per campsite). This would represent a major, long-term, beneficial impact.

Table 4-137 summarizes the overnight visitation changes expected under this alternative. A major net increase in overnight park visitation is projected. The combined impact of the proposed lodging and campsite changes is estimated to be a net increase in 38,400 room-nights annually. This represents an additional 120,600 overnight visitor stays within Yosemite Valley annually, which equates to a 10.1% increase from 1998 overnight visitation (1.2 million overnight visitors). These overnight visitation increases are based on the expected high level of visitor demand for the additional Yosemite Lodging facilities and campsites. This increase represents a long-term, major, beneficial impact on park overnight visitation.

**Table 4-137
Estimated Potential Overnight Visitation Impacts**

Lodging	Change in Capacity	Projected Change in Room-Nights	Projected Change in Overnight Visitor Stays
Yosemite Lodge	124	39,800	126,300
Curry Village	(208)	200	600
Housekeeping Camp	(164)	(18,400)	(73,600)
Camping	110	16,800	67,300
TOTAL	(138)	38,400	120,600

Note: These are conservative future estimates of overnight visitation demand, because they are based on the pre-flood demand for in-park lodging. As a result, they do not assume any visitor demand increases from factors such as reduced vehicle congestion, environmental restoration, improved lodging facilities, or population growth. Negative amounts are denoted by ().

Minority and Low-Income Visitors/Environmental Justice

Impacts on minority and low-income visitors would be similar as described under Alternative 2 except that under this alternative a major increase in camping units is proposed which would lessen the adverse impacts associated with the overall decrease in rustic-style accommodations.

Visitor Population Conclusion

Under this alternative, Yosemite Valley’s lodging capacity is proposed to decrease by 138 lodging units, yet a net increase of 120,600 visitor overnight stays annually is projected. This is equivalent to a 10.1% increase from 1998 overnight visitation, which represents a long-term, major, beneficial impact. Day visitation would remain unchanged. Due to the limitations of available data and the potential influence of other factors, impacts to low-income and minority visitors are qualitatively determined to be long-term, minor, and beneficial.

R E G I O N A L E C O N O M I E S

Visitor Spending

No changes in Yosemite visitor spending behavior are projected, since this alternative proposes no major changes that would alter the type of goods and services available to visitors.

Furthermore, no major change in the character of the park visitor population is expected. Therefore, visitor spending patterns and estimates based primarily on the 1998 Yosemite Area Regional Transportation System (YARTS) survey have been used to estimate future visitor spending behavior.

The primary effects on visitor spending within the region would be related to changes in park visitor population projected under this alternative. As discussed, the increase in overnight visitation within the park is the only impact on park visitation associated with this alternative. It is projected that approximately 120,600 additional visitor overnight stays would be gained under this alternative. To be conservative, it is assumed that these overnight visitors to the park would replace an equal number of day visitors; therefore, no net change in park visitation is expected. Visitor spending in the affected region would be affected because the typical spending behavior of park overnight visitors and day visitors differ. Any changes in visitor spending in the affected counties would impact output and employment in those counties, particularly within their lodging, food and beverage, retail, and transit sectors.

It is possible that these additional park overnighers could be attracted away from lodging in the region outside the park. If these vacated rooms are not occupied by new visitors or day visitors, relocation of these overnight guests from lodging outside the park into the Valley would have no net economic effect on the region's economy, because no new spending would be attracted into the area. However, given the high demand for lodging in the region (especially during the peak season), it is expected that some day visitors would likely choose to stay overnight in the region. As a result, the net economic impact on the regional economy from the additional overnight stays would be the net increase in daily visitor spending of \$35.76 per capita (\$61.30 – \$25.54, the difference between overnight spending and day-visitor spending) multiplied by the increased overnight visitation (120,600), which would equate to approximately \$4.3 million in visitor spending. This represents a long-term, moderate, beneficial impact to Yosemite visitor spending.

This is a conservative estimate of the beneficial spending impact on the county economy. The additional lodging capacity proposed under this alternative would still be lower than the Valley's pre-flood levels; therefore, it might be expected that increasing the Valley lodging capacity would bring back overnight visitors to the park who otherwise would remain displaced by the 1997 flood. The analysis has conservatively assumed that the additional overnight visitors will be gained from current day visitors; therefore, no net change in park visitation is expected. However, if instead new park visitors were attracted to stay overnight in the park, there would be an even greater growth in visitor spending.

There would still be potential for future growth in day visitation under this alternative. It is estimated that an additional 43,400 day visitors per month could be accommodated during weekdays in July and August in the Valley. In addition to visitor spending growth based on increased park visitation, the region also could increase visitor spending by encouraging more of the existing park visitors to stay longer or to stay overnight in the region. Increased length of stay would increase visitor spending, which would have a beneficial impact on the region's economy.

Table 4-138 presents the estimated impact on Yosemite visitor spending in each of the affected counties caused by changes in lodging and camping facilities. It indicates that, except in Mariposa County, the estimated impacts of this alternative on Yosemite visitor spending within the affected region counties would be negligible. In Mariposa County, Yosemite visitor spending would be expected to increase by approximately 3.1% over current levels which would represent a long-term, moderate, beneficial impact. Overall, Yosemite visitor spending within the five-county region would be expected to increase by about 1.8%; this would have a long-term, minor, beneficial impact on Yosemite visitor spending within the regional economy.

Table 4-138
Estimated Visitor Spending Impacts

County	Estimated Total Yosemite Visitor Spending (\$million/yr)	Estimated Impact on Spending (\$million/yr)	Impact on Spending as a Percentage of Total Yosemite Visitor Spending
Madera	\$38.1	(\$0.10)	(0.2%)
Mariposa	\$143.4	\$4.48	3.1%
Merced	\$4.8	(\$0.03)	(0.6%)
Mono	\$30.8	(\$0.06)	(0.2%)
Tuolumne	\$22.2	\$0.02	0.1%
All	\$239.3	\$4.31	1.8%

Note: All monetary figures are in 1998 constant dollars. Totals may not add up exactly due to rounding.

Increasing the overnight lodging capacity would increase the future total overnight visitation within the Valley. This would have a minor, long-term, beneficial impact on Yosemite visitor spending by increasing the number of visitors (and hence visitor spending) that can be accommodated overnight in the Valley.

Table 4-139 shows the total direct and secondary visitor spending impacts anticipated under this alternative. The anticipated change in overnight capacity and associated visitor spending would cause total regional output to increase by about \$6.52 million dollars annually. Most of this change would be driven by an approximately \$6.8 million increase in the annual output of Mariposa County. The portion of this spending expected to occur in the county's lodging sector would result in an approximately \$349,500, or 7%, increase in the county's recent average annual hotel occupancy tax revenues, a long-term, major, beneficial impact.

Table 4-139 further indicates that impacts to employment in Madera, Merced, Mono, and Tuolumne Counties would be negligible. Mariposa County would experience an increase of about 120 jobs, an approximately 1.5% increase in recent countywide employment. This represents a long-term, minor, beneficial impact to Mariposa County.

County	Estimated Impact on Spending (\$million/yr)	Estimated Spending Associated Impact on Annual Output (\$million/yr)	Estimated Spending Associated Impact on Annual Employment (FTE)
Madera	(\$0.10)	(\$0.15)	(2.7)
Mariposa	\$4.48	\$6.82	120.4
Merced	(\$0.03)	(\$0.05)	(0.8)
Mono	(\$0.06)	(\$0.10)	(1.7)
Tuolumne	\$0.02	\$0.03	1.4
All	\$4.31	\$6.52	116.6

Note: All monetary figures are in 1998 constant dollars. Totals may not add up exactly due to rounding.
FTE = Full Time Equivalents

Construction Spending and Employment

Construction costs proposed under this alternative total approximately \$482.0 million in 2000 dollars. In 1998 dollars, this cost corresponds to approximately \$454 million. The development cost estimates include about \$21.8 million for a bus fleet in 1998 dollars. This spending is expected to occur outside the region. In addition, a considerable portion of the other construction spending would occur outside the affected region. As a result, total expected construction spending within the five-county affected region is estimated to be approximately \$280.1 million. Table 4-140 presents the expected average annual construction spending the affected region by five-year phase. The table also shows the total regional output and employment impacts expected to result from those expenditures.

During the first five-year phase of project implementation, project construction spending would generate an estimated \$35.2 million of additional output per year in the five-county region's construction sector. This is equivalent to a 4.9% increase over recent regional construction-sector output, and represents a short-term, moderate, beneficial impact. During the same period, project construction spending would cause total annual industrial output (direct and secondary) in the

region to increase by approximately \$50.3 million in 1998 dollars (including construction- and nonconstruction-sector output). This is equivalent to a 0.4% increase over recent regional industrial output, and represents a short-term, negligible, beneficial impact.

Table 4-140 also shows that during the first five-year phase of project implementation, project construction spending would generate an estimated 409 full-time-equivalent jobs in the region's construction sector. This is equivalent to an almost 4.5% increase over recent regional construction-sector employment and represents a short-term, moderate, beneficial impact. During the same period, project construction spending would cause the region's total employment (direct and secondary) to increase by an estimated 628 jobs (including construction- and nonconstruction-sector jobs). This translates to a 0.38% increase in total employment in the region and represents a short-term, negligible, beneficial impact.

Period (Years)	Average Annual Construction Spending (\$million/yr)	Direct Construction Sector Output Impacts (\$million/yr)	Total Construction Spending-Associated Output Impacts ¹ (\$million/yr)	Direct Construction Sector Employment Impacts (FTE)	Total Construction Spending-Associated Employment Impacts ² (FTE)
1-5	35.2	35.2	50.3	409	628
6-10	17.2	17.2	24.6	200	307
11-15	3.6	3.6	5.1	41	63
Total	280.1	280.1	400.3		

Note: All monetary figures are in 1998 constant dollars Totals may not add up exactly due to rounding.

1. Impacts include both direct and indirect spending-related impacts. Cost estimates exclude estimated engineering/planning costs.

2. Total impacts include both direct and indirect spending-related impacts. Employment impacts expressed in terms of Full Time Equivalents (FTE).

Table 4-141 presents the project's expected annual construction spending schedule within Mariposa County. The table also shows the countywide output and employment impacts expected to result from those expenditures. During the first five-year phase of project implementation, project construction spending would generate an estimated \$7.7 million of output per year in Mariposa County's construction sector. This is equivalent to an approximately 22% increase over recent output in that sector, and represents a short-term, major, beneficial impact. During the same period, project construction spending would cause total annual industrial output (direct and secondary) in the county to increase by approximately \$11.0 million in 1998 dollars. This is equivalent to a 2.2% increase in the county's total industrial output, and represents a short-term, minor, beneficial impact.

Table 4-141 also shows that during the first five-year phase of project implementation, project construction spending would generate an estimated 92 full-time-equivalent jobs in Mariposa County's construction sector. This is equivalent to an approximately 20% increase in recent employment in that sector, and represents a short-term, major, beneficial impact. During the same period, project construction spending in the county would cause the county's total employment (direct and secondary) to increase by an estimated 140 jobs. This translates to about a 1.7% increase in total employment in the county, and represents a short-term, minor, beneficial impact.

Output and employment generated would decrease by more than 50% during the second five-year construction phase and 90% during the final five-year construction phase, when compared to the first five-year construction phase. All regional output and employment impacts would end after 15 years.

Period (Years)	Average Annual Construction Spending (\$million/yr)	Direct Construction Sector Output Impacts (\$million/yr)	Total Construction Spending-Associated Output Impacts ¹ (\$million/ yr)	Direct Construction Sector Employment Impacts (FTE)	Total Construction Spending-Associated Employment Impacts ² (FTE)
1 - 5	7.7	7.7	11.0	92	140
6 - 10	3.8	3.8	5.4	45	69
11 - 15	0.8	0.8	1.1	9	14
Total	61.1	61.1	87.7		

Note: All monetary figures are in 1998 constant dollars. Totals may not add up exactly due to rounding.

1. Impacts include both direct and indirect spending-related impacts. Cost estimates exclude estimated engineering/planning costs.

2. Total impacts include both direct and indirect spending-related impacts. Employment impacts expressed in terms of Full Time Equivalents (FTE).

Following implementation of projects proposed under Alternative 5, it is expected that approximately \$18.2 million (1998 dollars) would be spent annually within the affected region to operate and maintain the park’s new visitor in-Valley transit shuttle system, to meet the staffing requirements of expanded park visitor facilities and employee housing, and to pay for additional operation and maintenance expenses incurred by the concessioner associated with new employee housing and visitor facilities. Table 4-142 indicates that this spending would generate about \$27.6 million of output per year, and 441 jobs within the affected region. This represents a long-term, negligible, beneficial impact on the region’s economy.

The table also indicates that new park-operations–related spending is expected to generate \$13.8 million dollars in additional output per year within Mariposa County. This would represent a 2.7% increase over recent county output, a long-term, moderate, beneficial impact to the county’s economy. Furthermore, park-operations–related employment is expected to increase employment in Mariposa County by 267 jobs (including 131 National Park Service positions), a 3.3% increase over recent county employment levels. This represents a long-term, moderate, beneficial impact on the county’s economy.

County(s) (In park)	Annual Park and Transit System Spending ¹ (\$million/yr)	Total Operation Spending Associated Output Impacts ² (\$million/yr)	Additional National Park Service Employees (FTE)	Total Operation Spending Associated Employment Impacts ³ (FTE)
Mariposa	\$8.5	\$13.8	131	267.1
Yosemite Region	\$18.2	\$27.6	131	441.1

Note: All monetary figures are in 1998 constant dollars. Totals may not add up exactly due to rounding.

1. Spending in Mariposa County calculated as the sum of estimated increased project-associated National Park Service operating costs and estimated spending on in-Valley component of transit operations.

2. Includes direct and secondary output (includes new National Park Service employee spending).

3. Includes direct and secondary employment (includes new National Park Service employee spending).

FTE = Full Time Equivalents

Other Revenues

Detailed analysis on the retail spending habits of National Park Service and Yosemite Concession Services employees is unavailable; therefore, the quantitative extent of retail trade resulting from employees living in Yosemite Valley, Wawona, or at the El Portal Administrative Site is not known. However, it is known that many employees do rely on local stores for groceries and other items. It is not known where other trade occurs. Experience indicates that it is likely that employees living in the Valley or El Portal travel either south or west along Highways 140 or 41 to the communities of Mariposa, Oakhurst, Merced, or Fresno to purchase supplies they cannot obtain in the park. Although it is not possible to quantitatively assess how this alternative would affect retail and sales revenues in Mariposa County, some qualitative assessments can be made.

No changes to employees' income are expected to be associated with relocations (except for the additional income from the housing incentives), and no changes in employee spending behavior are expected. However, Mariposa County's economy may experience long-term, minor benefits if: (1) relocated employees shift some of their spending to Mariposa and Merced from Oakhurst and Fresno, (2) there is net growth in the park employee population, and (3) employee spending increases as a result of increased income from housing incentives.

Mariposa County's economy may experience long-term, negligible, adverse impacts if employees who relocate to Wawona shift some of their spending from Mariposa to Oakhurst. These changes to Mariposa County's economy may be offset if: (1) there is net growth in the park employee population, and (2) employee spending increases as a result of increased income from housing incentives.

Under this alternative, approximately 487 park employees and family members (420 employees, 12 spouses, and 55 children) would be relocated from the Valley to El Portal. Although retail facilities in El Portal are limited, most of the relocated employees would continue to work within the Valley and would likely purchase goods there. Employees relocated to El Portal would also be approximately 30 minutes closer to Mariposa and Merced and approximately the same distance from Oakhurst and Fresno. As a result, relocated employees would have comparable access to spending opportunities and may be expected to shift some of their spending to Mariposa. While the magnitude of any such changes in employee spending cannot be estimated, the impacts to Mariposa and Madera Counties are expected to be long-term, negligible, and beneficial.

Under this alternative, additional housing for 254 new park employees would likely increase spending incrementally. In addition, housing for 24 new employees not currently living in the Valley would be developed at Wawona. Spending by these additional park employees, for the most part, would represent new spending income for Mariposa County (although because many would be seasonal employees, the spending benefits to the county would be limited). The primary direct benefit to the county's economy would be from additional sales tax revenues from this employee spending.

The potential financial impacts on Mariposa's economy from the proposed housing changes at Wawona would be negligible. The local spending and tax impacts (such as local sales and real estate taxes) would have a negligible beneficial impact on Mariposa's economy and the tax impacts associated with the relocated housing are expected to be negligible.

Spending by these park employees would mostly represent new spending income for Mariposa County (although many would be seasonal employees, so the spending benefits to the county would be limited). The primary direct benefit to the county's economy would be from additional sales tax revenues from this employee spending.

Mariposa County currently assesses a 1.25% tax on all retail and restaurant sales within the county, including the majority of the concessioner's sales within Yosemite National Park. The average concessioner employee's wages are low, and it is estimated that the annual earnings of the employees would be approximately \$4.8 million. Of these wages, only a small proportion would be available for purchasing taxable goods and services in the region. Even if 10% of their gross income was spent on purchasing goods within Mariposa County, the sales tax revenues would be only \$4,800, which would have a long-term, negligible, beneficial impact on the county's economy.

The primary concessioner would be expected to pay a total of approximately \$500,000 in housing incentives annually for employees relocating out of the Valley to El Portal and Wawona. Any additional spending generated by this additional revenue would also have a long-term, negligible, beneficial impact on the county's economy.

Overall, the future change in local sales tax revenues is projected to be negligible, because no appreciable change in local spending by park employees is expected as a result of this alternative.

Mariposa County does not individually tax employees of the park's primary concessioner for possessory interest. Instead, the county assesses Yosemite Concession Services operations annually to determine its possessory tax payment owed to the county. If Yosemite Concession Services financial situation is impacted adversely by this alternative, then its possessory tax payments to the county are expected to decrease. However, the magnitude of Yosemite Concession Services current possessory tax payments to the county is proprietary information, and the county would not project the magnitude of the likely change to its revenues under this alternative. It is possible, though, that long-term, major, adverse impacts to the county's tax revenues could occur if Yosemite Concession Services concession operations are significantly affected.

No county building or permit fees would be generated by the proposed construction on federal land within Mariposa County. However, the county's possessory interest tax revenues would be affected by net changes to permanent National Park Service and non- Yosemite Concession Services employees' housing facilities. The county assesses possessory interest taxes to these park employees based on the value of their housing. Under this alternative, the National Park Service would add approximately 30 bed spaces for permanent National Park Service and non- Yosemite Concession Services employees. Currently, the Mariposa County Assessors Office estimates that the annual possessory tax revenues associated with the properties to be removed are approximately \$7,000. The assessed value of the replacement employee housing is estimated to be \$2.5 million, which would result in approximately \$25,000 in possessory tax revenues to Mariposa annually. Therefore, it is projected that the county would obtain net possessory tax revenues of \$18,000 once all the replacement housing for the National Park Service and other concessioner employees is completed. This additional revenue would have a long-term, negligible, beneficial impact on the county's tax revenues.

The new employee housing in El Portal and Wawona is planned to primarily accommodate permanent hourly workers who otherwise would be housed in the tent cabins within the Valley. These employees are not likely to be able to afford unsubsidized housing. Any increase in the demand for private housing would be associated with the small population of middle and upper management Yosemite Concession Services employees. It is expected that only the 90 managerial concessioner employees currently living in the Valley would be able to consider purchasing a home locally. Relocation of Yosemite Concession Services headquarters would reduce the commute time for any concession office staff living in privately owned housing in Mariposa.

Even if a number of concession employees purchase private homes as a result of the proposed employee housing changes, there would only be a net increase in the county's real estate tax revenues if house prices had risen since the property was purchased previously. According to local real estate agents, after a period of appreciation in local home values during the early and mid-1980s, local house prices have not changed much over the last 10 years. As a result, the net tax revenue impact to the county from any house sales would be long-term, negligible, and beneficial.

Regional Housing

Of the 403 additional employees anticipated as part of this alternative, a minimum of 49 employees could be required to seek housing outside the park. The adjacent areas of Mariposa, Madera, and Tuolumne counties have been assessed for their ability to accommodate these private housing needs. Although Mono County is included in some analysis in this chapter, it is not included here because it is unlikely that the employees associated with this alternative would seek housing in Mono County due to its distance from the Valley, and the seasonal closing of Highway 120 (Tioga Pass Road). The addition of a minimum of 49 employees seeking private housing would bring the total number of employees privately housed from its current level of 563 to 617.

As indicated on table 3-32, population growth in Mariposa, Madera and Tuolumne counties is projected to increase between the years 2000 and 2020 by approximately 9,500 (or 47%), 80,100 (or 60%) and 31,300 (or 47%), respectively. The need for additional employees associated with this alternative will occur gradually over a 15–20 year period as various elements of the plan are implemented. Therefore, the addition of 49 employees in the region as a result of this alternative represents approximately 0.04% of this projected regional growth over this timeframe.

Based upon economic and demographic information for these three counties provided by the State of California Department of Finance (California Department of Finance 2000), Mariposa, Madera, and Tuolumne counties have an existing single family and multi-family housing stock of 9,146, 39,018 and 28,252 units, respectively, and existing housing vacancy rates of approximately 27.2% (2,487 units), 8% (2,466 units) and 28.8% (8,136 units), respectively, based on 1999 data. These vacancy rates have remained at these levels since 1990. In addition, new single family and multi-family housing authorizations in 1998 for each of these three counties were 71, 633 and 413, respectively. Assuming these trends in housing data presented above continue into the future for these three counties, accommodating a minimum of 49 employees in private housing in the three-county region would be feasible. Therefore, the addition of a minimum of 49 employees

privately housed in the region would have a negligible, long-term, adverse affect on regional housing demands.

Again, the National Park Service does not have jurisdictional authority over the potential use of private lands in the region outside Yosemite National Park. Therefore, additional housing requirements to accommodate the 369 new employees associated with this alternative could be met within areas under its jurisdictional authority in Yosemite Valley, El Portal, Wawona, and Foresta.

Regional Economies Conclusion

Economic impacts of this alternative on the affected environment would result primarily from project construction spending. During the first five years of development, over \$35 million in annual spending would expand the regional economy by about \$50.6 million of output. This would represent a short-term, negligible, beneficial impact. In Mariposa County, however, the estimated \$11.1 million project-related increase in annual output during the first five years of implementation would have a short-term, minor, beneficial impact on the county's overall economy. In addition, during the first five years of development, it is estimated that approximately 630 total jobs would be generated in the affected region. This represents a short-term, negligible, beneficial impact on regional employment. In Mariposa County, however, the estimated 141 jobs generated directly and secondarily by project spending would have a short-term, minor, beneficial impact on that county's employment.

Impacts on employment would occur as new jobs are created from construction spending and visitor spending. Assuming the unemployed labor force in the Yosemite region would fill the majority of these new jobs, unemployment rates would drop significantly under this alternative. This would represent a short-term, major, beneficial impact on the region's economy. Housing impacts would be negligible, based on the assumption that new jobs would be filled by existing residents of the Yosemite region.

Redevelopment of the park's lodging and campsite facilities also would impact the regional economy by changing visitor spending in the region. Completion of these visitor facility changes is expected to occur 10 years after the start of project construction. During this 10-year period, overnight capacity of the park would not be allowed to fall below current levels. Once full build-out is completed, it is estimated that annual visitor spending would increase by about \$8.9 million in 1998 dollars.

Project-related increases in regional spending by Yosemite visitors is expected to have a beneficial output, and employment impacts of Alternative 5 would result from expansion of National Park Service operations and the new park visitor transit system.

The overall economic impacts of the changes in visitor spending and operational spending to the regional economy would be long-term, minor, and beneficial. This impact would result primarily from the long-term, moderate, beneficial impact associated with the spending and employment effects from the increased park operations.

For Mariposa County, the overall economic impacts of the changes would be long-term, major, and beneficial. This overall impact would result from the combined effect of the moderate,

beneficial impact from increased visitor spending, and the moderate, beneficial impact from increased park operations.

The overall combined economic impacts of this spending change on the surrounding counties would be long-term, negligible, and beneficial. This beneficial impact would result from a long-term, moderate, beneficial impact in Mariposa County and a long-term, negligible, beneficial impact in Tuolumne County. In fact, each of the other surrounding counties would experience a long-term, negligible, adverse impact on their economies from the expected spending change. Adverse impacts to these counties, however, may decrease as the counties attract additional park visitors to replace the day visitors who converted to in-park overnight visitors as a result of increased in-park capacity.

Assuming that housing trends in Mariposa, Madera and Tuolumne Counties continue in the future as they have in the recent past, accommodating a minimum of 49 employees in private housing in the three-county region would be feasible and have a negligible, long-term, adverse affect on regional housing demands.

Cumulative Impacts

Although none of the projects identified in Appendix H would be expected to attract additional visitors to the park, these projects would be expected to change the lodging patterns of the visitor population. As described under Alternative 1, the new lodging units identified in Appendix H would be expected to accommodate approximately 525,500 overnight stays per year, and these stays would be filled by park visitors who would otherwise have been day visitors. Under Alternative 5, therefore, the increase in lodging capacity in the Valley would be augmented by the new lodging units in the region. Combined with the net increase of 120,600 stays described above, the cumulative impact would be an increase of approximately 646,100 overnight stays per year.

Visitor Spending

In addition to the increase in lodging capacity in the Valley under this alternative, there would be an increase in lodging capacity from the projects described in Appendix H. As described under Alternative 1, the projects in Appendix H would generate approximately \$18.8 million in direct annual visitor spending in the region. Thus, the total annual change in visitor spending would be approximately \$23.1 million under this alternative.² This represents a long-term, moderate, beneficial impact on the regional economy.

Secondary impacts generated by \$23.1 million in additional visitor spending is estimated to be \$12.4 million. At full build-out, therefore, the total estimated impact on annual output under this alternative would be \$35.5 million, a long-term, minor, beneficial impact on the regional economy. If new visitors are attracted to the region by the increase in lodging capacity, visitor spending would be higher, and the impact would be greater.

² Assuming the proposed changes in Alternative 5 would cause overnight visitor spending to increase by \$4.31 million when all lodging and camping construction/removal is complete.

While project-related increases in regional spending by Yosemite visitors are expected to have a beneficial impact on the Yosemite region, the majority of the expected beneficial output and employment impacts of Alternative 5 would result from expansion of National Park Service operations and the new park visitor transit system.

Construction Spending

Local construction spending from the projects identified in Appendix H is estimated to average \$255.0 million annually. Under this alternative, an additional \$18.7 million per year in local construction spending would occur on average from the proposed renovation of campsites, and the development and relocation of housing, parking, and other structures. Total construction spending on the projects under this alternative and from projects described in Appendix H would be approximately \$272.1 million per year.

Additional construction spending would generate secondary output impacts as a result of local spending on material inputs and wage spending by project labor. For annual construction spending of \$272.1 million, secondary impacts would be estimated at approximately \$116.8 million. The total change in annual output (direct and secondary) would therefore be \$388.9 million, a short-term, major, beneficial impact on overall industrial output in the region. Of this increase, approximately 87% is associated with housing construction in Merced County.

New park-operations-related spending is expected to generate an additional \$27.6 million in output per year in the Yosemite Region.

Employment

The equivalent of up to 731 jobs would be supported by the increase in visitor spending in the region. In addition, the equivalent of approximately 2,900 to 9,200 full-time jobs would be supported each year from construction spending in the region. An additional 441 jobs would be generated by new park-operations-related spending. Much of the general labor and raw materials would probably come from local sources. Unemployed labor (i.e., the available workforce) in the surrounding region (22,180), would considerably outnumber the projected number of new jobs created from construction and visitor spending. A labor shortage is not anticipated because of the large number of unemployed workers in the region. However, employment needs could also be met by residents of counties outside the affected region, such as Fresno, particularly for the large construction projects in Merced County such as the proposed housing development and University of California, Merced Campus development. In such a case, the economic benefits identified would instead be gained outside the region.

As discussed under Alternative 1, several other projects would create temporary and full-time employment opportunities within the region in the reasonably foreseeable future. Because the local workforce is expected to fill the new employment opportunities, no significant influx of workers is expected; therefore, no new housing is projected to be needed to accommodate employment impacts from this alternative or cumulative impact scenario.

Overall, impacts on employment would occur as new jobs are created from visitor spending, construction spending and operations spending. Assuming the unemployed labor force in the Yosemite region would fill the majority of these new jobs, unemployment rates would drop under

this alternative. This would represent a short-term, major, beneficial impact on the region's economy. Under the assumption that new jobs would be filled by existing residents of the Yosemite region, there would be no impact on housing in the region.

C O N C E S S I O N E R S A N D C O O P E R A T O R S

Yosemite Concession Services

The changes to park facilities and operations proposed under this alternative would affect both Yosemite Concession Services' operations and its finances. The National Park Service planning staff used detailed information provided by the current concessioner to analyze existing concessioner operations and the proposed alternatives to estimate future operational and financial impacts on the concessioner within the park. The impact analysis assumes that there would be no change in park visitation and visitor spending behavior, to make conservative projections of the concessioner's future operational and financial conditions.

- It is expected that the majority of in-Valley housing would be for seasonal employees. The reduced number of housing units that would remain in Yosemite Valley would have an adverse impact on current or any future concessioner because there would be insufficient housing for a full shift of employees to be based in the Valley. In-Valley employee housing should be sufficient to provide housing for approximately 80% of employees necessary to staff concession operations for one shift. As a result, the concessioner's ability to meet visitor service needs under circumstances such as road closures or other commuting difficulties (such as fire or flood conditions preventing employees from commuting in and out of the Valley) would be reduced. This would represent a long-term, minor, and adverse impact on the concessioner's future operations.
- It is expected that future out-of-Valley employee housing would be occupied predominantly by year-round employees. These employees also would be required to commute into the Valley using an employee transit system. However, from a visitor service perspective, year-round employees should ideally remain close to the work site for maximum guest service benefit and operational needs. As a result, the concessioner's ability to meet visitor service demand would be reduced, because its best and most reliable employees would be housed in El Portal.
- It is expected that several adverse impacts could remain after proposed employee housing changes were implemented under this alternative. The concessioner's ability to recruit qualified and experienced management personnel may continue to be constrained by the limited availability of housing. Because a major proportion of the employee housing would be relocated to El Portal, one of the concessioner's greatest recruiting attractions would be reduced: namely, enabling employees to live, work, and recreate in Yosemite Valley. However, future housing designs would attempt to accommodate future employee housing needs. Furthermore, the quality of all new replacement housing would be improved compared to the current housing facilities. The combined impact of these factors would be expected to have a long-term, minor, adverse impact on the concessioner operations.

- Relocation of the Village Garage to El Portal would adversely affect the concessioner's towing service. Disabled vehicles would need to be towed to El Portal and, as a result, would increase the response time for its towing service. Additional heavy-duty tow trucks would have to be purchased, operated, and maintained to provide roadside assistance to buses and other large vehicles (e.g., shuttle bus and recreational vehicles) over longer distances. This would represent a long-term, minor, adverse impact on the concessioner's future operations.

Three types of financial impacts are expected under this alternative: (1) changes to the concessioner's gross revenue (sales receipts) and profitability, (2) employee housing and relocation-related cost increases including furniture, fixtures, and equipment (FF&E) expenses, and (3) annual repair and maintenance cost on new facilities. The magnitude of these impacts would depend on whether the impacts occur during the remainder of the current concessioner's contract (i.e., until 2008) or under a subsequent contract. The estimated financial impacts discussed below are expressed in terms of stabilized annual revenues and costs. These impacts are also generally represented as net impacts compared to the concessioner's 1998 financial conditions.

Gross revenue impacts reflect changes to the concessioner's sales resulting from the proposed change to visitor services. The furniture, fixtures, and equipment (FF&E) impact represents the initial cost of outfitting the proposed new facilities to make them operational and the subsequent replacements of the new fixtures and facilities as they wear out (typically after seven years of use).³ Maintenance and employee housing cost impacts represent the additional expenditures necessary to operate under the new configuration of facilities. The profit impact clearly shows the financial impacts on the concessioner's business because it includes changes in both annual revenues and costs.

The impact analysis includes an evaluation of whether concessioner profits will be adequate to allow the concessioner to earn a reasonable return relative to its investment and operating risk. To evaluate the impact of the *Yosemite Valley Plan* alternatives on the concessioner, the analysis began by evaluating the concessioner's current capacity to earn a profit and then considered how each aspect of the *Yosemite Valley Plan* alternatives would impact that capacity.

The concessioner's profit capacity may be understood as consisting of two components—its present profit plus the amount of its federal contribution. In other words, the concessioner's financial contribution to the federal government represents the amount of money it is able to pay after earning a reasonable return. It is important to note that this judgment is based on the fact that the current Yosemite concessioner obtained the concession contract in a fair market competition in which it presumably is retaining reasonable profits that are neither insufficient nor excessive.

³The series of periodic future investments in furniture, fixtures & equipment can be viewed as equivalent to an annual average investment. In this way, the annual impact of the furniture, fixtures & equipment expense increase can be represented in the concessioner's resulting profit performance. Indeed, if the furniture, fixtures & equipment purchases are financed with debt, as might be expected, the debt service would be an annual cost.

If the changes in concessioner operations induced by the *Yosemite Valley Plan* do not erode all of the concessioner's ability to make financial payments to the government, a reasonable profit will remain available to the concessioner. On the other hand, if the *Yosemite Valley Plan* eliminates the concessioner's ability to make any federal contribution, the concessioner may still earn a reasonable return as long as its profits are not also eroded. However, if the concessioner was unable to make any payments to the federal government and was also unable to earn a reasonable profit, that situation could not be sustained. The concessioner would choose to discontinue operations.

The total profit impact on the next concessioner's operations associated with the proposed alternative is projected to be an annual decrease in its profits of \$8.1 million. This projection is based on the combined profit impacts associated with: (1) changes to the concessioner's gross revenue (sales receipts) and profitability, (2) employee housing and relocation-related cost increases including furniture, fixtures, and equipment, and (3) annual repair and maintenance costs on new facilities.

The changes to visitor services proposed under this alternative are projected to generate additional net profits of \$2.9 million annually. These profits would be obtained from annual revenue increases of approximately \$4.0 million. The profit gains would primarily result from increasing the highly profitable Yosemite Lodge accommodations and adding to the number of campsites within the Valley.

Future employee housing and relocation cost increases are projected to be approximately \$5.0 million per year. These consist primarily of increases in the annual costs for furniture, fixtures, and equipment (FF&E) replacement (\$1.3 million, including the cost of capital for this expenditure), heat and utilities (\$0.8 million), employee transportation (\$0.6 million), insurance (\$0.5 million), and wage increases to encourage employees to relocate out of the Valley (\$0.5 million). Additional housing-related staff needs are estimated to cost less than \$0.3 million. Other associated costs total approximately \$0.9 million. It is estimated that annual repair and maintenance of the new concession-related facilities would cost approximately \$6.0 million. Therefore, the impact on the next concessioner's resulting total profit is projected to be an annual loss of \$8.1 million ($\$2.9 \text{ million} - \$5.0 \text{ million} - \$6.0 \text{ million} = -\8.1 million).

In summary, based on the analysis of proposed changes under this alternative, future concession operations would be expected to experience a \$9.2 million decrease in annual profits. This loss could be offset by reducing the current or any future concessioner's federal contribution from its current level of \$9.9 million annually to cover the concessioner's projected profit reduction. In this case, it is estimated that the current or any future concessioner would be able to make a net contribution of approximately \$1.8 million to the federal government annually. This would represent a long-term, negligible, adverse impact on concession operations.

Table 4-143 shows the projected financial impacts to Yosemite Concession Services under Alternative 5.

Table 4-143 Projected Annual Financial Impacts (\$ Million)			
Impact	Alt 1	Alt 5	Net Change
Revenue	\$0	\$4.0	\$4.0
Profit from Operations	\$0	(\$8.1)	(\$8.1)
Concessioner's Govt. Contribution	\$9.9	\$9.9	\$0
Net Profit Impact & Govt. Contribution	\$9.9	\$1.8	(\$8.1)

Note: All figures are in 1998 constant dollars.

The projected revenue impact would represent a 4.6% increase in the concessioner's 1998 revenues, which would be a long-term, moderate, beneficial impact. If the concessioner's governmental contribution were used to offset the projected profit losses from its operations, then this alternative would have a negligible, adverse impact on the concession operations. However, the annual financial return to the federal government from the concession operations would be reduced from \$9.9 million to \$1.8 million, a reduction of 82%, which would represent a long-term, major, adverse impact to the federal government.

Yosemite Medical Clinic

Under this alternative, Yosemite Medical Clinic would remain in its existing location. Also, under Alternative 5, it is projected that approximately 38,400 additional room-nights would add 120,600 overnight stays annually within the Valley. This represents an increase of approximately 7.7% in park overnight stays, and corresponds to a 3.3% increase in total park visitation (compared to 1998 visitation levels). However, this increase is still less than the average pre-flood levels and would represent a long-term, moderate, beneficial impact to the Clinic.

Although relocation to El Portal might encourage some employees to seek medical attention at other clinics outside the park, the majority of these employees would continue to work in the Valley, and may continue to seek medical attention at the Valley Medical Clinic. However, the net effect and future magnitude of these impacts on the concessioner's future sales cannot be quantified.

The Ansel Adams Gallery

Under this alternative, The Ansel Adams Gallery would remain in its current location. Numerous modifications are proposed for the Yosemite Village Area: development of a new transit center in Yosemite Village near the Yosemite Village Store, expansion of fast food facilities at the Village Grill and Degnan's, removal of public parking throughout the Yosemite Village area, and the transformation of the Yosemite Village area as an interpretive hub. Day-visitor parking (550 spaces) would be developed at Camp 6 adjoining Yosemite Village.

Removal of nearby parking could reduce the Gallery's annual sales. Currently most visitors take their purchases with them. Many visitors may be reluctant to make purchases if they must use the shuttle buses to return to their cars or overnight accommodations. However, the transit center would be a central component of the future Valley and out-of-Valley shuttle systems. It is expected that more park visitors would pass through the area, making Yosemite Village an increasingly important part of most park visitors' travel itineraries. Also under this alternative, day-visitor parking would be located within walking distance of the Gallery. Therefore, it is

expected that this alternative would have a long-term, minor, beneficial impact on the Ansel Adams Gallery by attracting more potential customers.

In addition, any changes in the park's annual visitation may be expected to have a corresponding effect on sales by altering the Gallery's customer base. However, the net effects and future magnitude of these impacts on the concessioner's future sales cannot be quantified.

Yosemite Association

Employee housing is the primary issue affecting the Yosemite Association's future operations. The Association currently experiences a shortage of employee housing, and any increase in future employees would increase the problem. This alternative proposes that some housing would be available for Yosemite Association employees; if this occurred it would have a long-term, moderate, beneficial impact on the Association's ability to recruit and retain staff.

The proposed changes to the Valley Visitor Center are expected to produce mainly long-term, moderate, beneficial impacts to the Yosemite Association. Under this alternative, the visitor center may be redesigned.

To provide a larger and more readily accessible space which would improve the Association's ability to provide effective information and orientation service, as well as retail sales, it is expected that annual sales at the new visitor center may increase due to the improved facilities and visitor experience. This would represent a long-term, minor, beneficial impact to the Association.

Under this alternative, the Yosemite Association's Valley office would be converted for use as a natural history museum. This would allow improvement of the existing cultural history museum within the existing museum building. The Yosemite Association expects these changes to have a long-term, moderate, beneficial impact on its finances because it would be able to enlarge and improve the existing Museum Store and open an additional store at the new national history museum.

Increases in Yosemite Association retail sales may require hiring additional retail employees. While the Yosemite Association cannot project the necessary staff increase, it does expect costs to be covered by the increased sales. This would cause a long-term, minor, adverse impact, as staff increases would exacerbate the housing problems noted above.

Yosemite Institute

Numerous impacts to the Yosemite Institute are expected due to proposed changes to overnight accommodations, administrative park operations, transportation, research library, archives, and museum.

Overnight Accommodations

The reduction in the number of Curry Village tent cabins and elimination of cabins without baths may affect the Yosemite Institute, which currently occupies approximately 80 units between September and June. Under this alternative, additional economy accommodations are proposed at Curry Village, adding 149 units suitable for Yosemite Institute use throughout the winter. As a result, lodging capacity for Yosemite Institute participants is expected to be adequate.

It is expected that Yosemite Institute would be required to pay higher room rates to Yosemite Concession Services for rooms with bath. Based on Yosemite Concession Services' current rate structure and depending on the availability of the remaining Curry Village tent cabins for Yosemite Institute's use in September and June, it is estimated that the Institute's average lodging costs would increase between 16% and 25%. This is equivalent to an average lodging cost increase of \$1.80 to \$2.70 per person per night. Based on an average annual total of 40,122 person-nights spent in Yosemite Concession Services accommodations by Yosemite Institute participants, Yosemite Institute's total lodging costs may be expected to increase between \$72,000 to \$108,000 (in 1999 dollars). This would represent a long-term, moderate, adverse impact on Yosemite Institute's program.

Transportation

Proposed transportation plans would have a long-term, negligible, adverse impact on Yosemite Institute's program, because most participants rely on commercial buses for their transportation needs, and all student visitors are overnight visitors. Yosemite Institute employees would welcome the opportunity to use public transportation to and from locations outside the Valley.

Administrative Park Operations

Under this alternative, Yosemite Institute's administrative offices would be relocated outside the Valley into government provided facilities in El Portal. The National Park Service would work with the Yosemite Institute and the primary concessioner to provide adequate facilities for the Institute's field operations that operate in the Valley during the off-season. These facilities would provide an adequate staging area and base of operations for the Yosemite Institute to perform the essential support for its field operations. Relocation of the administrative park operations would represent a long-term, minor, adverse impact on Yosemite Institute's education programs.

El Portal Chevron Station

Under this alternative, the overall number of visitors entering along Highway 140 is not expected to change. The majority of day visitors would continue to drive into the park or use the park transit system from the out-of-Valley parking sites. It is expected that there would be a moderate increase in visitors using transit or tour buses to access the Valley. Growth in bus traffic would increase the demand for diesel fuel, which would be expected to have a long-term, minor, beneficial impact on the station's revenues. Correspondingly, the use of transit buses by day visitors parking at the El Portal satellite parking facilities would reduce the number of visitor vehicles using the station. Visitor fuel sales may therefore be expected to decrease; this would have a long-term, minor, adverse impact on the station's annual revenues.

In addition, while the proposed increase in employees living in El Portal would generate a moderate increase in demand for automotive fuel, these gains would likely be offset by the reduction in the number of employees commuting daily into the Valley. Instead, these employees would be required to use the employee transit system. Overall, it is expected that this alternative would have a long-term, minor, adverse impact on the El Portal Chevron concession.

El Portal Market

Under this alternative, the El Portal Market would remain at its current location, and its facilities and operations would be unchanged throughout the term of the existing contract. The store's primary source of customers is from park visitor traffic along Highway 140. It is expected that the use of transit or tour buses by day visitors would reduce private vehicle traffic and thus potential customers.

Although past population increases have not resulted in increased sales at the market, it is possible that the increase in employee housing at El Portal would result in a minor increase in revenues. Therefore, overall this alternative is expected to have a long-term, negligible, adverse impact on El Portal Market's sales.

Concessioners and Cooperators Conclusion

The operational and financial impacts to the primary concessioner would be as described above, including, a \$8.1 million decrease in annual profits. This loss could be offset by reducing the current or any future concessioner's federal contribution from its current level of \$9.9 million annually to cover the concessioner's projected profit reduction. In this case, it is estimated that the current or any future concessioner would be able to realize a reasonable profit and contribute approximately \$1.8 million to the federal government annually. This would represent a long-term, negligible, adverse impact on concession operation.

Projected increases in park visitation is expected to have a long-term, moderate, beneficial impact on the Yosemite Medical Clinic.

The net impacts from proposed changes in visitor parking and visitation on the Ansel Adams Gallery are indeterminate.

The proposed changes to visitor interpretation facilities are expected to have a long-term, major, beneficial impact on the Yosemite Association by providing improved and increased retail sales opportunities. However, associated increases in employees and the limited employee housing for the Yosemite Association staff may have a long-term, moderate, adverse impact on the organization.

Long-term adverse impacts to the Yosemite Institute are expected from the proposed changes to overnight accommodations and park facilities. Reductions in Curry Village tent cabins would have a moderate adverse impact, because program participants would need to use other newly built but more expensive lodging facilities. Relocation of the program's administrative office out of the Valley is expected to have a long-term, minor, adverse impact.

The proposed changes to visitor access and relocation of employee housing would have a long-term, minor, adverse impact on the El Portal Chevron Station, and a negligible adverse impact on the El Portal Market.

Cumulative Impacts

Yosemite Concession Services

The cumulative impacts would be the same as described under Alternative 1. The primary concessioner would be expected to assume costs of future “repair and maintenance” on *existing* park facilities used for its operations, an estimated annual cost of \$1.7 million. As a result, under this alternative, a total cumulative impact resulting in a net federal contribution of \$0.1 million by the concessioner is projected. This figure is the difference between a \$1.8 million projected federal contribution by the concessioner, and the \$1.7 million repair and maintenance cost on existing park facilities used by the concessioner. This would represent a long-term, negligible, adverse impact on the concessioner because its net profits would be unaffected by the reduction in its future federal contribution.

Other Concessioners and Cooperators

The cumulative impacts would be the same as described under Alternative 1.

Park Operations

NATIONAL PARK SERVICE OPERATIONS

Superintendent's Office

This alternative would have no impact on the Superintendent's office staff or its annual funding requirements.

Maintenance Operations

Buildings and Grounds

To provide the levels of service considered necessary, it is estimated that approximately 25 additional buildings and grounds personnel would be needed under this alternative. This would represent approximately \$937,000 for additional salary and operations costs annually. Construction of new shuttle bus stops, buildings, housing units, out of valley parking lots, picnic areas, and changes in building functions from administrative to public use would require additional custodial service and facility maintenance.

The rehabilitation of historic districts would require additional staffing and associated funding.

The traveler information and traffic management system, once implemented, could displace visitors to outlying districts or expand visitation to off-peak seasons. This would be a long-term, minor, adverse impact on buildings and grounds operations in outlying districts, in that the levels of maintenance and custodial services required for peak season operations would be needed for a longer period of the year.

Roads and Trails

To provide the levels of service considered necessary, it is estimated that approximately 29 additional roads and trails personnel would be needed. This would represent approximately \$1,087,500 for additional salary and operations costs annually.

A new parking lot in the east Valley would require additional maintenance (equipment and staffing) for snow removal. Three new parking lots in out-of-Valley locations (two of which are located above the traditional snowline in the spring and fall seasons) would require maintenance equipment and staffing, primarily for snow removal.

An increase in trails in the Valley and El Portal would create additional workload that would affect the trails and forestry operation. Snow removal in the winter and hazard tree removal and trail repairs throughout the year would continue for the life of the new trail system.

If the stable were to move to McCauley Ranch it would increase the travel time for packers to get to Valley trailheads but would decrease travel times to destinations in the Tioga Road corridor. Additional staffing and salary would be required to provide more pack trips or longer work shifts, to cover additional travel time for pack trips leaving from Yosemite Valley trail heads.

Demand for trash pickup in the El Portal area and out-of-Valley parking areas would increase due to the relocation of administration functions, and the increase in the number of housing units and visitor-use areas.

Utilities

It is estimated that approximately six additional utilities personnel would be needed to provide appropriate levels of service. This would represent approximately \$225,000 in additional salary and operations costs annually. Moving the parkwide functions to El Portal and retaining only a Valley shop space, constructing new buildings, and relocating utilities out of highly valued resource areas would impact the Utilities Branch. New service connections and, in the case of the out-of-Valley parking areas, entirely new utility systems would require an increase in the annual maintenance and operational costs to provide these additional levels of service and to meet state and federal regulations for public utility systems.

Moving the stable to McCauley Ranch would increase the travel time for the back country utilities operation to Valley trailheads but would decrease travel times to destinations in the Tioga Road corridor. However, there would be an impact to the backcountry utilities operation due to increased logistic maneuvering when leaving from Yosemite Valley trailheads.

The overall impact to maintenance operations would be long-term, moderate, and adverse until funding is provided to meet the need. When funded, the impacts would be long-term, negligible, and neutral.

Visitor and Resource Operations

Visitor and Resource Protection

It is estimated that approximately 27 additional visitor protection personnel would be needed to provide prescribed levels of service. This would represent approximately \$1,012,500 in additional

salary and operations costs annually. Newly restored areas would need to be protected, security for the newly constructed museum expansion would need to be provided, and regular patrols of out-of-Valley parking areas would be needed.

Relocating the base of operations for Search and Rescue from Yosemite Valley to El Portal would have the potential for long-term, minor, adverse effects upon incident costs, in that activities in Yosemite Valley, where most complex rescues occur, would have more logistical costs than under Alternative 1, because coordination of Yosemite Valley operations would be more difficult, while coordination of activities in other parts of the park would potentially improve.

Interpretation

Greatly expanded interpretive and educational facilities and programs would require a large increase in staffing for the Interpretation Division. The new museum and library with expanded public access would also require increased staffing. The Interpretation Division would have to operate additional visitor contact facilities and conduct additional interpretive programs. It is estimated that approximately 30 additional interpretive personnel would be needed to provide prescribed levels of service. This would represent approximately \$1,125,000 in additional salary and operations costs annually.

Resources Management

Restoration of impacted areas, continued monitoring of restoration efforts, mitigation measures to facilitate restoration resulting from changing visitor-use patterns, and expanded efforts working with the six culturally associated American Indian tribal groups would require an increase in staffing. Staffing and funding would be needed to implement the Visitor Experience and Resource Protection (VERP) program. It is estimated that approximately seven additional resources management personnel would be needed to provide prescribed levels of service. This would represent approximately \$262,500 for additional salary and operating costs annually. Overall, impacts to visitors would be long-term, moderate, and adverse until fully funded. Once funded, the impacts would be long-term, negligible, and neutral.

Administration

Valley administrative operations would be shifted to El Portal. This would have a long-term, minor, adverse impact on administration operations as a result of increases in logistic maneuvering. Administrative operations would be increased by five positions and \$187,700 to support park operations.

Concessions Management

Management and monitoring of new concession operations and facilities would require two additional staff at \$75,000 annually. This would have a short-term, moderate, adverse impact on concessions management, in that there would be an increase in costs for increasing the level of service required under this alternative during the period when concession services would be revised and refined.

Depending on the location chosen by the park's principal concessioner for its headquarters, coordination and communication would potentially be more difficult than under Alternative 1. However, adverse the impact of communication and coordination difficulties would likely be moderate over the short term, reducing to minor as both operations adjust to the new working environment.

C O N C E S S I O N E R S A N D C O O P E R A T O R S

Impacts on park concessioners are evaluated in the Social and Economic Environments section of this chapter.

T R A N S I T O P E R A T I O N S

The annual recurring costs for operations and maintenance of the bus fleet for this alternative would be \$8,448,000. This cost would be long-term, major, and adverse impact to this operation until fully funded. Once funded, the impacts would be long-term, negligible, and neutral.

C O N C L U S I O N

This alternative would require that approximately 131 additional park personnel be added to current staffing levels in the Maintenance Operations, Protection Operations, Interpretation, Resources Management, and Administrative Divisions. This would require an additional \$4,912,500 annually (or approximately \$37,500 per person) in additional park funding for salary and operations costs above those discussed under Alternative 1. The cost for the additional park personnel would represent a long-term, moderate, adverse impact until funded. Once funded, there would be a long-term, negligible, and neutral impact to these operations.

C U M U L A T I V E I M P A C T S

Cumulative impacts would result from other park planning projects and regional activities. There could be a moderate increase in the workloads of the Maintenance Operations, Interpretation, and Resources Management Divisions as a result of the transit system developed by Yosemite Area Regional Transit System (inter-agency) due to increased needs in facility maintenance, custodial services, visitor education, and resource monitoring. This would be a long-term, moderate, adverse impact because of workload increases. YARTS operations would result in a long-term, minor, beneficial impact on protection operations due to the alleviation of traffic congestion. These moderate effects, in combination with the major impacts of implementing in-park and in-Valley transit systems, would result in adverse operational impacts that are long-term and major compared to Alternative 1.

The redesign of the South Entrance and Mariposa Grove areas would increase the workload of the Protection Operations, Maintenance Operations, and Resources Management Divisions in the short term during initial planning and implementation. This would be a short-term, minor, adverse impact. This project would require a long-term commitment from and create an increased workload for the Interpretation Division. This project would have a major, adverse impact on the workload of the Interpretation Division. The Protection Operations and Maintenance Operations Divisions would achieve long-term, moderate, benefits when the project is completed due to decreased workloads for their operations. These effects, when considered in

combination with the major impact of providing more interpretive services at improved visitor information centers, would result in long-term, moderate, and adverse operational impacts.

Fire management planning and wilderness management planning would require an increase in the workloads of the Protection Operations and Resources Management Divisions. This would have short-term, major, adverse impacts on both divisions. The workload of fire management staff would increase over the long term as a result of this planning effort. This alternative would create the need for planning, design, and program refinement, which would also have short-term, major, adverse impacts; cumulative adverse impacts would remain short-term, but major.

Numerous proposed residential and commercial developments along each entrance corridor would have no long-term, major impacts on operations, assuming that a traveler information and traffic management system would be developed and that the park would not provide emergency services to those areas. Should the park be required to provide emergency services to these areas, there would be some impacts unless cooperative agreements were adopted and financial support was available from involved county governments. Short-term, moderate to major, adverse impacts would be expected during times of construction. Considered in combination with the actions in this alternative, adverse effects upon Protection Operations would remain moderate to major and long term.

A research station for the University of California, campus at Merced (UC Merced) would have a long-term, moderate to major benefit resulting from educational and research support and the creation of a viable recruitment pool for new employees.

Many other in-park actions such as major campground rehabilitation, development concept planning, and water treatment plant rehabilitation (including water and wastewater improvements at Tuolumne Meadows and White Wolf) would have short-term, major, adverse impacts on staff availability during times of construction or development. When considered in combination with the actions in this alternative, the cumulative effect of these activities on park operations would remain major and adverse, but of a short-term duration.

Energy Consumption

Under Alternative 5, housing beds would be relocated from Yosemite Valley to El Portal, Wawona, and Foresta, and additional beds would be added to El Portal and Wawona to accommodate present unmet needs and potential future growth as a result of operational changes associated with this alternative. Table 4-144 summarizes existing housing (Alternative 1) and estimated propane consumption and analogous data for Alternative 5.

Under Alternative 5, there would be an increase of about 340% in propane consumption in El Portal, a 275% increase in Wawona, a small increase in Foresta, and a decrease of about 40% in the Valley. However, when combined, the overall propane consumption increase as a result of implementation of Alternative 5 would be 79,110 gallons per year, or 23%, which would represent a moderate, long-term, adverse impact on propane consumption.

Table 4-144 Changes in Housing and Propane Consumption				
Location	Alternative 1		Alternative 5	
	No. of Beds	Propane (gal/yr)	No. of Beds	Propane (gal/yr)
Yosemite Valley	1,277	260,510	752	153,400
El Portal	290	59,160	1,007	205,400
Wawona	112	22,850	310	63,240
Foresta	4	810	14	2,860
Cascades and Arch Rock	12	2,450	0	0
Total	1,695	345,790	2,083	424,900

Table 4-145 lists estimated fuel consumption for visitor-related travel to and from the Valley due to the Alternative 5 transportation plans, and for additional out-of-Valley employee commuting due to the relocation of residences from the Valley to El Portal and Wawona. By 2015, Alternative 5 would result in a 44% decrease in visitor-related gasoline consumption and a 120% increase in diesel (or alternative) fuel consumption. This increase would be associated with new shuttle buses operating from out-of-Valley day-visitor parking areas and the expanded Valley shuttle service.

A 44% decrease in gasoline consumption by the year 2015 would represent a savings of 1,080,800 gallons over Alternative 1, whereas the 120% increase in diesel (or alternative) fuel consumption would represent an increase of 258,200 gallons over Alternative 1. Overall Alternative 5 by the year 2015 would yield a combined savings of 822,600 gallons of fuel. This is a net decrease from Alternative 1 in motor fuel consumption of approximately 30% and would represent a moderate, long-term, beneficial impact. Similar energy savings would be achieved for years 2005 and 2010 as well.

Table 4-145 Vehicle Fuel Consumption			
Alternative	Total (Gal/Yr)		Total Fuel Consumption (Gal/Yr)
	Gasoline	Diesel or Alternative Fuel	
2000			
Alternative 1	2,905,800	230,200	3,136,000
Alternative 5	NA	NA	NA
2005			
Alternative 1	2,695,100	224,500	2,920,600
Alternative 5	1,521,600	494,200	2,015,800
2010			
Alternative 1	2,555,400	219,100	2,774,500
Alternative 5	1,442,200	483,000	1,925,200
2015			
Alternative 1	2,480,800	213,800	2,694,600
Alternative 5	1,400,000	472,000	1,872,000

CONCLUSION

Employee housing space-heating consumption would decrease in the Valley, but would increase at El Portal and Wawona during the 2000-2015 time frame. Overall, there would be a minor

increase in total housing units for Alternative 5 and an associated minor, long-term, adverse impact on home energy consumption.

The reduction in gasoline consumption in 2015 relative to Alternative 1 reflects the shift by park visitors from private vehicles to shuttle buses, as well as a fleet turnover to vehicles with improved fuel economy over time. The increase in diesel (or alternative) fuel consumption would be attributable to the deployment of shuttle buses for visitors. The combined motor fuel savings for Alternative 5 in the years 2005, 2010 and 2015 would represent a moderate, beneficial, long-term impact.

C U M U L A T I V E I M P A C T S

Other actions in the immediate area and greater San Joaquin Valley may have cumulative impacts. The cumulative impact on energy consumption under Alternative 5 would be associated with new housing and lodging developments outside the park. A moderate, long-term, adverse impact would result from these reasonably foreseeable future projects in the region, as described for Alternative 2. Alternative 5, however, would represent minimal contribution to the overall cumulative impact, because the net increase in employee housing for Alternative 5 would be only about 1% of new housing projected for the region.

*Unavoidable
Adverse
Impacts*

Final
Yosemite
Valley
Plan

Supplemental EIS

Photo on previous page by Gustav Fagerstrom, courtesy of Yosemite Museum

The first tourist excursion into Yosemite Valley occurred in 1855. By the 1870s, hotels had been built to accommodate tourists hardy enough to endure the dusty, multi-day journey. This tourist party poses in front of Yosemite Falls in about 1875.

UNAVOIDABLE ADVERSE IMPACTS

The following discussion identifies impacts to resources associated with the implementation of each alternative. These impacts have been identified as being unavoidable, moderate to major, and adverse.

Alternative 1

Generally, Alternative 1 would result in continued degradation of natural resources due to continued use and existing development. Existing structures would remain within highly valued resource areas such as wetlands, meadows, riparian areas, and California black oak woodlands. Existing bridges would also continue to impede flood flows and channel movement. Visitation levels would also continue to grow, resulting in more crowding, congestion, and delays for visitors. The potential risk for unavoidable adverse impacts to structures and human life would continue within the floodplain and rockfall zones.

CULTURAL RESOURCES

The Superintendent's House (Residence 1) would be allowed to deteriorate, leading to its eventual loss.

Alternative 2

No appreciable, unavoidable, adverse impacts on scenic, geologic hazards, or energy consumption would take place under this alternative.

WATER RESOURCES

The Camp 6 parking area would be situated within a portion of the floodplain that could experience high-velocity, deep flows during a flood event such as were observed during the January 1997 flood. This parking facility could impede the river's ability to naturally migrate and change course during extreme flood events and reduce the area available to the river for sediment deposition. In addition, impacts to riverbank stability (soils compaction, accelerated erosion, and vegetation loss) could occur due to the radiating effects associated with the increased concentration of visitors. Overall, development of a parking facility in the Camp 6 area could result in localized adverse impacts on hydrology and floodplain values.

FLOODPLAINS

The construction of 657 employee beds in the 100-year floodplain at Hennessey's Ranch would have long-term, adverse impact due to the presence of people in the floodplain at night; however, risk to property and human safety would be mitigated through the extension and elevation of the existing levee. (see also Water Resources above)

WETLANDS

In Yosemite Valley up to 141 acres of wetland would be restored, however, Alternative 2 would adversely impact up to approximately 23 acres of potential wetland areas, resulting in direct

wetland loss and indirect impacts on wetland hydrology. These impacts would occur from proposed new development (12 acres) and redevelopment of facilities (11 acres). Impacts to these potential wetland areas would be minimized to the extent feasible during facility design and site layout once the potential wetland areas have been fully delineated. There would be no net-loss of wetlands.

S O I L S

Alternative 2 would develop and therefore adversely affect 69 acres of soil within the Valley and up to 80 acres of soil in out-of-Valley areas, the majority of which would occur within non-highly valued resource soil types. These adverse impacts would include soil removal, profile mixing, compaction, and erosion as a result of new development activities. Impacts to highly valued resource soils would be minimized to the extent feasible during facility design and site layout.

V E G E T A T I O N

Alternative 2 would impact 75 acres of vegetation within the Valley, 54 acres of which would occur within non-highly valued resource vegetation types. Up to 80 acres of vegetation would be impacted in out-of-Valley areas. These adverse impacts would include loss of vegetation and degradation of vegetation communities from new development and changes in visitor use. In Yosemite Valley and out-of-Valley areas, impacts to highly valued resource vegetation types would be minimized to the extent feasible, and special consideration would be given to retaining natural topography, native soils, and large trees during facility design and site layout.

W I L D L I F E

Unavoidable adverse effects on wildlife would be caused by loss or degradation of 75 acres of habitat in Yosemite Valley, 54 acres of which would occur in non-highly valued resource habitat types. Up to 80 acres of habitat would be affected in out-of-Valley areas. Wildlife would be affected by habitat fragmentation, local reductions in food, cover, and reproductive sites at project locations, and by the disturbance from increased human use of these areas. To the extent feasible, impact to wildlife would be minimized through site design to avoid highly valued resource habitats, by the preservation of features important to wildlife (e.g., snags), and control of human access to sensitive habitats.

S P E C I A L - S T A T U S W I L D L I F E S P E C I E S

Alternative 2 would potentially have adverse effects on three special-status wildlife species. These effects would occur through removal or degradation of habitat (thus affecting the availability of food, cover, and reproductive sites), habitat fragmentation, and through an increase in human disturbance in the vicinity of developments. To the extent feasible, these impacts would be minimized through site-specific surveys for special-status species, and site designs limiting the effects on species found in the areas of potential development.

S P E C I A L - S T A T U S P L A N T S P E C I E S

Alternative 2 would result in the potential loss or degradation of habitat with moderate to major, adverse effects for three park rare species. These impacts would occur as a result of new

development, including parking facilities. These impacts would be mitigated to the extent practicable through site-specific surveys and design to avoid impacts to individuals found in development areas.

A I R Q U A L I T Y

Under this alternative there would be short-term adverse impact to air quality due to the increased emissions of nitrogen oxide which is attributed to the operation of shuttle buses from the three out-of-Valley parking areas and the expanded in-Valley shuttle fleet. Nitrogen oxide would also increase with the use of compressed natural gas fueled buses.

C U L T U R A L R E S O U R C E S

Alternative 2 would result in the potential destruction of the majority of one archeological site with high data potential, and one historic village site in El Portal. Development in Yosemite Valley and El Portal would result in the potential loss of many traditional gathering areas. It would also result in the loss of historic structures such as the individually significant Stoneman and Sugar Pine Bridges, the concessioner's stable, and many other contributing elements of the cultural landscape. As with Alternative 1, the Superintendent's House (Residence 1) would be lost. The Camp Curry Historic District also would be changed substantially, resulting in the loss of a majority of the character-defining tent cabins. Actions in the Merced River gorge would result in the removal of six of the remaining seven elements of the Yosemite Hydroelectric Power Plant historic property. However, the National Park Service would pursue a data recovery program, including an inventory and evaluation of impact areas, continue consultation with culturally associated American Indian tribes, and examine alternative uses for historic structures in an effort to avoid, minimize, and mitigate impacts. In keeping with the Programmatic Agreement, the National Park Service would continue to consult with the State Historic Preservation Office during continued studies, the creation of site-specific designs, and project implementation.

M E R C E D W I L D A N D S C E N I C R I V E R

Reconstruction of the El Portal Road between the Cascades Diversion Dam and Pohono Bridge could, depending on design, have a long-term, adverse impact on the hydrologic processes Outstandingly Remarkable Value due to the continued presence of bank stabilization materials in the river channel. The reconstruction of the El Portal Road and the removal of the Cascades Diversion Dam would have a short-term, adverse impact on the scenic Outstandingly Remarkable Value. The removal of historic bridges (i.e., Sugar Pine and Stoneman) would have long-term, moderate, adverse impacts on the cultural Outstandingly Remarkable Value because river-related historic structures would be lost and could have short-term, adverse impacts to the scenic and hydrologic processes Outstandingly Remarkable Value, due to the presence of construction equipment in and near the river. The relocation of the former Superintendent's House (Residence 1) would have a long-term, moderate, adverse impact on the cultural Outstandingly Remarkable Value because the structure would be moved away from the river, an important consideration in the original placement of the historic structure. The construction of a new parking facility in Yosemite Village (Camp 6) could have a long-term, adverse impact on the

scenic Outstandingly Remarkable Value depending on design. The possible construction of a traffic check station would have a long-term, adverse impact on the cultural Outstandingly Remarkable Value due to the possible disturbance of ethnographic gathering areas and a river-related archeological site.

V I S I T O R E X P E R I E N C E

This alternative would have impacts on visitor experience, including an increase in the amount of time required for day visitors to travel to the Valley, some loss of private vehicle access to east Valley destinations, and the inconvenience of having to carry personal possessions instead of relying on private vehicles as transport and storage devices. This would result from many day visitors having to park in out-of-Valley areas and enter the Valley by shuttle during peak season. Lodging units would decrease to 961, but campsites would increase to 500. The net effect would be a reduction of the overnight visitor capacity of Yosemite Valley. The impacts related to discontinuation of commercial stock rides would be long-term and adverse. Difficult access for raft and kayak users could lead to their displacement; this impact would be long-term and adverse. The potential development of a traffic check station at Taft Toe could result in a long-term, adverse impact on the night sky.

T R A N S P O R T A T I O N

Alternative 2 would result in an increase in the average travel time necessary for day visitors to access the Valley from the entrance stations (an additional 21 minutes on average). This increase would be caused by having to wait at transit facilities and shuttle stops, and by the longer travel times on buses.

N O I S E

This alternative would result in an increased number of sound events as a result of an increased number of bus trips west of El Capitan crossover, along Southside Drive west of Sentinel Bridge, on Sentinel Drive, Yosemite Village and in the out-of-Valley parking locations.

S O C I A L A N D E C O N O M I C E N V I R O N M E N T S

Alternative 2 would cause increases in population growth in the local communities of El Portal and Wawona, and would have an adverse impact on the local social environment, including law enforcement and court services, medical services to park employees, the elementary school system, and child care operations. In Foresta, the social environment would experience adverse impacts associated with visitor parking facilities if they are to be developed. Limited housing for Yosemite Association employees would have an adverse impact.

P A R K O P E R A T I O N S

Under this alternative, the profit level of the primary concessioner would be reduced to the point that an additional \$3 million annually would need to be mitigated. If the concessioner is unable to make a fair and reasonable profit from its operations, the concessioner would presumably choose to discontinue operations in the absence of measures to mitigate this economic impact. Some of these measures, if selected, could adversely affect park operations. Two such mitigation measures

would include (1) changing the distribution of park entrance fee revenues and (2) providing relief from building repair and maintenance costs. If either or both of these measures were to be used to offset impacts to the primary concessioner, National Park Service operating costs would increase. For example, the National Park Service would be responsible for funding the building repair and maintenance costs no longer allocated to the primary concessioner. If entrance fees were allocated to the concessioner and diverted from other projects, either those projects would not go forward or the National Park Service would have to secure additional park operating funds.

Alternative 3

No appreciable, unavoidable, adverse impacts on water resources, air quality, geologic hazards, transportation, park operations, or energy consumption would take place under this alternative.

F L O O D P L A I N S

The construction of 656 employee beds in the 100-year floodplain at Hennessey's Ranch would have a long-term, adverse impact, due to the presence of people in the floodplain at night; however, risk to property and human safety would be mitigated through the extension and elevation of the existing levee.

W E T L A N D S

In Yosemite Valley there would be 156 acres of wetland restored; however, alternative 3 would adversely affect up to approximately 17 acres of potential wetland areas, resulting in direct wetland loss and indirect impacts on wetland hydrology. These impacts would occur from proposed new development (7 acres) and redevelopment of facilities (10 acres). In addition, impacts to wetland areas in the vicinity of Taft Toe would be expected as a result of the radiating effects of increased visitor presence. Impacts to these potential wetland areas would be minimized to the extent feasible during facility design and site layout once the potential wetland areas have been fully delineated. There would be no net-loss of wetlands.

S O I L S

Alternative 3 would impact 98 acres of soil within the Valley and less than 40 acres of soil in the out-of-Valley areas, the majority of which would occur within non-highly valued resource soil types. These adverse impacts would include soil removal, profile mixing, compaction, and erosion as a result of new development activities. Impacts to highly valued resource soils would be minimized to the extent feasible during facility design and site layout.

V E G E T A T I O N

Alternative 3 would affect 99 acres of vegetation within the Valley, the majority of which (85 acres) would occur within non-highly valued resource vegetation types. Up to 37 acres of vegetation in out-of-Valley areas would also be impacted. These adverse impacts would include loss of vegetation and degradation of vegetation communities from new development and changes in visitor use. Impacts to highly valued resource vegetation types would be minimized to the

extent feasible, and special consideration would be given to retaining natural topography, native soils, and large trees during facility design and site layout.

W I L D L I F E

Unavoidable adverse impacts on wildlife would be caused by loss or degradation of 99 acres of habitat in Yosemite Valley, 85 acres of which would occur in non-highly valued resource habitat types. Up to 37 acres of habitat would be affected in out-of-Valley areas. Wildlife would be affected by habitat fragmentation, local reductions in food, cover, and reproductive sites at project locations, and by the disturbance from increased human use of these areas. To the extent feasible, impact to wildlife would be minimized through site design to avoid highly valued resource habitats, by the preservation of features important to wildlife (e.g., snags), and control of human access to sensitive habitats.

S P E C I A L - S T A T U S W I L D L I F E S P E C I E S

Alternative 3 would potentially have adverse effects on one special-status wildlife species. These effects would occur through removal or degradation of habitat (thus affecting the availability of food, cover, and reproductive sites), habitat fragmentation, and through an increase in human disturbance in the vicinity of developments. To the extent feasible, these impacts would be minimized through site-specific surveys for special-status species, and site designs limiting the effects on species found in the areas of potential development.

S P E C I A L - S T A T U S P L A N T S P E C I E S

Alternative 3 would result in the potential loss or degradation of habitat for two park rare species. These impacts would occur as a result of new development including parking facilities. However, these impacts would be mitigated to the extent practicable through site-specific surveys and designs to avoid impacts to individuals found within areas of potential development.

S C E N I C R E S O U R C E S

Alternative 3 would affect 99 acres of scenic resources due to vegetation loss. However, these impacts would occur in areas adjacent to existing development, limiting the amount of new development that would be noticeable, with the exception of the new parking/transit facility and visitor center at Taft Toe which would be adverse, major, and long-term.

N O I S E

This alternative would result in an increased amount of nonvehicle noise events in the new housing areas proposed in El Portal. The number of sound events as a result of an increased number of bus trips east of El Capitan crossover, along Southside Drive, and Yosemite Village.

C U L T U R A L R E S O U R C E S

Alternative 3 would result in the potential destruction of the majority of one archeological site, and one historic village with high data potential in El Portal. Development in El Portal and Yosemite Valley would also damage or destroy gathering areas and historic villages. Individually significant historic structures, Stoneman Bridge, and Sugar Pine Bridge would be lost. Many

contributing elements of the cultural landscape would be lost such as the Ahwahnee Row Houses, NPS maintenance facilities, and the concessioner stables, among others. The Camp Curry Historic District would be substantially changed, resulting in the loss of a majority of the character-defining tent cabins and other contributing structures. The historic land use and spatial organization of the Valley would be substantially altered with the addition of day-visitor parking and transit and orientation facilities at Taft Toe. Removal of the Cascades Diversion Dam, screenhouse, and residences would result in the loss of six of the remaining seven elements of the Yosemite Hydroelectric Power Plant historic property. However, the National Park Service would pursue a data recovery program, including an inventory and evaluation of impact areas, continue consultation with culturally associated American Indian tribes, and examine alternative uses for historic structures in an effort to avoid, minimize, and mitigate impacts. In keeping with the Programmatic Agreement, the National Park Service would continue to consult with the State Historic Preservation Office (SHPO) during continued studies, the creation of site-specific designs, and project implementation.

M E R C E D W I L D A N D S C E N I C R I V E R

The reconstruction of the El Portal Road between the Cascades Diversion Dam and Pohono Bridge could, depending on design, have a long-term, adverse impact on the hydrologic processes Outstandingly Remarkable Value due to the continued presence of bank stabilization materials in the river channel. The reconstruction of the El Portal Road and the removal of the Cascades Diversion Dam would have short-term, adverse impacts on the scenic Outstandingly Remarkable Value. The removal of historic bridges (i.e., Sugar Pine, Stoneman, Superintendent's, and Housekeeping) would have long-term, adverse impacts on the cultural Outstandingly Remarkable Value because river-related historic structures would be lost and could have short-term, adverse impacts to the scenic and hydrologic processes Outstandingly Remarkable Value, due to the presence of construction equipment in and near the river. The removal of the former Superintendent's House (Residence 1) and Lamon Orchard would have long-term, adverse impacts on the cultural Outstandingly Remarkable Value because river-related historic resources would be lost. The possible construction of a traffic check station would have a long-term, adverse impact on the cultural Outstandingly Remarkable Value due to possible disturbance to ethnographic gathering areas and a river-related archeological site. The discontinuation of private stock use would have a long-term, adverse impact on the recreation Outstandingly Remarkable Value because the diversity of river-related recreational opportunities would be diminished.

V I S I T O R E X P E R I E N C E

This alternative would have impacts on visitor experience including the need for most visitors to travel by means other than their private vehicles to destinations within the Valley. This would also result in some loss of private vehicle access to east Valley destinations and the inconvenience of having to carry personal possessions instead of relying on private vehicles as transport and storage devices. The number of campsites would decrease to 449 and lodging units would decrease to 982, resulting in fewer units and sites available for overnight users. The impacts related to discontinuation of commercial stock rides would be long-term and adverse. Difficult access for raft and kayak users as well as anglers could lead to their displacement; this would be long-term

and adverse. The development of a parking and transit facility at Taft Toe would result in a long-term, adverse impact on the night sky.

S O C I A L A N D E C O N O M I C E N V I R O N M E N T S

Alternative 3 would cause increases in population growth in El Portal that would have an adverse impact on the local social environment, including law enforcement and court services, medical services to park employees, the elementary school system, and child care operations.

Alternative 4

No appreciable, unavoidable, adverse impacts on geologic hazards, water resources, park operations, or energy consumption would take place under this alternative.

F L O O D P L A I N S

The construction of 656 employee beds in the 100-year floodplain at Hennessey's Ranch would have a moderate, adverse impact, due to the presence of people in the floodplain at night; however, risk to property and human safety would be mitigated through the extension and elevation of the existing levee.

W E T L A N D S

In Yosemite Valley there would be 149 acres of wetland restored; however, Alternative 4 would adversely affect up to approximately 18 acres of potential wetland areas resulting in direct wetland loss and indirect impacts on wetland hydrology. These impacts would occur from proposed new development (7 acres) and redevelopment of facilities (11 acres). In addition, impacts to wetland areas in the vicinity of Taft Toe would be expected as a result of the radiating effects of increased visitor presence in this area. Impacts to these potential wetland areas would be minimized to the extent feasible during facility design and site layout once the potential wetland areas have been fully delineated. There would be no net loss of wetlands.

S O I L S

Alternative 4 would affect 98 acres of soil within the Valley and up to 70 acres of soil in out-of-Valley areas, the majority of which would occur within non-highly valued resource soil types. These adverse impacts would include soil removal, profile mixing, compaction, and erosion as a result of new development activities. Impacts to highly valued resource soils would be minimized to the extent feasible during facility design and site layout.

V E G E T A T I O N

Alternative 4 would impact 102 acres of vegetation within the Valley, of which 88 acres would occur within non-highly valued resource vegetation types. Up to 70 acres of vegetation in out-of-Valley areas would also be impacted. These adverse impacts would include loss of vegetation and degradation of vegetation communities from new development and changes in visitor use. In Yosemite Valley, impacts to highly valued resource vegetation types would be minimized to the extent feasible and special consideration would be given to retaining natural topography, native soils and large trees during facility design and site layout.

W I L D L I F E

Unavoidable, adverse impacts on wildlife would be caused by loss or degradation of 102 acres of habitat in Yosemite Valley, 88 acres of which would occur on non-highly valued resource habitat types. Up to 70 acres of habitat would be affected in out-of-Valley areas. Wildlife would be affected by habitat fragmentation, local reductions in food, cover, and reproductive sites at project locations, and by the disturbance from increased human use of these areas. To the extent feasible, impact to wildlife could be minimized through site design to avoid highly valued resource habitats, by the preservation of features important to wildlife (e.g., snags), and control of human access to sensitive habitats.

S P E C I A L - S T A T U S W I L D L I F E S P E C I E S

Alternative 4 would potentially have adverse effects on 2 special-status wildlife species. These effects would occur through removal or degradation of habitat (thus affecting the availability of food, cover, and reproductive sites), habitat fragmentation, and through an increase in human disturbance in the vicinity of developments. To the extent feasible, these impacts would be minimized through site-specific surveys for special-status species, and site designs limiting the effects on species found in the areas of potential development.

S P E C I A L - S T A T U S P L A N T S P E C I E S

Alternative 4 would result in the potential loss or degradation of habitat for three park rare species. These impacts would occur as a result of new development including parking facilities. However, these impacts would be mitigated to the extent practicable through site-specific surveys and designs to avoid impacts to species occurring in these development areas.

A I R Q U A L I T Y

Under this alternative there would be short-term adverse impact to air quality due to the increased emissions of nitrogen oxide which is attributed to the operation of shuttle buses from the three out-of-Valley parking areas and the expanded in-Valley shuttle fleet. Nitrogen oxide would also increase with the use of compressed natural gas fueled buses.

S C E N I C R E S O U R C E S

Alternative 4 would affect 99 acres of scenic resources due to vegetation loss. However, these impacts would occur in areas adjacent to existing development, limiting the amount of new development that would be noticeable, with the exception of the new parking/transit center and visitor center at Taft Toe which would be adverse, major, and long-term.

C U L T U R A L R E S O U R C E S

Alternative 4 would result in the potential destruction of the majority of one archeological site, and one historic village with high data potential in El Portal. Development in El Portal and Yosemite Valley would also damage or destroy gathering areas and historic villages. It would also result in the loss of individually significant historic structures such as the Stoneman and Sugar Pine Bridges. In addition, many contributing elements of the cultural landscape would be lost (such as the Ahwahnee Row Houses, National Park Service maintenance facilities, and the

concessioner stables). The Camp Curry Historic District would be substantially altered, resulting in the loss of a majority of the character-defining tent cabins and other contributing structures. The historic spatial organization and land-use patterns in the cultural landscape would be altered substantially with the addition of day-visitor parking, transit, and orientation facilities at Taft Toe. Removal of the Cascades Diversion Dam and residences would result in the loss of six of the remaining seven elements of the Yosemite Hydroelectric Power Plant historic property. However, the National Park Service would pursue a data recovery program, including an inventory and evaluation of impact areas, continue consultation with culturally associated American Indian tribes, and examine alternative uses for historic structures in an effort to avoid, minimize, and mitigate impacts. In keeping with the Programmatic Agreement, the National Park Service would continue to consult with the State Historic Preservation Office (SHPO) during continued studies, the creation of site-specific designs, and project implementation.

M E R C E D W I L D A N D S C E N I C R I V E R

The reconstruction of the El Portal Road between the Cascades Diversion Dam and Pohono Bridge could, depending on design, have a long-term, adverse impact on the hydrologic processes Outstandingly Remarkable Value due to the continued presence of bank stabilization materials in the river channel. The reconstruction of the El Portal Road and the removal of the Cascades Diversion Dam would have a short-term, adverse impact on the scenic Outstandingly Remarkable Value. The removal of historic bridges (i.e., Sugar Pine, Stoneman, Superintendent's, and Housekeeping) would have long-term, adverse impacts on the cultural Outstandingly Remarkable Value because river-related historic structures would be lost and could have short-term, adverse impacts to the scenic and hydrologic processes Outstandingly Remarkable Values due to the presence of construction equipment in and near the river. The removal of the former Superintendent's House (Residence 1) would have a long-term, adverse impact on the cultural Outstandingly Remarkable Value because a river-related historic structure would be lost. The possible construction of a traffic check station would have a long-term, adverse impact on the cultural Outstandingly Remarkable Value due to possible disturbance to ethnographic gathering areas and a river-related archeological site.

V I S I T O R E X P E R I E N C E

This alternative would have impacts on visitor experience, including an increase in the amount of time necessary to travel to the Valley caused by the need to park at Taft Toe or out-of-Valley areas and access the Valley by shuttle. This would also result in some loss of private vehicle access to east Valley destinations and the inconvenience of having to carry personal possessions instead of relying on private vehicles as transport and storage devices. The number of campsites would decrease to 441 and lodging units would decrease to 982, resulting in fewer units and sites available for overnight users. The impacts related to discontinuation of commercial stock rides would be long-term and adverse. Difficult access for raft and kayak users as well as anglers could lead to their displacement; this would be long-term and adverse. The development of a parking and transit facility at Taft Toe would result in a long-term, adverse impact on the night sky.

TRANSPORTATION

Alternative 4 would result in an increase in travel time needed to access the Valley from the entrance stations (additional 29 minutes on average). This increase would be caused by having to wait at transit facilities and shuttle stops for buses.

NOISE

This alternative would result in an increased number of sound events as a result of an increased number of bus trips west of El Capitan crossover, along Southside Drive west of Sentinel Bridge, on Sentinel Drive, Yosemite Village and in the out-of-Valley parking locations.

SOCIAL AND ECONOMIC ENVIRONMENTS

Alternative 4 would cause increases in population growth in El Portal that would have an adverse effect on the local social environment, including law enforcement and court services, medical services to park employees, the elementary school system, and child care operations.

Alternative 5

No appreciable, unavoidable, adverse impacts on geologic hazards, scenic, transportation, park operations, or energy consumption would take place under this alternative.

WATER RESOURCES

The Camp 6 parking area would be situated within a portion of the floodplain that could experience high-velocity, deep flows during a flood event such as were observed during the January 1997 flood. This parking facility could impede the river's ability to naturally migrate and change course during extreme flood events and reduce the area available to the river for sediment deposition. In addition, impacts to riverbank stability (soils compaction, accelerated erosion, and vegetation loss) could occur due to the radiating effects associated with the increased concentration of visitors. Overall, development of a parking facility in the Camp 6 area could result in localized, long-term, adverse impacts on hydrology and floodplain values.

FLOODPLAINS

The construction of 656 employee beds in the 100-year floodplain at Hennessey's Ranch would be a long-term moderate, adverse impact, due to the presence of people in the floodplain at night; however, risk to property and human safety would be mitigated through the extension and elevation of the existing levee.

WETLANDS

In Yosemite Valley there would be 131 acres of wetland restored; however, Alternative 5 would adversely affect up to approximately 27 acres of potential wetland areas resulting in direct wetland loss and indirect impacts on wetland hydrology. These impacts would occur from proposed new development (12 acres) and redevelopment of facilities (15 acres). Impacts on these potential wetland areas would be minimized to the extent feasible during facility design and site layout once the potential wetland areas have been fully delineated. There would be no net loss of wetlands.

S O I L S

Alternative 5 would have impacts to 67 acres of soil within the Valley and up to 80 acres of soil in the out of Valley areas, the majority of which would occur within non-highly valued resource soil types. These adverse impacts would include soil removal, profile mixing, compaction, and erosion as a result of new development activities. Impacts on highly valued resource soils would be minimized to the extent feasible during facility design and site layout.

V E G E T A T I O N

Alternative 5 would impact 69 acres of vegetation within the Valley, of which 53 acres would occur within non-highly valued resource vegetation types. Up to 78 acres of vegetation in the out-of-Valley areas, would also be impacted. These adverse impacts would include loss of vegetation and degradation of vegetation communities from new development and changes in visitor use. In Yosemite Valley, impacts to highly valued resource vegetation types would be minimized to the extent feasible, and special consideration would be given to retaining natural topography, native soils, and large trees during facility design and site layout.

W I L D L I F E

Unavoidable, adverse impacts on wildlife would be caused by loss or degradation of 69 acres of habitat in Yosemite Valley, 53 acres of which would occur in non-highly valued resource habitat types. Up to 78 acres of habitat would be affected in out-of-Valley areas. Wildlife would be affected by habitat fragmentation, local reductions in food, cover, and reproductive sites at project locations, and by the disturbance from increased human use of these areas. To the extent feasible, impact to wildlife could be minimized through site design to avoid highly valued resource habitats, by the preservation of features important to wildlife (e.g., snags), and control of human access to sensitive habitats.

S P E C I A L - S T A T U S W I L D L I F E S P E C I E S

Alternative 5 would potentially have adverse effects on 3 special-status wildlife species. These effects would occur through removal or degradation of habitat (thus affecting the availability of food, cover, and reproductive sites), habitat fragmentation, and through an increase in human disturbance in the vicinity of developments. To the extent feasible, these impacts would be minimized through site-specific surveys for special-status species, and site designs limiting the effects on species found in the areas of potential development.

S P E C I A L - S T A T U S P L A N T S P E C I E S

Alternative 5 would result in the potential loss or degradation of habitat for three park rare species. These impacts would occur as a result of new development including parking facilities. However, these impacts would be mitigated to the extent practicable through site-specific surveys and design to avoid impacts to individual plants occurring in these development areas.

A I R Q U A L I T Y

Under this alternative there would be short-term adverse impact to air quality due to the increased emissions of nitrogen oxide which is attributed to the operation of shuttle buses from

the three out-of-Valley parking areas and the expanded in-Valley shuttle fleet. Nitrogen oxide would also increase with the use of compressed natural gas fueled buses.

CULTURAL RESOURCES

Alternative 5 would result in the potential destruction of the majority of one archeological site, and one historic village with high data potential in El Portal. Development in El Portal and Yosemite Valley would also damage or destroy gathering areas and historic villages. It would also result in loss of individually significant historic structures such as the Sugar Pine and Ahwahnee Bridges. Many contributing elements of the cultural landscape would be lost, including the Ahwahnee Row Houses, NPS maintenance facilities, and the concessioner stables. The Camp Curry Historic District would be substantially changed, resulting in the loss of a majority of the character-defining tent cabins and other contributing structures. Removal of the Cascades Diversion Dam and residences would result in the loss of six of the remaining seven elements of the Yosemite Hydroelectric Power Plant historic property. However, the National Park Service would pursue a data recovery program, including an inventory and evaluation of impact areas, continue consultation with culturally associated American Indian tribes, and examine alternative uses for historic structures in an effort to avoid, minimize, and mitigate impacts. In keeping with the Programmatic Agreement, the National Park Service would continue to consult with the State Historic Preservation Office (SHPO) during continued studies, the creation of site-specific designs, and project implementation.

MERCED WILD AND SCENIC RIVER

The reconstruction of the El Portal Road between the Cascades Diversion Dam and Pohono Bridge could, depending on design, have a long-term, adverse impact on the hydrologic processes Outstandingly Remarkable Value due to the continued presence of bank stabilization materials in the river channel. The reconstruction of the El Portal Road and the removal of the Cascades Diversion Dam would have short-term, adverse impacts on the scenic Outstandingly Remarkable Value. The construction of new campsites would have long-term, adverse impacts on the hydrologic processes and biological Outstandingly Remarkable Values due to occupation of the 100-year floodplain, loss of river-related vegetation, and radiating impacts to the river from the concentration of visitors. The removal of historic bridges (i.e., Sugar Pine and Ahwahnee) would have long-term, moderate, adverse impacts on the cultural Outstandingly Remarkable Value because river-related historic structures would be lost and could have short-term, adverse impacts to the scenic and hydrologic processes Outstandingly Remarkable Value due to the presence of construction equipment in and near the river. The removal of the former Superintendent's House (Residence 1) would have a long-term, adverse impact on the cultural Outstandingly Remarkable Value because a river-related historic structure would be lost. The possible construction of a traffic check station would have a long-term, adverse impact on the cultural Outstandingly Remarkable Value due to possible disturbance to ethnographic gathering areas and a river-related archeological site.

NOISE

This alternative would result in an increased number of sound events as a result of an increased number of bus trips west of El Capitan crossover, along Southside Drive west of Sentinel Bridge, on Sentinel Drive, Yosemite Village and in the out-of-Valley parking locations.

VISITOR EXPERIENCE

This alternative would have impacts on visitor experience, including an increase in the amount of time necessary to travel to the Valley caused by the need for many day visitors to park in out-of-Valley areas and access the Valley by shuttle. This would also result in some loss of private vehicle access to east Valley destinations and the inconvenience of having to carry personal possessions instead of relying on private vehicles as transport and storage devices. Difficult access for raft and kayak users as well as anglers could lead to their displacement; this would be long-term and adverse. Impacts due to the loss of lodging would be long-term and adverse. The potential development of a traffic check station at Taft Toe could result in a long-term, adverse impact on the night sky.

SOCIAL AND ECONOMIC ENVIRONMENTS

Alternative 5 would cause increases in population growth in the local communities of El Portal and Wawona and would have an adverse impact on the local social environments, including law enforcement and court services, medical services to park employees, the elementary school system, and child care operations. In Foresta, the social environment would experience adverse impacts associated with parking facilities.

*Irreversible
and
Irretrievable
Commitments of
Resources*

Final
Yosemite
Valley
Plan

Supplemental EIS

Photo on previous page courtesy of NPS

For thousands of years, native people regularly burned Yosemite Valley's meadows to keep them open. The last 100 years of fire suppression has contributed to a change in vegetation, including conifer invasion into meadows. Yosemite National Park's fire crews now periodically start fires, reintroducing this natural process back into the ecosystem.

IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES

The irretreivable and irreversible commitments of resources that are associated with each alternative are summarized below. Irreversible commitments are those that cannot be reversed, except perhaps in the extreme long-term. Irretreivable commitments are those that are lost for a period of time.

Alternative 1

The irretreivable and irreversible commitments of resources associated with Alternative 1 are limited to the consumption of energy resources, because no specific actions would be taken to change any of the natural or cultural resources, visitor experience, or park operations.

ENERGY CONSUMPTION

Propane consumption would continue at an estimated rate of 260,000 gallons per year through the year 2015. The estimated combined annual motor fuel consumption in 2000 would be 3,136,000 gallons. This amount would be expected to decrease to an annual amount of 2,694,600 gallons of motor fuel by the year 2015 due to the incremental replacement of the vehicle fleet with vehicles having improved fuel economy.

Alternative 2

Under this alternative, no appreciable irreversible or irretreivable commitments of resources would be associated with water resources, floodplains, air quality, geologic hazards, scenic resources, noise, visitor experience, transportation, social and economic environments, park operations, or energy resources.

WETLANDS

Up to approximately 23 acres of potential wetlands in Yosemite Valley would be adversely affected as a result of the construction and redevelopment of new facilities. This represents an irretreivable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate impacted wetland areas and return them to their preconstruction state at some point in the future.

SOILS

Up to 69 acres of soil would be adversely affected under this alternative as a result of the construction of new facilities in Yosemite Valley, and approximately eight acres of this impact would occur within highly valued resource soils. This represents an irretreivable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate these impacted soil types and return them to their preconstruction state at some point in the future.

VEGETATION

Up to 75 acres of vegetation would be adversely affected in Yosemite Valley under this alternative as a result of the construction of new facilities. However, only 21 of these acres impacted would occur within highly valued resource vegetation types. About 80 acres would be affected outside of Yosemite Valley. This represents an irretrievable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate impacted vegetation types and restore them to their preconstruction state at some point in the future.

WILDLIFE

Up to 75 acres of wildlife habitat would be adversely affected in Yosemite Valley under this alternative as a result of the redevelopment and construction of facilities. Approximately 21 of these acres would be highly valued resource habitat types. Approximately 80 acres would be affected outside of Yosemite Valley. Removal and degradation of habitat would affect the availability of food, cover, and reproductive sites for wildlife, and result in associated indirect human impacts from the use of the development. This represents an irretrievable commitment of these resources for at least the duration of this alternative. It would, however, be possible to restore impacted habitats to some semblance of their preconstruction state at some point in the future.

SPECIAL-STATUS WILDLIFE SPECIES

Adverse effects on 3 special-status wildlife species would have an irreversible impact as long as development under this alternative occupies habitat and causes local human disturbance. It would be possible to reverse these impacts at some future date if the development was removed and some semblance of the natural habitat was restored.

SPECIAL-STATUS PLANT SPECIES

Adverse and irretrievable impacts would occur to two park rare species. Trillium and common juniper would be affected by new development within existing populations. It would be possible to reverse these impacts at some future date if the development was removed and the habitat for these species was restored to natural conditions. Irreversible impacts would occur to one park rare species. Individual planted giant sequoias in Yosemite Valley could be removed during restoration and possibly redevelopment actions. None of these actions would affect the overall sustainability of giant sequoias within the park's three naturally occurring groves, with negligible overall impacts on this species.

CULTURAL RESOURCES

The removal of historic structures and contributing elements of the cultural landscape plus the disturbance of archeological sites would have an irreversible impact. However, prior to the removal or disturbance of these resources, documentation and data recovery would be completed, thus maintaining the historical record and limiting the impact to the loss of the physical structure and historic associations. The disruption and destruction of traditional gathering areas and historic village sites also would have irreversible impacts; however, the National Park Service

would continue to consult with associated American Indian tribes in an effort to minimize these impacts.

M E R C E D W I L D A N D S C E N I C R I V E R

The bank stabilization that may, depending on design, be necessary to reconstruct the El Portal Road between the Cascades Diversion Dam and Pohono Bridge would result in an irretrievable impact to the hydrologic process Outstandingly Remarkable Value because a portion of the river channel would be displaced by the stabilization material. The removal of historic bridges (i.e., Sugar Pine and Stoneman) would have an irreversible adverse impact to the cultural Outstandingly Remarkable Value.

E N E R G Y C O N S U M P T I O N

Estimated annual propane consumption for the years 2000-2015 would be 405,800 gallons. The estimated combined annual motor fuel consumption by the year 2015 is 1,688,300 gallons.

Alternative 3

Under this alternative, no appreciable irreversible or irretrievable commitments of resources would be associated with water resources; floodplains; air quality; geologic hazards; scenic resources; noise; visitor experience; transportation; social and economic environments; or park operations. The irreversible and irretrievable impacts to special-status vegetation species, and to cultural resources would be the same as described for Alternative 2.

W E T L A N D S

Up to approximately 17 acres of potential wetlands in Yosemite Valley would be affected as the result of the construction and redevelopment of new facilities. This represents an irretrievable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate impacted wetland areas and return them to their preconstruction state at some point in the future.

S O I L S

Up to 98 acres of soil would be adversely affected under this alternative as a result of the construction of new facilities in Yosemite Valley. However, none of this impact would occur within highly valued resource soils. This represents an irretrievable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate these impacted soil types and return them to their preconstruction state at some point in the future.

V E G E T A T I O N

Up to 99 acres of vegetation in Yosemite Valley would be adversely affected under this alternative as a result of the construction of new facilities. However, approximately 14 of these impacted acres would occur within highly valued resource vegetation types. About 37 acres of vegetation would be affected outside Yosemite Valley. This represents an irretrievable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate

impacted vegetation types and return them to their preconstruction state at some point in the future.

W I L D L I F E

Up to 99 acres of wildlife habitat would be adversely affected in Yosemite Valley under this alternative as a result of the redevelopment and construction of facilities. Approximately 14 acres of this impacted area would occur in highly valued resource habitat types. Approximately 37 acres of habitat would be affected outside Yosemite Valley. Removal and degradation of habitat would affect the availability of food, cover, and reproductive sites for wildlife resulting in indirect impacts associated with use of the development. This represents an irretrievable commitment of these resources for at least the duration of this alternative. It would, however, be possible to restore impacted habitats to some semblance of their preconstruction state at some point in the future.

S P E C I A L - S T A T U S W I L D L I F E S P E C I E S

Adverse effects on 1 special-status wildlife species would have an irreversible impact as long as development under this alternative occupies habitat and causes local human disturbance. It would be possible to reverse these impacts at some future date if the development was removed and some semblance of the natural habitat was restored.

S P E C I A L - S T A T U S P L A N T S P E C I E S

Adverse and irretrievable impacts would occur to one park rare species. Common juniper would be affected by new development within existing populations. It would be possible to reverse these impacts at some future date if the development was removed and the habitat for these species was restored to natural conditions. Irreversible impacts would occur to one park rare species. Individual planted giant sequoias in Yosemite Valley could be removed during restoration and possibly redevelopment actions. None of these actions would affect the overall sustainability of giant sequoias within the park's three naturally occurring groves, with negligible overall impacts on this species.

M E R C E D W I L D A N D S C E N I C R I V E R

The bank stabilization that may, depending on design, be necessary to reconstruct the El Portal Road between the Cascades Diversion Dam and Pohono Bridge would result in an irretrievable impact to the hydrologic process Outstandingly Remarkable Value because a portion of the river channel would be displaced by the stabilization material. The loss of historic bridges (i.e., Sugar Pine, Stoneman, Superintendent's, and Housekeeping) would have an irreversible adverse impact to the cultural Outstandingly Remarkable Value. The removal of the former Superintendent's House (Residence 1) and Lamon Orchard would result in an irretrievable impact to the cultural Outstandingly Remarkable Value.

E N E R G Y C O N S U M P T I O N

Estimated annual propane consumption for the years 2000-2015 would be 380,310 gallons. The estimated combined annual motor fuel consumption by the year 2015 is 2,165,800 gallons.

Alternative 4

Under this alternative, no appreciable irreversible or irretrievable commitments of resources would be associated with water resources, floodplains, air quality, geologic hazards, scenic resources, visitor experience, transportation, noise, social and economic environments, or park operations. The irreversible and irretrievable impacts to special-status vegetation species, and cultural resources, would be the same as described for Alternative 2.

W E T L A N D S

Up to approximately 18 acres of potential wetlands would be affected as the result of the construction and redevelopment of new facilities. This represents an irretrievable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate impacted wetland areas and return them to their preconstruction state at some point in the future.

S O I L S

Up to 98 acres of soil would be adversely affected under this alternative as a result of the construction of new facilities in Yosemite Valley. However, none of this impact would occur within highly valued resource soil. This represents an irretrievable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate these impacted soil types and return them to their preconstruction state at some point in the future.

V E G E T A T I O N

Up to 102 acres of vegetation in Yosemite Valley would be adversely affected under this alternative as a result of the construction and redevelopment of new facilities. However, approximately 14 of these impacted acres would occur within highly valued resource vegetation types. About 70 acres of vegetation would be affected outside of Yosemite Valley. This represents an irretrievable commitment of this resource for at least duration of this alternative. However, it would be possible to rehabilitate impacted vegetation types and return them to their preconstruction state at some point in the future.

W I L D L I F E

Up to 102 acres of wildlife habitat would be adversely affected in Yosemite Valley under this alternative as a result of the redevelopment and construction of facilities. Approximately 14 of these acres would be highly valued resource habitat types. Approximately 70 acres of habitat would be affected outside Yosemite Valley. Removal and degradation of habitat would affect the availability of food, cover, and reproductive sites for wildlife, and result in associated indirect human impacts from the use of the development. This represents an irreversible commitment of these resources for at least the duration of this alternative. It would, however, be possible to restore impacted habitats to some semblance of their preconstruction state at some point in the future.

SPECIAL-STATUS WILDLIFE SPECIES

Adverse effects on 2 special-status wildlife species would have an irreversible impact as long as development under this alternative occupies habitat and causes local human disturbance. It would be possible to reverse these impacts at some future date if the development was removed and some semblance of the natural habitat was restored.

SPECIAL-STATUS PLANT SPECIES

Adverse and irretrievable impacts would occur to two park rare species. Common juniper and whitneya would be affected by new development within existing populations. It would be possible to reverse these impacts at some future date if the development was removed and the habitat for these species was restored to natural conditions. Irreversible impacts would occur to one park rare species. Individual planted giant sequoias in Yosemite Valley could be removed during restoration and possibly redevelopment actions. None of these actions would affect the overall sustainability of giant sequoias within the park's three naturally occurring groves, with negligible overall impacts on this species.

MERCED WILD AND SCENIC RIVER

The bank stabilization that may, depending on design, be necessary to reconstruct the El Portal Road between the Cascades Diversion Dam and Pohono Bridge would result in an irretrievable impact to the hydrologic process Outstandingly Remarkable Value because a portion of the river channel would be displaced by the stabilization material. The removal of historic bridges (i.e., Sugar Pine, Stoneman, Superintendent's, and Housekeeping) would have an irreversible adverse impact to the cultural Outstandingly Remarkable Value. The removal of the former Superintendent's House (Residence 1) would result in an irretrievable impact to the cultural Outstandingly Remarkable Value.

ENERGY CONSUMPTION

Estimated annual propane consumption for the years 2000-2015 would be 405,810 gallons. The estimated combined annual motor fuel consumption by the year 2015 is 1,644,100 gallons.

Alternative 5

There would be no significant irreversible or irretrievable commitments of resources associated with water resources, floodplains, air quality, geologic hazards, scenic resources, visitor experience, transportation, noise, social and economic environments, and park operations. The irreversible and irretrievable impacts to special-status vegetation species, and cultural resources would be the same as described for Alternative 2.

WETLANDS

Up to approximately 27 acres of potential wetlands would be affected as the result of the construction and redevelopment of new facilities. This represents an irretrievable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate impacted wetland areas and return them to their preconstruction state at some point in the future.

SOILS

Up to 67 acres of soil would be adversely affected under this alternative as a result of the construction of new facilities in Yosemite Valley. However, approximately eight acres of this impact would occur within highly valued resource soil. This represents an irretrievable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate these impacted soil types and return them to their preconstruction state at some point in the future.

VEGETATION

Up to 69 acres of vegetation in Yosemite Valley would be adversely affected under this alternative as a result of the construction and redevelopment of new facilities. However, approximately 16 of these impacted acres would occur within highly valued resource vegetation types. About 78 acres of vegetation would be affected outside Yosemite Valley. This represents an irretrievable commitment of this resource for at least the duration of this alternative. However, it would be possible to rehabilitate impacted vegetation types and return them to their preconstruction state at some point in the future.

WILDLIFE

Up to 69 acres of wildlife habitat would be adversely affected in Yosemite Valley under this alternative as a result of the redevelopment and construction of facilities. Approximately 16 of these acres would be highly valued resource habitat types. Approximately 78 acres of habitat would be affected outside Yosemite Valley. Removal and degradation of habitat would affect the availability of food, cover, and reproductive sites for wildlife, and result in associated indirect human impacts from the use of the development. This represents an irreversible commitment of these resources for at least the duration of this alternative. It would, however, be possible to restore impacted habitats to some semblance of their preconstruction state at some point in the future.

SPECIAL-STATUS WILDLIFE SPECIES

Adverse effects on 3 special-status wildlife species would have an irreversible impact as long as development under this alternative occupies habitat and causes local human disturbance. It would be possible to reverse these impacts at some future date if the development was removed and some semblance of the natural habitat was restored.

SPECIAL-STATUS PLANT SPECIES

Adverse and irretrievable impacts would occur to two park rare species. Trillium and common juniper would be affected by new development within existing populations. It would be possible to reverse these impacts at some future date if the development was removed and the habitat for these species was restored to natural conditions. Irreversible impacts would occur to one park rare species. Individual planted giant sequoias in Yosemite Valley would be removed during restoration and possibly redevelopment actions. None of these actions would affect the overall sustainability of giant sequoias within the park's three naturally occurring groves, with negligible overall impacts on this species.

MERCED WILD AND SCENIC RIVER

The bank stabilization that may, depending on design, be necessary to reconstruct the El Portal Road between the Cascades Diversion Dam and Pohono Bridge would result in an irretrievable impact to the hydrologic process Outstandingly Remarkable Value because a portion of the river channel would be displaced by the stabilization material. The removal of historic bridges (i.e., Sugar Pine and Ahwahnee) would have an irreversible adverse impact to the cultural Outstandingly Remarkable Value. The removal of the former Superintendent's House (Residence 1) would result in an irretrievable impact to the cultural Outstandingly Remarkable Value.

ENERGY CONSUMPTION

Estimated annual propane consumption for the years 2000-2015 would be 424,900 gallons. The estimated combined annual motor fuel consumption by the year 2015 is 1,872,000 gallons.

*Relationship of
Short-Term Uses
and
Long-Term
Productivity*

Final
Yosemite
Valley
Plan

Supplemental EIS

Lusy Telle (Miwok/Patule) weaving in the re-created Indian Village behind the Yosemite Museum, circa 1950. She sold an array of baskets and beaded items to Yosemite visitors when she worked as a demonstrator.

RELATIONSHIP OF SHORT-TERM USES AND LONG-TERM PRODUCTIVITY

This section discusses the effects of the short-term use of resources (as proposed in each of the alternatives) on the long-term productivity of the resources. The resources have been grouped into three categories: natural, hazards, and cultural.

Alternative 1

No measurable change from current conditions is expected. The existing relationship of short-term uses of the environment and the maintenance and enhancement of long-term productivity would be expected to continue. For example, existing structures would remain within highly valued resource areas such as wetlands, meadows, riparian areas, and California black oak woodlands. Existing bridges would also continue to impede flood flows and channel movement. Visitation levels would also continue to grow, resulting in more crowding, congestion, and delays for visitors. The potential risk for unavoidable adverse impacts would continue for structures and human life within the floodplain and rockfall zones. Therefore, the impacts associated with the short-term use of the environment would continue to adversely affect long-term productivity.

Alternative 2

NATURAL RESOURCES

Generally, for most natural resources the long-term productivity gained from large-scale restorations of highly valued resources would outweigh the short-term, adverse impacts on these natural resources. Short-term, adverse impacts to these resources would consist of construction-related impacts of new development and restoration activities (e.g., construction equipment, grading, increased erosion potential, and vegetation removal). The long-term productivity of these resources would be enhanced through increased size, integrity, and connectivity. The long-term or net gains for these natural resources can be quantified as follows:

- **Water Resources:** The removal of Sugar Pine Bridge, the possible removal of Stoneman Bridge, and the replacement of the Happy Isles footbridge would result in short-term impacts caused by increased erosion during demolition activities. However, the beneficial effects of the long-term restoration of the natural river hydrologic processes would outweigh these adverse impacts.
- **Wetlands:** This alternative would provide a net gain of 118 acres of wetlands (141 acres of wetlands restored minus the 23 acres of potential wetlands impacted as a result of the construction and redevelopment of new facilities).
- **Soils:** This alternative would provide approximately 177 acres of restored soils, of which approximately 128 acres would be highly valued resource soil types.
- **Vegetation, Wildlife, and Special-Status Species:** This alternative would restore 175 acres of natural vegetation in Yosemite Valley, of which 160 acres (91%) would be highly valued vegetation types. This restoration would increase habitat availability, integrity, and

continuity for plants, wildlife, and special-status species. New development would occur on 75 acres in Yosemite Valley, of which only 21 acres (28%) would be highly valued resource vegetation types.

- Scenic Resources and Merced Wild and Scenic River: The short-term disruption of these resources during restoration and implementation activities would be more than offset by the long-term enhancement and preservation of scenic resources and the designated Outstandingly Remarkable Values of the Merced Wild and Scenic River segments.
- Energy Consumption: In the short term, fuel consumption would likely remain relatively consistent with existing usage. However, after implementation of this alternative, long-term fuel consumption would be reduced.

H A Z A R D S

Two distinct hazards occur in the Valley as a result of its landscape features: flooding and rockfall. There are structures currently located within the floodplain of the Merced River and within the talus slope and shadow line zones of the Valley walls. The actions of Alternative 2 would reduce the long-term risk to human life and property by relocating a number of structures and high-occupancy gathering places outside of these hazard zones.

C U L T U R A L R E S O U R C E S

Historic structures would be removed and archeological sites would be disturbed or lost, resulting in long-term, adverse effects to cultural resources. However, the affected resources would be documented in accordance with the Programmatic Agreement, creating permanent records of individual cultural resources. The restoration of natural areas would substantially improve the overall cultural landscape in Yosemite Valley.

Alternative 3

N A T U R A L R E S O U R C E S

Generally, for most natural resources the long-term productivity gained from large-scale restorations of highly valued resources would outweigh the short-term, adverse impacts on these natural resources. Short-term, adverse impacts to these resources would consist of construction-related impacts of new development and restoration activities (e.g., construction equipment, grading, increased erosion potential, and vegetation removal). The long-term productivity of these resources would be enhanced through increased size, integrity, and connectivity. The long-term or net gains for these natural resources can be quantified as follows:

- Water Resources: Removal of four bridges would result in short-term impacts caused by increased erosion during demolition activities. However, the beneficial impacts of the long-term restoration of the natural river hydrologic processes would outweigh these adverse impacts.
- Wetlands: This alternative would provide a net gain of 139 acres of wetlands (156 acres of wetlands restored minus the 17 acres of potential wetlands impacted as a result of the construction and redevelopment of new facilities).

- **Soils:** This alternative would provide approximately 206 acres of restored soils, of which approximately 144 acres would be highly valued resource soil types.
- **Vegetation, Wildlife, and Special-Status Species:** This alternative would restore 205 acres of natural vegetation in Yosemite Valley, of which 186 acres (91%) would be highly valued resource vegetation types. This restoration would increase habitat availability, integrity, and continuity for plants, wildlife, and special-status species. New development would occur on 102 acres in Yosemite Valley, of which only 14 acres (14%) would be highly valued resource vegetation types.
- **Scenic Resources and Merced Wild and Scenic River:** The short-term disruption of these resources during the restoration and implementation activities would be more than offset by the long-term enhancement and preservation of scenic resources and the designated Outstandingly Remarkable Values of the Merced Wild and Scenic River segments.
- **Energy Consumption:** In the short term, fuel consumption would likely remain relatively consistent with existing usage. However, after implementation of this alternative, long-term fuel consumption would be reduced.

H A Z A R D S

Two distinct hazards occur in the Valley as a result of its landscape features: flooding and rockfall. There are structures currently located within the floodplain of the Merced River and within the talus slope and shadow line zones of the Valley walls. The actions of Alternative 3 would reduce the long-term risk to human life and property by relocating a number of structures and high-occupancy gathering places outside of these hazard zones.

C U L T U R A L R E S O U R C E S

Historic structures would be removed and archeological sites would be disturbed or lost, resulting in long-term, adverse impacts to cultural resources. However, the affected resources would be documented in accordance with the Programmatic Agreement, creating permanent records of individual cultural resources. The restoration of natural areas would substantially improve the overall cultural landscape of Yosemite Valley.

Alternative 4

N A T U R A L R E S O U R C E S

Generally, for most natural resources the long-term productivity gained from large-scale restorations of highly valued resources would outweigh the short-term, adverse impacts on these natural resources. Short-term, adverse impacts to these resources would consist of construction-related impacts of new development and restoration activities (e.g., construction equipment, grading, increased erosion potential, and vegetation removal). The long-term productivity of these resources would be enhanced through increased size, integrity, and connectivity. The long-term or net gains for these natural resources can be quantified as follows:

- **Water Resources:** Removal of four bridges would result in short-term impacts caused by increased erosion during demolition activities. However, the beneficial effects of the long-

term restoration of the natural river hydrologic processes would outweigh these adverse impacts.

- **Wetlands:** This alternative would provide a net gain of 131 acres of wetlands (149 acres of wetlands restored minus the 18 acres of potential wetlands impacted as a result of the construction and redevelopment of new facilities).
- **Soils:** This alternative would provide approximately 193 acres of restored soils, of which approximately 141 acres would be highly valued resource soil types.
- **Vegetation, Wildlife, and Special-Status Species:** This alternative would restore 193 acres of natural vegetation in Yosemite Valley, of which 174 acres (90%) would be highly valued resource vegetation types. This restoration would increase habitat availability, integrity, and continuity for plants, wildlife, and special-status species. New development would occur on 102 acres in Yosemite Valley, of which only 14 acres (14%) would be highly valued resource vegetation types.
- **Scenic Resources and Merced Wild and Scenic River:** The short-term disruption of these resources during the restoration and implementation activities would be more than offset by the long-term enhancement and preservation of scenic resources and the designated Outstandingly Remarkable Values of the Merced Wild and Scenic River segments.
- **Energy Consumption:** In the short term, fuel consumption would likely remain relatively consistent with existing usage. However, after implementation of this alternative, long-term fuel consumption would be reduced.

H A Z A R D S

Two distinct hazards occur in the Valley as a result of its landscape features: flooding and rockfall. There are structures currently located within the floodplain of the Merced River and within the talus slope and shadow line zones of the Valley walls. The actions of Alternative 4 would reduce the long-term risk to human life and property by relocating a number of structures and high-occupancy gathering places outside of these hazard zones.

Historic structures would be removed and archeological sites would be disturbed or lost, resulting in long-term, adverse effects to cultural resources. However, the affected resources would be documented in accordance with the Programmatic Agreement, creating permanent records of individual cultural resources. The restoration of natural areas would substantially improve the overall cultural landscape in Yosemite Valley.

Alternative 5

N A T U R A L R E S O U R C E S

Generally, for most natural resources the long-term productivity gained from large-scale restorations of for most natural resources would outweigh the short-term, adverse impacts on these natural resources. Short-term, adverse impacts to these resources would consist of construction-related impacts of new development and restoration activities (e.g., construction

equipment, grading, increased erosion potential, and vegetation removal). The long-term productivity of these resources would be enhanced through increased size, integrity, and connectivity. The long-term or net gains for these natural resources can be quantified as follows:

- **Water Resources:** Removal of two bridges would result in short-term impacts caused by increased erosion during demolition activities. However, the beneficial impacts of the long-term restoration of the natural river hydrologic processes would outweigh these adverse impacts.
- **Wetlands:** This alternative would provide a net gain of 104 acres of wetlands (131 acres of wetlands restored minus the 27 acres of potential wetlands impacted as a result of the construction and redevelopment of new facilities).
- **Soils:** This alternative would provide approximately 161 acres of restored soils, of which approximately 122 acres would be highly valued resource soil types.
- **Vegetation, Wildlife, and Special-Status Species:** This alternative would restore 163 acres of natural vegetation in Yosemite Valley, of which 147 acres (91%) would be highly valued resource vegetation types. This restoration would increase habitat availability, integrity, and continuity for wildlife and special-status species. New development would occur on 69 acres in Yosemite Valley, of which only 16 acres (23%) would be highly valued resource vegetation types.
- **Scenic Resources and Merced Wild and Scenic River:** The short-term disruption of these resources during the restoration and implementation activities would be more than offset by the long-term enhancement and preservation of scenic resources and the designated Outstandingly Remarkable Values of the Merced Wild and Scenic River segments.
- **Energy Consumption:** In the short term, fuel consumption would likely remain relatively consistent with existing usage. However, after implementation of this alternative, long-term fuel consumption would be reduced.

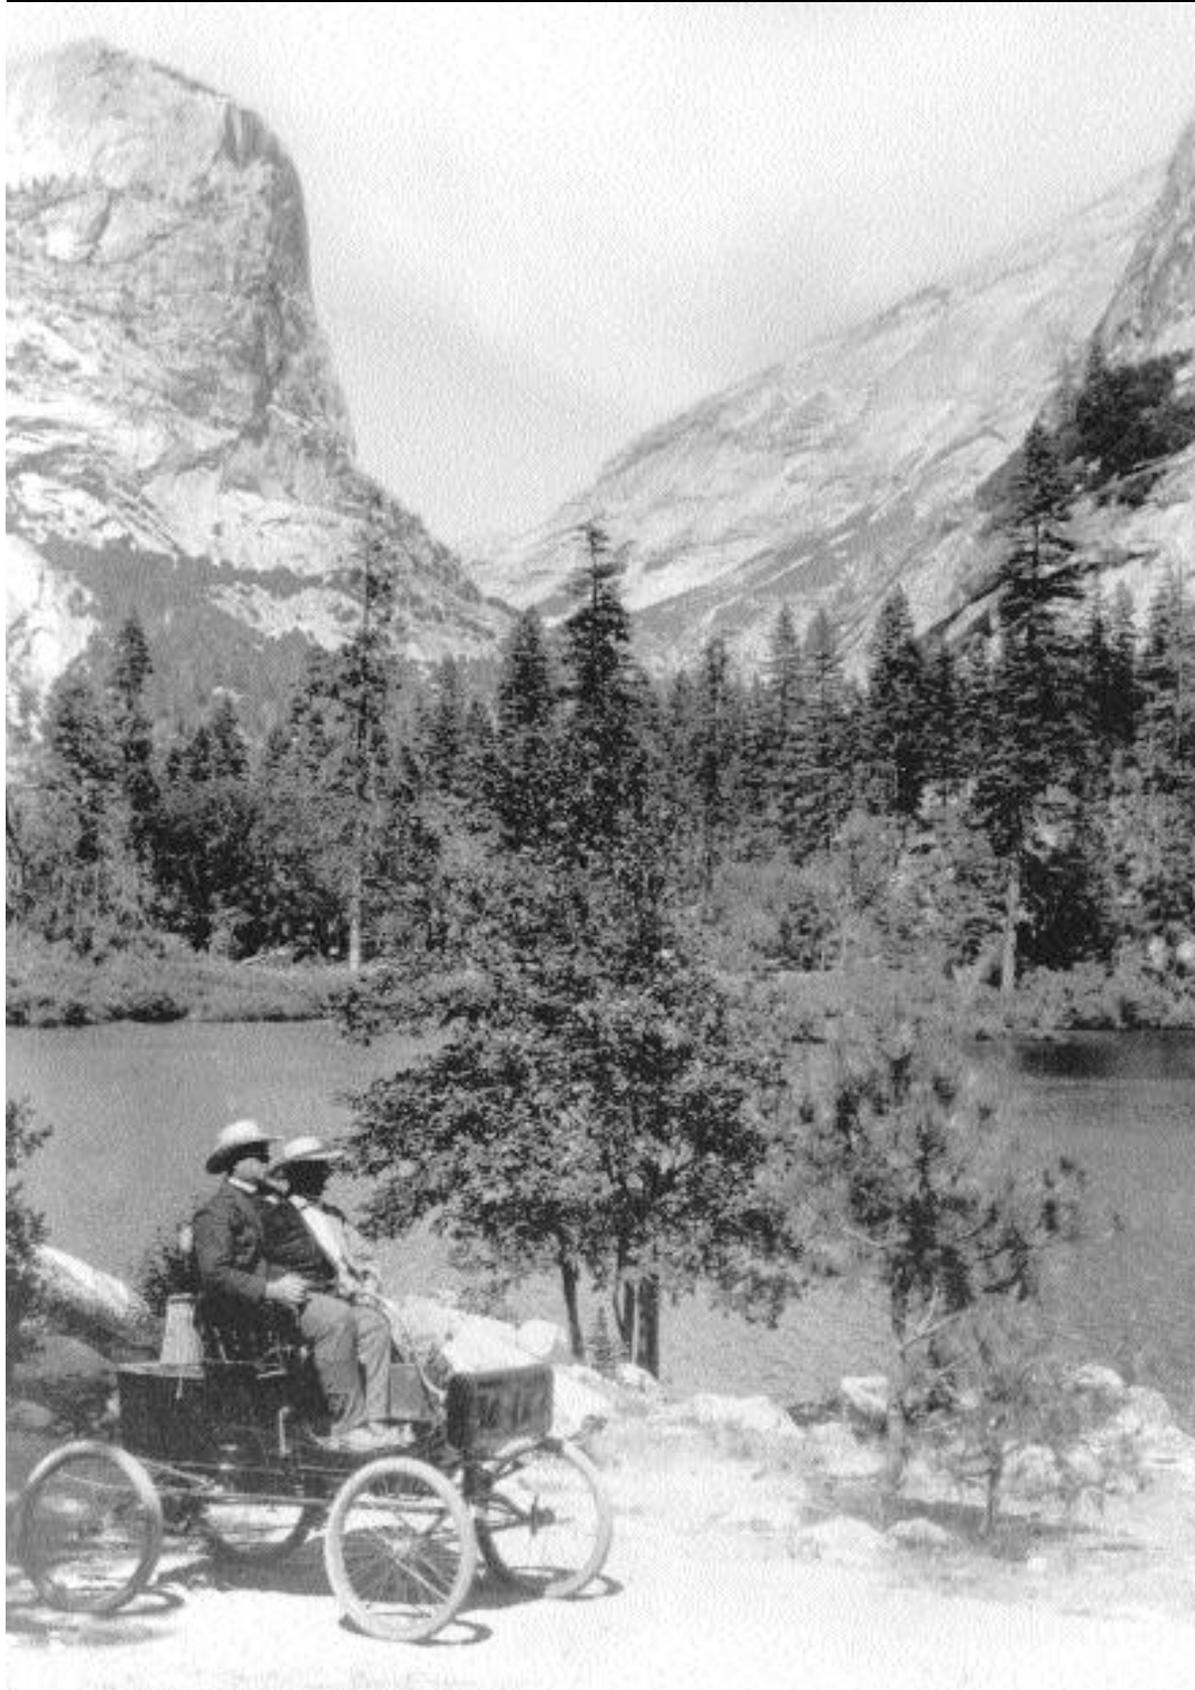

H A Z A R D S

Two distinct hazards occur in the Valley as a result of its landscape features: flooding and rockfall. There are structures currently located within the floodplain of the Merced River and within the talus slope and shadow line zones of the Valley walls. The actions of Alternative 5 would reduce risk to human life and property by relocating a number of structures and high-occupancy gathering places outside of these hazard zones.

C U L T U R A L R E S O U R C E S

Historic structures would be removed and archeological sites would be disturbed or lost, resulting in long-term, adverse effects to cultural resources. However, the affected resources would be documented in accordance with the Programmatic Agreement, creating permanent records of individual cultural resources. The restoration of natural areas would substantially improve the cultural landscape in Yosemite Valley.

The first car to enter Yosemite Valley, a 1900 Locomobile, driven by Oliver Lippincott, a Los Angeles photographer. Automobiles were banned in Yosemite from 1907 until 1913, when they were again permitted in the park.

CONSULTATION AND COORDINATION

Introduction

This chapter describes the history of public involvement leading up to and during development of the *Final Yosemite Valley Plan/SEIS*. Public participation in the planning process helps to ensure that the National Park Service fully understands and considers the public's interest. Through public involvement, the National Park Service shared information about the planning process, issues, and proposed actions. In turn, the planning teams were informed of the concerns and values of those groups and individuals who participated in the process. Also as part of public involvement and in compliance with laws and regulations, management agencies and other public constituencies were consulted. Chapter 5 describes these consultations and their results. With the help of the public's involvement, the National Park Service is able to make better informed decisions and improved plans.

Public and agency participation throughout the planning process allowed the planning team to:

- Analyze and incorporate comments from previous planning efforts
- Collect scoping comments to help define the range of issues to be addressed
- Provide opportunities for the public to obtain the knowledge necessary to make informed comments
- Collect public, American Indian, and agency comments on the *Draft Yosemite Valley Plan/SEIS*
- Consult with other management agencies
- Produce the best possible plan

Public and agency participation in the planning process will not end with the *Final Yosemite Valley Plan/SEIS*, but will continue throughout the design and implementation phases of the plan.

Scoping and Public Comment

The purpose of scoping is to identify issues and concerns related to the planning process and to determine the range of issues that will be addressed in the environmental analysis. Typically, scoping occurs at the beginning of a planning process. In the case of the *Draft Yosemite Valley Plan/SEIS*, however, scoping has been taking place since 1991 as part of previous planning efforts for the 1992 *Draft Yosemite Valley Housing Plan/SEIS* and its 1996 Addendum, the 1997 *Draft Yosemite Valley Implementation Plan/SEIS*, and the 1997 *Yosemite Lodge Development Concept Plan/Environmental Assessment*, the related *Finding of No Significant Impact*, and its 1998 modified version. Each of these planning efforts had its own scoping and public comment period. As part of the scoping process for the *Draft Yosemite Valley Plan/SEIS*, public comments from these previous efforts were reanalyzed; relevant issues were included as were concerns raised since 1991.

The National Park Service received approximately 1,400 public comment letters in response to the 1992 *Draft Yosemite Valley Housing Plan/SEIS*. This plan proposed to move most employee

housing and National Park Service and concession headquarters to Foresta. As a result of public comment, an *Addendum to the Draft Yosemite Valley Housing Plan/SEIS* was released in December of 1996. The 1996 addendum described a newly proposed alternative that shifted the majority of housing and administrative headquarters to El Portal, as originally called for in the 1980 *General Management Plan*. A total of 195 comments in reference to the 1996 addendum were received.

The National Park Service received 3,853 comment letters in response to the 1997 *Draft Yosemite Valley Implementation Plan/SEIS*. The 1999 *Draft Yosemite Valley Plan/SEIS* incorporated many ideas, suggestions, and concerns gained from the public's involvement in the 1997 draft implementation plan. In response to the 1997 *Yosemite Lodge Development Concept Plan/EA/FONSI*, the National Park Service received 391 comments.

The formal public scoping period for the *Draft Yosemite Valley Plan/SEIS* began with a *Federal Register* notice on December 16, 1998, that described the intent of the *Draft Yosemite Valley Plan/SEIS* and solicited comments from the public through January 15, 1999. Based on requests from the public, the formal scoping period was extended through February 1, 1999. The *Federal Register* notice, in addition to announcing the formal scoping period, stated that all comments associated with previous planning efforts would be "duly reconsidered" in the *Draft Yosemite Valley Plan/SEIS* planning process.

A total of 598 scoping comment letters were received during the formal scoping period. Initially, a team of park staff evaluated the scoping comments and prepared a summary report (NPS 1999). Later, these comments were included in the comprehensive reanalysis, which included all previous comments from associated planning efforts.

Because the comments from previous plans were originally analyzed in diverse contexts using different methods, they were reanalyzed using a common methodology developed by the U.S. Forest Service's Content Analysis Enterprise Team (CAET). The Content Analysis Enterprise Team used the same methodology to read and analyze all letters, emails, and faxes received during the formal scoping period for the *Draft Yosemite Valley Plan/SEIS*.

In the reanalysis of previous comments, 6,468 letters, emails, and faxes were read and analyzed by the Content Analysis Enterprise Team. These responses contained 23,768 individual comments that were coded, categorized, and entered into the content analysis database. This analysis, *Summary of Public Comment, Yosemite Valley Planning 1992-1999* (USFS 1999), was a key tool used to ensure that public comments were addressed in the *Draft Yosemite Valley Plan/SEIS*. Concern statements raised through the public comment process and the park's response to those concern statements were included as Volume III of the *Draft Yosemite Valley Plan/SEIS*. The reanalysis of public comments from previous Yosemite Valley planning efforts has not been published as part of the *Final Yosemite Valley Plan/SEIS*.

Table 5-1
Number of Responses and Number of Signatures Sorted by Planning Process
Summary of Public Comments, Yosemite Valley Planning, 1992-1999

Planning Process	Number of Responses	Number of Signatures	Number of Comments
1992 <i>Draft Yosemite Valley Housing Plan/SEIS</i>	1,437	5,866	3,226
1996 <i>Addendum to the Draft Yosemite Valley Housing Plan/SEIS</i>	195	219	835
1997 <i>Yosemite Lodge Development Concept Plan/EA/FONSI</i>	391	536	753
1997 <i>Draft Yosemite Valley Implementation Plan/SEIS</i>	3,853	6,941	16,078
1999 <i>Draft Yosemite Valley Plan/SEIS (Scoping)</i>	592	617	2,876
Totals	6,468	14,179	23,768

THE DRAFT YOSEMITE VALLEY PLAN/SEIS

In a press release dated March 27, 2000, the National Park Service announced the availability of the *Draft Yosemite Valley Plan/SEIS* for public review. The period of public review ran from April 7 through July 5, 2000.¹ The official notice of the National Park Service’s public release of the plan was published in the *Federal Register* on April 13, 2000 (Vol. 65, No. 72, page 19,923). This notice stated that the public comment period would run from April 7 through July 7, 2000, a period of 92 days. Throughout the public comment period, the National Park Service was actively advertising that public comments would be accepted through July 7. This advertising effort included a notice on the Yosemite National Park web site, statements in press releases for public meetings, information sheets handed out to the public, and announcements at all related, National Park Service public meetings and presentations.

On Friday, April 14, 2000, the Environmental Protection Agency (EPA) published their weekly summary announcement of environmental impact statements officially filed and available for public review (*Federal Register* Vol. 65, No. 73, page 20,155). The official EPA announcement listed the “due” date for comment as July 14, 2000. Unfortunately, because Yosemite planners expected the EPA notice to mirror the National Park Service notice, this discrepancy was not discovered until mid-August. Thus, the *Draft Yosemite Valley Plan/SEIS* public comment period was technically a period of over 90 days, from April 14 through July 14, 2000. No extension of the comment period was made.

In an effort to reconcile the official review period set by the EPA *Federal Register* notice and the National Park Service’s originally advertised 92-day comment period beginning April 7 and running through July 7, all comments received, or having a postmark dating, from March 28² through July 14, 2000, were analyzed and used in formulating the *Final Yosemite Valley Plan/SEIS*.

¹ By April 4, a total of 1,219 Executive Summaries and 639 full sets of the *Draft Yosemite Valley Plan/SEIS* had been shipped to people who had previously requested copies. Another 1,500 Executive Summaries, 1,000 full plans, and 2,000 CD-ROMs of the full plan were requested and distributed to members of the public during the public comment period.

² This was the date the first comment on the *Draft Yosemite Valley Plan/SEIS* was received, the day after the National Park Service press conference announcing the plan.

The letters of public comment received by July 7 were read and analyzed by the U.S. Forest Service Content Analysis Enterprise Team (CAET) and National Park Service staff. The results were forwarded to Yosemite National Park in a series of interim reports throughout the comment period and in CAET's final report, *Summary of Public Comment, Yosemite Valley Plan Draft Environmental Impact Statement* (USFS 2000c). These reports were used to develop the *Final Yosemite Valley Plan/SEIS*. The process of analyzing and using public comments is described in more detail in Volume III of this document.

The letters received between July 7 and July 14 were read and analyzed by National Park Service and the U.S. Forest Service CAET staff the week of August 14; five new public concerns were identified. The CAET staff subsequently produced an additional report, *Addendum, Summary of Public Comment, Yosemite Valley Plan Draft Environmental Impact Statement*, that is incorporated into their earlier summary report as Appendix I (USFS 2000c).

During the public comment period, the National Park Service held 14 public meetings throughout California. These meetings consisted of an open house where the public could view displays, interact with park staff, and attend a formal public hearing on the plan. Approximately 1,500 people attended these public meetings. Written comments were formally received at these meetings, and 365 people testified during the public hearings and their statements were recorded by a court reporter. The National Park Service also held public meetings in Seattle, Washington; Denver, Colorado; Chicago, Illinois; and Washington, D.C. Over 100 individuals attended these meetings.

COMMENTS ON THE DRAFT YOSEMITE VALLEY PLAN/SEIS

During the public comment period, approximately 10,200 comment letters, postcards, e-mails, faxes, comment forms, and public hearing testimonies were received on the *Draft Yosemite Valley Plan/SEIS*. These comments were read and analyzed by a joint U.S. Forest Service and National Park Service team and then were distilled into 867 distinct public concern statements (see Vol. III, Public Comments and Responses, for a complete description of the comment analysis process).

INFORMATIONAL MEETINGS AND PUBLIC OUTREACH

In addition to the public scoping process and the public meetings and hearings conducted for the *Draft Yosemite Valley Plan/SEIS*, the National Park Service has continued to conduct numerous other public involvement activities related to the *Draft Yosemite Valley Plan/SEIS*. These include the mailing of periodic planning updates, presenting regularly scheduled open houses in the park, developing and displaying wayside exhibits in the park, conducting ranger-led walks, and meeting with a number of interested and affected groups.

The park produces a periodic four- to eight-page *Planning Update* newsletter that is mailed to the addresses on its extensive mailing list. Each *Planning Update* provides the current status of ongoing planning activities within the park, including information and notices concerning the *Draft* and *Final Yosemite Valley Plan/SEIS*. Between January 1999 and August 2000, five

Planning Updates were mailed to between 5,000 and 11,000 individuals, organizations, and agencies.

To provide visitors in the park an opportunity to learn more about the alternatives being considered in the *Draft Yosemite Valley Plan/SEIS* and an opportunity to comment, open house sessions were held at the Yosemite Valley Visitor Center from Wednesdays through Sundays throughout the comment period. The open houses were staffed by park employees familiar with the *Draft Yosemite Valley Plan/SEIS* and stocked with exhibits, maps, copies of the document, and comment forms. Over 1,650 people attended a total of 63 open houses. Hundreds of individuals submitted written comments while attending these open houses.

A special four-page insert covering the planning process was prepared for the *Yosemite Guide*, the park's informational newspaper. The newspaper described the planning process and informed visitors on how they could get involved. Over 380,000 copies of the *Yosemite Guide* with the special insert were distributed to park visitors during the public comment period.

A series of regularly scheduled ranger-led walks were held on weekends from April 15, 2000, through the end of the comment period. These hour-long walks provided an opportunity for the public to get a first-hand look at many of the key areas that could be affected by the actions proposed in the *Draft Yosemite Valley Plan/SEIS*. The walks also enabled visitors to discuss issues with other members of the public and park staff. In all, 264 people attended 26 walks.

The National Park Service installed 10 interpretive wayside exhibits in key areas in the Valley. Areas selected were those that could be affected by actions included in the *Draft Yosemite Valley Plan/SEIS*, including Camp 4 (Sunnyside Campground), Lower Yosemite Falls, the concession stable, and Curry Village. The signs informed visitors of the potential changes that could occur at each location, and guided visitors to areas where they could receive more information.

The National Park Service maintains a web site (nps.gov/yose/planning.htm) which contains a wide range of information about planning activities and updates on issues related to the development of the *Draft* and *Final Yosemite Valley Plan/SEIS*, as well as the full text of the *Draft Yosemite Valley Plan/SEIS*.

From the onset of planning for the 1992 *Draft Yosemite Valley Housing Plan/SEIS*, park staff members have met informally and consulted with a diverse group of organizations. Between December 1998 and July 2000, the National Park Service conducted informational meetings with the following groups:

American Alpine Club	California State Polytechnic University, San Luis Obispo
American Alpine Club of Berkeley	California State University – Stanislaus – environmental philosophy class
American Indian Council of Mariposa, Inc.	California Preservation Foundation
Angels-Murphys Rotary Club	Central Sierra Environmental Resource Center
Aquatic Outreach Institute	Climbing organizations
Backcountry Horseman of California Convention	Commonwealth Club of California
Bishop Chamber of Commerce	East Bay Bicycle Coalition
Bishop Rotary Club	Eastern Madera County Chamber of Commerce
Bridgeport Chamber of Commerce	El Portal Post Office
California Bicycle Coalition	El Portal Town Planning Advisory Committee
California Native Plant Society	
California State Horseman's Association Concord	

Foresta Homeowners Association
 Foresta Preservation Association
 Fresno Chamber of Commerce
 Fresno Visitors Bureau
 Friends of the River
 Greater Area Merced Chamber of Commerce

AGENCY AND AMERICAN INDIAN CONSULTATION AND COORDINATION

Comment letters from federal and state agencies and American Indian tribes are published in Vol. III, Summary of Public Comments and Responses, Chapter 9.

Advisory Council on Historic Preservation and California State Historic Preservation Officer

The 1966 National Historic Preservation Act (NHPA), as amended in 1992, requires federal agencies to consult with the State Historic Preservation Officer (SHPO) and the Advisory Council on Historic Preservation (ACHP) regarding undertakings that may affect historic properties. The National Park Service has consulted with the California SHPO and the ACHP in development of the *Draft Yosemite Valley Implementation Plan/SEIS*, the *Draft Yosemite Valley Housing Plan/SEIS*, the *Draft Yosemite Valley Plan/SEIS*, and other subordinate plans such as the Yosemite Lodge Redesign Project and the El Portal Road Improvement Project (NPS). Several meetings were held to discuss specific aspects of these proposed undertakings as well as the Yosemite Programmatic Agreement for compliance with Section 106 of the NHPA. This Programmatic Agreement addresses individual undertakings proposed in the *Draft* and *Final Yosemite Valley Plan/SEIS*. Although consultations were frequent and at times informal, the following meetings were held:

August 15, 1996: Meeting with a representative from the SHPO to discuss the range of options being considered in the 1997 *Draft Yosemite Valley Implementation Plan* and to consider alternative approaches to completing NHPA Section 106 compliance.

June 18, 1997: Meeting with a representative from the SHPO and the ACHP to discuss the proposed Programmatic Agreement as an approach to completing NHPA Section 106 compliance for the *Draft Yosemite Valley Implementation Plan/SEIS* and the *Draft Yosemite Valley Housing Plan/SEIS*.

July 30, 1997: Meeting with a representative from the SHPO to further discuss the proposed Yosemite Programmatic Agreement.

October 15, 1998: Meeting with a representative from the SHPO, the ACHP, and members of the National Trust for Historic Preservation to discuss the *Draft Yosemite Valley Implementation Plan* and the draft Programmatic Agreement.

October 21, 1999: Meeting with a representative from the SHPO and the ACHP to discuss the proposed actions in the *Draft Yosemite Valley Plan/SEIS*, the methodology for analyzing impacts to cultural resources, and NHPA Section 106 compliance through the Programmatic Agreement.

August 16-17, 2000: On-site meeting in Yosemite Valley with representatives from the SHPO to discuss formal SHPO comment on the *Draft Yosemite Valley Plan/SEIS* and specific changes in the Preferred Alternative. Site visits were made to Sugar Pine and Stoneman Bridges, Camp 4 (Sunnyside Campground), and Curry Village.

American Indian Consultation

As part of the development of the *Draft and Final Yosemite Valley Plan/SEIS*, the National Park Service consulted with the following park-associated federally recognized tribes and nonfederally recognized American Indian communities who refer to themselves as “tribes”: the American Indian Council of Mariposa County, Inc.; the North Fork Mono Rancheria; the Tuolumne Band of Me-Wuk Indians; the Chukchansi Tribal Government; the Mono Lake Indian Community; the Bridgeport Paiute Indian Colony; and the Bishop Paiute Tribal Council. These consultations have been ongoing throughout the planning process for the *Draft Yosemite Valley Housing Plan/SEIS* and the *Draft Yosemite Valley Implementation Plan/SEIS*, and will continue through the design and implementation phases for activities taking place under the *Yosemite Valley Plan*. At present, the National Park Service is consulting with seven American Indian tribes and groups regarding issues such as access for traditional use, gathering of traditional materials, protection and mitigation of impacts to traditional cultural resources, and preservation and management of important cultural places.

The following meetings have taken place between July 1995 and July 2000:

July 24, 1995: Meeting with North Fork Mono tribal board of directors in Bass Lake, California. National Park Service representatives met with the tribal council to discuss issues and concerns related to the earlier *Draft Yosemite Valley Implementation Plan/SEIS*. Six tribal members were present.

July 26, 1995: Meeting with Mono Lake Indian Community chairman and members in Lee Vining, California. National Park Service representatives met with the tribe to discuss issues and concerns related to the earlier *Draft Yosemite Valley Implementation Plan/SEIS*. Five tribal members were present.

July 27, 1995: Meeting with American Indian Council of Mariposa County, Inc. and a representative of the Tuolumne Band of Me-Wuk Indians in Mariposa, California. National Park Service representatives met with the tribal council to discuss issues and concerns related to the earlier *Draft Yosemite Valley Implementation Plan/SEIS* and *Draft Yosemite Valley Housing Plan/SEIS*. Fifteen tribal members were present.

September 12, 1996: Meeting with the American Indian Council of Mariposa County, Inc. to provide updated information on status and specifics of the earlier *Draft Yosemite Valley Implementation Plan/SEIS*. Six tribal members were present.

Several meetings and on-site walks were held with representatives of the American Indian Council of Mariposa County, Inc. from 1997 through 1999 regarding actions originally proposed as part of Yosemite’s flood recovery program and other individual actions. These include reconstructing the El Portal Road, rebuilding the Yosemite Lodge complex, constructing administrative facilities in El Portal, and rehabilitating the Lower Yosemite Fall area.

April 19, 1999: Meeting with American Indian Council of Mariposa County, Inc. National Park Service representatives met with one member of the tribal board of directors for a site walk-through at a location proposed for housing development in El Portal.

October 5, 1999: Meeting with the North Fork Mono Indian Tribe in North Fork, California. National Park Service representatives met with the tribal council to discuss the *Draft Yosemite Valley Plan/SEIS*.

October 6, 1999: Meeting with the Mono Lake Indian Community in Lee Vining, California. National Park Service representatives met with the tribal chairman and several members to discuss, among other things, the *Draft Yosemite Valley Plan/SEIS*.

October 28, 1999: Meeting with the American Indian Council of Mariposa County, Inc. National Park Service representatives met with the tribal council and several members to discuss the *Draft Yosemite Valley Plan/SEIS*.

June 28, 2000: Meeting with the American Indian Council of Mariposa County, Inc. in Yosemite Valley, California. National Park Service representatives met with representatives of the tribe to discuss the *Draft Yosemite Valley Plan/SEIS*. Five tribal representatives were present.

July 14, 2000: Meeting with the Mono Lake Indian Community in Yosemite Valley, California. National Park Service representatives met with two tribal representatives to discuss the *Draft Yosemite Valley Plan/SEIS*.

July 17, 2000: Meeting with the North Fork Mono Indian Tribe in Yosemite Valley, California. National Park Service representatives met with three tribal representatives to discuss the *Draft Yosemite Valley Plan/SEIS*.

August 4, 2000: Meeting with the North Fork Mono Indian Tribe in Wawona, California. National Park Service representatives met with tribal members for a site walk-through at a location proposed for housing development in Wawona.

August 14, 2000: Meeting with the Bishop Paiute Tribe in Bishop, California. National Park Service representatives met with four tribal representatives to discuss the *Draft Yosemite Valley Plan/SEIS*.

August 21, 2000: Meeting with the Tuolumne Me-Wuk Indians in Yosemite Valley, California. National Park Service representatives met with three tribal representatives to discuss the *Draft Yosemite Valley Plan/SEIS*.

August 22, 2000: Meeting with the Bridgeport Paiute Indians in Bridgeport, California. National Park Service representatives met with the tribal council and members to discuss the *Draft Yosemite Valley Plan/SEIS*.

September 7, 2000: Meeting with the American Indian Council of Mariposa County, Inc. to discuss changes in the *Draft Yosemite Valley Plan/SEIS*.

U.S. Fish and Wildlife Service

The Endangered Species Act of 1973, as amended (16 USC 1531 et seq.) requires all federal agencies to consult with the U.S. Fish and Wildlife Service to ensure that any action authorized, funded, or carried out by the agency does not jeopardize the continued existence of listed species or critical habitat.

The National Park Service requested a list of federally listed endangered and threatened species that may be present or affected by actions proposed in the *Draft Yosemite Valley Plan/SEIS* in March 2000. The species list was received from the U.S. Fish and Wildlife Service on March 29, 2000 and is included in the Biological Assessment (Appendix K).

A Biological Assessment on the *Draft Yosemite Valley Plan/SEIS* was submitted to the U.S. Fish and Wildlife Service on May 11, 2000. At this time, the National Park Service requested that formal consultation be initiated with the U.S. Fish and Wildlife Service. In June of 2000, the U.S. Fish and Wildlife Service requested more information on elderberry plants, which serve as habitat for the valley elderberry longhorn beetle, a federally listed species. This information was submitted on July 5, 2000, along with a revised Biological Assessment on the *Draft Yosemite Valley Plan/SEIS*, which reflected the new information.

In August of 2000, a Biological Assessment on the *Final Yosemite Valley Plan/SEIS* was submitted to the U.S. Fish and Wildlife Service. The National Park Service met with the U.S. Fish and Wildlife Service in Yosemite on August 30, 2000. Mitigation and compensation measures for potential impacts on the Valley elderberry longhorn beetle were discussed and potential development and restoration sites were visited. The U.S. Fish and Wildlife Service prepared a Biological Opinion in September 2000 (see Vol. II, Appendix L) based on the Biological Assessment (see Vol. II, Appendix K).

Environmental Protection Agency

The National Park Service consulted with the Environmental Protection Agency on a periodic basis during development of the *Draft Yosemite Valley Plan/SEIS* and solicited formal comments during review of the published document. Key issues identified by the Environmental Protection Agency in their comments on the *Draft Yosemite Valley Plan/SEIS* include:

- Air quality impacts (specifically clean fuels, transit, and fleet maintenance)
- Pollution prevention and materials reuse
- Sustainability principles

Consultation with the Environmental Protection Agency is ongoing throughout the design and implementation phases of the *Yosemite Valley Plan*.

U.S. Geological Survey

The expertise of the U.S. Geological Survey was used to evaluate geological hazards within portions of the planning area. The U.S. Geological Survey published reports that document rockfall and debris flow characteristics. This information was used in the plan as a development consideration.

National Park Service Water Resources Division

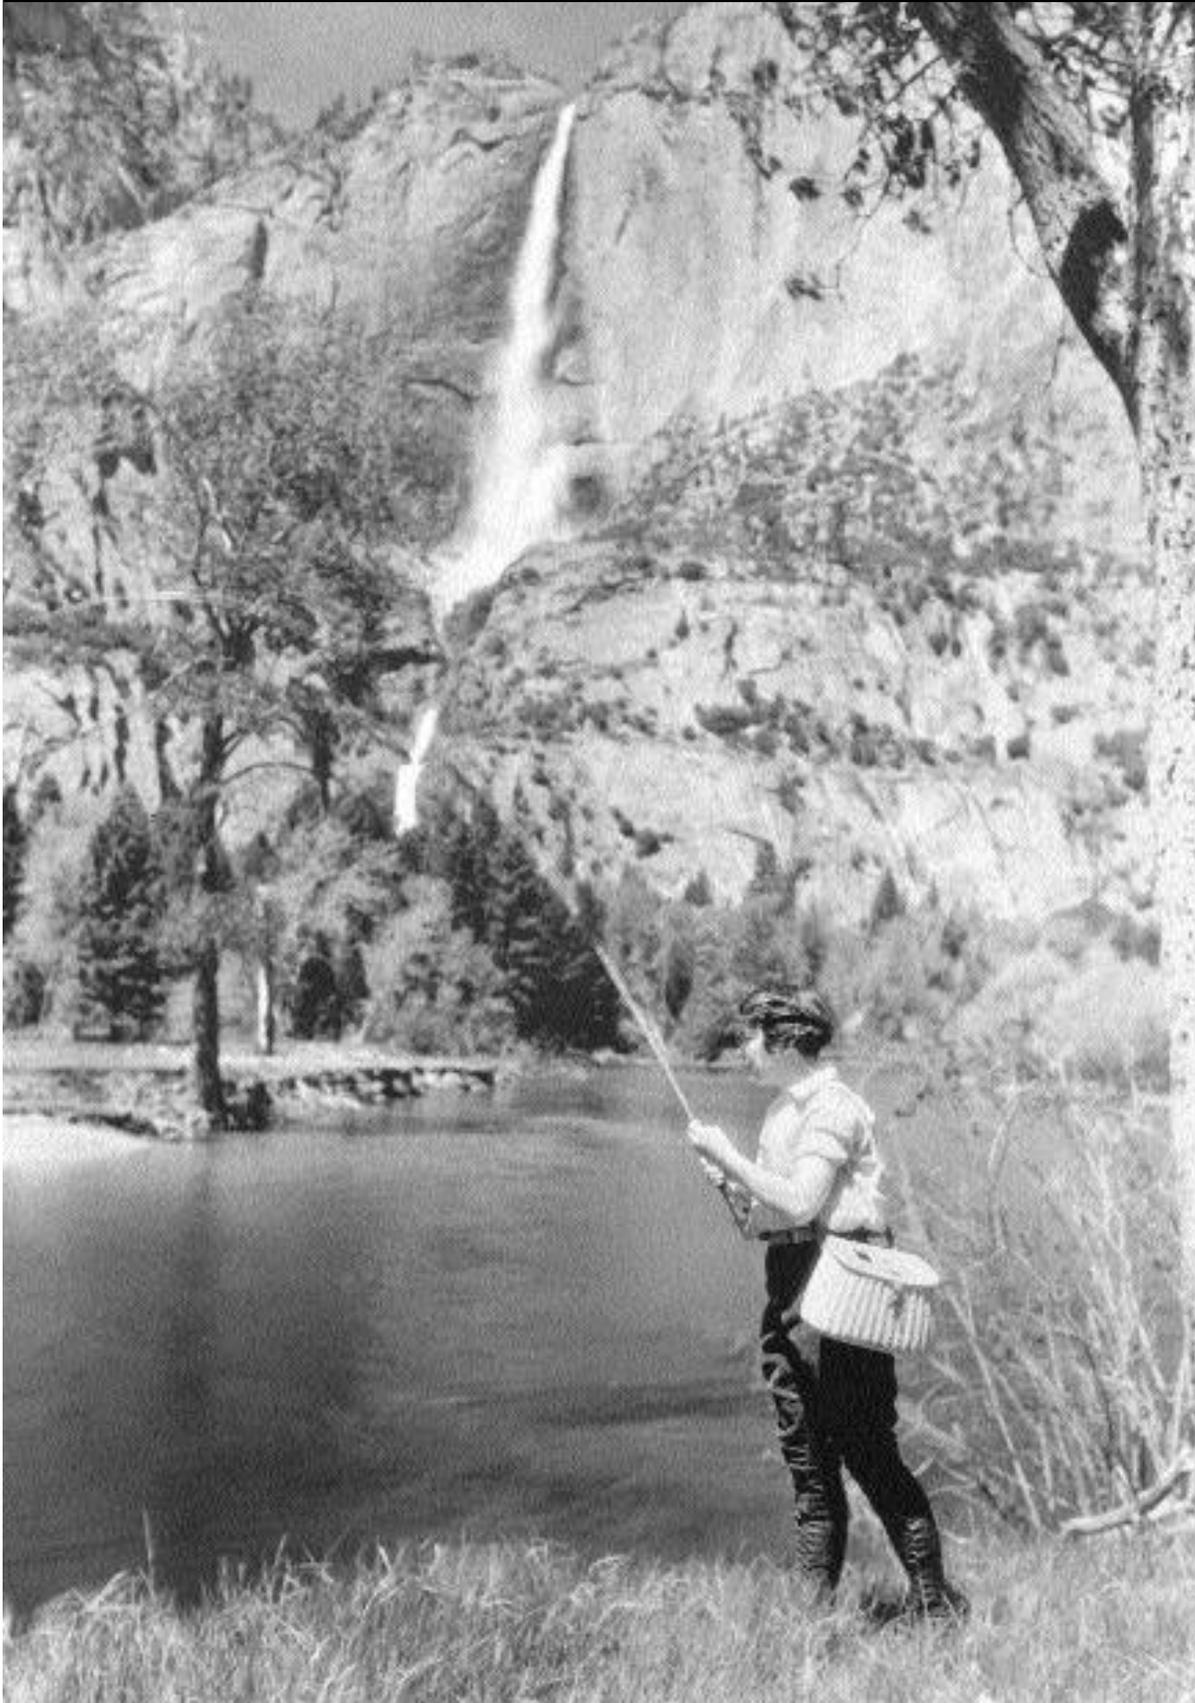

Executive Orders 11988 Floodplain Management and 11990 Protection of Wetlands consultation on direct federal agencies to enhance floodplain and wetland values, to avoid development in wetlands and floodplains whenever there is a practicable alternative, and to avoid impacts associated with the occupancy or modification of floodplains or wetlands to the extent

possible. Communication and site visits with the National Park Service Water Resources Division have taken place on a regular basis to ensure that the National Park Service is meeting all obligations under these Executive Orders and to oversee wetland delineation.

Foresta Preservation Association

The National Park Service has an obligation to formally advise the Foresta Preservation Association of actions concerning Foresta residents, as stipulated by Civil Action 92-5617-OOW (Benson v. USA, et al.). To meet this obligation, *Draft Yosemite Valley Plan/SEIS* documents, planning updates, and information sheets were distributed directly to the association, via its president. Additionally, National Park Service staff met directly with Foresta residents to inform and advise them on the elements, contents, and status of the *Draft Yosemite Valley Plan/SEIS*.

California black oak and canyons silhouetted against El Capitan.

GLOSSARY

100-year floodplain: The land adjacent to a river corridor that would be covered by water during a 100-year flood event. A 100-year flood event has a 1% probability of occurring during any given year.

A-weighted noise level (dBA): Noise intensity as measured with devices that have the same sensitivity to sound frequencies as the human ear.

Abutment: A structure that supports the ends of a bridge or dam.

Action alternative: An alternative that proposes a change to existing conditions or current management direction. The environmental consequences of an action alternative are analyzed in relation to the No Action Alternative. *Also see* No Action Alternative.

Adaptive reuse: A new use for a structure or landscape other than the historic use, normally entailing some modification of the structure or landscape. *Also see* Rehabilitation (cultural resources).

Affected environment: The existing biological, physical, cultural, social, and economic conditions that are subject to both direct and indirect changes as a result of actions described within alternatives under consideration.

Air quality: A measure of health and visibility-related characteristics of air, often derived from quantitative measurements of the concentrations of specific injurious or contaminating substances.

Alluvial: Processes by which sediment is deposited by running water.

Alluvium: Sediment deposited by a stream or other body of running water.

Alternatives: A reasonable range of options that can accomplish an agency's objectives.

Ambient noise: The existing sounds at a given location coming from all sources, both near and far.

Anaerobic: Existing in the absence of free oxygen.

Annosus root disease: A root disease caused by a widespread native fungus (*Heterobasidion annosum*). In pines, the fungus spreads through the root system, attacking the inner bark and sapwood. Two to six years after initial infection, the fungus reaches the root crown and girdles the tree, but remains active as a wood-decaying organism within the roots and trunk of the dying tree. Pines weakened by annosus root disease are often killed by bark beetles. Incense-cedars, however, are not affected by bark beetles and will stand green for many years until the disease so weakens the trees that they fall down. Cedars are thought to act as a reservoir for annosus root disease because they take so long to die from the disease.

Anthropogenic: Resulting from the influence or actions of human beings, e.g., the burning of the Valley floor by American Indians to clear brush.

Aquatic state: The period in the life cycle of some organisms that is spent almost entirely in water. For example, many insects have an aquatic larval stage.

Armillaria root rot: A native plant disease primarily affecting oaks, but other tree species as well; sometimes exacerbated by management activities. It can also result in tree hazards.

Average level (L_{eq}): The constant sound level for a specific measurement period that has the same total sound energy as the actual varying sound levels recorded over the period.

Background noise: The all-encompassing sound associated with a given environment at a specified time, usually a composite of sound from many sources and directions. Background noise remains in a given location in a given situation when all uniquely identifiable, discrete sound sources are eliminated, rendered insignificant, or otherwise not included.

Bank: The slope of land adjoining a body of water, especially a river, stream, lake, or channel.

Base of talus: *See* Talus slope zone.

Bed: Refers to the number of bed spaces assigned to employees in a given location. A bed could represent a multi-room house, a dormitory, or single-room unit. For example, a single-family house dedicated to one employee is considered to be one bed, regardless of the number of family members living in the same residence.

Best Management Practices: Effective, feasible (including technological, economic, and institutional considerations) conservation practices and land- and water-management measures that avoid or minimize adverse impacts to natural and cultural resources. Best Management Practices may include schedules for activities, prohibitions, maintenance guidelines, and other management practices.

Biodiversity: Or biological diversity, includes genetic diversity within species, species diversity within a community, and diversity in a full range of biological communities. An area is considered biologically diverse when it includes rich and stable populations of native species that are naturally distributed across the landscape.

Biological community: An association of plants and animals in a region dominated by one or more prominent species or by a physical characteristic (e.g., California black oak community).

Biota: All plants, animals, and microscopic life forms that make up a biological community or region.

Biotic: Of or produced by living things; composed of plant, animal, or microscopic life forms.

Braided stream system: A stream pattern that is characterized by the division of water flow into more than one channel. A basic characteristic of this pattern is the diversion of a single trunk channel into a network of interconnected branches and the formation of interspersed islands.

California black oak woodland: A vegetation community dominated by California black oak (*Quercus kelloggii*). Other species that may be present include canyon live oak, California buckeye, Douglas-fir, incense-cedar, and ponderosa pine. The canopy can be continuous, intermittent, or

savanna-like. Shrubs may or may not be common. Ground layer vegetation is sparse or grassy (Sawyer 1995).

Cabin (cultural resource): A small, rustic residential structure usually occupied seasonally.

Cabin (lodging): A structure containing one to four lodging units, as defined in the 1992 *Concession Services Plan/EIS*.

California Wilderness Act of 1984: A federal law that designated a number of additional wilderness areas in California, including those in Yosemite National Park.

Cambium: A thin layer of cells between the wood and bark in most vascular plants; the cells increase by division and differentiate to form new wood or bark.

CEQ: The President's Council on Environmental Quality (CEQ) was established by the National Environmental Policy Act (NEPA). The council's mission is to oversee and develop national environmental policy.

Choosing by Advantages: A decision-making process used as part of developing the *Yosemite Valley Plan* to analyze and refine the alternatives.

Colluvial soils: Loose earth material (such as rock fragments, sand, etc.) that accumulates on steep slopes or at the base of talus slopes through the action of gravity.

Community: When used in a social or political context, refers to the group of people living in a particular area. When used in a biological context, any group of interacting organisms belonging to a number of different species that occur in the same habitat. *Also see* Biological community.

Concessioner: A private commercial entity that conducts business under contract with the National Park Service in Yosemite National Park to provide food, lodging, retail, recreation, and other services to park visitors. The primary concessioner in the park is Yosemite Concession Services. Other concessioners include Yosemite Medical Clinic, The Ansel Adams Gallery, El Portal Market, and El Portal Chevron.

Concession Services Plan: The 1992 amendment to Yosemite's *General Management Plan* that guides the management of concession enterprises, such as lodging, food, retail, and other commercial services in Yosemite National Park. This plan serves as the basis for contracts between the National Park Service and the park's primary concessioner.

Conifer invasion: The progressive growth of coniferous trees, such as pines and incense cedars, into areas that formerly did not support these species. Over the last 150 years human-caused changes (such as alteration of soil moisture and suppression of a natural fire regime) have encouraged unnatural rates of conifer spread, reducing the size and continuity of meadows in Yosemite Valley.

Connectivity: The degree to which physical connections are maintained between large areas of habitat and patches of habitat, and between different types of habitat. Connectivity increases biodiversity and enhances reproduction and survival of species. *Also see* Habitat fragmentation.

Cottage: A lodging structure containing five to eighteen lodging rooms, as defined in the 1992 *Concession Services Plan/EIS*.

Crownsprout: An adaptation of plants to produce new growth from a stump or burl typically damaged by cutting or fire. New growth often appears as circular or crown-like.

Cultural landscape: A geographic area, including both cultural and natural elements, associated with a historic event, activity, or person, or exhibiting other cultural or aesthetic values. There are two primary types of cultural landscapes in Yosemite Valley: historic designed landscapes, such as The Ahwahnee and the Yosemite Village Historic District; and ethnographic landscapes, such as the entirety of Yosemite Valley.

Cultural resources: Properties such as landscapes or districts, sites, buildings, structures, objects, or cultural practices that are usually greater than 50 years of age and possess architectural, historic, scientific, or other technical value. By their nature, cultural resources are non-renewable.

Cumulative effects: Effects on the environment that result from the incremental impacts of an action when added to other past, present, and reasonably foreseeable future actions, regardless of which agency (federal or non federal) or person undertakes such actions. Cumulative effects can result from individually minor, but collectively significant, actions taking place over a period of time.

dBA: *See* decibel (dBA)

Day visitor: All visitors who do not spend the night in the park.

Day-Night Average (DNL): An average of daytime and nighttime noise levels with an adjustment that takes into consideration the greater need for quiet at night.

Debitage: Waste flakes of stone created during the process of stone tool manufacturing. *Also see* Lithic.

Debris flow: Soil, rock, and other materials that are rapidly transported by water and gravity. Debris flows occur in a variety of environments throughout Yosemite, ranging from steep ephemeral and perennial stream channels below cliffs to nearly flat alluvial fans adjacent to the Merced River floodplain.

Decadent trees: Stands of trees with greatly reduced growth, usually occurring as one of three types: (1) over-mature trees nearing end of normal life, (2) younger trees limited by site conditions such as soil deficiencies, and (3) overcrowding due to exclusion of natural and cultural fires.

Decibel (dBA): A unit of measure of sound intensity.

Decompaction: A natural resource restoration technique that includes loosening or breaking up unnaturally compacted soils to facilitate water movement and root growth.

Degradation (natural resources): Refers to negative impact(s) to natural resources or natural processes. The impact may be singular or cumulative; the extent may be local or ecosystem-wide. The term degradation is used broadly and may refer to: reduction in habitat size, reduction in extent of plant populations, declining species vigor exhibited as reduced population numbers, reduced reproductive success, increased mortality rates, and/or decreased percent of available habitat utilized.

Deluxe Lodging: A type of overnight visitor lodging having the largest number of amenities and, correspondingly, the highest price range found in Yosemite National Park. The only deluxe accommodations provided in Yosemite are at The Ahwahnee. As required by law, prices are established by the National Park Service after considering market forces and relevant factors, as well as reviewing a sample of comparable facilities operated under similar conditions in California. Double occupancy prices for deluxe lodging in 1999 ranged from \$241 - \$313, plus tax, depending on room type and season.

Design day: A planning term meaning a typically busy day; the level of visitation for which various facilities, systems, and programs would be designed to handle.

Designed historic landscape: A landscape significant as a design or work of art, that was consciously designed and laid out either by a master gardener, landscape architect, architect, or horticulturist to a design principle, or by an owner or other amateur according to a recognized style or tradition. A designed historic landscape has historical association with a significant person, trend, or movement in landscape gardening or architecture, or a significant relationship to the theory or practice of landscape architecture.

Doghair thickets: Young stands of equally aged trees (usually white fir, incense-cedar, and ponderosa pine) densely packed due to exclusion of natural and cultural fires. Such thickets are highly susceptible to insect outbreaks, diseases, wildfire, and mechanical damage from snow and wind.

Ecological restoration: See Restoration (natural).

Economy lodging: A type of overnight visitor lodging having basic amenities and offering the lowest-priced, hard-sided accommodations found in Yosemite National Park (rustic lodging with canvas roof and/or walls is priced lower). Economy lodging in Yosemite Valley can be found at Curry Village. As required by law, prices are established by the National Park Service after considering market forces and relevant factors as well as reviewing a sample of comparable facilities operated under similar conditions in California. Double occupancy prices for economy lodging in 1999 ranged from \$45 - \$75, plus tax, depending on room type and season.

Ecosystem: A system that involves the interaction of organisms with their physical environment.

Ecotone: A transition zone between different habitat types, such as the area between meadows and California black oak woodlands.

El Portal Administrative Site: An area of federally owned land under National Park Service jurisdiction outside of Yosemite National Park and adjacent to the western park boundary along Highway 140. In 1958, the administrative site, including the community of El Portal, was designated by the U.S. Congress to be used for park operations, housing, and administration. *See* Vol. I C, plate 1-6.

Eluviation: The movement through the soil of materials brought into suspension or dissolved by the action of water.

Emergent wetland: A wetland characterized by frequent or continual surface water inundation, dominated by herbaceous plant species rooted underwater and emerging into air (e.g., cattails, rushes).

Employee bed: *See* Bed.

Endangered species: *See* Threatened and endangered species.

Energy equivalent: *See* Average level (L_{eq}).

Environmental consequences: A section of an environmental impact statement that is the scientific and analytic basis for comparing alternatives. This discussion includes the environmental effects of the alternatives, any adverse effects that cannot be avoided, and short-term, long-term and cumulative effects. These environmental effects include ecological, aesthetic, historical, cultural, economic, and social (Bass and Herson 1993).

Environmental Impact Statement: A detailed statement required by the National Environmental Policy Act (NEPA) when an agency proposes a major action that significantly affects the quality of the human environment. This document describes and analyzes the activities that might affect the human environment (Bass and Herson 1993).

Environmental justice: Ensuring the rights of low-income people and communities of color to experience and enjoy clean and healthy environments. Executive Order 12898 requires that the National Park Service ensures that its programs, policies, and activities do not exclude, discriminate, or deny persons because of their race, color, or national origin.

Erratics: Rock fragments of any size carried by glacial or floating ice and deposited at some distance from the place of origin.

Exotic species: *See* Non-native species.

Facilities: Refers to buildings, houses, campgrounds, picnic areas, visitor-use areas, operational areas, and associated supporting infrastructure such as roads, trails, and utilities.

Facultative wetland species: Plant species that can, but do not always, occur in wetlands. Facultative species indicate possible wetland conditions; further study of other wetland indicators (e.g., soils and inundation patterns) may be warranted.

Fell-field: A community of widely scattered dwarfed vegetation that grows in the barren land above the timberline.

Fen: A unique wetland type, possessing a water source that originates from alkaline ground water. Typically fens possess unique wetland vegetation adapted to saturated alkaline growing conditions.

Fire return interval: The typical period of time between naturally occurring fires. Fire return intervals vary by vegetation type and location.

Floodplain: Land on either side of a stream or river that is submerged during floods.

Fluvial: A term used to indicate the presence or interaction of a river within an area or landform.

Footprint: The land area covered or occupied by a function or structure.

Frazil ice: Stream ice with the consistency of slush, formed when small ice crystals develop in super-cooled stream water as air temperatures drop below freezing. These ice crystals join and are pressed together by newer crystals as they form.

Free-flowing river: A body of water existing or flowing under natural conditions without impoundments, diversions, straightening, riprapping, or other modification of the waterway (as defined in the Wild and Scenic Rivers Act - 16 USC 1286 [b]). *Also see* Riprap.

Fuel loads: The quantities of burnable, wildland fire fuels, normally expressed in tons per acre. The exclusion of natural and cultural fires has resulted in unnaturally high and hazardous fuel loads in many forested areas making management by prescribed fire unsafe.

Fuel/propulsion technology: The practical application of knowledge in the development of fuels, both petroleum and nonpetroleum, and the engineering of appropriate power and drive systems for vehicles.

Full build-out: The condition that occurs when all planned facilities are constructed; the utilization of all suitable and designated locations within an area.

Geologic hazards: Natural geologic processes (i.e., rockfall) that occur or could potentially occur in locations that present a threat to humans or developed areas.

Geographic information system (GIS): A unique assemblage of hardware, software, and personnel that integrates digital databases, spatial technologies, and analytical methods in order to capture, store, edit, analyze, and display geographic data.

Geomorphic: Refers to the shape of the earth, or the shape of features on the earth's surface.

Glaciation: A collective term for geologic processes of glacial activity, including erosion, deposition, and the resulting effects of such action on the earth's surface.

Groundwater: All water found below the surface of the ground. *Also see* Surface water.

Habitat fragmentation: The partitioning of larger habitats into smaller more isolated parcels, usually as a result of development. Fragmentation of habitat can negatively affect the abundance and diversity of plants and animals in an area.

Hazard trees: "...any tree...either alive or dead, which due to outwardly visible defects could fall down (in part or in entirety) and strike a person or property within any designated portion of a development zone." (WR-093)

Hazardous material: A substance or combination of substances that, because of quantity, concentration, or physical, chemical, or infectious characteristics, may either: (1) cause or significantly contribute to an increase in mortality or an increase in serious, irreversible, or incapacitating illness, or (2) pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported, used, or disposed of.

Hazardous waste: Hazardous materials that no longer have practical use, such as substances that have been discarded, spilled, or contaminated, or that are being temporarily stored prior to proper disposal.

Headwaters: The point or area of origin for a river or stream.

Herbaceous: Refers to plants that lack a woody structure.

Highly valued resources: A set of natural and cultural resources that are the park's highest priority for protection and restoration. Highly valued resources in Yosemite Valley are those that

make up the Merced River ecosystem (Merced River, wetlands, riparian, and meadow communities), California black oak woodlands, sensitive wildlife habitat, rich soil areas, National Historic Landmarks, and important archeological sites. Highly valued resources are graphically portrayed in Vol. IC, plate C.

Historic American Buildings Survey (HABS)/Historic American Engineering Record (HAER): An architectural and engineering documentation program that produces a thorough archival record of buildings, engineered structures, and cultural landscapes significant in American history and the growth and development of the built environment.

Historic character: The sum of all visual aspects, features, materials, and spaces associated with the historic nature of a site, structure, or landscape.

Historic district: A geographically definable urban or rural area, possessing a significant concentration, linkage, or continuity of sites, landscapes, structures, or objects united by past events or aesthetically by plan or physical developments. A district may also be composed of individual elements separated geographically but linked by association or history.

Historic topography: The physical features and contours of a place or region as they existed during historic time.

Hotel: A structure containing more than eighteen lodging rooms, as defined in the 1992 *Concession Services Plan/EIS*.

Housing actions: The component of alternatives that describes the potential locations, types, and numbers of employee housing. *Also see* Bed.

Housing support facilities: Amenities required by a typical residential community (i.e., post office, food preparation and service, recreational facilities, barber shop, child care, etc.).

Housekeeping unit: A type of rustic accommodation found within Housekeeping Camp in Yosemite Valley. The unit is composed of a concrete three-walled structure with canvas roof and door, a small patio, and a common bathroom. *Also see* Rustic accommodation.

Hydric soils: Soils that are characterized by an abundance of moisture, periodically producing anaerobic conditions.

Hydrodynamics: The flow, fluctuation, and character of water in a system.

Hydrogeomorphology: The science dealing with how the land is shaped by hydrological processes, such as the formation of the floodplain in Yosemite Valley and the channels of the Merced River.

Hydrologic response: The response of a watershed to precipitation, often the resulting streamflow from a precipitation event or snowmelt.

Hydrology: The science dealing with the properties, distribution, and circulation of water on the surface of the land, in the soil and underlying rocks, and in the atmosphere.

Hydromorphic classification: A wetland classification system that distinguishes wetland features based on position in the landscape, geomorphic setting, and hydrodynamics (National Research Council 1995).

Hydrophilic: Refers to soils that have an affinity for water, usually soils with high clay content.

Hydrophyte: Any plant growing in water or in a substrate that has an abundance of moisture. Hydrophytes are typically found in wetland habitats.

Illuviation: The accumulation in a soil layer of material that has been leached out of another layer.

Impacts: Effects, both beneficial and adverse, of an action on the human environment. Direct effects are those occurring at the same time and place as the action itself. Indirect effects occur later in time or are farther removed in distance from the action, yet are reasonably foreseeable.

IMPLAN: An economic impact assessment modeling system that allows the user to build economic models to estimate the impacts of economic changes.

Infrastructure: The various systems and facilities needed to support park operations and visitor services (e.g., sewer and water systems, electric systems, communication lines, roads and trails, and various support buildings).

Internal/external air pollution sources: Sources of air pollution either outside of a region or within a region; Yosemite Valley experiences air pollution from both sources: air pollution caused by motor vehicles within the Valley and air pollution originating in the San Joaquin Valley and moving into the Yosemite area.

Interpretation: Programs that support the mission of the National Park Service by assisting people in understanding, enjoying, and contributing to the protection of the park's natural, cultural, and scenic resources and dynamic processes. Interpretive programs include walks and evening programs, guided tours, formal education programs for school groups, exhibits, audio-visual productions, and publications. In Yosemite, these programs are provided by the National Park Service and park partners, including Yosemite Concession Services, the Yosemite Association, The Ansel Adams Gallery, the Yosemite Institute, and the Sierra Club.

Inoculum: Refers to naturally occurring fungal material used to inoculate root systems.

Krummholz: Krummholz is the name given to dwarfed and stunted trees that occupy environments characterized by intense solar radiation, high winds, excessive salts, and large diurnal temperature fluctuations.

L_{eq} : *See* Average level (L_{eq}).

Lacustrine: Of, or relating to lakes.

Ladder fuels: Flammable materials between the ground and tree canopy (a single tree or stand of trees) that provides an opportunity for a ground fire to ignite the canopy. Ladder fuels are typically composed of immature trees, shrubs, and dead or downed branches.

Lateral moraines: Linear moraines deposited along the sides of a glaciated valley. *See* Moraine.

Life zone: Bands of characteristic vegetation occurring along elevation gradients.

Liquefaction: A process by which water-saturated soils lose strength and liquefy during ground shaking events.

Lithic: Of or relating to stone or stone tools.

Lodging unit/room: Concessioner-operated facilities for overnight visitors. A lodging unit may be a single structure, such as a tent cabin, or a series of rooms grouped into larger motels or hotels. Lodging rooms in Yosemite are available at a range of prices that correspond to the type of structure as well as the amenities provided. *See* Cabin (lodging); Cottage; Hotel; Housekeeping unit; Motel. *Also see* Deluxe Lodging; Economy Lodging; Mid-scale Lodging; Rustic Lodging.

Mast crop: The fallen fruit of forest trees (such as acorns) used as forage by wildlife.

Mechanical treatment: The alteration of the landscape using hand implements, power tools, and heavy equipment.

Medial moraine: A deposit of glacial debris that indicates the point of contact between two glaciers moving in a parallel direction, combining their respective lateral moraines. *See* Moraine; Lateral moraines.

Microclimate: The distinct yet uniform, localized climate of a small site or habitat.

Mid-scale lodging: A type of overnight visitor lodging having a moderate number of amenities and, correspondingly, a price range located between deluxe and economy. In Yosemite Valley, mid-scale lodging rooms are located at Yosemite Lodge and Curry Village. As required by law, prices are established by the National Park Service after considering market forces and relevant factors as well as reviewing a sample of comparable facilities operated under similar conditions in California. Double occupancy prices for mid-scale lodging in 1999 ranged from \$78 - \$115, plus tax, depending on room type and season.

Mission 66 style (architecture): Refers to buildings developed in national parks between 1956 and 1966, during a period of experimentation with new structural forms, modern materials, and machine-driven methods of construction. The intent was to provide low maintenance, economical, permanent structures.

Mitigation: An activity designed to avoid, minimize, rectify, eliminate, or compensate for impacts of a proposed project. A mitigation measure should be a solution to an identified environmental problem.

Mixed conifer zone: Plant communities consisting of a mix of conifers such as pine, fir, incense-cedar, and Douglas-fir. The zone includes lower montane, montane, and upper montane coniferous forests. California black oak and other hardwoods are common associates.

Monoculture: The cultivation or growth of a single crop or organism to the exclusion of all others. Pervasive invading non-native plant species can sometimes create a near monoculture situation.

Montane: Of, relating to, or growing in the biogeographic zone of relatively moist cool upland slopes below the timberline, dominated by large coniferous trees.

Moraine: An accumulation of mineral material, such as boulders, stones, and sediment that is transported and deposited by a glacier.

Mosaic: A descriptive term for vegetation where the mix of species types and ages creates a diverse assemblage of vegetation or vegetation communities. This term can also be used to describe diversity in habitat types.

Motel: A structure containing more than eighteen lodging rooms, as defined in the 1992 *Concession Services Plan/EIS*.

Multi-use paved trail: A trail that is intended for pedestrian and bicycle use. Occasionally, short segments of multi-use trails may also be used for horses, maintenance, and emergency access by motor vehicles.

Museum collection: Objects, works of art, historic documents, and natural history specimens collected according to a rational scheme and maintained so they can be preserved, studied, and interpreted for public benefit.

National Environmental Policy Act (NEPA): The federal act that requires the development of an environmental impact statement (EIS) for federal actions that might have substantial environmental, social, or other impacts.

National Historic Landmark: A district, site, building, structure, landscape, or object of national historical significance designated by the Secretary of the Interior under authority of the Historic Sites Act of 1935 and entered in the National Register of Historic Places.

National Register of Historic Places: The comprehensive list of districts, sites, buildings, structures, and objects of national, regional, state, and local significance in American history, architecture, archeology, engineering, and culture. This list is maintained by the National Park Service under authority of the National Historic Preservation Act of 1966.

Natural quiet: The absence of human-caused sounds.

Natural process: A collective term for processes, including hydrologic, geologic, biologic, and ecosystemic, that are not the result of human manipulation.

Natural resources: Features and values that include plants and animals, water, air, soils, topographic features, geologic features, paleontologic resources, natural quiet, and clear night skies.

Natural topography: The natural shape or contour of the land.

No Action Alternative: An alternative in an environmental impact statement that continues current management direction. A no action alternative is a benchmark against which action alternatives are compared.

Non-native species: Species of plants or animals that do not naturally occur in a particular area and often interfere with natural biological systems. Also known as alien, introduced, or exotic species.

Non-point sources: Pollutants that enter the environment from general noncontained locations. Examples of non-point sources are roadways, parking lots, and landscaped areas. Pollutants from these locations can include petrochemicals, heavy metals, and fertilizers.

Nonwilderness: Areas in Yosemite that have not been designated for special protection under the California Wilderness Act of 1984.

Obligate wetland species: Plant species that almost always occur in wetlands.

Off-season: Refers to a period of year when Yosemite visitation is lowest, usually from late autumn to early spring. *Also see* Peak season.

Ordinary high water: That line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impressed on the bank, shelving, changes in the character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.

Out-of-Valley parking: Day-visitor parking outside of Yosemite Valley. Out-of-Valley parking refers to parking areas located either inside or outside the park boundary.

Outstandingly Remarkable Values (ORVs): The exceptional values of a river that warranted its inclusion in the national Wild and Scenic Rivers System. ORVs are the “scenic, recreational, geologic, fish and wildlife, historic, cultural, or other similar values...that shall be protected for the benefit and enjoyment of present and future generations.”

Overnight visitor: Refers to visitors who spend the night in Yosemite Valley. This includes those that stay in lodging, campgrounds, and wilderness areas.

Overstory: The layer of foliage in a forest canopy.

Over-the-road coach: A bus designed for high-speed travel on highways with storage under the floor; a tour bus.

Oxbow: A bend in a meandering river channel that is abandoned as the river shifts its course over time. Oxbows can remain saturated with surface water or groundwater for some time, providing diverse wetland habitats for vegetation and wildlife.

Paleoenvironment: The environment that existed during some time in prehistory.

Palustrine: A term relating to vegetated wetlands (e.g., marsh, swamp, fen, bogs) and small, shallow ponds.

Park partner: An organization that maintains a formal agreement with the National Park Service to provide visitor services in conjunction with Yosemite National Park or otherwise assist the National Park Service; examples include the Yosemite Institute, Yosemite Association, Yosemite Fund, and the Sierra Club (operates LeConte Memorial Lodge).

Particulate matter (PM₁₀ and PM_{2.5}): Particles with diameters of 10 microns or less (PM₁₀) or 2.5 microns or less (PM_{2.5}). Such particles can be inhaled into the air passages and the lungs and can cause adverse health effects. High levels of PM_{2.5} are also associated with regional haze and visibility impairment.

Peak season: Refers to a period of the year when park visitation is highest: broadly speaking, this includes late spring, summer, and early fall. *Also see* Off-season.

Pedestrian/stock trail: Mostly unpaved trails intended to accommodate both pedestrians and stock users. (Use of bicycles on unpaved trails is prohibited.)

Point bars: Areas along the inside bends of a meandering river where material is deposited.

Pool-riffle: The relationship, usually expressed as a ratio, between the surface area of pools and that of small rapids (riffles) in a given portion of a stream or river.

Post-flood conditions: Describes the environment in Yosemite Valley following the January 1997 flood. Post-flood conditions include any subsequent clean-up activities, such as the removal of flood-damaged facilities at Yosemite Lodge and the closure of Upper and Lower River Campgrounds.

Potential Wilderness additions: In Yosemite, these are areas that are officially designated as potential Wilderness additions under the California Wilderness Act of 1984. Potential Wilderness additions are managed as Wilderness until the time that they can be become designated Wilderness. Potential Wilderness additions can become Wilderness without further Congressional action if the use (e.g., roads and trails) or activity (e.g., motorized use) precluding Wilderness designation ceases.

Prescribed fire: Fires that are intentionally ignited under controlled conditions to meet management goals for natural resources and processes, wildland fire protection, and cultural resource preservation.

Preservation (cultural resource): The act or process of applying measures to sustain the existing form, integrity, and material of a historic structure, landscape, or object. Work may include preliminary measures to protect and stabilize the property, but generally focuses on the ongoing preservation, maintenance, and repair of historic materials and features rather than extensive replacement and new work.

Preservation (natural resource): The act or process of preventing, eliminating, or reducing impacts to natural resources and natural processes.

Programmatic accessibility: The ability for visitors with disabilities to participate in the range of programs offered in the park. This includes access to interpretive programs, concessioner services, scenic views, and audio-visual media.

Protected species: *See* Threatened and endangered species.

Protohistoric: Refers to a time immediately before written history.

Radiating impacts: Human activity and associated foot traffic that originates in visitor focal points, such as parking lots, and spreads into adjacent areas.

Recessional moraines: A moraine or series of moraines deposited by glaciers as they retreat across a landscape. *See* Moraine.

Reconstruction: The act or process of depicting, by means of new work, the form, features, and detailing of a nonsurviving historic structure or landscape for the purpose of replicating its appearance at a specific time and in its historic location. (The term also refers to the resulting structure or landscape.)

Record of Decision (ROD): The public document following the preparation of an environmental impact statement that reflects the agency's final decision, rationale behind the decision, and commitments to monitoring and mitigation.

Redevelop: A term that applies to areas that are currently developed, where all or part of the existing development is removed and replaced, modified, or adaptively reused.

Regional transit: A system that provides transportation to and from Yosemite Valley and other areas of the park from communities and locations outside of the park.

Rehabilitation (cultural resources): The act or process of making possible an efficient, compatible use for a historic structure or landscape through repair, alterations, and additions while preserving the portions or features which convey the historical, cultural, and architectural values. *Also see* Adaptive use.

Rehabilitation (natural resources): All activities conducted to improve the quality or biologic function of an impacted natural resource. The term rehabilitation connotes a less extensive process than restoration. Site impacts may preclude a full restoration, but project work is undertaken to enhance the extent or function of natural processes.

Resilient soil: Types of soil that can withstand certain levels of human impact (e.g., foot traffic) without changing its natural character and biological function.

Resilient ecosystem: Ecosystem types that have the ability to rebound from negative impacts to resources and natural processes with negligible or minimal long-term effects.

Restricted access: During periods of high traffic congestion, some vehicles may be required to wait to gain entry to Yosemite Valley (and sometimes the entire park) for portions of the day, with the exception of those visitors who have lodging or camping reservations.

Restricted Access Plan: The Restricted Access Plan lists the criteria and procedures for implementing restricted access. *See* Restricted access.

Restoration (cultural): The act or process of accurately depicting the form, features, and character of an existing historic structure, landscape, or object as it appeared at a particular period of time, by removing modern additions and replacing lost portions of historic fabric, paint, or other elements.

Restoration (natural): Work conducted to remove impacts to natural resources and restore natural processes, and to return a site to natural conditions.

Revegetation: Replacement or augmentation of native plants in an area largely or entirely denuded of vegetation.

Riffle: *See* Pool-riffle.

Riparian areas: Areas that are on or adjacent to rivers and streams; these areas are typically rich in biological diversity (flora and fauna).

Riprap: Any hardening of a shoreline (with rocks or cement) to stabilize river banks for the protection of facilities on or near the bank.

Riverine: Of or relating to a river. A riverine system includes all wetlands and deepwater habitats contained within a river channel.

River Protection Overlay (RPO): A buffer area intended to protect the Merced River within the park boundary and the El Portal Administrative site, as prescribed by the 2000 *Draft Merced Wild and Scenic River Comprehensive Management Plan/Environmental Impact Statement*. The River Protection Overlay includes the river channel and extends outward 150 feet from the ordinary

high water line above 3,800 feet elevation (including Yosemite Valley and Wawona), and 100 feet from the ordinary high water line below 3,800 feet (including El Portal). It is graphically depicted in Vol. IC, plates F-1 to F-3.

Rockfall: Associated forms of mass movement such as rock avalanches, rockslides, debris slides, and debris flows (Wieczorek, et al. 1998).

Rockfall shadow zone (SL): A distance calculated to determine outlying boulder locations beyond the extent of talus. The SL is determined by a procedure based on the apex of the talus and a minimum shadow angle of 22 degrees (Wieczorek et al. 1998). It is graphically depicted in Vol. IC, plate D.

Rockfall talus zone: *See* Talus slope zone.

Rustic lodging: The most economical lodging type provided in the park; rustic lodging has the fewest number of amenities. Most rustic lodging consists of canvas tents on wooden frames and are furnished with cots. Linen service and daily housekeeping are generally not provided. In Yosemite Valley, rustic lodging is provided at Curry Village and Housekeeping Camp. As required by law, prices are established by the National Park Service after considering market forces and relevant factors, as well as reviewing a sample of comparable facilities operated under similar conditions in California. Double occupancy prices for rustic lodging in 1999 ranged from \$40 - \$46, plus tax, depending on room type and season.

Rustic style (architecture): Refers to a building style developed in the 1920s and 1930s in national parks. The rustic style emphasized the use of natural materials and textures and thoughtful integration with the natural landscape.

Saprophytic: Obtaining food by absorbing dissolved organic material; saprophytic plants live on dead or decaying organic matter and assist in the breakdown of such into humus.

Scarification: A restoration term meaning the decompaction or loosening of topsoil to allow for enhanced vegetative growth and absorption of moisture.

Section 35: The area on the South Fork of the Merced River, originally designated by the U.S. Geological Survey, that demarcates the "township of Wawona" and contains intermixed parcels of private and National Park Service lands.

Sediment: A particle of soil or rock dislodged, transported, and deposited by surface runoff or a stream. The particle can range in size from microscopic to cobble stones.

Sense of arrival: An emotional and mental state that accompanies the end of a visitor's travels and the beginning of their park experience. For many visitors, arriving in Yosemite Valley marks the end of a considerable journey involving both lengthy planning and travel. For some, a sense of arrival is created by the clear opportunity to park their car, learn about and plan activities in the park, and begin their exploration of the park with the assistance of exhibits, signs, guidebooks, trails, shuttle buses, etc. For others, this sense of arrival begins with the first sight of Yosemite icons (e.g., Tunnel View, El Capitan, Half Dome). For returning visitors, this sense of arrival may occur as they check into their campsite, cabin, or lodging room.

Sheetflow: Flowing water that is not confined to a channel.

Shoulder season: The nonpeak park visitation season on either side of peak summer months. For example, the calendar months of April, May, September, and October are included in the shoulder season.

Snag(s): Snags consist of dead trees that remain standing or leaning against another tree. Snags provide cavity habitats for a variety of wildlife species. Snags near trails or camping areas represent hazards which must be managed or removed.

Social trails: A social trail is an informal, nondesignated trail between two locations. Social trails often result in trampling stresses to sensitive vegetation types.

Special Use Occupancy: Designation for structures or facilities that can have more than 300 people present at one time.

Statement of Finding (SOF): As it refers to floodplains, a document normally associated with an environmental impact statement or environmental assessment that explains why an action is to be taken in a regulatory floodplain. The SOF describes the risk associated with use of the regulatory floodplain and how mitigation of flood risk would be achieved. (*See Appendix N.*)

Stewardship: The responsibility of caring for the park. This often grows from an understanding of and respect for the principles of the National Park System and the needs of the park's natural, social, and cultural environment.

Stock: This term generally refers to horses and mules used for riding or carrying packed supplies on established trails.

Succession: The process by which vegetation is either re-established following a disturbance or by which it initially develops in an unvegetated site. This term also refers to the entire process from initial colonization to the development of vegetation typical of that geographic area.

Surface water: Water that naturally flows or settles on top of natural landforms and vegetation, often as rivers, streams, lakes, ponds, and other bodies of water.

Talus: An accumulated mass of rock fragments (broken rock formed by falling, rolling, or sliding) of various sizes derived from and lying at the base of a steep slope (Wieczorek, et al. 1998).

Talus slope zone (TS): The area where the majority of accumulated rock debris is deposited at the base of a steep slope following a mass movement event (i.e., rockfall) (Wieczorek, et al. 1998). It is graphically depicted in Vol. IC, plate D.

Tarn: A small, mountain lake or pool.

Terminal moraine: Ridges of material deposited at the terminus of a glacier. *See Moraine.*

Terrestrial: Living on or growing from land.

Threatened and endangered species: Species of plants and animals that receive special protection under state and federal laws. Also referred to as listed, endangered, or protected species.

Traffic check station: A location where vehicle access is regulated; typically requires buildings, multiple traffic lanes, and staffing.

Transit bus: A mode of transportation that operates on a schedule along routes with established stops. Transit buses do not require daytime parking in Yosemite Valley, as they continuously pick up and drop off passengers along their established routes.

Umacha: A Miwok structure made of cedar bark and used for shelter.

Understory: An underlying layer of vegetation, specifically the vegetative layer, and especially the trees and shrubs, between the forest canopy and the ground cover.

Ungulates: Hoofed herbivores, e.g., mule deer.

Upland community: The vegetation found where soil conditions are average to dry and where soils are only infrequently flooded or saturated. In Yosemite Valley, mixed conifer, California black oak, and live oak communities dominate uplands.

User groups: Park visitors who participate in any one activity are considered members of a user group. An individual may belong to a number of different user groups. User groups may desire different, and sometimes conflicting, experiences in the same area (e.g., fishing and swimming in the same stretch of river).

Visitor experience: The perceptions, feelings, and interaction a park visitor has in relationship with the environment. Within the context of the proposed alternatives, the Visitor Experience section describes general access, facilities, visitor services, interpretation and orientation, and recreational opportunities. Other elements also contribute to the quality of the visitor experience, such as the condition of natural and cultural resources, air quality, transportation, and noise.

Visitor Experience Resource Protection (VERP): A process developed for the National Park Service to help manage the impacts of visitor use on the visitor experiences and resource conditions in national parks.

Walk-in campground: A campground with consolidated parking areas separated from the individual campsites. Campers walk a short distance from the parking area to their campsites (e.g., Camp 4 [Sunnyside Campground]).

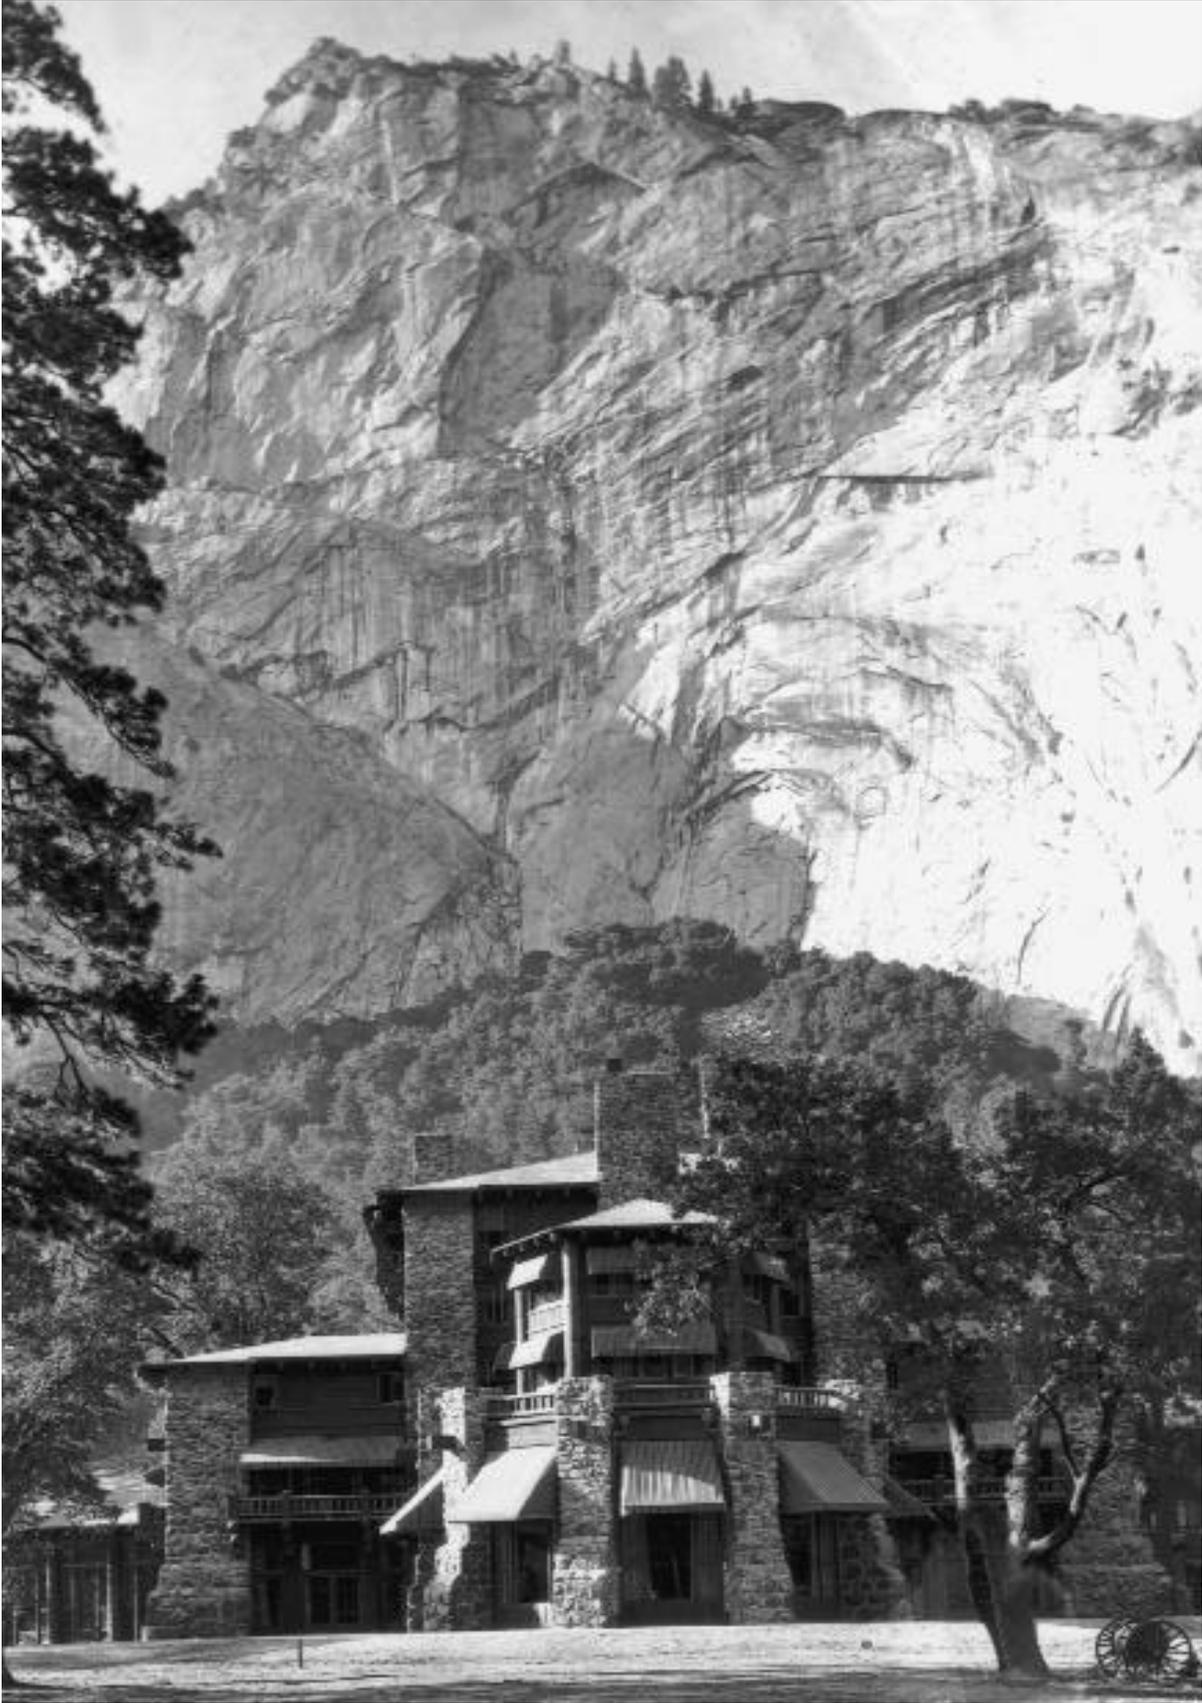

Walk-to campground: A campground with no parking at the campsite, and no designated parking place associated with the campground. These campgrounds would be available for campers arriving in Yosemite Valley without a private vehicle (i.e., by bus, on foot, by bicycle).

Watershed: The region draining into a river, river system, or body of water.

Wetland: Areas that are inundated by surface or groundwater with a frequency sufficient to support, under normal circumstances, vegetation or aquatic life that requires saturated or seasonally saturated soil conditions for growth and reproduction.

White pine blister rust: A non-native disease affecting five-needled pines including sugar pine and also shrubs in the genus *Ribes* (alternate host). Extensive prevention and control efforts in the 1930s focused on eradication of *Ribes* bushes. These efforts resulted in the creation of several small settlements to house the thousands of people hired by the government for this work project.

Wilderness: Areas protected by provisions of the Wilderness Act of 1964. These areas are characterized by a lack of human interference in natural processes; generally, there are no roads, structures, installations, and the use of motorized equipment is not allowed.

YOSEMITE NATIONAL PARK • CALIFORNIA
United States Department of the Interior

Scot Miller

The cover photographs for all volumes of this document were taken by nature and scenic photographer Scot Miller. Since his first visit to Yosemite in 1990, Miller has tried to capture the magnificence and grandeur of the park. Through his photography he hopes to inspire others to have an appreciation and understanding of Yosemite's uniqueness, along with its value as a national treasure worth preserving for future generations. He currently lives in Carrollton, Texas.

Lawrence Ormsby

The illustrations in this document were drawn in pencil and pen and ink by Lawrence Ormsby, partner in Ormsby and Thickstun Interpretive Design. For more than two decades, Ormsby has worked with National Park Service interpreters and historians to prepare illustrations for interpretive publications and exhibits. This year he received the National Park Service Director's Award for his illustration and cartography work in *A Land in Motion: California's San Andreas Fault*. He currently lives in Cave Creek, Arizona.

Permission to use copyrighted images in the *Yosemite Valley Plan/Supplemental Environmental Impact Statement* has been granted by the copyright holders in return for payment of a fee. These images are not placed in the public domain by their appearance herein. They cannot be copied or otherwise reproduced except in their printed context within this document without the written consent of the copyright holders.

PLATES

INTRODUCTION

This volume provides a graphic interpretation of the alternatives considered in the Final Yosemite Valley Plan/Supplemental Environmental Impact Statement. These individual graphics, referred to as “plates,” characterize the important aspects and relationships of the alternatives and their various components. The plates are intended to highlight the resource and value-based elements used during the planning process as well as the extent and type of actions proposed for each alternative. These plates are included to help the reader better understand how significant natural and cultural resources influenced the development of the alternatives, and also help the reader evaluate the alternatives and their potential environmental consequences. Therefore, it is most useful to view these plates in conjunction with Volume IA: Chapter 1, Purpose of and Need for the Action; Chapter 2, Alternatives; Chapter 3, Affected Environment; and Volume IB: Chapter 4, Environmental Consequences.

In this volume, there are 50 plates divided into six sections. There is one section of overview plates, and one section of plates for each alternative considered in the *Final Yosemite Valley Plan/SEIS*.

The plates are map-like and are primarily based on spatial data adapted from a geographic information system (GIS). However, in order to maintain accuracy and make the plates easy to understand, the geographic information has occasionally been generalized. This means that not all features (such as intermittent streams or small structures) are shown, and some proposed features (such as new trails) may not be shown in their precise locations.

The level of detail on the plates differs depending upon the scale of the area displayed. For example, plate A – State Overview shows a large geographic area, but in limited detail. Comparably, plate D – Yosemite Valley Development Considerations depicts a smaller area with a moderately higher level of detail. The site plates for each alternative, such as plate 1–4, Alternative 1, Yosemite Village, focus on a smaller area and therefore show the greatest level of detail.

DESCRIPTION OF PLATES

Overview Plates

The overview plates include several Yosemite National Park location graphics (plates A, B, and C), as well as resource-specific views of Yosemite Valley, including Highly Valued Natural and Cultural Resources (plate D), Development Considerations (plate E), Scenic Analysis (plate F), and Merced Wild and Scenic River Management Zones (plates G1–G3). The overview plates are intended to provide a context for the planning process and a comprehensive view of the significant resources within Yosemite Valley. For a more detailed description of the information presented on the overview plates, see Volume IA, Chapter 1, Purpose of and Need for the Action; Chapter 2, Alternatives; and Chapter 3, Affected Environment.

Alternative Plates

There is one section of plates for each of the five alternatives. Each alternative section includes a Yosemite Valley Overview, East Yosemite Valley Overview, and site plates for Yosemite Lodge, Yosemite Village, Curry Village and Campgrounds, El Portal, and Foresta. Site plates for Wawona and out-of-Valley parking locations are included only in alternative sections that have actions proposed for those areas. For instance, Alternative 3 does not include a proposal for out-of-Valley parking. Therefore, there is no out-of-Valley parking plate in the Alternative 3 section. For more detailed information on the location and type of actions proposed under each alternative, see Volume IA, Chapter 2, Alternatives.

Color is used on the alternative plates to differentiate the types of development actions proposed within a given area. For instance, linear features in Yosemite Valley, such as roads and trails, are distinguished by color as either existing (black) or new (red). Restored road and trail corridors (corridors that are removed) are not shown on the alternative plates. Area features, such as lodging and parking, are distinguished by colors to indicate type of development or natural resource restoration. The four land-use categories used to illustrate area features are as follows:

Existing Development (Brown): Existing development areas currently have concentrated facilities and use (e.g., buildings, campgrounds, and picnic areas) or have been affected by recent concentration of facilities in the area (e.g., former campgrounds and housing areas unused since the 1997 flood). Existing development typically includes historic properties (except historic orchards). Major parking areas are shown as existing development, but small parking areas, such as roadside turnouts, are not. Areas shown as existing development in the action alternatives (Alternatives 2 through 5) would remain essentially unchanged.

Redevelopment (Orange): Redevelopment areas are those with existing development proposed for a change in land use. All or part of an area shown for the redevelopment area could be altered. Redevelopment could include demolishing one structure and constructing

another in its place; constructing a new type of facility in a currently impacted area; or developing an area to include new or rehabilitated structures, new or realigned transportation corridors, and intermittent areas of natural resource restoration. Existing facilities (e.g., buildings, roads, etc.) are only shown in redevelopment areas if they are likely to remain.

New Development (Purple): New development areas indicate the maximum extent of development proposed in a place that does not currently contain existing development. New facilities could be constructed in all or part of the area shown.

Natural Resource Restoration (Green): Natural resource restoration areas contain existing development and some adjacent impacted areas that would be restored to natural conditions. Restoration could occur outside of existing development where human intervention has altered floodplain and riparian characteristics near heavily used areas, such as campgrounds or lodging. For instance, if a campground next to the Merced River is proposed for restoration, the entire campground, plus any land between the campground and the river, would be restored.

DATA SOURCES AND REFERENCES

The graphic information shown on these plates has been adapted from two main sources: data contained within the Yosemite National Park Geographic Information System (GIS), and data provided in published maps and reports. The data developed within the park's GIS are derived from a variety of sources, including U.S. Geologic Survey 7.5-minute quadrangles and the Yosemite Maintenance Division's survey data for roads, utilities, and structures. The information provided by the park's GIS includes the alternative action boundaries, transportation corridors, and facility locations.

Several images, documents, and digital datasets were adapted for use from publications and reports. The following reference list includes several maps and reports that have been incorporated into the overview and alternative plates. The original scale of the map or data is noted in parentheses, when known.

-  Highly Valued Resources

 Elevations below 4,200 feet. Yosemite Valley floor is 4,900 feet.

 Historic Stone Bridges

Highly valued resources are natural and cultural resources in Yosemite Valley studied and determined to have the highest priority for protection and restoration. Studied areas include the Merced River ecosystem, wetlands, riparian communities, meadows, California black oak woodlands, wildlife habitat, soil, National Historic Landmarks, archeological sites, and burial sites. For more discussion of highly valued resources, see Volume 1A, Chapter 2, Actions Common to All Action Alternatives.

Plate D
Highly Valued Natural and Cultural Resources
 Yosemite Valley

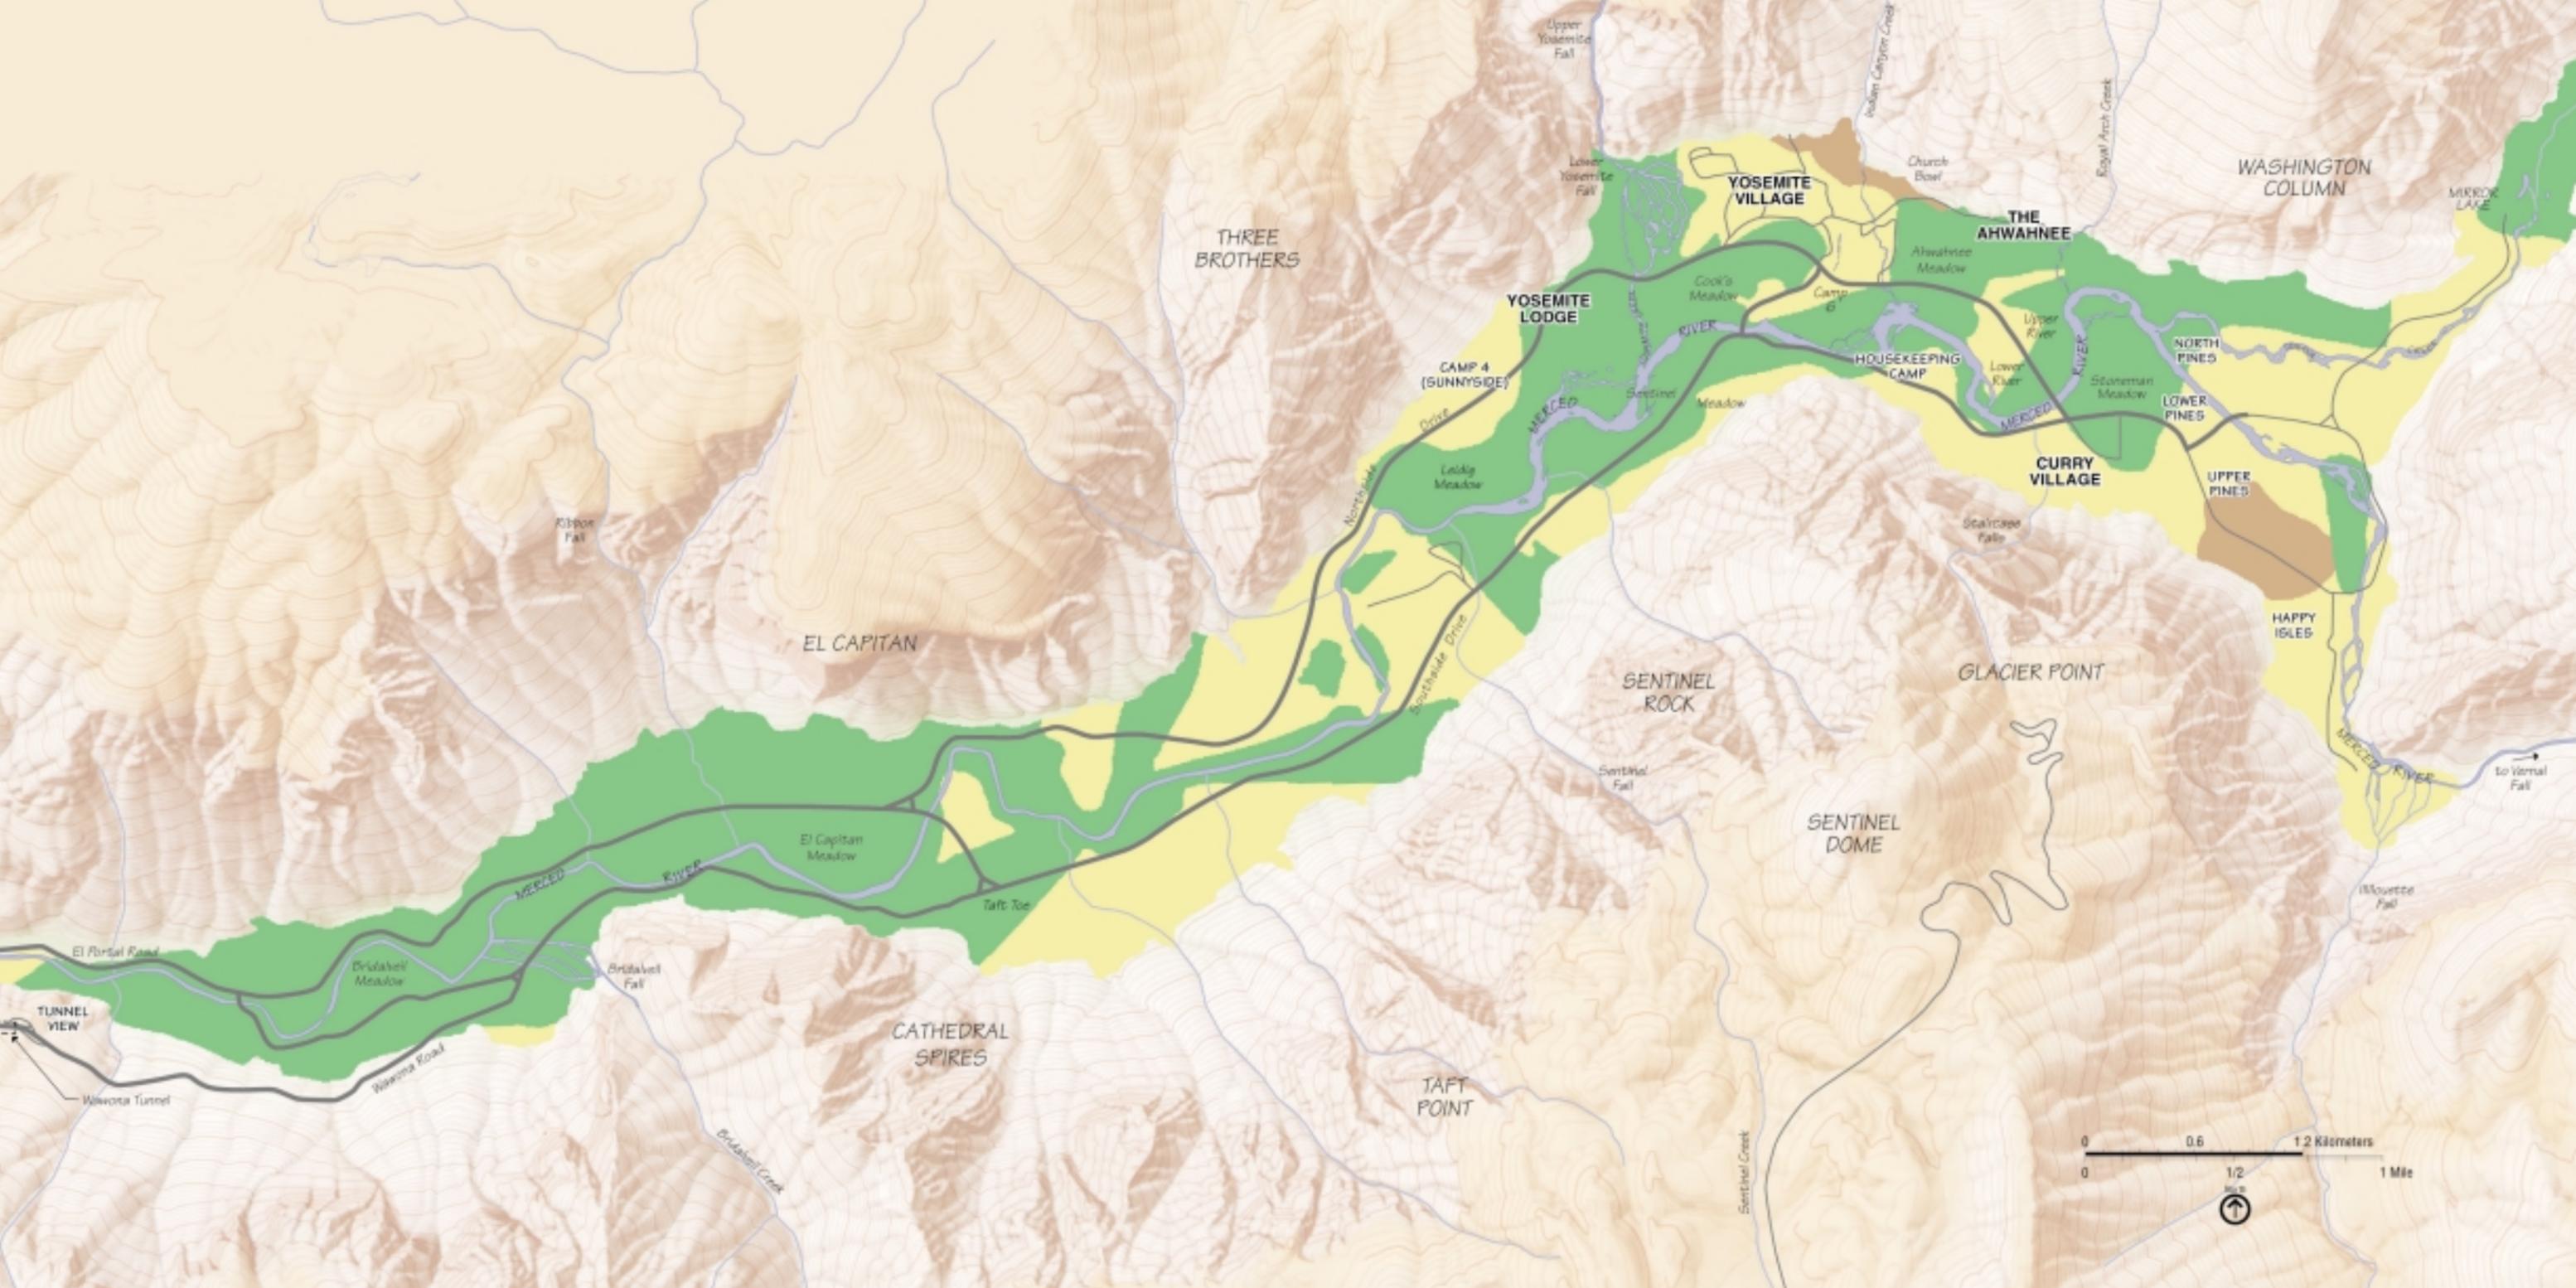

Legend

-  Base map, with 40-Foot Contour Interval
-  **Flood Extent**
January 1997 flood extent for most of valley, predicted 100-year floodplain in campground areas.
-  Wilderness Boundary Line
-  Existing Primary Roads
-  Existing Secondary Roads
-  **Base of Talus Line**
Area where majority of rock debris is deposited during a mass movement event.
-  **Shadow Line**
Probable furthest extent of individual rocks beyond the talus line.
-  Rock Slide, Rock Fall, or Stream Deposition Deposits

Yosemite Valley is only one mile wide, its walls are steep and several thousand feet high, and the Merced River flows through its length. Both cliffs and river present hazards to visitors, staff, and development, leaving only small areas with low probability of being affected by falling rocks or rising waters. The National Park Service has endeavored to find those areas of the Valley better suited for providing services and facilities.

For a more in-depth discussion of development considerations, see Volume IA, Chapter 2, Alternatives and Volume IB, Chapter 4, Environmental Consequences.

Legend

-  Base map, with 40-Foot Contour Interval
-  A - Scenic
-  B - Scenic
-  C - Scenic
-  Existing Primary Roads
-  Existing Secondary Roads

A - Scenic
 Areas included in scenic views commonly chosen by eminent early photographers and painters, or included in the most significant scenic views that exist today (includes all meadows and the Merced River).

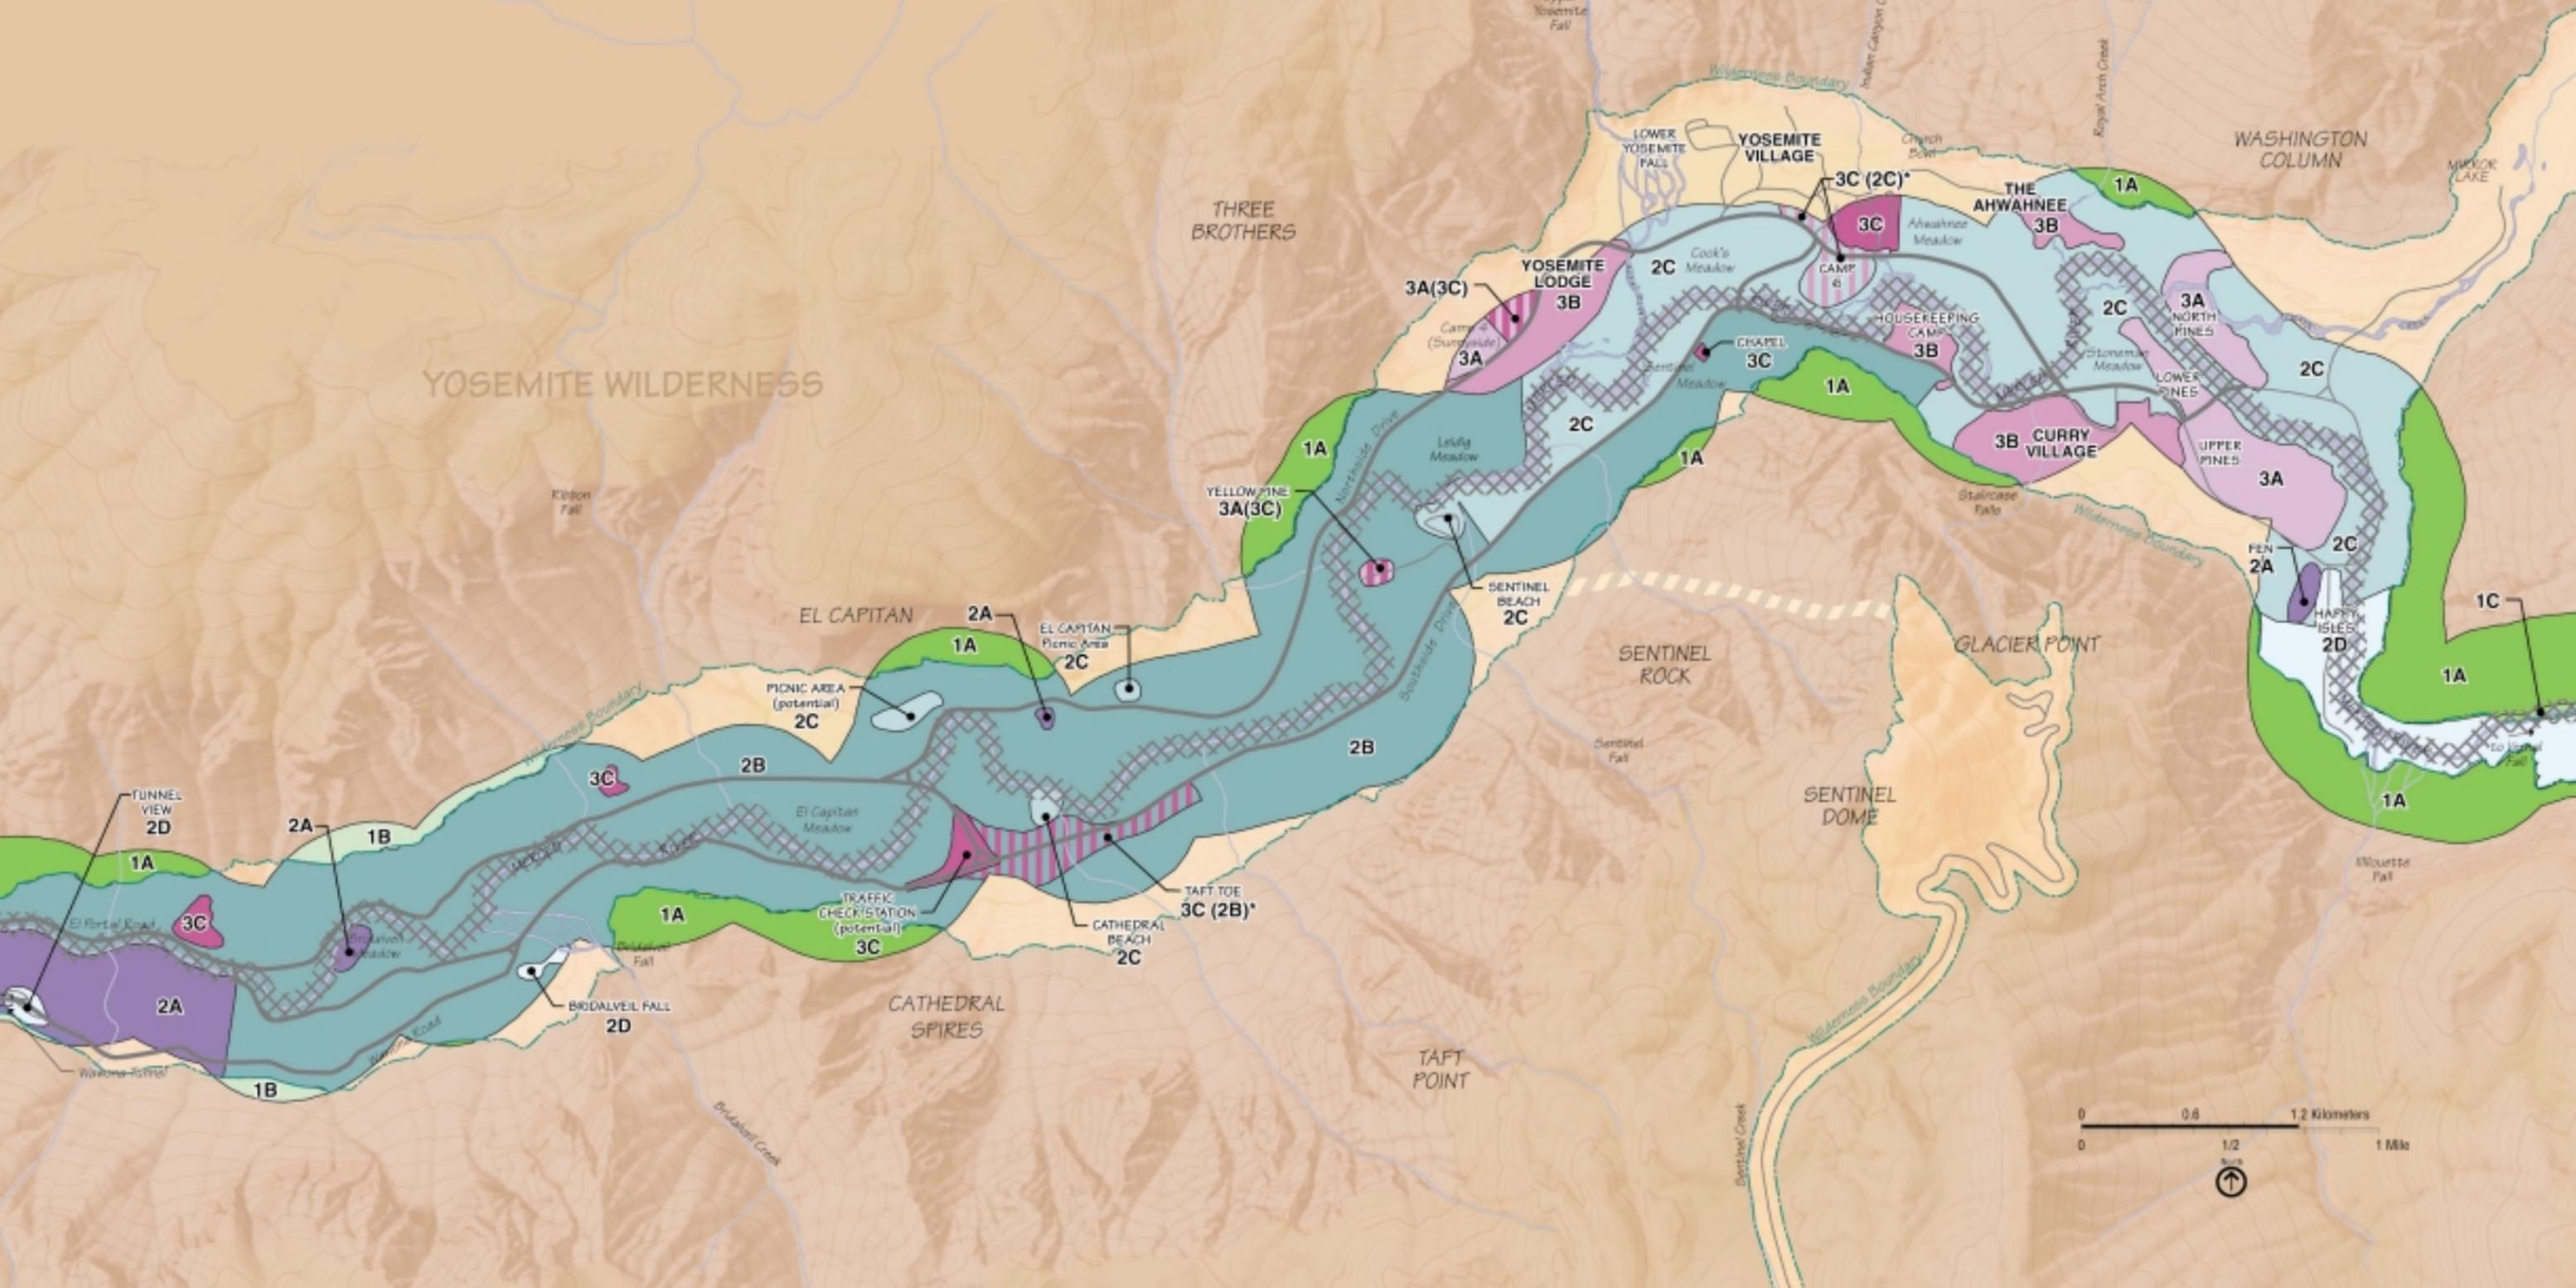

B - Scenic
 Areas included in scenic views less commonly chosen by historic photographers and painters, or that comprise less significant modern views.

C - Scenic
 Areas of minor scenic quality and areas that can accept visual intrusion without detracting from other primary or secondary vistas.

This data is from the 1980 General Management Plan. For more discussion, see Volume Ia, Chapter 3, Affected Environment and Volume Ib, Chapter 4, Environmental Consequences.

Scot Miller

The cover photographs for all volumes of this document were taken by nature and scenic photographer Scot Miller. Since his first visit to Yosemite in 1990, Miller has tried to capture the magnificence and grandeur of the park. Through his photography he hopes to inspire others to have an appreciation and understanding of Yosemite's uniqueness, along with its value as a national treasure worth preserving for future generations. He currently lives in Carrollton, Texas.

Lawrence Ormsby

The illustrations in this document were drawn in pencil and pen and ink by Lawrence Ormsby, partner in Ormsby and Thickstun Interpretive Design. For more than two decades, Ormsby has worked with National Park Service interpreters and historians to prepare illustrations for interpretive publications and exhibits. This year he received the National Park Service Director's Award for his illustration and cartography work in *A Land in Motion: California's San Andreas Fault*. He currently lives in Cave Creek, Arizona.

Permission to use copyrighted images in the *Yosemite Valley Plan/Supplemental Environmental Impact Statement* has been granted by the copyright holders in return for payment of a fee. These images are not placed in the public domain by their appearance herein. They cannot be copied or otherwise reproduced except in their printed context within this document without the written consent of the copyright holders.

APPENDIX A – APPLICABLE LAWS, REGULATIONS, AND EXECUTIVE ORDERS

This appendix describes the key pieces of legislation that form the legal context for development of the *Final Yosemite Valley Plan/SEIS*. These pieces of legislation have guided development of this document and would continue to guide its implementation.

National Park Service Enabling Legislation

Act of June 30, 1864, 13 Stat. 325, 16 USC §48. Authorizes a grant to California for the “Yosemite Valley,” and for land embracing the “Mariposa Big Tree Grove.” This tract was “to be held for public use, resort, and recreation” by the state of California, and to “be inalienable for all time.”

Act of August 25, 1916 (National Park Service Organic Act), PL 64-235, 16 USC §1 et seq. As amended. On August 15, 1916, Congress created the National Park Service with the National Park Service Organic Act. This act, as reaffirmed and amended in 1970 and 1978, establishes a broad framework of policy for the administration of national parks:

“The Service thus established shall promote and regulate the use of the Federal areas known as National Parks, Monuments, and Reservations... by such means and measures as to conform to the fundamental purpose of the said Parks, Monuments, and Reservations, which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations.”

General Legislation and Regulations

Americans with Disabilities Act, PL 101-336, 104 Stat. 327, 42 USC §12101. This act states that all new construction and programs will be accessible to individuals with disabilities. Additionally, National Park Service Special Directive 83-3 states that accessibility will be proportional to the degree of development (i.e., areas of intense development such as visitor centers, museums, drive-in campgrounds, etc., will be entirely accessible, and areas of lesser development such as backcountry trails and walk-in campgrounds may have fewer accessibility features). All development proposed in the *Final Yosemite Valley Plan/SEIS* must be consistent with this act.

Architectural Barriers Act of 1968, PL 90-480, 82 Stat. 718, 42 USC §4151 et seq. This act establishes standards for design/construction or alteration of buildings to ensure that physically disabled persons have ready access to and use of such buildings. The act excludes historic structures from the standards until they are altered. All development proposed in the *Final Yosemite Valley Plan/SEIS* must be consistent with this act.

California Wilderness Act of 1984 (PL 98-425). In 1984, Congress officially included most of Yosemite National Park in the National Wilderness Preservation System and named it the Yosemite Wilderness. Many other California wilderness areas were established or expanded with the passage of this act. Inclusion of an area in the National Wilderness Preservation System does

not change the jurisdictional responsibility for the land. The National Park Service continues to manage the Yosemite Wilderness under the additional requirements for the Wilderness Act of 1964. Though the project area for the *Final Yosemite Valley Plan/SEIS* does not include designated Wilderness, indirect impacts on designated Wilderness have been evaluated.

Council on Environmental Quality Regulations for Implementing the Procedural Provisions of the National Environmental Policy Act (NEPA) (40 CFR Parts 1500-1508). The Council on Environmental Quality regulations for implementing the National Environmental Policy Act (NEPA) establish the process by which federal agencies fulfill their obligations under the NEPA process. The Council on Environmental Quality regulations ascertain the requirements for environmental assessments and environmental impact statements that document the NEPA process. The Council on Environmental Quality regulations also define such key terms as “cumulative impact,” “mitigation” and “significantly” to ensure consistent application of these terms in environmental documents. This environmental impact statement was prepared as directed in the Council on Environmental Quality regulations.

National Environmental Policy Act (NEPA) of 1970. PL 91-190, 83 Stat. 852, 42 USC §4341 et seq. The NEPA process is intended to help public officials make decisions that are based on understanding of environmental consequences, and take actions that protect, restore, and enhance the environment. Regulations implementing NEPA are set forth by the Council on Environmental Quality. The NEPA process guides the overall planning process for the *Final Yosemite Valley Plan/SEIS*.

Rehabilitation Act of 1973, PL 93-112, 87 Stat. 357, 29 USC §701 et seq. As amended by the Rehabilitation Act Amendments of 1974, 88 Stat. 1617, this act sets forth a broad range of services and basic civil rights for individuals with disabilities. It prohibits discrimination against persons with visual, hearing, mobility, and mental impairments. All development proposed in the *Final Yosemite Valley Plan/SEIS* must be consistent with this act.

Wild and Scenic Rivers Act of 1968 as amended (PL 90-542; 16 USC 12371-1287). This act identifies distinguished rivers of the nation that possess remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural, or other similar values; preserves the rivers’ free-flowing condition; and protects their local environments. The Merced River in Yosemite National Park was designated a Wild and Scenic River in 1987. All actions proposed in this plan will protect and enhance the values that are recognized by the Merced Wild and Scenic River designation.

Wilderness Act of 1965 (PL 88-577). The Wilderness Act protects congressionally-designated wilderness areas from roads, dams, and other permanent structures; from timber cutting and the operation of motorized vehicles and equipment; and, since 1984, from new mining claims and mineral leasing. Though the *Final Yosemite Valley Plan/SEIS* does not directly impact designated Wilderness, indirect impacts on wilderness will be identified and addressed.

Natural Resources Legislation

Clean Air Act, as amended, PL Chapter 360, 69 Stat. 322, 42 USC §7401 et seq. Section 118 of the Clean Air Act requires all federal facilities to comply with existing federal, state, and local air pollution control laws and regulations. The National Park Service works in conjunction with

the Mariposa County Air Pollution Control District to ensure that all construction activities meet requirements.

Federal Water Pollution Control Act (commonly referred to as the Clean Water Act) of 1977 (33 USC 1251 et seq.). The Clean Water Act provides for the restoration and maintenance of the physical, chemical, and biological integrity of the nation's waters. Section 404 of the act prohibits the discharge of fill material into navigable water of the United States, including wetlands, except as permitted under separate regulations by the U.S. Army Corps of Engineers and U.S. Environmental Protection Agency. The placement of fill in wetlands should be avoided if there are practicable alternatives. Compliance with Section 401 and 404 of the Clean Water Act will be completed as necessary prior to any new construction proposed in this plan.

Clean Water Act Amendments of 1987. The 1987 amendments to the act required that the Environmental Protection Agency establish regulations for the issuance of municipal and industrial stormwater discharge permits as part of the National Pollutant Discharge Elimination System. The final Environmental Protection Agency regulations were published in November 1990. These regulations apply to any construction activities that disturb more than five acres of land.

A Notice of Intent to comply with the state's General Construction Activity Stormwater Permit will be submitted to the State Water Resources Control Board, and a Stormwater Pollution Prevention Plan will be developed and approved for all proposed construction projects that affect more than 5 acres.

Comprehensive Environmental Response, Compensation, and Liability Act (commonly referred to as CERCLA or the Superfund Act) PL 96-510, 94 Stat. 2767, 42 USC §9601 et seq. Congress enacted CERCLA to address growing concerns about the need to clean up uncontrolled, abandoned hazardous waste sites and to address future releases of hazardous substances into the environment. Applicable sites in Yosemite National Park are managed under the National Park Service CERCLA program.

Endangered Species Act of 1973, as amended, PL 93-205, 87 Stat. 884, 16 USC §1531 et seq. The Endangered Species Act protects threatened and endangered species, as listed by the U.S. Fish and Wildlife Service, from unauthorized take, and directs federal agencies to ensure that their actions do not jeopardize the continued existence of such species. Section 7 of the act defines federal agency responsibilities for consultation with the U.S. Fish and Wildlife Service and requires preparation of a Biological Assessment to identify any threatened or endangered species that is likely to be affected by the proposed action. The National Park Service initiated and maintained formal consultation with the U.S. Fish and Wildlife Service throughout the *Final Yosemite Valley Plan/SEIS* process and prepared a Biological Assessment (see Appendix K) in order to meet obligations under the Endangered Species Act.

Porter-Cologne Water Quality Control Act (California Water Code, Section 13020). Under the authority of the Porter-Cologne Act and federal Clean Water Act, Regional Water Quality Control Boards act as regional agencies for the State Water Resources Control Board and are responsible for regional enforcement of water quality laws and coordination of water quality control activities. The regional board for the Yosemite area is the Central Valley.

Resource Conservation and Recovery Act, as amended (RCRA), PL 94-580, 30 Stat. 1148, 42 USC §6901 et seq. This act establishes a regulatory structure for the management of solid and hazardous waste from the point of generation to disposal. In particular, applicable provisions include those that address underground storage tanks and sites contaminated with elements identified under Federal and State Resource Conservation and Recovery Act regulations.

Cultural Resources Legislation

Antiquities Act of 1906, PL 59-209, 34 Stat. 225, 16 USC §432 and 43 CFR 3. This act provides for the protection of historic or prehistoric remains, “or any antiquity,” on federal lands. It protects historic monuments and ruins on public lands. It was superseded by the Archeological Resources Protection Act (1979) as an alternative federal tool for prosecution of antiquities violations in the National Park System.

Archeological Resources Protection Act of 1979, PL 96-95, 93 Stat. 712, 16 USC §470aa et seq. and 43 CFR 7, subparts A and B, 36 CFR. This act secures the protection of archeological resources on public or Indian lands and fosters increased cooperation and exchange of information between private, government, and the professional community in order to facilitate the enforcement and education of present and future generations. It regulates excavation and collection on public and Indian lands. It requires notification of Indian tribes who may consider a site of religious or cultural importance prior to issuing a permit. The act was amended in 1988 to require the development of plans for surveying public lands for archeological resources and systems for reporting incidents of suspected violations.

National Historic Preservation Act of 1966, as amended, PL 89-665, 80 Stat. 915, 16 USC §470 et seq. and 36 CFR 18, 60, 61, 63, 68, 79, 800. The National Historic Preservation Act requires agencies to take into account the effects of their actions on properties listed in or eligible for listing in the National Register of Historic Places. The Advisory Council on Historic Preservation has developed implementing regulations (36 CFR 800), which allow agencies to develop agreements for consideration of these historic properties. Yosemite National Park, in consultation with the Advisory Council, the California State Historic Preservation Officer (SHPO), American Indian tribes and the public, has developed a Programmatic Agreement for planning, design, construction, operations and maintenance activities. This Programmatic Agreement provides a process for compliance with National Historic Preservation Act, and includes stipulations for identification, evaluation, treatment, and mitigation of adverse effects for actions affecting historic properties. The National Park Service will follow stipulations of this Programmatic Agreement for all future planning and design projects, including development of the Indian Cultural Center and all out-of-Valley development described in the final plan. The Programmatic Agreement allows the National Park Service to implement standard mitigating measures for some actions, if the State Historic Preservation Officer and the public are notified and provided an opportunity to comment (see Appendix D).

American Indian Religious Freedom Act, PL 95-341, 92 Stat. 469, 42 USC §1996. This act declares policy to protect and preserve the inherent and constitutional right of the American Indian, Eskimo, Aleut, and Native Hawaiian people to believe, express, and exercise their

traditional religions. It provides that religious concerns should be accommodated or addressed under NEPA or other appropriate statutes.

Native American Grave Protection and Repatriation Act, PL 101-601, 104 Stat. 3049, 25 USC §3001-3013. This act assigns ownership or control of Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony that are excavated or discovered on federal lands or tribal lands to lineal descendants or culturally affiliated Native American groups.

Executive Orders

Executive Order 11593: Protection and Enhancement of the Cultural Environment. This Executive Order instructs all federal agencies to support the preservation of cultural properties. It directs them to identify and nominate cultural properties under their jurisdiction to the National Register of Historic Places and to “exercise caution... to assure that any federally owned property that might qualify for nomination is not inadvertently transferred, sold, demolished, or substantially altered.”

Executive Order 11988: Floodplain Management. This Executive Order requires federal agencies to avoid, to the extent possible, adverse impacts associated with the occupancy and modification of floodplains, and to avoid development in floodplains whenever there is a practical alternative. If a proposed action is found to be in the applicable regulatory floodplain, the agency shall prepare a floodplain assessment, known as a Statement of Findings. A Statement of Findings has been prepared for the *Final Yosemite Valley Plan/SEIS* in accordance with National Park Service, Special Directive 93-4 (Floodplain Management Guideline) and is included as Appendix N.

Executive Order 11990: Protection of Wetlands. This Executive Order established the protection of wetlands and riparian systems as the official policy of the federal government. It requires all federal agencies to consider wetland protection as an important part of their policies and take action to minimize the destruction, loss or degradation of wetlands, and to preserve and enhance the natural and beneficial values of wetlands. Should adverse impacts on wetlands be identified, a Wetland Statement of Findings would be prepared and included in subsequent compliance (such as an environmental assessment or environmental impact statement) for the specific project.

Presidential Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations. This Executive Order requires all federal agencies to incorporate environmental justice into their missions by identifying and addressing disproportionately high and adverse human health or environmental effects of their programs and policies on minorities and low-income populations and communities. Impacts on minority and low-income populations have been identified and are addressed in Vol. IA, Chapter 3, Affected Environment and Vol. IB, Chapter 4, Environmental Consequences.

Presidential Executive Order 12902: Energy Efficiency and Water Conservation. This Executive Order directs each agency involved in the construction of a new facility to design and construct it to use energy efficiently, conserve water, and employ renewable energy technologies.

The requirements of this Executive Order would be met during the design phase for any new facilities proposed in the *Final Yosemite Valley Plan/SEIS*.

Executive Order 13101: Greening the Government Through Waste Prevention, Recycling, and Federal Acquisition. This Executive Order requires that federal agencies increase the procurement of environmentally preferable or recovered materials. Agencies are directed to set annual goals to maximize the number of recycled products purchased relative to nonrecycled alternatives. In addition, each agency is to establish a program for promoting cost-effective waste prevention and recycling at each of its facilities. The requirements of this executive order would be met during development and implementation phases of the *Final Yosemite Valley Plan/SEIS*.

Executive Order No. 13112: Invasive Species. This Executive Order prevents the introduction of invasive species and directs federal agencies to not authorize, fund, or carry out actions that it believes are likely to cause or promote the introduction or spread of invasive species. Actions proposed in the *Final Yosemite Valley Plan/SEIS* include measures to prevent the introduction and spread of invasive species.

Department of the Interior – Director’s Orders

Director’s Orders provide guidance for implementing certain aspects of National Park Service policy. Copies of those that have been completed may be obtained by contacting the NPS Office of Policy or by accessing the National Park Service web site at www.nps.gov/refdesk/DOrders/. The following Director’s Orders may be relevant to the *Final Yosemite Valley Plan/SEIS* planning process:

Completed Director’s Orders

1. The Directives System
2. Park Planning
9. Law Enforcement Program
- 16A. Reasonable Accommodation for Applicants and Employees with Disabilities
17. National Park Service Tourism
18. Wildland Fire Management
20. Agreements
21. Donations and Fundraising
28. Cultural Resource Management
32. Cooperating Associations
41. Wilderness Preservation & Management
- 50B. Occupational Safety and Health
- 77-1. Wetland Protection
83. Public Health

Valley
Plan

Supplemental EIS

APPENDIX B – MERCED WILD AND SCENIC RIVER

This appendix contains an overview of the management elements of the *Merced Wild and Scenic River Comprehensive Management Plan/Final Environmental Impact Statement* (referred to hereafter as the *Merced River Plan*). The *Merced River Plan* is a programmatic plan and, unlike the *Final Yosemite Valley Plan/SEIS*, does not specify detailed actions. The *Merced River Plan* uses management elements to prescribe future conditions, typical visitor activities and experiences, and permitted park facilities and management activities in the Merced River corridor. By using the management elements, the *Merced River Plan* applies a consistent set of decision-making criteria and considerations, including: boundaries, classifications, updated Outstandingly Remarkable Values, the Section 7 determination process, the River Protection Overlay, management zones and prescriptions, and the Visitor Experience and Resource Protection (VERP) framework.

The *Draft Merced Wild and Scenic River Comprehensive Management Plan/Environmental Impact Statement* was released in January 2000. Over 2,400 public comments were received and responded to in preparation of the *Merced River Plan*, released in July 2000.

Management Elements of the Merced River Plan

To apply the management element framework to future decisions regarding specific actions, the National Park Service would use the management elements as a set of decision-making criteria with which to evaluate projects in terms of visitor use, facility siting, and design, and other potential actions in the Merced River corridor. For actions that meet these mandatory criteria, the National Park Service would apply additional considerations to further evaluate the actions. All proposed actions would be evaluated against the criteria and considerations. Also, existing facilities in the Merced River corridor would be evaluated when major reconstruction is needed, a facility is no longer of use, or a management initiative occurs (such as those based on planning efforts or new information). In addition, the National Park Service would follow the requirements of other regulatory processes, such as the National Environmental Policy Act and the National Historic Preservation Act.

CRITERIA AND CONSIDERATIONS

The following criteria, which integrate the management elements of the *Merced River Plan*, must be met:

- Actions within the boundaries of the river corridor must protect and enhance the Outstandingly Remarkable Values.
- Actions must be consistent with the classification of that river segment.
- Actions must protect the Outstandingly Remarkable Values, regardless of where an Outstandingly Remarkable Value is located. When Outstandingly Remarkable Values lie within the boundary of the Wild and Scenic River, the Outstandingly Remarkable Value must be protected and enhanced. When Outstandingly Remarkable Values are in conflict

with each other, the net effect of the actions to Outstandingly Remarkable Values must be beneficial.

- Actions that are considered “water resources projects” under Section 7 of the Wild and Scenic Rivers Act (i.e., occurring on the bed or banks of the Merced River) must follow a Section 7 determination process to determine whether they have a direct and adverse impact on the values for which the river was designated Wild and Scenic. Proposed actions outside the river corridor in Merced River tributaries will also undergo Section 7 determination to determine whether they affect the values for which the river was designated Wild and Scenic.
- Actions within the River Protection Overlay must comply with the River Protection Overlay conditions.
- Actions must be compatible with the appropriate management zone and its prescriptions.
- Actions must be compatible with desired visitor experience and resource conditions under the VERP framework.

If a proposed action meets the above criteria, the National Park Service would also make additional considerations to minimize an impact by locating facilities outside the river corridor if there is a feasible alternative; designing facilities or actions to minimize or mitigate impacts to the river; and avoiding, minimizing, or otherwise mitigating negative impacts to visitor experience.

B O U N D A R I E S

Boundaries define the area to be protected under the Wild and Scenic Rivers Act. The boundaries of the Merced River corridor vary by segment and have been derived from several sources of data. The Wild and Scenic Rivers Act allows for river corridor boundaries that average no more than 320 acres of land per river mile, measured from the ordinary high water mark on both sides of the river. Boundaries, however, do not limit the protection of Outstandingly Remarkable Values, which must be protected whether they are inside or outside the corridor boundaries.

Based on the *Merced River Plan*, a quarter-mile boundary is applied to the entire corridor, except in the El Portal Administrative Site. In the El Portal Administrative Site segment (Segment 4), the boundary is the 100-year floodplain or the extent of the 100-foot River Protection Overlay (whichever is greater) from the park boundary downstream to the administrative site boundary (see Vol. Ic, plate G-2). (Note: This applies only for lands under National Park Service jurisdiction. The U.S. Forest Service has not delineated a boundary on lands under its jurisdiction along the El Portal segment of the Merced River.)

C L A S S I F I C A T I O N S

In the *Merced River Plan*, east Yosemite Valley (Nevada Fall to Sentinel Beach), El Portal, and Wawona are classified as “recreational.” See chapter 3 or 4 under the Wild and Scenic section for a standard sentence to describe scenic or recreational. The recreational classification reflects the current extent of developed areas and facilities in these segments. The impoundment segments (very short segments between Yosemite Valley and the Gorge, and on the South Fork above Swinging Bridge) are classified as recreational due to the presence of small dams that interfere

with the free-flowing condition of the river. The west Valley and the Gorge segments are classified as scenic.

In addition, the *Merced River Plan* allows for the removal of the Cascades Diversion Dam and the Wawona Impoundment. If either of these structures were removed, the classifications of the segments would be changed to reflect surrounding classifications (e.g., from recreational to scenic).

Outstandingly Remarkable Values

Outstandingly Remarkable Values are defined by the Wild and Scenic Rivers Act as those characteristics that make the river worthy of special protection. These can include scenery, recreation, fish and wildlife, geology, history, culture, and other similar values, which are to be considered in determining eligibility for Wild and Scenic River designation.

Two vital questions establish the criteria for selection of Outstandingly Remarkable Values:

- Is the value river-related or river-dependent?
- Is the value rare, unique, or exemplary in a regional or national context?

Both of the above criteria must be satisfied in order for a characteristic to be included as an Outstandingly Remarkable Value. Table B-1 lists Outstandingly Remarkable Values of the Merced River as identified in the *Merced River Plan*.

Segment Number and Name	Outstandingly Remarkable Values (by category)
Main Stem Merced River	<i>Scientific</i> – These segments of the river corridor constitute a highly significant scientific resource because the watershed is largely within designated Wilderness in Yosemite National Park.
1) Wilderness	<p><i>Scenic</i> – This segment includes views from the river and its banks of the glaciated river canyon, exposed bedrock riverbed, Merced Lake and Washburn Lake, the Bunnell Cascades, the confluence of tributaries, a large concentration of granite domes, and the Clark and Cathedral Ranges.</p> <p><i>Geologic Processes/Conditions</i> – This segment traverses a U-shaped, glacially carved canyon separated by cascades and soda springs below Washburn Lake.</p> <p><i>Recreation</i> – This segment provides outstanding opportunities for solitude along the river, with primitive and unconfined recreation. There is a spectrum of levels of recreational use. River-related recreational opportunities include day hiking, backpacking, horseback riding and packing, camping, and enjoyment of natural river sounds. Untrailed tributaries provide enhanced opportunities for solitude.</p> <p><i>Biological</i> – This segment includes a nearly full range of intact Sierran riverine environments, high-quality riparian, meadow, and aquatic habitats (such as the meadow at Washburn Lake), and special-status species such as mountain yellow-legged frog.</p> <p><i>Cultural</i> – This segment includes portions of a prehistoric trans-Sierra route in use for thousands of years and many prehistoric sites. There are many historic resources such as homestead sites, trails, river crossings, High Sierra Camp sites, and structures.</p> <p><i>Hydrologic Processes</i> – The segment is characterized by a free-flowing river and excellent water quality. The river gradient drops from 13,000 to 6,000 feet in elevation. There are examples of natural conditions, including glacial remnants, a logjam in Little Yosemite Valley that is hundreds of years old, and numerous cascades.</p>

**Table B-1
The Outstandingly Remarkable Values of the Merced River (Main Stem and South Fork)**

Segment Number and Name	Outstandingly Remarkable Values (by category)
2) Valley	<p><i>Scenic</i> – This segment provides magnificent views from the river and its banks of waterfalls (Nevada, Vernal, Illilouette, Yosemite, Sentinel, Ribbon, Bridalveil, and Silver Strand), rock cliffs (Half Dome, North Dome/Washington Column, Glacier Point, Yosemite Point/Lost Arrow Spire, Sentinel Rock, Three Brothers, Cathedral Rock, and El Capitan), and meadows (Stoneman, Ahwahnee, Cook’s, Sentinel, Leidig, El Capitan, and Bridalveil). There is a scenic interface of river, rock, meadow, and forest throughout the segment.</p> <p><i>Geologic Processes/Conditions</i> – This segment contains a classic, glaciated, U-shaped valley, providing important examples of a mature meandering river; hanging valleys such as Yosemite and Bridalveil Creeks; and evidence of glaciation (e.g., moraines below El Capitan and Bridalveil Meadows).</p> <p><i>Recreation</i> – This segment offers opportunities to experience a spectrum of river-related recreational activities, from nature study and sightseeing to hiking. Yosemite Valley is one of the premier outdoor recreation areas in the world.</p> <p><i>Biological</i> – Riparian areas and low-elevation meadows are the most productive communities in Yosemite Valley. The high quality and large extent of riparian, wetland, and other riverine areas provide rich habitat for a diversity of river-related species, including special-status species, neotropical migrant songbirds, and numerous bat species.</p> <p><i>Cultural</i> – This segment contains evidence of thousands of years of human occupation reflected in a large number of archeological sites and continuing traditional use today. Nationally significant historic resources are found here, such as designed landscapes and developed areas, historic buildings, and circulation systems (trails, roads, and bridges) that provide visitor access to the sublime views of natural features that are culturally valuable.</p> <p><i>Hydrologic Processes</i> – This segment is characterized by a meandering river, world-renowned waterfalls, an active flood regime, oxbows, unique wetlands, and fluvial processes.</p>
3a) Impoundment (would become part of Segment 3b, Gorge – classified as “scenic,” if Cascades Diversion Dam were removed)	<p><i>Geologic Processes/Conditions</i> – This segment contains the dramatic transition from the U-shaped, glaciated Yosemite Valley to the V-shaped river gorge.</p> <p><i>Biological</i> – This segment contains rich riparian habitat.</p>
3b) Gorge	<p><i>Scenic</i> – This segment provides views from the river and its banks of the Cascades, spectacular rapids among giant boulders, Wildcat Fall, Tamarack Creek Fall, the Rostrum, and Elephant Rock.</p> <p><i>Geologic Processes/Conditions</i> – This segment is characterized by a classic V-shaped river gorge with a continuous steep gradient.</p> <p><i>Recreation</i> – This segment provides a spectrum of river-related recreational opportunities, such as picnicking, fishing, photography, and sightseeing.</p> <p><i>Biological</i> – This segment is characterized by diverse riparian areas and associated special-status species that are largely intact and almost entirely undisturbed by humans.</p> <p><i>Cultural</i> – This segment contains cultural resources, including prehistoric sites and historic sites and structures such as those relating to historic engineering projects.</p> <p><i>Hydrologic Processes</i> – This segment is characterized by exceptionally steep gradients (2,000-foot elevation drop in approximately six miles).</p>

**Table B-1
The Outstandingly Remarkable Values of the Merced River (Main Stem and South Fork)**

Segment Number and Name	Outstandingly Remarkable Values (by category)
4) El Portal	<p><i>Geologic Processes/Conditions</i> – This segment contains a transition from igneous to metasedimentary rocks (metasedimentary rocks are among the oldest in the Sierra Nevada).</p> <p><i>Recreation</i> – This segment provides a range of river-related recreational opportunities, in particular white-water rafting and kayaking (class III to V) and fishing.</p> <p><i>Biological</i> – This segment contains riverine habitats such as riparian woodlands and associated federal and state special-status species, including Tompkin’s sedge and Valley elderberry longhorn beetle and its critical habitat (elderberry shrub). Expanses of north-facing habitat allow unlimited access to the riparian zone for wildlife species.</p> <p><i>Cultural</i> – This segment contains some of the oldest archeological sites in the Yosemite area, as well as many historic Indian villages and traditional gathering places. River-related historic resources include structures related to early tourism and industrial development.</p> <p>Hydrologic Processes – This segment is characterized by continuous rapids.</p>
South Fork Merced River	<p><i>Scientific</i> – These segments of the river corridor constitute a highly significant scientific resource because the watershed is largely within designated Wilderness in Yosemite National Park.</p>
5) Wilderness	<p><i>Scenic</i> – This segment provides views from the river and its banks of unique river features, including large pothole pools within slick rock cascades, old growth forest, and meadows.</p> <p><i>Geologic Processes/Conditions</i> – This segment is characterized by glaciated valleys in the high country and V-shaped canyons above Wawona. Moraine meadows and soda springs above Gravelly Ford are also unique, river-related geologic features.</p> <p><i>Recreation</i> – This segment provides outstanding opportunities for river-related solitude, enjoyment of natural river sounds, and primitive and unconfined recreation. This segment of the river is predominantly without trails, with the exception of four bridgeless trail crossings in the upper reaches of the segment.</p> <p><i>Biological</i> – This segment includes a nearly full range of riverine environments typical of the Sierra Nevada. Examples of river-related federal and state special-status species include Wawona riffle beetle and mountain yellow-legged frog.</p>
	<p><i>Cultural</i> – This segment includes river-related prehistoric sites and resources and reflects historic stock use and cavalry activities.</p> <p><i>Hydrologic Processes</i> – This segment is characterized by a free-flowing river and excellent water quality.</p>
6) Impoundment (would become part of segment 7 Wawona if an alternative water source were secured and impoundment were removed)	<p><i>Scenic</i> – This segment provides views from the river and its banks of the river and Wawona Dome.</p> <p><i>Hydrologic Processes</i> – This segment has excellent water quality.</p>
7) Wawona	<p><i>Scenic</i> – This segment provides views from the river and its banks of Wawona Dome.</p> <p><i>Recreation</i> – This segment offers opportunities to experience a spectrum of river-related recreational activities, from nature study and photography to hiking.</p> <p><i>Biological</i> – This segment contains a diversity of river-related species, wetlands, and riparian habitats. There are federal and state special-status species in this segment, including Wawona riffle beetle.</p> <p><i>Cultural</i> – This segment contains evidence of thousands of years of human occupation, including numerous prehistoric and historic Indian villages, historic sites, structures, and landscape features related to tourism, early Army and National Park Service administration, and homesteading.</p>
8) Below Wawona	<p><i>Scenic</i> – This segment provides views from the river and its banks of continual white-water cascades in the deep and narrow river canyon in a untrailed, undisturbed environment.</p> <p><i>Geologic Processes/Conditions</i> – This segment contains a transition from Paleozoic Era igneous to Cretaceous Period metasedimentary rocks (metasedimentary rocks are among the oldest in the Sierra Nevada).</p>

Table B-1 The Outstandingly Remarkable Values of the Merced River (Main Stem and South Fork)	
Segment Number and Name	Outstandingly Remarkable Values (by category)
	<p><i>Recreation</i> – This segment provides outstanding opportunities for river-related solitude, enjoyment of natural river sounds, and primitive and unconfined recreation in an untrailed, undisturbed environment. River-related recreational opportunities include hiking, fishing, and white-water kayaking.</p> <p><i>Biological</i> – This segment is characterized by diverse riparian areas that are intact and largely undisturbed by humans. River-related federal and state special-status species in this segment include Wawona riffle beetle.</p> <p><i>Cultural</i> – This segment contains archeological sites and historic resources such as trail segments representing early cavalry activity.</p> <p><i>Hydrologic Processes</i> – This segment is characterized by a free-flowing river with continual white-water cascades.</p>

Section 7 Determination Process

“Water resources projects,” that is, those that are within the bed or banks of the Merced River and therefore affect the river’s free-flowing condition, are subject to Section 7 of the Wild and Scenic Rivers Act (16 USC 1278).¹ As the designated “river manager” for the Merced River for the segments addressed by the *Merced River Plan*, the National Park Service must carry out a Section 7 determination on all proposed water resources projects to ensure that they do not directly and adversely impact the values for which the river was designated.²

The National Park Service is responsible for making the final determination as to whether a proposed water resources project would have a direct and adverse impact to the values for which the river was designated Wild and Scenic. The agency should coordinate its evaluation process with other agencies that are required to review and comment on the project. Depending on the type and location of the project, this may include the U.S. Fish and Wildlife Service, the U.S. Environmental Protection Agency, the U.S. Forest Service, the Bureau of Land Management, and the U.S. Army Corps of Engineers. Review of Section 7 projects would also be coordinated with other environmental review processes, such as those required by the National Environmental Policy Act and the National Historic Preservation Act, as appropriate.

The National Park Service would undertake the following steps as part of its Section 7 determination process for nonemergency projects. In emergency situations (e.g., a broken sewer pipe in or near the river), a Section 7 determination must be carried out as soon as possible after the project is completed. Changes to mitigate impacts from an emergency project should be implemented, when necessary, based on the findings of the Section 7 analysis.

¹“Water resources projects” include nonlicensed Federal Energy Regulatory Commission projects, such as dams, water diversions, fisheries habitat and watershed restoration, bridges and other roadway construction/reconstruction, bank stabilization, channelization, levees, boat ramps, and fishing piers, that occur within the bed and banks of a designated Wild and Scenic River (IWSRCC 1999).

²This description of the Section 7 determination process is adapted from a technical report by the Interagency Wild and Scenic Rivers Coordinating Council (IWSRCC 1999).

1. The National Park Service would describe the purpose and need of the proposed project, its location, duration, magnitude, and relationship to past and future management activities.
2. The National Park Service would analyze the potential impacts of the proposed project on the values for which the river was designated. This analysis should follow the guidelines provided by the *Wild and Scenic Rivers Reference Guide* of the Interagency Wild and Scenic Rivers Coordinating Council (1999) and other applicable guidance.
3. The National Park Service would define the likely duration of the projected impacts.
4. The National Park Service would assess the effects of the projected impacts on the achievement or timing of achievement of the management goals of the *Merced River Plan* (based on the Wild and Scenic Rivers Act).
5. The National Park Service would use this analysis to make a Section 7 determination. This determination would document the effects of the proposed activity, including any direct and adverse effects on the values for which the river was designated.
6. Projects determined to cause direct and adverse impacts to the values for which the river was designated could be redesigned and resubmitted for a subsequent Section 7 determination.
7. The National Park Service would also follow Section 7 procedures to determine whether projects above or below the designated river or on its tributary streams would invade the area or unreasonably diminish the scenic, recreational, or fish and wildlife values present in the designated corridor.

River Protection Overlay

The areas immediately adjacent to the river channel, along with the river channel itself, are particularly important to the health and proper functioning of the river ecosystem. These areas allow for the main channel to link with backwater areas, tributaries, and groundwater systems; provide for increased channel diversity; and contribute sources of needed nutrients and woody debris to the river.³ Additionally, they can help protect surrounding development from potential flood damage and can be used to filter runoff water draining into the river.

To ensure that the river channel itself and the areas immediately adjacent to the river are protected, the *Merced River Plan* includes a management tool called the River Protection Overlay. The River Protection Overlay would provide a buffer area for natural flood flows, channel formation, riparian vegetation, and wildlife habitat and would protect riverbanks from human-caused impacts and associated erosion. The River Protection Overlay is intended to apply the requirements of the Wild and Scenic Rivers Act, including the protection and enhancement of the Outstandingly Remarkable Values and the preservation of the free-flowing condition of the river, at a higher standard than that of the underlying management zones. It is intended as a primary mechanism to achieve the goals of the *Merced River Plan*. The River Protection Overlay

³In most circumstances, trees or other large woody debris falling into the river are recognized as part of the natural processes and would be left in the river to aid in the recovery of aquatic and riparian habitat.

is also intended to be the location of highest priority for restoration of hydrologic processes and biotic habitats within the river corridor.

Within the River Protection Overlay, future actions shall be consistent with the following conditions:

1. Nonessential facilities (including, but not limited to, riprap, levees, diversion walls, impoundments, bridges, bridge abutments, roads, campsites, buildings, utilities, and other structures) should not be located in the River Protection Overlay, except when they meet the following two criteria: (1) where required for access to or across the river, for health and safety, or for the maintenance of historic properties; and (2) where it is impractical to locate them outside the River Protection Overlay.
 - Existing facilities meeting these criteria may remain, and they may be replaced, repaired, or relocated within the River Protection Overlay, but only if the replacement, repair, or relocation does not directly and adversely affect the Outstandingly Remarkable Values.
 - New facilities and development may be constructed in the River Protection Overlay only when meeting these criteria and when located where they do not materially impair the natural function of the river, impede linkages to tributary inflow and backwater areas, or disrupt contribution of woody debris to the river, and where they do not have a direct and adverse impact on the Outstandingly Remarkable Values.
2. Actions to construct, replace, repair, or relocate essential facilities (i.e., primary roads and bridges, wastewater collection and treatment, domestic water supply, electrical distribution, and similar facilities required to keep the park open) and facilities that directly protect and enhance the Outstandingly Remarkable Values (e.g., raft launch facilities to preserve the spectrum of recreational experiences and to concentrate use in a hardened area), within the bed and banks of the river, may be permitted provided that:
 - Project design minimizes impacts to the free-flowing condition of the river, interference with linkages to tributary inflow and backwater areas, and disruption of contribution of woody debris to the river.
 - The project incorporates mitigation measures to avoid or reduce impacts.
3. Facilities and development covered by paragraphs 1 or 2, above, that occur within the bed or banks of the river, and that affect the free-flowing condition of the river must also comply with Section 7 of the Wild and Scenic Rivers Act.
4. Other existing facilities that are not addressed by paragraphs 1 or 2 should be removed and must be removed, at the earliest practicable opportunity, when major rehabilitation is needed or when a facility is no longer of use.

The specific areas included with the River Protection Overlay may shift over time to follow the movement of the river channel itself. The width of the River Protection Overlay is determined by site topography and vegetation and includes the area needed to encompass riparian and adjacent upland vegetation and habitat. The River Protection Overlay, in areas above 3,800 feet, includes the river channel itself and extends 150 feet on both sides of the river measured from the ordinary high water mark; and in areas below 3,800 feet includes 100 feet on both sides of the river

measured from the ordinary high water mark. Generally, a wider band is required along the river in the flatter, open valleys, while a narrower buffer provides adequate protection in the steeper, V-shaped river gorges of the lower elevations. This transition occurs approximately at the 3,800-foot elevation mark, in the gorge area below Yosemite Valley on the main stem of the Merced River, and downstream of Wawona on the South Fork. Approximately 70 miles of the river would have a 150-foot River Protection Overlay, including Yosemite Valley and Wawona. Approximately 11 miles of the river would have a 100-foot River Protection Overlay, including the El Portal Administrative Site. (For a graphic representation of the River Protection Overlay, see Vol. Ic, Plates G-1, G-2, and G-3).

Management Zoning Prescriptions

This section defines the management zones used for the Merced River corridor. Management zoning is a technique used by the National Park Service to classify park areas and prescribe future desired resource conditions, visitor activities, and facilities. A management zone is defined in the National Park Service's Visitor Experience and Resource Protection (VERP) framework as:

A geographical area for which management directions or prescriptions have been developed to determine what can and cannot occur in terms of resource management, visitor use, access, facilities or development, and park operations. Each zone has a unique combination of resource and social conditions, and a consistent management prescription. Different actions will be taken by the National Park Service in different zones with regard to the type and levels of use and facilities (NPS 1997i).

Management zoning is one of the elements in the *Merced River Plan* that helps protect and enhance Outstandingly Remarkable Values. Management zoning prescribes certain uses and facilities that are not allowed in an area. In the absence of zoning, additional development and higher-intensity uses could impact Outstandingly Remarkable Values over the long term. Management zoning also provides opportunities for restoration of Outstandingly Remarkable Values in areas where lower use and facility levels are prescribed. Management zoning protects the spectrum of recreational opportunities (an Outstandingly Remarkable Value) by allowing for visitor access and use of facilities in more resilient locations, and different intensities of use along the corridor.

Management zones are schematically represented on plates G-1, G-2, and G-3 in Vol. Ic.

Zoning Categories

The management zones for the Merced River corridor fall into three general categories: (1) Wilderness zones, (2) Diverse Visitor Experience zones, and (3) Developed zones. For each of these three categories, there are individual management zones that provide for certain levels and types of visitor experiences, resource conditions, facilities, and uses. Existing uses or facilities that are not compatible with the management prescriptions of their zones could be removed, relocated, or modified over time. Management zones generally allow for the repair, maintenance, and reconstruction of established facilities (such as structures, utilities, roads, and bridges) unless specifically noted. All zones also allow for scientific research and monitoring activities,

particularly related to the analysis of visitor experience and resource protection of the river corridor.

Relationship to River Protection Overlay

The River Protection Overlay is applied over the zoning categories throughout the length of the river corridor. In all cases, where the management prescription and the River Protection Overlay are in conflict, the prescription that provides the greater protection and enhancement of the Outstandingly Remarkable Values takes precedence.

Application of Management Zoning

Each zone prescribes the *maximum* level of activities and facilities. In practice, lower levels of visitor use and facilities may be provided than are allowed for in the zoning prescriptions. Typical uses in lower-intensity zones are generally acceptable uses for higher-intensity zones. For example, areas zoned for overnight lodging may be used for less-developed activities such as walk-in camping or could include protected natural areas. These decisions would be based on site-specific conditions as assessed through routine management activities. The zones, delineated conceptually on plates G-1, G-2, and G-3 of Vol. Ic, are also fairly broad to allow future managers to direct development within the zone. Within a given zone, there may be some areas used for higher-intensity facilities or activities, while other areas within the same zone are left natural and open.⁴

Uses or activities allowed in a management zone may be subject to limitations over time. If ongoing monitoring (as implemented through the VERP framework) indicates that impacts on the resource or visitor experience are no longer at an acceptable level, previously designated areas may be further restricted. Management zone prescriptions can also be temporarily superseded by contingencies, such as the need to respond to emergencies. For example, trails, roads, and facilities may be temporarily closed because of fire, rockfall, or flood.

CATEGORY 1: WILDERNESS ZONES

Approximately 34 miles of the main stem and 19 miles of the South Fork of the Merced Wild and Scenic River corridors flow through designated Wilderness and are managed under the guidance and requirements of the 1964 Wilderness Act and the California Wilderness Act of 1984. As such, these segments will continue to be managed to preserve an environment in which the natural world, along with the processes and events that shape it, are largely unchanged by human use, and to allow for various forms of exploration in an environment primarily free of modification. Access limits are imposed to control human-induced change, and management actions such as education, regulation, and restoration will occur as appropriate to protect natural and cultural resources and designated Outstandingly Remarkable Values. Visitor use and enjoyment is encouraged as long as such use does not result in levels of human impact that compromise wilderness and river values. Visitors would encounter a variety of opportunities for solitude, primitive and unconfined recreation, and

⁴The purpose of management zoning is to provide overall guidance for decision-making over the long term. Zoning does not attempt to predict or prescribe every conceivable use or facility decision. Small, isolated “spot” zones were not utilized to distinguish particular facilities or use areas.

physical challenge. The presence of park staff would be limited, focused on locations of heavy use such as camping areas.

The Wilderness zones would be managed to protect the natural hydrologic and ecologic processes of the Merced River and its immediate environment. Other than trails and designated overnight areas, the Wilderness zones would exhibit natural conditions, with high-quality riparian, meadow, and aquatic habitats. There would be high diversity of native plant and animal species and relatively minimal disturbance and human impact. The Merced River would remain free of impoundments, and natural processes, such as deposits of woody debris into the river, would occur without human interference. Water quality in the area would be very high.

There are four Wilderness zones:

- Zone 1A: Untrailed
- Zone 1B: Trailed Travel
- Zone 1C: Heavy Use Trail
- Zone 1D: Designated Overnight

WILDERNESS ZONE MANAGEMENT OBJECTIVES

The overall management objectives for the Wilderness zones are as follows⁵:

- Manage for protection of Outstandingly Remarkable Values, with an emphasis on protection and enhancement of natural resource Outstandingly Remarkable Values
- Manage for ecosystem integrity
- Preserve natural biodiversity
- Allow natural processes to prevail
- Mitigate, reduce, or eliminate human-caused impacts
- Manage for a high-quality wilderness visitor experience
- Protect all wilderness values (ecological, geological, scientific, educational, scenic, or historical in nature)
- Apply the “minimum requirement” guidance concept in all administrative operational functions in accordance with the Wilderness Act
- Manage for the preservation of cultural resources

Zone 1A. Untrailed

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Untrailed zone would be primarily free of signs of modern human presence, with extremely high opportunity for solitude due to the remoteness of the area and lack of trails. Management activities in this zone would be minimal, allowing resources and natural processes to exist in their most pristine state. The Untrailed zone would be managed with very low

⁵These objectives are consistent with the *Wilderness Management Plan* (1989).

tolerance for resource degradation from visitor use, and management action could be taken to change visitor use patterns if such degradation occurred.

Visitor experience would be primarily based on hiking through often difficult terrain. There would be no formal trails or directional markers in this zone. There would be few, if any, human encounters, and wilderness skills and knowledge could be necessary to safely navigate these areas. Natural and cultural resources could be observed, but there would be no formal interpretation or visitor accommodations. This area would provide substantial opportunities for scientific study of natural processes in undisturbed conditions.

The difficulty of access characterized by the Untrailed zone would serve to reduce visitor use, thereby protecting and enhancing biological, geologic, hydrologic, cultural, scenic, and scientific Outstandingly Remarkable Values. Opportunities for solitude, primitive and unconfined recreation, and enjoyment of natural river sounds are among the recreational Outstandingly Remarkable Values prominent in this zone.

Activities – The following activities would be typical in this zone:

- Overnight camping 100 feet or more from a water body, by permit
- Hiking
- Rock climbing and mountaineering
- Swimming and wading
- Fishing⁶
- Photography and nature study

Facilities – The following facilities would be allowed in this zone:

- Limited numbers of legal and appropriately dispersed campsites

The following are examples of facilities that would not be allowed in this zone:

- Support facilities such as food storage, ranger stations, and compost toilets
- Utilities
- Bridges
- Formal trails
- Interpretive signs or programs
- Commercial overnight facilities

Zone 1B. Trailed Travel

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Trailed Travel zone would be characterized by light to moderate use focused on marked and maintained trails. Opportunities for solitude would range from moderate to high. There would be some management presence to accommodate resource protection and visitor use. The

⁶Fishing is allowed subject to California Department of Fish and Game regulations in all management zones.

Trailed Travel zone would be managed with very low tolerance for resource degradation from visitor use, and management action could be taken to change visitor use patterns if such degradation occurred.

Most visitors would experience this area by hiking, although a small percentage of visitors have traditionally used pack animals and could continue to do so. Visitor encounters would be infrequent, except in areas common for campsites and at key trail junctions. While there would be opportunities for challenge and adventure, the well-marked and maintained trails would allow visitors with a diversity of hiking abilities to experience the wilderness.

Through limitations on development and access, the Trailed Travel zone would protect and enhance biological, geologic, hydrologic, cultural, scenic, and scientific Outstandingly Remarkable Values. Opportunities for solitude, primitive and unconfined recreation, and enjoyment of natural river sounds are among the recreational Outstandingly Remarkable Values prominent in this zone.

Activities – The following activities would be typical in this zone:

- Overnight camping 100 feet or more from a water body or trail, by permit
- Hiking
- Rock climbing and mountaineering
- Stock use as allowed in the *Wilderness Management Plan*
- Swimming and wading
- Fishing
- Photography and nature study
- Very limited interpretive programs (e.g., guided walks for small groups)

Facilities – The following facilities would be allowed in this zone:

- Marked and maintained trails (walls and water bars could be used to provide for protection of resources)
- Limited numbers of legal and appropriately dispersed campsites
- Historic features
- Occasional directional and regulatory signs, and safety signs only as necessary
- Footbridges only at trail crossings where necessary for resource protection and visitor access (in compliance with the *Wilderness Management Plan*)

The following are examples of facilities that would not be allowed in this zone:

- Large campsites with facilities
- Commercial overnight facilities
- Utilities

Zone 1C. Heavy Use Trail

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Heavy Use Trail zone would be characterized by high levels of use on marked and maintained trails and associated areas. Due to high use levels, opportunities for solitude at peak times would be more limited on trails in this area. In some locations, sections of paved or rocked trails and fencing could be used to direct visitor use away from sensitive ecosystems. The Heavy Use Trail zone would be managed with a low tolerance for resource degradation due to visitor use, and management action could be taken to redirect use if such degradation occurred.

Most visitors would experience this area by hiking, although a small percentage of visitors have traditionally used pack animals and could continue to do so. Encounters with other visitors could be frequent during certain periods of the day or at key trail junctions, vistas, and other high-use locations. The well-marked and maintained trails would allow for visitors with a diversity of hiking abilities to experience the wilderness.

Through limitations on development, the Heavy Use Trail zone would protect and enhance biological, geologic, hydrologic, cultural, scenic, and scientific Outstandingly Remarkable Values. While opportunities for solitude would be lower than in the less-traveled Untrailed and Trailed Travel zones, this zone would provide ready access to wilderness hiking and backpacking near the Merced River.

Activities – The following activities would be typical in this zone:

- Hiking
- Rock climbing and mountaineering
- Stock use as allowed in the *Wilderness Management Plan*
- Photography and nature study
- Swimming and wading
- Fishing
- Very limited interpretive programs (e.g., guided walks for small groups)

Facilities – The following facilities would be allowed in this zone:

- Marked and maintained trails. (Some trails could have remnant paving, soil amendments, or hardened surfaces. Stairs, walls, fencing, and other trail features could be constructed for visitor use management and protection of sensitive areas.)
- Directional, regulatory, and safety signs
- Footbridges only at trail crossings where necessary for resource protection and visitor access (in compliance with the *Wilderness Management Plan*)

The following are examples of facilities that would not be allowed in this zone:

- Campsites
- Commercial overnight facilities

Zone 1D. Designated Overnight

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Designated Overnight zone would be characterized by the heaviest overnight use of all areas of the Wilderness zones. Designated overnight areas would be centered at destination locations with facilities for resource protection and visitor use, specifically at the Little Yosemite Valley Campground, Moraine Dome Campground, Merced Lake Campground, and the Merced Lake High Sierra Camp (a potential Wilderness addition). Opportunities for solitude would range from low to moderate depending on the season. Social interaction would be common. The presence of National Park Service staff would be moderate to high in order to prevent or mitigate most adverse impacts. The Designated Overnight zone would be managed with a low tolerance for resource degradation due to visitor use. Facilities such as signs and fencing could be used to prevent unacceptable impacts. Campsites would be located away from any sensitive natural or cultural areas, including meadows, streams, lakes, and historic and archeological sites, to minimize impacts.

Most visitors would experience this area by hiking and/or staying overnight. Small percentages use pack animals and could continue to do so. Visitor encounters with others would be frequent during much of the hiking seasons. The well-marked trails and facilities would allow for a diversity of users to experience the wilderness.

The Designated Overnight zone concentrates visitor facilities in a localized area, allowing for higher protection and enhancement of biological, geologic, hydrologic, cultural, scenic, and scientific Outstandingly Remarkable Values outside this zone. This zone also ensures that historic structures such as the High Sierra Camp could remain for continued use or for interpretive purposes. Signs, fencing, and other features could be used to direct visitors away from sensitive biological and cultural Outstandingly Remarkable Values, as necessary.

Activities – The following activities would be typical in this zone:

- Overnight camping only within a campground setting, by permit
- Hiking
- Wilderness skiing
- Photography and nature study
- Very limited interpretive programs (e.g., occasional ranger talks, guided walks)
- Stock use as allowed in the *Wilderness Management Plan*
- Use of High Sierra Camps as allowed in the *Wilderness Management Plan*

Facilities – The following facilities would be allowed in this zone:

- High Sierra Camps as allowed in the *Wilderness Management Plan*
- Designated campsites of moderate size
- Food storage and campfires, subject to regulation
- Compost toilets and toilet enclosures (as necessary to protect resources)

- Structures such as the Little Yosemite Valley Campground and Ranger Station, Merced Lake Campground, and Merced Lake High Sierra Camp (to concentrate use and reduce or mitigate ecosystem degradation, or for interpretation as a cultural resource)⁷
- Marked and maintained trails. (Some trails could have remnant paving, soil amendments, or hardened surfaces. Stairs, walls, fencing, and other trail features could be constructed for visitor use management and protection of sensitive areas.)
- Directional, safety, informational, and regulatory signs, and minimal interpretive signs when required for protection of resources
- Utilities associated with above facilities

The following are examples of facilities that would **not** be allowed in this zone:

- New commercial overnight facilities
- Campsites outside of designated areas

Category 2: Diverse Visitor Experience Zones

The Merced River corridor serves as an important recreational resource, providing opportunities for nature study, hiking, picnicking, swimming, fishing, and other activities for many of the 4 million people who visit Yosemite National Park each year. The Merced River corridor also serves as a continuous visual element of the landscape, setting off significant features such as waterfalls, granite domes, and peaks.

Natural resource management in these zones would strive to protect and enhance the natural functioning of ecological and hydrological systems while accommodating moderate levels of visitor use. The Category 2 zones are designed to protect and enhance biological, hydrologic, geologic, scenic, cultural, and scientific Outstandingly Remarkable Values, as well as the recreational Outstandingly Remarkable Values. This would be achieved by maintaining, wherever possible, the integrity of an overall ecological unit (such as a meadow, woodland, or wetland), while allowing for some human alteration of the landscape. Riparian, aquatic, and meadow communities in the river corridor play a particularly critical role in a variety of ecosystem processes and are also contributing cultural landscape resources. Restoration of the ecological and hydrological systems in these areas would focus on enhancing the diversity and stability of natural functions. Resource degradation would be minimized by the careful design and siting of facilities that direct visitor and administrative activities to locations able to withstand heavy use. Monitoring of visitor impacts on natural and cultural resources would help ensure adaptive and timely management responses to potential resource degradation.

The Diverse Visitor Experience zones would be managed to protect and enhance the hydrologic and ecologic processes of the Merced River and its immediate environment. Riparian areas and meadows should remain largely intact, supporting a diversity of native vegetation and wildlife species. However, localized areas could be developed with trails, roads,

⁷As provided for in the California Wilderness Act of 1984, if overnight use of the Merced Lake High Sierra Camp were restricted through a future, more detailed level of planning (e.g., update to the *Wilderness Management Plan*), the designation would change from potential Wilderness addition to “designated Wilderness.”

and parking areas and a greater amount of resource protection features (e.g., fencing and boardwalks) to allow for visitor access. Higher levels of resource impacts (e.g., trampling and soil erosion) and a greater amount of resource protection features might be expected in limited areas within the Day Use and Attraction zones to accommodate high numbers of visitors. The free flow of the river would remain primarily unimpeded. Water quality in the area should be of high quality.

Four management zones are defined for the Diverse Visitor Experience zone category:

- Zone 2A: Open Space (and Undeveloped Open Space)
- Zone 2B: Discovery
- Zone 2C: Day Use
- Zone 2D: Attraction

Objectives

The overall management objectives for the Diverse Visitor Experience zones are:

- Manage for protection, enhancement, and restoration of Outstandingly Remarkable Values, sensitive resources, and natural processes
- Provide opportunities for varied levels of recreational use
- Provide quality interpretive and educational programs
- Direct visitors to locations able to withstand heavy use
- Manage major attraction areas to allow visitors to enjoy the resource with minimal environmental damage
- Manage for the protection and maintenance of cultural resources, including historical and archeological sites

2A. Open Space

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Open Space zone would be characterized by relatively undisturbed natural areas that receive only incidental or casual use. Maintenance of these conditions would allow for the protection and enhancement of the biological, hydrologic, scenic, cultural, and scientific Outstandingly Remarkable Values while providing access to diverse visitor activities.

The visitor experience in this zone would be self-directed, with few visitor or management encounters, which would contribute to the diversity of experiences in the recreation Outstandingly Remarkable Value. The Open Space zone would be managed with very low tolerance for resource degradation from visitor use to protect and enhance biological, hydrologic, scenic, cultural, and scientific Outstandingly Remarkable Values. Visitation levels may be controlled by parking limitations and by the lack of shuttle bus stops. These limits on use and facilities would allow natural areas to remain relatively unimpaired and to receive continued protection, restoration, and enhancement.

There would be limited trails and interpretive facilities. These would direct visitors away from hazardous areas and sensitive Outstandingly Remarkable Values, such as unique wetlands, and promote understanding of natural processes. These areas would be generally quiet with limited facilities. The areas could be relatively easy to access or could require considerable walking and skill to access. Though not directly accessible by vehicles or from parking areas, noise from nearby vehicles could affect visitor experiences in this zone.

Resource protection activities in this zone would include preservation of cultural resources and restoration of natural processes impacted by contemporary development, restoration of natural flood cycles and river channel dynamics to sustain native plant and wildlife species, and use of fire management practices called for in the *Fire Management Plan* to enhance biological and hydrologic Outstandingly Remarkable Values. This zone also encourages the protection and enhancement of cultural resource Outstandingly Remarkable Values, including archeological sites, by limiting development and access. Restoration of natural resources such as wetlands and meadows would also contribute to the restoration of the cultural landscape.

Activities – The following activities would be typical in this zone:

- Hiking and walking
- Photography and nature study
- Stock use in specified locations
- Swimming and wading
- Fishing
- Rock climbing
- Very limited interpretive programs (e.g., guided walks for small groups)

Facilities – The following facilities would be allowed in this zone:

- Realigned or relocated vehicular roads that do not adversely affect Outstandingly Remarkable Values
- Limited turnouts for short-term parking and scenic viewing or shuttle bus stops
- Limited unpaved trails for hiking
- Limited interpretive signs to protect natural or cultural resources or to promote understanding of natural processes
- Boardwalks, fencing, and other features to direct travel appropriately to avoid sensitive resources, such as meadows
- Bridges where necessary for access, improved circulation, safety, and resource protection
- Utilities (wells, utility lines, pump stations, and other facilities where they are screened from view)
- Minimal utility crossings of the river, only where necessary to support park operations

The following are examples of facilities that would **not** be allowed in this zone:

- New roads or paved trails

- Day-visitor parking
- Support facilities, such as restrooms and picnic tables
- Interpretive centers
- Food services
- Bicycle paths
- Nonmotorized watercraft launch/removal facilities
- Campgrounds and lodging

2A+ . Undeveloped Open Space

The Undeveloped Open Space zone would be managed as *de facto* wilderness, primarily free from signs of human presence due to its inaccessibility. This zone would be used to protect those areas outside designated Wilderness that have limited or no trail access, such as the area west of the Wawona Campground along the South Fork. While Undeveloped Open Space areas would remain in pristine condition, visitors could experience some human influence due to noise from nearby roads. Typical activities would be hiking, rock climbing, swimming, nature study, and fishing. Access would require considerable effort because there are no trails.

This zone would be managed in a similar manner as the Untrailed zone (1A), protecting and enhancing biological, geologic, hydrologic, cultural, scenic, and scientific Outstandingly Remarkable Values through limitations on development and access. The following facilities normally allowed in the Open Space zone (2A) would **not** be allowed in this zone. Other prescriptions from the Open Space zone would apply.

- Roads, either existing or new
- Turnouts
- Interpretive or directional signs
- Trails, boardwalks, or fencing
- Bridges
- Utilities

2B. Discovery

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Discovery zone would be characterized by relatively quiet natural areas where visitor encounters are low to moderate, which would contribute to the diversity of experiences in the recreation Outstandingly Remarkable Value. However, during high-use periods, some concentrated use and more frequent visitor encounters could occur on trails that link destination points through the Discovery zone. The Discovery zone would be managed with low tolerance for resource degradation from visitor use, emphasizing the protection and enhancement of biological, hydrologic, scenic, cultural, and scientific Outstandingly Remarkable Values as well as emphasizing low-intensity types of use in recreation Outstandingly Remarkable Values. Limits on use and facilities would allow natural areas to

remain relatively unimpaired, when they are not close to one of the few access roads. There would likely be trail access and interpretive signs at principal features and gathering areas, but the visitor experience would be largely self-directed. Areas in the Discovery zone could be used by individuals or smaller organized groups. Access to these areas could require a moderate level of physical exertion, although some locations would be served by an access road and parking turnouts.

Within the Discovery zone, visitors would be likely to experience a variety of resources, including distant and close-range scenic views as well as opportunities to wade, swim, or fish in the river and to observe wildlife and plants. If use levels impacted resources, resource protection measures could be used, such as fencing and signs to direct travel from sensitive resources, well-marked trails and boardwalks, recycling and trash containers, relocation of shuttle bus stops in this or adjacent zones, or other measures as needed.

Resource protection activities in this zone would include restoration of natural processes impacted by past or current human use, restoration of natural flood cycles and river channel dynamics to sustain native plant and wildlife species, and use of fire management practices called for in the *Fire Management Plan* to enhance biological and hydrologic Outstandingly Remarkable Values. This zone also encourages the protection and enhancement of cultural resource Outstandingly Remarkable Values, including archeological sites, by limiting development and access. Restoration of natural resources such as wetlands and meadows would also contribute to the restoration of the cultural landscape.

Activities – The following activities would be typical in this zone:

- Hiking and walking
- Bicycling
- Photography and nature study
- Stock use in specified locations
- Swimming and wading
- Fishing
- Rock climbing
- Picnicking, relaxing, and gathering at informal locations
- Limited interpretive opportunities (e.g., informal ranger contacts, guided walks for small groups)

Facilities – The following facilities would be allowed in this zone:

- Vehicular roads and improved trails (could be realigned or relocated where they do not adversely affect Outstandingly Remarkable Values)
- Small turnouts for trail access parking, scenic viewing, or shuttle stops
- Trails for hiking and through-trails for bicycling
- Minimal restroom facilities as needed to protect resources

- Fences, boardwalks, platforms, and other features to direct travel around sensitive resources
- Interpretive, directional, and safety signs
- Bridges where necessary for access, improved circulation, safety, and/or resource protection
- Utilities such as well sites, utility lines, pump stations, and other facilities (where screened from view)
- Minimal utility crossings of the river, only where necessary to support park operations

The following are examples of facilities that would **not** be allowed in this zone:

- Day-visitor parking
- Picnic facilities
- Nonmotorized watercraft launch and removal facilities
- Interpretive centers
- Food services
- Campgrounds and lodging

2C. Day Use

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Day Use zone is intended to be applied to popular park destinations, where visitors could spend significant periods of time enjoying the park resources in a relatively accessible setting. The Day Use zone enhances opportunities for visitors to enjoy more intensive recreational activities near the Merced River and could support a range of active recreational opportunities such as swimming, picnicking, and rafting, which would contribute to the diversity of experiences in the recreation Outstandingly Remarkable Value. Visitors would expect moderate to high numbers of encounters with other park users and crowding on certain peak days. Large groups could use these areas. Day Use areas could be accessible by automobile, shuttle bus, and by bicycle, with interpretive trails or other marked trails leading to waterfalls, beaches, and scenic views. In order to accommodate heavier and more concentrated activity, facilities such as parking areas, restrooms, fencing of sensitive areas, picnic tables, and recycling and trash receptacles would be allowed.

Resource protection activities in this zone would be comparable to those described in zones 2A and 2B. However, due to the larger volume of visitors, the Day Use zone would be managed with moderate tolerance for resource degradation from visitor use in specified areas. To protect and enhance cultural, biological, and hydrologic Outstandingly Remarkable Values, more extensive resource protection measures could be needed to direct visitor use away from sensitive resources. Examples could include boardwalks adjacent to meadows or fencing to prevent trampling and overuse. By encouraging higher levels of visitor use in the Day Use zone, adjacent Open Space and Discovery zones would experience the desired lower levels of visitor

use for these areas. Some Day Use areas also protect historic resources, such as continued use of the Wawona Golf Course.

Activities – The following activities would be typical in this zone:

- Hiking and walking
- Photography and nature study
- Picnicking and social gathering
- Bicycling
- Stock use in specified locations
- Swimming and wading
- Rock climbing
- Fishing
- Use of non-motorized watercraft
- Full range of interpretive programs (e.g., ranger-led walks, talks)

Facilities – The following facilities would be allowed in this zone:

- Roads and improved trails (could be realigned or relocated where they do not adversely impact Outstandingly Remarkable Values)
- Day-visitor parking
- Turnouts for parking or scenic lookouts
- Bicycle trails
- Shuttle bus stops
- Support facilities (e.g., restrooms, picnic tables, telephones)
- Marked, maintained, and paved trails, including bicycle paths and interpretive trails
- Fences, boardwalks, walls, signs, and other features to direct travel appropriately around sensitive resources
- Nonmotorized watercraft launch and removal facilities
- Interpretive, directional, and safety signs and exhibits
- Utilities such as well sites, utility lines, pump stations and other facilities (where screened from view)
- Utility crossings of the river (where necessary to support park operations)
- Bridges where necessary for access, improved circulation, safety, and/or resource protection

The following are examples of facilities that would **not** be allowed in this zone:

- Interpretive centers
- Food services
- Campgrounds and lodging

2D. Attraction

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Attraction zone would be applied to main park features that attract large numbers of visitors, such as viewing areas for Bridalveil Fall. Due to the large number of visitors, this zone would be managed with moderate tolerance for resource degradation in specified areas, not to exceed established standards. The visitor experience in this zone would be highly structured, with well-marked and often paved trails or other trails to guide visitors, which would contribute to the diversity of experiences in the recreation Outstandingly Remarkable Value. Visitors could expect a high level of encounters with other visitors in these moderately to very busy areas. Attraction areas could be accessible by automobile, shuttle bus, bicycle, and/or trail.

To accommodate high levels of visitor use, substantial facilities such as restrooms, parking lots, bus access and parking, and picnic tables could be provided at the entry point of the attraction area or another appropriate site. Facilities would be concentrated within the attraction area to minimize the extent of development and impacts. As a result, many areas within an Attraction zone would have a well-used trail, but minimal developed uses away from the entry “hub” or access point. Trails could be paved, fenced, and well signed to reduce potential resource impacts. Visitor use in sensitive areas would be formalized and concentrated to avoid resource damage.

By encouraging higher levels of visitor use in the Attraction zone, adjacent Open Space and Discovery zones would experience the desired lower levels of visitor use for these areas. This zone also would ensure that visitors have the opportunity to enjoy the park’s most popular features, some of which are designated scenic, recreational, or cultural Outstandingly Remarkable Values (e.g., views of granite domes, Wawona Covered Bridge).

Activities and Uses – The following uses would be typical in this zone:

- Hiking and walking
- Photography and nature study
- Sightseeing
- Stock use in specified locations
- Swimming and wading
- Fishing
- Rock climbing
- Bicycling (only in specified locations, to ensure visitor safety and resource protection)
- Full range of interpretive programs (e.g., ranger-led walks, talks)

Facilities – The following facilities would be allowed in this zone:

- Roads (could be realigned or relocated where they do not adversely impact Outstandingly Remarkable Values)
- Day-visitor parking (to accommodate visitor access and administrative needs at high use areas)

- Bicycle trails
- Shuttle bus stops
- Support facilities such as restrooms, picnic tables, telephones, stables, and limited food services (where appropriate)
- Marked maintained and paved trails, including bike paths, and interpretive trails. (Trails could be hardened to direct visitors and minimize resource damage. Fences, boardwalks, walls, signage, and other features could be used to direct travel.)
- Interpretive centers
- Interpretive signs, exhibits, displays, and kiosks
- Utilities such as wells, utility lines, pump stations and other facilities (where screened from view)
- Bridges where necessary for access, improved circulation, safety, and/or resource protection
- Limited utility crossings of the river (where necessary to support park operations)

The following are examples of facilities that would **not** be allowed in this zone:

- Nonmotorized watercraft launch and removal facilities
- Campgrounds and lodging

Category 3: Developed Zones

Carefully designed and located facilities are needed to meet the diverse needs of the many people who visit Yosemite National Park each year. The use of limited Developed zones provides sites for the facilities that enable the park to support its year-round visitor and employee populations and serve the needs of visitors. These include lodging, utilities, housing, and transportation facilities. Most of the developed zones are located in areas that are currently, or that were previously, altered by development.

The purpose of the Developed zones is to direct high-impact activities and facilities to areas better able to withstand heavy use and/or already developed locations in order to further protect and enhance the hydrologic, biological, geologic, cultural, scenic, scientific, and recreation Outstandingly Remarkable Values in other parts of the corridor. The facilities allowed for in the Developed zones, such as campsites, lodging, day-visitor parking, and operational facilities, are necessary to properly manage park visitors, many of whom are coming to experience the scenic, recreational, and other Outstandingly Remarkable Values of the Merced Wild and Scenic River.

While these zones could absorb the most concentrated visitor and administrative use, resource impacts would be minimized through design and siting of facilities, and the application of mitigation and restoration measures. These measures could include temporary or permanent fencing to reduce or exclude use in sensitive resources, revegetation with native species, and/or the prevention of the establishment of non-native species. Visitor use would be managed to reduce the potential impacts of concentrated use.

There are three Developed zones:

- Zone 3A: Camping
- Zone 3B: Visitor Base and Lodging
- Zone 3C: Park Operations and Administration (includes day-visitor parking)

Developed Zone Management Objectives

The overall management objectives for the Developed zones include:

- Manage for protection and enhancement of Outstandingly Remarkable Values
- Concentrate support facilities to reduce development pressure on the remainder of the river corridor
- Provide overnight accommodations, support services, and amenities for visitors
- Provide quality interpretive and educational programs
- Provide support facilities for park operations
- Provide transportation facilities designed for sustainability
- Manage for the protection of cultural resources and cultural Outstandingly Remarkable Values
- Implement natural resource mitigation and restoration to the greatest extent feasible

3A. Camping

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Camping zone would provide visitors with opportunities for both vehicle-access camping and walk-in camping. Vehicle-access camping areas would include campsites with adjacent parking, providing convenient access to various facilities. Support facilities such as picnic tables and restrooms would be provided at camping areas. The Camping zone primarily supports the recreational Outstandingly Remarkable Values by ensuring access to diverse recreational activities near the Merced River. Most areas designated as Camping zones have been previously developed, including historic resources such as Camp 4 (Sunnyside Campground), which would be preserved under this zone. By concentrating relatively high-impact development to localized areas, this zone helps to protect and enhance natural and cultural resource Outstandingly Remarkable Values in the zone as a whole and in other parts of the river corridor.

Walk-in camping would provide an opportunity for visitors to camp away from vehicles, but retain access to facilities such as restrooms, water, and picnic tables. Campsites would be accessed by relatively short and well-marked trails with directional and informational signs. In walk-in camping areas, visitors would have the opportunity to engage more directly with the natural environment of the Merced River corridor without the visual impacts of entry roads, parking lots, vehicles, or other major facilities.

While the Camping zone would allow for both vehicle-access and walk-in camping, the less-intensive walk-in camping would be directed to more sensitive areas (e.g., North Pines), while

vehicle-access camping would be directed to areas better able to withstand heavy use (e.g., Upper Pines). In both vehicle-access and walk-in camping areas, visitor encounters would be moderate to high in the relatively dense clusters of campsites. The Camping zone would be managed with moderate to high tolerance for resource impacts in localized areas. While a certain level of hardening for parking sites and trampling by campers is expected, use would be directed away from sensitive areas. River access would be provided via marked and potentially hardened trails to direct visitors to areas better able to withstand heavy use, such as annually (or regularly) flooded deposition bars.

Activities – The following activities would be typical in this zone:

- Overnight camping within designated campsites
- Hiking and walking
- Swimming and wading
- Fishing
- Sightseeing and photography
- Picnicking
- Bicycling (only in specified locations, to ensure visitor safety)

Facilities – The following facilities would be allowed in this zone:

- Designated campsites (could be equipped with fire rings, picnic tables, nearby restroom facilities, and Recreational Vehicle hookups)
- Roads and parking areas
- Shuttle bus stops
- Marked, maintained, and paved trails (fences, boardwalks, walls, footbridges, signs, and other features could be used to protect resources)
- Maintenance and administrative facilities needed to support campgrounds
- Directional, safety, informational, regulatory, or interpretive signs
- Bridges where necessary for access, improved circulation, safety, and/or resource protection
- Utilities such as wells, utility lines, pump stations, and other facilities (where screened from view)
- Interpretive facilities such as an amphitheaters

The following are examples of facilities that would **not** be allowed in this zone:

- Lodging, food services, stores
- Administrative offices not associated with camping
- Maintenance facilities not associated with camping

3B. Visitor Base and Lodging

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The Visitor Base and Lodging zone includes areas developed for visitor overnight use as well as support facilities and services such as orientation facilities, eating establishments, gift shops, and equipment rental. Most areas designated as Visitor Base and Lodging zones have been previously developed, including historic resources such as The Ahwahnee, Wawona Hotel, and LeConte Memorial Lodge, which would be preserved under this zone. The visitor could expect a bustling atmosphere in these areas, with high incidence of visitor encounters during peak-use times. Facilities and lodging areas would be easily accessible by shuttle bus, automobile, trail, and bicycle.

With its relatively intense level of development, a higher degree of resource impacts may be tolerated in localized areas within the Visitor Base and Lodging zone. Future projects in this zone would be designed to minimize the footprint of developed areas and to protect and restore adjacent natural and cultural resources. River access would be provided via marked and potentially hardened trails to direct visitors to areas most able to withstand heavy use, such as annually (or regularly) flooded deposition bars. Structures such as fences, boardwalks, or walls could be provided to reduce impacts on riparian areas from casual river access generated by nearby lodging facilities.

The Visitor Base and Lodging zone primarily supports the recreational Outstandingly Remarkable Values by providing for visitor uses, facilitated by development such as visitor centers, museums, and lodging, which enable visitors to access the park and learn about its natural and cultural resources. Additionally, by concentrating relatively high-impact development to localized areas, this zone would help to protect and enhance natural and cultural resource Outstandingly Remarkable Values in the zone as a whole and in other parts of the river corridor.

Activities – The following activities would be typical in this zone:

- Lodging
- Hiking and walking
- Swimming and wading
- Fishing
- Sightseeing and photography
- Bicycling (only in specified locations, to ensure resource protection and visitor safety)
- Shopping
- Dining
- Full range of formal interpretation (e.g., slide shows, visitor center, walks)
- Marked, maintained, and paved trails

Facilities – The following facilities would be allowed in this zone:

- Bicycle trails

- Visitor overnight accommodations (lodges, motel-type units, cabins, tent cabins)
- Fences, boardwalks, walls, signs, and other features to direct use and protect resources
- Visitor services (e.g., visitor center, museums, eating establishments, gift shops, equipment rental)
- Roads and parking areas
- Bus turnouts, stops, and parking
- Bridges where necessary for access, improved circulation, safety, and/or resource protection
- Utilities such as wells, pump stations, utility lines, and other facilities (screened from view)
- Interpretive facilities, such as amphitheaters
- Supporting operational facilities, such as employee housing, only where it is ancillary to the primary use (i.e., a small percentage of the total available area)

The following are examples of facilities that would **not** be allowed in this zone:

- Administrative offices not associated with visitor base or lodging operations
- Maintenance facilities and major utilities not associated with visitor base or lodging operations
- Day-visitor parking/transit center

3C. Park Operations and Administration

VISITOR EXPERIENCE AND RESOURCE PROTECTION

The limited use of the Park Operations and Administration zone would provide locations for facilities that support the efficient functioning of the park. Many areas designated as 3C have been previously developed, including historic resources such as the Chapel in Yosemite Valley, which would be preserved under this zone. The 3C zone would also provide opportunities for the management of private vehicles and public transit in the park, as well as interpretive centers that help visitors learn about the park's natural and cultural resources. Visitor use and experience of these zones would be limited. These areas would likely be relatively busy, with heavy impacts from vehicles, and would be managed with a high tolerance for resource impacts in localized areas. New facilities would use sustainable design and construction principles to protect adjacent natural and cultural resources, and would be subject to the criteria and considerations (see the beginning of this chapter).

The Park Operations and Administration zone would primarily support access to the recreational Outstandingly Remarkable Values of the Merced River by providing space for necessary park operations purposes as well as for day-visitor parking. Additionally, by concentrating relatively high-impact development in localized areas, this zone would help to protect and enhance natural and cultural resources in the zone as a whole and in other parts of the river corridor.

Activities – The following activities would be typical of this zone:

- Administrative activities by park staff
- Maintenance and repair activities by park operations staff
- Transportation/transit-related activities
- Visitor orientation and interpretation near parking/transit areas
- Picnicking near parking/transit areas
- Bicycling (only in specified locations, to ensure visitor safety)
- Marked, maintained, and paved trails, including bicycle paths and interpretive trails

Facilities – The following facilities would be allowed in this zone:

- Day-visitor parking/transit center
- Roads, paved and unpaved (in strictly administrative areas, roads could be dirt or paved and closed to nonadministrative traffic)
- Support facilities (including park administrative offices, employee housing, storage, construction staging areas, and utilities such as wastewater treatment plants, sprayfields for reclaimed water, domestic water supply, power plants, and other facilities)
- Interpretive facilities
- Visitor support facilities such as restrooms, picnic tables, telephones, food services, bicycle rental, small gift shops, showers, and lockers for visitors and employees
- Park information and orientation signs, exhibits, and kiosks
- Bridges where necessary for access, improved circulation, safety, and/or resource protection

The following are examples of facilities that would **not** be allowed in this zone:

- Campgrounds and lodging for visitors

Visitor Experience and Resource Protection

Purpose

The Visitor Experience and Resource Protection (VERP) framework is a tool developed by the National Park Service to address user capacities and is adopted by the *Merced River Plan* to meet the requirements of the Wild and Scenic Rivers Act. The VERP framework protects both park resources and visitor experience from impacts associated with visitor use, and helps managers address visitor use issues. The nine elements of the VERP framework are an ongoing, interactive process of determining desired conditions,⁸ selecting and monitoring indicators and standards that reflect these desired conditions, and taking management action when the desired conditions are not being realized. VERP is a decision making *framework*, but does not diminish management’s role in decision making; in fact, management would have to make crucial decisions in determining desired conditions, choosing appropriate management

⁸“Desired conditions” encompasses desired cultural resource conditions, desired natural resource conditions, and desired visitor experiences.

action, and assessing occasional overlap between protecting park resources and providing for visitor experiences. For the purposes of this plan, the VERP framework would be used as a form of adaptive management.⁹ Where uncertainty exists about impacts associated with visitor use, knowledge and understanding of visitor use issues would improve and evolve over time, and management actions would adapt accordingly. Continual hypothesis testing, data collection, and data analysis would likely result in refinement of desired conditions and, accordingly, refinement of indicators and standards. The implementation of the VERP framework for the Merced Wild and Scenic River corridor would focus on protecting the Outstandingly Remarkable Values and would dovetail with future implementation of the VERP framework outside the river corridor.

Overview of the VERP Framework

The VERP framework consists of nine elements, four of which are key: (1) determination of desired conditions, which are part of the management zone prescriptions; (2) selection of indicators and standards that reflect the desired conditions; (3) monitoring of the indicators and standards; and (4) implementation of management action when the desired conditions are violated or when conditions are deteriorating and preventive measures are available. Together, these elements would help park managers make decisions about visitor use and resource protection.

DESIRED CONDITIONS AND MANAGEMENT ZONES

The VERP framework relies on the concept of desired conditions, which are contained in the management zone prescriptions and identify how different areas in the river corridor would be managed. Each management zone prescribes a set of desired resource conditions, desired visitor experiences, and types and levels of uses. The *Merced River Plan* management zoning is designed to protect and enhance the Outstandingly Remarkable Values and free-flowing condition of the Merced River. Desired conditions would focus on the Outstandingly Remarkable Values and guide the protection and enhancement of those Outstandingly Remarkable Values, and could be refined over time as knowledge and understanding of conditions and issues improve.

INDICATORS AND STANDARDS

A major premise of VERP is that desired conditions, which are qualitative in nature, can be translated into measurable indicators and standards. Indicators and standards reflect desired conditions and enable park management to determine whether or not desired conditions are being realized. “Indicators” which are measurable variables, are determined first; “standards” are the acceptable measurements (i.e., values) for that indicator. Specific indicators and standards would be developed for desired conditions for each combination of management zone and ecological type. Resource indicators measure impacts from visitor use to the cultural, biological, and/or physical resources. Social indicators measure impacts to the visitor experience

⁹Adaptive management is a process that allows the development of a plan when some degree of biological and socioeconomic uncertainty exists. It requires a continual learning process, a reiterative evaluation of goals and approaches, and redirection based on an increased information base and changing public expectations (Baskerville 1985).

caused by interactions with other visitors. Indicators should be specific, objective, reliable, related, responsive, nondestructive, sensitive to visitor use, and should address Outstandingly Remarkable Values. Standards should be quantitative, measurable, and feasible.

MONITORING

Detailed monitoring protocols would be developed for each standard to ensure accurate, valid data. Monitoring would begin as soon as a standard is selected and a monitoring protocol is developed.

MANAGEMENT ACTIONS

If monitoring revealed that a standard associated with an indicator were being violated, then desired conditions would not be realized and management action would be initiated. Management action could determine that the violation of the standard was caused by natural variation and that the standard needed to be adjusted or a new indicator and standard selected to better reflect desired conditions. Actions to manage or limit visitor use would be implemented when the standard was violated due to impacts associated with visitor use.

VERP PHASING PLAN

Yosemite National Park began development of the parkwide VERP framework in 1998 and continues to develop desired conditions, indicators, standards, and monitoring protocols. The VERP framework outlined herein for the Merced River corridor will be developed and implemented within five years after the final Record of Decision on the *Merced River Plan* and would dovetail with the larger, parkwide VERP program.

WHAT VERP IS NOT

It is worth noting what VERP will not do.

- VERP does not specify the total number of visitors that the river corridor, as a whole, can accommodate at one time. Such an aggregate figure would mask problems at “hot spots” and would not provide managers with useful guidance for addressing use-related problems.
- As a framework for addressing user capacity, VERP is not driven by the capacity of existing infrastructure. Expanding or constructing facilities does not necessarily mitigate visitor use impacts to visitor experience or resources.
- VERP, as applied in the Merced Wild and Scenic River corridor, may not directly transfer to other areas of Yosemite National Park. It may be implemented elsewhere in the park at some future date; desired conditions, indicators, and standards are being developed with this possible expansion in mind. However, due to an emphasis on Outstandingly Remarkable Values and other factors, it is possible that future implementation of VERP outside of the Merced Wild and Scenic River corridor will not dovetail perfectly.
- VERP does not address impacts that do not result directly from visitor use. Impacts from park operations and management activities (e.g., fire management), natural variability

(e.g., high water), development (e.g., construction, demolition), and other causes not directly associated with visitor activities are managed through other methods.

- VERP is not static. Visitor use patterns, desired visitor experiences, and resource conditions change with time. VERP is an iterative process of monitoring, evaluation, and adjustment.

Geologic Hazard
Guidelines*

Final
Yosemite
Valley
Plan

Supplemental EIS

APPENDIX C – YOSEMITE VALLEY GEOLOGIC HAZARD GUIDELINES

Background

Rockfalls and other associated forms of mass movement, such as rockslides, debris flows, and rock avalanches, are natural processes that continue to shape Yosemite Valley. During historical time (1850-present), more than 400 rockfalls or other forms of mass movement have been documented. Several people have been killed by such geologic hazards and many others injured. Many trails, roads, and buildings have also been destroyed or seriously damaged by such processes.

For land-use planning in Yosemite Valley, the U.S. Geological Survey and the National Park Service have cooperated to document potential geologic hazards, primarily rockfalls, debris flows, and rock avalanches (hereafter referred to as rockfall) in the Valley. The documentation consisted of a review of archival records, aerial photographic interpretation, and field mapping (USGS 1992). Most recently the National Park Service requested the U.S. Geological Survey to conduct additional field work and to assess the previous information in order to produce a report on the rockfall potential within the Valley (USGS 1998). In the report, there were two areas of potential rockfall identified. The first area lying closest to the Valley walls was identified as the Talus Slope Zone, where the majority of materials are deposited during a mass movement event. The second area identified was the Rock Fall Shadow Line Zone which extends out from the Talus Slope zone and is the area in which individual rocks may travel out from the Talus. These zones indicate the closer one approaches the Valley walls, the greater the potential for damage by a mass movement event.

The frequency and magnitude of rockfall within the Valley can and does vary considerably. Singular events involving stones or rocks less than one cubic meter occur on a fairly regular basis depending upon weather conditions, freeze/thaw conditions, moisture conditions, and rock composition/condition. Events of greater magnitude up to 100,000 cubic meters may occur on an interval of over ten years (USGS 1998). The location of these movements can also be fairly random within the Valley.

It is not possible to avoid all rockfall related risks in a narrow valley like Yosemite Valley. This means that some facilities located in the Valley will be exposed to risk of damage by rockfall. The National Park Service is currently revising its *Management Policies* pertaining to geologic resources and hazards. Excerpts from the most recent *Draft Management Policies*, January, 2000 state that:

- The National Park Service will work to protect park visitors, staff, and infrastructure from geologic hazards.
- The National Park Service will allow natural geologic processes to proceed unimpeded. Geologic processes will be addressed during planning and other management activities in an effort to reduce hazards that can threaten the safety of park visitors and staff and the long-term viability of park infrastructure.

- Park managers will work closely with specialists at the U.S. Geological Survey and elsewhere, and with local, state, and federal disaster management officials, to devise effective geologic hazard identification and management strategies. Although the magnitude and timing of future geologic hazards are difficult to forecast, park management will strive to understand future hazards and, once understood, minimize their potential impact on visitors, staff, and developed areas. The National Park Service will work to avoid placing new facilities in geologically hazardous areas. Managers will examine the feasibility of phasing out, relocating, or providing alternative facilities for park developments subject to hazardous processes.
- The National Park Service will strive to avoid locating new facilities in areas where they may be damaged or destroyed by natural geologic and hydrologic processes, unless no practicable alternative exists and safety and hazard probability factors have been considered.

Using this management guidance, the following guidelines were developed for new and existing structures within Yosemite Valley.

Guidelines

The 1916 Organic Act requires the National Park Service to provide for public enjoyment of the parks while conserving the scenery, natural and historic objects, and wildlife of parks in a manner that will leave them unimpaired for the enjoyment of future generations. Balancing these policies requires National Park Service managers to exercise judgment and discretion, particularly when making decisions about visitor safety and protection. Therefore, Yosemite National Park's decisions about locating and relocating facilities are an exercise of discretion. Each decision will be based on the park's balancing of the policy of promoting public enjoyment including minimizing safety hazards, with other policies such as: minimizing human intrusion on natural and historic resources and wildlife; conserving cultural resources, scenery, aesthetics, and visitors' natural park experiences; minimizing environmental impact; and operating within limits of available financial and human resources.

In evaluating the uses of existing facilities within the Valley, the National Park Service should first determine the historical significance of each facility and determine its Occupancy Category (figure C-1).

EXISTING FACILITIES

- A. The National Park Service should work to remove structures or uses in the Essential and Hazardous categories from the Talus Slope and Shadow Line zones, unless no practicable alternative exists and if safety and hazard probability factors have been considered. If historic structures are identified as Essential or Hazardous Occupancy categories, or if the National Park Service determines there are other policy reasons for leaving the structures, the structure may remain if contingency planning is completed to provide for the function in the event a rockfall or other geologic incident occurs.
- B. The National Park Service should evaluate structures and uses in the Special Occupancy category in the Talus Slope zone. Such evaluations should include safety and hazard

considerations and other policies. If the evaluation shows there are policy reasons to retain these structures and/or uses in their existing locations, they may remain at the discretion of the National Park Service.

- C. The National Park Service should evaluate safety and hazard considerations and other policies relevant to structures and uses in the Standard and Miscellaneous Occupancy categories. If the evaluation indicates there are policy reasons to retain these structures and/or uses in their existing locations, the structures may remain at the discretion of the National Park Service.

In evaluating the placement and uses of new facilities within the Valley, the National Park Service should first determine those facilities' Occupancy Category (figure C-1).

NEW FACILITIES

- A. The National Park Service should place new structures or uses in the Essential, Hazardous, and Special Occupancy (occupant loads greater than 300) categories outside the Talus Slope and Shadow Line zones, unless no practicable alternative exists and all safety and hazard probability factors have been considered.
- B. The National Park Service should place structures in the Standard Occupancy category outside the Talus Slope zone, unless no practicable alternative exists and all safety and hazard probability factors have been considered.
- C. Miscellaneous structures may be placed in any area if there is no practicable alternative. Before locating new miscellaneous structures in the Talus Slope zone, the National Park Service should conduct a site-specific review that includes safety and hazard considerations.

Figure C-1
Occupancy Categories for Yosemite National Park Facilities

Essential Facilities

- Fire station (National Park Service & concessioner)
- Visitor protection/search and rescue
- Medical clinic
- Jail
- Court
- Communications center
- High voltage

Hazardous Facilities

- Fuel storage

Special Occupancy Facilities

- Assembly facilities (occupancy load of greater than or equal to 300)
 - Eating and drinking establishments
 - Auditoriums
 - Visitor center
- Education facilities (occupancy load of greater than or equal to 300)

Standard Occupancy Facilities

- Assembly facilities (occupancy load of less than 300)
 - Eating and drinking establishments
 - Auditoriums
 - Visitor contact stations
- Education facilities (occupancy load of less than 300)
- Offices
- Post office
- Retail sales
- Maintenance facilities
- Hotels
- Dormitories
- Multi-family housing
- Single-family housing

Miscellaneous Structures

- Unoccupied storage structures
- Restrooms
- Picnic areas
- Campground

Yosemite
Valley
Plan

Supplemental EIS

APPENDIX D – CULTURAL RESOURCES PROGRAMMATIC AGREEMENT

PROGRAMMATIC AGREEMENT AMONG THE NATIONAL PARK SERVICE AT YOSEMITE, THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER, AND THE ADVISORY COUNCIL ON HISTORIC PRESERVATION REGARDING PLANNING, DESIGN, CONSTRUCTION, OPERATIONS AND MAINTENANCE, YOSEMITE NATIONAL PARK, CALIFORNIA.

WHEREAS, the National Park Service (NPS) at Yosemite National Park (YOSE) has determined that planning, design, construction, operations and maintenance may have an effect on properties included in, or eligible for inclusion in, the National Register of Historic Places, and has consulted with the California State Historic Preservation Officer (SHPO) and the Advisory Council on Historic Preservation (Council) pursuant to Section 800.13 of the regulations (36 CFR Part 800), implementing Section 106 of the National Historic Preservation Act of 1966, as amended (16 U.S.C. 470f; hereinafter NHPA); and

WHEREAS, the NPS, the Council, and National Conference of State Historic Preservation Officers (NCSHPO) executed a Nationwide Programmatic Agreement on July 17, 1995 that establishes a framework for taking historic properties into account and is supplemented by this agreement; and

WHEREAS, the NPS completed a 1980 General Management Plan (GMP) that provides the management direction for YOSE; and

WHEREAS, the NPS, SHPO and Council executed a November 1, 1979, Memorandum of Agreement (MOA) that is still in effect to cover actions specified in the 1980 GMP; and

WHEREAS, a Concessions Services Plan and a Yosemite Valley Plan exist or are underway to implement proposals of and amend the 1980 General Management Plan; and

WHEREAS, the NPS has on staff or has access to qualified cultural resource specialists who meet, at a minimum, the appropriate qualifications set forth in the Department of the Interior's "Professional Qualifications Standards" (36 CFR Part 61, Appendix A) to carry out programs for cultural resource management. These include cultural resource management advisors described in Stipulation III (C)(3) of the nationwide programmatic agreement; and

WHEREAS, the terms in 36 CFR Section 800.2 "Definitions" are applicable throughout this Programmatic Agreement, including "Historic Property" to mean any prehistoric or historic district, site, building, structure or object included in, or eligible for inclusion in, the National Register of Historic Places. Historic Properties include artifacts and remains that are related to and located within such properties, cultural landscapes, as defined in National Register Bulletins 18 and 30, and traditional cultural properties, as defined in National Register Bulletin 38. "Indian Tribes" refers to American Indian tribes, bands, organized groups, or communities recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians, and who are culturally affiliated with YOSE lands and resources; and

WHEREAS, YOSE has consulted with Indian Tribes (American Indian Council of Mariposa County, Inc., the Tuolumne Me-Wuk Tribal Council, the Mono Lake Indian Community, the Bridgeport Paiute Tribe, the Chukchansi Nation, the Northfork Mono Rancheria and the Northfork Mono Indian Museum) and has provided these parties the opportunity to participate in the development of, and to concur in the terms of, this Agreement; and

WHEREAS, YOSE has consulted with the National Trust for Historic Preservation (National Trust) and has invited the National Trust to concur in this agreement; and

WHEREAS, YOSE has notified the public of the formulation of this agreement and provided them an opportunity to comment;

NOW, THEREFORE, the NPS, SHPO, and Council agree that YOSE shall carry out its responsibilities under the NHPA, as amended, for those undertakings/actions specified in Stipulation II below.

Stipulations

YOSE shall ensure that the following measures are carried out:

I. P O L I C Y

YOSE shall manage and preserve the historic properties of the park through undertakings and research, consistent with good management and stewardship. These efforts are, and will remain, in keeping with the NHPA, the National Environmental Policy Act of 1969 (NEPA), and other applicable laws, executive orders, regulations and policies. YOSE shall implement its programs with public review and in consultation with other federal agencies, the SHPO, Indian Tribes, city and county governments and their respective authorities, as appropriate.

A. Guidelines, standards, and regulations that are relevant to this Agreement and that shall provide guidance and performance standards for management of historic properties include:

- | | |
|----------|--|
| NPS/ACHP | The Secretary of the Interior's Standards and Guidelines for Federal Agency Historic Preservation Programs Pursuant to the National Historic Preservation Act [Section 110 Guidelines] |
| ACHP | Treatment of Archeological Properties: A Handbook |
| FHWA | Manual for Uniform Traffic Control Services |
| NPS | Maintenance Management Program, Operations Manual, Parts 1&2 |
| NPS | Museum Handbook, Parts 1&2 |
| NPS | Director's Order 2: Park Planning |
| NPS-6 | Interpretive and Visitor Services Guidelines |
| NPS-12 | NEPA Compliance Guidelines |
| NPS-28 | Cultural Resource Management Guideline |
| NPS-38 | Historic Property Leasing Guidelines |

- NPS-76 Housing Design and Rehabilitation Guidelines
- USDI Archeology and Historic Preservation: Secretary of the Interior's Standards and Guidelines
- USDI The Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings
- USDI The Secretary of the Interior's Standards for Historic Preservation Projects with Guidelines for Applying the Standards
- USDI The Secretary of Interior's Standards for the Treatment of Historic Properties with Guidelines for the Treatment of Cultural Landscapes
- US Uniform Federal Accessibility Standards (49 FR 31528-31617)
- US Americans with Disabilities Act Accessibility Guidelines (56 FR 45731-45778)
- US Native American Graves Protection and Repatriation Act Regulations: Final Rule (43 CFR Part 10)

As needed, additional guidelines may be developed for the built or designed landscapes of YOSE. Proposed new guidelines developed by YOSE shall be submitted to the SHPO for review and comment. The SHPO shall have 30 days after receiving the proposed guidelines to respond to specific treatments described in the guidelines.

B. YOSE shall use the following Cultural Resource Identification and Professional or Technical Plans and Studies in management:

- NPS YOSE Hazard Tree Plan
- NPS YOSE Fire Management Plan
- NPS YOSE Wilderness Management Plan
- NPS YOSE Resource Management Plan
- NPS YOSE Archeological Synthesis and Research Design
- NPS Cultural Landscape Report, Yosemite Valley
- NPS Ethnographic Evaluation of Yosemite Valley, the Native American Cultural Landscape
- NPS Historic Resource Study, Yosemite National Park
- NPS List of Classified Structures, YOSE
- NPS Wilderness Historic Resource Study
- NPS Archeological Inventory, Testing, Data Recovery and Monitoring Reports
- NPS Ethnographic Studies
- NPS YOSE Interpretive Prospectus

II. APPLICABILITY

This agreement is applicable to all individual actions relating to:

- A. Routine maintenance and park operations
- B. Individual actions proposed in the 1980 *General Management Plan*, that will be attached in Appendix C, and individual actions proposed in implementing plans including, but not limited to:
 - 1992 Concessions Services Plan
 - Yosemite Valley Plan (in preparation)
- C. Design projects
- D. Specific management plans

III. SCOPE OF AGREEMENT

- A. This Agreement applies to undertakings at YOSE that have not been covered by previous agreements, and that are under the direct or indirect supervision of the NPS including undertakings performed by NPS lessees, permittees, concessionaires, cooperators and park partners.
- B. The NPS shall ensure that the lessees, permittees, concessionaires, cooperators and park partners are notified that they are subject to the terms of this Agreement.

IV. RELATIONSHIP TO OTHER PLANS

- A. This Agreement incorporates provisions of, but does not supersede, the 1979 MOA executed for the 1980 GMP. Provisions of that agreement will continue to be implemented as written.
- B. This Agreement supplements the 1995 Nationwide Programmatic Agreement among the NPS, the Council, and the National Conference of State Historic Preservation Officers.

V. PARTICIPATION OF INDIAN TRIBES

- A. YOSE shall consult with Indian Tribes in such a manner as to meaningfully involve them in decisions affecting resources of concern.
- B. Within one year of the execution of this Agreement, YOSE shall develop an agreement that sets forth the process by which Indian Tribes will be involved in considering the impacts of undertakings on Historic Properties at YOSE that are of interest to them. This protocol will:
 1. Define when consultation between the YOSE and tribes is necessary
 2. Identify individuals or offices directly involved in the consultation process
 3. Outline key elements of the consultation process
 4. Outline the process to be followed in case of inadvertent discovery of human remains or other items subject to the NAGPRA

- C. Until this agreement is in place, YOSE shall continue to consult with Indian Tribes according to 36 CFR Part 800 and, when appropriate, the provisions of NAGPRA.

VI. PUBLIC PARTICIPATION

- A. YOSE shall consult with the signatories to this Agreement and with other Interested Parties or Persons to determine if there are organizations or individuals that may be concerned with actions described in Stipulation VIII below, and shall provide notice to the public of the undertakings subject to the stipulations of this Agreement through the public participation process of the National Environmental Policy Act (NEPA) and its implementing regulations set forth in 40 CFR Parts 1500-1508. Any member of the public may participate as an Interested Person in the consultation for a particular action upon notifying YOSE of their interest. YOSE, SHPO and Council, if participating, shall jointly determine when such Interested Persons shall be invited to participate as a consulting party for individual undertakings in accordance with 36 CFR Section 800.5(e)(1)(iv). YOSE shall take into account the views of such parties regarding any adverse effect of an undertaking described in Stipulation VIII below.
- B. Documentation regarding identification and National Register evaluation of historic properties, when not subject to confidentiality concerns, will be available for inspection at YOSE, SHPO, or NPS Pacific West Regional Office.

VII. CONSIDERATION OF HISTORIC PROPERTIES

Pursuant to the NHPA and in the earliest stages of the planning process, YOSE shall identify, evaluate, determine effects to, and treat historic properties in conformance with all applicable regulations, policies and guidelines listed in Stipulation I above.

A. Identification

1. YOSE shall consult with Indian Tribes and Interested Persons, as appropriate, on activities to locate and inventory Historic Properties, in accordance with Section 110 of the NHPA, and 36 CFR Section 800.4 .
2. If no Historic Properties are identified, YOSE shall maintain documentation of the inventory for purposes of review under Stipulation XVIII and no further action will be necessary.
3. If Historic Properties are identified, and consistent with any confidentiality protocols provided by the Tribe(s) and/or described in Section 304, NHPA, all final reports resulting from the Historic Properties surveys stipulated above shall be submitted to SHPO.

B. National Register Evaluation

1. YOSE, in consultation with SHPO, shall follow the procedures in 36 CFR Section 800.4 (c) (1 through 3) to evaluate the historical significance of all properties that may be affected by an undertaking. If YOSE and SHPO do not agree on the National Register eligibility of any property, or if the Council so requests, YOSE shall obtain a formal determination of eligibility from the Keeper of the National Register pursuant to 36 CFR

Section 800.4 (c) (4). If SHPO does not respond within the review period described in Stipulation IX below, YOSE may assume SHPO concurrence with YOSE determinations.

2. As part of the 1980 GMP planning process, NPS evaluated and SHPO concurred in National Register eligibility determinations of certain properties in Yosemite. These determinations are itemized in the Case Report accompanying the 1979 MOA (summary list to be appended within six months). In addition, subsequent studies have evaluated properties under National Register criteria. These determinations will be reviewed, on a case by case basis by YOSE cultural resource staff or advisors, for new information or changed circumstances. Previous National Register determinations will be revisited by YOSE staff or cultural resources advisors if new information, such as recognition of new property types (e.g., cultural landscapes and traditional cultural properties) or change in historic context(s), is forthcoming or if SHPO so requests.
3. If traditional cultural properties are identified through the process outlined in Stipulation VII (A), YOSE shall seek the participation of all Indian Tribes (or other groups as appropriate) who ascribe traditional cultural values to those properties in applying the National Register criteria. Except as provided by any confidentiality protocols developed by Indian Tribes, and/or those described in Section 304, NHPA, YOSE shall ensure that documentation of determinations, including the SHPO's comments, are made available for inspection according to provisions stated in Stipulation VI.

C. Assessment of Effect

YOSE shall determine the effect of any undertaking subject to this Agreement using the Criteria of Effect and Adverse Effect (36 CFR Part 800). At its discretion, YOSE may consult with the signatories to this Agreement or with other Interested Persons regarding effect determinations for individual undertakings.

1. Repetitive, Low Impact Activities

Repetitive, low impact activities defined in Appendix B will be undertaken with no additional review by YOSE cultural resource staff. The project proponent shall maintain records of actions for inspection according to Stipulation XVII below.

2. Actions Having No Effect or No Adverse Effect

Activities determined by YOSE to have "No Effect" or "No Adverse Effect" to Historic Properties, as defined in 36 CFR Part 800, may be implemented and will be documented for purposes of this Agreement by YOSE without further review by the Council or SHPO, provided:

- a) that the undertaking is not subject to provisions of Stipulation VIII(B);
- b) that the applicable YOSE management office has submitted a proposed undertaking to the YOSE Section 106 Coordinator for review and concurrence 15 work days prior to the start of the undertaking;

- c) that the YOSE Section 106 Coordinator has reviewed the undertaking to ensure that identification and evaluation of Historic Properties in the area of potential effect has been completed according to Stipulation VII (A) and (B) above, and that adequate information has been compiled to identify and evaluate the effects of proposed undertakings on Historic Properties;
- d) that YOSE ensures that decisions regarding proposed undertakings are made and carried out in conformance with the standards and guidelines in Stipulation I above;
- e) that YOSE shall ensure that recovery of archeological data is based on the existing YOSE Archeological Research Design and Archeological Synthesis and Revised Research Design;
- f) that YOSE has consulted with the appropriate Indian Tribe(s) regarding possible effects to Native American archeological or traditional cultural properties;
- g) that YOSE has determined that the proposed action either does not affect or does not adversely affect Historic Properties based on the criteria of adverse effect found in 36 CFR Section 800.9; and
- h) Monitoring, when appropriate, shall be summarized in a brief letter report. If Historic Properties are discovered during implementation, a detailed monitoring report shall be prepared. Large-scale ground disturbing activities shall be monitored in accordance with a monitoring plan. The monitoring plan shall include, at minimum, the following elements:
 - i. a detailed summary of properties that may be exposed during construction activities, based on archival research;
 - ii. treatment strategies (i.e., documentation, data recovery excavations, protection, etc.) for anticipated property types;
 - iii. specific guidelines for any necessary work stoppages;
 - iv. the locations of Historic Properties to be avoided and the means by which they will be avoided;
 - v. specific areas and phases of construction which will be monitored;
 - vi. a schedule for submitting progress reports of monitoring activities to the SHPO;
 - vii. a process for dealing with types of properties not anticipated in the monitoring plan, including names of individuals or offices to be contacted in the event of discovery
 - viii. reporting requirements, to be followed upon project completion
 - ix. specific procedures to be followed in the event of discovery of human remains
 - x. Indian tribal monitoring procedures

VIII. RESOLUTION OF ADVERSE EFFECTS

YOSE shall make every reasonable effort to avoid adverse effects to Historic Properties identified according to Stipulation VII (A) through project design, facilities' location, or other means. Avoidance alternatives will be documented during the NEPA process.

When avoidance of a Historic Property is not feasible or prudent, and the undertaking does not involve properties or actions described in (B) below, YOSE, as part of its examination of treatment options, may decide to implement one or more Standard Mitigating Measures (SMM) described in (A) below. YOSE shall notify the following parties in writing of the decision to implement SMM:

- the SHPO
- Indian Tribe(s) (when American Indian properties are involved)
- members of the public who have made their interest in the undertaking known according to provisions outlined in Stipulation VI.

Consultation with the Council will not be undertaken when YOSE decides to implement SMM. If the SHPO, any Indian Tribe or any Interested Person does not object, within 14 calendar days of the notification, to YOSE's decision to treat the adverse effect according to the SMM, YOSE will proceed without further involvement of these parties. Should the SHPO, Indian Tribe, or Interested Person(s) object to the implementation of SMM as set forth above, YOSE shall make every effort to resolve the objection. If YOSE decides not to implement SMM, or YOSE and the objecting party are unable to resolve the objection, YOSE shall consult in accordance with (B) below, Required Consultation.

A. Standard Mitigating Measures

1. Recordation

- a) Individual, nationally significant Historic Properties will be documented according to the standards of the Historic American Buildings Survey or Historic American Engineering Record, as appropriate. The level of documentation for these Historic Properties shall be determined by the NPS. Copies of documentation will be deposited in the YOSE archives, SHPO, and Library of Congress.
- b) The following categories of structures, whether significant at the national, state, or local level, will be documented by black and white 5 x 7 photographic prints, and a Historic Record that includes narrative history and original drawings where available. Copies of documentation will be deposited in the YOSE archives and with SHPO:
 - Contributing elements in a historic district (unless individually eligible)
 - Individual elements of linear resources, such as ditches, roads, trails
 - Minor elements of a complex (e.g., sheds, garages)
 - Individual elements of cultural landscapes
 - Individual Historic Properties of state and local significance

2. Salvage

If a Historic Property will be demolished, YOSE historical architect, curator and/or preservation specialist will conduct a documented inspection to identify architectural elements and objects that may be reused in rehabilitating similar historic structures, or that may be added to the YOSE museum collection.

3. Interpretation

YOSE will ensure that the story of human interaction with nature and changes in that interaction is a central theme in the interpretation of the Yosemite story. This interpretation will include a history of alteration of the human environment and reasons for that change.

4. National Register Reevaluation

Within 120 working days after adverse alteration, relocation, or demolition of a Historic Property, YOSE shall consult with SHPO regarding the Property's continued eligibility for the National Register. The results of this consultation, with accompanying documentation, shall be forwarded to the Council and Keeper of the National Register. Should YOSE and SHPO disagree, YOSE shall seek a determination from the Keeper in accordance with 36 CFR Section 800.4 (C)(4).

B. Required Consultation

YOSE shall consult, according to 36 CFR Section 800.5(e) with the SHPO, Indian Tribe(s) (as appropriate) and Interested Persons as defined and identified under Stipulation VI (as appropriate), and shall invite the Council's participation regarding any action that:

1. may affect a National Historic Landmark
2. may affect a human burial
3. adversely affect a traditional cultural property
4. generates significant public controversy
5. involves a disagreement among YOSE, the SHPO, any Indian Tribe, or any Interested Persons regarding proposed use SMMS

IX . REVIEW PERIODS

- A. YOSE shall submit the results of all identification efforts, NRHP eligibility determinations, discovery plans, and treatment plans to SHPO, Indian Tribes, and Council (as necessary) for a 30 calendar day review and comment period, unless otherwise agreed to. Opportunity for review by Interested Persons is as identified in Stipulation VI. This period shall begin upon receipt of adequate documentation by the reviewing party. If any reviewing party does not respond to YOSE within 30 calendar days of receipt of adequate documentation, YOSE may assume that that party does not object to the findings and recommendations as detailed in the submission. If any party does not respond, does not object, or proposes changes that YOSE accepts, no further review by that party will be required and YOSE may proceed according to its findings and recommendations.

- B. Should any party object to findings or recommendations in any submittal within the time period specified in (A) above, YOSE shall consult with the objecting party to resolve the objection. If the objection is not resolved, YOSE shall consult according to Stipulation XIV, Dispute Resolution.

X. DISCOVERY

A. Native American Human Remains

1. YOSE shall ensure that any Native American burials or Native American human remains, funerary objects, sacred objects and objects of cultural patrimony discovered during implementation of an undertaking, archeological fieldwork, or other actions, are treated with appropriate respect and according to federal law, including, but not limited to, the Native American Graves Protection and Repatriation Act, Public Law 101-601 (NAGPRA) and its implementing regulations (43 CFR Part 10, Native American Graves Protection and Repatriation Act Regulations). Actions described herein do not constitute compliance with provisions of NAGPRA.
2. If objections are raised by any Indian Tribe regarding treatment of human remains or cultural items as defined under NAGPRA, the objection shall be resolved in accordance with NAGPRA. YOSE shall notify SHPO and Council of any such dispute if so requested by involved tribes.

B. Other Historic Properties

YOSE shall notify the SHPO and Indian Tribe(s), as appropriate, as soon as practicable if it appears that an undertaking will affect a previously unidentified property that may be eligible for inclusion in the National Register, or affect a known Historic Property in an unanticipated manner. YOSE shall stop all potentially harmful activities (if ongoing) in the vicinity of the discovery and shall take all reasonable steps to avoid or minimize harm to the property until YOSE concludes consultation. If the newly discovered property has not previously been included in or determined eligible for listing in the National Register, YOSE may assume that the property is eligible for purposes of this Agreement. YOSE shall notify the SHPO at the earliest possible time and consult with the SHPO to develop actions that will take the effects of the undertaking into account. YOSE will notify SHPO of any time constraints, and YOSE and SHPO will mutually agree upon time frames for this consultation. YOSE shall provide the SHPO (and Indian Tribe[s], as appropriate) with written recommendations that take the effects of the undertaking into account. If the SHPO does not object to YOSE's recommendations within the agreed upon time frame, YOSE will implement the recommendations. If SHPO or the Indian Tribe(s) object to the proposed treatment, and these objections cannot be resolved, YOSE shall follow procedures outlined in Stipulation XIV, Dispute Resolution.

XI. NATURAL DISASTERS

In the past YOSE has experienced major floods, fires, earthquakes, wind damage from storms, earth slides, and other natural disasters/emergencies which are likely to recur in the future. For a

period not exceeding 45 days after the conclusion of the emergency (plus any extension agreed upon by YOSE, SHPO and Council) YOSE will proceed as follows:

- A. YOSE will, without SHPO consultation, undertake emergency actions pursuant to the terms of this Agreement to stabilize Historic Properties and prevent further damage.
- B. YOSE cultural resource specialists shall work closely with the emergency operations team, participate in discussions regarding emergency response activities and monitor work that has the potential to affect Historic Properties.
- C. YOSE staff shall consult with the appropriate Indian Tribe(s) regarding emergency actions.
- D. All work having the potential to affect Historic Properties shall be documented.
- E. Every effort will be made to avoid known or discovered Historic Properties during emergency response activities. However, in those rare cases where this is impossible or could impede emergency responses, photographic and written documentation of affected Historic Properties shall be completed.
- F. All such emergency measures shall be undertaken in a manner that does not foreclose future preservation or rehabilitation, unless YOSE determines that integrity has been permanently lost.
- G. Within 90 days after the conclusion of the disaster or emergency period, YOSE shall submit to the SHPO, Council and the Federal Preservation Officer, NPS a report that documents how any effect of disaster or emergency response operations on Historic Properties were taken into account.

X I I . E M E R G E N C Y R E P A I R S

- A. In the event that damage to or failure of park infrastructure poses an immediate threat to life or health, YOSE will undertake emergency repairs with on-site monitoring by appropriate cultural resource specialists.
- B. Should Historic Properties be discovered during emergency repair activity, all work that could result in adverse effects shall cease provided the Superintendent or designated representative determines work cessation will not impede emergency repairs. If the work stoppage at the discovery site will impede emergency repairs, emergency repair will continue and YOSE officials shall immediately notify the SHPO by telephone and provide the following information:
 - 1. finding of a required emergency
 - 2. description of the emergency and steps necessary to address the situation
 - 3. description of the discovery and its apparent significance
 - 4. description of the emergency and potential effect on the discovery feature
 - 5. efforts to consider Historic Properties
- C. Repairs and emergency treatment of any discovered properties shall be documented by YOSE on a Preservation Assessment Form or its equivalent. This form, along with a

description of the emergency situation, signed by the requesting park official and the cultural resource specialist accomplishing the monitoring, shall be provided to the SHPO within 15 days of the emergency repair.

XIII. PERMITS

- A. Permits and other legal agreements including, but not limited to, special use permits, leases, concessions, contracts and easements (hereinafter “Permits”) for use of lands or structures in YOSE reflect a diversity of utilities and uses. All such Permits shall contain terms and conditions YOSE deems appropriate to protect and preserve Historic Properties.
- B. YOSE shall require that any undertaking proposed and implemented by a permittee/licensee, which may affect a Historic Property, shall meet the guidelines and standards set forth in Stipulation I above, and is reviewed by YOSE in accordance with Stipulation VII (c). Any permittee/licensee who proceeds with an undertaking without project review and approval, and who forecloses the obligation of YOSE to fulfill terms of this agreement, may be subject to appropriate sanctions in accordance with the terms of the permit/license.

XIV. DISPUTE RESOLUTION

- A. Should SHPO or Council object within 30 calendar days to any matter submitted by YOSE for review pursuant to this Agreement, YOSE shall consult with the objecting party to resolve the objection. If after 30 calendar days YOSE or the objecting party determines that the objection cannot be resolved, YOSE shall forward all documentation relevant to the dispute to the Council. Within 30 calendar days after receipt of all pertinent documentation, the Council will either:
 - 1. provide YOSE with recommendations, which YOSE shall take into account in reaching a final decision regarding the dispute; or
 - 2. notify YOSE that it will comment pursuant to 36 CFR Section 800.6(b), and proceed to comment. Any Council comment provided in response to such a request shall be taken into account by YOSE in accordance with 36 CFR Section 800.6(c)(2) with reference only to the subject of the dispute; YOSE’s responsibility to carry out all actions under this Agreement that are not the subjects of the dispute will remain unchanged.
- B. Should any Indian Tribe object to the manner in which the terms of this Agreement are implemented, YOSE shall take the objection into account and consult with the objecting party for 30 calendar days. If YOSE determines that the objection cannot be resolved, YOSE shall refer the objection to the Council according to Section A of this Stipulation.
- C. Should any Interested Persons or a member of the public object to the manner in which this Agreement is implemented, YOSE shall take the objection into account and consult with the objecting party for 30 calendar days. If YOSE determines that the objection cannot be resolved, YOSE shall refer the objection to the Council in accordance with Section A of this Stipulation.
- D. Should the subject of an objection pertain to the eligibility of a property for listing in the National Register, YOSE shall consult with the objecting party for a 30-day period. If the

objection is not resolved within those 30 calendar days, YOSE shall refer the matter to the Keeper of the National Register for a final determination.

XV . FUTURE AGREEMENTS

Programmatic agreements or memoranda of agreement may be negotiated by YOSE, SHPO, and the Council, as appropriate, and may supplement this Agreement.

XVI . AMENDMENTS

Any signatory may request that this Agreement be amended, whereupon the parties will consult in accordance with 36 CFR Section 800.13. Where the parties cannot agree on executing an amendment, the matter shall be addressed pursuant to Stipulation XIV, Dispute Resolution. Any amendment agreed upon will be executed in the same manner as the original Agreement.

XVII . FAILURE TO CARRY OUT AGREEMENT

In the event YOSE does not or cannot carry out the terms of this Agreement, YOSE shall comply with the NPS Nationwide Programmatic Agreement with regard to individual undertakings covered by this Agreement.

XVIII . REVIEW OF AGREEMENT

- A. On or before November 15 of each year for two years and biannually thereafter, so long as this Agreement is in effect, YOSE shall prepare and provide to the signatories and all parties invited to concur with this Agreement and the NPS Federal Preservation Officer a report describing how YOSE is carrying out its responsibilities under this Agreement. The report shall include, at a minimum, a list of “no effect and “no adverse effect” actions carried out in accordance with Stipulation VIII (B), above; efforts to identify and/or evaluate potential Historic Properties; monitoring efforts, and treatment of Historic Properties. YOSE shall ensure that this report is made available for public inspection pursuant to Stipulation VI, that potentially Interested Persons and members of the public are made aware of its availability, and that interested members of the public are invited to provide comments to the Council and SHPO as well as to YOSE. The SHPO, Council, and Indian Tribes may review the annual report and provide comments to YOSE. At the request of any party to this Agreement, YOSE shall supplement this process through meeting(s) to address comments and/or questions.
- B. The SHPO and the Council may monitor activities carried out pursuant to this Agreement, and the Council will review such activities if so requested. YOSE shall cooperate with the SHPO and the Council in carrying out their monitoring and review responsibilities.

XIX . TERMINATION

YOSE, SHPO, or Council may terminate this Agreement by providing 30 calendar days’ written notice to the other parties provided that the parties will consult during the period prior to termination to seek agreement on amendments or other actions that would avoid termination. In the event of termination, the NPS shall comply with 36 CFR Sections 800.4 through 800.6 for individual undertakings covered by this Agreement.

XX. EXPIRATION

This Programmatic Agreement shall be null and void fifteen (15) years from date of execution of this Agreement by the Council.

Execution and implementation of this Programmatic Agreement evidences that YOSE has satisfied its Section 106 responsibilities for all individual undertakings referenced in this Agreement.

Appendix A: Secretary Of Interior's Professional Qualification Standards

The following requirements are those used by the National Park Service, and have been previously published in the Code of Federal Regulations, 36 CFR Part 61. The qualifications define minimum education and experience required to perform identification, evaluation, registration, and treatment activities. In some cases, additional areas or levels of expertise may be needed, depending on the complexity of the task and the nature of the historic properties involved. In the following definitions, a year of full-time professional experience need not consist of a continuous year of full-time work but may be made up of discontinuous periods of full-time or part-time work adding up to the equivalent of a year of full-time experience.

HISTORY

The minimum professional qualifications in history are a graduate degree in history or closely related field; or a bachelor's degree in history or closely related field plus one of the following:

1. At least two years of full-time experience in research, writing, teaching, interpretation, or other demonstrable professional activity with an academic institution, historic organization or agency, museum, or other professional institution; or
2. Substantial contribution through research and publication to the body of scholarly knowledge in the field of history.

ARCHAEOLOGY

The minimum professional qualifications in archeology are a graduate degree in archeology, anthropology, or closely related field plus:

1. At least one year of full-time professional experience or equivalent specialized training in archeological research, administration or management;
2. At least four months of supervised field and analytic experience in general North American archeology; and
3. Demonstrated ability to carry research to completion.

In addition to these minimum qualifications, a professional in prehistoric archeology shall have at least one year of full-time professional experience at a supervisory level in the study of archeological resources of the prehistoric period. A professional in historic archeology shall have at least one year of full-time professional experience at the supervisory level in the study of archeological resources of the historic period.

ARCHITECTURAL HISTORY

The minimum professional qualifications in architectural history are a graduate degree in architectural history, art history, historic preservation, or closely related field, with coursework in American architectural history; or a bachelor's degree in architectural history, art history, historic preservation or closely related field plus one of the following:

1. At least two years of full-time experience in research, writing, or teaching in American architectural history or restoration architecture with an academic institution, historical organization or agency, museum, or other professional institution; or
2. Substantial contribution through research and publication to the body of scholarly knowledge in the field of American architectural history.

ARCHITECTURE

The minimum professional qualifications in architecture are a professional degree in architecture plus at least two years of full-time experience in architecture; or a State license to practice architecture.

HISTORIC ARCHITECTURE

The minimum professional qualifications in historic architecture are a professional degree in architecture or a State license to practice architecture, plus one of the following:

1. At least one year of graduate study in architectural preservation, American architectural history, preservation planning, or closely related field; or
2. At least one year of full-time professional experience on historic preservation projects.

Such graduate study or experience shall include detailed investigations of historic structures, preparation of historic structures research reports, and preparation of plans and specifications for preservation projects.

Appendix B: Repetitive Low Impact Activities

The following classes of undertakings are considered exempt from further review or consultation under the terms of this Agreement. NPS staff are not required to notify or consult with YOSE cultural resource staff about these classes of undertakings unless the project proponent has reason to believe that a specific exempt undertaking may affect historic properties. (NOTE: Items 1, 6, and 11 should be recorded in building files, and should include date, action taken, building location, type of paint used, etc.).

1. Maintenance (housekeeping, routine maintenance, and building monitoring) which includes:
 - a) Painting of historic structures (exterior and interior) to match existing color or based on paint analysis by a historical architect or exhibit specialist (structures);
 - b) Regrading of terrain adjacent to a building to achieve positive water runoff in areas not designated as archeologically sensitive;
 - c) Housekeeping, routine maintenance, building monitoring and other such actions (such as replacement of individual window panes, replacement of window putty, repair/replacement of light switches, and rewiring existing fixtures in existing conduit) that do not incur damage to historic fabric;
 - d) Roofing maintenance or replacement, when maintained or replaced in kind with original historic appearance and materials;

2. Routine grounds maintenance, such as grass cutting and treatment, maintenance of shrubs, and tree trimming;
3. Installation of environmental monitoring units, such as weather, water, air quality, and natural science monitoring units, provided that such installations are done in an unobtrusive manner and do not impact historic fabric or cultural landscapes;
4. Maintenance of existing roads or existing parking areas, including repaving and grading, within previously disturbed areas;
5. Maintenance of fire detection and suppression systems and security alarm systems, if done in an unobtrusive manner and without impacting historic fabric;
6. Rehabilitation, maintenance, or replacement of above-ground utility lines or transmission lines, unless it requires heavy equipment traffic with the potential for ground disturbance;
7. Health and safety activities such as non-destructive testing for radon gas, asbestos, lead-based paint, lead pipes, and hazardous materials and wastes;
8. Mitigation or abatement of hazardous materials, under the direction of the park exhibit specialist, including the following:
 - a) Removal of damaged asbestos floor tile and replacement with appropriate historic or non-historic floor treatment;
 - b) Carpeting over damaged asbestos floor tiles which do not contribute to the historic significance of a structure;
 - c) Encapsulation of lead-based paint in window trim and molding where there is no change to color or appearance;
9. Maintenance operations for non-contributing buildings in a historic district, except excavations and borings in archeologically sensitive areas;
10. Conducting non-ground disturbing elements of an Integrated Pest Management (IPM) program for removal of pests such as termites, insects and rodents.
11. Fire hazard reduction activities that do not involve ground or surface disturbance and that do not have the potential to affect access to or use of resources by Native Americans;
12. Routine trail maintenance limited to brushing and light maintenance of existing trail tread with hand tools;
13. Felling of hazardous trees along trails, roadways, utility corridors, or within recreation areas, provided they are not designed elements of historic landscapes and provided that they are left in place and do not generate risk of indirect effects on historic properties from intense burning,
14. Removal of hazard trees from road prisms, so long as ground disturbance is not allowed off previously disturbed areas associated with road prisms;

15. Maintenance of existing facilities that does not involve new or additional ground disturbance (e.g., maintenance or replacement of cattle guards, gates, fences, guard rails, barriers, traffic control devices, light fixtures, curbs, sidewalks, etc.);
16. Maintenance (that does not add to nor change the configuration of the existing facilities) of existing electronic communication sites involving no ground disturbance.
17. Repair/removal of bridges when integrity has been lost.

Plan

Supplemental EIS

APPENDIX E – ADVERSE EFFECTS AND STANDARD MITIGATION MEASURES FOR HISTORIC PROPERTIES

This table depicts actions adversely affecting historic sites, structures, and landscape elements, and the standard mitigating measures (as described in the Yosemite Programmatic Agreement, Appendix D) that the National Park Service proposes to use. Actions that do not adversely affect these historic properties are not listed here.

Alternative One		
Description of Action	Adverse Effect	Standard Mitigation Measure(s)*
Superintendent’s House (Residence 1)		
Superintendent’s House (Residence 1) managed through benign neglect	Eventual loss of Superintendent’s House (Residence 1) and garage; individually significant as well as contributing elements to the Yosemite Village Historic District	Salvage (recordation complete)
Orchards		
Lamon Orchard managed through benign neglect; salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Lamon Orchard; a contributing element in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage cuttings, interpretation
Curry Orchard managed through benign neglect; salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Curry Orchard; a contributing element in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage cuttings, interpretation
Hutchings Orchard managed through benign neglect; salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Hutchings Orchard; a contributing element in Yosemite Village Historic District	Recordation, salvage cuttings, interpretation

Alternative Two		
Description of Action	Adverse Effect	Standard Mitigation Measure(s)
Camp 4 (Sunnyside Campground)		
Relocate five sites; relocate parking	Loss of contributing elements to Sunnyside Campground Historic Site	Recordation
Yosemite Falls Area		
Realign and rehabilitate trails; rehabilitate, reconstruct, or remove bridges	Loss, rehabilitation, or reconstruction of up to seven footbridges and alteration of trail segments; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation
Yosemite Village		
Relocate Superintendent’s House (Residence 1) and garage	Potential loss of National Register eligibility status of Superintendent’s House (Residence 1) and garage; individually significant as well as contributing structures in Yosemite Village Historic District	Interpretation (recordation complete)
<small>*Note: This table depicts only standard mitigating measures as stipulated in the Yosemite Programmatic Agreement. Other mitigating measures, such as relocating historic structures, are described in the text of the document and are not represented here. Other actions, such as rehabilitating and adaptively reusing historic structures, do not result in adverse effects and therefore are not represented here.</small>		

Alternative Two		
Description of Action	Adverse Effect	Standard Mitigation Measure(s)
Remove some existing facilities (if unfeasible to reuse) and redesign National Park Service (NPS) Maintenance area to accommodate some NPS district operations, Pacific Bell, shuttle maintenance, and overnight parking	Possible loss of up to 14 structures: NPS warehouse, Camp 1 structures, NPS Operations Building (Fort Yosemite), NPS maintenance shop buildings and garages; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage
Remove Concessioner Headquarters Building, Yosemite Village Garage, apartment, and shop buildings, and Hospital Row apartments.	Loss of up to eight structures including the Concessioner Headquarters, Village Garage complex and the road west of garage, and the Hospital Row apartments, contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, interpretation, salvage
The Ahwahnee		
Remove Ahwahnee tennis courts and restore portion of Ahwahnee Meadow	Loss of contributing element (tennis courts) at The Ahwahnee historic property	Recordation, interpretation
Concessioner Stable		
Remove concessioner stable, and associated structures; relocate some structures to McCauley Ranch, if feasible	Loss of 16 structures: stable buildings, housing, and associated facilities; contributing elements in Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
Curry Village		
Remove 253 visitor tent cabins; construct new cabins with bathrooms	Loss of the majority of tent cabins and introduction of nonhistoric facilities in Camp Curry Historic District	Recordation, salvage, interpretation, National Register re-evaluation
Remove parking and historic fruit trees from Curry Orchard; remove the majority of comfort stations	Loss of Curry Orchard parking and Curry Orchard; loss of comfort stations; contributing elements in Yosemite Valley Cultural Landscape Historic District	Recordation, interpretation
Ecological Restoration, Including Bridge Removal		
Restore Valley meadows, and riparian corridor within Merced River Protection Overlay at former campsites (Upper and Lower River Campgrounds), picnic area, and river corridor at Yosemite Lodge	Loss of the road bisecting Camps 7 and 15; loss of meadow ditches and river control structures such as wing dams, check dams, etc.; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, interpretation
Remove Sugar Pine Bridge and, if necessary, Stoneman Bridge, and the raised causeway between Ahwahnee and Sugar Pine Bridges	Loss of Sugar Pine, and possibly, Stoneman Bridges (individually significant historic structures)	Salvage, interpretation, National Register re-evaluation (recordation complete)
Remove Happy Isles footbridge	Loss of Happy Isles footbridge (also known as the Old Happy Isles Bridge); a contributing element of the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
Circulation Changes		
Convert Southside Drive to two-way traffic (involves widening and minor realignment) between El Capitan Bridge and Curry Village	Modification of Southside Drive; a contributing circulation structure in the Yosemite Valley Cultural Landscape Historic District	Recordation
Orchards		
Manage and maintain (but no replanting) Lamon Orchard; salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Lamon Orchard; a contributing element in Yosemite Valley Cultural Landscape Historic District	Recordation, salvage of cuttings, interpretation

Alternative Two		
Description of Action	Adverse Effect	Standard Mitigation Measure(s)
Remove Curry Orchard; salvage cuttings and establish representative plants at appropriate facility outside of the park	Loss of Curry Orchard; a contributing element in Yosemite Valley Cultural Landscape Historic District	Recordation, salvage of cuttings, interpretation
Neither manage nor maintain Hutchings Orchard; salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Hutchings Orchard; a contributing element in Yosemite Village Historic District	Recordation, salvage of cuttings, interpretation
Cascades Area		
Remove Cascades Diversion Dam, Screenhouse, and four Cascades residences	Loss of six structures; contributing elements in the Yosemite Hydroelectric Power Plant Historic Property	Recordation, salvage, National Register property re-evaluation

Alternative Three		
Description of Action	Adverse Effect	Standard Mitigation Measure(s)
Camp 4 (Sunnyside Campground)		
Relocate five sites; relocate parking; add 32 sites adjacent to Camp 4 (Sunnyside Campground)	Loss of contributing elements to Sunnyside Campground Historic Site; construction of nonhistoric features adjacent to historic site	Recordation, interpretation
Yosemite Falls Area		
Realign and rehabilitate trails; rehabilitate, reconstruct, or remove bridges; relocate Clark Bench and Muir plaque	Relocation, rehabilitation, or loss of eight footbridges, alteration of trail segments, and relocation of small-scale features (bench and plaque); contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
Yosemite Village		
Remove Superintendent's House (Residence 1) and garage	Loss of Superintendent's House (Residence 1) and garage; individually significant as well as contributing elements in the Yosemite Village Historic District	Salvage (recordation complete)
Remove existing structures and redesign National Park Service (NPS) Maintenance area to accommodate some NPS district operations	Loss of up to 14 contributing structures: former NPS warehouse, Camp 1 structures, NPS Operations Building (Fort Yosemite), maintenance shop and garage buildings; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage
Construct new fire station in Yosemite Village Historic District housing area	Introduction of nonhistoric facility in Yosemite Village Historic District	Recordation
Remove Concessioner Headquarters Building; remove Ahwahnee Row housing, Y Apartments, Village Garage, associated apartment and shop buildings	Loss of 24 structures: Concessioner Headquarters; Village Garage; garage apartment and utility buildings; Ahwahnee Row houses, cottages and converted cabins, laundry room and garages; and Y Apartments; contributing elements in the Yosemite Valley Cultural Landscape District	Recordation, salvage, interpretation
The Ahwahnee		
Remove Ahwahnee tennis courts and restore portion of Ahwahnee Meadow	Loss of tennis courts; a contributing element in The Ahwahnee historic property	Recordation, interpretation

Alternative Three		
Description of Action	Adverse Effect	Standard Mitigation Measure(s)
Concessioner Stable		
Remove concessioner stable and associated structures	Loss of 16 structures: concessioner stable buildings, housing, and associated structures; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
Curry Village		
Remove 277 visitor tent cabins; remove Tresidder Residence, Cabin 90A/B, and Huff House; construct new cabins with bathrooms	Loss of the majority of tent cabins, Tresidder Residence, Huff House, and Cabin 90A/B; introduction of nonhistoric facilities in Camp Curry Historic District	Recordation, salvage, interpretation, National Register re-evaluation
Remove parking and fruit trees from Curry Orchard, and remove the majority of comfort stations	Loss of Curry Orchard and Curry Orchard parking, loss of comfort stations; contributing elements in Yosemite Valley Cultural Landscape Historic District	Recordation, interpretation
Ecological Restoration, Including Bridge And Orchard Removal		
Restore Valley meadows, and riparian corridor within Merced River Protection Overlay at former Upper and Lower River Campgrounds, picnic area, and river corridor at Yosemite Lodge	Loss of the road bisecting Camps 7 and 15; loss of meadow ditches and river control structures such as wing dams, check dams, etc.; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, interpretation
Remove Stoneman and Sugar Pine Bridges	Loss of Stoneman and Sugar Pine Bridges; individually significant historic structures	Salvage, interpretation, National Register re-evaluation (recordation complete)
Remove Housekeeping and Superintendent's Bridges	Loss of Housekeeping and Superintendent's Bridges; both contributing structures in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
Remove fruit trees from Hutchings Orchard	Loss of Hutchings Orchard; a contributing element in Yosemite Village Historic District	Recordation, salvage of cuttings, interpretation
Remove fruit trees from Lamon Orchard	Loss of Lamon Orchard; a contributing element in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage of cuttings, interpretation
Circulation Changes		
Realign and widen portions of Southside Drive	Modification of Southside Drive; a contributing circulation structure in the Yosemite Valley Cultural Landscape Historic District	Recordation
Merced River Gorge		
Remove Cascades Diversion Dam, Screenhouse, and four Cascades residences	Loss of six structures; contributing elements in the Yosemite Hydroelectric Power Plant historic property	Recordation, salvage, National Register re-evaluation

Alternative Four

Description of Action	Adverse Effect	Standard Mitigation Measure(s)
Camp 4 (Sunnyside Campground)		
Remove five sites	Loss of contributing elements of Sunnyside Campground Historic Site	Recordation, interpretation, National Register re-evaluation
Yosemite Falls Area		
Realign and rehabilitate trails; rehabilitate, reconstruct, or remove bridges; relocate Clark Bench and Muir plaque	Loss, relocation or rehabilitation of seven footbridges; relocation of Clark Bench and Muir plaque, and modification of some trail segments; contributing elements (structures and small-scale features) in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage
Yosemite Village		
Remove Superintendent's House (Residence 1) and garage	Loss of Superintendent's House (Residence 1) and garage; individually significant as well as contributing elements in the Yosemite Village Historic District	Interpretation, (recordation complete)
Remove existing facilities and redesign National Park Service (NPS) Maintenance area to accommodate some NPS district operations	Loss of up to 13 contributing structures: former NPS warehouse, Camp 1 structures, maintenance shops, and garage buildings; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage
Construct new fire station in Yosemite Village Historic District housing area	Introduction of nonhistoric facility in Yosemite Village Historic District	Recordation
Remove Concessioner Headquarters Building; remove Ahwahnee Row housing; Y Apartments; Village Garage, associated shop buildings, and apartment	Loss of 24 structures: Concessioner Headquarters Building; Village Garage, garage apartment and shops, Ahwahnee Row houses, cottages and converted cabins, laundry room and garages; and Y Apartments; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
The Ahwahnee		
Remove Ahwahnee tennis courts and restore portion of Ahwahnee Meadow	Loss of tennis courts; contributing element in The Ahwahnee historic property	Recordation, interpretation
Concessioner Stable		
Remove Concessioner Stable and associated buildings	Loss of 16 structures; concessioner stable buildings, housing, and associated structures; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
Curry Village		
Remove 277 tent cabins; remove Tresidder Residence, Huff House, and Cabin 90A/B; construction of new cabins with bathrooms	Loss of the majority of tent cabins; loss of Tresidder Residence, Huff House, and Cabin 90A/B; introduction of nonhistoric facilities in Camp Curry Historic District	Recordation, salvage, interpretation, National Register re-evaluation
Remove parking from Curry Orchard and remove the majority of comfort stations	Loss of Curry Orchard Parking, loss of comfort stations; contributing elements in Yosemite Valley Cultural Landscape Historic District	Recordation, interpretation

Alternative Four		
Description of Action	Adverse Effect	Standard Mitigation Measure(s)
Ecological Restoration, Including Bridge Removal		
Restore Valley meadows, and riparian corridor within Merced River Protection Overlay; restore riparian and upland vegetation at former Upper and Lower River Campgrounds and river corridor at Yosemite Lodge	Loss of the road bisecting Camps 7 and 15; loss of meadow ditches and river control structures such as wing dams, check dams, etc.; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, interpretation
Remove Stoneman and Sugar Pine Bridges	Loss of Stoneman and Sugar Pine Bridges; individually significant historic structures	Salvage, interpretation, National Register re-evaluation (Recordation complete)
Remove Housekeeping and Superintendent's Bridges	Loss of Housekeeping and Superintendent's Bridges; contributing structures in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
Circulation Changes		
Widen and convert Southside Drive to two-way traffic from El Capitan Bridge to Curry Village	Modification of Southside Drive; a contributing circulation structure in the Yosemite Valley Cultural Landscape Historic District	Recordation
Orchards		
Manage Lamon Orchard through benign neglect; salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Lamon Orchard; a contributing element in Yosemite Valley Cultural Landscape Historic District	Recordation, salvage of cuttings, interpretation, National Register re-evaluation
Manage Curry Orchard through benign neglect; salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Curry Orchard; a contributing element in Yosemite Valley Cultural Landscape Historic District	Recordation, salvage of cuttings, interpretation
Manage Hutchings Orchard through benign neglect; salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Hutchings Orchard; a contributing element in Yosemite Village Historic District	Recordation, salvage of cuttings, interpretation
Merced River Gorge		
Remove Cascades Diversion Dam, Screenhouse, and four Cascades residences	Loss of six structures; contributing elements in the Yosemite Hydroelectric Power Plant historic property	Recordation, salvage, National Register District re-evaluation

Alternative Five		
Description of Action	Adverse Effect	Standard Mitigation Measure(s)
Camp 4 (Sunnyside Campground)		
Relocate five campsites; construct employee housing adjacent to Camp 4.	Loss of contributing elements and introduction of major noncontributing structures at Sunnyside Campground Historic Site	Recordation, interpretation, National Register re-evaluation
Yosemite Falls Area		
Realign and rehabilitate trails; rehabilitate, relocate, or remove bridges	Loss of three footbridges, rehabilitation of up to four footbridges, and modification of some trail segments; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage
Yosemite Village		
Remove Superintendent's House (Residence 1) and garage	Loss of Superintendent's House (Residence 1) and garage; individually significant as well as contributing elements in the Yosemite Village Historic District	Salvage (recordation complete)

Alternative Five

Description of Action	Adverse Effect	Standard Mitigation Measure(s)
Remove existing facilities and redesign National Park Service (NPS) Maintenance area to accommodate NPS district operations, Pacific Bell, shuttle maintenance and overnight parking	Loss of up to 14 contributing structures (including former NPS warehouse, Camp 1 structures, NPS Operations Building [Fort Yosemite], maintenance shop buildings; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage
Remove Concessioner Headquarters Building; remove Ahwahnee Row houses, Y Apartments, Hospital Row apartments, Village Garage, associated shops, and apartment	Loss of 26 structures: Concessioner Headquarters Building, Village Garage, garage apartment and shop buildings, Ahwahnee Row houses, cottages and converted cabins, laundry room and garages, Hospital Row apartments, and Y Apartments; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
The Ahwahnee		
Remove Ahwahnee tennis courts and restore portion of Ahwahnee Meadow	Loss of tennis courts; contributing element in The Ahwahnee historic property	Recordation, interpretation
Concessioner Stable		
Remove concessioner stable and associated facilities	Loss of concessioner stable buildings, houses, and associated facilities; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, salvage, interpretation
Curry Village		
Remove 277 visitor tent cabins; remove Tresidder Residence, Huff House, and Cabin 90A/B; construct new cabins with bathrooms	Loss of the majority of tent cabins, Tresidder Residence, Huff House, and Cabin 90A/B; introduction of nonhistoric facilities in Camp Curry Historic District	Recordation, salvage, interpretation, National Register re-evaluation
Remove parking and orchard trees from Curry Orchard, and remove the majority of comfort stations	Loss of Curry Orchard Parking; loss of Curry Orchard; loss of comfort stations; contributing elements in Yosemite Valley Cultural Landscape Historic District	Recordation, salvage of cuttings, interpretation
Orchards		
Manage and maintain Lamon Orchard (but no replanting); salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Lamon Orchard; a contributing element in Yosemite Valley Cultural Landscape Historic District	Recordation, salvage of cuttings, interpretation
Neither manage nor maintain Hutchings Orchard; salvage cuttings and establish representative plants at appropriate facility outside of the park	Eventual loss of Hutchings Orchard; a contributing element in Yosemite Village Historic District	Recordation, salvage of cuttings, interpretation
Remove Curry Orchard	Loss of Curry Orchard; a contributing element in Yosemite Valley Cultural Landscape Historic District	Recordation, salvage of cuttings, interpretation
Ecological Restoration, Including Bridge Removal		
Restore Valley meadows, and riparian corridor within Merced River Protection Overlay at former campsites, picnic area, and river corridor at Yosemite Lodge	Loss of the road bisecting Camps 7 and 15; loss of meadow ditches and river control structures such as wing dams, check dams, etc.; contributing elements in the Yosemite Valley Cultural Landscape Historic District	Recordation, interpretation
Remove Ahwahnee and Sugar Pine Bridges	Loss of Ahwahnee and Sugar Pine Bridges; individually significant historic structures	Salvage, interpretation, National Register re-evaluation (recordation complete)

APPENDIX F – VEGETATION RESTORATION OBJECTIVES FOR SELECTED AREAS IN YOSEMITE VALLEY

Appendix F presents four separate tables that outline the anticipated vegetation composition to which general areas would be restored as proposed in Alternatives 2, 3, 4, and 5. Upland vegetation, as well as the highly valued resources of California black oak, riparian, and meadow vegetation types would all be affected by proposed restoration actions. General areas of Yosemite Valley are grouped together to facilitate comparisons among the alternatives. Alternative 1 represents existing conditions and is not presented in these tables. It should be noted that acreage totals for each general area were rounded to the nearest 1 acre unless the area size was less than an acre. In that case, it is denoted as “trace”. Totals for each vegetation type may differ slightly from those presented in Vol. IA, Chapter 2, Alternatives, due to rounding. Acres of restored wetland are represented by riparian and meadow acreages in the table below.

Alternative 2					
Area	Acres Restored				Total
	Upland	Black Oak	Riparian	Meadow	
The Ahwahnee (tennis courts, utility area)	2	1	–	–	3
Campgrounds (Upper and Lower River, Lower and North Pines, Backpackers, Group, Yellow Pine, Camp 4 [Sunnyside Campground], dump station)	4	10	63	24	101
Curry Village (portion of Curry Orchard, rockfall zone)	6	2	2	trace	10
Housekeeping Camp (River Protection Overlay)	1	3	9	–	13
Lower Yosemite Fall (human-built rock rubble pile)	–	–	trace	–	trace
Yosemite Lodge (former cabin area)	2	2	16	20	40
Yosemite Valley – General (Swinging Bridge and Church Bowl Picnic Areas, Camp 6 (River Protection Overlay), Superintendent’s House (Residence 1))	trace	1	6	trace	8

Alternative 3					
Area	Acres Restored				Total
	Upland	Black Oak	Riparian	Meadow	
The Ahwahnee (tennis courts, utility area)	2	1	-	-	3
Campgrounds (Upper and Lower River, Lower and North Pines, Backpackers, Group, Yellow Pine, Camp 4 [Sunnyside Campground], dump station)	4	13	61	25	103
Curry Village (Curry Orchard, rockfall zone)	9	3	4	1	17
Housekeeping Camp (River Protection Overlay, highly valued resources)	2	4	12	-	18
Lower Yosemite Fall (human-built rock rubble pile, Hutching's Orchard)	-	2	trace	-	2
Yosemite Lodge (former cabin area)	2	2	16	20	40
Yosemite Valley – General (Swinging Bridge and Church Bowl Picnic Areas, Camp 6, Superintendent's House (Residence 1), Lamon Orchard, kennel, former gas station)	Trace	6	8	8	22

Alternative 4					
Area	Acres Restored				Total
	Upland	Black Oak	Riparian	Meadow	
The Ahwahnee (tennis courts, utility area)	2	1	-	-	3
Campgrounds (Upper and Lower River, Lower and North Pines, Backpackers, Group, Yellow Pine, Camp 4 [Sunnyside Campground], dump station)	3	13	58	25	99
Curry Village (rockfall zone)	9	-	3	-	12
Housekeeping Camp (River Protection Overlay, highly valued resources)	2	4	12	-	18
Lower Yosemite Fall (human-built rock rubble pile)	-	-	trace	-	trace
Yosemite Lodge (former cabin area)	2	2	16	20	40
Yosemite Valley – General (Swinging Bridge and Church Bowl Picnic Areas, Camp 6, Superintendent's House (Residence 1), kennel, former gas station)	trace	5	7	6	18

Supplemental EIS

APPENDIX G – TRANSPORTATION ASSUMPTIONS

Visitation

VISITOR USE LEVELS

The following data sources were used in the estimation of existing visitor-use levels and use patterns in Yosemite Valley:

- Permanent traffic counters on Southside Drive at the Yosemite Chapel and Northside Drive west of Camp 4 (Sunnyside Campground). These counters provide hourly and daily traffic counts and monthly summaries on a continuous basis.
- Vehicle and visitor counts at Yosemite National Park gates reported in monthly statistical summaries.
- Traffic turning movement counts conducted at several locations in the Valley in 1999 as part of the *Draft Yosemite Valley Plan/SEIS*.
- Counts of Valley shuttle buses, Valley Floor Tour and in-park tour passengers provided by Yosemite Concession Services Corporation for 1998 and previous years.
- Parking occupancy and turnover studies conducted in the Valley in 1992.
- Exit surveys of visitors conducted in 1993 and in 1998.
- Visitor use and satisfaction surveys conducted at Yosemite Falls and at the Mist Trail in 1998.
- Lodging room availability, occupancy, length of stay, and party size data for each month in 1998 provided by Yosemite Concession Services Corporation.
- Yosemite Valley campground unit availability, occupancy, length of stay, and party-size data provided by Yosemite National Park for 1998.
- Employee housing data for 1998 provided by Yosemite Concession Services Corporation and Yosemite National Park.
- Estimates of jobs in the Valley provided by Yosemite Concession Services Corporation and Yosemite National Park.
- Data on employee vehicle registration from Yosemite Concession Services Corporation and Yosemite National Park.
- Field measurements of existing parking areas by Yosemite National Park staff.

SELECTION OF DESIGN DAY AND DESIGN HOURS

The requirements for in-Valley shuttle bus service and bus bays for out-of-Valley shuttle buses, tour buses, and other transit buses were based on the level of visitor use occurring on a typical busy weekend day in the summer. Traffic counts in 1998 from the permanent count stations on Southside Drive and Northside Drive were analyzed to determine levels of activity on weekends

and weekdays during the summer. The days with the highest traffic volume were identified and sorted in descending order to identify a basis for selecting the design day. Based on the relative volumes of the highest traffic days and using the professional judgement of the transportation planning team, the fourth highest day (July 25) in 1998 was selected as the design day. The total vehicle volume entering the Valley on the design day was 7,200.

The hourly traffic volumes entering the Valley and exiting the Valley were examined for the design day to select design hours for transportation analysis. The peak inbound hour occurred between 11:00 A.M. and 12:00 noon, when 772 vehicles entered Yosemite Valley. The peak outbound hour occurred between 5:00 P.M. and 6:00 P.M., when 908 vehicles left Yosemite Valley.

VISITOR USE AND OTHER ACTIVITY FOR THE DESIGN DAY

Visitor use for the design day was estimated from the volume of traffic entering the Valley on that day. Vehicles entering the Valley at the Yosemite Chapel counter and exiting at the Camp 4 (Sunnyside Campground) counter carry a combination of day visitors, newly-arriving (and departing) overnight visitors, overnight visitors returning from (or leaving for) day trips, commercial tour buses carrying both day and overnight visitors, employees commuting to (and from) work in the Valley from residential areas in El Portal and other locations, administrative trips, and vehicles recirculating within the valley to and from the El Capitan crossover. Available data and assumptions were used to develop a model to allocate the daily and hourly vehicle trips detected by the counters by type of trip for entering and exiting traffic. This model provided baseline data for Alternative 1, the No Action Alternative, and estimates of future visitation for each action alternative. The following paragraphs document the process used to estimate visitor demand.

OVERNIGHT VISITATION

The number of overnight visitors staying in the Valley on the design day was determined from the number of lodging units available, the average party size in the lodging quarters, the number of individual and group campsites available, and the average party size in the individual and group campsites. Because the demand for overnight accommodations in Yosemite Valley exceeds the available supply, it was assumed that the number of overnight visitors equaled the capacity of overnight units throughout the peak visitation season.

The estimated overnight use of the Valley in 1998 included 4,213 lodging guests, including visitors at Housekeeping Camp, 2,170 campers in Valley sites, and 348 wilderness backpackers that started trips from the Valley. The overnight users are estimated to stay an average of 2.99 nights at campsites and 1.98 nights at lodging units. It is estimated that 13.5% of the overnight guests in lodging units travel to the Valley in tour buses. The occupancy of vehicles serving overnight lodging guests is assumed to be equal to the average party size for lodging guests. Campers are assumed to travel in groups of 2.9 people per vehicle. These factors result in a vehicle trip demand of 435 trips per day for newly arriving lodge guests, 372 trips per day for campers, and 40 trips per day for wilderness backpackers. In addition, lodging guests and campers are estimated to make 1,032 vehicle trips out of the Valley to visit other areas in the park.

COMMUTERS AND ADMINISTRATIVE TRAFFIC

There were an estimated 377 employees that commuted to and from the Valley on the design day. A survey of employee travel behavior indicated that 72% of employees drive alone, 21% carpool and 7% travel by bus or vanpool. The resulting commute vehicle trip volume is 310 per day. An additional 67 vehicle trips are estimated to occur for other administrative purposes. The alternatives call for relocating employee housing from Yosemite Valley to El Portal and other locations. The analysis of Alternatives 2, 3, 4, and 5 assumes that an employee transportation system would be developed to transport employees from employee housing to the Valley. The impact analysis assumes that the future number of commuter vehicle trips to the Valley would remain the same as or be lower than 1998.

COMMERCIAL TOUR BUSES AND OTHER TRANSIT SERVICES

Commercial tour bus entries and passengers are recorded at the entrance stations and reported on a monthly basis. All tour buses are assumed to travel to Yosemite Valley. On the design day, an estimated 77 tour buses entered the Valley. These buses carried a mix of day and overnight visitors. The analysis of action alternatives assumes that commercial tour buses would continue to serve about 13.5% of overnight visitors in lodge units and 13.5% of day visitors.

INTERNAL CIRCULATION

Traffic counts taken at the El Capitan crossover indicate that about 10% of the traffic that enters the east end of the Valley near the Yosemite Chapel is coming from Northside Drive via the El Capitan Bridge. Alternatives that retain the existing traffic pattern assume that there would be a similar volume of recirculating traffic. Many other vehicle trips are currently made between locations within the Valley. An example is a trip from a campsite to the Yosemite Village Store for groceries. Depending on the alternative, these vehicle trips would continue to be made or they would be replaced by trips on Valley shuttle buses.

DAY VISITORS

The number of vehicle trips by day visitors to the Valley was estimated by subtracting estimates of the number of vehicle trips associated with every other type of travel from the total vehicle volume. In other words, the vehicle volume for day visitors on the design day was the number of vehicles remaining from the 7,200 total vehicles after subtracting the estimated vehicle volumes for overnight visitor turnover, day trips by overnight visitors, commuters and other administrative trips, commercial buses, and recirculating vehicles. The number of day visitors was then calculated using an average vehicle occupancy of 2.9 for private vehicles and adding the estimated number of day visitors arriving via tour bus (13.5% of all day visitors). The estimated number of day visitors using this method was 13,950 on the design day. This estimate was compared to independent estimates of the number of day visitors to the Valley generated from exit surveys. The estimates were found to be similar within acceptable limits.

DIURNAL VISITATION PATTERNS

The hourly distribution of visitor arrival and departure times was based on the observed volume of vehicles at the Yosemite Chapel and Camp 4 (Sunnyside Campground) permanent count stations and assumptions regarding the proportion of vehicle trips of each type that occurred in the design hours.

DAY-OF-WEEK VISITATION PATTERNS

The relationship between conditions on the design day and other days of the week was determined by analyzing traffic counts for each day of the week and for the overall average day during the peak visitation season. It was assumed that overnight accommodations continue to be fully occupied on all days in the peak visitation season (July and August). As a result, the difference between the seasonal average traffic volumes and the design day volumes was assumed to be caused by lower day visitation on nonpeak days. The average day visitation in the peak season was estimated to be 10,950 people per day, compared to 13,950 for the design day. Estimates of total annual visitation to the Valley were based on the average daily visitation and seasonal visitation variations described in the next section.

SEASONAL VISITOR USE

Traffic entering and exiting the Valley is counted continuously and the counts are recorded and analyzed to determine seasonal patterns and annual averages. To develop estimates of visitor demand by month and for the year, the average daily traffic counts for each month were compared to the counts for the design day. The ratio of the monthly count to the design day count was used to estimate visitation for months other than the peak season. It was assumed that overnight and day visitation vary proportionally over the year.

DISTRIBUTION OF VISITOR USE IN VALLEY

Overnight Visitors

Overnight visitors were assumed to be distributed among locations throughout the Valley based on the number of campsites and lodging units in each developed area. In the action alternatives, overnight visitors were assumed to travel to destinations within the Valley from their overnight accommodations using shuttle buses, bikes, or walking paths. Surveys of visitor travel to the major features of Yosemite Falls and Vernal Fall trail in 1998 were used as a starting point for estimates of overnight visitor travel in the Valley. These estimates were used to determine the demand for in-Valley shuttle bus service.

Day Visitors

Day visitors were assumed to travel in private vehicles to the parking areas defined in each alternative, or to parking locations outside the Valley. Other visitors were assumed to use commercial tour buses and other forms of public transportation to reach Yosemite Valley. Each alternative includes a bus transfer facility or transit hub where day visitors arriving in buses from parking areas outside the Valley would gain access to walking trails, bike trails, and shuttle buses operating within the Valley. Depending on the location of the parking and bus transfer facilities,

varying proportions of the visitors were assumed to use shuttle buses to reach features and activity areas. Alternatives with transit facilities in Yosemite Village were assumed to offer more opportunities for walking and biking and less need for shuttle bus service than alternatives with transit facilities in the west Valley.

TRANSPORTATION FACILITIES, SERVICES, AND VOLUME

Transportation facilities and services incorporated in the plan alternatives were sized to meet anticipated demand by all relevant user groups. Transportation demand for the plan alternatives was estimated by determining the number of vehicle trips that would be made by visitors and other travelers to the Valley if they were not constrained by the capacity of facilities provided in the plan. It was assumed that the proportion of visitors and employee commuters (the two largest components of travel demand to the Valley) using private vehicles and buses to travel to the vicinity of the park would remain the same as in 1998. It also was assumed that the average number of people traveling in private vehicles would remain the same as in 1998. Depending on the alternative, varying numbers of the vehicle trips would be intercepted at locations outside the Valley. The travelers would then be transported by bus to their destinations in the Valley.

PARKING DEMAND AND SUPPLY

The demand for parking in Yosemite Valley fluctuates with the flow of day visitors into the Valley throughout the day, the arrival and departure of commuting employees, and the arrival and departure patterns of overnight visitors. The net change in the accumulation of vehicles in the east Valley is estimated over time by comparing the hourly counts of inbound and outbound vehicles. The total vehicle occupancy of the Valley at any time is determined by adding to the net change a baseline number that reflects the number of resident vehicles, park and concession vehicles, and the minimum estimated number of overnight visitor vehicles that are in the Valley at the time of lowest total occupancy.

The lowest occupancy of vehicles in the east Valley occurs near midnight on weeknights. Some lodging units and campsites may be unoccupied on these nights and all day visitors and commuting employees have left the Valley by this time of night. It is estimated that 3,180 vehicles are parked in the Valley at the minimum occupancy time.

The highest occupancy of vehicles occurs on Saturdays during the afternoon. It is estimated that about 4,700 vehicles are either parked or driving on the roads in the Valley east of the Yosemite Chapel during Saturday afternoons in the peak season. The components of parking demand are discussed in more detail below.

The supply of parking that is available and endorsed for visitor use was estimated by Yosemite National Park staff during a field survey in 1999. Improvements to the parking areas at Camp 6 and the historic Curry dump were made in 1999. These improvements allowed more vehicles to be parked in the same developed area by organizing the parking areas and providing better delineation of parking spaces. Under present use patterns, all parking areas are used by a mix of day and overnight visitors and employees.

Overnight Visitors

The estimated parking demand for overnight visitors includes 861 lodge guest vehicles, 1,112 camper vehicles (includes vehicles at Housekeeping Camp), and 120 backpacker vehicles. The peak demand for overnight parking of 2,093 visitor vehicles is estimated to occur in the evening after all overnight visitors have arrived. During the afternoon, when the overall maximum vehicle occupancy occurs, an estimated 1,595 overnight visitor vehicles are parked in the Valley. This estimate is based on assumptions regarding the number of departing visitor vehicles that have not been replaced by new arriving visitor vehicles, and the number of overnight visitors that have left the Valley in their vehicles to make day trips to other areas.

The overnight parking demand assumed in the alternatives is equal to the number of overnight units, with the exception of walk-to campsites, which are assumed to be used by visitors traveling to the Valley by alternative modes, and sites at Camp 4 (Sunnyside Campground), where an average of 3 vehicles per site is assumed. The number of vehicles parked could be higher, since individual campsites can accommodate two vehicles and group sites can accommodate up to three vehicles. The parking is generally located with the overnight units. Walk-in campsites have parking lots located within a reasonable walk distance, rather than at each site.

Day Visitors

Most of the fluctuation in the number of vehicles in the Valley over time is caused by the arrivals and departures of day-visitor vehicles. The number of day-visitor vehicles in the Valley at the time of maximum occupancy was estimated by calculating the net change in vehicle occupancy in the Valley from Friday at midnight to Saturday afternoon. After accounting for a net reduction in the number of overnight vehicles in the Valley over the same time period and considering the number of employee commuter vehicles that are estimated to be in the Valley at the peak time, the number of day-visitor vehicles parked or driving on Valley roads was estimated to be 1,737 vehicles.

The overall parking supply for each alternative is designed to provide enough parking to meet a specific demand level, which in total equals the visitation level in the *General Management Plan*. The location of parking varies by alternative. The parking supply for alternatives that include parking areas outside Yosemite Valley includes a factor to account for the additional time required for visitors to travel between the parking lots and the Valley.

For those alternatives with out-of-Valley parking for day visitors, parking was located along the major Valley access corridors, including Highway 140 (El Portal Road), Highway 41 (Wawona Road), and Highway 120 (Big Oak Flat Road). The share of parking for each route was based on estimates of the number of visitors making trips to and from the Valley from each route. A 1993 and a 1998 survey of visitors exiting the park were used to estimate the share of Valley visitors from each route.

The alternatives were designed to provide parking and, where required, shuttle bus service within the park to accommodate the *General Management Plan* total visitation of 18,241 people per day. Because each alternative accommodates a differing number of overnight visitors, the alternatives provide parking for different numbers of day visitors in the park (see Vol. IA, Chapter 2, Actions Common to All Action Alternatives).

Table G-1 shows the number of day visitors that would be served by parking in the park (both in-Valley and out-of-Valley) under each alternative.

Table G-1 Day Visitors Served by In-Park Parking					
	Alternative				
	1	2	3	4	5
Day Visitors Served by In-Park Parking	13,950	12,852	13,0291	13,077	12,350

1. The number of visitors shown for Alternative 3 reflects the capacity of the parking lot in the Valley only, because this alternative was defined to not include out-of-Valley parking.

The number of parking spaces required to accommodate the desired number of day-visitors was determined as follows:

- Determine the number of parking spaces that would be required to park all day-visitor vehicles in the Valley at the time of maximum occupancy. It is estimated that 1,737 day-visitor vehicles are presently parked on Valley roads or driving on Valley roads at peak time. Using a parking efficiency ratio of 97.5%, 1,782 parking spaces would be needed to park these vehicles assuming that a traveler information and traffic management system is in place.
- Determine the number of daily visitors that would be served by each parking space: 13,950 daily visitors/1,782 parking spaces = 7.83 visitors per space.
- Divide the number of day visitors to be served in each alternative by 7.83 to determine how many parking spaces would be needed in the Valley. For Alternative 3, with parking in a single lot, a parking efficiency ratio of 100% was used. As a result, the number of spaces needed was slightly lower than the other alternatives on a per-visitor basis.
- Subtract the actual number of spaces provided in the Valley from the number required to determine the “equivalent” spaces to be provided outside the Valley.
- Apportion the out-of-Valley spaces to each approach route, based on the share of Valley visitors making trips in and out the same route (50% to Big Oak Flat Road, 24% to El Portal Road and 26% to Wawona Road).
- Adjust the number of parking spaces in each corridor to reflect the extra travel time required to reach the parking. Because the current average stay duration is 4.5 hours, the parking expansion adjustment was (Round-trip time + 4.5 hours)/4.5 hours.

TOUR BUSES

At present there are 23 designated tour bus parking spaces in the parking lot serving the Lower Yosemite Fall trail. The existing spaces are not sufficient to meet the demand for tour bus parking. As a result, tour buses are parked in other locations, including roadside turnouts.

The alternatives provide for tour bus loading and unloading at lodging units for overnight visitors. Day visitors arriving in tour buses would be dropped off and picked up at the valley transit transfer center. After dropping passengers at the designated loading areas, tour buses would proceed to a parking area. The location of the parking area for tour buses varies by alternative. Tour buses would park in the area designated for overnight parking of Valley shuttle buses. This parking area would not be used by shuttle buses during the day when parking

demand for tour buses is greatest. Tour bus use in the future is unknown. The impact analysis assumes that tour buses would continue to serve about 13.5% of day visitors and overnight lodging guests. Day visitors that do not park in the Valley or at remote locations in the park may also use commercial tour buses to enter the Valley. The capacity of the passenger loading areas and bus parking would accommodate growth in tour bus use beyond the levels assumed in the impact analysis.

COMMUTERS AND ADMINISTRATIVE VEHICLES

Parking demand for commuters and other administrative vehicles not based in the Valley is currently estimated to be 283 vehicles. This assumes that 75% of the commuter vehicles traveling into the Valley on a typical day are in the Valley when parking demand is greatest. All of the alternatives assume that traffic management measures and alternative transportation systems would provide commuter and administrative parking needs at or below the existing amount. Parking for commuters and other administrative vehicles is assumed to be located at the work sites of employees and not in public parking areas used by visitors under the action alternatives.

RESIDENTS

Resident parking demand is estimated based on an assumed ratio of 0.8 vehicles per resident employee. The current parking requirement for employee residents is 1,022 vehicles. Some residents currently park vehicles in visitor parking areas because parking is not available at some residences.

All of the action alternatives call for a reduction in the number of residents in the Valley and a corresponding decrease in the demand for resident parking. Parking for residents in the action alternatives is assumed to be provided at the place of residence and not in public areas used by visitors.

ROADWAY TRAFFIC AND FACILITIES

Traffic volumes and the resulting requirements for roadway capacity were estimated by forecasting the daily and peak hour vehicle volumes for day visitors, overnight visitors, commuters, and other administrative vehicles, and the various types of bus service. Traffic routes were determined for each type of user, reflecting the locations of parking provided in each alternative. Overnight visitor traffic was assigned to lodging and campgrounds in proportion to the overnight capacity of each area. Day-visitor traffic was assigned to the parking areas defined in each alternative. Buses carrying visitors entering the Valley were routed to the transfer facility provided in each alternative, or to Yosemite Village if no transfer facility was included in an alternative. Administrative traffic was assigned to employment areas in the Valley. The following paragraphs describe how traffic volumes on roadway segments was forecast for the design day.

TRAFFIC ENTERING THE VALLEY

The total volume of vehicle traffic entering the Valley varies by alternative. Traffic is a function of the day-visitor parking, the campsites and lodging units provided in each alternative, and the number of bus trips required to serve parking areas outside the Valley. This section describes how private vehicle traffic was estimated for the alternatives.

Estimates of daily and hourly traffic volumes were developed for the following categories of vehicle traffic:

- Day visitors
- Overnight visitor turnover
- Day trips by overnight visitors
- Commuters and administrative trips
- Recirculating traffic

The process for estimating the daily volume of each category was described in an earlier section of this appendix. Additional detail for traffic by hour of the day is provided below.

It is estimated that 4,159 vehicle trips are currently made by day visitors into the Valley on the design day. As described previously, 1,782 parking spaces would be needed to accommodate day visitor demand. The number of vehicle trips per parking space was determined to be $4,159/1,782 = 2.33$ trips per space. The number of vehicle trips for day visitors entering the Valley was then determined by multiplying this number of vehicle trips per space by the number of parking spaces included in the alternatives.

Hourly traffic volumes for vehicles entering and leaving the Valley were determined for the peak inbound hour and the peak outbound hour of the design day. Table G-2 shows the factors that were applied to each category of traffic to estimate total hourly traffic volumes.

Table G-2					
Percent of Daily Traffic by Direction and Hour of Day					
Traffic Direction and Hour of Day	Type of Traffic				
	Day Visitor	Overnight Turnover	Day Trips by Overnight	Administrative	Commercial Bus
Entering Valley					
Inbound Peak	15.2%	2.0%	2.0%	4.0%	20.0%
Outbound Peak	2.0%	13.0%	13.0%	3.0%	1.0%
Exiting Valley					
Inbound Peak	0.8%	20.0%	20.0%	2.0%	1.0%
Outbound Peak	15.2%	10.0%	4.0%	16.0%	5.0%

T R A F F I C V O L U M E S O N R O A D S

The alternatives include varying modifications to the existing roadway system. To evaluate the impacts of each alternative on the valley transportation system, a traffic impact analysis was conducted. The traffic impact analysis included trip generation, trip distribution, trip assignment and roadway network analysis (described in the next section).

T R I P G E N E R A T I O N

Previous sections of this appendix document the process for estimating the number of vehicle trips generated by the different traffic user groups in the Valley. Table G-2 above shows the percentage of trips that occur during selected hours of the day.

TRIP DISTRIBUTION

Once the number of vehicle trips was estimated, the next step was to determine where the vehicles were traveling. The road network within the park is limited and primarily exists to provide direct access to lodging, parking, Yosemite Village, and attractions. The trip distribution model was developed for each alternative based on destinations of users. Overnight visitor destinations were distributed based on the number of campsite and lodge units in each area of the Valley. Commuter and administrative trips were distributed based on the assumption that 60% of these vehicle trips were destined for Yosemite Village and 40% were destined for the Curry Village area.

TRIP ASSIGNMENT

Once the trip distribution step was completed, the vehicle trips were assigned to the roadways in each alternative. The trip assignment varied for each alternative to reflect the changes to the roadway and transit networks. In all alternatives, except Alternative 3 and Alternative 4, buses traveling to the Valley were assumed to drop-off and pick-up passengers at Yosemite Village. To conservatively estimate the impact from the internal circulation and recirculation use categories, internal circulation traffic was assumed to travel the entire length of the Valley from Pohono Bridge or El Capitan Bridge to Stoneman Bridge. The road network was divided into 14 segments to assign the trips to the roadway system.

TRAFFIC FLOW AND LEVEL OF SERVICE

Once the estimated trips generated by each alternative were assigned to the Valley roadway network, several roadway segments and intersections were analyzed for each alternative. The transportation system was evaluated for both the inbound and outbound peak hours.

To evaluate the impacts of the various alternatives on the roadway system, nine roadway sections were selected for analysis including five roadway segments and four intersections. The chosen sections below were among the more heavily traveled routes within the Valley.

Roadway Sections

- Pohono Bridge
- El Capitan Bridge
- El Portal Road Segment D, from the intersection of the El Portal and Big Oak Flat Roads east to Pohono Bridge
- Southside Drive (near the Yosemite Chapel)
- Northside Drive (between Yosemite Lodge and Yosemite Village)

Intersections

- Southside Drive/Sentinel Road
- Northside Drive/Sentinel Road
- Northside Drive/Camp 6 – Village Access
- Southside Drive/Northside Drive

Transit

VALLEY SHUTTLE BUSES

Throughout each alternative, shuttles are included as the primary visitor distribution system within the Yosemite Valley. They are designed to transport visitors from designated parking areas and lodging facilities to the various scenic areas of the Valley. The intent of the shuttles is to relieve traffic congestion and enhance the visitor experience by providing improved circulation.

Demand estimates for Valley shuttles are developed from the prescribed modes of Valley access, and the size and location of lodging and camping facilities within each alternative, with consideration for the estimated number of visitors desiring to use the multi-use paved trail once in the Valley. Each alternative provides Valley access through a combination of in-Valley parking, overnight Valley lodging and camping capacity, and a system of out-of-Valley parking facilities and shuttles. The estimated daily Valley visitation is held constant at 18,241 visitors per day across all alternatives. Access to the Valley is managed using a combination of the Valley access options listed above and a traveler information and traffic management system, or the Restricted Access Plan.

The methodology employed in developing Valley shuttle demand estimates for the action alternatives (Alternatives 2 through 5) assumes that overnight visitors would be allowed to drive their personal vehicles to the Valley and park at the appropriate lodging or camping facility. Once at the overnight facility, visitors would be required to utilize the Valley shuttles or the multi-use paved trail for circulation among the various Valley visitor sites. Day visitors would be required to park in designated areas upon arrival at the park and then use shuttles or multi-use paved trail for circulation. Depending on alternative, day visitors are provided in-Valley parking spaces at a designated parking hub. Once the in-Valley parking is filled, visitor management actions are taken to divert day visitors to designated out-of-Valley parking locations where a system of out-of-Valley shuttles would take them to and from the Valley. After the out-of-Valley parking is filled, the only Valley access for visitors would be regional transit or other alternative transportation services. The following tables show the number of people who would board each shuttle route at the Valley transit hub under each action alternative. People also would board shuttle routes at other locations. Boardings at the transit hub are used to estimate the maximum demand on the shuttle routes.

	Ahwahnee Shuttle	West Valley	East Valley	Total
Peak Season Daily Boardings	1,340	4,560	10,528	16,428
Off-Season Daily Boardings	1,009	3,053	7,921	11,983

Table G-4 In-Valley Shuttle Boardings by Route at the Transit Hub Alternative 3 – Taft Toe (1,622 parking spaces)					
	Ahwahnee Shuttle	Yosemite Lodge	Happy Isles	Bridalveil Circulator	Total
Peak Season Daily Boardings	5,361	8,200	7,419	2,736	23,716
Off-Season Daily Boardings	3,609	5,354	5,530	1,832	16,325

Table G-5 In-Valley Shuttle Boardings by Route at the Transit Hub Alternative 4 – Taft Toe (550 parking spaces)					
	Ahwahnee Shuttle	Yosemite Lodge	Happy Isles	Bridalveil Circulator	Total
Peak Season Daily Boardings	5,379	8,203	7,393	2,736	23,711
Off-Season Daily Boardings	3,621	5,354	5,512	1,832	16,319

Table G-6 In-Valley Shuttle Boardings by Route at the Transit Hub Alternative 5 – Camp 6 (550 parking spaces)			
	East Valley	West Valley	Total
Peak Season Daily Boardings	14,593	1,706	16,299
Off-Season Daily Boardings	10,992	1,182	12,174

Shuttle service levels and associated support facilities are designed to provide convenient Valley circulation based on demand estimates developed for each alternative. Generally, shuttle services within each alternative are designed to provide a connection between the designated parking facilities and transit centers and the visitor center (as defined for each alternative), and additional connections to circulator services for the east Valley and, for some alternatives, the west Valley. Route variations and service levels change, depending on the location of in-Valley parking and the transit hub for each alternative.

The level of visitor activity expected, and primary activities for each location, defines passenger facilities. At the designated transit hub for each alternative, passenger facilities would include visitor orientation and information services, and other visitor services. Other passenger facilities would be located at Valley shuttle stops. These generally include visitor orientation material and route signs. Passenger seating, waste receptacles, and other limited passenger amenities may be provided at high-use shuttle stops. Valley shuttle support facilities include waiting areas (bus bays) at major visitor access and destination areas, and vehicle maintenance and overnight storage. Maintenance facilities are assumed to provide space and equipment for light maintenance and fueling in Yosemite Valley. Major repair functions would be located in the El Portal Administrative Site. Required area for maintenance and storage is determined under each alternative by the fleet size for the alternatives.

Capital, operating, and maintenance cost estimates were prepared for the transit elements of each alternative based on planning-level unit costs. The type of vehicle defined for the described service determines vehicle capital cost estimates. Standard low-floor shuttle buses used for the

Valley shuttle service are estimated at \$250,000 per vehicle. High capacity, low-floor shuttle buses (used for circulator and connector services described for each alternative) are estimated at \$350,000 per vehicle. These bus types and capital cost estimates are used for comparison purposes only. Actual bus configurations may change as the routes are implemented. Bus specifications for each shuttle service will be prepared as part of the implementation and procurement process. Operation and maintenance cost estimates for each shuttle are developed using a two-variable cost methodology. Shuttle operations are estimated to cost \$30.50 per vehicle hour traveled (VHT) and include operator salary and various planning and administrative costs related to the size of the operating staff. Shuttle fuel and maintenance is estimated to cost \$0.61 per vehicle mile traveled (VMT), including fuel and maintenance material (such as equipment and parts), and maintenance personnel salaries. Operating speeds vary by vehicle type and shuttle service within each alternative, but generally, the in-Valley shuttle services are expected to operate at average speeds of 12 to 20 miles per hour depending on vehicle type.

O U T - O F - V A L L E Y S H U T T L E S

Out-of-Valley shuttle buses provide transportation for day visitors between designated out-of-Valley parking and the Valley Visitor/Transit Center for each alternative. Under Alternatives 2, 4, and 5, in-Valley parking is supplied at various levels and is supplemented by out-of-Valley parking for day visitors. Alternative 3 provides all day-visitor parking within the Valley at the Taft Toe Visitor/Transit Center and does not provide out-of-Valley day-visitor parking and shuttle service. Alternative 1 manages Valley daily visitation through the Restricted Access Plan and provides no additional in-Valley parking or out-of-Valley parking.

Demand estimates for out-of-Valley shuttles in Alternatives 2, 4, and 5 are based on the designated number of out-of-Valley parking spaces provided by each alternative. Generally, alternatives with more in-Valley parking have fewer out-of-Valley parking spaces.

The amount of out-of-Valley shuttle service for each alternative is designed to accommodate the estimated demand for each service based on assumed arrival times at parking areas and assumed duration of day-visitor stays in the Valley. Out-of-Valley shuttle services provide day-visitor transport from three primary Valley access corridors: north, west, and south. The north access corridor serves the Big Oak Flat and Tioga Pass entrance stations. Out-of-Valley parking facilities for this access corridor would most likely be located along Highway 120 (Big Oak Flat Road). The west access corridor is defined as Highway 140 (El Portal Road) and provides visitor access from the Arch Rock Entrance Station. Out-of-Valley parking for this corridor is located at El Portal for each of the out-of-Valley service alternatives. The south access corridor is defined as Highway 41 (Wawona Road) and provides visitor access from the South Entrance Station. Out-of-Valley parking for this corridor is defined within each alternative. The following tables present demand estimates as total daily visitor round-trips on out-of-Valley shuttles by alternative and route.

Table G-7 Out-of-Valley Shuttle Boardings by Route Alternative 2 – Camp 6 (550 parking spaces)				
	Badger Pass	El Portal	Hazel Green or Foresta	Total
Peak Season Daily Boardings	1,921	1,773	3,694	7,387

Table G-8 Out-of-Valley Shuttle Boardings by Route Alternative 4 – Taft Toe (550 parking spaces)				
	Badger Pass	El Portal	South Landing	Total
Peak Season Daily Boardings	1,971	1,820	3,791	7,582

Table G-9 Out-of-Valley Shuttle Boardings by Route Alternative 5 – Camp 6 (550 parking spaces)				
	Heness Ridge	El Portal	Foresta	Total
Peak Season Daily Boardings	1,808	1,669	3,477	6,953

Out-of-Valley parking areas and the shuttle services to the Valley would not be operated during periods of low demand. Generally, parking in the Valley is expected to be adequate to meet day-visitor demand from November through March. During the shoulder seasons (April, May, and October) out-of-Valley shuttle service would operate at a lower level than during the summer. Service on the shuttles would be tailored to visitor needs throughout the year. Operating costs for out-of-Valley shuttles were estimated using the same unit costs documented for the in-Valley shuttle system.

REGIONAL TRANSIT AND TOUR BUSES

Regional transit and other modes of transportation will be able to access the Valley under each alternative in the event regional service is implemented by private, commercial service providers. The National Park Service does not have authority to operate services outside the park, but is committed to working with other service providers desiring to implement regional transit service.

IN-PARK TOURS AND SHUTTLES

In-park tours and shuttles, as described in Vol. IA, Chapter 3, Affected Environment, are expected to remain in operation in each alternative and are not affected by actions of the alternatives. Minor route deviations would be required for each alternative as road segments are closed or traffic flow directions are altered.

*Considering
Cumulative
Effects*

Final
Yosemite
Valley
Plan

Supplemental EIS

APPENDIX H – CONSIDERING CUMULATIVE EFFECTS

Introduction

The Council on Environmental Quality's regulations for implementing the National Environmental Policy Act defines cumulative effects as:

the impact on the environment which results from the incremental impact of the action when added to other past, present and reasonably foreseeable future actions regardless of what agency (Federal or non-federal) or person undertakes such actions. (40 CFR § 1508.7)

The following is a scenario of projects that may have potential cumulative impact when considered along with actions called for in the *Final Yosemite Valley Plan/SEIS*. The purpose of this scenario is to evaluate (1) whether the resources, ecosystems, and human communities have already been affected by past or present activities, and (2) whether other agencies or the public have plans that may affect resources in the future.

The Affected Region

This list of projects was developed through an iterative process with individuals, groups, and agency officials and attempts to include major projects within the affected environment relative to each impact topic. The region of evaluation was established based upon an observation of natural boundaries, the recognition of potential ecological relationships to Yosemite National Park, and with a general understanding of the common issues to be addressed in the impact analysis. However, overall the descriptions of the projects listed below were provided by those contacted.

In addition to considering other past, present, and reasonably foreseeable projects from within Yosemite National Park, the region of analysis included surrounding counties as follows.

- The National Park Service contacted county planning departments in each of the eight major counties surrounding Yosemite National Park:
 - Fresno County, CA
 - Inyo County, CA
 - Madera County, CA
 - Mariposa County, CA
 - Merced County, CA
 - Mono County, CA
 - Stanislaus County, CA
 - Tuolumne County, CA

- The National Park Service contacted city planning offices or city economic development councils in each of the seven key cities in the Yosemite National Park region:
 - Fresno, CA
 - Mammoth Lakes, CA
 - Merced, CA
 - Mariposa, CA
 - Modesto, CA
 - Oakdale, CA
 - Oakhurst, CA
- Other federal land management agencies with jurisdiction over lands surrounding Yosemite National Park (The National Park Service contacted agency public information officers, planners, and National Environmental Policy Act coordinators at each of these agencies):
 - State of California, Department of Transportation, Stockton, CA
 - U.S. Forest Service – Inyo National Forest, Bishop, CA
 - U.S. Forest Service – Stanislaus National Forest, Sonora and Groveland, CA
 - U.S. Forest Service – Sierra National Forest, Clovis, CA
 - U.S. Forest Service – Toiyabe National Forest, Carson City, NV
 - U.S. Bureau Of Land Management – Folsom Field Office, Folsom, CA

National Park Service planners evaluated each project listed from the perspective of the individual characteristics of each impact topic. Analysis of potential cumulative impacts was specific to those projects that may have a compounding effect when considered with the actions of each alternative.

Cumulative Impact Scenario

Agency: California State Department of Transportation; U.S. Department of Transportation; Mariposa County; Merced County Association of Governments; Mono County; National Park Service – Yosemite National Park; U.S. Forest Service – Sierra National Forest and Inyo National Forest

Project Name: **Yosemite Area Regional Transportation System (YARTS)**

Description: YARTS is a collaborative, inter-agency effort begun in 1992 to evaluate the feasibility of a regional transportation system and to identify the best options for initial implementation and upkeep of such a system. YARTS is a Joint Powers Authority under California law and the National Park Service is an ex-officio partner of the JPA Commission, participating in all discussions but not as a voting member. The YARTS mission statement is as follows:

YARTS will provide a positive alternative choice for access to Yosemite National Park for visitors, employees, and residents. YARTS service is not intended to replace auto-access or trans-Sierra travel, but is intended to provide a viable alternative that offers a positive experience, maximizing comfort and convenience for riders while guaranteeing access into the park. (Yosemite Area Regional Transportation Strategy 1999:4)

YARTS has four primary objectives:

- Increase transportation options
- Reduce reliance on automobiles
- Support local economies
- Improve regional air quality

The target market for YARTS service includes those visitors staying overnight in the gateway communities and Yosemite National Park employees who live in the gateway communities. Decisions on the placement of bus stops and transfer facilities are local land-use decisions that will be made by the County Board of Supervisors in gateway communities, and by the National Park Service for locations inside the park boundaries. YARTS staging areas outside the park are undergoing a region-wide NEPA/CEQA process and will likely be a part of a region-wide shuttle bus system.

- YARTS is designed as a voluntary service that uses incentives to attract riders.
- YARTS is not intended to replace auto access to Yosemite National Park and does not support a ban on auto access to the park.
- YARTS supports the use of alternative fuels and is committed to operating vehicles utilizing the cleanest possible fuel as soon as practical.
- YARTS service will be designed to offer a seamless service between the gateway communities and major destinations within Yosemite National Park. YARTS buses will stop at attractions throughout the park and Yosemite Valley and will coordinate services with the park's internal shuttle bus operations.
- The initial YARTS service is a demonstration project. The purpose of the demonstration project will be to evaluate the public reaction to taking the bus, the quality of the service provided, and the impacts of YARTS transit on local communities.

A two-year demonstration service will test the YARTS concept. Implementation of the demonstration service occurred in May 2000 and the service is scheduled to operate until May 2002, with most service offered in the summer months.

One component of the YARTS effort to date includes bus stop improvements. On the Highway 140 corridor, eleven stops in each direction were approved, including stops in El Portal, Midpines, Mariposa, Cathey's Valley, and Merced. The project also includes approved stops in Mono County. Twelve to fifteen stops are currently approved and in use in Yosemite National Park. Three are approved and in use in the El Portal Administrative Site. Only minor safety improvements have occurred at the El Portal sites.

Agency Name: American Indian Council of Mariposa County, Inc. (Southern Sierra Miwok)

Project Name: **Indian Cultural Center**

Description: An Indian Cultural Center would be established by the American Indian Council of Mariposa County, Inc. (Southern Sierra Miwok) at the site of the last-occupied Indian village in Yosemite Valley (west of Camp 4 [Sunnyside Campground]). This center would provide a location for culturally associated Indian people to conduct traditional ceremonies and to practice and teach techniques of traditional lifeways. While the center would be open to the public, access might be limited during special ceremonies. Some public interpretation would occur, but this cultural center would not replace the primary educational function of the current Indian Village of Ahwahnee at Yosemite Village.

Facilities at the Indian Cultural Center would consist of structures and landscape features typical of an Indian village from the mid- to late-19th century. One large, partly subterranean ceremonial roundhouse and a smaller sweatlodge would be constructed. Approximately 15 cedar bark umachas (conical houses) would be built in the vicinity of the roundhouse and sweatlodge. Plants important for food, basketry, and medicinal uses may be grown. Existing archeological features, such as mortar rocks, would remain in place and be incorporated into the village design. The last extant structure from the original village, a small cabin (the former Westley and Alice Wilson home) currently being used as a National Park Service office, would be moved back to the village and adaptively reused as the cultural center office. A new kitchen and restroom facility would be constructed. Utilities (water, sewer, propane, unimproved road access, and electrical service) would be provided. Screening would be established where necessary to visually separate the cultural center and Northside Drive, Yosemite Lodge, Camp 4 (Sunnyside Campground), and the Valley Loop Trail. The Valley Loop Trail could be relocated to a route south of the cultural center to minimize intrusions. Overnight parking for scheduled activities would be provided at the Indian Cultural Center or other administrative areas.

Agency Name: National Park Service

Project Name: **Bridalveil Horse Camp Rehabilitation**

Description: This site was identified as a high priority for campground improvement in the park based on severe resource impacts due to soil loss, specifically erosion from failing roads, stock trails, social trails, and deteriorating stock campsites. Planned work includes arresting potential water pollution from stock campsites and rehabilitation of the gravel campground loop road.

Agency Name: National Park Service

Project Name: **Discovery View Scenic Overlook Vault Toilet Installation**

Description: This project proposes to install a vault toilet at the Discovery View scenic overlook in Yosemite Valley. Work will include purchasing a four-unit manufactured concrete vault toilet structure; excavating the vault site; and assembling of the restroom on site.

Agency Name: National Park Service

Project Name: **El Portal Road Improvement Project**

Description: This federal jurisdiction transportation project, which is entirely within the National Park Service's jurisdiction, involves the reconstruction of 7.5 miles of the El Portal Road (Segments A, B, and C) from the Yosemite National Park boundary in El Portal to Cascades Diversion Dam near the intersection of El Portal Road and Big Oak Flat Road. The project will improve access to Yosemite Valley and reduce safety concerns. The El Portal Road is a primary route for visitors accessing Yosemite Valley, and is the shortest all-weather route to the Valley. It also serves as the primary commuting route for park employees living in El Portal, Midpines, and Mariposa.

Agency Name: National Park Service

Project Name: **El Portal, Trailer Village Closure**

Description: The project calls for continuing to implement the actions described in the 1993 *Trailer Village Closure Policy*. Due to flood related risks all existing trailers would be removed from the site. The houses at Abbieville would not be effected. As a part of the closure process, the National Park Service would need to comply with the provisions of the Uniform Relocation Act of 1970, and on a case by case basis evaluate individual eligibiligy for housing and moving benefits.

Agency Name: National Park Service

Project Name: **Fire Management Plan Update**

Description: The National Park Service is updating the 1990 *Yosemite National Park Fire Management Plan*. The objectives associated with updating the plan are to improve ecosystem health, enhance public safety, and provide guidance to park operations for successfully integrating fire with other vegetation management principles. The plan will address prescribed fire, wildland fire, and community fire protection services. It is also expected to address parkwide fire issues and consider effects to burn units, vegetation associations, air resources, watersheds, soils, cultural landscapes, and other natural, cultural, and social resource variables.

Agency Name: National Park Service

Project Name: **Happy Isles to Vernal Falls Trail Reconstruction**

Description: This project proposes to reconstruct 5,400 linear feet of the Vernal Fall Trail from Happy Isles to the base of the Mist Trail stairs. Actions include construction of an average tread width of seven feet; rebuilding of trail walls; redistribution of old pavement as sub-base; and application of layers of aggregate road base, tack oil, and asphalt, with a granite dust topcoat. On steeper sections of the trail, improved traction will be provided for pedestrians. A functioning drainage system will be established in the trail corridor by paving water breaks and constructing rock drainages to channel water away from the trail.

Agency Name: National Park Service/City and County of San Francisco

Project Name: **Hetch Hetchy Road Reconstruction**

Description: To maintain administrative and visitor access to O'Shaughnessy Dam, the Hetch Hetchy Reservoir and other associated areas, the National Park Service (NPS) in 1999 and 2000 improved 8.6 miles of the Hetch Hetchy Road in Yosemite National Park, Tuolumne County, California. This included:

- Repairing the roadbed
- Resurfacing the road with asphalt concrete
- Re-grading and paving the existing drainage ditch
- Installing 15 culverts and associated inflow and outflow structures
- Repairing damaged embankments and stone wall

The action stabilized the roadway, decreased annual maintenance requirements, reduced the likelihood of future road closures associated with flood events, improved the safety of the road, and helped ensure a safe and reliable water supply for the City and County of San Francisco.

Agency Name: National Park Service

Project Name: **Hodgdon Meadow Campground Rehabilitation**

Description: This project was identified as a priority for campground infrastructure improvement to mitigate impacts to resources.

Agency Name: National Park Service

Project Name: **Hodgdon Meadow Water and Wastewater Treatment Improvement**

Description: Hodgdon Meadow is located at an elevation of 4,575 feet. During peak summer usage, water and wastewater must be provided for 70 residents, up to 440 campers (130 campsites with two restrooms), and up to 5,000 visitors per day who use the Big Oak Flat Entrance Station facilities. Improvements are required to meet state and federal regulations regarding public health and safety and to protect the natural environment.

Improvements to the water system will include: providing an additional water source, improving disinfection, increasing water storage capacity, improving water system controls, replacing asbestos cement pipe, equalizing system pressure, and constructing a dedicated line from treatment to storage. Improvements to the wastewater system will include: improving solids handling and effluent quality, improving the disinfection system, constructing primary and secondary treatment facilities, improving the spray field, replacing the leach field, and replacing the septic tank.

Agency Name: National Park Service

Project Name: **Merced River at Eagle Creek Ecological Restoration**

Description: The National Park Service proposes to mitigate human-caused impacts to the riverbank and floodplain at the confluence of Eagle Creek and the Merced River in Yosemite

Valley. Actions proposed in the project include: removal of an undetermined amount of abandoned park infrastructure including a sewer line and manhole; revegetation of the damaged riverbank using brush-layering, seeding, and mulching techniques; construction of a temporary fence to guide visitor activities to resilient areas; and elimination of a road shoulder used for parking.

Agency Name: National Park Service

Project Name: **Merced Wild and Scenic River Comprehensive Management Plan**

Description: In 1999 and 2000, the National Park Service developed a comprehensive management plan for sections of the Merced Wild and Scenic River that it administers. The purpose of the *Merced River Plan* would be to protect and enhance the river's Outstandingly Remarkable Values for the benefit and enjoyment of present and future generations.

The final plan and environmental impact statement was released to the public in July 2000; the planning process was completed in August 2000, with the signing of the Record of Decision. Included in the plan are descriptions of the boundaries, the official classification of river segments, and a description of the Outstandingly Remarkable Values associated with the Merced River. The *Merced River Plan's* land-use zoning prescriptions have served as a guide to protect river values during the *Yosemite Valley Plan* process, and have thereby directed the type of potential development and potential levels of use allowed within the river corridor in Yosemite Valley, Wawona, and El Portal.

Agency Name: National Park Service

Project Name: **Protection of Giant Sequoias at Mariposa Grove**

Description: This project proposes to protect the Mariposa Grove of giant sequoia trees by mitigating impacts caused by human activities. Work will include construction of a quarter-mile of boardwalks in areas where soils have been compacted and sequoia roots have been damaged; restoration of natural drainage patterns by re-routing a quarter-mile of trails to more appropriate sites; control of invasive non-native plant species; and evaluation of the preservation efforts through a monitoring program. This project is identified as priority 9 in the approved Resource Management Plan (Project Statement number YOSE-N-305.000).

Agency Name: National Park Service

Project Name: **Red Peak Pass Trail Rehabilitation**

Description: This project proposes to reconstruct the trail from Red Peak Pass to the Triple Peak Fork of the Merced River. Work will include extensive construction of rock retaining wall, rip-rap tread, water breaks, terrace steps, and meadow restoration.

Agency Name: National Park Service

Project Name: **Rehabilitation of Tuolumne Grove Trailhead Parking**

Description: This project would redesign and pave the existing Tuolumne Grove dirt trailhead parking area to accommodate automobile, buses and/or recreation vehicles for summer and

winter use. It would include preparation of preliminary design plans, environmental compliance documents, construction drawings, and bid documents. Construction projects include: vault toilets; installation of signs for improved way-finding; development of a picnic area; revegetation of cut slopes; visual screening of the trailhead area from Tioga Road; and providing for accessibility for visitors with disabilities.

Agency Name: National Park Service

Project Name: **Replacement/Rehabilitation of Yosemite Valley Main Sewer Line**

Description: This project consists of slip lining the sewer between Yosemite Lodge lift station and the El Capitan wood yard and also includes the selective replacement of manholes.

Agency Name: National Park Service

Project Name: **Mariposa Grove Roadway Improvement and Giant Sequoia Restoration**

Description: The National Park Service is considering alternatives for restoring giant sequoia habitat in the Lower Mariposa Grove of Giant Sequoias in Yosemite National Park by relocating the existing parking to the South Entrance area. It is expected that water drainage improvements will be made to the Mariposa Grove Road and that the existing water supply line would then be relocated into the road corridor. At the South Entrance area, the roadway would have minor realignments to address roadway safety problems, requiring the relocation of the park's South Entrance Station.

Agency Name: National Park Service

Project Name: **South Fork Merced River Bridge Replacement**

Description: The existing flood-damaged and temporary replacement South Fork Merced River Bridge will be replaced with a single-span structure.

Agency Name: National Park Service

Project Name: **Tamarack Campground Rehabilitation**

Description: This campground was identified as the highest priority for campground improvement based on severe resource impacts due to soil loss, specifically erosion from failing roads, trails, social trails, and deteriorating campsites. Much of the eroded soil is being deposited in a fragile creek. Planned work includes rehabilitation of the campground loop, relocation of ten campsites off Tamarack Creek, revegetation of the stream bank, and provision of additional campsites where possible within camp boundaries.

Agency Name: National Park Service

Project Name: **Tuolumne Meadows Development Concept Plan**

Description: The draft planning objectives of this document include the following:

- Identify sites to be restored to natural conditions
- Incorporate restoration actions to enhance these conditions and visitor experiences

- Identify appropriate levels of development
 - Produce a comprehensive design plan for National Park Service and concessioner housing
 - Assure that site layout, functional relationships, and circulation patterns will be designed in a manner with the least impact on resource values
-

Agency Name: National Park Service

Project Name: **Tuolumne Meadows Water and Wastewater Improvements**

Description: The original objective of these improvements was to halt surface water diversion from the seasonally unpredictable and unprotected Dana Fork, and to develop a water supply from reliable and protected ground water sources. However, hydrogeological evaluations have found no aquifer capable of providing an adequate water supply. The park is steering toward using an infiltration gallery to collect water directly from the main stem of the Tuolumne River. The collection site would be placed under the Tioga Road Bridge that crosses the main stem of the Tuolumne River near Lembert Dome.

Also, this project would include design and construction to improve process efficiency of the Tuolumne Meadows water and wastewater treatment facilities, which currently impose grave risks to the environment and threats to public health. Tuolumne Meadows is the largest sub alpine meadow in the Sierra Nevada; the meadow is fragile, with a short growing season, where recovery from resource damage can take years to accomplish. The treatment facilities, located at an elevation of 8,575 feet, support approximately 5,000 park visitors and 200 park staff daily from May through October. Facilities served include a 304-site campground, a visitor center, a retail sales/service station, a 104-bed lodge, food service and grocery facility, and employee housing.

Work will include construction of a new wastewater treatment plant, modification of an existing pump station to transport raw sewage to the new plant location, elimination of sewage lagoons, and demolition of the existing plant. The new facility will include extended aeration, a covered 860,000-gallon effluent storage tank, sludge-handling capabilities, and an expanded sprayfield. The water line and electric service will be extended one mile to the new plant location and the access road will be improved. A 150,000-gallon water storage tank will be constructed. All work will be performed through contracts.

Agency Name: National Park Service

Project Name: **Tuolumne Wild and Scenic River Comprehensive Management Plan**

Description: In 1984, the Tuolumne River was designated a Wild and Scenic River. The Wild and Scenic Rivers Act requires that managing agencies develop a comprehensive management plan for Wild and Scenic Rivers that flow in their jurisdiction. The draft planning objectives of this document include the following:

- Review and finalize classifications and boundaries, and establish Outstandingly Remarkable Values for the Tuolumne Wild and Scenic River
- Delineate management zones and develop zoning prescriptions
- Address user capacity

Agency Name: National Park Service

Project Name: **Wawona, Seventh Day Adventist Parcel Land Exchange**

Description: The park has been involved in land exchange negotiations with the Seventh Day Adventist (SDA) Recreational Camp, located in Wawona. SDA is owner of a parcel of land adjacent to the park boundary and designated Wilderness. Current land use impacts adjacent Wilderness lands. The parcel desired by the National Park Service would be exchanged for park land adjacent to the lower portion of the existing SDA parcel, but away from the Wilderness boundary.

Agency Name: National Park Service

Project Name: **Wawona Campground Rehabilitation**

Description: The purpose of this project is to implement the *General Management Plan* goal to rehabilitate the Wawona Campground. Preliminary design plan, construction drawings, and bid documents will include the following actions: a) rehabilitate the campground entrance and loop road and individual campsite spurs, b) retrofit campsites and restrooms to meet accessibility standards, c) install low-flow toilet, replace toilet partitions, repaint, install energy efficient lights and heat, replace composition roofs with metal, and insulate and winterize the restrooms in loop A and B, d) construct showers e) replace exterior privacy partitions, f) reconstruct the amphitheater, g) remove septic tanks and leach fields, h) extend sewer, electrical service, and telephone 1.5 miles, i) replace existing signs with the new park sign system, and j) prepare a vegetation management plan which includes shoreline protection and reestablishes privacy and shade in the campground.

Agency Name: National Park Service

Project Name: **White Wolf Water System Improvements**

Description: The National Park Service proposes to design and construct upgrades to correct treatment process deficiency and capacity for the White Wolf water distribution, collection, and treatment facilities. The project includes the development of a new underground state-approved water source; the construction of a new state approved treatment facility, and the replacement of approximately 9,200 linear feet of water supply and distribution piping. The project would provide remote supervisory control and data acquisition of SCADA water treatment and improve vehicular and pedestrian access to the water treatment facility in an attempt to minimize existing safety concerns. Once the project is complete, emphasis will be focused on the restoration and revegetation of all disturbed areas.

Agency Name: National Park Service

Project Name: **Wilderness Management Plan Update**

Description: The National Park Service is updating the 1989 *Yosemite National Park Wilderness Management Plan*. The objective of updating the plan is to provide guidance to park operations for the successful management of Yosemite's designated Wilderness, which comprises over 95% of the park. The plan will address land management issues within the wilderness including

visitor use, vegetation associations, air resources, noise issues, watersheds, soils, cultural landscapes, and other natural, cultural, and social resource variables. The plan update would also address the use of the five High Sierra Camps in Yosemite National Park.

Agency Name: National Park Service

Project Name: **Yosemite Creek Campground Restoration**

Description: This campground was identified as the second highest priority for campground improvement in the park based on severe resource impacts due to soil loss, specifically erosion from failing roads, trails, social trails, and deteriorating campsites. Much of the eroded soil is being deposited in a fragile creek. Planned work includes rehabilitation of the campground loop, relocation of eight campsites off Yosemite Creek, revegetation of the stream bank, and the addition of campsites where possible within camp boundaries.

Agency Name: National Park Service, Yosemite Institute

Project Name: **Yosemite Institute, Crane Flat Campus Improvement**

Project Description: This project proposes an educational center at Crane Flat that would enable Yosemite Institute to provide educational and interpretive programs about the park's compelling stories. Facilities would be operated by Yosemite Institute, and accommodate Yosemite Institute groups and park partner interpretive and educational programs, training programs, research and field seminars. The campus design and function would model sustainable energy and resource practices, and would meet accessibility standards. Existing facilities include dormitories, a shower house with bathrooms, kitchen and dining areas, field equipment storage, offices, staff housing, and indoor and outdoor spaces for meetings, training, instruction, and evening and campfire programs. Among the expanded facilities would be a science lab with hands-on study collections of common Sierra plants and vertebrates, and dissecting scopes.

Agency Name: National Park Service

Project Name: **Yosemite Valley Shuttle Bus Stop Improvements**

Description: This project consists of the preparation of preliminary design plans, environmental compliance documents, and construction drawings; and the construction of six 10 × 80 foot concrete braking pads, and the rehabilitation or replacement of 94,000 square feet of asphalt road approaches.

Agency Name: National Park Service

Project Name: **Yosemite View Parcel Land Exchange**

Description: The park has been involved in land exchange negotiations with Yosemite Motels, Inc., owners of a parcel of land adjacent to the park boundary. The parcel desired by the National Park Service would be exchanged for park land directly downstream of the existing Yosemite Motels, Inc. development, between California Highway 140 and the Merced River, upstream of the confluence with Crane Creek. This parcel would accommodate a new entrance station complex and provide space for other needs. Yosemite Motels, Inc. would use exchanged

park lands for construction of motel units, parking lots, a public trail system, and nature/river interpretive study areas.

Agency Name: National Park Service, State of California

Project Name: **Sierra Nevada Research Institute – University of California, Merced**

Description: The Sierra Nevada Research Institute facilities are being considered near or in both Yosemite and Sequoia-Kings Canyon National Parks. To serve Yosemite National Park, the potential project locations under consideration are Hazel Green Ranch and Wawona. At Hazel Green Ranch, the project would consist of a new facility that would include a research laboratory, operational and residential space for researchers, and a small student dormitory. At Wawona, the project would consist of providing similar facilities by adaptively using existing buildings located in the Wawona area.

Agency Name: Hetch Hetchy Water and Power, City and County of San Francisco

Project Name: **O’Shaughnessy Compound Water System Improvements**

Description: The O’Shaughnessy Dam/Hetch Hetchy Reservoir is located in the northwestern portion of Yosemite National Park. The purpose of this project is to repair and replace the piping and appurtenances of the domestic water system for the O’Shaughnessy Dam Compound. During construction there will be reduced access to some portions of the compound and visitor facilities. Excavation and other construction activities may uncover artifacts from the O’Shaughnessy Dam construction period (1915-1938).

Agency Name: Hetch Hetchy Water and Power, City and County of San Francisco

Project Name: **O’Shaughnessy Dam Well**

Description: The dam outlet facilities will be modified to allow outlets to be used at more than one elevation for diverting water to the Canyon Tunnel. The feasibility of alternative conceptual designs is currently being evaluated.

Agency Name: Yosemite Sierra Visitors Bureau, Madera County

Project Name: **Winter Recreation Feasibility Study**

Description: The Yosemite Sierra Visitors Bureau has applied for funding for an Eastern Madera County Winter Recreation Feasibility Study to define the potential or lack of potential for winter recreation opportunities in Eastern Madera and the surrounding area. This would be accomplished through a market research study to identify: (1) if there is an interest in winter recreation opportunities, (2) whether this would lend itself to an anticipated winter visitation, (3) obtaining feedback from existing U.S. Forest Service recreation business permit holders for the purpose of identifying better levels of service to the general public from these recreation providers, and (4) preparation of an implementation plan which relates the demand and the potential for obtaining funding and in-kind services to support recommendations, if any, from the analyses.

Agency Name: Madera County

Project Name: **Highway 41 Extension**

Description: Highway 41 is a two-lane highway extending in a north/south direction through eastern Madera County from the Fresno County Line to the Mariposa County Line. It provides access to Yosemite National Park and the recreational areas of the east county.

The *Madera County Area Regional Transportation Plan* (November 1994) lists the following planned improvements for Highway 41:

Table H-1 Planned Improvements for Highway 41 in Madera County		
Location	Short-Range 1992-1999	Long-Range 2000-2014
1. Fresno County Line to Avenue 11	2 lane highway to 4 lane freeway	4 lane freeway to 6 lane freeway
2. Avenue 11 to Avenue 12		2 lane highway to 4 lane freeway
3. Avenue 11 to Street 15		2 lane highway to 4 lane arterial
4. Avenue 15 to 145	Operational improvements/passing lanes	Operational improvements/passing lanes
5. At Road 417 intersection		Construct turn lanes
6. Coarsegold Creek Bridge to Marava	Safety Improvements	
7. Fresno River to Road 200		4 lane arterial & channelization
8. Ranger Station to Cedar Valley Rd.	Resurfacing	

Note: Projects are listed according to their proximity to Yosemite National Park.

The first two project improvements are located immediately outside of Fresno, California, approximately 50 miles south of the park, and the last project improvement is located approximately 8 to 10 miles from the park.

The “Fresno County Line to Avenue 11” and the “Avenue 11 to Avenue 12” improvements are the most likely to occur in the near future. The others, with the exception of resurfacing work for the “Ranger Station to Cedar Valley Road,” which has already been completed, probably will not occur until at least 2015. The “Coarsegold Creek Bridge to Marava” project involves very minor safety improvements.

Highway 41 improvements are expected to relieve existing congestion problems, but it is not anticipated that they will affect traffic counts near the park. According to Bob Stone, Executive Director of the Madera County Transportation Commission, Highway 41 traffic counts are 30,000 trips per day at the county line and 3,000 trips per day at the Yosemite National Park gate.

Agency Name: Madera County

Project Name: **Rio Mesa Area Plan**

Description: This area plan encompasses approximately 15,000 acres on the east side of Highway 41, between the San Joaquin River and Highway 145. Construction of approximately 29,000 dwelling units is expected over 100 years. The elevation of the project area is almost 500 feet and lower on flat valley land. This project has an approved area plan that at this stage is

conceptual. The next step would require the property owners to work together to develop sub-area plans. No estimates can be made at this time regarding the number of units to be constructed in the next 15 to 20 years. Several different property owners are involved in this project and a timeline for progression to the next tier of planning is difficult to estimate.

Agency Name: Mariposa County

Project Name: **Expansion of County Transit System**

Description: Mariposa County plans to use federal funds matched with the local Transportation Fund dollars for bus purchases to meet the needs of the Mariposa County Transit System. Plans are to purchase four new buses that will be used to replace existing buses. As part of this project, service has been expanded from Coulterville and Greeley Hill to Mariposa, adding one trip per week. County transit system service would potentially be merged with the Yosemite Area Regional Transit System when YARTS is implemented.

Agency Name: Mariposa County

Project Name: **Hazel Green Ranch**

Description: Hazel Green Ranch is a privately owned piece of land abutting the western boundary of the park. The owner of Hazel Green Ranch has proposed to develop an eco-tourism project including approximately 250 guest rooms as single, double, and quad hard-sided cabins as well as 50 summer tent cabins. Food service, merchandise sales, and a University of California research station (see Sierra Nevada Research Institute) are also under consideration. Meadow preservation would be a focus for the property. Circulation and access in the resort area would be designed to emphasize a pedestrian environment with raised walkway providing much of the circulation. Facilities and activities would be provided for year-round recreation. Parking would be provided along the perimeter of the resort, adjacent to the area proposed for use as a transit center, parking area, and visitor contact facility (see Out-of-Valley Transit Facilities, under Alternative 2)

Because of the potential development of a 200-meter public access road (see Alternative 2) across park lands to a transit center, parking area, and visitor contact station located on Hazel Green Ranch, the National Park Service is concerned about the potential for uncontrolled growth on this property and along the park boundary. To remedy these concerns, the landowner has agreed to put a deed restriction on the Hazel Green property, limiting development to 300 lodging units should the road, parking, and transit elements of the project move forward.

Agency Name: Mariposa County

Project Name: **Incline Road Reconstruction, Foresta Road Bridge to South Fork**

Project Description: During the flood of January 1997, Incline Road sustained substantial damage. The objective of this project was to reconstruct the roadway to pre flood conditions from Foresta Bridge to a point near the Merced River/South Fork Merced River confluence. The project consisted of reconstructing the roadway by reinforcing the fill and resurfacing with both road base and asphalt. The project was completed in June 2000.

Agency Name: Mariposa County

Project Name: **Mariposa County General Plan Update**

Description: The Mariposa County General Plan will update county wide zoning ordinances and related implementing documents. This update is intended to allow Mariposa County to comply with current California law. Specifically, it is intended that this would allow Mariposa County to comply with changes to state law that have changed since the 1980 General Plan was adopted. This update will follow established public involvement protocol and may respond to county wide land-use issues.

Agency Name: Mariposa County

Project Name: **Mariposa Creek Pedestrian/Bike Path**

Description: This pedestrian/bike path will eventually traverse the town of Mariposa for 3.5 miles from Highway 49 north, to the Mariposa County fairgrounds, two miles south of the Highway 140/49 intersection. The bike/pedestrian path will eventually add other routes and could serve local commuters when complete. Currently, the county is beginning construction of a three block section located in the center of the town of Mariposa. Estimated project completion is approximately ten years, depending on funding availability.

Agency Name: Mariposa County

Project Name: **Recreation Master Plan**

Description: This plan, now in the early planning stage, is intended to address county wide recreational opportunities, facilities, and strategies.

Agency Name: Mariposa County

Project Name: **Road Improvement and Circulation Policy**

Description: This project will establish access standards for subdivisions and other developments; will establish State of California Fire Safety Standards, define a county grading ordinance and establish county-wide road improvement standards.

Agency Name: Mariposa County

Project Name: **Road Realignment and Bridge Replacement of Highway 49 and Old Highway**

Description: The intersection, currently located south of the community of Mariposa, would be relocated closer to Mariposa, with other lane and bridge improvements included. The purpose of the project is to eliminate safety concerns. Construction activities are scheduled to begin in the year 2003 and are expected to extend into multiple planning cycles due to the relatively high cost of the project and the timing of various project components.

Agency Name: Mariposa County

Project Name: **Silvertip Resort Village Project**

Description: Located within the community of Fish Camp in southern Mariposa County, the proposed development includes a 137-room hotel, 40 cabins, conference facilities, an exterior swimming pool, three decorative ponds, an on-site wastewater disposal system, and 359 parking spaces, as well as roadway, pathway, and utility line extensions.

Agency Name: Mariposa County

Project Name: **Wawona Town Planning Area Specific Plan Update**

Description: This project is intended to update the 1987 Wawona Town Plan. The current planning objectives include amendment to and/or revision of Wawona Town Zoning Ordinances to address current nonconforming uses, to make the plan more reflective of other existing development, to provide for minimal community growth, and seek to establish a formal process for National Park Service involvement in town planning.

Agency Name: Mariposa County

Project Name: **Yosemite Motels Expansion**

Description: This project site is located along the north and south sides of Highway 140 at the existing Yosemite View Lodge development, within the El Portal Town Planning Area. Permitting has been requested to construct a 78-unit motel and a multi-purpose chapel/recreation building. Proposed access to the 78-unit motel and multi-purpose chapel/recreation building would be from the north side of Highway 140. Permitting has also been requested for the construction of a 63-unit, 3-story motel building and associated parking near the existing Yosemite View Lodge. Access to this 63-unit building would be from the south side of Highway 140.

Agency Name: Mariposa County

Project Name: **Yosemite West Re-zoning for 55 acres**

Description: This project would call for the re-zoning of a 55 acre parcel in the Yosemite West area to allow for the development of: employee housing, visitor parking, National Park Service and concessioner operating facilities, regional commercial and office service facilities and a hotel complex.

Agency Name: Mariposa County

Project Name: **Yosemite West, Rezone – Transient Rental Overlay Zone Amendment**

Description: The goal of this project is to provide a mixed-use development in Yosemite West that would complement the existing residential neighborhood and minimize work/home commute patterns inside the park for some employees.

Agency Name: Mariposa County

Project Name: **Yosemite West, Specific Plan**

Description: The objectives of this plan will be to resolve current land-use conflicts in Yosemite West by defining land-use standards and zoning criteria. The Yosemite West Community Advisory Committee is currently working with Mariposa County to identify other related goals and objectives of the proposed specific plan.

Agency: Mariposa County

Project Name: **Yosemite West, Thirty-One Acre Bed and Breakfast**

Description: This project would be located on thirty-one acres of land located adjacent to and immediately west of the current Yosemite West Subdivision. Access to the site would require travelling over two segments of roadway located within Yosemite National Park. The complex would need to comply with Mariposa County zoning ordinances and State of California waste water treatment regulations.

Agency Name: Mariposa County

Project Name: **Yosemite West, Wastewater Improvement Projects**

Description: The community of Yosemite West has received a Cease and Desist Order from the State of California, Regional Water Control Board. This order has required the Yosemite West Community to improve its wastewater treatment facilities by the fall of 2001. Wastewater treatment facilities in Yosemite West are currently undersized and cannot adequately treat the volume of sewage received. Mariposa County has also issued a moratorium on building in Yosemite West until such time as the wastewater treatment facilities are improved.

Agency Name: Merced County

Project Name: **University of California Campus, Merced**

Description: A development concept is underway for a new 10,300-acre university community which would include 8,100 acres owned by trusts, 200 acres owned by the County of Merced, and 2,000 acres that would be donated by a trust. The new development will be located north and east of Lake Yosemite, just outside of Merced, California. Currently, 150 acres are and would remain a golf course; the remaining acreage is currently undeveloped. At completion, the new community is expected to encompass 5,000 developed acres, with 31,500 residents and 31,600 students, faculty, and staff, for a total population of 63,100. The development will consist of 12,000 housing units, 825,000 square feet of commercial property, and a 2,750,000 square-foot business/employment center. This project is expected to bring significant urban development and growth to the northern portion of Merced County.

The Merced campus is scheduled to open in fall 2005 and site construction is expected to begin in summer 2001. This development is located approximately 40 miles from Yosemite National Park, it requires approximately two hours of driving time on Highway 140 to reach the park. The site is located at the base of the Sierra Nevada foothills and is primarily composed of grazing land and non-native grasslands, with some wetlands.

Agency Name: City of Merced

Project Name: **Merced City General Plan**

Description: By 2015, the City of Merced is expected to increase from its 1999 population of 62,000 to 133,000. The growth area was expanded from 16,000 acres to 20,500 acres in 1997 to accommodate the expected increase in population with the adoption of the City of Merced's General Plan.

Agency Name: California Department of Transportation, Amtrak

Project Name: **Rail Projects**

Description: New stations planned for the San Joaquin Corridor:

- Merced – 1 year to 18 months
- Fresno – unknown time frame
- Modesto – by Dec. 1, 1999
- Bakersfield – unknown time frame

The Modesto station north of Highway 132 for the Burlington Northern/Santa Fe rail line serves the San Joaquin Valley. The rail line runs from Kern County in the south to Sacramento in the north and provides service to local ridership as well as to tourists and visitors. This line serves the east San Joaquin Valley.

Currently there are five round-trips per day in this corridor: four from the Bay Area to Bakersfield and back and one from Sacramento to Bakersfield and back. The addition of another round-trip from Sacramento to Bakersfield is anticipated within one month. Last year, 700,000 Amtrak passengers traveled the San Joaquin corridor. In addition, two-thirds of those 700,000 passengers also boarded buses chartered by Amtrak. At the Bakersfield station, there are eight bus routes to take Amtrak passengers to various destinations beyond the station.

A rail corridor improvement project is underway to upgrade track, signalization, etc., along the Union Pacific corridor from Sacramento to Stockton. Another project is planned for improvements to the Burlington Northern corridor between Stockton and Bakersfield. These improvements would decrease running time and increase ridership.

The San Joaquin corridor is the fourth most popular corridor in the country in terms of ridership.

Agency Name: Mono County

Project Name: **Double Eagle Resort Construction at June Lake**

Description: Approved plans for this project include an 11,000 square-foot resort/spa development, a 2,960 square-foot restaurant, a 2,520 square-foot conference facility, and 22 rental cabins with a 4,000-square-foot recreation building. The restaurant, spa, and 14 of the 22 rental cabins were proposed to be completed in the summer of 1999. The other eight cabins were scheduled for construction during the summer of 1999, while other facilities are still in the planning phase. This project is currently in the construction phase.

Agency Name: Mono County

Project Name: **Hide-a-Way Down Canyon Condominiums, June Lake**

Description: This project, now in the preliminary planning stage, will include ten condominium units.

Agency Name: Mono County

Project Name: **Highlands, June Lake**

Description: Approved plans for Phase I of this project include 113 condominium units and 35 single-family residential lots. Lots are expected to become available for sale in 2000, and construction of the condominium units may occur in two or three years. This project is currently in the planning (Environmental Impact Report) phase.

Agency Name: Mono County

Project Name: **Mono County Regional Transportation Plan**

Description: The goal of this project is summarized as follows: “Through it’s transportation planning efforts, the Mono County Regional Transportation Plan will assist in the preservation and protection of the park by strengthening the relationship between the Yosemite region and its eastern gateway.”

The objectives of this project are as summarized: A) support the park’s mission to preserve the resources that contribute to Yosemite’s unusual character and attractiveness; B) improve opportunities for access by alternative modes; C) encourage diversity in visitor destinations and experiences; D) provide for safe and consistent transportation between Yosemite National Park and its eastern gateway; and E) develop transportation infrastructure that supports access to and within the gateway communities.

Agency Name: Mono County

Project Name: **Residential Development, Crowley Lake**

Description: This project, now in the preliminary planning stage, will include a 48-unit multi-family apartment complex.

Agency Name: Mono County

Project Name: **RV Park Specific Plan and Construction, Bodie**

Description: This project will be located at the junction of U.S. 395 and S.R. 270 and will propose to impact approximately 13 acres of land on a 155 acre parcel. The project will consist of a general store, office, restroom, 10-unit motel, 600-square-foot old west museum, 32 space RV park, RV park restroom/shower, 8 cabins, 14 tent camping spaces, and 2 single-family residences.

Agency Name: Mono County

Project Name: **Tioga Inn Improvement, Lee Vining**

Description: Plans have been approved for this 120-room hotel at the intersection of Highways 395 and Highway 120. The hotel will also include ten residential housing units, banquet facilities, a coffee shop, a restaurant, and a gas station. Construction is estimated to begin in 2001 or 2002. This project is currently in the construction stage.

Agency Name: Tuolumne County

Project Name: **Evergreen Lodge Expansion**

Description: The Evergreen Lodge is located on Evergreen Road just south of Camp Mather, approximately 7.5 miles from Highway 120. Expansion plans are being considered to increase the size of the Lodge from 21 guest units to 109 guest units with associated amenities. It is anticipated that construction will not be completed until 2001 or 2002.

Agency Name: Tuolumne County, Yosemite National Park, Stanislaus National Forest, Federal State Route (Highway) Administration, City and County of San Francisco, National Park Service, California State Department of Transportation.

Project Name: **Evergreen Road Improvement**

Description: Discussions have been held regarding the improvement of Evergreen Road through the Forest Highway program. Evergreen Road provides access to Camp Mather and the Hetch Hetchy area from Highway 120 near the Big Oak Flat Entrance Station to Yosemite National Park. The project would improve Evergreen Road and possibly reroute it east of Camp Mather to Hetch Hetchy Road. No action has been taken on this project since discussions were held in October of 1998 and the project appears to be on hold.

Agency Name: Tuolumne County

Project Name: **Rush Creek Guest Lodging and Conference Facilities**

Description: Plans are being reviewed for approximately 144 guest units and conference facilities on approximately 18 acres near the intersection of Hardin Flat Road and Highway 120, approximately one mile west of the Big Oak Flat Entrance Station. The Rush Creek Lodge currently occupies the site. Construction is expected to be completed in 2001 or 2002.

Agency Name: Tuolumne County

Project Name: **Yosemite Gateway Plaza, Big Oak Flat**

Description: The project, now in the planning stage, may include: 1) two hotels at 200 rooms each; 2) a 80,000 square-foot commercial center; 3) an IMAX-type theater; 4) fast-food restaurants; 5) a gas station; 6) a 200 space RV park; 7) an information building; and 8) parking to serve Yosemite National Park.

Agency Name: U.S. Forest Service, Stanislaus National Forest

Project Name: **A-Rock Reforestation**

Description: This project will occur within Mariposa County at T2S, R19-20E and T3S, R19-20E. The Forest Service will reforest 5,000 acres within the A-Rock Fire. Reforestation activities may include burning, mechanical, and ground and aerial application of herbicides. The decision notice and FONSI were signed in March 1999.

Agency Name: U.S. Forest Service – Stanislaus National Forest

Project Name: **Aspen Fuels Reduction (G020003)**

Description: The project is located in Tuolumne County at the Evergreen and Aspen Valley Road junction; T1S, R19E, Sec 26 & 35. This project proposes manual and mechanical removal of under-story trees to allow 500 acres of under-burning with prescribed fire to improve spotted owl habitat and provide protection to owl habitat and general forest from stand replacing wildfire. A portion of a Spotted Owl Protected Activity Center (PAC) is included within the treatment area.

Agency Name: U.S. Forest Service, Stanislaus National Forest

Project Name: **Fire Management Action Plan for Wilderness**

Description: This is a forest-wide action to incorporate the recently approved *Federal Wildland Fire Policy* that involves changes in terminology, funding sources, and management of wildland fires. A site-specific environmental analysis is in progress. The fire policy for wilderness allows naturally ignited fires to burn across boundaries (between U.S. Forest Service and National Park Service, for example) as long as the fire stays within certain prescribed conditions. As the fire burns, it is monitored and evaluated to ensure that it stays within these conditions.

Agency Name: U.S. Forest Service

Project Name: **Granite Project: Watershed Protection and Enhancement (G049905)**

Description: The project is located in Tuolumne County at T1N, T2N, R18, 19E. The watershed protection and enhancement is project proposed for 12,000 acres in the Reed, Jawbone, and Granite Creek Watersheds.

Agency Name: U.S. Forest Service, Inyo and Sierra National Forest

Project Name: **Revised Draft, Environmental Impact Statement – Management Direction for the Ansel Adams, John Muir, and Dinkey Lakes Wildernesses**

Description: The U.S. Forest Service is preparing a Forest Plan amendment for wilderness direction and land and resource management plans for three designated wilderness areas. The original planning began in 1991 and a draft EIS was released in 1997, followed by a one-year comment period. The U.S. Forest Service received over 2,000 comments. A revised draft was released to the public on August 23, 2000. The biggest issues leading to a revised draft were the lack of sufficient data to support the decisions made by the document and concerning commercial uses in the wilderness areas. The document will focus on three main areas:

- Visitor use
- Commercial services management
- Recreational pack stock management

One of the issues related to commercial use involves commercial outfitters who begin their trips in these wilderness areas and then move into Yosemite National Park. Outfitter operations that travel to Yosemite Valley could be affected by changes in wilderness operations.

Agency Name: U.S. Forest Service, Stanislaus National Forest (Groveland Ranger District)

Project Name: **Orange Crush Fuels Treatment Projects**

Description: This project will occur within Mariposa County at T1S, R19E, Sec. 27, 28, 29, 32, 33 & 34. This project proposes to add 290 acres of prescribed burning of natural fuels outside the timber sale area for the Orange Crush Timber Sale (Crush Multi-Product Environmental Assessment-GO99212) and modify the original prescribed burning prescriptions. The total area to be treated with prescribed fire would be 1,018 acres.

Agency Name: U.S. Forest Service, Stanislaus National Forest (Summit Ranger District)

Project Name: **Pinecrest Basin Forest Plan Amendment**

Description: U.S. Forest Service is evaluating how to manage the current recreational use that is occurring along the Highway 108 corridor (north of the park), particularly in the Pinecrest Lake area. There are 300 cabin permits issued in the lake area in addition to numerous campgrounds. The recreational use is excessive and methods to manage people are being explored. This project is currently in the early planning phase.

Agency Name: U.S. Forest Service, Stanislaus National Forest

Project Name: **Rogge-Ackerson Fire Reforestation**

Description: The U.S. Forest Service will reforest 4,500 acres affected by the Rogge-Ackerson fires. Reforestation activities may include burning, slash piling, deep tilling, shredding, and application of herbicides. The decision notice and FONSI was signed in March 1999.

Agency Name: U.S. Forest Service, Pacific Southwest Region (PSW)

Project Name: **Sierra Nevada Framework for Conservation and Collaboration**

Description: *The following information was copied directly from the Sierra Nevada Framework web site @ www.r5.fs.fed.us/snfc.*

In 1992, the U.S. Forest Service Pacific Southwest Region (PSW) initiated a Sierra Nevada-wide planning effort in response to a 1991 technical report on the declining status of the California spotted owl. Interim guidelines for protecting owl habitat were adopted in January 1993. The U.S. Forest Service subsequently began developing a long-term management plan for owl habitat and other issues. A draft environmental impact statement (EIS) for this work was released in 1995. A revised draft EIS was scheduled for release in 1996. However, release of new scientific information in the Sierra Nevada Ecosystem Project (SNEP) report influenced the withdrawal of the revised draft EIS. The Secretary of Agriculture empanelled a Federal

Advisory Committee (FAC) to review and advise on the EIS and SNEP report. The committee concluded that the revised draft EIS was inadequate in its current form as either an owl or ecosystem management-planning document. The FAC report offered recommendations for addressing inconsistencies with new scientific information, identified shortcomings in some key elements of the analysis process, and stressed the need for more collaborative planning.

In January 1998, in response to the FAC report and other information, the Forest Service and the PSW Research Station initiated a collaborative effort to incorporate new information into management of Sierra Nevada National Forests. This effort, known as the Sierra Nevada Framework for Conservation and Collaboration, incorporates the latest scientific information into national forest management through broad public and intergovernmental participation in natural resource planning. The framework includes the Sequoia, Sierra, Stanislaus, Eldorado, Inyo, Tahoe, Plumas, Lassen and Modoc National Forests, and the Lake Tahoe Basin Management Unit. In addition, Region 5 (PSW) is working with personnel from the Humboldt-Toiyabe National Forest in Region 4 to ensure coordination and compatibility of management across administrative boundaries.

The amendment effort is focused on five problem areas: old forest ecosystems; riparian, aquatic, and meadow ecosystems; fire and fuels; noxious weeds; and lower west-side hardwood forests.

Alternative 1 is the No Action Alternative that allows current forest management patterns to continue. Alternatives 2 through 8 address the five problem areas in the following manner:

- Protect and increase old forests
- Protect and restore healthy streams and stream sides
- Increase consistency in fuels treatments
- Reduce the spread of noxious weeds and
- Protect and rehabilitate lower west-side hardwood ecosystems

The action alternatives are also similar in that they incorporate adaptive monitoring and feedback to improve management; they employ ecosystem assessment; and they require increased coordination and cooperation with tribes, local government, agencies, and the public. Alternatives 2 through 8 differ in emphasis, in the amount of land in designated areas (land allocations), in the amount of management activity that occurs, and in the flexibility for local adjustments.

The emphasis of each alternative is as follows. For more specific actions, see the summary of alternatives at the web site address provided above.

- Alternative 2 – protection reserves: Biodiversity and ecological reserves; large acreage in designated areas; limited management activity; and limited flexibility for local adjustment
- Alternative 3 – restoration: Management Emphasis Areas; moderate acreage in designated areas; moderate amount of management activity; and limited flexibility for local adjustments
- Alternative 4 – resilience and sustainability: Resilient ecosystems and sustainable outputs; small acreage in designated areas; active management; and local flexibility

- Alternative 5 – protection and restoration: Emphasize ecological values; moderate acreage in designated areas; limited activity in areas without roads and more activity in areas with roads; and limited flexibility for local adjustment
 - Alternative 6 – not being developed: Extensive use of prescribed fire
 - Alternative 7 – whole forest: Landscape diversity; small acreage in designated areas; active management on much of landscape; and high degree of flexibility to adjust management to respond to local conditions
-

Agency Name: U.S. Forest Service and Bureau of Land Management

Project Name: **South Fork and Merced Wild and Scenic River Implementation Plan**

Description: The U.S. Forest Service and the Bureau of Land Management developed a joint *South Fork and Merced Wild and Scenic River Implementation Plan* in 1991 for the segments of the main stem and South Fork of the Merced River that are under the jurisdiction of these agencies. The segments include a 15-mile portion of the main stem extending from the El Portal Administrative Site to a point 300 feet upstream of the confluence with Bear Creek; a 21-mile segment of the South Fork from the park boundary to the confluence of the Merced River; and a 3-mile segment of the South Fork just upstream of Wawona, where the National Park Service has jurisdiction over the north side of the river and the U.S. Forest Service has jurisdiction over the south side. The plan calls for the long-term protection of natural and cultural resources and the management of the area for the use and enjoyment of visitors such that the resource would be unimpaired for future use and enjoyment as a natural setting.

Agency Name: Bureau of Land Management

Project Name: **Briceburg Bridge Reconstruction**

Description: The Briceburg Bridge is located approximately 15 miles west of El Portal. It crosses the Merced River from Highway 140 to Burma Grade Road and provides access to a 4.5-mile frontage road on the river's north side. Along this frontage road visitors are provided access to three Bureau of Land Management campgrounds, river frontage for river-related activities such as fishing, river-access points for rafters, and the Merced River Canyon Trail.

The bridge was damaged in the flood of 1997 and was slated for reconstruction from August to December 1999 (now complete). The bridge was closed during construction.

Agency Name: Bureau of Land Management

Project Name: **Merced River Canyon Trail Acquisition**

Description: A trail for walking and mountain biking runs intermittently from approximately El Portal to Lake McClure along the old railroad bed adjacent to the Merced River. The trail was heavily damaged in a recent flood and is being reconstructed, as money becomes available. Private in-holdings occur throughout the trail's length, thus disrupting the continuity of the trail. The Bureau of Land Management is attempting to negotiate land exchanges in order to acquire some of the private land and create a continuous trail running along the canyon from the Bagby Recreation Area to Yosemite National Park.

Data*

Final
Yosemite
Valley
Plan

Supplemental EIS

APPENDIX I – AIR QUALITY DATA

Carbon Monoxide And PM₁₀ Hot Spot Modeling

INTRODUCTION

Short-term air quality analyses were performed for carbon monoxide levels and concentrations of particulate matter which are equal to or less than 10 microns in diameter (commonly known as PM₁₀) on a roadway segment in order to assess the relative impact of the proposed transportation mitigation alternatives on ambient air quality in Yosemite Valley. The analyses were performed using the dispersion model CALINE3, which is the preferred U.S. Environmental Protection Agency (EPA) line-source Gaussian plume dispersion model that predicts the hourly average impacts of inert pollutants near roadways. The roadway geometry, worst-case meteorological parameters, traffic volumes, receptor positions, and emission factors were inputs to the model. The roadway link selection and traffic volumes definition were based on transportation studies conducted for the National Park Service (BRW 2000), and the carbon monoxide and PM₁₀ emission factors were integrated from the Yosemite Valley vehicle emissions database (EA 1996). Persistence factors were applied to the predicted maximum hourly average concentrations of carbon monoxide and PM₁₀ to estimate the maximum 8-hour average carbon monoxide concentrations and 24-hour average PM₁₀ concentrations. Moreover, the maximum concentrations imparted to traffic conditions of the proposed transportation alternatives were independently compared to those of the existing traffic conditions (No Action Alternative) in order to determine the amount and direction of changes in carbon monoxide and PM₁₀ concentrations. A roadway link representing the worst-case level of service (LOS) in Yosemite Valley was used for the analyses.

MODEL DESCRIPTION

CALINE3 is a line-source air quality model based on the Gaussian diffusion equation and employs a mixing zone concept to characterize pollutant dispersion over the roadway. The purpose of the model is to assess air quality impacts near transportation roadways. Using source strength, meteorology, and site geometry, the model predicts pollutant concentrations for receptors located within 150 meters of the roadway. CALINE3 divides individual roadway links into a series of elements from which incremental concentrations are computed and then summed to form a total concentration estimate for a particular receptor location. CALINE3 treats the region directly over the roadway as a zone of uniform emissions and turbulence. This is designated as the mixing zone and is defined as the region over the traveled way plus three meters on either side. The additional width accounts for the initial horizontal dispersion imparted to pollutants by the vehicle wake.

A link is defined as a straight segment of roadway having a constant width, height, traffic volume, and vehicle emission factor. The location of the link is specified by the endpoint coordinates of its centerline. The location of a receptor is specified in terms of X, Y, Z coordinates. The program automatically sums the contributions from each link to each receptor. After this is completed for all receptors, a background value may be added. Surface roughness is

assumed to be uniform throughout the study area. The meteorological variables of atmospheric stability, wind speed, and wind direction are also taken as constant over the study area.

Pollutant deposition and settling are also taken into account in CALINE3. Deposition velocity is a measure of the rate at which a pollutant can be adsorbed or assimilated by a surface. It involves a molecular diffusive process through the laminar sublayer covering the surface. Settling velocity is the rate at which a particle falls with respect to its immediate surroundings. A composite vehicle emission factor in grams per vehicle-mile must be provided for each link.

ROADWAY LINK SELECTION

Based on the levels of service and the traffic volume of the existing conditions, the Northside Drive segment from Yosemite Lodge to the park headquarters was selected for modeling. It is a two-way road segment for the existing traffic conditions and measures 1.13 miles long and 20 feet wide. This segment presents the worst-case traffic conditions. The associated levels of service are “D” and “E” for the A.M. and P.M. peak travel hours, respectively. The level of service quantifies the performance of a roadway section, and it ranges from “A” (best operating condition) to “F” (worst operating condition).

CALINE 3 INPUTS

Modeling Parameters

The modeling parameters define the averaging interval, the aerodynamic roughness coefficient, the settling and deposition velocities, the link/receptor geometry units, and the number of links and receptors. An averaging time of one hour was selected in order to study the short-term “hot spot” effect of carbon monoxide and PM₁₀. Moreover, the mandatory limit in CALINE3 is 120 minutes, which represents a reasonable limit of the power law approximation in the model formulation. A uniform aerodynamic roughness coefficient of 50 centimeters was selected since the valley road network lies on a relatively flat terrain with mixed vegetation and scattered buildings. This value corresponds to a rural, rolling, and lightly wooded terrain. The deposition velocity of PM₁₀ was estimated to be 0.5 centimeters per second (Zanneti 1990). CALINE3 assumes that the settling velocity is equal to the deposition velocity. Carbon monoxide deposition and settling rates are negligible. The link/receptor coordinates are expressed in meters, and 7 links and 14 receptors were defined (see Figure 1).

Link Geometry

The link geometry defines the link types, the endpoint coordinates, the link heights, and the mixing zone widths. The selected road segment was subdivided into seven straight segments whose locations are shown in Figure 1. An arbitrary X – Y (east – north) referential system was defined at about midpoint of the entire road segment. The links were numbered 1 to 7 from the east. All the links are at-grade, except link 4, which was defined as a bridge. The receptor locations are shown in Figure 1 as well. They are located very close to the link in order to simulate the short-term effects of the pollutants and to satisfy the assumptions of CALINE3. They are assigned the average breathing height of 1.8 meters. They are numbered 1 to 14 from

the west. The mixing zone is 12.2 meters wide (20 feet travel-lane width plus 10 feet on each side) for Alternative 1 and 12.8 meters for the proposed alternatives (22 feet travel-lane width).

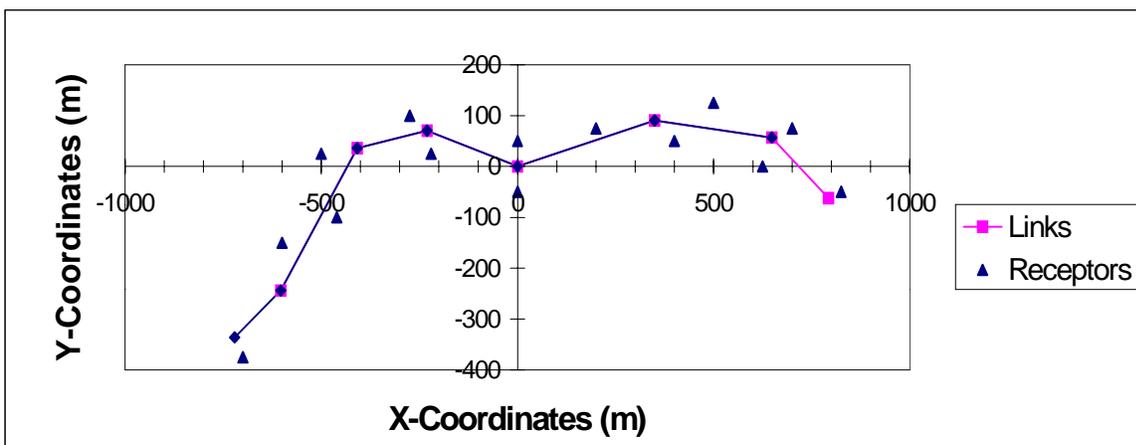

Figure 1. Selected Road Segment Link Geometry and Receptor Locations.

Link Activities

The link activities define the traffic volumes and the emission factors. The traffic volume data (in vehicles per hour) for the existing traffic conditions and the proposed transportation alternatives were obtained from National Park Service transportation studies (BRW 2000). Table I-1 presents the traffic volume data for the modeling segment. It was assumed that the total traffic volume remains constant on the entire road segment.

Alternative	A.M. Peak Hour Traffic Volume	P.M. Peak Hour Traffic Volume
1	532	911
2	132	147
3	140	155
4	139	154
5	465	466

The composite travel emission factors (in grams per vehicle mile) were estimated from the Yosemite Valley vehicle emissions database developed using EMFAC7G (EA 1996). For carbon monoxide, the average running exhaust and continuous start exhaust emission factors weighted by the vehicle number in each vehicle class were summed to generate the composite emission factor for the road segment. The weighted-average running exhaust emission factor was estimated at the design constant speeds of 35 miles per hour for automobiles and 25 miles per hour for buses. The weighted-average continuous start emission factor was calculated by estimating the average vehicle “soak” time, which is the time between turning an engine off and restarting the engine, for the vehicle fleet. Assuming the average stay for each visitor in the valley to be 4.5 hours and the average travel time per vehicle to be 64 minutes, the difference, 206 minutes, represents the average vehicle soak time. The estimation of the composite emission factor for PM₁₀ is similar to that of carbon monoxide. In addition, the average PM₁₀ tire and

brake wear emission factors and the entrained paved road dust were added to the average running exhaust and continuous start exhaust. Table I-2 shows the estimated composite carbon monoxide and PM₁₀ emission factors. In addition, it was assumed that the composite emission factors remain constant on the selected road segment.

Pollutant	Emission Factor (grams/vehicle-mile)
Carbon Monoxide	56.0
PM ₁₀	1.6

Modeling Conditions

The meteorological parameters needed to run the model these include wind speed and direction, atmospheric stability class, mixing height, and ambient background concentrations. In this study, the worst-case meteorological conditions and pollutant background concentrations that can be anticipated at the site were used. These parameters are summarized in Table I-3.

Parameter	Value
Wind Speed (m/s)	1.0
Wind Direction (degrees)	5° – 360°
Atmospheric Stability Class	6 (stable)
Mixing Height (m)	500
Background Carbon Monoxide (ppm)	3.0 (1 hour average)
Background PM ₁₀ (µg/m ³)	21.0 (24 hour average)

MODELING RESULTS

Carbon Monoxide Results

The maximum hourly average carbon monoxide concentrations predicted from the activities on the modeling road segment for the five transportation alternatives are presented in Tables I-4 and I-5. The 8-hour average carbon monoxide concentrations calculated by applying a persistence factor of 0.7 (EPA 1992) to the 1-hour average values also are presented in Tables I-4 and I-5. The spatially unpaired reductions relative to Alternative 1 in maximum carbon monoxide concentrations imparted to each of the proposed alternative are presented in Table I-4 and 5 as well. The maximum hourly average carbon monoxide concentrations (including the background concentration) vary from 3.50 parts per million to 5.10 parts per million for the A.M. peak travel hour and from 3.60 parts per million to 6.50 parts per million for the P.M. peak travel hour. The maximum 8-hour average carbon monoxide concentrations (including the background concentration) vary from 2.45 parts per million to 3.57 parts per million for the A.M. peak travel hour and from 2.52 parts per million to 4.55 parts per million for the P.M. peak travel hour. The reductions in generated maximum concentration vary from 9% to 76% for the A.M. peak travel hour and from 46% to 83% for the P.M. peak travel hour. Table I-4 and I-5 show that the P.M. peak travel hour represents the worst-case traffic and carbon

monoxide air quality conditions. However, the reductions in air quality impacts during the P.M. peak travel hour are the highest for each alternative.

The data also indicate that the maximum carbon monoxide concentrations contributed by the traffic on the modeling road segment are below the federal and California 1-hour average standards of 35 parts per million and 20 parts per million, respectively and the 8-hour average federal and California carbon monoxide standard of 9 parts per million.

Alt	1-hour Maximum Concentration w/o background (ppm)	1-hour Maximum Concentration w/ background (ppm)	8-hour Maximum ¹ Concentration w/o background (ppm)	8-hour Maximum Concentration w/ background (ppm)	Change Relative to Alternative 1 w/o background (%)

5	1.90	4.90	1.33	3.43	45.7

1. Calculated using the persistence factor 0.7
Percentages derived from 8-hour maximum concentrations without background.

PM₁₀ Results

The maximum hourly average PM₁₀ concentrations predicted from the activities on the modeled road segment for the five transportation alternatives are presented in Tables I-6 and I-7. The 24-hour average PM₁₀ concentrations calculated by applying a persistence factor of 0.4 (U.S. EPA 1992) to the 1-hour average values also are presented in Tables I-6 and I-7. The spatially unpaired reductions relative to Alternative 1 in maximum PM₁₀ concentrations imparted to each of the proposed alternative are presented in Tables I-6 and I-7 as well. The maximum 24-hour average PM₁₀ concentrations (including the background concentration) vary from 27.40 micrograms per cubic meter (µg/m³) to 46.20 µg/m³) for the A.M. peak travel hour and from 28.20 µg/m³ to 64.20 µg/m³ for the P.M. peak travel hour. The reductions in generated maximum concentration vary from 11% to 75% for the A.M. peak travel hour and from 48% to 83% for the P.M. peak travel hour. Table I-6 and I-7 show that the P.M. peak travel hour represents the worst-case traffic and PM₁₀ air quality conditions. However, the

reductions in air quality impacts during the P.M. peak travel hour are the highest for each alternative.

The data also indicate that the maximum 24-hour average PM₁₀ concentrations contributed by the modeled road segment traffic are below the federal 24-hour average standard of 150 µg/m³ for all alternatives, but exceeds the California 24-hour standard of 50 µg/m³ for the evening peak travel hour for the No Action Alternative (Alternative 1).

CONCLUSION

CALINE3 was used to study the short-term hot spot effects of carbon monoxide and PM₁₀ pollutants for five transportation alternatives in Yosemite Valley. The dispersion modeling was applied to the Northside Drive roadway segment from Yosemite Lodge to park headquarters, which represents the worst-case operating conditions. The results of the modeling show that the 1-hour and 8-hour average maximum concentrations of carbon monoxide are below the federal standards. The 24-hour average PM₁₀ concentrations are below the federal standard, but exceed the California standard for Alternative 1, the No Action Alternative for the evening peak travel hour. The reductions in maximum concentrations from the proposed alternatives relative to the No Action Alternative vary from 9.5% to 83% for carbon monoxide and from 11% to 83% for PM₁₀.

Analysis
Methods*

Final
Yosemite
Valley
Plan

Supplemental EIS

APPENDIX J – SOCIOECONOMIC ANALYSIS METHODS

The key methods and assumptions used in the socioeconomic analysis for the *Final Yosemite Valley Plan/SEIS* are provided below. The methods and assumptions are presented and discussed according to three issue areas: (1) visitor demand and park visitation projections, (2) regional economic impacts, and (3) cumulative impacts.

Visitor Demand and Park Visitation Projections

For purposes of the impact analysis, visitor demand for park access was projected to remain unchanged in the future from its current conditions. The rationale for this assumption is discussed below. In addition, 1998 park visitation levels were used as the baseline conditions for the visitation analysis, and it is estimated that summer day visitation averaged 10,950 visitors per day. During the summer, visitation is typically greater during the weekends. As a result, day visitor use on the busiest days of the year would be higher than 10,950.

Table J-1 shows the expected visitor use based on overnight and day-visitor parking facilities for each alternative. These expected visitor use levels were compared with the baseline conditions (1998 park visitation levels shown in Alternative 1) to evaluate whether projected future visitation demand could be accommodated.

Alternative	Expected Use Level of Yosemite Valley Overnight Facilities	Expected Use Level of Valley by Day Visitors That Can Be Accommodated	Total Daily Visitation
1	6,387	10,950 (13,950) ¹	17,337 (20,337)
2	5,389	12,852	18,241
3	5,212	13,029	18,241
4	5,164	13,077	18,241
5	5,891	12,350	18,241

Note: The table assumes that existing visitor characteristics and visitor use patterns would continue. Characteristics that could change over time and affect the number of visitors who would use facilities in the park include the number of people in each party or vehicle, the length of stay, the distribution of visitor arrivals and departures over the course of the day, the ridership on tour buses, the locations in the Valley visited by each party, and the number of vehicles at each campsite, among others. Additionally, the number of visitors (use level) on any particular day will vary according to daily fluctuations in these characteristics.

¹ 10,950 is the peak season average day visitor level, while 13,950 is the fourth largest peak summer day-visitor level.

The analysis also considered that park visitation on the busiest days during the summer would be higher than the 10,950 average visitation estimate. It is expected that the existing and proposed traveler information and traffic management systems would help to mitigate any potential adverse impacts associated with visitor capacity during the busiest days. These systems could help visitors to plan in advance of their visit and forewarn visitors when day-visitor parking is approaching full capacity. This would help manage park visitation by encouraging and directing visitors to visit during non-peak periods of the day and season. In which case, no net reduction in total annual visitation would occur since peak period visitation would be shifted to less busy days (i.e., weekdays) or less busy times of the day.

Using the methodology and assumptions discussed above, future day use was projected for each of the action alternatives. These visitation projections were compared with the baseline conditions to evaluate the type and magnitude of day visitor impacts for each alternative.

FUTURE VISITOR DEMAND AND PARK VISITATION PROJECTIONS

Projecting the magnitude and nature of future day visitation is difficult due to the complexities associated with the proposed alternatives and numerous uncertainties associated with other independent factors that may affect future visitor demand for park access.

Table J-2 identifies the major factors that may influence an increase or decrease in future day use at Yosemite National Park. Past visitation and visitor use patterns are important factors influencing future Yosemite-related visitation and spending, and numerous other factors are shown that may affect future day use. While some of these factors relate to the proposed alternatives (such as future environmental restoration and changes in transportation and access), several other significant factors operate independently of the proposed alternatives (such as underlying visitor demand for outdoor recreation and population growth).

Many of the factors influencing future day use may have countervailing influences. For example, relocating parking out of the east Valley may add time to day visitors' trips into the park, but the resulting reduced congestion may increase visitation demand. It is not possible to determine the net influences of these and other factors on future day use for several reasons. First, the number and variety of factors potentially influencing future visitation cannot be easily combined to estimate a net impact on day use. Second, there is insufficient information on current visitor demand and attitudes on which to base any future visitor response to the proposed changes at Yosemite. Third, social and economic data for many of these factors is insufficiently detailed to fully understand the likely effects on potential visitors. Fourth, visitors may respond to changes in park facilities and operations by changing their demand for park access, their spending behavior, their use patterns and/or their length of stay. These responses cannot be predicted easily, especially when complex and innovative changes are being proposed. Fifth, the identified visitation factors and influences are based on several basic assumptions about future Yosemite visitor demand (see the bottom of Table J-2). If these assumptions are not consistent with future conditions, then future day use may change markedly.

Due to uncertainties of the future influence of the factors identified above, for purposes of the impact analysis, it has been assumed that future visitor demand will be unchanged from 1998 levels. As a result, changes in future visitation among alternatives have been evaluated solely on the basis of visitor facility service capacity differences associated with the proposed alternatives. This assumption was considered to be a conservative approach that would allow for a clear comparison of the various alternatives and associated impacts.

**Table J-2
Factors Potentially Influencing Future Day Visitation To Yosemite National Park**

	Factors Potentially Increasing Visitation	Factors Potentially Decreasing Visitation
UNDERLYING DEMAND	Increased Population Growth in Market Area/Region	—
	Increased California Tourism	—
	Increased In-Park Accommodations	Decreased In-Park Accommodations
	Increased Local Accommodations	Decreased Local Accommodations
	—	Development of Substitute Tourism Destinations
	—	Construction and Implementation Impacts
	Favorable Publicity & Marketing	Unfavorable Publicity & Marketing
PARK ACCESS	Vehicle Management System Improvements	Vehicle Management System Limitations
	Guaranteed Entry	Reservation System
	Low Entry Fees	Higher Entry Fees
	—	Relocated Parking
	—	Satellite Parking
	Greater In-Valley Shuttle Service	Shuttle Transfer
	Increased Alternative Transit (YARTS)	—
	Maximum Acceptable Service Level (MASL)	Maximum Acceptable Service Level (MASL)
VISITOR EXPERIENCE	Improved Visitor Experience	—
	Improved Visitor Orientation	—
	Improved Interpretation	—
	Reduced Traffic & Congestion	—
	Increased Recreational Opportunities	Reduced Recreational Opportunities
	Improved Hiking, Biking, Nature Viewing	Reduced Car Touring, Horseback Riding
	—	Reduced Picnicking

Key Assumptions

- No change to fundamental nature of demand for Yosemite visitation
- No change to current visitor behavior such as visitation patterns, visitor spending, or visitor origin and destination
- Minor additional cost and potential time delay to visitors from traveler information and traffic management system, west Valley, and satellite parking
- Changes to visitor experience consistent with National Park Service’s visitor experience objectives

Methods For Determining Regional Economic Impacts

The economic impacts of each *Final Yosemite Valley Plan/SEIS* alternative on the affected region would result from: (1) spending to implement each of the project’s components, and (2) changes in the park’s lodging and campsite capacity. Regional and county-specific output and employment impacts were estimated for each of these project effects using the input-output IMPLAN (Impact Planning) model. IMPLAN was selected over several other input-output systems for a number of reasons including: (1) it closely follows the accounting conventions used in the widely cited “Input-Output Study of the U.S. Economy,” by the Bureau of Economic Analysis, (2) it provides comprehensive and detailed data coverage of the entire United States, (3) it provides a high degree of flexibility in geographic coverage and model formulation, and (4) it allows for business sector aggregation by Standard Industrial Classification sector. IMPLAN

provides estimates of the cumulative (or multiplied) economic effects that result directly and secondarily from an initial stimulus to an industrial sector (e.g., spending changes in construction, mining, manufacturing, retail, etc.).

Secondary impacts include indirect effects and induced effects. *Direct* multipliers are those which determine the immediate effect within the sector(s) of the economy where the initial stimulus occurs. *Induced* multipliers represent the impact of the initial stimulus on the economy from changes in personal consumption (as a result of changes in employee income). *Indirect* multipliers represent the impact of the initial stimulus on the economy as a result of changes in business spending. IMPLAN can be used to estimate each of these multipliers separately. Once these multipliers are calculated they can be combined to quantify the total impacts of an actual or hypothetical shift in spending in a specific economic sector. Once the impacts are estimated they can be compared to a baseline of economic data for the specific area of study to evaluate the magnitude (or significance) of the impact.

Significance thresholds applied in the evaluation of magnitudes are as follows:

- Below 1% = negligible
- Above 1% but below 2.5% = minor
- Above 2.5% but below 5.0% = moderate
- Above 5% = major

These thresholds are based on best professional judgement.

Impacts Of Construction Spending

It is estimated that construction proposed under each of the *Final Yosemite Valley Plan/SEIS* action alternatives would take fifteen years to finish and be approximately 65% and 95% complete five and ten years, respectively, after the start of construction. For the analysis of construction-spending impacts, a gravity model was used to develop a reasonable estimate of the construction spending distribution among the counties surrounding Yosemite that are expected to supply the majority of the material and labor resources needed to implement the *Yosemite Valley Plan*. The model weighs each county by the ratio of its population over the distance of its largest city from the proposed project site squared (similar to the approach used to measure the gravitational pull between two bodies in physics where population is a proxy for mass).

$$\begin{array}{l} \text{Construction} \\ \text{Spending} \\ \text{Distribution} \end{array} = \frac{\text{County Population}}{(\text{Distance To Project Site})^2}$$

In this manner, it is assumed that the larger the population (and thus, presumably, labor and construction material resources of a county), the greater the potential share of project construction spending would go to that county. At the same time, it is assumed that the further the county is away from the proposed project site, the smaller the potential share of project construction spending would go to that county. Seven counties were included in the model, the five Yosemite-region counties (Madera, Mariposa, Merced, Mono, and Tuolumne) as well as Fresno and

Stanislaus Counties. Mariposa County's weight based on the gravity model was doubled to anticipate some immigration of labor into Mariposa County during construction of the project.

Ultimately how the *Yosemite Valley Plan* is implemented would effect how construction spending impacts occur in the five Yosemite-area counties, the use of a gravity model is necessary since specific details of project implementation are not determined. The gravity model results are used to estimate output and employment impacts resulting from project construction for the five-county affected region as a whole. In addition, the projected construction spending impacts on Mariposa County are evaluated separately.

The gravity model results indicate that about 70% of the total project's construction cost (excluding planning) would be spent within the affected Yosemite region. Similarly, it is estimated that 15% of the total project's construction cost (excluding planning) would be spent within Mariposa County alone. The percentages were used to calculate the portion of the total construction cost for the development proposed under each alternative, excluding planning costs, expected to be spent within the affected region as a whole and Mariposa County specifically. (Historically, the majority of engineering and planning work on infrastructure and facility development at Yosemite has been conducted outside the Yosemite region. Therefore, the analysis assumes that none of the *Yosemite Valley Plan* construction planning costs would be spent within the Yosemite region.)

Impacts Of Visitor Spending

Following implementation of each alternative, visitation patterns to the park will likely change. The distribution of the resulting visitor-spending impacts among the counties in the Yosemite region was estimated from a combination of: (1) recent traffic count along routes entering and exiting Yosemite as compiled by BRW, Inc., and (2) visitor lodging and spending patterns within the affected region. Although visitation may also be affected during implementation of proposed projects, (particularly any new Valley lodging during the first ten years of project construction), the visitor spending impacts associated with project implementation were not estimated for several reasons. First, the actual schedule for the implementation of specific *Yosemite Valley Plan* development proposals has yet to be determined. Second, no studies have been conducted to evaluate the potential effects on visitor and employee access of those proposals. Third, the National Park Service would work to minimize the impacts of *Yosemite Valley Plan* implementation on visitors through a combination of signage, construction timing (e.g., work during off-peak hours, etc.) and other measures, and the details of these approaches are not available. Fourth, it is the intention of the National Park Service to permit use of all Valley lodging units planned for removal until new units are completed.

METHODS FOR DETERMINING CUMULATIVE IMPACTS

Under each alternative, an array of development projects would be implemented in the region, as identified in Appendix H (Cumulative Impacts Scenario). Implementation of these projects is likely to be gradual and coordinated. Nonetheless, these projects could have an appreciable impact on various elements of the region's socioeconomy, including: (1) visitation and visitor spending, (2) local construction spending, and (3) employment and housing. Cumulative impacts represent the impacts of these projects *in combination with* the projects proposed under each alternative.

Visitation And Visitor Spending

The park itself is the primary destination for more than 50% of the visitors to Yosemite National Park.¹ Accordingly, most of the future non residential projects in the region would be designed to accommodate park visitors. Several projects in the cumulative impacts scenario are planned to enhance visitor experience, such as the Yosemite Area Regional Transportation System and shuttle bus stop improvements. Yet, Yosemite National Park is already one of the major tourist attractions in the United States, primarily because of its scenic resources and natural conditions. Therefore, new projects designed to provide relatively minor enhancements to visitor experience would not be expected to generate significant increases in visitation or visitor spending.

Impacts on visitation and visitor spending were assumed to occur as a result of lodging projects in the cumulative impacts scenario. Given the high demand for lodging in the region, especially during the peak season, it is expected that some day visitors would likely choose to stay overnight in the region if there is additional capacity. This may translate into an increase in overnight visitation and visitor spending. This is a relatively conservative assumption because it assumes that there would be no net increase in visitation associated with increases in the region's lodging capacity (only a switching of day visitors to out-of-park overnight visitors).

The cumulative impacts scenario identified 757 lodging units to be constructed on seven properties in the region. The number of additional overnight stays was estimated by multiplying the number of new lodging units by 3.17 guests per room, assuming 60% occupancy.² These additional stays would represent out-of-park overnight visitors, who spend an average of \$61.30 per capita per day. Assuming that these out-of-park overnight visitors would otherwise be day visitors, the net economic impact of each additional overnight stay would be \$35.76 (\$61.30 - \$25.54), or daily per capita spending by out-of-park overnight visitors less day visitors. If additional visitors are attracted to the region by the increase in lodging capacity, visitor spending growth would be even higher and the impact would be even greater.

Actual impacts on the local economy would result when businesses and individuals spend money locally that was earned from new visitor spending. These secondary impacts were calculated using IMPLAN in the same manner as the direct economic impacts of the alternatives were calculated. (See Vol. IB, Chapter 4, Environmental Consequences.)

Local Construction Spending

Local construction spending would be generated primarily by housing, transportation, and other commercial projects in the region. Appendix H (Cumulative Impacts Scenario) shows that over 35,700 new housing units (including 23,500 in the City of Merced³ and 12,000 in the proposed university community at the University of California, Merced) are planned for construction over

¹Gramann, 1992.

²Guests per room based on BRW estimate. Occupancy based on average occupancy at facilities managed by Yosemite Motels (Source: Barry Brouillette, Yosemite Motels, August 10, 1999).

³Population is projected to increase by 71,000 by the year 2015. At 3.02 persons per household (average for City of Merced), this equates to 23,500 new housing units.

the next 15 years. Construction spending for these housing projects was estimated using a unit cost of \$65.80 per square foot (based on 1999 *Uniform Building Code* valuation data for Dwellings [Type V-Masonry] in California).⁴ The average square footage per unit was assumed to be 1,500 square feet.⁵

Construction spending estimates for transportation projects were obtained from project proponents.

Commercial projects in Appendix H (Cumulative Impacts Scenario) include new lodging units, conference facilities, office space, and restaurants. A total of 757 new lodging units were identified in the cumulative impacts scenario. Construction spending was estimated for these projects using a unit cost of \$64.86 per square foot (based on 1999 *Uniform Building Code* valuation data for Hotels and Motels [Type V-N] in California).⁶ The average square footage per unit was assumed to be 288 square feet.⁷

Other commercial projects identified in the cumulative impacts scenario would result in over 3.6 million square feet of new construction. Construction spending for these projects was calculated assuming an average construction cost per square foot of \$63.75.⁸

Additional construction spending would generate output impacts, not only directly but also secondarily, as a result of local spending on material inputs and wage spending by project labor. These impacts were estimated using IMPLAN.

Employment And Housing

When available, employment impacts associated with the projects identified in Appendix H (Cumulative Impacts Scenario) were obtained directly from project proponents. Otherwise, employment impacts were calculated as a function of spending impacts. County multipliers were used to determine the number of new full-time equivalent (FTE) jobs that would be generated per one million dollars in increased construction spending. In addition, the number of jobs associated with increased spending for lodging, food and beverages, retail, and transit were calculated based on county multipliers.

Housing impacts were determined based on the amount of new workers that would need to be accommodated in the region as a result of employment impacts.

CHAPTER I. INTRODUCTION

Purpose and Need

The National Park Service in Yosemite has prepared the *Final Yosemite Valley Plan Supplemental Environmental Impact Statement (Final Yosemite Valley Plan/SEIS)* to provide direction and propose specific actions to restore, protect, and enhance the natural, cultural, and scenic resources of Yosemite Valley, and to provide a high-quality, resource-based experience for visitors. The purpose of this Biological Assessment is to review the *Final Yosemite Valley Plan* in sufficient detail to determine effects of the plan on federal and state-listed threatened or endangered species, federal and state species of concern, state-listed rare species, and species that are locally rare or threatened. All of these species are also referred to as special-status species throughout this document.

The *Final Yosemite Valley Plan/SEIS* aims to restore degraded areas and reduce development within the Merced River ecosystem and other highly valued natural and cultural resource environments. The plan proposes to reduce traffic congestion and supports the use of alternative fuels to reduce mobile sources of air pollution. It presents alternatives to expand orientation and interpretation services and proposes to move nonessential housing, administrative headquarters, offices, and other functions out of Yosemite Valley. Many of these functions would move to the El Portal Administrative Site on the western boundary of the park. The plan proposes options for the size and placement of parking areas, both within and outside of Yosemite Valley.

This Biological Assessment will evaluate the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS*, Alternative 2. The areas that could be affected by the Preferred Alternative include Yosemite Valley, the El Portal Administrative Site, Wawona, Foresta, the Tioga Entrance Station, the Arch Rock Entrance Station, the South Entrance Station, the Big Oak Flat Entrance Station, and proposed parking areas in the western part of the park at Badger Pass, El Portal, and Hazel Green or Foresta. These areas are designated as the project area. Detailed maps of the project area are available in Vol. IC, *Final Yosemite Valley Plan/SEIS*.

This Biological Assessment will:

- Evaluate and document the effects of the Preferred Alternative on special-status species or their critical habitat that are known to be or could be present within the project area
- Determine the need for consultation and conference with the U.S. Fish and Wildlife Service (USFWS)
- Conform to requirements of the Endangered Species Act (19 USC 1536 [c], 50 CFR 402) and the National Environmental Policy Act (42 USC 4321 et seq., implemented at 40 CFR Parts 1500-1508)

U.S. Fish and Wildlife Service Consultation

The Endangered Species Act (Section 7 [a][2]) directs federal agencies to consult with the responsible agency (in this case, the USFWS) to determine whether proposed actions are likely to

jeopardize the continued existence of a listed species or destroy or adversely modify critical habitat. To initiate the consultation process with the USFWS, the National Park Service requested a list of federally listed endangered or threatened species that may be present or may be affected by actions proposed in the *Draft Yosemite Valley Plan/SEIS*. The National Park Service requested that the list include species that are found in the region of the following U.S. Geological Survey quadrangles: Ackerson Mountain, El Capitan, El Portal, Half Dome, Tioga Pass, Yosemite Falls, and Wawona. An informal USFWS list was received on January 24, 2000. A formal updated list was received on March 29, 2000 (see Appendix K-1).

The National Park Service evaluated all federally listed species found in the seven U.S. Geological Survey quadrangles that encompass the area that could be affected by the plan (see table K-1). Each species was evaluated by National Park Service biologists familiar with habitat requirements to determine whether each species could be found in the project area. Several species were removed from further evaluation because biologists determined that they do not occur within the project area (see Species Removed from Further Analysis).

In addition to federally listed endangered or threatened species, the USFWS provided a list of candidate species and federal species of concern. Candidate species are currently being reviewed by the USFWS and are under consideration for possible listing as endangered or threatened. There were no candidate species identified in the project area for the *Draft Yosemite Valley Plan/SEIS*. Species of concern are species for which listing is possibly appropriate, but for which the USFWS lacks sufficient information to support a listing proposal. Each species of concern was evaluated by National Park Service biologists familiar with habitat requirements and added to the list of species to be evaluated in this assessment, if appropriate (see table K-1). Candidate species and species of concern have no protection under the Endangered Species Act, though National Park Service policies require consideration of these species in park planning (NPS 1988).

**Table K-1
Species Considered in this Biological Assessment**

Federal Endangered Species

Mammals

Sierra Nevada bighorn sheep (*Ovis canadensis sierrae*)

Federal Threatened Species

Birds

Bald eagle (*Haliaeetus leucocephalus*)

Reptiles and Amphibians

California red-legged frog (*Rana aurora draytonii*)

Fish

Delta smelt (*Hypomesus transpacificus*)

Paiute cutthroat trout (*Oncorhynchus clarki seleniris*)

Central Valley steelhead (*Oncorhynchus mykiss*)

Sacramento spittail (*Pogonichthys macrolepidotus*)

Invertebrates

Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*)

Table K-1
Species Considered in this Biological Assessment

Federal Species of Concern

Birds

Harlequin duck (*Histrionicus histrionicus*)
Northern goshawk (*Accipiter gentilis*)
California spotted owl (*Strix occidentalis occidentalis*)
(Little) willow flycatcher (*Empidonax traillii brewsteri*)
Bell's sage sparrow (*Amphispiza belli belli*)

Fish

Longfin smelt (*Spirinchus thaleichys*)
Red Hills roach (*Lavinia symmetricus*)

Mammals

Mount Lyell shrew (*Sorex lyelli*)
Spotted bat (*Euderma maculatum*)
Small-footed myotis bat (*Myotis ciliolabrum*)
Long-eared myotis bat (*Myotis evotis*)
Fringed myotis bat (*Myotis thysanodes*)
Long-legged myotis bat (*Myotis volans*)
Yuma myotis bat (*Myotis yumanensis*)
Greater western mastiff bat (*Eumops perotis californicus*)
Sierra Nevada snowshoe hare (*Lepus americanus tahoensis*)
Sierra Nevada (Mono Basin) mountain beaver (*Aplodontia rufa californica*)
Sierra Nevada red fox (*Vulpes vulpes necator*)
California wolverine (*Gulo gulo luteus*)
American (pine) marten (*Martes americana*)
Pacific fisher (*Martes pennanti pacifica*)

Reptiles and Amphibians

Limestone salamander (*Hydromantes brunus*)
Mount Lyell salamander (*Hydromantes platycephalus*)
Yosemite toad (*Bufo canorus*)
Foothill yellow-legged frog (*Rana boylei*)
Mountain yellow-legged frog (*Rana muscosa*)
Northwestern pond turtle (*Clemmys marmorata marmorata*)
Southwestern pond turtle (*Clemmys marmorata pallida*)
Northern sagebrush lizard (*Sceloporus graciosus graciosus*)

Invertebrates

Merced Canyon (Yosemite) shoulderband snail (*Helminthoglypta allynsmithi*)
Keeled sideband snail (*Monadenia circumcarinata*)
Mariposa sideband snail (*Monadenia hillebrandi*) [Formerly known as Yosemite Mariposa sideband snail (*Monadenia hillebrandi yosemitensis*)]
Sierra pygmy grasshopper (*Tetrix sierrana*)
Wawona riffle beetle (*Atractelmis wawona*)
Bohart's blue butterfly (*Philotiella speciosa bohartorum*)

Plants

Tiehm's rock-cress (*Arabis tiehmii*)
Yosemite woolly-sunflower (*Eriophyllum nubigenum*)
Congdon's lomatium (*Lomatium congdonii*)
Slender-stemmed (Hetch Hetchy) monkeyflower (*Mimulus filicaulis*)
Bolander's clover (parasol clover) (*Trifolium bolanderi*)

Table K-1
Species Considered in this Biological Assessment

California State Endangered Species

Birds

Bald eagle (*Haliaeetus leucocephalus*)
American peregrine falcon (*Falco peregrinus anatum*)
Great gray owl (*Strix nebulosa*)
Willow flycatcher (*Empidonax traillii*)

California State Threatened Species

Mammals

Sierra Nevada red fox (*Vulpes vulpes necator*)
California wolverine (*Gulo gulo luteus*)

California State Rare Species

Plants

Yosemite onion (*Allium yosemitense*)
Tompkin's sedge (*Carex tompkinsii*)
Congdon's woolly-sunflower (*Eriophyllum congdonii*)
Congdon's lewisia (*Lewisia congdonii*)

California State Species of Special Concern

Birds

Harlequin duck (*Histrionicus histrionicus*)
Cooper's hawk (*Accipiter cooperi*)
Northern goshawk (*Accipiter gentilis*)
Sharp-shinned hawk (*Accipiter striatus*)
Prairie falcon (*Falco mexicanus*)
Golden eagle (*Aquila chrysaetos*)
Merlin (*Falco columbarius*)
Long-eared owl (*Asio otus*)
California spotted owl (*Strix occidentalis occidentalis*)
Yellow warbler (*Dendroica petechia*)

Mammals

Sierra Nevada mountain beaver (*Aplodontia rufa californica*)
Spotted bat (*Euderma maculatum*)
Yuma myotis bat (*Myotis yumanensis*)
Greater western mastiff bat (*Eumops perotis californicus*)
Pallid bat (*Antrozous pallidus*)
Townsend's big-eared bat (*Corynorhinus townsendii townsendii*)
White-tailed hare (*Lepus townsendii*)
Pacific fisher (*Martes pennanti pacifica*)

Reptiles and Amphibians

Limestone salamander (*Hydromantes brunus*)
Mount Lyell salamander (*Hydromantes platycephalus*)
California red-legged frog (*Rana aurora draytonii*)
Yosemite toad (*Bufo canorus*)
Foothill yellow-legged frog (*Rana boylei*)
Mountain yellow-legged frog (*Rana muscosa*)
Northwestern pond turtle (*Clemmys marmorata marmorata*)
Southwestern pond turtle (*Clemmys marmorata pallida*)

**Table K-1
Species Considered in this Biological Assessment**

Park Rare Species

Plants

Sugar stick (*Allotropa virgata*)
 Snapdragon (*Antirrhinum leptaleum*)
 Sweetwater Mountains milkvetch (*Astragalus kentrophyta* var. *danaus*)
 Black and white sedge (*Carex albonigra*)
 Capitata sedge (*Carex capitata*)
 Congdon's sedge (*Carex congdonii*)
 Indian paintbrush (*Castilleja foliolosa*)
 Alpine cerastium (*Cerastium beeringianum*)
 Small's southern clarkia (*Clarkia australis*)
 Sierra claytonia (*Claytonia nevadensis*)
 Child's blue-eyed Mary (*Collinsia childii*)
 Collinsia (*Collinsia linearis*)
 Draba (*Draba praelta*)
 Round-leaved sundew (*Drosera rotundifolia*)
 Stream orchid (*Epipactis gigantea*)
 Desert fleabane (*Erigeron linearis*)
 Rambling fleabane (*Erigeron vagus*)
 Fawn-lily (*Erythronium purpurascens*)
 Northern bedstraw (*Galium boreale* ssp. *septentrionale*)
 Dane's gentian (*Gentianella tenella* ssp. *tenella*)
 Goldenaster (*Heterotheca sessiliflora* ssp. *echioides*)
 Yosemite ivesia (*Ivesia unguiculata*)
 Common juniper (*Juniperus communis*)
 Pitcher sage (*Lepechinia calycina*)
 Sierra laurel (*Leucothoe davisiae*)
 False pimpernel (*Lindernia dubia* var. *anagallidea*)
 Congdon's monkeyflower (*Mimulus congdonii*)
 Inconspicuous monkeyflower (*Mimulus inconspicuus*)
 Palmer's monkeyflower (*Mimulus palmeri*)
 Pansy monkeyflower (*Mimulus pulchellus*)
 Dwarf sandwort (*Minuartia pusilla*)
 Sierra sweet-bay (*Myrica hartwegii*)
 Azure penstemon (*Penstemon azureus* ssp. *angustissimus*)
 Phacelia (*Phacelia platyloba*)
 Phacelia (*Phacelia tanacetifolia*)
 Snow willow (*Salix reticulata*)
 Wood saxifrage (*Saxifraga mertensiana*)
 Bolander's skullcap (*Scutellaria bolanderi*)
 Groundsel (*Senecio serra* var. *serra*)
 Giant sequoia (*Sequoiadendron giganteum*)
 Ladies' tresses (*Spiranthes porrifolia*)
 Trillium (*Trillium angustipetalum*)
 Hall's wyethia (*Wyethia elata*)

The USFWS also provided a list of federal and state-listed species that may occur in Mariposa County (see Appendix K-1). Each species on the Mariposa County list was evaluated by National

Park Service biologists familiar with habitat requirements and added to the list of species to be evaluated in this assessment, if appropriate (see table K-1).

In May 2000, the National Park Service mailed the *Biological Assessment on the Draft Yosemite Valley Plan/SEIS* to the USFWS and requested formal consultation with regard to the *Yosemite Valley Plan/SEIS*. Later that month, the USFWS requested additional information on the Valley elderberry longhorn beetle. Specifically, the USFWS requested information on whether elderberry plants (which serve as the beetle's host plant) occur in riparian habitats below 3,000 feet in the project area. The USFWS also requested the number of stems of each elderberry plant over 1 inch at ground level. In June 2000, the additional information was mailed to the USFWS along with the *Revised Biological Assessment on the Draft Yosemite Valley Plan/SEIS*, which reflected the new information.

The public comment period for the *Draft Yosemite Valley Plan/SEIS* (NPS 2000a) closed in early July. At this point, the planning team began to use an analysis of the over 10,600 public comments to guide the direction of the *Final Yosemite Valley Plan/SEIS*. The biological assessment team used decisions made during this period as the basis for this Biological Assessment. The USFWS will use this Biological Assessment to render a Biological Opinion on the *Final Yosemite Valley Plan/SEIS* (NPS 2000b).

Species Evaluated in this Biological Assessment

F E D E R A L L Y L I S T E D S P E C I E S

The Endangered Species Act defines an endangered species as any species that is in danger of extinction throughout all or a significant portion of its range. A threatened species is defined as any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range. Of the federally listed species that could be affected by the *Final Yosemite Valley Plan/SEIS*, one is endangered: Sierra Nevada bighorn sheep (*Ovis canadensis sierrae*); and three are threatened: bald eagle (*Haliaeetus leucocephalus*), Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), and California red-legged frog (*Rana aurora draytonii*).

The Sierra Nevada bighorn sheep formerly ranged throughout the high elevations of the Sierra Nevada. By the beginning to the 20th century, however, their numbers had been decimated by overhunting, competition for forage with domestic sheep, and especially by diseases contracted from domestic sheep. By 1999, fewer than 200 Sierra Nevada bighorn sheep were left in the entire range, prompting its listing that year as endangered.

The bald eagle suffered steep population declines from the effects of pesticides in its food chain, resulting in its listing by the USFWS as a federally endangered species in 1978. Populations of bald eagles, however, have rebounded since the banning of the pesticide DDT in the United States in 1972. As a result, the species was reclassified from endangered to threatened in 1995. In 1999, the USFWS proposed to remove the bald eagle from the List of Endangered and Threatened Wildlife in the lower 48 states of the United States because available data indicated

the species has recovered. A final rule is expected in the near future. No critical habitat in the Sierra Nevada has been designated by the USFWS.

The Valley elderberry longhorn beetle was listed by the USFWS as threatened on August 8, 1980. This listing was primarily a result of destruction of riparian habitat in the San Joaquin Valley that removed the beetle's host plant, the elderberry. Critical habitat has been designated for the beetle in two areas: along the American River near the Sacramento metropolitan area and along Putah Creek in Solano County. However, the beetle also occurs up to 3,000 feet in elevation in the Sierra Nevada.

The California red-legged frog was listed as threatened in 1996 after its virtual disappearance from the Central Valley and the Sierra Nevada. The cause(s) of this disappearance are not well understood, but theories include pesticides, habitat destruction, and predation by non-native bullfrogs.

SPECIAL-STATUS SPECIES

Special-status species that could be affected by this plan are listed in table K-1. The species on this list include the federally endangered and threatened species in the seven U.S. Geological Survey quadrangles that encompass the project area for the plan (see USFWS Consultation), species listed in the California Natural Diversity Data Base, applicable species on the list of endangered and threatened species in Mariposa County provided by the USFWS (see Appendix K-1), and "park rare" plants identified by National Park Service. Park rare plants include those that are:

- locally rare natives
- listed by the California Native Plant Society
- endemic to the park or local vicinity
- at the furthest extent of their range
- of special importance to the park (identified in legislation or park management objectives)
- the subject of political concern or unusual public interest
- vulnerable to local population declines
- subject to human disturbance during critical portions of their life cycle

There is no classification of "park rare" for any wildlife species.

Species Removed from Further Analysis

The following species are on the list of "Endangered and Threatened Species that may occur or be Affected by Projects in the USFWS 7 ½ Minute Quads" that was provided by the USFWS (see Appendix K-1). However, the National Park Service has determined that they would not be affected by the *Final Yosemite Valley Plan/SEIS* because they do not occur in the project area, as described under Alternative 2, nor were they historically found in the project area, as described below. Therefore, there is no effect on these species from the Preferred Alternative in the *Draft Yosemite Valley Plan/SEIS*, nor are they potentially indirectly or cumulatively affected by the Preferred Alternative. These species will not be evaluated further in this Biological Assessment.

Paiute cutthroat trout, *Oncorhynchus* (= *Salmo*) *clarke seleniris* (Federal Threatened). The native range of the Paiute cutthroat trout was extremely limited – to approximately 9 miles of stream habitat in Silver King Creek, Alpine County. The California Department of Fish and Game has introduced the subspecies into creeks outside the historic range, including Delaney Creek in Yosemite National Park. The subspecies does not occur in the project area for the *Final Yosemite Valley Plan/SEIS*.

Delta smelt, *Hypomesus transpacificus* (Federal Threatened). The Delta smelt occurs only in Suisun Bay and the Sacramento-San Joaquin estuary (“Delta”) near San Francisco Bay in California (Thelander 1994). Historically, this species occurred from Suisun Bay upstream to Sacramento on the Sacramento River and to Mossdale on the San Joaquin River (Thelander 1994). The reduction of freshwater inflows to the Delta from water developments, water diversions, and drought appears to be the most deleterious factor affecting this species (Thelander 1994). The subspecies does not occur in the project area for the *Final Yosemite Valley Plan/SEIS*.

Sacramento spittail, *Pogonichthys macrolepidotus* (Federal Threatened). Until recently, the Sacramento spittail was thought to be limited to tidal fresh and brackish waters of the Sacramento-San Joaquin Delta, Suisun Bay; and to marshes in Suisun, Napa, and Petaluma (Baxter 1994, Baxter et al. 1996). Recent surveys have found that some fish spend summers in the main stem of the Sacramento (CDFG 1999a). The Sacramento spittail is threatened by large freshwater exports from Sacramento and San Joaquin River diversions, loss of shallow-water habitat, introduced aquatic species, and agricultural and industrial chemicals. The subspecies does not occur in the project area for the *Final Yosemite Valley Plan/SEIS*.

Central Valley steelhead, *Oncorhynchus mykiss* (Federal Threatened). This species does not occur in the project area for the *Final Yosemite Valley Plan/SEIS* (CDFG 1999b).

Longfin smelt, *Spirinchus thaleichthys* (Federal Species of Concern). This species does not occur in the project area for the *Final Yosemite Valley Plan/SEIS* (CDFG 1999b).

Red Hills roach, *Lavinia symmetricus* (Federal Species of Concern). This species does not occur in the project area for the *Final Yosemite Valley Plan/SEIS* (CDFG 1999b).

Bell’s sage sparrow, *Amphispiza belli belli* (Federal Species of Concern). This subspecies does not occur in the project area for the *Final Yosemite Valley Plan/SEIS* (CDFG 1999b).

Northern sagebrush lizard, *Sceloporus graciosus graciosus* (Federal Species of Concern). This subspecies does not occur in the project area for the *Final Yosemite Valley Plan/SEIS* (CDFG 1999b).

Mono Basin mountain beaver, *Aplodontia rufa californica* (Federal Species of Concern). This listing is specific to the population of Sierra Nevada mountain beaver that occurs in the Mono Basin. This population belongs to the same subspecies as occurs in Yosemite, which is a state species of special concern.

Keeled sideband snail, *Monadenia circumcarinata* (Federal Species of Concern). The keeled sideband snail is a terrestrial snail that is not known to occur outside the Tuolumne River canyon, where it is found in association with steep limestone outcrops and talus slopes (Pilsbre 1939,

Maciolek 1985). The California Academy of Sciences has records for eight specimens collected in Tuolumne and Stanislaus Counties. The nearest locality to the project area is Paper Cabin Ridge, above the Tuolumne River. Paper Cabin Ridge is about 18.5 miles west of the Yosemite National Park boundary. Therefore, this species does not appear to occur within the project area.

Yosemite woolly-sunflower, *Eriophyllum nubigenum* (Federal Species of Concern). This annual herb in the aster family is endemic to California and occurs on south-facing granite slabs, domes, and on gravelly soils in the upper Merced River watershed. This species does not occur in the project area and would not be indirectly affected by any actions in the Preferred Alternative of the *Final Yosemite Valley Plan/SEIS*.

Critical Habitat

Critical habitat is a specific area or type of area that is considered to be essential for the survival of a species, as designated by the USFWS under the Endangered Species Act. No critical habitat occurs in Yosemite National Park or the El Portal Administrative Site for any special-status species that is known to occur or has the potential to occur in these areas.

CHAPTER II. CURRENT MANAGEMENT DIRECTION

Authorities

The following legislation and policies address the management of special-status species in the park: the National Park Service Organic Act, the Endangered Species Act, the National Environmental Quality Act, the California Endangered Species Act, the Migratory Bird Conservation Act, the Fish and Wildlife Coordination Act, the Wild and Scenic Rivers Act, and the Wilderness Act.

The USFWS normally takes the lead departmental responsibility of coordinating and implementing provisions of the Federal Endangered Species Act for all listed endangered, threatened, and candidate species. This Biological Assessment is prepared in accordance with Section 7 of the Federal Endangered Species Act of 1973, as amended, as part of the consultation process with the USFWS.

Policy and Program Objectives

The following National Park Service policies and program objectives prescribe the management of special-status species:

- The *Natural Resources Management Guideline* NPS-77 (1991) states:
“Management affects the distribution, abundance, and ecological relationships of and among species. Whereas preservation can be accomplished by a zoo, botanical garden, or other non-natural refugium, the National Park Service’s goal is the long-term preservation of species and their ecological role and function as part of a “natural ecosystem.” It is, therefore, critical that ecological aspects of management prevail in dealing with threatened and endangered species. An understanding of factors limiting the distribution and abundance of the species of concern must be well understood and incorporated into any management action.”
- National Park Service *Management Policies* (1988) states:
“Consistent with the purposes of the Endangered Species Act (16 USC 1531 et seq.), the National Park Service will identify and promote the conservation of all federally listed threatened, endangered, or candidate species within park boundaries and their critical habitats.”
“The National Park Service also will identify all state and locally listed threatened, endangered, rare, declining, sensitive, or candidate species that are native to and present in the parks, and their critical habitats. These species and their critical habitats will be considered in National Park Service planning activities.”
- The 1980 *General Management Plan* for Yosemite states:
“Protect threatened and endangered plant and animal species and reintroduce, where practical, those species eliminated from the natural ecosystems.”

CHAPTER III. THE FINAL YOSEMITE VALLEY PLAN/SEIS

The Preferred Alternative – Yosemite Village and Out-of-Valley Parking

This alternative would restore approximately 180 acres of currently disturbed or developed land in Yosemite Valley to natural conditions. It would consolidate parking for day visitors at Yosemite Village, where a new Valley Visitor Center would be located, and in parking areas outside Yosemite Valley. There would be fewer campsites and lodging units than there are now. This alternative would result in a major reduction in vehicle travel in the eastern portion of Yosemite Valley during summer months. The area of the former Upper and Lower River Campgrounds would be restored to a mosaic of meadow, riparian, and oak woodland communities, roads would be removed from Ahwahnee and Stoneman Meadows, and parking would be removed from Curry Orchard. Southside Drive would be converted to two-way traffic from El Capitan crossover to Curry Village, and Northside Drive would be converted to a multi-use (bicycle and pedestrian) paved trail from El Capitan crossover to Yosemite Lodge. There would be minimal new development west of Yosemite Lodge.

Actions outside of Yosemite Valley would include relocation of employee housing to El Portal and Wawona, relocation of National Park Service and concessioner stables to McCauley Ranch in Foresta, establishment of day-visitor parking at Badger Pass, Hazel Green or Foresta, and El Portal. Hazel Green is the preferred location for out-of-Valley parking to accommodate visitors arriving to the park via Highway 120. If negotiations with the private landowner at Hazel Green do not yield a satisfactory agreement, Foresta would become the preferred location. Improved visitor orientation would be provided at the Tioga Pass, South Entrance, El Portal, and Big Oak Flat Entrances. For a detailed description of the Preferred Alternative, refer to Vol. IA, Chapter 2 of the *Final Yosemite Valley Plan/SEIS* (NPS 2000b).

Summary of Major Changes in Relation to Existing Conditions

RESTORE

- Large tracts of meadow, riparian, and California black oak woodland communities along the river from Clark's Bridge downstream to Swinging Bridge

REMOVE

- Roads through Stoneman and Ahwahnee Meadows (including the road through the former Upper and Lower River Campgrounds)
- North Pines Campground
- Sugar Pine Bridge and possibly Stoneman Bridge to restore the hydrologic system of the Merced River

- Other historic structures: concessioner stable, Cascades Diversion Dam, and Cascades houses
- Most parking in east Valley other than at lodging, campgrounds, and the Yosemite Village area
- The Concessioner Headquarters Building
- Commercial trail rides in Yosemite Valley
- Curry Orchard and associated parking, and restore to natural conditions

E S T A B L I S H O R P R E S C R I B E

- A Visitor Experience and Resource Protection (VERP) study to identify existing and desired conditions for natural resources, cultural resources, and visitor experience
- A traveler information and traffic management system to provide information to visitors, provide incentives for efficient use of available parking and transportation services, and manage access and parking
- Out-of-Valley day-visitor parking areas at Badger Pass, El Portal, and Hazel Green or Foresta
- Some utility hookups for recreational vehicles, and shower facilities in campgrounds
- New walk-to campsites for visitors without personal vehicles
- Land management zoning throughout Yosemite Valley
- Design guidelines for rehabilitating the landscape in existing historic developed areas and for new construction
- An Indian Cultural Center at the last historically occupied Indian Village in Yosemite Valley

I M P L E M E N T

- A contiguous River Protection Overlay, as proposed in the *Merced Wild and Scenic River Comprehensive Management Plan/Final Environmental Impact Statement*

C O N S T R U C T

- A day-visitor parking area for 550 vehicles at Yosemite Village
- A visitor/transit center at Yosemite Village
- A vehicle bridge across Yosemite Creek near Yosemite Lodge
- A replacement footbridge at Happy Isles near the Nature Center
- Lodging at Yosemite Lodge and Curry Village
- Campsites at Camp 4 (Sunnyside Campground), east of Curry Village, in the Upper Pines area, and north of Tenaya Creek
- Employee housing at Curry Village, El Portal, Wawona, and Foresta

- Two firehouses, one in the Yosemite Village area (not in historic district), and one in the Curry Village area

C O N V E R T

- Museum/Valley District Building to a museum
- Southside Drive from El Capitan crossover to Curry Village to two-way traffic, one-lane each direction (road widened where necessary)
- Northside Drive from El Capitan crossover to Yosemite Lodge from a vehicle road to a multi-use (bicycle and pedestrian) paved trail
- Trail to the base of Yosemite Falls to a route accessible by people with mobility impairments and provide a larger viewing platform

I N C R E A S E / E X P A N D

- Shuttle bus service to Bridalveil Fall and out-of-Valley parking areas
- Interpretive and orientation services, including a new visitor center in Yosemite Valley and at or near principal park entrances
- Multi-use (bicycle and pedestrian) paved trails

R E D U C E

- Stock trails by approximately 0.5 mile
- Lodging by 199 units (including 164 units at Housekeeping Camp)
- Traffic entering the Valley on a typically busy day by approximately two-thirds

R E L O C A T E

- Principal employee housing to El Portal and Wawona, leaving 683 beds in Yosemite Valley
- National Park Service and concessioner administrative stable operations to McCauley Ranch in Foresta
- National Park Service and concessioner headquarters out of Yosemite Valley
- Historic Superintendent's House (Residence 1) and its garage to a site within the historic district in Yosemite Village
- Museum collection storage, research library, and archives to a central facility in El Portal

CHAPTER IV. EXISTING ENVIRONMENT

Habitat Descriptions

YOSEMITE VALLEY

Yosemite Valley is a glacier-carved valley with sheer granite cliffs rising over 2,000 feet above the valley floor. Alluvial deposits are found to a depth of about 2,000 feet below the soil surface, creating a huge underground aquifer. The Merced River meanders along the nearly level Valley floor. Habitats in Yosemite Valley can be loosely grouped into meadow, riparian, and upland. Mammals resident or transient in Yosemite Valley include deer mouse, California ground squirrel, western gray squirrel, broad-footed mole, Botta's pocket gopher, mink, ringtail, raccoon, coyote, bobcat, mule deer, mountain lion, and black bear.

Meadows. Meadows in Yosemite Valley are found along the Merced River where water tables are high and flooding is common. Meadows serve as a transition zone, linking aquatic and riparian habitats along the Merced River to drier upland habitats such as California black oak. Aquatic life and nutrients concentrate in meadow ponds during dry summer months. This concentrated food source spills over into the Merced River during periods of high water and helps to sustain aquatic life in the river. Meadows in Yosemite Valley were maintained in the past by natural flooding and by frequent, low-intensity broadcast fires set by Native American residents of the Valley. Today, prescribed fire is used as a tool to clear the meadows of encroaching conifers and release nutrients into the soil.

Special-status species that are representative of meadows in Yosemite Valley include the peregrine falcon, willow flycatcher, great gray owl, California red-legged frog, special-status bats, round-leaved sundew, northern bedstraw, phacelia, ladies' tresses, and false pimpnel (see table K-2 for a complete listing of special-status species that have been found or could occur in Yosemite Valley).

Riparian Habitats. Riparian zones extend outward from the banks of the Merced River and its tributaries toward adjacent meadow and forest communities. Broadleaf deciduous trees such as white alder, black cottonwood, and willow characterize riparian zones in Yosemite Valley. Riparian vegetation along moving water is frequently disturbed and constantly responds to the deposition and removal of soil. Riparian vegetation actively colonizes new areas and is made up of a wide range of ages and types of vegetation. This in turn provides a wide range of foraging, nesting, and resting opportunities for wildlife.

Special-status species that are representative of riparian habitats in Yosemite Valley include the California red-legged frog, harlequin duck, willow flycatcher, yellow warbler, long-eared owl, special-status bats, the foothill yellow-legged frog, stream orchid, fawn-lily, and Sierra laurel (see Table K-2 for a complete listing of special-status species that have been found or could occur in Yosemite Valley).

Upland Habitats. Upland plant communities are found where soil moisture conditions are average to dry and where soils are not periodically flooded or saturated. Upland habitats cover

about 75% of Yosemite Valley and are dominated by mixed conifer, canyon live oak, California black oak, and microhabitats on steep granite walls (Acree 1994).

Mixed conifer communities in Yosemite Valley are typically dominated by ponderosa pine, but may have significant numbers of incense-cedar, Douglas-fir, white fir, California black oak, and an occasional sugar pine. The mixed conifer community is naturally adapted to low-intensity, frequent fires. Nearly 100 years of fire suppression has resulted in a change from open forest to dense thickets of shade-tolerant tree species such as incense-cedar and white fir. Under natural conditions, the return interval for fire is estimated at 8 to 12 years (NPS 1990). Most undeveloped, mixed conifer areas of Yosemite Valley are now managed through a combination of mechanical removal of hazardous fuel and prescribed burning. These treatments simulate the natural and Native American – maintained fire regimes of the Valley and help decrease forest densities to more natural levels.

Canyon live oak communities grow on both north- and south-facing talus slopes. They often form pure or almost pure stands. Fires in this community are infrequent but intense, with a fire return interval of 20 to 50 years on south-facing slopes. Most trees and shrubs in this community resprout after fires.

In addition to being a component of the mixed conifer community, California black oaks in Yosemite Valley form pure, open stands of large trees with a herbaceous understory. These pure stands are found between the upland forest communities and lower-lying meadow and riparian communities. These stands are unique to the Valley due to thousands of years of Native American activities, including annual burning and removal of young conifers. California black oaks also grow in dense stands on talus slopes near drainages.

Special-status species that are representative of upland habitats in Yosemite Valley include the California spotted owl, Cooper's hawk, special-status bats, sugar stick, azure penstemon, phacelia, and wood saxifrage (see Table K-2 for a complete listing of special-status species that have been found or could occur in Yosemite Valley).

E L P O R T A L

El Portal lies in the Merced River canyon at 2,000 feet in elevation. The Merced River in this segment is lined with a narrow band of riparian vegetation with occasional wider floodplains. A dense mosaic of chaparral and foothill woodland communities lines the steep canyon walls. Many factors shape this unique biological environment, including natural floods and lightning-ignited fire. Soils derived in the contact zone between metamorphic and granitic rock form a unique substrate for vegetation. Many special-status plants are concentrated in this unique area. Steep canyon walls that are almost inaccessible to human passage create secluded refuges for wildlife. Extremely hot and dry summer weather places a critical importance on riparian habitat for many wildlife species.

Plant communities in El Portal include blue oak woodland, interior live oak woodland, gray pine-oak woodland, interior live oak chaparral, and riparian woodland. All of these communities are adapted to regular, frequent natural fires sparked by lightning.

Special-status species that have been found or could occur in El Portal include the Cooper's hawk, sharp-shinned hawk, golden eagle, long-eared owl, yellow warbler, bald eagle, California spotted owl, special-status bats, western pond turtle, foothill yellow-legged frog, Wawona ruffle beetle, Valley elderberry longhorn beetle, Merced canyon shoulderband snail, Yosemite mariposa sideband snail, Bohart's blue butterfly, Sierra pygmy grasshopper, Yosemite onion, Tompkin's sedge, Indian paintbrush (*Castilleja foliolosa*), collinsia (*Collinsia linearis*), Congdon's woolly-sunflower, pitcher sage, Congdon's lewisia, Congdon's lomatium, Congdon's monkeyflower, Palmer's monkeyflower, and phacelia (*Phacelia platyloba*) (see table K-2 for a complete listing of special-status species that have been found or could occur in El Portal).

H A Z E L G R E E N

Vegetation at the Hazel Green area adjacent to the Big Oak Flat Road is dominated by a white fir/sugar pine/red fir association. Large white fir and sugar pine form a partially closed canopy, with an open subcanopy and minimal groundcover on the westernmost portions of the site. Average trees range from 30 inches to more than 100 inches in diameter, indicating a mixed-aged stand that has been in existence for some time. The majority of this area was burned at a low intensity by the 1987 Stanislaus Complex Fire.

A ponderosa pine/incense-cedar vegetation type occurs in the central portion of the site, which is located on a knoll straddling the Hazel Green and Bull Creek headwaters. Emergent sugar pine is dominant in the subcanopy, which was logged in the early 1920s. A small stand of red willow occurs along the artificial drainage ditches adjacent to the Big Oak Flat Road, where the headwaters of Hazel Green Creek are concentrated into one large culvert beneath the road. Hazel-nut, ocean-spray, and white alder with sedges and rushes grow within and immediately adjacent to the drainage ditch. A small open stand of ponderosa pine occurs around the edges of the meadow at the headwaters of Bull Creek; it has a high proportion of California black oaks. Non-native grasses, including Kentucky bluegrass and various forbs, dominate the meadow.

Special-status species that are representative of the Hazel Green area include the Northern goshawk, Sharp-shinned hawk, California spotted owl, yellow warbler, Small's southern clarkia, and slender-stemmed monkeyflower (see table K-2 for a complete listing of special-status species that have been found or could occur at Hazel Green).

W A W O N A

The proposed site for new housing in Wawona occurs on a gentle north-facing slope above the South Fork of the Merced River. A lower montane mixed conifer forest of ponderosa pine, incense-cedar, sugar pine, white fir, and Douglas-fir dominates the site. Shade-tolerant incense-cedar and white fir dominate the subcanopy. Small stands of California black oak with an understory of native perennial grasses (including blue wildrye and California brome) characterize natural openings and rock outcrops within the site.

Special-status species that are representative of the area include the Cooper's hawk, sharp-shinned hawk, yellow warbler, California spotted owl, special-status bats, California red-legged frog,

snapdragon, Sierra sweet-bay, Bolander's skullcap, and trillium (see table K-2 for a complete listing of special-status species that have been found or could occur in Wawona).

B A D G E R P A S S

Dense montane coniferous forest and wet meadow habitat surround the existing parking lot at Badger Pass. Dominant forest species include red fir, white fir, Jeffrey pine, and lodgepole pine, with a mountain whitethorn understory. Vegetation in the meadow includes sedges, willows, and alder. Red firs grow in the vegetated islands in the parking lot.

Special-status species that are representative of the area include the Cooper's hawk, northern goshawk, great gray owl, Yuma myotis bat, Sierra Nevada mountain beaver, American marten, Pacific fisher, Sierra Nevada red fox, Yosemite toad, mountain yellow-legged frog, and Bolander's clover (see table K-2 for a complete listing of special-status species that have been found or could occur at Badger Pass).

T I O G A P A S S E N T R A N C E S T A T I O N

Tioga Pass is located in a subalpine zone characterized by long, broad meadows with small glacial lakes and subalpine coniferous forests. Winters are long and severe, and summers are brief and cool. Intensely strong winds on exposed ridges and passes can dwarf and stunt trees.

Meadow vegetation consists of low-growing, native, tussock-forming grasses, sedges, rushes, and perennial herbs. Shorthair reedgrass, shorthair sedge, pussy-toes, cinquefoil, and dwarf lupine are common. The subalpine forest is found on drier slopes and is relatively open, though it becomes denser along stream channels. The upland forest is made up of lodgepole pine and whitebark pine, with an understory that ranges from sparse perennials in bedrock fractures to sparse shrubs, herbs, and grasses.

Many wildlife species from lower elevations seasonally use the subalpine habitat at Tioga Pass, including mule deer, mountain lion, white-crowned sparrow, and the dark-eyed junco. Special-status species that are representative of the area include the Yosemite toad, mountain yellow-legged frog, American marten, Tiehm's rock cress, and black and white sedge (see table K-2 for a complete listing of special-status species that have been found or could occur in the Tioga Pass area).

F O R E S T A

The 1990 A-Rock Fire significantly altered vegetative cover and wildlife habitat in Foresta. Before the fire, very dense mixed coniferous forest and California black oak habitat dominated upland areas. A mixture of montane chaparral, mixed conifer, and riparian species have emerged since the fire and dominate upland areas. Tree species include California black oak, ponderosa pine, knobcone pine, and occasional sugar pines. Montane chaparral species include Mariposa and greenleaf manzanita, deerbrush ceanothus, and goldenbush. The herbaceous layer contains native early-successional species such as lupine and lotus. Non-native plants including spotted knapweed, yellow star-thistle, cheat grass, and tocalote are also found.

Special-status species that are representative of the area include the Cooper's hawk, great gray owl, sharp-shinned hawk, golden eagle, bald eagle, yellow warbler, willow flycatcher, special-status bats, western pond turtle, California red-legged frog, foothill yellow-legged frog, snapdragon, inconspicuous monkeyflower, and pansy monkeyflower (see table K-2 for a complete listing of special-status species that have been found or could occur in Foresta).

SOUTH ENTRANCE STATION

The South Entrance to Yosemite supports dense montane mixed coniferous forest habitat on drier upland sites, and riparian habitats along stream channels. The remains of historic railroad logging activity are visible throughout the site. Forested areas are dominated by a white fir overstory with smaller sugar pines, Douglas-fir, and ponderosa and Jeffrey pines. The understory is fairly sparse due to dense shading from the subcanopy and canopy.

Fire has been excluded from much of the area for over a century, and fuel loads have built up to the point that typical shrub species in this habitat, such as whitethorn ceanothus and greenleaf manzanita, are nearly absent. Perennial herbaceous species such as trail plant, wood orchid, and rattlesnake plantain are common. The leach field (for the residence and restrooms at the entrance station) is an unnatural opening in the forest canopy and has a variety of native and non-native plants including sedges, horsetail rush, bull thistle, and rabbit's-ear.

Riparian vegetation is found throughout the South Entrance area along stream courses and in low areas that retain water. Riparian areas are dominated by cottonwood, mountain dogwood, and alder, with an understory of willow, Sierra sweet-bay, and western azalea. Ground cover consists of horsetail, bracken fern, and other moisture-dependent species. Non-native species such as bull thistle and cut-leaf blackberry have become established in these riparian corridors, but remain a minor component.

Special-status species that are representative of South Entrance include Cooper's hawk, California spotted owl, special-status bat species, American marten, and Sierra sweet-bay (see table K-2 for a complete listing of special-status species that have been found or could occur at South Entrance).

BIG OAK FLAT ENTRANCE STATION

Vegetation in the vicinity of the Big Oak Flat Entrance is dominated by two types: a white fir/sugar pine/red fir vegetation type, and a ponderosa pine/incense cedar vegetation type with emergent sugar pine. The fir association, found along the west side of the parking area and along drainages in the area, is characterized by variably-sized trees with diameters up to 40 inches.

Most of this site was logged in the early 1920s, prior to its inclusion in Yosemite National Park. The subcanopy is dominated by shade-tolerant white fir with little shrub or ground cover. The ponderosa pine vegetation type occurs on drier sites to the east of the current parking area and has a more open canopy. The subcanopy is dominated by young incense cedar and a sparse understory of whitethorn ceanothus and greenleaf manzanita.

Special-status wildlife species that are representative of Big Oak Flat Entrance include Cooper’s hawk, California spotted owl, American marten, and all special status bat species. No special-status plant species are known to occur in the area.

Species Accounts

Table K-2 presents a summary of species addressed in this analysis.

Table K-2 Special-Status species					
Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
INVERTEBRATES					
Merced Canyon (Yosemite) shoulderband snail <i>Helminthoglypta allynsmithi</i>	E	FSC			Found in rockslide habitat with shade and moisture. Recorded in Merced River canyon near El Portal.
Mariposa sideband snail <i>Monadenia hillebrandi</i>	E, Y	FSC			Occurs in rockslide habitat with shade and moisture. Reported in Yosemite Valley in the early 1900s.
Sierra pygmy grasshopper <i>Tetrix sierrana</i>	E, SE, W	FSC			One record for El Portal (1953). Only other record is from Madera County.
Wawona riffle beetle <i>Atractelmis wawona</i>	E, W, Y	FSC			Limited distribution in the main stem and South Fork of the Merced River. Little known of exact distribution or habitat needs.
Valley elderberry longhorn beetle <i>Desmocerus californicus dimorphus</i>	E	FT			Found in conjunction with its host plant, the elderberry (<i>Sambucus</i> spp.), below 3,000 feet in elevation.
Bohart’s blue butterfly <i>Philotiella speciosa bohartorum</i>	E	FSC			An annual in the buckwheat family (<i>Chorizanthe membrane</i>) is the suspected preferred forage plant. It is found in association with serpentine soils. Last recorded in 1970 near Briceburg in the Merced River canyon.
REPTILES AND AMPHIBIANS					
Limestone salamander <i>Hydromantes brunus</i>	E	FSC	CT		Very limited distribution along Merced River and its tributaries between elevations of 800 and 2,500 feet, usually in association with limestone outcrops. El Portal lies within elevational range, but not recorded there or elsewhere in park.
Mount Lyell salamander <i>Hydromantes platycephalus</i>	Y, T	FSC	CSC		Occurs in massive rock areas between 4,000 and 11,500 feet in elevation, in rock fissures, seeps, shade, and low-growing plants. Two records in Yosemite Valley: base of Cathedral Rocks and base of Bridalveil Fall.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

² Special-status species: FE = federally endangered, FT = federally threatened, FD = federally delisted (status to be monitored for at least five years), FSC = federal species of concern, CE = California endangered, CT = California threatened, CSC = California species of special concern, R = California rare, PR = Yosemite park rare

**Table K-2
Special-Status species**

Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
Yosemite toad <i>Bufo canorus</i>	BP, T	FSC	CSC		Restricted to areas of wet meadows in central Sierra Nevada between elevations of 6,400 and 11,300 feet.
California red-legged frog <i>Rana aurora draytonii</i>	F, W, Y, E	FT	CSC		Found in quiet pools in permanent streams in mixed conifer zones and foothills. Prefers riparian deciduous habitat. Many park museum specimens from one lake (6,000 feet elevation). Once found in Yosemite Valley, but now apparently extinct due to loss of habitat and predation by bullfrogs and other species.
Foothill yellow-legged frog <i>Rana boylei</i>	E, F, W, Y	FSC	CSC		Formerly abundant, and found up to elevations of 6,000 feet, this species has virtually disappeared from its range in the Sierra Nevada from unknown causes. Preferred habitat was rocky streams and wet meadows. Historical records exist from Yosemite Valley, but none recent.
Mountain yellow-legged frog <i>Rana muscosa</i>	BP, T	FSC	CSC		A species of mountain habitats, occurring between elevations of 4,500 to over 12,000 feet; found in streams, lakes, and ponds in a variety of vegetation types.
Northwestern pond turtle <i>Clemmys marmorata marmorata</i>	E, F, W, Y	FSC	CSC		Found in the Sierra Nevada up to 6,000 feet. Has decreased by up to 80% in numbers, probably due to habitat fragmentation and non-native predators. Habitat is permanent water in a variety of habitat types. Recent records include several from Crane Creek in El Portal and an unconfirmed report in Yosemite Valley in 1999.
Southwestern pond turtle <i>Clemmys marmorata pallida</i>	E, F, W, Y	FSC	CSC		Found in the Sierra Nevada up to 6,000 feet. Has decreased by up to 80% in numbers, probably due to habitat fragmentation and non-native predators. Habitat is permanent water in a variety of habitat types. Recent records include several from Crane Creek in El Portal and an unconfirmed report in Yosemite Valley in 1999.
BIRDS					
Harlequin duck <i>Histrionicus histrionicus</i>	E, W, Y	FSC	CSC		Breeds along large, swift-moving mountain rivers. Was formerly found in every major watershed in the Sierra, but has disappeared, with no sightings in the last 20 years. Formerly nested in Yosemite Valley.
Cooper's hawk <i>Accipiter cooperi</i>	BO, BP, E, F, HG, SE, W, Y		CSC		Found in wooded areas up to elevations of 9,000 feet in the Sierra Nevada. Numerous recent records for Yosemite, especially in Yosemite Valley. Habitat destruction in its range has led to population declines. Frequently hunts along wooded edges.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

² Special-status species: FE = federally endangered, FT = federally threatened, FD = federally delisted (status to be monitored for at least five years), FSC = federal species of concern, CE = California endangered, CT = California threatened, CSC = California species of special concern, R = California rare, PR = Yosemite park rare

**Table K-2
Special-Status species**

Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
Northern goshawk <i>Accipiter gentilis</i>	BO, BP, HG, SE, T, Y	FSC	CSC		Favors moderately dense coniferous forests broken by meadows and other openings, between 5,000 and 9,000 feet elevation. Typically nests in mature conifer stands near streams. Habitat destruction in its range has caused population declines. Has been recorded in the Valley, primarily between November and February.
Sharp-shinned hawk <i>Accipiter striatus</i>	BO, BP, HG, SE, W, E, Y		CSC		Hunts in open coniferous forest and edges of meadows and clearings between 4,000 and 7,000 feet elevation in the Sierra Nevada. Nest in forests. One 1930 nesting record for Yosemite Valley.
Golden eagle <i>Aquila chrysaetos</i>	E, T, Y		CSC		Found in a wide range of elevations in the park. Needs open terrain for hunting. Feeds primarily on small mammals. Nests on cliffs and in large trees in open areas.
Bald eagle <i>Haliaeetus leucocephalus</i>	E, F, W, Y	FT	CE		Forages over river, streams, and lakes. Primarily eats fish, also carrion, waterbirds, and small mammals. Transient in the park. No nesting in the park.
Merlin <i>Falco columbarius</i>	E, W, Y, F		CSC		Occurs mostly below 4,000 feet, ranging from annual grasslands to ponderosa pine and California black oak woodland, but prefers open country. Feeds primarily on birds. Reduction in numbers over recent decades may be due to pesticides.
Prairie falcon <i>Falco mexicanus</i>	F, Y, T		CSC		Primarily associated with grasslands and meadows where it feeds on small mammals and birds. Nests on cliffs. Has declined in California from several probable factors, including nest robbing by humans, control of prey species, and pesticides. Many records of this species in alpine areas of Yosemite, but it is also occasionally seen in Yosemite Valley and Foresta.
American peregrine falcon <i>Falco peregrinus anatum</i>	W, Y	FD	CE		Usually nest on high cliffs near water to search for prey. Three active nest sites in Yosemite Valley.
Long-eared owl <i>Asio otus</i>	E, W, Y		CSC		Requires riparian or other thickets with small, densely canopied trees for roosting and nesting. Proximity of this habitat to meadow edges for hunting also enhances quality. One nesting record in Yosemite Valley in 1915.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

² Special-status species: FE = federally endangered, FT = federally threatened, FD = federally delisted (status to be monitored for at least five years), FSC = federal species of concern, CE = California endangered, CT = California threatened, CSC = California species of special concern, R = California rare, PR = Yosemite park rare

**Table K-2
Special-Status species**

Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
Great gray owl <i>Strix nebulosa</i>	BP, F, HG, W, Y		CE		Entire California population of this species is restricted to the Yosemite region, where it reaches southernmost extent of its North American range. Breeds in mixed conifer/red fir forests bordering meadows. Winters in mixed conifer down to blue oak woodlands. Research suggests that human disturbance could affect foraging success of this species, which may explain its absence from the Valley.
California spotted owl <i>Strix occidentalis occidentalis</i>	BO, BP, E, F, HG, SE, W, Y	FSC	CSC		Breeds in oak and ponderosa pine forests upslope to lower-elevation red fir forests (up to elevations of 7,600 feet), with mixed conifer the optimum type. Presence of California black oak in the forest canopy also enhances habitat suitability. Confirmed sightings in Yosemite Valley near Happy Isles, Mirror Lake, Yosemite Chapel, and the base of Cathedral Rocks. Suitable habitat in or near all the project sites, with the exception of Tioga Pass.
Willow flycatcher <i>Empidonax traillii</i>	BO, BP, F, W, Y	FSC (ssp. <i>brewsteri</i>)	CE		Breeds in mountain meadows and riparian areas from 2,000 to 8,000 feet elevation in the Sierra Nevada, with lush growth of shrubby willows. Has disappeared from much of its range, due to habitat destruction and parasitism from brown-headed cowbirds.
Yellow warbler <i>Dendroica petechia</i>	BO, E, F, HG, SE, BP, W, Y		CSC		Prefers riparian woodlands, but also breeds in chaparral, ponderosa pine, and mixed conifer habitats with substantial amounts of brush. In recent decades, numbers of breeding pairs have declined dramatically in many lowland areas of California. A major cause of this decline has apparently been brown-headed cowbird parasitism.
Mammals					
Mount Lyell shrew <i>Sorex lyelli</i>	T	FSC			Favors riparian zones and other wet sites.
Pallid bat <i>Antrozous pallidus</i>	BO, BP, E, F, HG, SE, W, Y, T		CSC		Primarily found below 6,000 feet elevation in a variety of habitats, especially oak, ponderosa pine, and giant sequoia. Roosts in rock outcrops, caves, and hollow trees. Known nursery colony in Yosemite Valley at The Ahwahnee. Population decline due to habitat destruction.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

² Special-status species: FE = federally endangered, FT = federally threatened, FD = federally delisted (status to be monitored for at least five years), FSC = federal species of concern, CE = California endangered, CT = California threatened, CSC = California species of special concern, R = California rare, PR = Yosemite park rare

**Table K-2
Special-Status species**

Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
Townsend's big-eared bat <i>Corynorhinus townsendii townsendii</i>	BO, BP, E, F, HG, SE, W, Y		CSC		Found in all habitats up to alpine zone. Requires caves, mines, or buildings for roosting. Prefers mesic habitats where it feeds on insects from brush or trees along habitat edges. Captured in Yosemite Valley during 1993 survey.
Spotted bat <i>Euderma maculatum</i>	BO, BP, E, F, HG, SE, W, Y, T	FSC	CSC		Rare throughout range. Uses crevices in rockfaces for roosting and reproduction. Forages in a wide variety of habitats, primarily for moths. Surveys (1992-1997) in Yosemite located this species in numerous locations, including Wawona, Crane Flat, Tuolumne Meadows, and especially Yosemite Valley.
Small-footed myotis bat <i>Myotis ciliolabrum</i>	BO, BP, E, F, HG, SE, W, Y	FSC			Usually found below 8,800 feet and in wooded and brushy habitats near water. Forages among trees and over water. Breeds in colonies in buildings, caves, and mines.
Long-eared myotis bat <i>Myotis evotis</i>	BO, BP, E, F, HG, SE, W, Y	FSC			Wide range from coast to high elevations in the Sierra Nevada, in montane oak woodlands. Roosts primarily in hollow trees, especially large snags or lightning-scarred live trees. Captured in Yosemite Valley in 1993.
Fringed myotis bat <i>Myotis thysanodes</i>	BO, BP, E, F, HG, SE, W, Y	FSC			Found to elevations of at least 6,400 feet in the Sierra Nevada in deciduous/mixed conifer forests. Feeds over water, in open habitats, and by feeding on insects from foliage. Roosts in caves, mines, buildings, and trees, especially large conifer snags. Captured during surveys in Yosemite Valley in 1993 near Yosemite Creek and
Long-legged myotis bat <i>Myotis volans</i>	BO, BP, E, HG, SE, W, Y	FSC			Found up to high elevations in the Sierra Nevada, in montane coniferous forest habitats. Forages over water, close to tree and cliffs, and in openings in forests. Roosts primarily in large-diameter snags. Forms nursery colonies numbering hundreds of individuals, usually under bark or in hollow trees. Captured in Yosemite Valley in 1993.
Yuma myotis bat <i>Myotis yumanensis</i>	BO, BP, E, F, HG, SE, W, Y	FSC	CSC		Usually occurs below 8,000 feet elevation. Forages over open, still, or slow-moving water and above low vegetation in meadows. Roosts in caves, buildings, or crevices. Nursery colonies of several thousand individuals may be in caves, mines, or buildings. Captured during surveys in Yosemite Valley and Wawona in 1993 and 1994.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

² Special-status species: FE = federally endangered, FT = federally threatened, FD = federally delisted (status to be monitored for at least five years), FSC = federal species of concern, CE = California endangered, CT = California threatened, CSC = California species of special concern, R = California rare, PR = Yosemite park rare

**Table K-2
Special-Status species**

Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
Greater western mastiff bat <i>Eumops perotis californicus</i>	BO, BP, E, F, HG, SE, W, Y, T	FSC	CSC		Found in a variety of habitats to over 10,000 feet in elevation. Roosts primarily in crevices in cliff faces and occasionally trees. Detected most often over meadows and other open areas, but will also feed above forest canopy, sometimes to high altitudes.
Sierra Nevada snowshoe hare <i>Lepus americanus tahoensis</i>	BP, T	FSC			Uncommon resident of upper elevations in the Sierra Nevada. Prefers the edges of forested habitats, heterogeneous habitats, and areas with dense understory, particularly in riparian habitats.
White-tailed hare <i>Lepus townsendii</i>	T		CSC		Suitable habitat is found in meadows, willow thickets, shrubby ridgetops, and open stands of lodgepole pines.
Sierra Nevada mountain beaver <i>Aplodontia rufa californica</i>	BP	FSC	CSC		Prefers willow-lined, perennial streams through montane meadows, where it establishes a system of burrows, often with the stream running through them. Known population at Badger Pass.
Sierra Nevada red fox <i>Vulpes vulpes necator</i>	BO, BP, F, HG, SE, W, Y, T	FSC	CT		Primarily found in red fir, lodgepole pine, subalpine forests, and alpine Sierra. Found mostly above 7,000 feet and rarely below 5,000 feet elevation. Five unconfirmed reports for Yosemite Valley, but these sightings could have been of eastern red fox, a non-native species that is present on the west slope of the Sierra Nevada.
California wolverine <i>Gulo gulo luteus</i>	T	FSC	CT		Found in a wide variety of mountain habitats. Needs water, caves, logs, or other cover for denning. No wolverine have been recorded within California since the 1970s.
American (pine) marten <i>Martes americana</i>	BO, BP, HG, SE, Y, T	FSC			Found in dense, complex coniferous forests with large trees and snags. Structural complexity near the ground is important for foraging and protection from predators.
Pacific fisher <i>Martes pennanti pacifica</i>	BO, BP, HG, SE, F, Y, W	FSC	CSC		Occurs in coniferous forests and deciduous-riparian habitats with a high canopy closure, mostly above 6,000 feet elevations. Carnivorous, but may also eat fruit and fungi. Densities in the central Sierra Nevada appear to be very low, for unknown reasons; higher densities in both the northern and southern Sierra Nevada. Fishers have been seen within the last 10 years near Henness Ridge and Crane Flat.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

² Special-status species: FE = federally endangered, FT = federally threatened, FD = federally delisted (status to be monitored for at least five years), FSC = federal species of concern, CE = California endangered, CT = California threatened, CSC = California species of special concern, R = California rare, PR = Yosemite park rare

**Table K-2
Special-Status species**

Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
Sierra Nevada bighorn sheep <i>Ovis canadensis sierrae</i>	T	FE	CE		High-elevation species that was reintroduced to the park in 1986. Population numbers have fluctuated between a high of 85+ animals in 1991 to less than 20 today.
Plants					
Yosemite onion <i>Allium yosemitense</i>	E, W		R		Confined to open metamorphic slabs, talus slopes, and scree. Restricted to the Merced River watershed.
Sugar stick <i>Allotropa virgata</i>	Y			PR	Confined to California black oak and mixed conifer forest areas.
Snapdragon <i>Antirrhinum leptaleum</i>	F, W			PR	Restricted to small washes and shallow ditches in disturbed areas.
Tiehm's rock-cress <i>Arabis tiehmii tiehmii</i>	T	FSC			Found in alpine fell-fields on the slopes of Mt. Dana above Tioga Pass.
Sweetwater Mountains milkvetch <i>Astragalus kentrophyta</i> var. <i>danaus</i>	T			PR	This strictly alpine species occurs on dry, exposed, unglaciated ridges and slopes along the Sierra Nevada crest from 10,000 to 12,500 feet in elevation.
Black and white sedge <i>Carex albonigra</i>	T			PR	Locally rare in the Sierra Nevada on subalpine talus slopes and cliff bases in marshy areas and springs.
Capitate sedge <i>Carex capitata</i>	T			PR	Restricted in the Sierra Nevada; strictly alpine.
Congdon's sedge <i>Carex congdonii</i>	T			PR	Found on talus slopes.
Tompkin's sedge <i>Carex tompkinsii</i>	E		R		Limited to foothill oak woodland and chaparral areas and along lower talus slopes. Found sporadically from Cascades to El Portal in the Merced River canyon.
Indian paintbrush <i>Castilleja foliolosa</i>	E			PR	Found on dry, open, rocky slopes on the edge of chaparral areas below 4,500 feet in elevation.
Alpine cerastium <i>Cerastium beeringianum</i>	T			PR	Infrequent in moist snowmelt or rivulets, mossy turf on lakeshores, and streambank overhangs above 9,500 feet in elevation.
Small's southern clarkia <i>Clarkia australis</i>	F, HG			PR	Confined to open ponderosa pine forests.
Sierra claytonia <i>Claytonia nevadensis</i>	T			PR	Endemic to California, limited to alpine fell-fields in perennially moist areas in granitic and metamorphic substrates.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

² Special-status species: FE = federally endangered, FT = federally threatened, FD = federally delisted (status to be monitored for at least five years), FSC = federal species of concern, CE = California endangered, CT = California threatened, CSC = California species of special concern, R = California rare, PR = Yosemite park rare

**Table K-2
Special-Status species**

Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
Child's blue-eyed Mary <i>Collinsia childii</i>	W			PR	Endemic to central and southern Sierra Nevada, reaching the northern extent of its range in Mariposa County. Occurs on shaded slopes and in open oak and mixed coniferous woodlands.
Collinsia <i>Collinsia linearis</i>	E			PR	Restricted to dry, metamorphic rock outcrops along the metamorphic-granitic contact zone.
Draba <i>Draba praelta</i>	T			PR	Rare in steep springs with bunch grass hummocks above 10,000 feet in elevation along the Sierra Nevada crest in the Tioga Pass region.
Round-leaved sundew <i>Drosera rotundifolia</i>	YV, W			PR	Confined to sphagnum bogs.
Stream orchid <i>Epipactis gigantea</i>	Y			PR	Restricted to moist granitic ledges, and planted in landscaped areas.
Desert fleabane <i>Erigeron linearis</i>	T			PR	Found in the granitic-metamorphic contact zone on the slopes of Mt. Dana.
Rambling fleabane <i>Erigeron vagus</i>	T			PR	Found in isolated populations on the slopes of Mt. Dana and adjacent alpine peaks.
Congdon's woolly-sunflower <i>Eriophyllum congdonii</i>	E		R		Restricted to dry, mostly south-facing metamorphic and metasedimentary outcrops. Occurs on dry ridges on metamorphic rocks, scree, and talus.
Fawn-lily <i>Erythronium purpurascens</i>	Y			PR	Known from riparian corridors in the eastern end of Yosemite Valley
Northern bedstraw <i>Galium boreale</i> ssp. <i>septentrionale</i>	Y			PR	Found in wet lower montane meadows.
Dane's dwarf gentian <i>Gentianella tenella</i> ssp. <i>tenella</i>	T			PR	Occurs in high elevation meadows and moist seepage areas on rock and shaded cliff crevices above 10,000 feet in elevation.
Goldenaster <i>Heterotheca sessiliflora</i> ssp. <i>echioides</i>	F			PR	Limited to grasslands and open oak woodlands below 4,400 feet in elevation.
Yosemite ivesia <i>Ivesia unguiculata</i>	BP			PR	Endemic to montane meadows and forest edges.
Common juniper <i>Juniperus communis</i>	T			PR	Found infrequently along the crest of the Sierra Nevada near treeline.
Pitcher sage <i>Lepechinia calycina</i>	E			PR	Found on rocky slopes within chaparral and canyon live oak woodlands.
Sierra laurel <i>Leucothoe davisiae</i>	Y			PR	Grows in wet areas and bogs in acid soil.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

² Special-status species: FE = federally endangered, FT = federally threatened, FD = federally delisted (status to be monitored for at least five years), FSC = federal species of concern, CE = California endangered, CT = California threatened, CSC = California species of special concern, R = California rare, PR = Yosemite park rare

**Table K-2
Special-Status species**

Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
Congdon's lewisia <i>Lewisia congdonii</i>	E		R		Grows on moist, exposed metamorphic rockfaces and slopes. Occurs in chaparral and mixed conifer forest on north-facing slopes in shade.
False pimpernel <i>Lindernia dubia</i> var. <i>anagallidea</i>	Y			PR	Occurs in wet meadows.
Congdon's lomatium <i>Lomatium congdonii</i>	E	FSC			Restricted to serpentine and metamorphic soils in canyon live oak woodlands.
Congdon's monkeyflower <i>Mimulus congdonii</i>	E			PR	Found in granitic soils in disturbed areas, seeps, runoff areas on slopes.
Slender-stemmed monkeyflower <i>Mimulus filicaulis</i>	HG	FSC			Found in vernal moist habitats, typically in gravelly soils in meadows and seeps in the lower to montane forest zone.
Inconspicuous monkeyflower <i>Mimulus inconspicuus</i>	F			PR	Found near hillside streams or seeps in partial shade.
Palmer's monkeyflower <i>Mimulus palmeri</i>	E			PR	Restricted to damp, shaded slopes under canyon live oaks.
Pansy monkeyflower <i>Mimulus pulchellus</i>	F			PR	Found in vernal moist, open, gravelly places such as vernal pools.
Dwarf sandwort <i>Minuartia pusilla</i>	BP			PR	Confined to open pine forests and chaparral slopes.
Sierra sweet-bay <i>Myrica hartwegii</i>	SE,W			PR	Endemic to the northern and central Sierra Nevada. Restricted to stream banks, forming small thickets along the river.
Azure penstemon <i>Penstemon azureus</i> ssp. <i>angustissimus</i>	Y			PR	Generally found in moist woodlands and open forests.
Phacelia <i>Phacelia platyloba</i>	E			PR	Found in gravelly or rocky soils in chaparral and canyon live oak woodland.
Phacelia <i>Phacelia tanacetifolia</i>	Y			PR	Grows in moist, sandy and gravelly, open areas.
Snow willow <i>Salix reticulata</i>	T			PR	Reaches the westernmost extent of its range in wet areas and seeps within alpine fell-fields along the crest of the Sierra Nevada in Yosemite.
Wood saxifrage <i>Saxifraga mertensiana</i>	Y			PR	Endemic to northern and central Sierra Nevada. Grows on mossy rocks and moist cliffs.
Bolander's skullcap <i>Scutellaria bolanderi</i>	W			PR	Occurs in gravelly soils along streambanks and in oak and pine woodlands.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

² Special-status species: FE = federally endangered, FT = federally threatened, FD = federally delisted (status to be monitored for at least five years), FSC = federal species of concern, CE = California endangered, CT = California threatened, CSC = California species of special concern, R = California rare, PR = Yosemite park rare

**Table K-2
Special-Status species**

Species	Area ¹	Status ²			Habitat Type/Occurrence
	BO, BP, E, F, HG, SE, T, W, Y	USFWS	State	Park	
Groundsel <i>Senecio serra</i> var. <i>serra</i>	T			PR	In the park, this species is restricted to open coniferous forests or sagebrush scrub on the lower slopes of Mt. Dana and the slopes west of Tioga Pass.
Giant sequoia <i>Sequoiadendron giganteum</i>	W, Y			PR	Grows in three discrete groves in the park, has also been planted in historic and recent landscaped areas.
Ladies' tresses <i>Spiranthes porrifolia</i>	Y			PR	Found in wet meadows.
Bolander's clover <i>Trifolium bolanderi</i>	BP	FSC			Confined to wet montane meadows.
Trillium <i>Trillium angustipetalum</i>	W			PR	Found in moist meadow, montane coniferous forests, foothills, and chaparral.
Hall's wyethia <i>Wyethia elata</i>	W			PR	Endemic to the central and southern Sierra Nevada. Occurs in open deciduous woodlands and coniferous forests.

¹ Area of Potential Occurrence: BO = Big Oak Flat, BP = Badger Pass, E = El Portal (includes Merced River gorge), F = Foresta, HG = Hazel Green, SE = South Entrance, T = Tioga Pass Entrance, W = Wawona, Y = Yosemite Valley

Federal Endangered Species

W I L D L I F E

Sierra Nevada bighorn sheep *Ovis canadensis sierrae*

General Ecology and Distribution. Sierra Nevada bighorn sheep are endemic to the Sierra Nevada. Originally, the Sierra Nevada bighorn sheep occurred throughout the range wherever suitable habitat was found. Between 1850 and 1900, their numbers declined dramatically due to diseases contracted from domestic sheep, overhunting, and competition for forage with domestic sheep. By the 1970s, their populations had dwindled to two remnant herds totaling approximately 300 sheep (Wehausen 1980).

In Yosemite, evidence from skulls and horn sheaths suggest that Sierra Nevada bighorn sheep inhabited the Sierra crest and the Cathedral Range. Population declines followed the pattern seen elsewhere in the Sierra Nevada and, by 1914, they were declared extinct in the park. In 1986, native Sierra Nevada bighorn were reintroduced to the Yosemite region in Lee Vining Canyon, just east of Tioga Pass. The size of the herd has fluctuated between a high of 85 or more animals in 1991 (Chow 1992) to less than 20 today (Wehausen 1980).

Sierra Nevada bighorn sheep spend the summer in the alpine where the absence of tree and shrub cover permits the sheep to more easily detect and avoid predators. In winter, the sheep generally move to lower elevations to escape deep snow, but will occasionally remain at higher elevations in light snow years. Suitable habitat is characterized by high elevation meadows in close proximity to steep, rocky terrain.

Reproductive Biology and Breeding Habitat. Adult bighorn generally segregate by sex throughout most of the year with; ewes, lambs, and subadults remain close to the safety of steep rocky terrain, while rams wander more widely. Rams join the ewes in late fall for breeding (Geist 1971).

Diet and Foraging Habitat. Bighorns are highly selective in their diet, generally choosing the most nutritious forage available. Diet includes grasses, herbs, and shrubs. Bighorn typically forage in or very close to steep rocky terrain where forage is sparse or widely scattered. In late summer of dry years, foraging will often be concentrated around springs and seeps where green vegetation is still available (Moore 1991).

Habitat Status in the Project Area. Tioga Pass is the only project area where Sierra Nevada bighorn sheep can be expected to occur. They have been sighted on Mt. Dana and make regular use of Tioga Peak.

Federal Threatened Species

W I L D L I F E

Bald eagle

Haliaeetus leucocephalus

General Distribution. The bald eagle can be found over most of North America. It breeds or winters throughout most of California. In the relatively mild climate of California, the breeding population of bald eagles is resident year-round in most areas. In fall and winter, migratory bald eagles from northern areas arrive in the state, where they remain until late winter or early spring.

Status. The bald eagle was listed as a federally endangered species in 1978 after habitat loss and pesticide contamination led to widespread population declines. Measures taken in the United States to protect habitat, outlaw DDT and other persistent organochlorine pesticides, and other recovery efforts resulted in a rebound in bald eagle populations. In 1995, the bald eagle was reclassified as a federal threatened species. In 1999, the USFWS proposed to remove the bald eagle from the List of Endangered and Threatened Wildlife in the lower 48 states of the United States, because available data indicated the species has recovered. A final ruling is expected by the end of 2000.

Reproductive Biology and Breeding Habitat. Breeding generally occurs from February to July. One to three eggs are laid in a stick platform nest placed in a tree, 50 to 200 feet off the ground. Young usually fledge by the end of August. Human activity near the nest, especially during egg-laying and incubation, can lead to nest desertion or disruption of breeding (USFWS 1986).

Nesting usually occurs within two miles of lakes, reservoirs, rivers, or large streams that support adequate food resources (USFWS 1986). Most nesting by bald eagles in California occurs from 1,000 to 6,000 feet in elevation, but can occur from sea level up to over 7,000 feet (Jurek 1988). Nest trees in California are most often ponderosa pines in mixed conifer stands. Bald eagles construct up to five nests in a nesting territory and alternate nests in different years.

Diet and Foraging Habitat. The most common prey of bald eagles in the west are fish, waterfowl, rabbits, and various type of carrion (Zeiner et al. 1990). Typically, large bodies of water or rivers with abundant fish, snags and other perches serve as foraging habitat.

Habitat and Status in the Project Area. According to park records, no bald eagles currently nest in Yosemite. There is a nesting pair at Cherry Lake, immediately outside the park. The Cherry Lake pair uses Lake Eleanor inside the park for foraging.

Transient bald eagles are occasionally seen in Yosemite Valley, El Portal, Wawona, and Foresta. Riparian and meadow areas may provide foraging habitat for transient eagles. The absence of anadromous fish runs in the Merced River probably limits its value as bald eagle habitat. Otherwise, the condition of river, riparian, and forest habitats that could be used by bald eagles is relatively intact.

California red-legged frog *Rana aurora draytonii*

General Distribution. The California red-legged frog is known to occur in 22 counties in California, primarily in central coastal California in Butte and El Dorado Counties. Currently, there are two known sites in the Sierra Nevada where the California red-legged frog is found. These sites are both on private land in proximity to Plumas and El Dorado National Forests (Fellers 1997).

The California red-legged frog tends to occur below 4,500 feet in elevation, though they have been found up to 8,000 feet in elevation (Fellers 1997). The most secure populations of California red-legged frog are found in aquatic sites that support substantial riparian and aquatic vegetation, and that lack non-native predators. California red-legged frogs found in coastal drainages are active year-round (Jennings et al. 1992), whereas those found in interior sites may be more seasonally inactive.

California red-legged frogs spend most of their lives in and near sheltered backwaters of ponds, marshes, springs, streams, and reservoirs. The largest densities of California red-legged frogs are associated with deep pools with dense stands of overhanging willows (*Salix spp.*) and an intermixed fringe of cattails (*Typha latifolia*) (Hayes and Jennings 1988; Jennings 1988). This is considered optimal habitat. California red-legged frog eggs, larvae, transformed juveniles, and adults also have been found in ephemeral creeks and drainages and in ponds that do not have riparian vegetation.

Accessibility to sheltering habitat is essential for the survival of the California red-legged frog and can be a factor limiting frog population numbers and survival. Sheltering habitat includes mammal burrows, damp leaf litter, downed wood and other cover objects (both natural and human-made), and dense shrubbery up to several hundred meters distant from aquatic sites. California red-legged frog may shelter in such places for weeks at a time in the wet season. California red-legged frogs may disperse up to eight kilometers from natal areas.

Status. The California red-legged frog has been extirpated or nearly extirpated from 70 percent of its former range. Historically, this species was found throughout the Central Valley and Sierra Nevada foothills. Possible reasons for this decline include habitat loss and change, acid precipitation, chemical pollution, introduced fish, drought, and compounded forces (Drost and Fellers 1994; USFWS 2000). Recent research has been focusing on contaminants (pesticides and herbicides) as the most likely cause of the decline (Fellers 1999). There is also concern about a newly described fungus that has been found associated with amphibian declines in other parts of the world (Fellers 1999).

Reproductive Biology and Breeding Habitat. California red-legged frogs breed from November through March, with earlier breeding records occurring in southern localities (Storer 1925). Females lay 750 to 4,000 eggs in clusters up to 10 inches across, attached to vegetation (Stebbins 1954).

Egg masses contain about 2,000 to 5,000 moderate-sized (0.08 to 0.11 inches in diameter), dark reddish-brown eggs. The egg masses are typically attached to vertical emergent vegetation such as bulrushes (*Scirpus* spp.) or cattail (Jennings et al. 1992). California red-legged frogs are often prolific breeders, laying their eggs during or shortly after large rainfall events in late winter and early spring (Hayes and Miyamoto 1984). Eggs hatch in 6 to 14 days (Jennings 1988). Increased siltation during the breeding season can cause asphyxiation of eggs and small larvae.

Larvae undergo metamorphosis 3.5 to 7 months after hatching (Storer 1925). Of the various life stages, larvae probably experience the highest mortality rates, with less than 1% of eggs laid reaching metamorphosis (Jennings et al. 1992). Sexual maturity normally is reached at 3 to 4 years of age (Storer 1925). California red-legged frogs may live 8 to 10 years (Jennings et al. 1992).

Diet and Foraging Habitat. The diet of California red-legged frogs is highly variable. Hayes and Tennant (1985) found invertebrates to be the most common food items; vertebrates, such as Pacific tree frogs and California mice, represented over half of the prey mass eaten by larger frogs. Hayes and Tennant (1985) found juvenile frogs to be active diurnally and nocturnally, whereas adult frogs were largely nocturnal. Feeding activity probably occurs along the shoreline and on the surface of the water (Hayes and Tennant 1985). Larvae most likely eat algae (Jennings et al. 1992).

Habitat and Status in the Project Area. Recent field studies in Yosemite found no California red-legged frogs (Fellers and Freel 1995; Fellers 1997). The California red-legged frog probably occurred in Yosemite Valley, El Portal, Foresta, and Wawona in the past. Yosemite Valley is one of two places in the park that would be a suitable site for reintroduction or recolonization of the species (Fellers 1997). Non-native bullfrogs would prevent successful reintroduction or recolonization (Thompson 2000)

Valley elderberry longhorn beetle *Desmoscerus californicus dimorphus*

General Distribution. The Valley elderberry longhorn beetle is an insect subspecies endemic to the Central Valley of California. It is found in riparian habitats and associated upland habitats where elderberry (*Sambucus* spp.), the beetle's foodplant, grows. The Valley elderberry longhorn beetle is found in California to an elevation of about 3,000 feet, and ranges as far north as the Shasta/Tehama county line (Barr 1991) and as far south as Kern County (Shields 1990). The Valley elderberry longhorn beetle is most commonly found along the margins of rivers and streams in the lower Sacramento River and upper San Joaquin Valley (USFS 1994a), most often in riparian elderberry savannah or moist valley oak woodlands. The Valley elderberry longhorn beetle is more abundant in dense native plant communities with a mature overstory and a mixed understory (Barr 1991). The species has been observed in the Sierra Nevada foothills, particularly in Fresno, Madera, and Placer Counties, as well as the eastern Coast Ranges foothills.

Status. The Valley elderberry longhorn beetle was listed by the USFWS as threatened on August 8, 1980. Critical habitat has been designated for the beetle in two areas – along the American River near the Sacramento metropolitan area and along Putah Creek in Solano County.

Threats to the beetle arise from loss and alteration of elderberry habitat through urbanization and agricultural use, the use of insecticides and herbicides, and fluctuations in stream water levels (Steinhart 1990). Grazing by domestic or wild herbivores and human pruning or burning are additional persistent threats to elderberry plants and the continued survival of the species (Barr 1991).

Reproductive Biology and Breeding Habitat. Mating and egg-laying occur in May. The Valley elderberry longhorn beetle is most visible during this period. Eggs are laid in crevices in elderberry bark, usually on stems greater than 1 inch in diameter, on healthy, unstressed elderberry plants. The eggs hatch in about 10 days, and the larvae bore into the pith of the stem where they feed and mature for one or two years by tunneling through the spongy pith of the large stems, trunks, and roots of the elderberry. Prior to changing into the adult life stage, the beetle larvae chew an emergence or exit hole in the trunk of the elderberry, through which the brightly colored adult beetle later exits the plant. The adult stage is short-lived.

Exit holes from which the larvae emerge are usually about the diameter of a standard wooden pencil and somewhat oval in shape. They occur on stems greater than 0.5 inches in diameter.

Diet and Foraging Habitat. The Valley elderberry longhorn beetle is completely dependent on its host plant, the elderberry (*Sambucus spp.*). From March to early June, adults feed in the riparian areas in which they breed. Adults utilize the foliage and possibly the flowers of two *Sambucus* species, *S. mexicana* and *S. racemosa* var. *microbotrys*. Larvae feed on the soft core of elderberry stems and excavate passages in the wood as they feed (Steinhart 1990). Both of these species are found in the El Portal area.

Habitat and Status in the Project Area. Potential Valley elderberry longhorn beetle habitat is defined by the presence of elderberry plants in areas below 3,000 feet in elevation. El Portal is the only part of the project area that lies below 3,000 feet in elevation. Though the presence or absence of the beetle itself has never been verified, elderberry plants with Valley elderberry longhorn beetle exit holes have been identified in El Portal.

Elderberry plants are ubiquitous throughout the Sierra Nevada foothills. Though never a dominant species, elderberry plants are a subdominant species of the following communities that surround El Portal: interior live oak forest, interior live oak woodland, blue oak woodland, canyon live oak forest, mixed north slope forest, foothill pine/live oak/chaparral woodland, northern mixed chaparral, interior live oak chaparral, and westside ponderosa pine forest.

In 1995, the National Park Service and the U.S. Geological Survey undertook an initial survey of Valley elderberry longhorn beetle habitat in potential development zones below 3,000 feet. All potential sites below 3,000 feet are located in El Portal. All elderberry plants in potential development sites were identified on the ground and mapped. Followup surveys were undertaken in 1997 and February 2000 in the Middle Road area, which had never been mapped, and in the Hillside East and Hillside West area, which had recently burned. The entire area was resurveyed

in June 2000, including new areas in Rancheria Flat, to obtain plant community information and the proximity of elderberry plants to water.

A total of 213 elderberry plants are in or near the boundaries of the project area. Of this total number, 124 plants have stems over 1 inch in diameter at ground level and are considered potential habitat for the elderberry beetle. Plants are distributed as follows:

Hillside East/Hillside West – This undeveloped grassland and woodland site supports about 17 elderberry plants. Many plants are in dense clusters that are difficult to differentiate as individual plants. None of the plants have stems greater than 1 inch in diameter, due to the effects of a prescribed burn that took place in 1999.

Village Center – This flat site retains an overstory of native oak (and other associated species). Native understory layers are largely missing due to development. A total of 14 elderberry plants occur in this area, all of which have stems greater than 1 inch in diameter. Beetle exit holes were found in one elderberry plant.

Old El Portal – This housing development retains a native, mature overstory layer (primarily oak species) and some native shrubs in the understory. There are six elderberry plants in old El Portal, five of which are on the east edge of Old El Portal in the Crane Creek drainage. These five plants have stems over 1 inch in diameter. None of the plants have beetle exit holes.

Rancheria – This housing development supports 136 elderberry plants, 74 of which have stems greater than 1 inch in diameter. Two plants with beetle exit holes were found.

Middle Road – This mostly undeveloped area supports 22 elderberry plants, 14 of which have stems greater than 1 inch in diameter. Four plants contained beetle exit holes.

Hennessey's Ranch (currently Trailer Village and Abbeville) – A total of 10 elderberry plants were found in this site, nine of which had stems greater than 1 inch in diameter. Some elderberry plants are located directly adjacent to trailers. Beetle exit holes were verified in four elderberry plants (Boroja 1998).

Railroad Flat – This developed site sustains six elderberry plants, all of which had stems greater than 1 inch in diameter.

Federal Species of Concern

W I L D L I F E

Harlequin duck *Histrionicus histrionicus*

General Distribution. Harlequin ducks are at the extreme southern extent of their range in California. They winter in marine waters along rocky coasts from San Luis Obispo County north, and breed inland along fast-flowing, shallow rivers and streams.

The last known breeding of the harlequin duck in the Sierra Nevada was on the upper Mokelumne River in Amador and Calaveras Counties in the 1970s, but potential breeding habitat in California has not been adequately surveyed.

Status. Both wintering and breeding populations of the harlequin duck have declined all over California, probably due to human disturbance along breeding streams and the damming of rivers (Remsen 1978).

Reproductive Biology and Breeding Habitat. It is likely that harlequin ducks still breed in California, but rarely. Nests are established near swift rivers or streams in recesses sheltered overhead by stream banks, rocks, woody debris, or low shrubs. Nests are usually within 7 feet of the water, but can be up to 90 feet away.

Diet and Foraging Habitat. In breeding areas, harlequin ducks feed primarily on invertebrates from the swift, shallow rivers that are its preferred habitat. In marine wintering habitat, mollusks and crustaceans are major foods.

Habitat and Status in the Project Area. Harlequin ducks are very rarely seen in Yosemite, but a pair was seen twice on the Merced River in Yosemite Valley in April 2000. Before these sightings, the most recent record of harlequin ducks was in 1980. Other areas where harlequin ducks could occur include the Merced River in El Portal and Wawona. Locally, human disturbance in riparian areas has likely caused direct disturbance and has degraded riparian vegetation that is important cover for nest sites and broods. Roads that follow the course of the Merced River have likely destroyed nesting habitat and adversely affected the quality of remaining habitat. Regionally, human disturbance and the destruction of habitat by human-made water impoundments have likely reduced the ability for harlequin ducks to recolonize or maintain a viable population in Yosemite National Park.

Northern goshawk *Accipiter gentilis*

General Distribution. Northern goshawks occur in Alaska, Canada, and the more northern mountains of the western United States. In California, goshawks breed in most mountain areas, where they generally remain through the winter. Some northern goshawks move downslope after breeding, as low as valley foothill hardwood habitats. Preferred habitat is moderately dense coniferous forests broken by meadows and other openings, between 5,000 and 9,000 feet elevation.

Status. Populations of goshawks have been declining in western North America, including California, primarily due to habitat destruction and human disturbance. Such factors include loss of habitat from logging, toxic chemicals, fire suppression, disease, shooting, and falconry (Bloom et al. 1986). Recent surveys in Yosemite National Park suggest that the density of nesting goshawks in the park is high relative to areas outside the park (Maurer 2000), which probably reflects the high quality of relatively intact forest habitats in the park.

Reproductive Biology and Breeding Habitat. Nesting begins in March or April. From one to five eggs are laid in a stick nest built in mature live trees, usually in dense, north-facing stands of coniferous, mixed, and deciduous forests (Zeiner et al. 1990). In the Sierra Nevada, goshawks breed in elevations that support mixed conifer forests up to higher lodgepole pine forests (Fowler 1988). Pairs of goshawks defend a territory within which one to five alternate nest trees may be used. Other characteristics of preferred goshawk nesting habitat may include older seral stages, high basal area, high canopy closure, open understories, and gentle slopes with east to northerly aspects (Hall 1984; Camilleri 1982; Saunders 1982; McCarthy 1986; Woodbridge et al. 1988; Austin 1993). Nests are also frequently associated with meadow, riparian habitats, or other natural forest openings.

Diet and Foraging Habitat. Goshawk studies indicate a dependence on squirrels such as the Douglas squirrel and golden-mantled ground squirrel, and mid-sized forest birds such as Stellar's jay and northern flicker (Schnell 1958; Bloom et al. 1986; Woodbridge et al. 1988). Goshawks hunt from tree perches, scanning the ground and lower canopy for prey. As such, an open understory improves their chances to detect and capture prey (Reynolds et al. 1992).

Habitat and Status in the Project Area. Except for localized effects from development, goshawk habitats in Yosemite are relatively intact and probably support near-natural numbers of this species. Areas affected by the *Final Yosemite Valley Plan/SEIS* where this species could occur include the Big Oak Flat Entrance, Badger Pass, South Entrance, Tioga Pass, Hazel Green, and Yosemite Valley. Goshawks are usually seen in Yosemite Valley between November and February, but such observations are rare and no breeding has been recorded in this area. As such, the existing impacts to habitats in Yosemite Valley are thought to have a negligible effect on the park's population of goshawks.

California spotted owl *Strix occidentalis occidentalis*

General Distribution. The California spotted owl is found throughout the entire Sierra Nevada from the southern Cascades south, and in the central Coast Ranges. Surveys through 1993 estimated approximately 1,600 spotted owl sites (pairs and territorial singles) in the Sierra Nevada (Gould 1993). California spotted owl habitat varies from oak and ponderosa pine forests to lower elevation red fir forests up to 7,600 feet in elevation. Prime habitat occurs between 3,000 and 7,000 feet.

Status. Populations of California spotted owls in the Sierra Nevada have steadily declined, and the subspecies is currently being considered for listing as threatened or endangered by the USFWS. The likely cause of this decline is habitat destruction and fragmentation from logging and development. Currently, the rate of decline of spotted owls in some parts of the Sierra Nevada is 10% per year (Steger 2000b). Comparison of the two most recent studies of spotted owls in Yosemite (Gould and Norton 1993; Steger 2000a) suggests that the population of spotted owls in the park is relatively stable. This is likely because habitats in the park are not subject to the same degradation factors as outside the park.

Reproductive Biology and Breeding Habitat. Breeding occurs from about mid-February to mid- or late-September, at which time the young are largely independent of their parents. Eggs are laid and incubated by the female from early April through mid-May. Nests are usually tree cavities, broken-off trees and snags, abandoned nests of other species, or mistletoe clumps. Trees used for nesting are usually very large. Nesting and roosting habitat of spotted owls is typically dense forest, with a canopy closure of greater than 70%. The presence of black oak in the canopy also enhances habitat quality.

Diet and Foraging Habitat. Spotted owls prey mainly on small mammals, but appear to focus on a few species. In the upper Sierra Nevada (over 4,000 feet), prey in mixed coniferous forests is mainly northern flying squirrels. In mid- to lower-elevation habitats, prey is usually both flying squirrels and dusky-footed woodrats. In foothill habitats, spotted owl prey is almost entirely woodrats.

Spotted owls tend to forage in intermediate to late successional forests with canopy closure greater than 40% and a mixture of tree sizes. Foraging habitat also usually shows signs of decadence and includes snags, old trees, and large downed logs. Flying squirrels also show a preference for mature forests where fungi and lichens may be important foods. Woodrats prefer forests with a brushy understory of shrubs or saplings.

Habitat and Status in the Project Area. Surveys conducted in the summer of 2000 provided the following results on the presence of California spotted owls in the areas that could be affected by the *Final Yosemite Valley Plan/SEIS* (Steger 2000a; Roberts et al. 1988):

Foresta: Six surveys of this area failed to locate any spotted owls. It is apparent that the 1990 A-Rock Fire changed the habitat in this location to the extent that it is no longer suitable for spotted owls. Gould and Norton (1993) found spotted owls in this vicinity during surveys in 1988.

Hazel Green: A male and a female spotted owl of unknown pair status were found northeast of the proposed project site. Although no nest or roosting area could be located for these owls, U.S. Forest Service records suggest a historic roost approximately a mile northeast of the Hazel Green site, and near where these owls were found.

Big Oak Flat Entrance: A single male was detected west, north, and east of the proposed project site during multiple surveys of the area. No main roosting area could be located, but recent U.S. Forest Service records indicate the area has historically been used by a nesting pair, with the likely nest site approximately two-thirds of a mile southeast of the entrance station.

Badger Pass: Two pairs of spotted owls were detected in this area, with one pair about one mile north of the ski area, and the other one about two-thirds of a mile west of the area. Both pairs were determined to be nonreproductive.

Wawona: In six complete surveys of the area, no spotted owls were detected.

South Entrance: Surveys revealed two pairs in this area. One pair had a nest site with two fledged young about 1-1/4 miles southeast of the entrance station. The second pair was found

about 1-1/4 miles northeast of the entrance station, and was once found within a half-mile of the site.

El Portal: In six complete surveys of this area, no spotted owls were found. Noise from the river and traffic may have hampered detection of owls. Habitat on the north side of the river was judged by the researchers to be of marginal quality to spotted owls, providing isolated patches of roosting and foraging habitat for owls likely nesting on the south side of the river, where habitat quality is high.

Yosemite Valley: A total of four spotted owls were found in this location. A nonreproductive pair was found near the base of Cathedral Spires, with their territory likely extending east. A single male was found near Ribbon Creek, on the north side of the Valley. A single female was found south of Mirror Lake. Neither of these owls was apparently paired. In Yosemite Valley, recent park records show spotted owl nest sites near Happy Isles, Mirror Lake, and near the base of Cathedral Rocks. Individual birds have been seen near the Chapel, Yellow Pine Campground, east of Curry Village, and in the government housing area near Yosemite Village.

Based upon these data, no spotted owl core nesting or roosting areas would be directly affected by development projects. Proposed project sites at Hazel Green, Badger Pass, South Entrance, Big Oak Flat Entrance, and Yosemite Valley, however, are all apparently within the territories of spotted owls, and the sites are likely used as foraging areas. California spotted owls are habitat specialists, needing canopy closure greater than 70% for nesting and roosting, and greater than 40% for foraging (Verner et al. 1992). Habitat meeting such criteria in project areas should be considered potential spotted owl habitat. Spotted owls may be sporadic breeders, with many pairs nesting when weather and prey conditions are favorable. Single owls or nonreproductive pairs that were found in this survey may, in such years, have nests near where they were found roosting.

Mount Lyell shrew *Sorex lyelli*

General Distribution. The Mount Lyell shrew was originally described from three specimens collected during the original Grinnell surveys (Grinnell and Storer 1924). Two of these specimens were found in the vicinity of Mount Lyell in Yosemite National Park. The third specimen was collected near Williams Butte in Mono County. Two more specimens were collected in 1946 in Mono County. The Mount Lyell shrew was found in moist situations near streams, in grass, or under willows (Grinnell and Storer 1924).

Status. Known only from the five specimens at the Museum of Vertebrate Zoology in Berkeley, California, the Mount Lyell shrew is a vulnerable species because of its apparently very limited distribution.

Reproductive Biology and Breeding Habitat. Little is known about the reproductive biology and breeding habitat of the Mount Lyell shrew.

Diet and Foraging Habitat. The Mount Lyell shrew probably eats insects and other invertebrates found while foraging on ground, in stumps and logs (Grinnell and Storer 1924).

Habitat and Status in the Project Area. Suitable habitat occurs at Tioga Pass.

Spotted bat *Euderma maculatum*

General Distribution. The spotted bat is considered to be one of North America's rarest mammals (Zeiner et al. 1990). It is known from only about 25 sites in California (Pierson and Rainey 1998). The spotted bat is a solitary cliff-dweller, and its distribution is closely linked to the availability of cliff roosting habitat. It is found in a wide variety of habitats, from low desert to coniferous forest (Wildlife Society 1996). It generally roosts on high cliff faces. The spotted bat produces echolocation calls within the range of normal hearing.

Surveys completed between 1992 and 1997 in Yosemite National Park found this species in numerous locations, including Wawona, Crane Flat, Tuolumne Meadows, and especially Yosemite Valley.

Status. The numbers of spotted bats have declined in recent decades, with likely causes including pesticide use and habitat destruction and fragmentation.

Reproductive Biology and Breeding Habitat. Females have one young per year, with birth occurring in June to July.

Diet and Foraging Habitat. The spotted bat feeds on a variety of insects, but predominately moths. In montane habitats, the spotted bat forages over meadows, along forest edges, or in open coniferous woodland. The spotted bat generally forages alone.

Habitat and Status in the Project Area. There is a significant population of spotted bats in Yosemite Valley (Pierson and Rainey 1996). Auditory bat surveys were conducted in 1993 at 24 stations in Yosemite Valley in four habitats: large open meadows, wetlands, forest, and open ponderosa pine forest. Acoustic data indicated the spotted bat was present only in meadow and wetland habitats (Pierson and Rainey 1993). Field surveys have confirmed spotted bats foraging on the north side of El Capitan Meadow, just below El Capitan, Bridalveil Meadow, Leidig Meadow, and Ahwahnee Meadow; the spotted bat was not found in Cook's Meadow or Stoneman Meadow (Pierson and Rainey 1993). It is likely that spotted bats roost on or near Half Dome and El Capitan; Yosemite Valley had the highest population of spotted bats of any location surveyed in California (Pierson and Rainey 1995). Acoustic data collected in 1994 suggest there is a significant population of spotted bats in the Wawona area (Pierson and Rainey 1995). Based upon these surveys, and the habitat and elevation range of this species, the spotted bat is expected to be present at all potential project sites.

Small-footed myotis bat *Myotis ciliolabrum*

General Distribution. The small-footed myotis bat is a common bat of arid uplands in California. It is found on the west and east sides of the Sierra Nevada, in Great Basin habitats from Modoc to Kern and San Bernardino Counties, and in coastal California south to the Mexican border. It occurs in a wide variety of habitats, primarily in relatively arid, wooded, and brushy uplands near water. The summer and winter ranges appear to coincide, but there are few records from winter. This species is found from sea level to at least 8,800 feet in elevation.

Status. Populations of small-footed myotis bats have apparently declined over recent decades, with likely causes including habitat destruction and fragmentation and the use of pesticides.

Reproductive Biology and Breeding Habitat. The small-footed myotis bat mates in the fall. The young are born from May through June, with a peak in late May. Usually there is a single young, but twins are common. Lactating females were found in June and July. Most young are flying by mid-August. The maximum-recorded longevity is 12 years.

Diet and Foraging Habitat. This species feeds on a variety of small flying insects. Prey includes moths, flies, beetles, and bugs. Foraging flight is slow and maneuverable. The small-footed myotis bat is often seen foraging among trees and over water.

Habitat and Status in the Project Area. The small-footed myotis bat is known to occur in Yosemite Valley, based on historic records and a specimen at the Museum of Vertebrate Zoology in Berkeley, California. The small-footed myotis bat was not captured during five days of mist netting in Yosemite Valley in 1993, though it was captured in Wawona in 1994 (Pierson and Rainey 1993; 1995). This species has the potential to occur in all of the proposed project areas in the park, except Tioga Pass.

Long-eared myotis bat *Myotis evotis*

General Distribution. The long-eared myotis bat is widespread in California but generally is believed to be uncommon in most of its range. This species has been found in nearly all brush, woodland, and forest habitats from sea level to at least 9,000 feet. This species is highly dependent on oak trees for roosting (Pierson 2000).

Mist-net surveys were conducted in the park in 1994 in Tuolumne Meadows, Pate Valley, and Wawona. The long-eared myotis bat was captured at the Wawona Golf Course and along the South Fork of the Merced River in Wawona (Pierson and Rainey 1995).

Status. Populations of long-eared myotis bats have apparently declined over recent decades, with likely causes including habitat destruction and fragmentation and the use of pesticides.

Reproductive Biology and Breeding Habitat. Mating probably occurs in the fall. The young are born from May to July, with a peak in June. The single yearly litter averages one young. Most

young are flying by early August. Nursery colonies of 12 to 30 individuals are found in buildings, crevices, snags, and behind bark.

Diet and Foraging Habitat. The long-eared myotis bat feeds on a variety of arthropods including beetles, moths, flies, and spiders. It consumes more beetles than other myotis species, and there is some evidence that it consumes more beetles when it occupies the same territory as *M. auricolus*. Insects are caught in flight, gleaned from foliage, or occasionally taken from the ground. Foraging flight is slow and maneuverable. This species is capable of hovering. It forages among trees, over water, and over shrubs, preferring the riparian edge (Pierson 2000). It usually forages less than 40 feet above the ground.

Habitat and Status in the Project Area. Mist-net bat surveys took place in Yosemite Valley in 1993 at Mirror Lake, Cook's Meadow, El Capitan Meadow, and at Yosemite Creek below Lower Yosemite Fall. The long-eared myotis bat was captured only at the Yosemite Creek site (Pierson and Rainey 1993). It was also captured in Wawona. This species is likely to occur in low numbers throughout most of the project area, except Tioga Pass.

Fringed myotis bat *Myotis thysanodes*

General Distribution. The fringed myotis bat is found throughout much of California and from southern through central Nevada. It is found in a wide range of habitats, from low desert scrub to high elevation coniferous forest. This species is found in the Sierra Nevada in deciduous/mixed conifer habitats to about 6,500 feet in elevation.

Day and night, the fringed myotis bat roosts in mines, caves, trees, and buildings. This species is very sensitive to roost disturbance (Wildlife Society 1996).

Status. Populations of fringed myotis bats have apparently declined over recent decades, with likely causes including habitat destruction and fragmentation and the use of pesticides.

Reproductive Biology and Breeding Habitat. The fringed myotis bat has one young per year, with birth occurring in May to June. Maternity roosts contain adult females and may include several hundred individuals, although most known California roosts are small (fewer than 40 females). Males roost singly or in small groups (Wildlife Society 1996).

Diet and Foraging Habitat. The diet of the fringed myotis bat is primarily beetles, but it includes a variety of other taxa, such as moths (Wildlife Society 1996). It tends to forage over water in river corridors in Yosemite (Pierson 2000).

Habitat and Status in the Project Area. Grinnell and Storer found the fringed myotis bat in 1924 in a location just outside the park boundary. Mist-net bat surveys took place in Yosemite Valley in 1993 at Mirror Lake, Cook's Meadow, El Capitan Meadow, and at Yosemite Creek below Lower Yosemite Fall (Pierson and Rainey 1993). The fringed myotis bat was captured in Cook's Meadow and the Yosemite Creek site. It was not found in mist-netting surveys in 1994 in Yosemite Valley (Pierson and Rainey 1995). The fringed myotis bat is likely to occur in the entire project area, with the exception of Tioga Pass.

Long-legged myotis bat
Myotis volans

General Distribution. The long-legged myotis bat is widespread in California, but generally is believed to be uncommon in most of its range. This species has been found in nearly all brush, woodland, and forest habitats from sea level to at least 9,000 feet in elevation. This species is highly dependent on oak trees for roosting (Pierson 2000), though it also uses rock crevices, mines, and buildings.

Reproductive Biology and Breeding Habitat. The long-legged myotis bat has one young per year, with birth occurring in June to July. Maternity colonies number from 200 to 500 individuals (Wildlife Society 1996).

Status. Numbers of long-legged myotis bats have apparently declined over recent decades, with likely causes including habitat destruction and fragmentation and the use of pesticides.

Diet and Foraging Habitat. This species feeds primarily on moths, but also feeds on other taxa, including beetles, flies, and termites. Foraging occurs in open areas, often at tree canopy height.

Habitat and Status in the Project Area. The long-legged myotis bat was not recorded in recent surveys in the park (Pierson and Rainey 1993; 1995), though it is expected. It was found in the Grinnell and Storer survey (1924). The bat is expected in all of the project areas, with the exception of Tioga Pass.

Yuma myotis bat
Myotis yumanensis

General Distribution. This species is found in a wide variety of habitats in the Sierra Nevada below 8,000 feet. It roosts in buildings, trees, mines, caves, or crevices. It also roosts under bridges (Wilderness Society 1996). It is one of the bat species that is most tolerant of human habitation, and one of the few that can survive in a relatively urbanized environment.

Mist-net surveys were conducted in the park in 1994 in Tuolumne Meadows, Pate Valley, and Wawona. The Yuma myotis bat was captured at Pate Valley and along the South Fork of the Merced River in Wawona (Pierson and Rainey 1995).

Status. Populations of Yuma myotis bats have apparently declined over recent decades, with likely causes including habitat destruction and fragmentation and the use of pesticides.

Reproductive Biology and Breeding Habitat. The Yuma myotis bat has one litter per year with an average of one young, with birth occurring in June to July. Maternity colonies can be large (200 to several thousand) and contain only adult females and their young. Males roost singly or in small groups.

Diet and Foraging Habitat. The Yuma myotis bat feeds primarily on emergent aquatic insects (Pierson 2000) and forages directly over the surface of open water and relatively still water such as ponds, or pools in streams and rivers.

Habitat and Status in the Project Area. Mist-net bat surveys took place in Yosemite Valley in 1993 at Mirror Lake, Cook's Meadow, El Capitan Meadow, and at Yosemite Creek below Yosemite Falls (Pierson and Rainey 1993). The Yuma myotis bat was captured at Mirror Lake, El Capitan Meadow, and the Yosemite Creek site. This species was also found in recent mist-netting surveys in Yosemite Valley and Wawona (Pierson and Rainey 1993; 1995). It is expected in all of the project sites, with the exception of Tioga Pass.

Greater western mastiff bat *Eumops perotis californicus*

General Distribution. The greater western mastiff bat is found along the west side of the Sierra Nevada, primarily at low to mid-elevations, but has been detected up to 10,000 feet in the summer. It is found in a variety of habitats, from desert scrub and chaparral to montane coniferous forest. Its distribution is tied to the availability of suitable roosting habitat and can sometimes be predicted on the basis of significant rock features, such as large granite formations.

Status. Numbers of greater western mastiff bats have apparently declined over recent decades, with likely causes including habitat destruction and fragmentation and the use of pesticides.

Reproductive Biology and Breeding Habitat. The greater western mastiff bat has one young per year, with birth occurring in June to July. Females form maternity colonies, although males are sometimes present.

Diet and Foraging Habitat. The diet of this species appears to be primarily moths, but also includes beetles and crickets in California. It forages in the open and ranges to high altitudes above ground. Some individuals are known to travel more than 25 miles to reach feeding grounds. It is detected most often over desert washes, grasslands, or meadows, but also feeds above the forest canopy.

Habitat and Status in the Project Area. There is a significant population of greater western mastiff bats in Yosemite Valley, based on mist-netting surveys (Pierson and Rainey 1995). Auditory bat surveys were conducted in 1993 at 24 stations in Yosemite Valley in four habitats: large open meadows, wetlands, forest, and open ponderosa pine forest. Acoustic data indicated the greater western mastiff bat was present in Bridalveil Meadow, El Capitan Meadow, Leidig Meadow, Cook's Meadow, Ahwahnee Meadow, Stoneman Meadow, Wosky Pond, and wetlands near Happy Isles. It was also detected in a few upland habitats east of El Capitan Meadow and Sentinel Picnic Area. It was not detected at Mirror Lake. Yosemite Valley has the highest population of the greater western mastiff bat in any localities surveyed in California (Pierson and Rainey 1995). It also has been captured in Wawona (Pierson and Rainey 1995). The greater western mastiff bat most likely forages in or near all of the project sites.

Sierra Nevada snowshoe hare
Lepus americanus

General Distribution. The Sierra Nevada snowshoe hare is an uncommon resident of upper elevations in the Sierra Nevada as far south as Mariposa, Mono, and Madera Counties. A search for records at the National Museum (Smithsonian), Museum of Vertebrate Zoology in Berkeley, California, and the Los Angeles County Museum found only two specimens from California, suggesting that Yosemite National Park may be near the southern limit of this species' range. Yosemite's faunal database contains records for 18 unconfirmed sightings, all from higher elevations. The hare prefers the edges of forested habitats, heterogeneous habitats, and areas with dense understory, particularly in riparian habitats. It is also found in areas with young firs that have branches drooping to the ground, and in patches of ceanothus and manzanita within or bordering fir or pine forests.

Status. Sierra Nevada snowshoe hares were likely always relatively scarce in Yosemite, since this area is apparently at the southern extreme of their range. However, effects such as logging and fire suppression have likely contributed to the Sierra-wide decline of this species.

Reproductive Biology and Breeding Habitat. The Sierra Nevada snowshoe hare breeds mid-February to June or July. The gestation period is 35 to 37 days. Snowshoe hares have 2 to 3 litters per year. Nests are built with grass, fur, and needles that may line a shallow, bowl-like depression placed under a shrub, log, or in slash.

Diet and Foraging Habitat. The Sierra Nevada snowshoe hare grazes and browses. Summer food primarily consists of grasses, forbs, sedges, and low shrubs. Needles and bark of conifers, and leaves and green twigs of willow and alder are eaten in the winter.

Habitat and Status in the Project Area. Unconfirmed sighting records and information from other locations suggest that forested areas surrounding the Tioga Pass and Badger Pass project areas may provide suitable habitat for this species. Given the elevation range of the snowshoe hare, its occurrence at Hazel Green, Big Oak Flat Entrance, and South Entrance is possible.

Sierra Nevada mountain beaver
Aplodontia rufa californica

General Distribution. The Sierra Nevada mountain beaver is found along the Pacific slope of western North America, from lower British Columbia south to the Sierra Nevada to California (Todd 1990). Mountain beavers are typically associated with moist meadows and riparian zones near small perennial streams and creeks within the montane zone (Todd 1990). Mountain beavers are confined to well-vegetated, moist, cool environments – a function of their poor ability to concentrate urine and low tolerance for temperature extremes (Nungesser and Pfeiffer 1965).

Mountain beaver habitat in Yosemite is found in sandy loam soils that are dominated by one or more of the following woody plants: dogwood (*Cornus* spp.), labrador tea (*Ledum glandulosum*), willow (*Salix* spp.), and alder (*Alnus* spp.). Common herbaceous plants include cow parsnip

(*Heracleum lanatum*), corn lily (*Veratrum californicum*), broad-leaved lupine (*Lupinus latifolius*), fireweed (*Epilobium spp.*), and various grasses (Todd 1990).

There are an estimated 200 to 550 mountain beaver sites in Yosemite National Park. Given rough estimates of two to 12 adults per site, from 400 to 6,600 adults lived in the park in 1990.

Status. Although Yosemite appears to have a relatively healthy population of mountain beavers, impacts such as logging, grazing, and water diversions in other parts of the Sierra Nevada have apparently caused serious declines in this species.

Reproductive Biology and Breeding Habitat. Mountain beavers breed from December through March. Young are born February through May. The litter size averages two to three young. Females usually do not bear young until their second year. Nest chambers are located from 1 to 4.5 feet below the ground surface (Zeiner et al. 1990).

Diet and Foraging Habitat. Mountain beavers feed on vegetative parts of plants including thimbleberry, salmonberry, blackberry, dogwood, salal, ferns, lupines, willow, and grasses. They forage underground, above ground, under snow, on the surface of snow, and up to 15 feet high in trees and bushes. Vegetation is stored near a burrow entrance or in underground chambers (Maser et al. 1981). Mountain beavers in the Sierra Nevada require abundant riparian plants for harvesting, but species composition is relatively unimportant (Todd 1990).

Habitat and Status in the Project Area. Mountain beavers are known to occur in the streams that drain from the meadows and ski slopes at Badger Pass (Monroe Meadow). No suitable habitat occurs in or near the other proposed project areas.

Sierra Nevada red fox *Vulpes vulpes necator*

General Distribution. In the Sierra Nevada, the Sierra Nevada red fox prefers forests interspersed with meadows and alpine fell-fields. It is found from 3,900 to 11,900 feet in elevation, although most sightings and records are from above 7,000 feet in elevation. The Museum of Vertebrate Zoology in Berkeley, California has 12 specimens collected from the immediate vicinity of Tioga Pass. The Museum of Vertebrate Zoology also has two specimens collected from Big Meadow, near Foresta. Open areas are used for hunting, and forested habitats are used for cover and reproduction. Today, this species is exceedingly rare, although a photograph was taken of a red fox at Tioga Pass Resort in January 1991. It could not be determined whether this individual belonged to the native subspecies or was an introduced eastern red fox.

Status. The Sierra Nevada red fox was, at one time, common to uncommon in suitable habitat. Near the turn of the 19th century, wide-scale trapping greatly reduced numbers of Sierra Nevada red foxes. Since then, activities such as logging, grazing, and fire suppression have likely affected the ability of this species to recover.

Reproductive Biology and Breeding Habitat. Breeding takes place in late winter (January-March). After a gestation period of 52 days, young are born in early spring (March-May). Den sites include rock outcrops, hollow logs and stumps, and burrows in deep, loose soil.

Diet and Foraging Habitat. The Sierra Nevada red fox hunts small and medium-sized mammals, ground squirrels, gophers, mice, marmots, woodrats, pikas, and rabbits. It hunts in meadows, fell-fields, grassland, and other open habitats.

Habitat and Status in the Project Area. There is extensive suitable habitat in the Tioga Pass project area. Based on historic occurrence in the Big Meadow area, suitable habitat also exists in all other project areas, except El Portal.

California Wolverine *Gulo gulo luteus*

General Distribution. The California wolverine is exceedingly rare, with its distribution scattered over large areas. Optimal habitat for the wolverine is in large tree stages with moderate to dense canopy cover, in red fir, lodgepole pine forests, and in alpine meadows. Special habitat requirements are low human disturbance, and rocky areas, caves, logs, or snags as den sites. Specimens in the Museum of Vertebrate Zoology in Berkeley, California collection originate from Saddlebag Lake and the head of Lyell Canyon. The Yosemite Field Museum has two specimens from Chiquito Lakes. All specimens were collected above 8,000 feet in elevation.

Status. Wolverines were apparently always scarce in the Sierra Nevada, but logging and recreational use of potential habitats have likely further reduced their abundance.

Reproductive Biology and Breeding Habitat. The wolverine mates in summer, with delayed implantation. It bears one to four young the next spring. The wolverine has one litter per year. It excavates burrows under shelving rock or in logs, caves, or snags.

Diet and Foraging Habitat. The wolverine is a solitary hunter and forages on the ground, in trees, burrows, and rock piles for carrion or live prey. It captures prey by digging animals out of their burrows, by pursuit and capture, or by ambush. Prey includes marmots, gophers, squirrels, rats, mice, birds, insects, and occasionally ungulates. The wolverine also eats fruits.

Habitat and Status in the Project Area. Based on the collection of specimens from nearby localities, Tioga Pass lies within the historical range of optimal wolverine habitat.

American marten *Martes americana*

General Distribution. The American marten is an uncommon to common resident of the Sierra Nevada. Its optimal habitats are various mixed evergreen forests that have more than 40% crown closure and large trees and snags. Important habitats include red fir, lodgepole pine, subalpine conifer, Jeffrey pine, and eastside pine (Grinnell et al. 1937; Schempf and White 1977; USFS 1994b). A survey for forest carnivores in Yosemite generally found martens inhabiting elevations

above 7,600 feet in lodgepole pine forest, subalpine meadow/forest edges, and rocky areas (Chow 2000).

Status. Numbers of martens in the Sierra Nevada have been reduced by human influences such as logging and fire suppression.

Reproductive Biology and Breeding Habitat. The American marten breeds in summer and has a gestation period of 220 to 290 days, including delayed implantation. Embryos are generally implanted in uterus in February and have an active growing period of about 37 days prior to birth. Most litters are born in March and April, and some as late as June. Females have one litter per year, with an average of 3.5 young. The young stay with females until autumn and then begin a solitary life. Dens are located in cavities in trees, snags, logs, and rock piles. Dens are usually lined with leaves, grass, mosses, or other vegetation.

Diet and Foraging Habitat. Martens are mostly carnivorous, taking primarily small mammals such as tree squirrels, chipmunks, mice, shrews, rabbits, hares, and pikas. In spring through autumn, martens often eat birds, insects, and fruits. Studies over two winters in Yosemite showed substantial differences in diet between the two winters. White-tailed jackrabbits were the principal food items in 1976/1977 (Hargis and McCullough 1984). Voles were the principal food item in 1979/1980 (Hargis and McCullough 1984).

Martens will eat fish and will forage along the edge of water. They may tunnel under snow. Martens may use their forepaws to remove birds from tree cavities. Individuals may travel up to 16 miles while hunting in one night. They forage on the ground as well as in trees, snags, logs, and rocky areas. During winter, wind-thrown trees and log piles are important as entrances into space under snow for hunting.

Habitat and Status in the Project Area. The Museum of Vertebrate Zoology in Berkeley, California has records for 19 specimens collected in or near Yosemite National Park. Six of these were collected in the Tioga Pass area. Grinnell and Storer (1937) indicated that the densest marten populations in the southern Sierra Nevada were in the Tioga Pass – Mono Lake area. Martens are also potentially found at Badger Pass, Hazel Green, the Big Oak Flat Entrance Station, the South Entrance Station, and rarely in Yosemite Valley.

Pacific fisher *Martes pennanti*

General Ecology and Distribution. The Pacific fisher is most often found between elevations of 4,000 to 7,000 feet in the Sierra Nevada. Its preferred habitat is mixed-conifer montane hardwood forest with large-diameter trees and a moderate to dense canopy cover. They are also associated with mixed hardwood/conifer forest between 4,000 and 6,000 feet in elevation. Records at the Museum of Vertebrate Zoology in Berkeley, California for specimens collected in Yosemite indicate that fishers were most commonly found between 6,000 and 7,000 feet in elevation. In recent years, the majority of reported fisher sightings and vehicle-related accidents

(road kills) have occurred along the Wawona and Big Oak Flat Roads near Henness Ridge and Crane Flat.

Status. Trapping in the Sierra Nevada near the end of the 19th century severely reduced numbers of fishers. Activities such as logging and fire suppression since then have likely inhibited the recovery of this species. Road kills are the single largest cause of unnatural adult fisher mortality.

Reproductive Biology and Breeding Habitat. Breeding generally occurs in mid- to late spring. Gestation, including delayed implantation, is approximately 327 to 358 days, with the period of active pregnancy following implantation and lasting approximately 30 to 60 days. Young are born in early to mid-spring. Natal dens typically consist of cavities found in large-diameter trees or snags.

Diet and Foraging Habitat. Fishers are largely carnivorous. Fishers eat rabbits and hares, especially snowshoe hares and rodents (mice, porcupines, squirrels, mountain beavers), shrews, birds, fruits, and carrion. They opportunistically forage on the ground surface and in trees.

Habitat and Status in the Project Area. Preferred fisher habitat, as evidenced by the locations of historic records and recent fisher sightings, occurs within all of the proposed project areas, except Tioga Pass and El Portal.

Limestone salamander *Hydromantes brunus*

General Distribution. The limestone salamander is found in a highly restricted range outside Yosemite National Park near Briceberg, Mariposa County. This area is protected by the 120-acre Limestone Salamander Ecological Reserve and the Bureau of Land Management's 1,600-acre Limestone Salamander Area of Critical Environmental Concern. The limestone salamander is found in limestone substrates in mixed chaparral habitats along the Merced River and its tributaries from 1,100 to 2,500 feet in elevation (Zeiner et al. 1988). It frequents limestone cliffs and ledges and in talus, especially where overgrown with moss. During periods of surface activity (November to the end of March), this species is uncommon to common on steep north- and east-facing slopes. California buckeye may be an indicator species for optimal habitat.

Status. The limestone salamander is considered vulnerable because of its highly restricted range.

Reproductive Biology and Breeding Habitat. Little is known about habitat requirements for breeding and egg laying for this salamander. A related salamander, *H. shastae*, apparently breeds and is known to lay eggs in limestone caverns.

Diet and Foraging Habitat. The limestone salamander most likely forages on insects and other small invertebrates.

Habitat and Status in the Project Area. The limestone salamander has never been collected in the park. Its closest occurrence is about 30 miles west of El Portal near Briceburg. The Museum of Vertebrate Zoology in Berkeley, California has an extensive collection of specimens originating

from the vicinity of Briceburg on the Merced River. Although the project area in El Portal lies within the elevation range of this species, and suitable vegetative habitat appears to exist, the species is not expected due to a lack of limestone substrate.

Mount Lyell salamander
Hydromantes platycephalus

General Distribution. The Mount Lyell salamander is found in wet habitats in the Sierra above 4,000 feet. It is typically found under large granite slabs and boulders at the edge of talus slopes (Stebbins 1985). Typical habitat includes rock fissures and seeps from streams or melting snow, shade, and low-growing plants. It has been found near cliffs, cave openings, melting snowbanks, and in the spray zone of waterfalls. Winter hibernation probably occurs within deep rock fissures or under slabs of exfoliating granite.

Status. Mount Lyell salamanders are considered a vulnerable species because of their highly restricted range.

Reproductive Biology and Breeding Habitat. Little is known about specific microhabitat requirements of breeding and egg laying. Eggs probably are deposited beneath granite rocks or slabs covering moist granite soil.

Diet and Foraging Habitat. Centipedes, spiders, termites, beetles, and adult and larval flies are important food items (Stebbins 1972). Food is obtained under surface objects or while foraging on the surface at night.

Habitat and Status in the Project Area. The Museum of Vertebrate Zoology in Berkeley, California has records for nine specimens taken from Yosemite Valley in the vicinity of Vernal Fall and Curry Village, six specimens from the top of Vernal Fall, 30 from the top of Half Dome, and 18 specimens from various parts of Lyell Canyon. There is suitable habitat for the Mount Lyell salamander in Yosemite Valley, Tioga Pass, and Badger Pass.

Yosemite toad
Bufo canorus

General Distribution. The Yosemite toad frequents high mountain meadows and forest borders, emerging soon after the winter snowpack melts. It is found in the central Sierra Nevada at elevations from 6,400 feet to 11,300 feet.

Status. The Yosemite toad has undergone significant population declines in recent years (Fellers and Drost 1993). The cause for the decline of Yosemite toads remains uncertain and does not appear to be strongly linked to either habitat degradation or non-native fish (Drost and Fellers 1994).

Reproductive Biology and Breeding Habitat. Breeding occurs in shallow pools and lake margins, or in quiet water of streams. Egg laying occurs from mid-April to mid-July, depending on local conditions. Eggs are deposited in shallow, quiet pools in wet meadows or in shallow tarns

surrounded by forest. Breeding sites are frequently slow-flowing runoff streams with short emergent sedges.

Diet and Foraging Habitat. The diet of this toad includes beetles, ants, mosquitoes, and spiders (Grinnell and Storer 1924; Mullally 1953). Tadpoles feed on bottom detritus or by filtering suspended plant material and planktonic animals.

Habitat and Status in the Project Area. In 1992, Drost and Fellers resurveyed a transect of the Sierra Nevada mountains that has been surveyed for the Yosemite toad in the early 1900s (Grinnell and Storer 1924). The Grinnell and Storer survey discovered the Yosemite toad and described it as a new species. Drost and Fellers found the Yosemite toad at just over half of the 13 sites where it was found by Grinnell and Storer, and in low numbers at most sites (Drost and Fellers 1994).

In 1997, a survey of over 260 sites in Yosemite found the Yosemite toad at a total of only five sites (Fellers and Freel 1995; Fellers 1997). During 1999, the Yosemite toad was found at 14 out of 291 sites that were surveyed. The number of sites with toads and the number of toads at each site were slightly higher than in recent years and may be indicative of a modest recovery, although it is too early to be certain (Fellers and Freel 1995, Fellers 1999).

Records from the Museum of Vertebrate Zoology in Berkeley, California show that juvenile toads and tadpoles were collected from Ahwahnee Meadow in Yosemite Valley in 1956. The collection also contains more than 150 specimens from the immediate vicinity of the Tioga Pass Entrance Station, suggesting that this species was once abundant in the area.

Sherman and Morton (1984;1993) documented changes in the breeding population of Yosemite toads at Tioga Pass. Their yearly surveys from 1971 to 1982 show a nine-fold decrease in marked males and a drop in the average number of toads. In 1992, Drost and Fellers surveyed the Tioga Pass area. No adults were found, and tadpoles were found in only two small ponds near Tioga Lake, despite an abundance of good habitat in the area (Drost and Fellers 1994).

The areas of likely occurrence of Yosemite toads in project sites, based upon previous observations and collections, are meadows and lakes near Tioga Pass. Assuming the identification of the toads and tadpoles obtained 45 years ago in the one collection from Yosemite Valley 45 years ago is correct, this area could be habitat for Yosemite toads; however, the lack of subsequent observations from this area, and the fact that the Valley is far below the usual elevation range of this species, indicate that Yosemite Valley is an unlikely site for a sustainable population of Yosemite toads.

Foothill yellow-legged frog *Rana boylei*

General Distribution. The foothill yellow-legged frog is found from western Oregon to southern California (Behler and King 1979). It was formerly abundant up to 6,000 feet in elevation in the Sierra Nevada, though it has virtually disappeared from its range from uncertain causes.

Remaining foothill yellow-legged frogs live in or near permanent freshwater rocky streams and rivers in a variety of habitats, including valley-foothill hardwood and conifer, chaparral, and wet meadow types (Zeiner et al. 1988). The yellow-legged frog prefers shallow, partially shaded streams with rocky substrates that are at least cobble-sized, with water less than 2 feet deep and fast-flowing water with riffles (Hayes and Jennings 1988). Streams with at least 40% riffles and at least 40% cobble-sized or greater substrates may best suit this species (Hayes and Jennings 1988).

Status. The mountain yellow-legged frog was formerly one of the most abundant amphibian species in California, but is now virtually extinct from its former range. Causes of this extreme decline are unknown at this point, but could include introduction of non-native amphibian (bullfrog) and fish species, pesticides, and disease. Recent data also suggest that fungal infections may be an important factor.

Reproductive Biology and Breeding Habitat. Breeding usually occurs during a two-week period after spring flooding between March and May. Clusters of 100 to 1,000 eggs are attached to gravel or rocks in moving water near stream edges (Zeiner et al. 1988). Tadpoles transform in three to four months (Zeiner et al. 1988).

Diet and Foraging Habitat. Adults feed on both aquatic and terrestrial invertebrates, favoring adult insects. Tadpoles probably graze on algae and diatoms along rocky stream bottoms (Zeiner et al. 1988).

Habitat and Status in the Project Area. Recent surveys found no foothill yellow-legged frogs in Yosemite National Park (Fellers and Freel 1995; Fellers 1997). Suitable habitat for this species occurs in Yosemite Valley, Foresta, Wawona, and El Portal.

Mountain yellow-legged frog *Rana muscosa*

General Distribution. The mountain yellow-legged frog is found in the Sierra Nevada, in the extreme western part of Nevada, and in portions of southern California (Behler and King 1979). In the Sierra Nevada it is found in streams, rivers, ponds, and lakes from 4,500 feet to over 12,000 feet in elevation (Jennings and Hayes 1994).

Mountain yellow-legged frogs are seldom found far from water. They occur in montane riparian, lodgepole pine, subalpine conifer, and wet meadow habitats (Zeiner et al. 1988). In the Sierra Nevada, this species is most abundant in lakes formed in glaciated terrain. It is rare or absent in high-elevation lakes where introduced trout have been established (Zweifel 1968). The mountain yellow-legged frog prefers well-illuminated, sloping banks of meadow streams, riverbanks, isolated pools, and lake borders with vegetation that is continuous to the water's edge (Zeiner et al. 1988). They are especially abundant along lakes and low-gradient streams with irregular shorelines and plentiful rocks (Mullally and Cunningham 1956).

Status. Mountain yellow-legged frogs were once one of the most abundant amphibians at elevations above 6,000 feet in the Sierra Nevada. As surveyed by Drost and Fellers (1994), this

frog has undergone significant declines and is now increasingly rare. Lack of frogs probably relates to a number of factors, including the presence of introduced trout and possible airborne contaminants that blow into the Sierra Nevada from the Central Valley (Fellers 1997).

Reproductive Biology and Breeding Habitat. Breeding in the Sierra Nevada usually occurs from June to August when lakes and streams are free from ice. Clusters of 100 to 500 eggs are attached to gravel or submerged rocks in shallow water (Zeiner et al. 1988). Tadpoles usually overwinter and may require two winters to complete their development (Zeiner et al. 1988).

Diet and Foraging Habitat. Mountain yellow-legged frogs feed primarily on aquatic and terrestrial invertebrates and favor terrestrial insects (Zeiner et al. 1988). Tadpoles graze on algae and diatoms along rocky bottoms in shallow water (Zeiner et al. 1988).

Habitat and Status in the Project Area. Though not found in the project area, recent surveys found the mountain yellow-legged frog in 43 sites in Yosemite (Fellers and Freel 1995; Fellers 1997). Suitable habitat is found at or near Badger Pass and Tioga Pass.

Northwestern pond turtle
Clemmys marmorata marmorata

Southwestern pond turtle
Clemmys marmorata pallida

[Note: Yosemite is in a zone of intergradation between these two subspecies, where interbreeding makes them indistinguishable. They will, therefore, be addressed here as a single species.]

General Distribution. The western pond turtle is found in the Sierra Nevada up to 6,000 feet in elevation. It is found in permanent ponds, rivers, streams, and irrigation ditches that typically have rocky or muddy bottoms and are overgrown with vegetation. Basking areas are required by this species and include partially submerged logs, rocks, mats of vegetation, or open mud banks.

Status. This species has decreased by up to 80% in numbers, probably due to habitat alternation and non-native predators.

Diet and Foraging Habitat. The diet of the western pond turtle includes small fish, frogs, various aquatic insects, and some plants. Insects probably make up the greatest part of the pond turtle diet, particularly the larvae and nymphs of caddisflies and dragonflies.

Reproductive Biology and Breeding Habitat. The western pond turtle depends on upland habitats in which individuals can over-winter, construct nest chambers, and lay eggs. Most nest chambers are excavated in compacted soils on south-facing slopes that have grassland or scrub vegetation. Eggs are laid between May and July. (VOLPE 1997).

Habitat and Status in the Project Area. Park records show sightings of the western pond turtle in Yosemite Valley and El Portal. Suitable habitat for this species occurs in Yosemite Valley, El Portal, and Wawona.

Merced Canyon shoulderband snail
Helminthoglypta allynsmithi

General Distribution. The Merced Canyon shoulderband snail lives in stable rock slides where there is tree or shrub cover.

Status. This species is vulnerable due to its apparent limited distribution in the Merced River canyon.

Reproductive Biology, Breeding Habitat, and Diet. Little is known about the reproduction and diet of the Merced Canyon shoulderband snail. It likely deposits its eggs in moist locations.

Habitat and Status in the Project Area. The California Academy of Sciences has records for seven specimens collected in the Merced River canyon between 1923 and 1932. These specimens were collected from 0.5 mile west of El Portal to 5.3 miles west of El Portal in rockslide areas (Roth 1972). No specimens have been collected in potential project sites in El Portal, and the habitat at these sites does not appear suitable for this species. The proximity of historic collections of this species, however, requires evaluation of potential impacts at project sites.

Mariposa sideband snail
Monadenia hillebrandi

This species is also known as Yosemite Mariposa sideband snail (formerly *Monadenia hillebrandi yosemitensis*).

General Distribution. The Mariposa sideband snail is a narrowly distributed land snail known from the Glacier Point, Curry Village, and Vernal Fall area of Yosemite, and the Merced River canyon west of El Portal (Pilsbry 1939). This snail lives in mossy rockslides with a cover of trees or shrubs (Roth 1972). It prefers stable rather than active rockslides, and rock piles with open crevices rather than those filled with silt. Roth's 1987 examination of the type specimen (*Monadenia hillebrandi yosemitensis*) revealed that the type specimen is really another species, *M. mormonum* (VOLPE 1997). As a result, the scientific name was changed.

Status. This species is vulnerable due to its apparent limited distribution in the Merced River canyon.

Reproductive Biology, Breeding Habitat, and Diet. Little is known about the reproduction and diet of the Mariposa sideband snail. It likely deposits its eggs in moist locations in its habitats.

Habitat and Status in the Project Area. Roth (1972) reports this species as inhabiting rockslides near Vernal Fall and Curry Village. The California Academy of Sciences has records for five specimens collected in the vicinity of Vernal Fall and the Mist Trail from prior to the period 1916 – 1932. Suitable habitat for the Mariposa sideband snail is found in Yosemite Valley and El Portal.

Sierra pygmy grasshopper
Tetrix sierrana

General Distribution. Pygmy grasshoppers are often found in riparian areas, particularly in the spring and early summer. They are generally small (less than 2 inches) with vestigial wings. This species has been found in only a few areas: in the vicinity of El Portal (Rehn and Grant 1956); and in the Sugar Pine area of Madera County at an elevation of 4,300 to 5,000 feet (VOLPE 1997).

Status. The apparent limited distribution of this species makes it vulnerable.

Reproductive Biology, Breeding Habitat, and Diet. Little is known of the breeding habitat of this species or its diet, but it likely lays its eggs in the moist soil of its habitat.

Habitat and Status in the Project Area. Suitable habitat is found in El Portal, Yosemite Valley, Wawona, and at the South Entrance.

Wawona riffle beetle
Atractelmis wawona

General Distribution. The Wawona riffle beetle occurs in rapid streams of California from 2,000 to 5,000 feet in elevation and is considered rare (Usingner 1956). The Wawona riffle beetle was previously known only from a few locations in California (Chandler 1954; Brown 1972), until more recently when it was found in several widely scattered locations in northern California, as well as southern Oregon and Idaho (Shepard and Barr 1991).

The beetle is small, measuring less than 1 inch. Both the larvae and adult life stages are aquatic, but neither life stage actually swims. Rather, both life stages move by crawling on underwater plants and debris. Adults and larvae are found together, usually in cool, small to medium-sized mountain streams and rivers. They are most abundant in aquatic mosses. Many taxa in this family (Elmidae riffle beetles) are typically found clinging to stones or beneath rocks in cold, fast-running water. They are rarely found in streams with seasonal variations in flow, heavy sediments, muddy or sandy bottoms, or low oxygen content (VOLPE 1997).

Status. The Wawona riffle beetle is limited in distribution and difficult to collect for assessment of its distribution and abundance, but appears to be rare where it does occur.

Reproductive Biology, Breeding Habitat, and Diet. Members of this family deposit eggs singly or in small groups on submerged rocks, organic debris, and vegetation. Larvae go through six to eight instars and may take three or more years to mature. They construct terrestrial pupal chambers in moist soils, under rocks, or in rotting wood. The newly emerged adults fly for a short period of time, then enter the water and lose the ability to fly (Merritt and Cummins 1984). Little is known about the diet of this species.

Habitat and Status in the Project Area. Suitable habitat for the Wawona riffle beetle occurs in the Merced River through Yosemite Valley and El Portal and in the South Fork of the Merced

River in Wawona. It was described and named after specimens collected in the South Fork of the Merced River in Wawona.

Bohart's blue butterfly
Philotiella speciosa bohartorum

General Distribution. The Bohart's blue butterfly has been collected in Briceburg (Mariposa County), the Merced area, Fresno County, and east of Johnsondale in Tulare County; however, additional collecting efforts would probably indicate a broader distribution (USFS 1994a).

Status. The Bohart's blue butterfly is vulnerable due to its limited distribution and its apparent dependence upon one plant species.

Reproductive Biology, Breeding Habitat, and Diet. Adults are active in late April, May, and early June and have been observed on flowers of the pink spineflower (*Chorizanthe membranacea*), which may also be the larval foodplant. The pink spineflower is common in grassland, chaparral, and foothill woodland habitat at about 5,000 feet throughout much of central and northern California (Hickman 1993). At the type locality in Briceburg, chaparral is present on slopes above the Merced River, with scattered patches of riparian scrub and woodland along the banks of the river (VOLPE 1997).

Habitat and Status in the Project Area. Suitable habitat in the form of vegetation and host plants appears to be present in El Portal, but no specimens of Bohart's blue butterfly have been seen or collected in this area.

Plants

Tiehm's rock cress
Arabis tiehmii

General Ecology and Distribution. This native perennial herb in the mustard family occurs in California and Nevada and is considered to be extremely rare.

Habitat and Status in the Project Area. Tiehm's rock cress occurs above Tioga Pass on granitic soils in alpine fell-fields on the slopes of Mt. Dana.

Congdon's lomatium
Lomatium congdonii

General Ecology and Distribution. Congdon's lomatium is a perennial herb restricted to serpentine and metamorphic soils in chaparral, gray pine, and oak woodlands. This Sierra Nevada endemic is known only from Tuolumne and Mariposa Counties.

Habitat and Status in the Project Area. Habitat for this species occurs in the El Portal area.

Slender-stemmed (Hetch Hetchy) monkeyflower
Mimulus filicaulis

General Ecology and Distribution. The slender-stemmed (Hetch Hetchy) monkeyflower is an annual herb in the snapdragon family. It is endemic to California and limited to Mariposa and Tuolumne Counties. It is found in vernal moist habitats, typically in gravelly soils and meadows and seeps, in the lower to montane forest zone of the Sierra Nevada.

Habitat and Status in the Project Area. Occurs in the open meadow and woodland area of Hazel Green Ranch.

Bolander's clover
Trifolium bolanderi

General Ecology and Distribution. Bolander's clover is an annual herb endemic to meadows of the Sierra Nevada in the montane coniferous zone (Ratliff and Harding 1993). It is found in a narrow elevation band between about 6,500 to 7,500 feet in elevation. It is limited to Fresno, Madera, and Mariposa Counties and found only in Yosemite National Park and the Sierra National Forest in California (Ratliff and Denton 1993). In 1991, there were only 20 meadows with known populations (Ratliff and Denton 1993).

Habitat and Status in the Project Area. Bolander's clover is not found in the project area. Though it does not occur in Monroe Meadow, which is directly adjacent to Badger Pass, it is found in moist meadows and wet forest understory in meadows in the Badger Pass area.

CALIFORNIA STATE ENDANGERED SPECIES

Wildlife

Sierra Nevada bighorn sheep (see Federal Endangered Species section)

Peregrine falcon
Falco peregrinus

General Distribution. The peregrine falcon is a neotropical migrant that occurs throughout the world, except in Antarctica. This species is found breeding, migrating, or wintering throughout most of California, except in the southeast. Active nesting sites are known along the coast north of Santa Barbara, in the Sierra Nevada, and in other mountains of northern California (Zeiner et al. 1990). Nest cliffs are found up to 7,500 feet in elevation, but most are below 4,500 feet (Monk et al. 1988). In the western Sierra Nevada, peregrines are found from the annual grassland through the lodgepole pine zones, in all successional stages (Verner et al. 1980).

Status. The peregrine falcon was recently delisted from federal endangered status, but it remains a California state endangered species.

Reproductive Biology and Breeding Habitat. Peregrines have relatively strict nesting requirements: vertical cliff habitat with large potholes or ledges that are inaccessible to land predators. They appear to prefer sheer cliffs at least 150 feet high that have a large cave or overhung ledge large enough to accommodate three to four nestlings (Monk et al. 1988). Pairs tend to return to the same nesting cliff (DeGraaf et al. 1991) or alternate between two different nesting cliffs in different years (Monk et al. 1988). They favor habitats with a high avian prey population, such as coastal areas or wetlands with large breeding populations of birds (Monk et al. 1988).

Diet and Foraging Habitat. The primary prey of peregrine falcons is a variety of bird species, ranging up to ducks in size, with pigeons and doves preferred prey in some areas. Mammals, insects, and fish are also sometimes taken (Zeiner et al. 1990). In inland California, including the Sierra Nevada, band-tailed pigeons, woodpeckers, and jays are among preferred prey (Verner et al. 1980). Peregrine falcons forage over a variety of habitats, including wooded areas, marshes, open grasslands, and bodies of water (USFWS 1982). Areas with high populations of birds, such as coasts or wetlands, are especially valuable (Monk et al. 1988).

Prey Habitat Needs. The bird species preyed upon by peregrine falcons are best supported in a landscape made up of various habitat types in various successional stages. This would include hardwood and coniferous forests, open woodlands and shrublands, riparian areas, and abundant snags. The assemblage of such habitats in natural distribution and structure would provide prey in natural abundance and diversity.

Habitat and Status in the Project Area. Prior to 1978, there was a 37-year absence of nesting records for the peregrine falcon in Yosemite, which roughly coincides with declines in numbers throughout North America and Europe (Assay and Davis 1984). Currently, there are three active nest sites in Yosemite Valley and one historic nest site near the Coulterville Road in the Merced River canyon (Thompson 2000). A pair of peregrine falcons appeared to be nesting on Wawona Dome in 1990, but no young were fledged, and no subsequent observations of peregrine falcons in this location have been made.

Great gray owl ***Strix nebulosa***

General Distribution. The great gray owl is a circumpolar species, but is considered rare throughout its range. In California, the center of abundance of this species is the Sierra Nevada, specifically in the Yosemite area (Winter 1986). The Sierra Nevada population of great gray owls marks the most southerly population in the world (Winter 1985; Reid 1989).

Status. Surveys in Yosemite National Park and adjacent national forests estimate the California population of great gray owls at 100 to 200 birds (Winter 1986). Recent population declines in California may be due to habitat degradation from logging and grazing.

Reproductive Biology and Breeding Habitat. Great gray owls form monogamous pairs that breed from about March to August. Eggs hatch from mid-May to mid-June, and young fledge in early June to early July. The young leave the nest before they can fly and remain around the nest through August. In the Sierra Nevada, great gray owls nest in mature red fir, mixed conifer, or lodgepole pine forests near wet meadows or other vegetated openings (Zeiner et al. 1990). Preferred breeding habitat is pine and fir forests near montane meadows that ranges from 2,460 to 7,380 feet in elevation (Winter 1986). In California, all reported great gray owl nests have been in the tops of large-diameter broken snags (Winter 1980). Nest snags are usually within a few hundred feet of a meadow. High snag densities may be critical for nesting habitat, since not all snags form top depressions suitable for nests. Nesting success is believed to depend on the abundance of voles (Winter 1986).

Diet and Foraging Habitat. Great gray owls feed primarily on rodents captured in meadows, but may also take some birds (Zeiner et al. 1990). In Yosemite National Park, recent surveys found that voles and pocket gophers make up 90% of the prey biomass in pellets (Winter 1986; Reid 1989). Owls in Yosemite restrict foraging to open meadows (Reid 1989). Adequate numbers of hunting perches are also important (Winter 1981; 1982). Meadows used by great gray owls are generally at least 25 acres in area and are in good ecological condition.

The great gray owl migrates downslope in winter. Winter ranges of the great gray owl in the Yosemite area include Big Meadow in Foresta, Wawona, Ackerson Meadow in the Stanislaus National Forest, and ranch land near Midpines (Mariposa County) in Jerseydale, Lush Meadows, and Bootjack (Skiff 1995).

Forested land from about 2,000 to 5,000 feet in elevation that contains openings suitable for vole and gopher populations is critical to sustain owls during the winter (Skiff 1995).

Habitat and Status in the Project Area. Great gray owls are regularly seen in meadows at Crane Flat, Foresta, Wawona, and along the Glacier Point Road. McCauley Meadow near Foresta is occasionally used by juvenile males driven out of primary meadows by dominant males, or as a transition meadow when there is a large snowpack in primary meadows. It is not used for nesting. Although great gray owls have not been seen in Monroe Meadow at Badger Pass, the species is frequently seen in nearby meadows (Skiff 1995) and could occasionally use Monroe Meadow without being detected.

Past research and recent surveys have not confirmed the presence of great gray owls at Hazel Green Ranch, but the meadows at this location are recognized as potential habitat, based upon their size and elevation (Skenfield 1999).

Meadows in Yosemite Valley appear to be good winter and staging habitat for great gray owls, but recent records in this location are rare. This could be due to the amount of human disturbance that occurs in this area. The fact that the range of nearly the entire California population of great gray owls is centered over Yosemite reflects the relatively intact condition of habitats in the park.

Willow flycatcher *Empidonax traillii*

General Distribution. The willow flycatcher is a neotropical migrant that breeds in riparian and moist meadow willow thickets in the U.S. and southern Canada (AOU 1983). In California, it is a rare to locally uncommon summer resident in wet meadow and montane riparian habitats from 2,000 to 8,000 feet in elevation. Three subspecies of willow flycatcher are present in California, with two subspecies—*E. t. brewsteri* (which is also a federal species of concern) and *E. t. adastus*—possible in Yosemite. Research currently underway is attempting to determine the exact range of each subspecies, or whether areas like Yosemite represent an area of intergrade between the two subspecies (Whitfield 2000). A statistically significant association has been found between meadow size and the occurrence of the willow flycatcher, showing that birds favor larger meadows (Serena 1982).

Status. Willow flycatchers historically nested in California wherever mesic willow thickets occurred (Grinnell and Miller 1944). In recent decades, however, breeding populations have disappeared from most lower-elevation habitats in the state. Alteration and destruction of riparian and meadow habitats is thought to be the principal cause for this decline (Remson 1978). Other contributing factors may include nest parasitism by brown-headed cowbirds, disturbance from grazing, and disturbance on wintering grounds (Serena 1982). The entire state population of willow flycatchers is thought to number around 200 pairs (CDFG 1991).

Reproductive Biology and Breeding Habitat. Breeding occurs from late May/early June to September, when an average of three to four eggs are laid in an open-cup nest placed about 1.5 to 10 feet high in a willow or other deciduous riparian shrub, usually near slow-moving streams, seeps, or standing water (Valentine et al. 1988). Nests are typically placed on the edges of vegetation clumps, which makes them susceptible to damage from wind, cattle, and predators (KRCD 1985). Willow flycatcher nests are frequently parasitized by brown-headed cowbirds. Parasitism occurs more often in lowland habitats than in higher elevations of the Sierra Nevada (Harris 1991), apparently due to differences in breeding period of cowbirds and willow flycatchers at higher elevations (Verner and Ritter 1983).

Diet and Foraging Habitat. Willow flycatchers forage by either gleaning insects from vegetation while flying, or by waiting on an exposed perch and capturing insects in flight (Ettinger and King 1980; Sanders and Flett 1989). As such, deciduous trees and shrubs interspersed with open areas enhance the quality of foraging habitat.

Habitat and Status in the Project Area. Willow flycatchers formerly nested in Yosemite Valley, but were last observed in 1966. It is likely that human disturbance, habitat destruction, and brown-headed cowbird parasitism were factors in this disappearance. A greater factor, however, has probably been the Sierra-wide decline of the species that has limited the ability of park habitats to sustain a viable population. Recent records of willow flycatchers in the park include Wawona Meadow, Hodgdon Meadow near the Big Oak Flat Entrance Station, and Westfall Meadow near Badger Pass.

CALIFORNIA STATE THREATENED SPECIES

Wildlife

Sierra Nevada red fox (see Federal Species of Concern section)

California wolverine (see Federal Species of Concern section)

Limestone salamander (see Federal Species of Concern section)

CALIFORNIA STATE RARE SPECIES

Plants

Yosemite onion *Allium yosemitense*

General Ecology and Distribution. The Yosemite onion is a narrow endemic that occurs in five known populations in the central Sierra Nevada (McNeal and Mortola 1985). This species in the lily family is found from the foothills into montane coniferous forests in rocky soils, primarily on metamorphic substrates. It is found on talus and scree slopes, ridges, metamorphic outcrops, and on the margins and cracks of large granitic slabs (Taylor 1982). It is limited in distribution to Mariposa and Tuolumne Counties.

Habitat and Status in the Project Area. The Yosemite onion is found in the vicinity of El Portal and Wawona on steep slopes generally inaccessible to casual visitation.

Tompkin's sedge *Carex tompkinsii*

General Ecology and Distribution. This perennial herb in the sedge family is endemic to the Sierra Nevada and is found only in Fresno, Madera, Mariposa, and Tuolumne Counties. Tompkin's sedge is limited to foothill oak woodland and chaparral areas and along lower talus slopes in moist and shaded areas.

Habitat and Status in the Project Area. Tompkin's sedge is found sporadically from El Portal east to the vicinity of Cascade Creek.

Congdon's woolly-sunflower *Eriophyllum congdonii*

General Ecology and Distribution. This species, a native annual herb in the aster family, is endemic to California and restricted to Mariposa County. It is found on dry, mostly south-facing metamorphic and metasedimentary outcrops in chaparral and oak woodlands. It is endemic to the

main stem of the Merced River canyon near El Portal and the South Fork of the Merced River downstream of Wawona.

Habitat and Status in the Project Area. Habitat for this species occurs throughout the Merced River gorge, El Portal, and lower portions of the South Fork of the Merced River downstream of Wawona.

Congdon's lewisia
Lewisia congdonii

General Ecology and Distribution. This perennial native herb is endemic to California and limited to Fresno, Madera, and Mariposa Counties. It grows on moist, exposed metamorphic rock faces and slopes in chaparral and mixed conifer forests. The lewisia (or "bitterroot") is often found on shaded, north-facing slopes (Taylor 1982).

Habitat and Status in the Project Area. This species is known from the slopes above the Merced River above El Portal and the Merced River gorge.

CALIFORNIA STATE SPECIES OF SPECIAL
CONCERN

Wildlife

Yosemite toad (see Federal Species of Concern section)

California red-legged frog (see Federal Threatened Species section)

Foothill yellow-legged frog (see Federal Species of Concern section)

Mountain yellow-legged frog (see Federal Species of Concern section)

Northwestern/Southwestern pond turtle (see Federal Species of Concern)

Mount Lyell salamander (see Federal Species of Concern section)

Harlequin duck (see Federal Species of Concern section)

Cooper's hawk
Accipiter cooperi

General Distribution. Cooper's hawks are found across most of the United States, inhabiting discontinuous woodlands and riparian woodlands, especially deciduous woodlands. In California, they range up to 9,000 feet in elevation in the Sierra Nevada. Dense stands of live oak, riparian deciduous, and other forest habitats near water are most frequently used by the Cooper's hawk.

Status. Numbers of Cooper's hawks have apparently declined, but this decline began to reverse after the banning of DDT in the United States in 1972 (Ehrlich et al. 1988). Low numbers of this species, however, are still of concern. Habitat destruction and the continued presence of

pesticide residues could be factors that contribute to low numbers of this species. Records of Cooper's hawk in Yosemite are relatively numerous.

Reproductive Biology and Breeding Habitat. Typical nests are in the crotches of deciduous trees between 20 and 50 feet above the ground, but nests are also found on the horizontal branches of conifers, often just below the lowest live branches. Cooper's hawks usually nest in second-growth conifer stands, or in deciduous trees in riparian areas, usually near streams (Zeiner et al. 1990). Peak breeding activity occurs May through July. Only the female incubates, while the male provides food during this period.

Diet and Foraging Habitat. Cooper's hawks feed primarily on small birds, especially young birds during nesting season, but will also take small mammals, reptiles, and amphibians. They hunt in sudden flights from a perch in dense cover, pursuing prey in the air through branches. Use of cover is an important hunting strategy for hiding, approaching, and attacking prey. Cooper's hawks will also search for prey from the air, using low, gliding flights (Zeiner et al. 1990). Broken woodland and forest edges are important foraging areas.

Habitat and Status in the Project Area. Suitable habitat for Cooper's hawks is largely intact in Yosemite National Park, except for localized impacts from development, especially in Yosemite Valley. Nonetheless, Cooper's hawks are regularly seen in the Valley, often near developed areas. Habitat for the Cooper's hawk is found in all of the project areas, with the exception of Tioga Pass.

Northern goshawk (see Federal Species of Concern section)

Sharp-shinned hawk *Accipiter striatus*

General Distribution. Sharp-shinned hawks occur across most of North America, inhabiting woodlands and forests, hunting in openings and along edges. In California, they breed in a variety of forested habitats between 4,000 and 7,000 feet in elevation. They winter in all but the most barren and open habitats, and often descend to lower elevations.

Status. North American numbers of sharp-shinned hawks declined greatly in the early 1970s, apparently from the effects of DDT and other pesticides in the environment that caused eggshell thinning. Populations rebounded somewhat after the banning of DDT in the United States in 1972, but populations continue to be low. Likely causes include habitat destruction and continued pesticide contamination. Observations of this species in Yosemite National Park are relatively rare; some records classified as Cooper's hawk may have been sharp shinned hawks, due to their similar appearance. One record exists of a sharp-shinned hawk nest in Yosemite Valley in 1930.

Reproductive Biology and Breeding Habitat. Nests of the sharp-shinned hawk are typically located in dense stands of small conifers which are moist, cool, and well-shaded. They are often present in areas near water with little ground cover. The nest is usually placed in dense foliage against the trunk or in the main crotch of a tree, usually between 6 and 80 feet above the ground.

The nest is usually very inconspicuous (Zeiner et al. 1990). Breeding habitats include ponderosa pine, black oak, riparian deciduous, mixed conifer, and Jeffrey pine. Riparian habitats are preferred, and habitat with north-facing slopes are critical.

Diet and Foraging Habitat. Diet is almost entirely small birds, with small mammals, reptiles, and insects rarely taken. Prey is surprised in sudden flights from a perch; the hawk may also hunt in low, gliding flights. Hunting often occurs in forest openings and edges, and brushy areas.

Habitat and Status in the Project Area. Sharp-shinned hawks are found throughout wooded habitat in the park from 4,000 to 7,000 feet in elevation. Habitat is largely intact in the park, except for localized habitat destruction from roads and development. Suitable habitat for the sharp-shinned hawk is found at Yosemite Valley, Badger Pass, Hazel Green, El Portal, and the Big Oak Flat Entrance Station.

Prairie falcon *Falco mexicanus*

General Distribution. Prairie falcons have a widespread distribution in open habitats of mountains, plains, deserts, and grasslands of western North America. In California, the species is found in most open habitats, avoiding densely forested areas. Their range includes southern deserts, Sierra Nevada Coast Ranges, San Joaquin Valley, and Great Basin habitats. The prairie falcon is also found in annual grasslands and alpine meadows, but prefers perennial grasslands, savannahs, rangeland, desert scrub, and some agricultural fields (Zeiner et al. 1990). Prairie falcons are not found along coastlines. In the Sierra Nevada, the species is found from open foothill habitats to alpine meadows and open lodgepole pine forests, and ranges to above the treeline in late summer.

Status. Declines of prairie falcons in California have been linked to pesticide and mercury poisoning, as well as habitat destruction, primarily from agriculture (Ehrlich et al. 1988). Surveys in 1971 and 1972 of former traditional prairie falcon nest sites within 48 miles of the San Joaquin Valley found 32 of 33 sites unoccupied (Garrett and Mitchell 1973).

Reproductive Biology and Breeding Habitat. Breeding occurs from mid-February to mid-September, with a peak between early May and early August. Formerly, breeding mostly occurred below coniferous forests, but most remaining pairs breed at higher elevations. Nest sites are usually on a cliff ledge that overlooks a large open area (Verner and Boss 1980). Clutch size ranges from three to six, with five the most common.

Diet and Foraging Habitat. Prey is primarily small mammals and small to medium-sized birds taken in open habitats. Prey are hunted in high, soaring flight or flushed and pursued in low flight.

Habitat Status in the Project Area. With the great declines in prairie falcon numbers in lower elevations of California, the open mountain habitats of the Sierra Nevada, as occur in Yosemite, are apparently among the last strongholds of the species in the state. Suitable habitat in potential project areas, as confirmed by observations, includes Tioga Pass, Yosemite Valley, and Foresta.

The 1990 A-Rock Fire likely improved the extent and quality of habitat for prairie falcons by creating a more open landscape. The reduction in meadow habitats in Yosemite Valley from conifer invasion has likely reduced habitat quality in that area.

Golden eagle
Aquila chrysaetos

General Distribution. Golden eagles occur over most of North America, ranging from high alpine habitats to low deserts. Nearly all nesting in the United States occurs west of the Great Plains, with the rest of the range used primarily by migrants (Palmer 1988). In California, the preferred habitat is typically rolling foothills, mountainous areas, sage-juniper flats, and desert (Zeiner et al. 1990). In the Sierra Nevada, golden eagles favor grasslands and areas of shrubs or saplings, and open-canopied woodlands of young blue oaks. In late summer, they often range to above timberline (Zeiner et al. 1990).

Reproductive Biology and Breeding Habitat. In the Sierra Nevada, golden eagles breed from mid-January to late September, with a peak between late April and August. Nests are typically on a cliff ledge with a good view of surrounding habitat, at elevations usually below 8,000 feet. Large trees or snags are also occasionally used (Verner and Boss 1980). Clutch size ranges from 1 to 3 eggs, but is usually 2, which are laid from early February to mid-May. Incubation lasts from 43 to 45 days, and the nestling period lasts 65 to 70 days (Zeiner et al. 1990).

Diet and Foraging Habitat. Golden eagles feed mostly on rabbits and rodents, but may also take other mammals, birds, reptiles, and carrion. Open terrain is needed for hunting, such as grasslands, deserts, savannahs, and forest and shrub habitats in early successional stages (Zeiner et al. 1990). Golden eagles most often hunt by soaring 100 to 300 feet above the ground, or may fly low, following the terrain to surprise prey. They may also hunt from a perch, flying directly to sighted prey.

Habitat Status in Project Area. The most recent observations of golden eagles come from El Portal and Foresta, likely due to the relatively open terrain in these areas. In most years, a nesting pair of golden eagles occupies a nest site on Elephant Rock in the Merced River gorge east of El Portal. Sightings also occur in Yosemite Valley, although these appear to be transient birds. Summer sightings at high-elevation areas, such as Tioga Pass, are not uncommon. Overall, the relatively intact habitats in Yosemite are beneficial to golden eagles, and recent large fires in the park have likely expanded the area of suitable habitat by providing more open terrain.

Bald eagle (see Federal Threatened Species section)

Merlin
Falco columbarius

General Distribution. Merlins have wide distribution in the northern hemisphere. Their range covers all of North America, except for some arctic regions. Merlins do not breed in California.

Birds seen here are migratory, wintering from September to May, and usually below 4,000 feet in elevation.

Status. In recent decades, numbers of merlin have declined markedly from unknown causes. Some data suggest pesticides or heavy metals in the food chain may be a factor (Ehrlich et al. 1988). Records of merlin in Yosemite are rare. The last reported sighting occurred in 1989 in Foresta.

Reproductive Biology and Breeding Habitat. Merlins do not breed in California, but in the northern parts of North America where they do breed, tree cavities and the abandoned nests of other birds are primary nest sites. In some areas, cliffs may be used, and some nests may even be established on the ground (Palmer 1988). Nearby open terrain for hunting appears to be an important factor. Clutches of 4 to 6 eggs are laid, usually in May, and incubated for around 30 days.

Diet and Foraging Habitat. Primary prey are small birds, but small mammals and insects are also taken. In California, coastlines, open grasslands, savannahs, woodlands, lakes, wetlands, edges, and early successional stages are preferred habitat. Hunting occurs in low flights, capturing prey in short dives and pursuits.

Habitat Status in the Project Area. Likely areas for merlins, based upon elevation and habitat, include Foresta, El Portal, Wawona, and Yosemite Valley. Concentrated development in these areas, especially in east Yosemite Valley, has likely affected local habitat quality for merlins. Overall, however, park habitats are relatively intact. Recent large fires in Yosemite have likely improved merlin habitat quality by creating more forest openings.

Long-eared owl *Asio otus*

General Distribution. Long-eared owls are found across most of the United States, but are uncommon throughout their range. In the Sierra Nevada, this species is found from blue oak savannah up to ponderosa pine and black oak habitats, usually in association with riparian habitats. Long-eared owls will also use live oak thickets and other dense stands of trees for roosting and nesting (Zeiner et al. 1990).

Status. Numbers of long-eared owls in California have been declining since the 1940s. Known factors in this decline are destruction and fragmentation of riparian and live oak habitats, but other factors may also be present. Records of long-eared owls in Yosemite are few, including one nesting record in Yosemite Valley in 1915.

Reproductive Biology and Status. Preferred nest sites are in trees with dense canopy coverage. Proximity of this habitat to meadow edges for hunting enhances quality. Old crow, hawk, magpie, or squirrel nests are often used as nests. Breeding occurs from early March to late July, with usually four to five eggs per nest.

Diet and Foraging Habitat. Prey is searched for in low, gliding flights in open areas and occasionally woodland and forested habitats (Zeiner et al. 1990). Prey consists mostly of voles and other small rodents, and occasionally other birds.

Habitat and Status in Project Area. Long-eared owl habitat is largely intact in the park, except for localized habitat destruction from roads and development. Suitable habitat for the long-eared owl is found in El Portal, Wawona, and Yosemite Valley.

California spotted owl (see Federal Species of Concern section)

Yellow warbler
Dendroica petechia

General Distribution. Breeding range of the yellow warbler extends over most of North America, and wintering range extends to northern South America. In California, yellow warblers breed over much of the state where suitable breeding habitat occurs. Some yellow warblers winter in extreme southern California.

Status. Destruction of riparian habitats and nest parasitism by brown-headed cowbirds have led to declines in lowland populations of yellow warblers.

Reproductive Biology and Habitat. Yellow warblers breed primarily in riparian woodlands from coastal, valley, and desert lowlands, up to 8,000 feet in the Sierra Nevada. Other breeding habitat includes montane chaparral, ponderosa pine, and mixed conifer where substantial amounts of brush occur (Zeiner et al. 1990). Breeding occurs from mid-April to early August, with peak activity in June. Three to six eggs are laid in an open-cup nest placed from 2 to 16 feet above the ground in a shrub or deciduous sapling. Nesting territories often contain heavy brush understory for nesting and tall trees for foraging and singing (Zeiner et al. 1990).

Diet and Foraging Habitat. Food of yellow warblers consists primarily of insects and spiders that are gleaned from the canopy of deciduous trees and shrubs. Occasionally, insects are hawked from the air, or berries are eaten.

Habitat and Status in the Project Area. Overall, riparian habitats are relatively intact, compared to areas outside the park, but localized destruction of such habitat from foot traffic, primarily in east Yosemite Valley, has likely affected yellow warblers. Breeding habitats in forested areas are, likewise, relatively intact, but a long history of fire suppression in the park may have affected habitat quality in areas where an unnaturally high degree of canopy closure limits understory growth. Suitable habitat for the yellow warbler occurs at all potential project sites except Tioga Pass.

Pallid bat
Antrozous pallidus

General Distribution. The pallid bat is found throughout California, primarily in the low to mid elevations, although it has been found to elevations of over 10,000 feet in the Sierra Nevada. It is

found in a variety of habitats, from desert to coniferous forest and nonconiferous woodlands. It is particularly associated with ponderosa pine, redwood, and giant sequoia habitats. It selects a variety of day roosts, including rock outcrops, mines, caves, hollow trees, buildings, and bridges. Recent research suggests a high reliance on tree roosts. It commonly uses bridges for night roosts.

In 1994, mist-net bat surveys took place in Tuolumne Meadows, Pate Valley, and Wawona. The pallid bat was captured in Pate Valley and Wawona (Pierson and Rainey 1995). It was also captured in Yosemite Valley in 1993 (Pierson and Rainey 1993).

Status. Declining populations of pallid bats may be caused by habitat destruction and fragmentation and the use of pesticides.

Reproductive Biology and Breeding Habitat. The pallid bat produces one to two young per year, but usually two, with birth occurring in May to June. Nursery colonies may contain up to several hundred females, but generally fewer than 100.

Diet and Foraging Habitat. The diet of the pallid bat is primarily ground-dwelling arthropods (scorpions, grasshoppers, long-horned beetles, Jerusalem crickets), but also includes large moths. Foraging occurs in and among vegetation as well as on the ground surface. Pallid bats may land and pursue prey on the ground.

Habitat and Status in the Project Area. Mist-net surveys took place in Yosemite Valley in 1993 at Mirror Lake, Cook's Meadow, El Capitan Meadow, and Yosemite Creek at the base of Lower Yosemite Fall. The pallid bat was captured only at the Yosemite Creek site (Pierson and Rainey 1993). It was also captured in 1994 in mist-net surveys in Wawona (Pierson and Rainey 1995). The pallid bat is expected in all of the project sites, with the exception of Tioga Pass.

Townsend's big-eared bat *Corynorhinus townsendii townsendii*

General Distribution. In California, the Townsend's big-eared bat is found from low desert to mid-elevation montane habitats. The majority of records are from low to moderate elevations, though the Townsend's big-eared bat has been found from sea level to almost 10,000 feet in elevation. Maternity colonies have been found to more than 5,000 feet in elevation in the Sierra Nevada. The Townsend's big-eared bat is concentrated in areas with mines (particularly in the desert regions to the east and southeast of the Sierra Nevada) or caves (in the northeast portion of California and karstic regions in the Sierra Nevada and Trinity Alps) as roosting habitat (Pierson and Fellers 1998).

In 1994, mist-net bat surveys took place in Tuolumne Meadows, Pate Valley, and Wawona. The Townsend's big-eared bat was captured in Wawona (Pierson and Rainey 1995). It was also captured in Yosemite Valley in 1993 (Pierson and Rainey 1993).

Status. Numbers of Townsend's long-eared bat appear to have decreased due to habitat destruction and fragmentation, pesticides, and disturbance of maternity colonies in mines and buildings.

Reproductive Biology and Breeding Habitat. Mating takes place in winter roosts from October to February. Females form maternity colonies and support one young per year. The gestation length varies from 56 to 100 days. Young bats are capable of flight at 2.5 to 3 weeks of age (Pierson and Fellers 1998). Birth occurs from May to July. Historically, maternity colonies contained several hundred females. Males roost individually. Current research shows that colony size is now typically made up of 35 to 150 individuals (Wildlife Society 1996).

Diet and Foraging Habitat. The Townsend's big-eared bat feeds primarily on small moths. In California, the bats tend to forage near native vegetation (Wildlife Society 1996).

Habitat and Status in the Project Area. Mist-net surveys took place in Yosemite Valley in 1993 at Mirror Lake, Cook's Meadow, El Capitan Meadow, and Yosemite Creek at the base of Yosemite Falls. The Townsend's big-eared bat was captured only at Mirror Lake (Pierson and Rainey 1993). It was also captured in 1994 in mist-net surveys in Wawona in close proximity to the South Fork of the Merced River (Pierson and Rainey 1995). The Townsend's big-eared bat is expected in all of the project sites, with the exception of Tioga Pass.

The Townsend's big-eared bat is also found in a barium mine on U.S. Forest Service land in El Portal. This mine is fenced and protected from disturbance.

Spotted Bat (see Federal Species of Concern section)

Yuma myotis bat (see Federal Species of Concern section)

Greater western mastiff bat (see Federal Species of Concern section)

White-tailed hare *Lepus townsendii*

General Distribution. White-tailed hares have a wide distribution over the plains and shrubby mountain areas of the northern United States and southern Canada. In California, the preferred habitats of the white-tailed hare are sagebrush, subalpine conifer, juniper, alpine dwarf-shrub, and perennial grasslands. It is also known to use wet meadows and early successional stages of various conifer types (Zeiner et al. 1990). White-tailed hares are most abundant above 8,500 feet, but may descend to lower elevations in winter, mostly on the east slope of the Sierra.

Status. Numbers of white-tailed hares in California have declined drastically in recent decades, and now the hare exists in fragmented populations. Overgrazing by livestock has been identified as a principal factor in this decline, with cultivation and other development in habitat also having negative effects (Zeiner et al. 1990). Although habitats in Yosemite are relatively intact, reported observations of white-tailed hares are rare, either due to the mainly nocturnal behavior of the species or reduction in numbers from regional effects on the species.

Reproductive Biology and Breeding Habitat. In California, white-tailed hares breed from February to July. An average of 4 to 5 young are born in a litter. In other parts of its range, 3 to 4 litters may be produced in a year, but, in California, no more than one litter may be produced. Young are born in a shallow nest on the ground, usually concealed under a bush.

Diet and Foraging Habitat. In spring through early fall, grasses and forbs form the bulk of the white-tailed hare's diet. Important habitats at this time of year are open alpine and mountain meadows, and open stands of trees with some brush and an herbaceous understory. In winter, the bark, buds, and twigs of shrubs such as sagebrush, creambush, and small trees are consumed.

Habitat Status in Project Area. Tioga Pass is the only project site that is likely to have white-tailed hares. The meadows, willow thickets, shrubby ridgetops, and open stands of lodgepole pine in this location are likely habitats.

Sierra Nevada mountain beaver (see Federal Species of Concern section)

Pacific fisher (see Federal Species of Concern section)

PARK RARE SPECIES

Plants

SUGAR STICK (ALLOTROPA VIRGATA)

General Ecology and Distribution. Sugar stick is found on dry, well-drained soils with abundant coarse woody debris and deep humus. It is found at lower elevations in closed-canopy forest stands with trees as young as 60 years, and in mature and old growth forests of Douglas-fir, white fir, and other vegetation types. It is widespread but rare throughout its range. It is a perennial saprophytic plant that requires an association with a fungus and vascular plants for establishment. During the growing season, the plant is unmistakable and conspicuous, with pink and white striped stems up to over 3 feet in height.

Habitat and Status in the Project Area. This species occurs at scattered locations throughout Yosemite Valley. Fire is thought to play an important role in its life cycle, and this species may be at risk because of many decades of successful fire suppression, as well as destruction and fragmentation of its habitat. Low-intensity underburns might be essential for its survival.

SNAPDRAGON (ANTIRRHINUM LEPTALEUM)

General Ecology and Distribution. Spurred snapdragon, an annual herb, is endemic to California and limited to the seasonally moist areas in the foothill and Sierra Nevada counties.

Habitat and Status in the Project Area. The snapdragon is restricted to small washes and shallow ditches in disturbed areas in Foresta and Wawona.

SWEETWATER MOUNTAINS MILKVETCH (ASTRAGALUS KENTROPHYTA VAR. DANAUS)

General Ecology and Distribution. This perennial herb in the pea family is endemic to California and is restricted to the subalpine and alpine areas of the park, in rocky soils and fell-fields.

Habitat and Status in the Project Area. The milkvetch occurs on alpine summits above Tioga Pass on metamorphic bedrock substrates.

BLACK AND WHITE SEDGE (CAREX ALBONIGRA)

General Ecology and Distribution. This perennial herb in the sedge family occurs in meadow, marsh, and seep spring areas and slopes in rocky soils within alpine fell-fields. It is a strictly an alpine species and is restricted to the southern Sierra Nevada in California, although it occurs in other mountainous areas of North America.

Habitat and Status in the Project Area. It is locally rare and occurs in the vicinity of Tioga Pass in perennially moist sites.

CAPITATE SEDGE (CAREX CAPITATA)

General Ecology and Distribution. This perennial herb is in the sedge family and is found throughout the Sierra Nevada as well as other high-elevation sites in North America. It occurs in meadow and perennially moist areas in subalpine and alpine forests and fell-fields, in rocky to loamy soils.

Habitat and Status in the Project Area. This herb is restricted to the Sierra Nevada and is strictly an alpine species in Yosemite.

CONGDON'S SEDGE (CAREX CONGDONII)

General Ecology and Distribution. This perennial herb in the sedge family is restricted to subalpine and alpine talus slopes and fell-fields and is endemic to California.

Habitat and Status in the Project Area. It is found at high elevations in metamorphic and granitic talus slopes.

INDIAN PAINTBRUSH (CASTILLEJA FOLIOLOSA)

General Ecology and Distribution. This perennial herb is found primarily in California in low-elevation foothill woodlands, grasslands, and chaparral regions. The species has reddish bracts covered with a dense mat of fine hairs.

Habitat and Status in the Project Area. It is found on dry, rocky, open slopes on the edge of chaparral areas in the El Portal area, and habitat exists throughout the Merced River gorge and El Portal area.

ALPINE CERASTIUM (CERASTIUM BEERINGIANUM)

General Ecology and Distribution. This perennial herb in the pink family is native to California and isolated to subalpine and alpine areas. It commonly occurs adjacent to perennial or nearly perennial snow banks where moisture is consistently available.

Habitat and Status in the Project Area. This herb is found near snow banks on granitic and metamorphic slopes above Tioga Pass.

S M A L L ' S S O U T H E R N C L A R K I A (C L A R K I A A U S T R A L I S)

General Ecology and Distribution. This annual herb is endemic to California and restricted to Madera, Mariposa, and Tuolumne Counties. It is found in foothill woodlands and lower montane forests.

Habitat and Status in the Project Area. This herb is found in Foresta in open areas.

S I E R R A C L A Y T O N I A (C L A Y T O N I A N E V A D E N S I S)

General Ecology and Distribution. This perennial herb is endemic to California and limited to alpine fell-fields in perennially moist areas in granitic and metamorphic substrates. In Yosemite, it remains from pre-glacial periods in small, isolated populations.

Habitat and Status in the Project Area. This herb is found along small streams flowing from higher peaks above Tioga Pass.

C H I L D ' S B L U E - E Y E D M A R Y (C O L L I N S I A C H I L D I I)

General Ecology and Distribution. This annual herb is endemic to California and limited to the central and southern Sierra Nevada, reaching the northern extent of its range in southern Mariposa County. It occurs on shaded slopes and in open California black oak and mixed coniferous woodlands.

Habitat and Status in the Project Area. This species occurs in Wawona; habitat exists throughout the basin on shaded slopes.

C O L L I N S I A (C O L L I N S I A L I N E A R I S)

General Ecology and Distribution. This annual herb in the snapdragon family is primarily limited to California, with some extensions into adjacent states. It is found in lower- to mid-elevation coniferous forests on rock outcrops and dry slopes. It reaches the southern extent of its range in Mariposa County.

Habitat and Status in the Project Area. Habitat for this species occurs throughout the Merced River gorge and in the El Portal area, where it is restricted to dry, metamorphic rock outcrops along the metamorphic-granitic contact zone.

D R A B A (D R A B A P R A E A L T A)

General Ecology and Distribution. Draba is a perennial herb in the mustard family and is confined to western North America in alpine wetland environments. Its westernmost populations are found along the crest of the Sierra Nevada in Inyo and Mono Counties, residing in localized perennially wet seeps.

Habitat and Status in the Project Area. This herb occurs on the slopes of Mt. Dana above Tioga Pass in small, isolated populations.

ROUND-LEAFED SUNDEW (DROSERA ROTUNDIFOLIA)

General Ecology and Distribution. This species, an insectivorous perennial herb, is found throughout North America, but it is limited to sphagnum bogs and acidic wetlands, which is an unusual habitat in the Sierra Nevada in the lower to upper montane coniferous forests.

Habitat and Status in the Project Area. Habitat for this species exists in isolated areas in Wawona and Yosemite Valley.

STREAM ORCHID (EPIPACTIS GIGANTEA)

General Ecology and Distribution. This species, a perennial herb in the orchid family, is widely distributed throughout California and North America. In Yosemite, it is restricted to moist granitic ledges and planted in landscaped areas.

Habitat and Status in the Project Area. This species occurs in Yosemite Valley within a number of landscaped areas. Former populations above Happy Isles were obliterated by the rockfall in 1996. Natural habitat for this species exists throughout the Valley in perennially moist, shaded areas.

DESERT FLEABANE (ERIGERON LINEARIS)

General Ecology and Distribution. This is a perennial herb in the aster family, native to California and confined to western North America. It reaches the southwestern extent of its range on the Sierra Nevada crest in the vicinity of Mt. Dana in rocky soils on slopes.

Habitat and Status in the Project Area. This species occurs at the granitic-metamorphic contact zone on the slopes of Mt. Dana.

RAMBLING FLEABANE (ERIGERON VAGUS)

General Ecology and Distribution. This perennial herb in the aster family is confined to western North America. It reaches the northern extent of its range on the Sierra Nevada crest in Tuolumne County. It occurs exclusively in rocky soils throughout alpine fell-fields.

Habitat and Status in the Project Area. Occurs in isolated populations on the slopes of Mt. Dana and on adjacent alpine peaks surrounding Tioga Pass.

FAWN-LILY (ERYTHRONIUM PURPURASCENS)

General Ecology and Distribution. This perennial herb is endemic to California and the Sierra Nevada. It grows along shaded streams and river corridors in montane coniferous forests.

Habitat and Status in the Project Area. This species is known from riparian corridors in the eastern end of Yosemite Valley. It was collected in the past for its showy flowers.

**NORTHERN BEDSTRAW (GALIUM BOREALE SSP.
SEPTENTRIONALE)**

General Ecology and Distribution. This species, a perennial herb in the bedstraw family, is found in moist areas within montane coniferous forests. It has a disjunct population in Mariposa

County, within Yosemite Valley meadows. The remainder of its range is in northern California and the Pacific Northwest.

Habitat and Status in the Project Area. In Yosemite, this species is known from a number of wet meadows in Yosemite Valley, and wet portions of drier meadows and oxbows.

**DANE'S DWARF GENTIAN (GENTIANELLA TENELLA SSP.
TENELLA)**

General Ecology and Distribution. This annual herb in the gentian family is found in subalpine forests and alpine fell-fields, meadows, and seeps throughout North America. In Yosemite, relict populations left intact from Pleistocene glaciation are found on the slopes of the Sierra Nevada crest.

Habitat and Status in the Project Area. It is found in alpine fell-fields at high elevations on the slopes of Mt. Dana and other peaks surrounding Tioga Pass.

**GOLDENASTER (HETEROTHECA SESSILIFLORA SSP.
ECHIOIDES)**

General Ecology and Distribution. This perennial herb in the aster family is limited to grasslands and open California black oak woodlands throughout the southern portions of California. It reaches the northernmost extent of its range in Tuolumne County.

Habitat and Status in the Project Area. Small, isolated populations of this species occur in the Foresta area. New populations have recently been discovered that are likely a result of the 1990 A-Rock Fire, which opened the forest canopy and removed unnaturally deep layers of litter and duff in the basin.

YOSEMITE IVESIA (IVESIA UNGUICULATA)

General Ecology and Distribution. This perennial herb in the rose family is endemic to California and limited to the southern Sierra Nevada. It occurs in meadow habitats within upper montane forests and reaches the northern extent of its limited range in Mariposa County.

Habitat and Status in the Project Area. This herb occurs in meadow and wet areas east of Badger Pass.

COMMON JUNIPER (JUNIPERUS COMMUNIS)

General Ecology and Distribution. This coniferous shrub in the cypress family is found throughout North America. In Yosemite, it is limited in distribution to montane and subalpine sites, where it grows on open, rocky, dry slopes.

Habitat and Status in the Project Area. This shrub grows in isolated patches at Tioga Pass and lodgepole pine forest to the west of the Tioga Road.

PITCHER SAGE (LEPECHINIA CALYCINA)

General Ecology and Distribution. Pitcher sage, a shrub in the mint family, is endemic to California and is found on rocky slopes within foothill and lowland chaparral and canyon live oak woodlands.

Habitat and Status in the Project Area. Habitat for this species occurs throughout the Merced River gorge and El Portal.

SIERRA LAUREL (LEUCOTHOE DAVISIAE)

General Ecology and Distribution. This shrub, a perennial in the heath family, is found slightly beyond California's boundaries and is restricted to wetland, bog, and moist habitats.

Habitat and Status in the Project Area. In Yosemite, sierra laurel grows adjacent to iron-rich springs and seeps in isolated locations along the Merced River and Tenaya Creek in Yosemite Valley.

FALSE PIMPERNEL (LINDERNIA DUBIA VAR. ANAGALLIDEA)

General Ecology and Distribution. This annual herb in the snapdragon family is found in freshwater wetlands and meadows at low to mid elevations in California and North America.

Habitat and Status in the Project Area. False pimpernel is found in meadow soils throughout Yosemite Valley that remain moist for the duration of the plant's seasonal life span.

CONGDON'S MONKEYFLOWER (MIMULUS CONGDONII)

General Ecology and Distribution. This annual herb in the snapdragon family is endemic to California. It reaches the northern extent of its range in the Sierra Nevada in Yosemite and is found in granitic soils in disturbed areas, seeps, and runoff areas on slopes.

Habitat and Status in the Project Area. Habitat for this species occurs in portions of the Merced River gorge and at El Portal.

INCONSPICUOUS MONKEYFLOWER (MIMULUS INCONSPICUUS)

General Ecology and Distribution. This annual herb in the snapdragon family is endemic to California. It is restricted to wetlands and seasonally moist sites in lower montane forests and foothill woodlands in partial shade.

Habitat and Status in the Project Area. Isolated populations of this species occur throughout Foresta where small hillside streams and seeps provide suitable habitat.

PALMER'S MONKEYFLOWER (MIMULUS PALMERI)

General Ecology and Distribution. This monkeyflower, an annual herb in the snapdragon family, is endemic to California and Baja California. It reaches the northern extent of its range in

Yosemite. It is restricted to damp, shaded slopes under canyon live oaks in foothill, chaparral, and lower montane forests.

Habitat and Status in the Project Area. Habitat for this species occurs in portions of the Merced River gorge and at El Portal.

PANSY MONKEYFLOWER (MIMULUS PULCHELLUS)

General Ecology and Distribution. This annual herb in the snapdragon family is endemic to California and limited to Mariposa, Tuolumne, and Calaveras Counties. It is restricted to wetlands and seasonally moist sites and reaches the southern extent of its range in Foresta.

Habitat and Status in the Project Area. It is found in small, isolated, vernal moist, open, gravelly places throughout the Foresta basin.

DWARF SANDWORT (MINUARTIA PULCHELLUS)

General Ecology and Distribution. This annual herb is confined to western North America. It reaches the southern extent of its range in the Sierra Nevada in Mariposa County and occurs in open montane coniferous forests.

Habitat and Status in the Project Area. This herb is found on dry slopes and forest openings east of Badger Pass.

SIERRA SWEET-BAY (MYRICA HARTWEGII)

General Ecology and Distribution. This perennial shrub in the wax-myrtle family is endemic to California. It is limited in occurrence to streambanks and riparian communities at low to moderate elevations in the Sierra Nevada, where it forms small thickets along the river.

Habitat and Status in the Project Area. It has a patchy distribution along the South Fork of the Merced River through Wawona as well as along tributaries to the South Fork and Big Creek near the South Entrance Station.

**AZURE PENSTEMON (PENSTEMON AZUREUS SSP.
ANGUSTISSIMUS)**

General Ecology and Distribution. This perennial herb in the snapdragon family is endemic to California and is near its southern extent in Yosemite. It is generally found in moist woodlands and open forests at lower to moderate elevations in the Sierra Nevada.

Habitat and Status in the Project Area. This herb is found in scattered locations in Yosemite Valley. It was first described from collections taken in Yosemite Valley, although that original population appears to have disappeared.

PHACELIA (PHACELIA PLATYLOBA)

General Ecology and Distribution. Broad-leaved phacelia is an annual herb endemic to California. It is restricted to Mariposa, Madera, and eastern Fresno Counties and is found in gravelly or rocky soils in chaparral and canyon live oak woodlands.

Habitat and Status in the Project Area. Habitat for this species occurs throughout the Merced River gorge and at El Portal.

PHACELIA (PHACELIA TANACETIFOLIA)

General Ecology and Distribution. This annual herb in the waterleaf family is found throughout California and is confined to western North America. It grows in seasonally moist, sandy and gravelly open areas.

Habitat and Status in the Project Area. This species occurs at scattered locations throughout Yosemite Valley, where it blooms and sets seed early each spring.

SNOW WILLOW (SALIX RETICULATA)

General Ecology and Distribution. This low-growing willow shrub is confined to western North America in subalpine and alpine habitats. It reaches the westernmost extent of its range in relict populations along the crest of the Sierra Nevada in Yosemite.

Habitat and Status in the Project Area. This scrub is found in wet areas and seeps within alpine fell-fields on the slopes of Mt. Dana and adjacent peaks surrounding Tioga Pass.

WOOD SAXIFRAGE (SAXIFRAGA MERTENSIANA)

General Ecology and Distribution. This perennial herb in the saxifrage family is endemic to California and limited to the northern and central Sierra Nevada. It reaches its southern extent in Mariposa County, where it grows on mossy rocks and moist cliffs in lower to montane coniferous forests.

Habitat and Status in the Project Area. This species occurs at scattered locations in moist, shaded sites throughout Yosemite Valley.

BOLANDER'S SKULLCAP (SCUTELLARIA BOLANDERI)

General Ecology and Distribution. This perennial herb in the mint family is endemic to California. It is primarily found in lower montane forests in the Sierra Nevada, where it occurs in gravelly soils along streambanks and in California black oak woodlands and ponderosa pine forests.

Habitat and Status in the Project Area. This species is known from isolated populations scattered throughout the Wawona basin.

GROUNDSEL (SENECIO SERRA VAR. SERRA)

General Ecology and Distribution. This perennial herb in the aster family is confined to western North America in montane to subalpine coniferous forests.

Habitat and Status in the Project Area. It is restricted to open coniferous forests or sagebrush scrub on the lower slopes of Mt. Dana and the slopes west of Tioga Pass.

GIANT SEQUOIA (SEQUIADENDRON GIGANTEUM)

General Ecology and Distribution. Giant sequoias are endemic to California and grow in 70 discrete groves in the central and southern Sierra Nevada within the montane forest belt. In Yosemite National Park, sequoias grow naturally in the Merced, Tuolumne, and Mariposa Groves.

Habitat and Status in the Project Area. Individual sequoia trees have been planted in Yosemite Valley and Wawona in landscaped and natural areas, both historically and in recent times.

LADIES' TRESSES (SPIRANTHES PORRIFOLIA)

General Ecology and Distribution. This perennial herb in the orchid family is found throughout western North America. It grows in wet meadows and bogs at low to mid elevations.

Habitat and Status in the Project Area. This species occurs at scattered locations throughout Yosemite Valley where deep, loamy soils and moist conditions prevail.

TRILLIUM (TRILLIUM ANGUSTIPETALUM)

General Ecology and Distribution. This perennial herb in the lily family is almost entirely restricted to California. It is most common in the coastal ranges of the state, but occurs in limited, small populations in the Sierra Nevada where it is found in shady areas within mature montane coniferous forests with well-developed duff and litter layers. This species may be at risk due to the lack of natural fire patterns, which allows an unnatural buildup of duff and litter to the exclusion of the plant, as well as overly intense fire behavior resulting in loss of root and plant materials through overheating.

Habitat and Status in the Project Area. This species is scattered over a 10-acre area along the south side of the South Fork of the Merced River in Wawona, near the eastern end of River Road.

HALL'S WYETHIA (WYETHIA ELATA)

General Ecology and Distribution. This species, a perennial herb in the aster family, is endemic to California. It is restricted to the southern Sierra Nevada foothills and lower montane forests and reaches the northern extent of its range in Yosemite.

Habitat and Status in the Project Area. It is found in open woodlands and forests in the Wawona basin.

CHAPTER V. ENVIRONMENTAL EFFECTS

Methods Used to Assess Effects

ASSUMPTIONS

The following assumptions were used as a basis in the analysis of effects on special-status species:

- The greater the size of a biotic community and the stronger its links to neighboring communities, the more valuable it is to the integrity and maintenance of biotic processes that sustain special-status species. Development limits the size of a community and fragments and disassociates communities from each other.
- The more developed areas become, the less valuable they are as habitat for special-status species. New development would increase human presence and increase the potential for soil, wildlife, and vegetation disturbance. The potential for negative wildlife interactions (such as human injury from wildlife and the introduction of unnatural food sources) also would increase. If development were removed from an area, the value of the habitat for special-status species would increase. In some cases, the dispersal of visitors over a wider area that may follow removal of developed facilities may well have a greater impact than focused visitor use within the well-defined area of development. Human effects can also improve habitat quality for non-native species and unnaturally increase the abundance of some native species, both of which can have an adverse effect on special-status species.
- The presence of humans and the effects of human food on the behavior, distribution, and abundance of wildlife species would continue in existing developments.
- Roads can change water inflow and outflow patterns and may dewater sections of meadow or wetland habitat (USFS 1996). Roads can also cause mortality of wildlife and may form barriers and fragment wildlife habitat.
- Development and effects in riparian zones may influence critical water quality elements such as temperature, suspended sediments, and nutrients. These elements interact in complex ways in aquatic systems and directly and indirectly influence patterns of growth, reproduction, and migration of aquatic organisms.
- Development that has an adverse effect on habitat features that are important to certain special-status species (e.g., particular plant species upon which a species relies, or habitat features that define suitable habitat for a species) can have an acute, negative effect on those species.
- Radiating effects of human use can affect use of habitats adjacent to developed areas by special-status species, even though such habitats are not directly affected by the development.
- Implementation of threatened or endangered species recovery plans and other formal agreements between the U.S. Fish and Wildlife Service and the National Park Service would not be affected by the management direction resulting from the *Final Yosemite*

Valley Plan/SEIS. The current management direction for special-status species would continue to remain in effect.

SPECIAL - STATUS PLANTS

The assessment of effects on special-status plants was based on the following:

- The sensitivity of the individual species to effects (based on the rarity, resilience, size of population, and extent of the species throughout the park)
- The location of the species in relation to the Preferred Alternative

SPECIAL - STATUS WILDLIFE

The assessment of effects on special-status wildlife was based on the following:

- The possibility of a species or its preferred habitat occurring in those areas expected to be affected
- The direct loss of habitat
- The partial loss of habitat from its modification
- The species' sensitivity to disturbance from human activities that may alter use of habitats in areas adjacent to development

Habitat fragmentation was also a critical component of the analysis. Restored blocks of habitat should be large enough to support viable populations, and intact habitat must not be reduced or affected to the point that it will no longer support viable populations.

IMPACT ANALYSIS

Actions proposed in the *Final Yosemite Valley Plan/SEIS* were evaluated in terms of the context, intensity, and duration of the effects, as defined below, and whether the effects were considered to be beneficial or adverse to the natural environment. Generally, the methodology for natural resource impact assessment follows direction provided in the *Council of Environmental Quality Regulations for Implementing the National Environmental Policy Act*, Section 1508.27.

Context. Certain effects of actions under the Preferred Alternative are dependent upon the setting in which they occur. For instance, actions that could reduce connectivity between habitat types could be minor if such connections are abundant in a given region; they would be moderate or major if they are not. The context of the impact determines whether the impact would be local or regional.

Intensity. The intensity and magnitude of effects are described as negligible, minor, moderate, or major. These designations are used to describe both beneficial and adverse effects. Both short- and long-term effects are relevant to the analysis.

- Negligible effects are imperceptible or not detectable.

- Minor effects are those that are slightly detectable, localized within a relatively small area, and would not effect the overall viability of the species. Without further effects, negative effects would be reversed and the species would recover.
- Moderate effects are those that are sufficient to cause a change in species in terms of abundance, distribution, or habitat quality or quantity, but the change would remain localized. Moderate effects are readily apparent and have the potential to become major effects.
- Major effects are substantial, highly noticeable, and can be permanent.

Impact Duration. The expected duration of effects is described as long term or short term.

- Short-term effects would occur over a period of less than 20 years.
- Long-term effects would occur over a period of 20 years or longer.

CUMULATIVE ANALYSIS

The cumulative analysis in this Biological Assessment is based on the cumulative projects identified in Appendix H of the *Final Yosemite Valley Plan/SEIS*. These projects were included in the cumulative analysis process based on observations of natural boundaries, the recognition of potential ecological relationships to Yosemite National Park, and with a general understanding of the common issues to be addressed in the impact analysis.

Federal Endangered Species

WILDLIFE

Sierra Nevada bighorn sheep (Ovis canadensis sierrae)

Direct and Indirect Effects

There would be no direct effects on the Sierra Nevada bighorn sheep or its preferred habitat.

Habitat for the Sierra Nevada bighorn sheep in the Tioga Pass area is located in steep terrain that is relatively inaccessible to casual visitors. Though there would be increased visitor use at Tioga Pass, it is not likely that visitors would often traverse areas used by the Sierra Nevada bighorn sheep. Therefore, there would be negligible effects on the Sierra Nevada bighorn sheep.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, and the Fire Management Plan Update (NPS) could provide benefits to the size, integrity, and connectivity of suitable habitat for the Sierra Nevada bighorn sheep. These regional plans would have a long-term, moderate, beneficial effect on the Sierra Nevada bighorn sheep.

Federal Threatened Species

Bald eagle (Haliaeetus leucocephalus)

Direct and Indirect Effects

Bald eagles are rarely seen within Yosemite and are not known to nest in the park. However, riparian and meadow areas of Yosemite Valley, Foresta, El Portal, and Wawona may provide foraging habitat for transient eagles. Actions proposed in this plan, such as restoration of at least 135 acres of meadow and riparian habitat and implementation of the River Protection Overlay, would have a moderate, beneficial impact on potential foraging habitat for the bald eagle. Upland habitats are not the primary habitats used by the bald eagle, and the size of the proposed new developments in Yosemite Valley, El Portal, Wawona, and Foresta are relatively small in relation to the range of the bald eagle. Therefore, development and fragmentation in upland habitats would have negligible effects on this species. There would be a relatively large amount of restoration of meadow and riparian habitat in relation to development in upland habitats; therefore, the Preferred Alternative would have an overall long-term, minor, beneficial effect on the bald eagle.

Cumulative Effects

Projects associated with the Merced River, such as the Yosemite View Parcel Land Exchange (NPS) could adversely affect habitat that is used by transient bald eagles. The River Protection Overlay prescribed in the Merced Wild and Scenic River Comprehensive Management Plan (NPS) has the potential to benefit eagles by preserving and restoring riparian and meadow habitat.

The overall cumulative effects on the bald eagle would be minor and beneficial because the River Protection Overlay prescribed in the *Merced Wild and Scenic River Comprehensive Management Plan/FEIS* would benefit transient eagles.

California red-legged frog (Rana aurora draytonii)

Direct and Indirect Effects

This species is not found in the project area, but likely occurred there at one time. Its absence from suitable habitat in the project area is thought to be a result of habitat loss and change, acid precipitation, chemical pollution, introduced fish and other species, drought, and a combination of factors (Drost and Fellers 1996).

The Preferred Alternative would restore a large tract of previously disturbed meadow and riparian habitat in the east end of Yosemite Valley, totaling at least 135 acres. Fellers (1999) states that Yosemite Valley is one of two places in the park where it might be possible to re-establish the California red-legged frog provided the non-native bullfrog population is removed. Construction of the Yosemite Village Visitor/Transit Center could directly impact riparian habitat. Overall, there would be a moderate gain in the size of suitable habitat for the California red-legged frog.

The Preferred Alternative would also establish the River Protection Overlay, which would offer increased protection to areas adjacent to the Merced River in Yosemite Valley, El Portal, and Wawona. The Preferred Alternative would maintain and restore:

- Riparian microhabitats and microclimates
- Riparian and aquatic vegetation
- Reduced sediment input levels during breeding season
- Surface and subsurface hydrologic processes
- The structural integrity of stream breeding habitats
- The connectivity of riparian habitats

The Preferred Alternative would also support the recruitment of large, woody debris into riparian areas and allow a shifting mosaic of habitats. These actions would have a moderate, beneficial impact on suitable habitat for the species. Development in areas outside of Yosemite Valley where California red-legged frogs could be present (El Portal, Wawona, and Foresta) would have a negligible effect on the species, because such development would occur in upland areas and have no effect on suitable habitat.

There would be a minor to moderate, beneficial effect on the species, due to the large area of suitable habitat that would be restored in relation to the suitable habitat that would be removed. Although California red-legged frogs are no longer present in these areas, preservation of suitable habitat would allow future reintroduction or recolonization of the species.

Cumulative Effects

Projects in the vicinity of Yosemite National Park are unlikely to affect any known existing populations of red-legged frogs. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could provide benefits to the size, integrity, and connectivity of suitable habitat for the California red-legged frog. Overall, these actions have the potential to have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time. Foreseeable projects that could have adverse effects on suitable habitat for the California red-legged frog include the Rio Mesa Area Plan (Madera Co.); University of California, Merced Campus (Merced Co.), and the City of Merced General Plan.

Environmental compliance carried out in association with these projects would result in further surveys to evaluate whether unknown populations of red-legged frogs could be affected.

Overall, cumulative impacts would be minor to moderate and beneficial, based on potential protection of red-legged frog habitat through implementation of plans that cover wide areas. Although this species is nearly extinct in the Sierra Nevada, habitat would be protected for potential reintroduction or recolonization of the species. Projects with a possible negative impact on red-legged frogs would affect a relatively small area of habitat compared to projects with potential beneficial effects. These projects could have a major, negative impact if they affected an

unknown population of red-legged frogs, which could be among the last in the Sierra Nevada. However, site surveys would be completed in compliance with state and federal regulations to ensure that all populations are known and avoided.

Valley elderberry longhorn beetle (Desmocerus californicus dimorphus)

Direct and Indirect Effects

Potential Valley elderberry longhorn beetle habitat is defined by the presence or absence of elderberry plants in areas below 3,000 feet in elevation. El Portal is the only part of the project area where potential habitat has been identified. About 124 elderberry plants of a size sufficient to support the Valley elderberry longhorn beetle occur in areas of existing or potential development in El Portal. These plants could be adversely affected by activities such as grading, removal of trailers and infrastructure, and construction of new buildings as proposed in the *Final Yosemite Valley Plan/SEIS*. However, planning and implementation would strive to avoid or mitigate such effects. Valley elderberry longhorn beetle exit holes which verify beetle activity were found in 11 elderberry plants, though beetle larvae could still be present in elderberry plants without exit holes. Plants retained in developed areas could be subject to future damage from human activities, such as unauthorized pruning and vehicles. Clearance for fire protection around newly developed sites would be accomplished through a combination of selected clearing, perimeter firebreaks (that may overlap with roads), and clearing around individual structures. Clearing would not be necessary beyond the construction boundaries identified in the plan, and therefore would not remove more elderberry plants.

There is an abundance of host plants for the Valley elderberry longhorn beetle in areas that surround proposed development sites in El Portal. Should any of the 124 elderberry plants need to be removed, there would be a minor to moderate, adverse effect on the beetle because of the abundance and wide distribution of elderberry plants outside of development zones. The National Park Service will work with the USFWS to develop mitigation procedures to avoid, minimize, or mitigate effects on the Valley elderberry longhorn beetle. The results of consultation with the USFWS will be incorporated into the *Final Yosemite Valley Plan/SEIS* and planning process.

Cumulative Effects

Foreseeable projects that could have adverse effects on the Valley elderberry longhorn beetle and its habitat include the Yosemite View Parcel Land Exchange (NPS), Yosemite Motels expansion (Mariposa Co.), Mariposa Creek Pedestrian/Bike Path (Mariposa Co.), University of California, Merced campus (Merced Co.), the City of Merced General Plan, and the Merced River Canyon Trail Acquisition (BLM). These projects would have the potential to damage or destroy elderberry plants and directly affect local Valley elderberry longhorn beetle populations.

Long-term, beneficial effects would be expected from the Sierra Nevada Framework for Conservation and Collaboration (USFS) and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) because these planning efforts could lead to greater protection of elderberry plants. Overall, cumulative effects would be minor and beneficial because of potential

protection of Valley elderberry longhorn beetle and its habitat through these wide-reaching regional plans. Actions with adverse impacts would potentially affect relatively small numbers of Valley elderberry longhorn beetle and small areas of habitat compared with the regional plans that would protect the beetle.

Federal Species of Concern

W I L D L I F E

Harlequin duck (Histrionicus histrionicus)

Direct and Indirect Effects

Harlequin ducks breed along large, swift-moving mountain rivers, but are very rarely seen in Yosemite National Park. A pair was seen twice on the Merced River in Yosemite Valley in April 2000. Before these sightings, the most recent record of harlequin ducks in the park was 1980. Records show that harlequin ducks nested in Yosemite Valley at one time and were also present on the Merced River in Wawona and El Portal.

The Preferred Alternative would establish the River Protection Overlay and restore or protect about 100 acres of suitable riparian and aquatic habitat for the harlequin duck in areas adjacent to the Merced River. This would provide a minor benefit with respect to habitat for the harlequin duck.

Construction of the Yosemite Village Visitor/Transit Center could remove habitat suitable for harlequin ducks, which would be a minor effect because of the small size of the areas affected and the existing level of disturbance in these areas. Development in Wawona would not affect river or riparian habitats and therefore would have a negligible effect on harlequin ducks. Overall, there would be a minor, beneficial effect on the harlequin duck, because the amount of riparian habitat lost would be minor in comparison with riparian habitat that would be protected and restored along the Merced River.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could provide benefits to the size, integrity, and connectivity of suitable habitat for the harlequin duck. The *Final Yosemite Valley Plan/SEIS* would restore or protect about 100 acres of suitable riparian and aquatic habitat. These actions could to have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

A foreseeable project that could have adverse effects on suitable habitat for the harlequin duck is the Yosemite View Parcel Land Exchange (NPS). There are no known populations of harlequin duck in this area. Cumulative projects are thus unlikely to affect any existing population of the

harlequin ducks. Overall, there would be a minor beneficial impact on the harlequin duck, based on the potential protection of suitable habitat offered by wide-reaching regional plans.

Northern goshawk (Accipiter gentilis)

Direct and Indirect Effects

The northern goshawk is typically found between 5,000 and 9,000 feet in elevation in dense coniferous forests broken by meadows and other openings. Possible development of a parking/transit center and access road at Hazel Green would directly displace an area of forested habitat, possibly affecting the local population of northern goshawks. However, the area is small and surrounded by large areas of suitable goshawk habitat, and a portion has already been affected by previous operations.

New development that is proposed at the Big Oak Flat Entrance Station, the South Entrance Station, and Tioga Pass would cause negligible effects due to the small size of the proposed development. Increased use of Badger Pass in the summer could cause a minor, adverse impact to local goshawks from increased human disturbance in the area. Goshawks are usually seen in Yosemite Valley between November and February, but such observations are rare, and no breeding has been recorded in this area. As such, proposed new development in Yosemite Valley would have a negligible effect on the park's population of goshawks. Overall, there would be a long-term, minor, adverse impact on the northern goshawk due to the possible development in partially undisturbed upland habitat at Hazel Green.

Cumulative Effects

Projects likely to have a beneficial effect on northern goshawk habitat include the Fire Management Plan Update (NPS) and the Sierra Nevada Framework for Conservation and Collaboration (USFS). Projects that could have an adverse effect on northern goshawk habitat include the Hazel Green Ranch project (guest rooms, food services, University of California research station) and the Evergreen Lodge Expansion (Tuolumne Co.). Overall, there would be a long-term, moderate, beneficial cumulative impact on the northern goshawk, primarily from the potential protection of wide areas of habitat through implementation of regional land management plans, compared to adverse effects on small, localized areas of habitat from individual projects.

California spotted owl (Strix occidentalis)

Direct and Indirect Effects

California spotted owl habitat ranges from oak and ponderosa pine forests to lower-elevation red fir forests up to 7,600 feet. Known or occupied habitat for the California spotted owl in Yosemite National Park totals approximately 142,400 acres (van Wagtenonk 2000). Forested areas with greater than 70% canopy closure are potential spotted owl nesting and roosting areas, while areas with greater than 40% closure are potential foraging areas.

The following actions would have beneficial effects on spotted owls:

- The removal of motor vehicle traffic from Northside Drive between Yosemite Lodge and El Capitan
- The removal of cabins at the Terrace in Curry Village

The following actions would have adverse effects on spotted owls:

- Construction of employee housing in El Portal at Hillside East and West and parking in El Portal
- Construction of a transit center and parking at Hazel Green
- New construction at the Big Oak Flat Entrance Station and South Entrance
- Rerouting of roads from meadows into upland habitats
- Development of housing in Wawona

There would be losses and gains in the quantity and quality of spotted owl habitat in Yosemite National Park. The removal of motorized traffic from Northside Drive is expected to have the most far-reaching beneficial effects, because disturbance from vehicles most likely extends far beyond the dimensions of the road. Recent surveys indicate that no developments under the *Final Yosemite Valley Plan/SEIS* would directly affect spotted owl nesting or roosting areas, but could affect some foraging habitat at South Entrance, Badger Pass, Yosemite Valley, Hazel Green, and Big Oak Flat Entrance. Overall, the actions listed above would have a negligible to minor, beneficial effect on California spotted owls; the area of potential habitat benefit in Yosemite Valley is large, but the beneficial impact would be offset by individual, localized, minor, adverse effects on foraging habitat from various new developments in the park.

Cumulative Effects

Declines of the California spotted owl in the Sierra Nevada have been linked to degradation of its forest habitats from logging, which affects the size of forested tracts as well as tree density and age. Projects likely to have a beneficial effect on spotted owl habitat, through long-term habitat improvements, include the Fire Management Plan Update (NPS), Sierra Nevada Framework for Conservation and Collaboration (USFS), Orange Crush Fuels Treatment Projects (USFS, Stanislaus), A-Rock Reforestation (USFS, Stanislaus), Rogge-Ackerson Fire Reforestation (Tuolumne Co.), and the Fire Management Action Plan for Wilderness (USFS, Stanislaus). Projects with potentially adverse effects include the Hazel Green Ranch project (guest rooms, food services, University of California research station) and Evergreen Lodge Expansion (Tuolumne).

Overall, the cumulative impacts on this species would be moderate and beneficial due primarily to regional plans that would either protect large areas of owl habitat or hasten a return of forested habitat that is more suitable for spotted owls. Projects with negative impacts would affect relatively small areas of local California spotted owl habitat, but would not have far-reaching impacts.

Mount Lyell shrew (Sorex lyelli)

Direct and Indirect Effects

The Mount Lyell shrew is found only in California, in a few locations in the vicinity of Mt. Lyell within or near the park (Ingles 1965). Only five individuals have been reported, all prior to 1924.

Any future parking facilities at Tioga Pass could have an adverse effect on habitat for the Mount Lyell shrew. The extent of habitat loss at this time is uncertain. Additional evaluation and compliance would be required to address potential effects on the Mount Lyell shrew.

Increased human use at Tioga Pass could increase foot traffic in meadows and vehicle-polluted runoff from paved areas. Under the Preferred Alternative, human use would be restricted from meadow areas, and parking area runoff would be collected for treatment. This would result in negligible, adverse effects on the Mount Lyell shrew from increased human use.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could provide benefits to the size, integrity, and connectivity of suitable habitat for the Mount Lyell shrew. These regional plans would have a long-term, minor, beneficial effect on suitable habitat for the Mount Lyell shrew.

Spotted bat (Euderma maculatum)

Direct and Indirect Effects

This species forages in a wide variety of suitable habitats in the park, such as Yosemite Valley, where there are rock crevices in high cliffs and canyons, areas of standing water, and healthy populations of moths and other flying insects. Crevices in rockfaces are used for roosting and reproduction.

The Preferred Alternative would restore a large tract of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. This would improve foraging habitat for spotted bats over a wide area of Yosemite Valley, where the species has been found in relatively high density.

New construction would take place in spotted bat foraging habitat at the Yosemite Village Visitor/Transit Center, the traffic check station near El Capitan crossover, new stables in Foresta, and campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and along Tenaya Creek. Potential foraging habitat could also be directly affected by construction of a transit and parking facility at Hazel Green. Alternatively, if parking is developed in Foresta, foraging habitat of spotted bats in this location could be affected, causing minor adverse effects.

Development of housing and parking in El Portal and housing in Wawona could result in a loss of spotted bat foraging habitat. Minor expansion of facilities at Big Oak Flat Entrance, South

Entrance, and Tioga Pass could cause disturbance of small areas of potential habitat adjacent to existing development. Because use of Badger Pass for parking would not result in additional habitat disturbance, this action would have a negligible effect. These effects, in total, would be minor and adverse because of the limited area of impact, the existing human disturbance in the area, and the large area of suitable, unaffected habitat that would continue to exist in surrounding areas.

The Preferred Alternative would not impact rockface habitat in the park. Therefore, roosting and breeding habitat would not be affected.

Data collected in 1993 (Pierson and Rainey) suggest that the spotted bat forages primarily in meadow and wetland habitats. There would be localized, minor, direct, adverse effects on bat foraging habitat from new development in upland habitats, which is less favored by spotted bats. Overall, the Preferred Alternative would have a moderate, beneficial impact on the spotted bat, because a large tract of meadow and riparian habitat would be restored in relation to upland habitat that would be removed.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green Ranch project (guest rooms, food services, University of California research station), Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could provide benefits to the size, integrity, and connectivity of suitable habitat for the spotted bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

Projects that could have adverse effects on suitable habitat for the spotted bat include the Yosemite View Parcel Land Exchange (NPS), El Portal Road Improvement Project (NPS), Yosemite Motels Expansion (Mariposa Co.), and Evergreen Lodge Expansion (Tuolumne Co.), which would be expected to have a minor, adverse effect on spotted bats, based upon their limited areas of effect. In total, there would be a moderate, beneficial impact on the spotted bat, due primarily to the protection of suitable habitat that could occur under wide-reaching regional plans. The projects with a possible adverse impact on the spotted bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

Small-footed myotis bat (Myotis ciliolabrum)

Direct and Indirect Effects

The small-footed myotis bat is primarily found in wooded and brushy habitats up to about 8,800 feet in elevation near water.

The Preferred Alternative would restore a large tract of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160

acres. This would improve foraging habitat for the small-footed myotis bat, although this species also forages in forest habitats.

Actions that could have an adverse effect on forest habitat include new campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and north of Tenaya Creek, as would construction of employee housing near Huff House at Curry Village. The widening of Southside Drive and a parallel pedestrian/bicycle path and the establishment of a traffic check station at El Capitan crossover could result in removal of trees from small areas. Development of a transit center and parking at Hazel Green, and parking and housing at El Portal and possible minor expansion of facilities at South Entrance and Big Oak Flat Entrance would result in removal of some forested habitat. If parking is established in Foresta instead of Hazel Green, a similar amount of foraging habitat would be affected in this location. In either area, development would require hazard tree mitigation, which could affect some bat roost sites, causing minor, adverse effects.

In total, the impact of these actions on small-footed myotis bats is expected to be minor and adverse, due to restoration of large areas of foraging habitat in Yosemite Valley, offset by localized adverse effects on forest habitats in the Valley and out-of-Valley areas from development.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green Ranch project (guest rooms, food services, University of California research station), the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could provide benefits to the size, integrity, and connectivity of suitable habitat for the small-footed myotis bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time. Projects that could have adverse effects on suitable habitat for the small-footed myotis bat include the Yosemite View Parcel Land Exchange (NPS), Yosemite Motels Expansion (Mariposa Co.), El Portal Road Improvement Project (NPS), and Evergreen Lodge Expansion (Tuolumne Co.). These projects would primarily affect forest habitat, except for the El Portal Road project, which affects mostly riparian areas.

In total, cumulative impacts on the small-footed myotis bat would be moderate and beneficial, based primarily on implementation of large-scale regional land management plans that could protect wide areas of habitat, compared to the small areas of adverse effects from individual projects.

Long-eared myotis bat (Myotis evotis)

Direct and Indirect Effects

The long-eared myotis bat is found primarily in forested habitat, especially coniferous, where it forages among trees and over shrubs and water, especially favoring riparian edges. Long-eared

myotis bats tend to roost in snags and lightning-scarred trees and are especially dependent upon oaks for roost sites.

Therefore, actions that affect forest habitats are most likely to affect this species. Adverse effects could result from the development of new campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and north of Tenaya Creek. The widening of Southside Drive and a parallel foot/bike path and the establishment of a traffic check station at El Capitan crossover could result in removal of trees from small areas. Development of a transit center and parking at Hazel Green, parking and housing at El Portal, and possible minor expansion of facilities at South Entrance and Big Oak Flat Entrance would result in removal of some forested habitat. If parking is established at Foresta instead of Hazel Green, a similar amount of foraging habitat would be affected in this location. In either area, development would require hazard tree mitigation, which could affect some bat roost sites and cause minor, adverse effects. Development of employee housing near Huff House at Curry Village is likely to result in the removal of trees, including some oaks.

Restoration of approximately 160 acres of black oak, riparian, and meadow habitats in Yosemite Valley would beneficially affect long-eared myotis, especially where oak roosting habitat and riparian foraging habitat are restored.

In total, effects under the Preferred Alternative would be minor and beneficial, due to restoration of large areas of highly suitable roosting and foraging habitat, offset by scattered new development in forest habitats, where large areas of suitable habitat adjacent to project areas would remain undisturbed.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green Ranch project (guest rooms, food services, University of California research station) the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the long-eared myotis bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

Foreseeable projects that could have adverse effects on suitable habitat for the long-eared myotis bat include the the Yosemite View Parcel Land Exchange (NPS), El Portal Road Improvement Project (NPS), Yosemite Motels Expansion (Mariposa Co.), and Evergreen Lodge Expansion (Tuolumne Co.). These projects would primarily affect forest habitat, except for the El Portal Road project, which affects mostly riparian areas.

In total, cumulative impact on the long-eared myotis bat would be moderate and beneficial, based primarily on implementation of large-scale regional land management plans that could protect wide areas of habitat, compared the small areas of adverse effects caused by individual projects.

Overall, there would be a moderate, beneficial cumulative impact on long-eared myotis bats. This is based on the potential protection of suitable habitat resulting from implementation of wide-reaching regional plans. The projects with a possible adverse impact on the long-eared myotis bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

Fringed myotis bat (Myotis thysanodes)

Direct and Indirect Effects

The fringed myotis bat is found in the Sierra Nevada in deciduous/mixed conifer habitats up to at least 6,400 feet in elevation. Foraging occurs over a variety of habitats, but the fringed myotis bat prefers forest edges and canopies. Fringed myotis bats roost in caves, mines, buildings, and trees.

The Preferred Alternative would restore a large tract of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. This would improve foraging and roosting habitat for the fringed myotis bat.

New construction would take place in fringed myotis bat habitat at the parking site at the Yosemite Village Visitor/Transit Center, the traffic check station near El Capitan crossover (if necessary), new stables in Foresta, and campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and along Tenaya Creek. Most of this construction would take place in upland habitats. Southside Drive would be widened from El Capitan crossover to Curry Village. This would directly displace habitat and increase the need for hazard tree reduction, slightly reducing the availability of trees for roosting and reproduction. These actions would have minor, direct, adverse effects on primarily upland habitat.

Development of a transit center and parking at Hazel Green, parking and housing at El Portal, and possible minor expansion of facilities at South Entrance and Big Oak Flat Entrance would result in removal of some forested habitat, although development in these areas already displaces a substantial area of potential habitat. The development of employee housing in Wawona would also affect forest habitat.

Overall, the Preferred Alternative would have a minor, beneficial impact on the fringed myotis bat, because a large area of bat foraging habitat would be restored in relation to the upland habitat displaced by new construction. If parking is established at Foresta instead of Hazel Green, a similar amount of foraging habitat would be affected in this location. In either area, development would require hazard tree mitigation, which could affect some bat roost sites and cause minor, adverse effects.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green eco-tourism project (guest rooms, food services, University of California Research Station), the Sierra Nevada Framework for Conservation and Collaboration, Forest Service plans for adjacent wilderness, the Yosemite National Park Fire Management Plan Update, and the *Merced River Wild and Scenic Comprehensive Management Plan/Environmental Impact Statement* could provide benefits to the

size, integrity, and connectivity of suitable habitat for the fringed myotis bat. These actions have the potential to have long-term moderate to major beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation, and the extent of their implementation over time.

Foreseeable projects that could have adverse effects on suitable habitat for fringed myotis bats include the Yosemite View Parcel Land Exchange (NPS), El Portal Road Improvement Project (NPS), Yosemite Motels Expansion (Mariposa Co.), and Evergreen Lodge Expansion (Tuolumne Co.). These projects would primarily affect forest habitat, except for the El Portal Road project, which affects mostly riparian areas.

Overall, there would be a moderate, beneficial cumulative impact on the fringed myotis bat. This is based on the potential protection of suitable habitat resulting from wide-reaching regional plans. The projects with a possible adverse impact on the fringed myotis bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

Long-legged myotis bat (Myotis volans)

Direct and Indirect Effects

This species is found up to high elevations in the Sierra Nevada in montane coniferous habitats. It forages over water, close to trees and cliffs, and in forest openings such as meadows. It roosts primarily in large-diameter snags.

The Preferred Alternative would restore a large tract of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. This would improve foraging and roosting habitat for the long-legged myotis bat.

New construction would take place in suitable habitat for the long-legged myotis bat at the parking site at the Yosemite Village Visitor/Transit Center, the traffic check station near El Capitan crossover, new stables in Foresta, and campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and along Tenaya Creek. Most of this construction would take place in upland habitats. Southside Drive would be widened from El Capitan crossover to Curry Village. This would directly displace habitat and increase the need for hazard tree reduction, slightly reducing the availability of trees for roosting and reproduction. Development of a transit center and parking at Hazel Green, parking and housing at El Portal, and housing at Wawona would affect areas of forest habitat. Possible minor expansion of facilities at South Entrance, Big Oak Flat Entrance, and Tioga Pass would likely result in removal of small areas of forest habitat. If parking is established at Foresta instead of Hazel Green, a similar amount of foraging habitat would be affected in this location. In either area, development would require hazard tree mitigation, which could affect some bat roost sites and cause minor, adverse effects.

Overall, the Preferred Alternative would have a minor, beneficial impact on the long-legged myotis bat from restoration of a large area of potential bat foraging habitat in relation to the new construction that would displace primarily upland habitat.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green Ranch project (guest rooms, food services, University of California research station) the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the long-legged myotis bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

Foreseeable projects that could have adverse effects on suitable habitat for the long-legged myotis bat include the Yosemite View Parcel Land Exchange (NPS), El Portal Road Improvement Project (NPS), Yosemite Motels Expansion (Mariposa Co.), and Evergreen Lodge Expansion (Tuolumne Co.). These projects would primarily affect forest habitat, except for the El Portal Road project, which affects mostly riparian areas.

Overall, there would be a moderate, beneficial cumulative impact on the long-legged myotis bat due to the potential for protection of suitable habitat through implementation of wide-reaching regional plans. The projects with a possible adverse impact on the spotted bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

Yuma myotis bat (Myotis yumanensis)

Direct and Indirect Effects

The Yuma myotis bat is found in a variety of habitats in the Sierra Nevada, but appears to prefer forested areas near open water, where it feeds primarily on emergent aquatic insects.

The Preferred Alternative would restore large areas of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. Restoration of natural river and meadow hydrology would improve quality of foraging habitat for the Yuma myotis bat.

New development that would occur in suitable habitat for the Yuma myotis bat includes the Yosemite Village Visitor/Transit Center, the traffic check station near El Capitan crossover, and campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and north of Tenaya Creek. Development of parking and housing at El Portal, and housing at Wawona and at Huff House near Curry Village could affect Yuma myotis habitat, because these areas are relatively close to water. Other out-of-Valley areas of potential development, such as a transit center and parking at Hazel Green, possible minor expansion of facilities at South Entrance and Big Oak Flat Entrance, and development of stables at Foresta, would be expected to have minimal effect on Yuma myotis bats, because the preferred foraging habitat over open water does not occur near these sites. Likewise, development of parking at Foresta instead of Hazel Green would affect some upland habitat, but not preferred foraging habitat of Yuma myotis bats. In either area, development would require hazard tree mitigation, which could affect some bat roost sites, which would be a minor, adverse effect.

The Yuma myotis is a bat species that commonly uses buildings and bridges for roosting, maternity colonies, and hibernation. Actions that would remove these structures could therefore have a detrimental effect on the species. The buildings and three bridges that would be removed in Yosemite Valley would be surveyed for bats prior to their deconstruction. Should bats be found, deconstruction would not occur during reproduction or hibernation, and bats would be excluded from these structures prior to deconstruction. This would minimize the impact on Yuma myotis bats from these actions.

In total, the Preferred Alternative would have a moderate, beneficial effect on Yuma myotis bats, due primarily to the restoration of large areas of foraging habitat, which is sparse in comparison to the forested habitat that would be adversely affected, but is more abundant.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green Ranch project (guest rooms, food services, University of California research station) the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Yuma myotis bat. These actions have the potential to have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

Foreseeable projects that could have adverse effects on suitable habitat for the Yuma myotis bat include the Yosemite View Parcel Land Exchange (NPS), El Portal Road Improvement Project (NPS), Yosemite Motels Expansion (Mariposa Co.), and Evergreen Lodge Expansion (Tuolumne Co.). These projects would primarily affect forest habitat, except for the El Portal Road project, which affects mostly riparian areas.

Overall, there would be a moderate, beneficial cumulative impact on the Yuma myotis bat due to the potential for protection of suitable habitat from implementation of wide-reaching regional plans. The projects with a possible adverse impact on Yuma myotis bats would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

Greater western mastiff bat (Eumops perotis californicus)

Direct and Indirect Effects

The greater western mastiff bat forages in a variety of suitable habitats in the park where there are rock crevices in cliff faces for roosting and healthy populations of flying insects in adjacent habitats. Trees are also occasionally used for roosting. The greater western mastiff bat is detected most often over meadows and other open areas, but will also feed above the forest canopy.

The Preferred Alternative would restore large areas of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. This would improve foraging habitat for the greater western mastiff bat. This restoration

would also reduce the need for hazard tree removal in the area, which would improve the availability of roosting sites.

New construction would take place in suitable foraging habitat for the greater western mastiff bat at the Yosemite Village Visitor/Transit Center, the traffic check station near El Capitan crossover, new stables in Foresta, and campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and along Tenaya Creek. Most of this construction would take place in upland habitats. Southside Drive would be widened from El Capitan crossover to Curry Village. This would directly displace habitat and increase the need for hazard tree reduction, slightly reducing the availability of trees for roosting and reproduction. These actions would have a minor, direct, adverse effect on bat foraging habitat in upland habitats.

Under this alternative, potential habitat would also be directly impacted by construction of a transit center and parking at Hazel Green. This would be a minor, adverse impact because of the limited area involved, the existing human disturbance in the area, and the large area of suitable, unaffected habitat that would continue to exist in surrounding areas. If parking is established at Foresta instead of Hazel Green, a similar amount of foraging habitat would be affected in this location. In either area, development would require hazard tree mitigation, which could affect some bat roost sites; this would be a negligible, adverse effect, since trees are not the preferred roost sites of mastiff bats.

Development of new housing and parking in El Portal and housing in Wawona could result in a loss of bat foraging habitat, causing a minor, adverse effect.

The Preferred Alternative would not affect rockface habitat in the park. Therefore, primary roosting and breeding habitat would not be affected.

Overall, the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS* would have a moderate, beneficial impact on the greater western mastiff bat, because large areas of mastiff bat foraging habitat in meadows and riparian areas would be restored relative to primarily upland habitat that would be displaced.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green Ranch project (guest rooms, food services, University of California research station) the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could provide benefits to the size, integrity, and connectivity of suitable habitat for the greater western mastiff bat. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

Foreseeable projects that could have adverse effects on suitable habitat for the greater western mastiff bat include the Yosemite View Parcel Land Exchange (NPS), El Portal Road Improvement Project (NPS), Yosemite Motels Expansion (Mariposa Co.), and Evergreen

Lodge Expansion (Tuolumne Co.). These projects would primarily affect forest habitat, except for the El Portal Road project which affects mostly riparian areas.

Overall, there would be a minor, beneficial cumulative impact on the greater western mastiff bat due to the potential for protection of suitable habitat from implementation of wide-reaching regional plans. The projects with a possible adverse impact on the greater western mastiff bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

Sierra Nevada snowshoe hare (Lepus americanus tahoensis)

Direct and Indirect Effects

This species is generally found between 4,500 feet and 8,000 feet (Williams 1986) in a variety of habitats. It prefers montane riparian areas with thickets of deciduous trees such as willow and alder. It also is found in young conifer stands that are interspersed with chaparral (Williams 1986; Zeiner et al. 1990).

Under this alternative, potential snowshoe hare habitat would be directly impacted by construction of parking at Hazel Green, and minor expansion of facilities at Big Oak Flat Entrance and South Entrance. This would be a minor, adverse impact because of the limited area that is impacted, the existing human disturbance in the area, and the large area of suitable habitat that would remain unaffected in surrounding areas. If parking is developed at Foresta instead of Hazel Green, a similar amount of potential habitat would be removed; but would have a negligible effect on snowshoe hares since Foresta is at the lower end of the elevation range for this species and few, if any, snowshoe hare are likely to be present.

There would be potential indirect effects on the snowshoe hares from increased human disturbance at Badger Pass. This indirect impact is expected to be minor and adverse because human use would be restricted in adjacent habitats. Overall, there would be a minor adverse impact on the Sierra Nevada snowshoe hare.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for snowshoe hares. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

A foreseeable project that could have adverse effects on suitable habitat for snowshoe hares includes Evergreen Lodge Expansion (Tuolumne Co.). This project would primarily affect forest habitat.

Overall, there would be a minor, beneficial impact on snowshoe hares due to the potential for protection of suitable habitat from implementation of wide-reaching regional plans. The projects

with a possible adverse impact on snowshoe hares would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

Sierra Nevada mountain beaver (Aplodontia rufa californica)

Direct and Indirect Effects

Increased human use at Badger Pass as a result of new parking facilities in the area would have an adverse effect on the Sierra Nevada mountain beaver through increased foot traffic in meadows and increased vehicle-polluted runoff from paved areas. Under the Preferred Alternative, human use would be restricted from meadow areas, and parking area runoff would be collected for treatment. This would result in long-term, minor, adverse impact on the mountain beaver.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the mountain beaver. These regional plans would have a long-term, moderate, beneficial effect on suitable habitat for the mountain beaver.

Sierra Nevada red fox (Vulpes vulpes necator)

Direct and Indirect Effects

This very rare species is typically found in upland forests above 7,000 feet, but the collection of a pair of red foxes at Big Meadow in Foresta suggests that the species may rarely occur at elevations as low as 4,500 feet. Records indicate, however, that the area around Tioga Pass offers the best habitat.

Given this distribution, the possible minor expansion of facilities at Tioga Pass has the greatest chance of affecting Sierra Nevada red foxes, although such impact would be minor because of the existing level of development and human disturbance in the area, and the expected limited area of expansion. Increased summer use of Badger Pass could affect red foxes by causing increased human disturbance in the area, but such impact would be expected to be minor, given the large area of potential habitat in the area that would remain unaffected. If the low elevation record of this species is taken as a valid reflection of its range, the transit and parking facility at Hazel Green or Foresta and minor expansion of facilities at Big Oak Flat Entrance and South Entrance could affect red foxes; however, the existing development, the expected limited area affected, and the apparent scarcity of the species at these elevations would result in minor, adverse effects.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green Ranch project (guest rooms, food services, University of California research station) the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the

Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for red foxes. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

A foreseeable project that could have adverse effects on suitable habitat for red foxes includes the Evergreen Lodge Expansion (Tuolumne Co.). This project would primarily affect forest habitat.

Overall, there would be a minor beneficial impact on Sierra Nevada red foxes due to the potential for protection of suitable habitat with implementation of wide-reaching regional plans. The projects with a possible adverse impact on red foxes would affect a relatively small area of habitat compared to projects with potential beneficial impact.

California wolverine (Gulo gulo luteus)

Direct and Indirect Effects

Wolverines typically inhabit semi-open terrain at or above the timberline from spring through fall, and then move to lower-elevation forests in winter. They have been seen in a variety of habitats, including treeless barrens, alpine meadows, and mixed coniferous forests (Thelander et al. 1994). The most important habitat characteristic appears to be a low level of human disturbance (Thelander et al. 1994).

Tioga Pass is the only project location likely to contain wolverine habitat. Minor expansion of the existing facilities would remove a small area of potential habitat. Increased human presence in this area could cause greater disturbance, especially since wolverines avoid contact with humans. However, given the existing level of development and disturbance, and the apparent scarcity of wolverines in the Sierra Nevada, development at Tioga Pass would be expected to cause minor, adverse impact to the species.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for wolverines. These actions have the potential for long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen for implementation and the extent of their implementation over time.

Given the high-elevation occurrence of wolverines and their aversion to human contact, no foreseeable projects would have an effect on this species.

Cumulative effects on wolverines would be minor and beneficial due to the potential for protection of habitat through implementation of wide-ranging land management plans.

American pine marten (Martes americana)

Direct and Indirect Effects

The American pine marten is dependent upon dense, complex coniferous forests with large trees and snags. A habitat with structural complexity near the ground appears to be especially important, as it provides cover from predators, foraging areas, and thermal cover during winter. Logging and land management practices that change these forest characteristics would have the most effect on martens.

Under this alternative, a transit center and parking at Hazel Green would cause direct impacts to potential marten habitat. This would be a minor, adverse impact because of the limited area involved, the existing human disturbance in the area, and the large area of suitable, unaffected habitat that would continue to exist in surrounding areas. If parking is developed at Foresta instead of Hazel Green, the resulting effect on martens would be negligible; habitat for martens at Foresta is marginal, because of its relatively low elevation and open canopy from the 1990 A-Rock Fire.

New development in Yosemite Valley would occur primarily in upland, forested habitat, which could have an adverse effect on martens. Such development, however, would occur primarily in east Yosemite Valley, where prior development would continue to affect habitat quality. In west Yosemite Valley, habitats would remain relatively unaffected, and removal of vehicle traffic from Northside Drive between Yosemite Lodge and El Capitan crossover would improve a broad swath of potential marten habitat. However, martens are quite rare in Yosemite Valley, probably because the Valley is much lower in elevation than prime marten habitat. As a result, changes in potential marten habitat in Yosemite Valley (beneficial and adverse) are expected to have a negligible effect on the species in that location.

Minor expansion of facilities at Tioga Pass, Big Oak Flat Entrance Station, and South Entrance would affect small areas of forest habitat and increase human presence in these areas. Increased use of Badger Pass for parking in summer would likewise increase human disturbance in the area. These effects are expected to be minor and adverse because of the limited areas that would be affected, and because human use would be controlled in adjacent habitats.

Overall, impact to marten under the Preferred Alternative would be minor and adverse due to development in various areas outside of Yosemite Valley.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green Ranch project (guest rooms, food services, University of California research station), Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, Orange Crush Fuels Treatment Projects (USFS, Stanislaus), A-Rock Reforestation (USFS, Stanislaus), Rogge-Ackerson Fire Reforestation (Tuolumne Co.), and the Fire Management Action Plan for Wilderness (USFS, Stanislaus) could benefit the martens by preserving forest habitat and hastening the post-fire regrowth of forests.

The Evergreen Lodge Expansion Project is likely to have an adverse effect on marten habitat. However, this project would affect relatively small areas of forest.

Overall, the cumulative impact would be moderate and beneficial as a result of regional plans and projects that could protect and hasten regrowth of forest habitats over wide areas of the Sierra Nevada.

Pacific fisher (Martes pennanti)

Direct and Indirect Effects

Fisher habitat is primarily conifer and mixed conifer forests. Development of a transit and parking facility at Hazel Green would have a minor, adverse effect on fishers, because previous fire and logging have affected the quality of forest habitats in this area. If parking is developed at Foresta instead of Hazel Green, the resulting effect on fishers would be negligible, since a severe fire in 1990 destroyed nearly all forest habitat in Foresta. Because roadway accidents are a major cause of unnatural fisher mortality, a parking facility at Hazel Green could minimize such mortality by reducing the amount of traffic between this location and Yosemite Valley. The area around Crane Flat has been identified as prime fisher habitat (Chow 2000). There would be direct and indirect effects on fishers from minor expansion of facilities at Big Oak Flat Entrance and South Entrance, and from the increased human presence around these areas. Increased summer use of Badger Pass for parking would likewise increase human disturbance in that area. These effects are expected to be minor and adverse because of the limited area of forest habitat involved, and because human use would be controlled in adjacent habitats.

Although fishers are very rare at lower elevations, records indicate that the species could also occur in Yosemite Valley, Wawona, and Foresta. In Yosemite Valley, projects that could adversely affect forest habitats could cause impacts to fishers. Such projects include the traffic check station near El Capitan crossover; campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and north of Tenaya Creek; and relocation of roads out of meadows. These projects would cause minor, adverse effects. However, removal of traffic from Northside Drive, from Yosemite Lodge to El Capitan crossover, could provide minor benefit to fishers by reducing disturbance and the chance of roadway accidents. Development of employee housing at Wawona would affect forest habitat and cause minor, adverse effects on fishers.

Overall, impacts on fishers under the Preferred Alternative would be minor to moderate and adverse.

Cumulative Effects

Regional and parkwide planning efforts such as the Hazel Green Ranch project (guest rooms, food services, University of California research station), Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, Orange Crush Fuels Treatment Projects (USFS, Stanislaus), A-Rock Reforestation (USFS, Stanislaus), Rogge-Ackerson Fire Reforestation (Tuolumne Co.), and the Fire Management Action Plan for Wilderness (USFS, Stanislaus) could provide benefits to the fisher.

The Evergreen Lodge Expansion (Tuolumne Co.) project is likely to have an adverse effect on fisher habitat.

Overall, the cumulative impact would be moderate and beneficial as a result of regional plans and projects that could protect and hasten regrowth of forest habitats over wide areas of the Sierra Nevada. Reforestation projects could hasten the return of forest habitats that are more favorable to the fisher. In comparison, projects with the potential for adverse impacts on martens would affect relatively small areas of forest.

Limestone salamander (Hydromantes brunus)

Direct and Indirect Effects

El Portal falls within the elevation range and habitat type of the limestone salamander, but the nearest documented occurrence of this species is approximately 30 miles west of Yosemite National Park, near Briceburg. The limestone substrate that is characteristic of the habitat of limestone salamanders is scarce in El Portal and would be avoided in development sites. Effects on this species would therefore be negligible.

Cumulative Effects

This species is found in a highly restricted and well-defined range near Briceburg, Mariposa County. Its habitat is protected by the 120-acre Limestone Salamander Ecological Reserve and the Bureau of Land Management's 1,600-acre Limestone Salamander Area of Critical Environmental Concern. Future proposed projects are not likely to impact habitat for the limestone salamander; therefore, cumulative effects on the limestone salamander would be negligible.

Mount Lyell salamander (Hydromantes platycephalus)

Direct and Indirect Effects

The Mount Lyell salamander is found in wet habitats above 4,000 feet and is associated with granite slabs and boulders at the edge of talus slopes (Stebbins 1985). New development proposed in the *Final Yosemite Valley Plan/SEIS* is not expected to take place in suitable habitat for the Mount Lyell salamander. Removal of housing from the Terrace at Curry Village could have a minor, beneficial effect on potential habitat for the species. Although records are lacking for the occurrence of Mount Lyell salamanders at Tioga Pass, suitable rocky habitat appears to occur on the surrounding ridges and mountains. The limited size of any further development at Tioga Pass, and its distance from likely Mount Lyell salamander habitat, indicate that effects on this species would be negligible.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat

for the Mount Lyell salamander. These actions could have long-term, minor, beneficial effects on suitable habitat, depending upon the alternatives chosen and the extent of their implementation over time. No foreseeable projects are expected to have an adverse effect on Mount Lyell salamanders.

Yosemite toad (Bufo canorus)

Direct and Indirect Effects

Any future new parking facilities at Tioga Pass could have an adverse effect on Yosemite toads through a direct loss of habitat. The extent of habitat loss at this time is uncertain, but in the event of development at Tioga Pass additional evaluation and compliance would be required to address potential effects on the Yosemite toad.

Increased human use at Tioga Pass could increase foot traffic in meadows and vehicle-polluted runoff from paved areas. Under the Preferred Alternative, human use would be controlled in meadow areas, and parking area runoff would be collected for treatment. This would result in negligible effects on the Yosemite toad at Tioga Pass. Surveys at Badger Pass did not detect Yosemite toads, but the species occurs in nearby meadows. It is possible that activities associated with winter use of the ski area (e.g., movement and compaction of snow) have reduced habitat quality at Badger Pass for Yosemite toads. The lack of detections at this location, combined with control of human use and polluted runoff, would result in negligible effects on Yosemite toads.

The Yosemite toad is regarded as a high-elevation species. There is a single historic record of this species in Yosemite Valley that places it approximately 2,500 feet below its usual range. It is unlikely that this record reflects the sustainable range of Yosemite toads. Meadow restoration in Yosemite Valley would have a negligible benefit to Yosemite toads.

Overall, effect of the Preferred Alternative on Yosemite toads is expected to be negligible.

Cumulative Effects

Projects that have an appreciable effect on high-elevation meadow habitats are most likely to affect the Yosemite toad. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Yosemite toad. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen, and the extent of their implementation over time.

Projects that could have a potentially adverse effect on the Yosemite toad include the Tioga Inn, Lee Vining (Mono Co.); Highlands, June Lake (Mono Co.); and the Double Eagle Resort Construction at June Lake (Mono Co.), though the presence of the Yosemite toad in these areas is unconfirmed.

Overall, cumulative impacts would be moderate and beneficial, based primarily on the potential for the protection of habitat and populations that would result from implementation of regional

and parkwide plans that would affect high-elevation areas. Adverse impacts would affect relatively small areas where the presence of the Yosemite toad is uncertain.

Foothill yellow-legged frog (Rana boylei)

Direct and Indirect Effects

This species has virtually disappeared from its range in the Sierra Nevada from unknown causes. However, projects that affect suitable habitat (e.g., wet meadows and rocky streams) may affect reintroduction and/or recolonization of this species. Suitable habitat for this species occurs in Yosemite Valley, Foresta, Wawona, and El Portal.

The Preferred Alternative in the *Final Yosemite Valley Plan/SEIS* would restore a large tract of previously disturbed meadow and riparian habitat in the east end of Yosemite Valley, totaling at least 135 acres. This would be potential habitat for the foothill yellow-legged frog, provided that the non-native bullfrog population is removed. The Preferred Alternative would also establish the River Protection Overlay, which would offer increased protection to areas adjacent to the Merced River. These actions under the Preferred Alternative would maintain and restore riparian microhabitats and microclimates; riparian and aquatic vegetation; appropriate sediment input levels during breeding season; surface and subsurface hydrologic processes; the structural integrity of stream breeding habitats; and the connectivity of riparian habitats.

The Preferred Alternative would support the recruitment of large woody debris into riparian areas and allow a shifting mosaic of habitats. The actions under this alternative would have a moderate, beneficial impact on potential habitat for the species.

Construction of the Yosemite Village Visitor/Transit Center could affect riparian and meadow habitat, which could provide suitable habitat for this species. This habitat loss would be minor because of the small size of the impact area in relation to habitat that would be restored. If parking is developed at Foresta, effects on potential foothill yellow-legged frog habitat would be negligible, since such development would be confined to upland areas.

Development of housing and parking in El Portal and housing in Wawona is expected to have a negligible effect on foothill yellow-legged frogs, because the development would not occur in habitat suitable for the species. Given that the foothill yellow-legged frog is no longer known to occur within the project area, but that there would be a relatively large amount of restoration of suitable habitat, the *Final Yosemite Valley Plan/SEIS* would have an overall minor to moderate, beneficial effect on the foothill yellow-legged frog.

Cumulative Effects

The impact on the foothill yellow-legged frog is similar to that on the California red-legged frog; because this species is virtually extinct in the Sierra Nevada, projects in its area of former occurrence would not affect any existing populations. However, projects that impact suitable habitat (e.g., wet meadows and rocky streams) may affect reintroduction and/or recolonization of this species.

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the foothill yellow-legged frog. These actions could have long-term, moderate to major, beneficial effects on suitable habitat, depending upon the alternatives chosen, and the extent of their implementation over time. Foreseeable projects that could have adverse effects on suitable habitat for the foothill yellow-legged frog include the Rio Mesa Area Plan (Madera Co.); University of California, Merced Campus (Merced Co.); and the City of Merced General Plan.

Overall, the cumulative impact would be beneficial due to the potential for protection of foothill yellow-legged frog habitat through implementation of plans that cover wide areas of the Sierra Nevada. Intensity would be minor, as this species is almost extinct from the Sierra Nevada region, but habitat would be protected for potential reintroduction or recolonization of the species. Projects with a possible negative impact on foothill yellow-legged frogs would affect a relatively small area of habitat compared to projects with potential beneficial impacts. These projects could have a major, negative impact if they affected an unknown population of foothill yellow-legged frogs, which could be among the last in the Sierra Nevada. However, site surveys would be completed in compliance with state and federal regulations to ensure that populations are known and avoided.

Mountain yellow-legged frog (Rana muscosa)

Direct and Indirect Effects

Mountain yellow-legged frog habitat occurs from 4,500 feet to over 12,000 feet in elevation in streams, lakes, and ponds in a variety of vegetation types. The species is known to occur in lakes and ponds at Tioga Pass and has been found in meadows near Badger Pass. Recent surveys at Badger Pass did not indicate the presence of mountain yellow-legged frogs in this location, although suitable habitat appears to be available.

Increased human use at Tioga Pass and Badger Pass as a result of new parking facilities in the area could have an indirect, adverse effect on the mountain yellow-legged frog through increased foot traffic in meadows and increased vehicle-polluted runoff from paved areas. Under the Preferred Alternative, human use would be restricted from meadow areas, and parking area runoff would be collected for treatment. An increase in the presence of ravens could arise from expanded human use in these areas. Ravens are known to prey on adult frogs. Thorough trash collection and maintenance of these proposed new facilities would be performed on a regular basis. Overall, there would be negligible effects on the mountain yellow-legged frog.

Cumulative Effects

The foreseeable projects that would have beneficial impact to the mountain yellow-legged frog include the Fire Management Plan Update (NPS), the Sierra Nevada Framework for Conservation and Collaboration (USFS), and the Fire Management Action Plan for Wilderness (USFS, Stanislaus).

Overall, the cumulative impact would be long-term, moderate, and beneficial due to the amount of habitat and number of populations that would be affected by the wide-reaching regional plans.

Northwestern pond turtle (Clemmys marmorata marmorata) and Southwestern pond turtle (Clemmys marmorata pallida)

Direct and Indirect Effects

The increased protection that would occur under the River Protection Overlay and restoration of aquatic and riparian habitat in Yosemite Valley would generally maintain the quality of turtle habitat and enhance shading, water quality, root strength, input of large and small woody debris, and input of organic matter to the river ecosystem. These are important components of western pond turtle habitat. This would constitute a long-term, moderate, beneficial effect on the western pond turtle.

Construction of the Yosemite Village Visitor/Transit Center could directly impact existing riparian habitat. The increased human population in El Portal could result in additional foot traffic and possible trampling of habitat for this species. Because western pond turtles are also dependent upon upland areas for hibernation and nesting, actions such as increased development in El Portal, construction of the Yosemite Village Visitor/Transit Center, and construction of new campsites could have a minor, adverse effect on this species. These habitat losses would have a minor adverse impact on western pond turtles because of the small size of the areas affected. If parking is developed in Foresta, there would be a negligible effect on western pond turtles, because such development would occur outside of the potential habitat for this species (Crane Creek).

Overall, the effect on western pond turtles would be minor and beneficial due to restoration and protection of suitable habitat in Yosemite Valley.

Cumulative Effects

Cumulative effects that could provide large-scale benefits to western pond turtle habitat include regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and the Merced Wild and Scenic River Comprehensive Management Plan (NPS). The Yosemite View Parcel Land Exchange (NPS) would directly remove suitable habitat for the western pond turtle. Overall, there would be a minor beneficial effect on the western pond turtle. This benefit would largely derive from implementation of regional and parkwide planning that would protect turtle habitat.

Merced Canyon shoulderband snail (Helminthoglypta allynsmithi)

Direct and Indirect Effects

This species is a land snail (as opposed to aquatic); thus, development in El Portal that would remove or alter talus could potentially affect habitat quality. However, no such development in El Portal would occur to implement actions in the *Final Yosemite Valley Plan/SEIS*. Therefore, there would be no effects on likely habitat for the Merced Canyon shoulderband snail.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and U.S. Forest Service plans for adjacent wilderness could improve the size, integrity, and connectivity of suitable habitat for the Merced Canyon shoulderband snail. These actions could have long-term, minor, beneficial effects on suitable habitat, though the proposed management direction has not been finalized.

Overall, there would be a minor, beneficial cumulative impact on the Merced Canyon shoulderband snail, due to the potential for protection of suitable habitat from wide-reaching regional plans.

Mariposa sideband snail (Monadenia hillebrandi)

Direct and Indirect Effects

The removal of housing from the Terrace at Curry Village could restore potential habitat for the Mariposa sideband snail. This would be a long-term, moderate, beneficial impact. There are no expected adverse effects on the Mariposa sideband snail.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and U.S. Forest Service plans for adjacent wilderness could improve the size, integrity, and connectivity of suitable habitat for the Mariposa sideband snail. These actions could have long-term, minor, beneficial effects on suitable habitat, although chosen alternatives and the chronology of their implementation have yet to be finalized.

Overall, there would be a minor, beneficial impact on the Mariposa sideband snail due to the potential for protection of suitable habitat from wide-reaching regional plans.

Sierra pygmy grasshopper (Tetrix sierrana)

Direct and Indirect Effects

The Sierra pygmy grasshopper has been found in El Portal. Suitable habitat for the Sierra pygmy grasshopper exists in El Portal, Yosemite Valley, and Wawona. Because this species favors riparian areas, restoration of riparian habitat and the establishment of the River Protection Overlay in Yosemite Valley, El Portal, and Wawona would have a beneficial effect on suitable habitat for the grasshopper. These benefits are tempered by the loss of suitable habitat at the Yosemite Village Visitor/Transit Center. In El Portal, suitable habitat would be displaced at Hillside East, Hillside West, Rancheria Flat, and Middle Road. Minor expansion of facilities at the South Entrance would have a negligible effect on the Sierra pygmy grasshopper, due to the expected small size of the affected area and the lack of riparian habitat in the area. The increased human population in El Portal could promote additional foot traffic and possible trampling of habitat for this species. This would be a long-term, minor, adverse effect. Overall, the Preferred Alternative could have a long-term, negligible to minor, adverse effect on suitable habitat for the Sierra pygmy grasshopper.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Sierra pygmy grasshopper. These actions could have long-term, minor, beneficial effects on suitable habitat, though the proposed management direction from these plans has not been finalized.

Wawona riffle beetle (Atractelmis wawona)

Direct and Indirect Effects

Because the Wawona riffle beetle spends most of its lifecycle in rapid streams from 2,000 to 5,000 feet in elevation, the increased protection afforded by the River Protection Overlay and restoration of riparian and aquatic habitat (about 100 acres) would protect Wawona riffle beetle habitat. These actions would generally maintain the quality of Wawona riffle beetle habitat and enhance shading, water quality, root strength of riparian vegetation, input of large and small woody debris, and input of organic matter (USFS 1994a). Construction of the Yosemite Village Visitor/Transit Center could have direct impacts to riparian habitat. Potential development in Wawona and El Portal is expected to have a negligible impact on Wawona riffle beetles, because riparian and river habitats would not be affected. Overall, there would be a long-term, moderate, beneficial effect on Wawona riffle beetle habitat due to the large amount of restored habitat in relation to habitat that would be impacted.

Cumulative Effects

Cumulative effects that could have large-scale benefits to riffle beetle habitat include regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and the Merced Wild and Scenic River Comprehensive Management Plan (NPS). The Yosemite View Parcel Land Exchange (NPS) would directly remove suitable habitat for the riffle beetle. Overall, there would be a minor, beneficial effect, due largely to regional and parkwide planning that would protect habitat for the riffle beetle.

Bohart's blue butterfly (Philotiella speciosa bohartorum)

Direct and Indirect Effects

Though the presence or absence of the Bohart's blue butterfly has not been verified in El Portal, apparently suitable habitat may be found in this location. The construction of new housing at Hillside East and West and Rancheria Flat, and the construction of parking at Middle Road could directly remove suitable habitat. The increased human population in El Portal could promote additional foot traffic and possible trampling of habitat for this species. These actions could have a long-term, minor, adverse effect on the Bohart's blue butterfly.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and U.S. Forest Service plans for adjacent wilderness could improve the size, integrity, and connectivity of suitable habitat for the Bohart's blue butterfly. These actions could have long-term, minor, beneficial effects on suitable habitat, though the proposed management direction from these plans has not been finalized.

P L A N T S

Tiehm's rock cress (Arabis tiehmii)

Direct and Indirect Effects

Tiehm's rock cress is found on granitic soils in alpine fell-fields on the slopes of Mt. Dana above Tioga Pass. There would be no direct impact on this species. Future development and increased facilities at Tioga Pass could result in indirect effects from increased visitor use. A new or expanded entrance station at Tioga Pass could encourage more day use and associated foot traffic in the area as well as increased hiking on Mt. Dana. The popular hike to the top of Mt. Dana is a cross-country path, without a formal route. Increased use on this route could have a long-term, moderate, adverse impact on Tiehm's rock cress.

Cumulative effects

There would be no direct effects on the species as a result of potential cumulative projects. Regional and parkwide planning efforts, such as the Sierra Nevada Framework for Conservation and Collaboration (USFS) and U.S. Forest Service plans for adjacent wilderness, could provide added protection to potential habitat for Tiehm's rock cress.

Congdon's lomatium (Lomatium congdonii)

Direct and Indirect Effects

Habitat for this species occurs in portions of the Merced River gorge and in the El Portal area. There would be no direct effects on this species. There would be negligible, indirect effects from an increased population in El Portal, as the plant is isolated on inaccessible, steep, north-facing slopes south of the river.

Cumulative Effects

There would be no direct impacts on the species as a result of potential cumulative projects.

Slender-stemmed (Hetch Hetchy) monkeyflower (Mimulus filicaulis)

Direct and Indirect Effects

This species could be directly impacted by development of a transit and parking facility at Hazel Green. Plants could also be affected by picnicking and trampling as a result of random use of

sites adjacent to parking and proposed lodging. This would result in a minor, adverse impact on this species.

Cumulative Effects

There could be a minor impact on the slender-stemmed monkeyflower from the Hazel Green Ranch project (guest rooms, food services, University of California research station). Plants could also be affected by picnicking and trampling due to random use of areas adjacent to the site. This would result in a minor, adverse impact on this species.

Bolander's clover (Trifolium bolanderi)

Direct and Indirect Effects

There would be no direct effects on this species.

Summer use of the Badger Pass area would increase as a result of use of the Badger Pass facility as a parking/transit area. This could encourage foot traffic into Bolander's clover habitat in neighboring meadows. Ratliff and Denton (1993) concluded that Bolander's clover occurs under varied environmental situations within the meadow environment. Where other environmental minimums are met, soil water is the most important variable in controlling the distribution of Bolander's clover (Ratliff and Harding 1993). Therefore, to protect the Bolander's clover, it is most important to preserve the meadow system as a whole, in particular, the consistency of water availability and dispersal throughout the meadow (Allen-Diaz 1991).

The design of the site as out-of-Valley parking would emphasize rapid transport of visitors to and from their vehicles, minimizing effects to neighboring meadows. These indirect effects are not expected to change the consistency of water availability and dispersal in neighboring meadows. Therefore, there would be a negligible adverse impact on Bolander's clover.

Cumulative Effects

There would be no direct impacts on the species as a result of potential cumulative projects. Regional and parkwide planning efforts, such as the Sierra Nevada Framework for Conservation and Collaboration, U.S. Forest Service plans for adjacent wilderness, and the Fire Management Plan Update, could provide added protection to potential habitat for the Bolander's clover.

California State Endangered Species

W I L D L I F E

American peregrine falcon (Falco peregrinus anatum)

Direct and Indirect Effects

The Preferred Alternative would restore a large tract of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. This would have a moderate, beneficial impact on potential foraging habitat for the peregrine falcon. In the west end of Yosemite Valley, construction of a traffic check station on

Southside Drive near El Capitan crossover could have a short-term, moderate, adverse impact during periods of construction. Construction would not take place when the peregrine falcon is nesting or foraging in the vicinity of Cathedral Rocks. Development in forested habitats in Yosemite Valley and Wawona would have a negligible effect on peregrine falcons because this habitat type is abundant in these locations, and the falcon prefers to hunt in open areas such as along cliff faces and over meadows and water. Overall, there would be a long-term, moderate, beneficial effect on the American peregrine falcon as a result of habitat restoration in Yosemite Valley under the Preferred Alternative.

Cumulative Effects

No cumulative actions are expected to have an impact on peregrine falcons. Overall, there would be a minor, beneficial effect due primarily to actions proposed in the *Final Yosemite Valley Plan/SEIS*. These actions would help return a diversity of habitats to Yosemite Valley over which the peregrine falcon hunts.

Great gray owl (Strix nebulosa)

Direct and Indirect Effects

The great gray owl is known to nest in the Crane Flat area, meadows near the Glacier Point Road, and near Hodgdon Meadow. The species also uses meadows in Foresta and Wawona as wintering and staging areas. Habitat suitable for wintering and staging great gray owls appears to occur in Yosemite Valley, but records of the species in this location are rare.

The restoration of meadows and riparian habitat in Yosemite Valley could increase the size, integrity, and continuity of important habitat for this species. Research suggests that great gray owls are sensitive to human disturbance (Wildman 1992), which may explain its rarity in Yosemite Valley. Vehicles and human use would be reduced in the restored habitat in Yosemite Valley, which could provide a long-term, moderate, beneficial effect on the great gray owl, but it is unknown whether such improvements would be adequate to allow the return of this species.

The overall impact of new parking at Badger Pass in the summer would be minor and adverse, given that great gray owls are not known to forage at Badger Pass, although the species is known to use neighboring meadows. Visitor use would be controlled in other meadow areas, including Hodgdon Meadow near the Big Oak Flat Entrance where increased human presence is expected, to limit the effect on great gray owls.

Construction of stables at McCauley Meadow near Foresta could impact great gray owls. McCauley Meadow is occasionally used by juvenile males driven out of primary meadows by dominant males, or as a transition meadow when there is a large snow pack in primary meadows. It is not used for nesting. Because McCauley Meadow is not nesting habitat, and rarely used by great gray owls, there would be a minor, adverse effect on great gray owls.

The development of a transit center and parking facility at Hazel Green would occur adjacent to but not within meadow habitat. Past studies and recent surveys at Hazel Green Ranch did not confirm use of meadows in this area by great gray owls; however, based upon their size and

elevation, the meadows have been identified as potential habitat for this species (Skenfield 1999). Increased human presence in this area could affect its use by great gray owls through increased disturbance of its habitat, resulting in minor, adverse effects. If parking is developed at Foresta instead of Hazel Green, human disturbance in adjacent areas would increase. This facility and the McCauley Ranch stables would be used primarily during periods when great gray owls are in nesting areas at higher elevations. Effects on great gray owls would therefore be moderate and adverse.

Overall, the effects of the Preferred Alternative on great gray owls would be minor and adverse for effects on the limited number of owls that use the McCauley Ranch area. Also, human disturbance could increase at Badger Pass, Hazel Green or Foresta, and Hodgdon Meadow (near Big Oak Flat Entrance), possibly affecting the owl.

Cumulative Effects

Nearly the entire California population of great gray owls breeds in the Yosemite National Park region, where habitats are relatively intact. The Hazel Green Ranch project (guest rooms, food services, University of California research station), because of its meadow habitats and proximity to the park, has the greatest potential to affect the great gray owl. Past and recent surveys, however, indicate the meadows are seldom used by great gray owls, and then probably by transient owls moving between wintering and nesting areas (Skiff 1995; Skenfield 1999). Development at Hazel Green would likely not occur in meadow habitats, but increased human disturbance in the area could deter owls from using these areas, resulting in minor, adverse effects. Habitats at other cumulative project sites are unsuitable for great gray owls, or previous effects at these sites have rendered habitats unsuitable. Therefore, no reasonably foreseeable development projects are expected to have an adverse effect on great gray owls.

Projects that could have a beneficial effect on the species by preserving or restoring habitat include the Sierra Nevada Framework for Conservation and Collaboration (USFS), Fire Management Plan Update (NPS), Merced Wild and Scenic River Comprehensive Management Plan (NPS), and the Fire Management Action Plan for Wilderness. In total, these actions would result in moderate, beneficial impacts on great gray owls.

In total, cumulative impacts on great gray owls would be moderate and beneficial due to implementation of land management plans that would have wide-ranging effects in preserving and restoring forest and meadow habitats. The Hazel Green Ranch project, in comparison, would affect an area of potential habitat that is probably used only transiently by migrating owls.

Willow flycatcher (Empidonax traillii)

Direct and Indirect Effects

Willow flycatchers have not been observed in Yosemite Valley for over 30 years. The species is typically found in meadows with a lush growth of willow shrubs. Threats to this species include habitat destruction, grazing, and nest parasitism by brown-headed cowbirds. Riparian and meadow restoration within Yosemite Valley would increase the size, integrity, and connectivity of potential habitat for this species and increase the chances for its recolonization. These effects

would be enhanced by the reduction in stable operations in Yosemite Valley, thus reducing cowbird abundance. Control of cowbird numbers in and near the relocated concession stables in Yosemite Valley would further reduce cowbird parasitism.

The development of new stables at McCauley Meadow in Foresta could increase the local abundance of cowbirds, which could affect willow flycatchers in this area. Mitigation of this impact could include trapping of cowbirds and use of processed feeds, which would limit the impact to minor and adverse. Increased development at Wawona and the Big Oak Flat Entrance would have a negligible effect on willow flycatchers in these areas, because these actions are not expected to affect meadow habitat. Development of parking at Hazel Green could cause increased human disturbance of adjacent meadows. Recent surveys, however, indicate that no willow flycatchers exist in this area, probably because the meadows lack thick willow growth necessary for nesting (Skenfield 1999). Therefore, the impact would be negligible.

There would be an overall minor to moderate, beneficial effect on the willow flycatcher due to the large amount of suitable habitat that would be restored in Yosemite Valley and the removal of National Park Service and concessioner administrative stables from Yosemite Valley. These would be reduced to minor benefits by the development of a new stable at McCauley Ranch, which could increase local cowbird populations.

Cumulative Effects

Projects that would cause degradation of meadow habitat or increased abundance of brown-headed cowbirds would adversely affect willow flycatchers through respective habitat loss and nest parasitism. The site of the Hazel Green Ranch project contains meadows that could be directly or indirectly affected. No willow flycatchers were found in this location during recent surveys, and habitat in the meadows appears to be unsuitable for the species.

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the willow flycatcher. Implementation of these plans could help restore habitats, control the effects of grazing, and reduce cowbird abundance by reducing fragmentation of forest communities. Overall, the cumulative impact on willow flycatchers would be minor and beneficial.

California State Threatened Species

W I L D L I F E

Sierra Nevada red fox (see Federal Species of Concern section)

California wolverine (see Federal Species of Concern section)

California State Rare Species

P L A N T S

Yosemite onion (Allium yosemitense)

Direct and Indirect Effects

The Yosemite onion is found in the vicinity of El Portal and Wawona on steep slopes that are generally inaccessible to casual visitation. Direct effects would not occur as a result of implementation of the Preferred Alternative. Increased residential populations in Wawona and El Portal could result in increased foot traffic and minor, adverse effects on the Yosemite onion.

Cumulative Effects

There would be no direct impact on the species as a result of potential cumulative projects. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could provide added protection to potential habitat for the Yosemite onion.

Tompkin's sedge (Carex tompkinsii)

Direct and Indirect Effects

Tompkin's sedge is found sporadically, from above Arch Rock Entrance Station to El Portal. Construction in the El Portal area at Middle Road, Rancheria Flat, Merced Flat Trailer Village, Hillside West, Hillside East, and the levee adjacent to Hennessey's Ranch (currently Trailer Village and Abbieville) would result in the direct removal of Tompkin's sedge. Continued and increased use of the El Portal area and road corridors could result in indirect, adverse effects on this species through the introduction and establishment of non-native species that may out-compete Tompkin's sedge. Overall, these effects on the species would be moderate and adverse.

Cumulative Effect

The Yosemite View Parcel Land Exchange could result in the direct removal of Tompkin's sedge. Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could provide added protection to potential habitat for Tompkin's sedge. Overall, these cumulative projects would have a minor, adverse effect on Tompkin's sedge.

Congdon's woolly-sunflower (Eriophyllum congdonii)

Direct and Indirect Effects

Habitat for Congdon's woolly-sunflower occurs throughout the Merced River gorge, El Portal, and lower portions of the South Fork of the Merced River. There would be no direct effects on

Congdon's woolly-sunflower as a result of the *Final Yosemite Valley Plan/SEIS*. Continued and increased use of the El Portal area could result in indirect, adverse effects to this species as a result of increased population and associated foot traffic in El Portal. Non-native species could be introduced and become established in newly developed areas and spread into Congdon's woolly-sunflower habitat. These indirect effects would have a long-term, minor, adverse impact on the species.

Cumulative Effects

Cumulative projects considered in relation to the *Final Yosemite Valley Plan/SEIS* would not affect Congdon's woolly-sunflower. Therefore, cumulative effects would be negligible.

Congdon's lewisia (Lewisia congdonii)

Direct and Indirect Effects

This species is known from the lower portion of the South Fork of the Merced River, El Portal, and through portions of the Merced River gorge. Continued and increased use of the El Portal area could result in indirect, adverse effects to this species through introduction and establishment of non-native species that could out-compete Congdon's lewisia, and through additional foot traffic that could result from an increased residential population. Most Congdon's lewisia plants are found in relatively inaccessible areas that have steep slopes and poison oak. Potential adverse effects on the species would be minor.

Cumulative Effects

Cumulative projects considered in relation to the *Final Yosemite Valley Plan/SEIS* would not affect Congdon's lewisia. Therefore, cumulative effects would be negligible.

California State Species of Special Concern

W I L D L I F E

Coopers's hawk (Accipiter cooperi)

Direct and Indirect Effects

The Cooper's hawk is found in wooded areas up to 9,000 feet in the Sierra Nevada. It frequently hunts along wooded edges.

The Preferred Alternative would restore a large tract of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. This would improve hunting habitat for the Cooper's hawk.

New construction would take place at the visitor/transit center at Yosemite Village, the traffic check station near El Capitan crossover, new stables in Foresta, and campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and north of Tenaya Creek. Roads would be moved out of meadows and into upland habitats, and Southside Drive would be widened from El Capitan crossover to Curry Village. These actions would directly

displace wooded habitat in Yosemite Valley. In Yosemite Valley, there would be an overall minor, beneficial impact on the Cooper's hawk, because a relatively large area of suitable habitat would be restored in relation to the habitat that would be removed.

Potential habitat would also be directly impacted by construction of a transit center and parking at Hazel Green. This would cause a minor, adverse impact because of the limited area that would be involved, the existing human disturbance in the area, and the large area of suitable, unaffected habitat that would continue to exist in surrounding areas. If parking is established at Foresta instead of Hazel Green, effects on Cooper's hawks would be negligible, since most of the forest in this location was destroyed by recent fire making the habitat marginal for the species.

In El Portal, development of parking and housing could result in a loss of forest habitat, but existing high levels of development in this area have likely already affected the quality of Cooper's hawk habitat.

Development of housing in Wawona would result in the removal of some forested habitat, which could adversely affect Cooper's hawks, but the limited size of this area, the existing level of development, and the presence of large amounts of suitable habitat in the surrounding areas would limit this impact to minor. Minor expansion of facilities at Big Oak Flat Entrance and South Entrance would have a negligible effect on Cooper's hawks, for the same reasons listed for Wawona. Increased visitor use of Badger Pass in summer would have a negligible effect on Cooper's hawks, because no new effects to habitat would occur.

The overall, long-term effect on the Cooper's hawk under the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS* would be minor and beneficial, because a large tract of suitable habitat would be restored in relation to suitable habitat that would be displaced by new development.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Cooper's hawk. These regional plans would have a long-term moderate, beneficial, effect on the Cooper's hawk. Foreseeable projects that could have adverse effects on suitable habitat for the Cooper's hawk include the Hazel Green Ranch project (guest rooms, food services, University of California research station), Yosemite View Parcel Land Exchange, Yosemite Motels Expansion, the El Portal Road Improvement project, and the Evergreen Lodge Expansion.

Overall, cumulative impacts on Cooper's hawks would be moderate and beneficial, due primarily to implementation of wide-ranging plans that would protect large areas of the Sierra Nevada, compared to localized adverse effects on relatively small areas from individual projects.

Northern goshawk (see Federal Species of Concern section)

Sharp-shinned hawk (Accipiter striatus)

Direct and Indirect Effects

Sharp-shinned hawks are rarely but regularly seen in Yosemite Valley, usually in the fall and early spring as they move between wintering and breeding areas. Only one nesting record exists for the park, from Yosemite Valley in 1930. It is possible that increasing human disturbance has affected the quality of Valley habitats to sharp-shinned hawks. Restoration of about 160 acres of previously disturbed meadow, riparian, and oak woodland habitats would improve overall habitat quality for sharp-shinned hawks. If human disturbance has been a factor in use of Yosemite Valley by sharp-shinned hawks, then removal of vehicle traffic from Northside Drive, from Yosemite Lodge to El Capitan crossover could improve habitat quality over a wide area of the Valley. These actions would result in overall moderate, beneficial effects on sharp-shinned hawks.

Under the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS*, potential habitat would be directly impacted by transit center and parking construction at Hazel Green. This would be a minor, adverse impact because of the limited area involved, the existing human disturbance in the area, and the large area of suitable, unaffected habitat that would continue to exist in surrounding areas. Minor expansion of facilities at Big Oak Flat Entrance and South Entrance would affect small areas of forest habitat, but the existing level of development and human disturbance, and the large area of suitable habitat that would remain unaffected in the surrounding areas, would limit the impacts in these locations to minor and adverse. Increased visitor use at Badger Pass in summer could cause increased human disturbance to surrounding areas, but such effects on sharp-shinned hawks are expected to be negligible.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve to the size, integrity, and connectivity of suitable habitat for the sharp-shinned hawk. These regional plans would have a long-term, moderate, beneficial effect on the sharp-shinned hawk.

Foreseeable projects that could have adverse effects on suitable habitat for the sharp-shinned hawk includes the Hazel Green Ranch project (guest rooms, food services, University of California research station), Yosemite View Parcel Land Exchange, Yosemite Motels Expansion, the El Portal Road Improvement projects, and the Evergreen Lodge Expansion.

Overall, cumulative impacts on sharp-shinned hawks would be moderate and beneficial, due primarily to implementation of wide-ranging plans that would protect large areas of the Sierra Nevada, compared to localized adverse effects on relatively small areas from individual projects.

Prairie falcon (Falco mexicanus)

Direct and Indirect Effects

Open areas such as meadows and grasslands are favored by prairie falcons for hunting, and cliff faces are used for nest sites. Actions that affect these habitats would therefore have the most effect on this species.

Restoration of meadow habitats in Yosemite Valley would benefit prairie falcons, but such benefit would be limited to minor, in light of the rarity of this species in the Valley (territorial peregrine falcons may be limiting use). The relocation of stables to McCauley Ranch could affect the quality of that habitat to prairie falcons, but the affected area would be relatively small, given the adjacent large meadow and the area opened by the A-Rock Fire. Minor expansion of facilities at Tioga Pass is expected to avoid meadows. Overall, impacts on prairie falcons under the Preferred Alternative would be minor and beneficial, primarily due to restoration of habitats in Yosemite Valley.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced River Wild and Scenic Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the prairie falcon. These actions could have long-term, moderate to major, beneficial effects on prairie falcon habitat, depending upon the alternatives chosen and the extent of their implementation over time.

Foreseeable projects that could have an adverse effect on prairie falcons include the Rio Mesa Area Plan; University of California, Merced campus; City of Merced General Plan; and Tioga Inn, Lee Vining. These cumulative projects would have a minor, adverse impact on prairie falcons, because of the limited area they would affect.

Overall, cumulative effects on prairie falcons would be minor and beneficial, due primarily to the protection of habitat provided by implementation of wide-ranging land management plans that would cover large areas of the Sierra Nevada; there would be a limited area of effect for those projects that have an adverse impact on prairie falcons.

Golden eagle (Aquila chrysaetos)

Direct Effects

Although golden eagles have been seen over most of the park, the areas of potential development under the Preferred Alternative that contain the most suitable habitat include El Portal, Yosemite Valley, Foresta, and Tioga Pass. The following are assessments of potential effects to golden eagles in these locations:

El Portal – Development of housing, parking, and operations in this location would primarily affect wooded areas near the bottom of the Merced River canyon, which is not preferred

golden eagle habitat. Most development would occur in or adjacent to areas with existing or previous development. These factors, coupled with the abundance of golden eagle habitat at higher elevations in the canyon, indicate that the impact on golden eagles under this alternative would be negligible.

Yosemite Valley – Restoration of meadow and riparian habitats would improve habitat quality for golden eagles under the Preferred Alternative. Even with this restoration, however, the terrain of Yosemite Valley would be marginal habitat for golden eagles, compared to other areas in the park (e.g., Merced River canyon, Foresta). Effects in Yosemite Valley would be minor and beneficial.

Foresta – Development of stables at McCauley Ranch, and, if decided, development of parking in Foresta would cause adverse effects to forest and meadow habitats. However, the area of such impact in relation to the range of a golden eagle is small. Such impact is also offset by the large area of open terrain suitable for golden eagles that was created by the 1990 A-Rock Fire. The combination of these factors indicates that actions under the Preferred Alternative would be negligible.

Tioga Pass – Development of expanded visitor facilities at the Tioga Pass Entrance Station could affect adjacent meadow and lodgepole pine habitats. The area of such impact, however, would be small relative to the range of a golden eagle, and abundant open terrain in the surrounding area would remain unaffected. These factors, combined with the seasonal use of this area by golden eagles, indicate that impact on this species would be negligible at Tioga Pass under this alternative.

Overall, effects of the Preferred Alternative on golden eagles would be minor and beneficial, due primarily to restoration of habitats in Yosemite Valley.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for golden eagles. These regional plans would have a long-term, moderate, beneficial effect on golden eagles.

Foreseeable projects that could have an adverse effect on golden eagles include the Rio Mesa Area Plan; University of California, Merced campus; City of Merced General Plan; and Tioga Inn, Lee Vining. These projects, in total, would have a minor, adverse effect on golden eagles, because of the limited area they would affect.

Overall, cumulative effects on golden eagles would be minor and beneficial, due primarily to the protection of habitat provided by implementation of wide-ranging land management plans that would cover large areas of the Sierra Nevada. There would be a limited area of effect for those projects that have an adverse impact on golden eagles.

Merlin (Falco columbarius)

Direct and Indirect Effects

Actions that would occur below 4,000 feet elevation — the primary range of merlins in California — would be most likely to affect the species. Under the Preferred Alternative, this includes the following locations:

Yosemite Valley – Restoration of meadow and riparian habitats and reduction of habitat fragmentation would improve the abundance and diversity of birds that merlin prey on in these open and edge habitats. This would be a moderate, beneficial effect on the merlin.

El Portal – Development of housing, parking, and operations to El Portal would likely have a detrimental effect on merlins by reducing habitat in this location. Most of the area likely to be affected, however, has either been affected by previous development or by its proximity to existing development. This, coupled with the abundance of suitable merlin habitat in the surrounding area, indicates that impact on merlins in this location would be minor and adverse.

Wawona – Development of housing in this location would likely affect a small area of wooded habitat that could be used by merlins, although such habitat is not optimal. The existing high level of development in this area, and its effect on adjacent habitats has already caused some degradation. Local impact on merlins from additional development under the Preferred Alternative would therefore be expected to be negligible.

Foresta – The development of stable facilities at McCauley Ranch could have a detrimental effect on meadow habitat that would be used for stock grazing, and meadow and forest habitat that would be removed to build the stable structures. Such actions would be expected to have a minor, adverse impact on merlin by affecting the diversity and abundance of prey. The stables could, however, also increase the abundance of certain opportunistic species of birds that feed on grain (i.e., brown-headed cowbird, brewer's blackbird, and European starling), which could in turn be preyed upon by merlins. While this situation may benefit a few merlins, such benefit is far outweighed by other resource effects created by unnatural concentrations of these bird species. If parking is developed at Foresta instead of Hazel Green, merlin habitat could be further affected at this location. The relatively open terrain of the burned forest, where parking would be developed, is suitable for merlins, but the best habitat — meadow edge — would not be affected by development. Therefore, impact from this development on merlins would be minor and adverse.

The overall impact on merlins under the Preferred Alternative would be minor and beneficial, due primarily to the large areas of habitat that would be restored in Yosemite Valley.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat

for the merlin. These regional plans would have a long-term, moderate, beneficial effect on the merlin.

Foreseeable projects that could have an adverse effect on merlins include Yosemite View Parcel Land Exchange; Rio Mesa Area Plan; Yosemite Motels Expansion; University of California, Merced campus; City of Merced General Plan. These projects would have a minor, adverse effect on merlins.

Overall, cumulative effects would be minor and beneficial, due primarily to the implementation of wide-ranging land management plans that could affect large areas of the Sierra Nevada.

Long-eared owl (Asio otus)

Direct and Indirect Effects

Given the rarity of observations in Yosemite Valley, and the age of the last confirmed nesting there, it is possible that increasing human disturbance has affected use of Valley habitats by long-eared owls, especially in meadow and riparian habitats. The Preferred Alternative in the *Final Yosemite Valley Plan/SEIS* would restore about 160 acres of previously developed meadow, riparian, and oak woodland habitat in Yosemite Valley. This could have a long-term, moderate, beneficial impact on long-eared owls.

Under the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS*, actions that would have adverse effects on potential long-eared owl habitat include:

- Construction of parking at Hazel Green and El Portal
- Construction of new housing in El Portal and Wawona
- Increased human use at the South Entrance and the Big Oak Flat Entrance

These actions would have a minor, adverse impact because of the limited area that would be involved, the existing human disturbance in the area, and the large area of suitable, unaffected habitat that would continue to exist in surrounding areas.

Overall, there would be a minor, beneficial impact on the long-eared owl as a result of a substantial amount of restored high-quality habitat in Yosemite Valley, and smaller reduction of lesser-quality habitat in other areas.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve size, integrity, and connectivity of suitable habitat for long-eared owls. These regional plans would have a long-term, moderate, beneficial effect on long-eared owls.

Foreseeable projects that could have adverse effects on suitable habitat for long-eared owls include the Yosemite View Parcel Land Exchange, Yosemite Motels Expansion, El Portal Road Improvement Project, and the Evergreen Lodge Expansion.

Overall, cumulative effects on long-eared owls would be minor and beneficial, due primarily to the protection of habitat provided by implementation of wide-ranging land management plans that would cover large areas of the Sierra Nevada. There would be a limited area of effect for those projects that have an adverse impacts on long-eared owls.

California spotted owl (see Federal Species of Concern)

Yellow warbler (Dendroica petechia)

Direct and Indirect Effects

The yellow warbler prefers riparian woodlands, but also breeds in chaparral, ponderosa pine, and mixed conifer habitats with substantial amounts of brush. The Preferred Alternative would restore a large tract of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. This would improve suitable habitat for the yellow warbler. Removal of stable operations from Yosemite Valley would benefit yellow warblers by reducing the number of brown-headed cowbirds.

New construction would take place at the Yosemite Village Visitor/Transit Center, the traffic check station near El Capitan crossover, and campsites east of Curry Village, at Camp 4 (Sunnyside Campground), Upper Pines Campground, and along Tenaya Creek. Roads would be moved out of meadows and into upland habitats, and Southside Drive would be widened from El Capitan crossover to Curry Village. These actions would directly displace wooded habitat in Yosemite Valley. In Yosemite Valley, there would be an overall moderate, beneficial impact on the yellow warbler because a relatively large area of highly suitable habitat (e.g., riparian) would be restored relative to the suitable habitat that would be removed (e.g., mixed conifer).

Mixed conifer habitat would be affected by the development of a transit center and parking at Hazel Green. If parking is developed in Foresta rather than Hazel Green, an area of brushy habitat would be removed, possibly having adverse effects on yellow warblers. Such habitat is not optimal and is available in abundance in the surrounding area burned in the A-Rock Fire. This would be a minor, adverse impact because the affected area is marginal habitat for yellow warblers, the affected area is limited, and large areas of suitable, unaffected habitat would continue to exist in surrounding areas.

In El Portal, effects on forest and riparian habitats from development of housing, work places, and parking would have a minor, adverse effect on yellow warblers because the affected area would be relatively small, and existing human effects to these habitats have already degraded their quality.

The moving of concession and National Park Service stables to McCauley Ranch in Foresta would increase the number of brown-headed cowbirds in the area and their parasitism on species such as the yellow warbler, resulting in minor, adverse impact. Development of housing in

Wawona and minor expansion of facilities at the South Entrance and Big Oak Flat Entrance would affect forest habitat. The limited size of the affected areas, the existing level of habitat disturbance, and the lack of highly suitable riparian habitat in these areas would limit the impact to minor and adverse. Increased use of Badger Pass in summer would have a negligible effect on yellow warblers because no additional degradation of habitat would occur.

The overall, long-term effect on yellow warblers under the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS* would be moderately beneficial, primarily due to the restoration of highly suitable riparian habitat and the reduction of stable operations in Yosemite Valley.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the yellow warbler. These regional plans would have a long-term, moderate, beneficial effect on the yellow warbler. The Hazel Green Ranch project (guest rooms, food services, University of California research station) would effect some yellow warbler habitat. This would be a minor adverse effect because the area affected is marginal habitat for yellow warblers, the affected area is limited, and large areas of suitable, unaffected habitat would continue to exist in surrounding areas.

Pallid bat (Antrozous pallidus)

Direct and Indirect Effects

The Preferred Alternative would restore a large tract of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. This would improve foraging habitat for the pallid bat, resulting in moderate, beneficial effects. If a transit center and parking is developed at Foresta instead of Hazel Green, an area of brushy upland habitat with snags would be affected. Because of the abundance of such habitat in this area, effects on pallid bats would be minor and adverse. This restoration would also reduce the need for hazard tree removal in the area, which would improve the availability of roosting sites.

In Yosemite Valley, new development would occur in pallid bat habitat through construction of the Yosemite Village Visitor/Transit Center and the traffic check station near El Capitan crossover, relocation of roads from meadow into forested habitats, widening of Southside Drive between El Capitan crossover and Curry Village, and construction of a bicycle/hiking path adjacent to Southside Drive. These actions would directly affect pallid bat habitat and increase the need for hazard tree reduction in those areas, slightly reducing the availability of trees for roosting and reproduction. In total, effects on forest habitats resulting from these actions would have a minor, adverse effect on pallid bats.

Outside of Yosemite Valley, projects that affect forest habitats could affect pallid bats. These include construction of a transit center and parking at El Portal and Hazel Green, development

of new housing at Wawona and El Portal, and minor expansion of facilities at the Big Oak Flat Entrance and South Entrance. Increased use of Badger Pass would have a negligible effect on pallid bats, because no habitat would be affected. In total, the effect of these actions would be limited to minor and adverse because of the development that currently exists in these areas, the relatively small areas that would be affected, and the abundance of suitable habitat that would remain unaffected in adjacent areas.

Bridge removal could have an adverse effect on night roosting habitat of pallid bats. There would, however, continue to be a variety of natural roosting sites for pallid bats (such as rock outcrops and hollow trees). The removal of bridges would have a minor, adverse effect on the pallid bat.

Overall, the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS* would have a moderate, beneficial impact on pallid bat by restoring large areas of potential bat foraging habitat in east Yosemite Valley, where an important colony of pallid bats is known to exist (at The Ahwahnee).

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could provide benefits to the size, integrity, and connectivity of suitable habitat for the pallid bat. These regional plans would have a long-term, moderate, beneficial effect on the pallid bat.

Foreseeable projects that could have adverse effects on suitable habitat for the pallid bat include the Hazel Green Ranch project (guest rooms, food services, University of California Research Station), Yosemite View Parcel Land Exchange, Yosemite Motels Expansion, El Portal Road Improvement Project, and the Evergreen Lodge Expansion.

Overall, there would be a minor, beneficial cumulative impact on the pallid bat. This conclusion is based on the potential protection of suitable habitat from wide-reaching regional plans. The projects with a possible adverse impact on the pallid bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts.

Townsend's big-eared bat (Corynorhinus townsendii townsendii)

Direct and Indirect Effects

The Preferred Alternative would restore a large tract of previously disturbed meadow, riparian, and California black oak woodland habitat in the east end of Yosemite Valley, totaling about 160 acres. This would improve foraging habitat for the Townsend's big-eared bat, providing moderate beneficial effects on this species.

In Yosemite Valley, new development would occur in Townsend's big-eared bat habitat through construction of the Yosemite Village Visitor/Transit Center and the traffic check station near El Capitan crossover, relocation of roads from meadow into forested habitats, widening of Southside Drive between El Capitan crossover and Curry Village, and construction of a bicycle/hiking path

adjacent to Southside Drive. These actions would directly affect foraging habitat of Townsend's big-eared bat. In total, the effect on forest habitats resulting from these actions would have a minor, adverse impact on pallid bats.

Outside of Yosemite Valley, projects that affect forest habitats could affect Townsend's big-eared bats. These include construction of a transit center and parking at El Portal and Hazel Green, development of new housing at Wawona and El Portal, and minor expansion of facilities at the Big Oak Flat Entrance and South Entrance. Increased use of Badger Pass would have a negligible effect on Townsend's big-eared bats because no habitat would be affected. This species has been confirmed as using the mines in El Portal for roosting and reproduction. Although no actions under this plan would affect the mines, development in forest areas below them would likely affect foraging habitat. In total, the effect of these actions would be limited to minor and adverse because of the development that currently exists in these areas, the relatively small areas involved, and the abundance of suitable habitat that would remain unaffected in adjacent areas.

Because Townsend's big-eared bats are known to roost in buildings and are highly sensitive to disturbance, structures slated for demolition would be evaluated for bats. If bats are detected during periods of the year when reproduction or hibernation is occurring, demolition would be delayed until the bats could be removed from the structure without adversely affecting their survival or that of their young (generally April and October). With such mitigation, effect on Townsend's big-eared bats would be negligible.

Overall, the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS* would have a minor, beneficial impact on the Townsend's big-eared bat, primarily by restoring a diversity of foraging habitats in east Yosemite Valley.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the Townsend's big-eared bat. These regional plans would have a long-term, moderate, beneficial effect on the Townsend's big-eared bat.

Foreseeable projects that could have adverse effects on suitable habitat for Townsend's big-eared bats include the Hazel Green Ranch project (guest rooms, food services, University of California research station), Yosemite View Parcel Land Exchange, Yosemite Motels Expansion, El Portal Road Improvement Project, and the Evergreen Lodge Expansion.

Overall, there would be a minor, beneficial cumulative impact on Townsend's big-eared bat. This conclusion is based on the potential protection of suitable habitat through implementation of wide-reaching regional plans. The projects with a possible adverse impact on the Townsend's big-eared bat would affect a relatively small area of habitat compared to projects with potential beneficial impacts. .

White-tailed hare (Lepus townsendii)

Direct and Indirect Effects

The Tioga Road and existing development in this area likely has a minor adverse effect on the local population of white-tailed hares through habitat reduction, mortality caused by vehicle traffic, and the effects of human activity and associated foot traffic. Any additional development in the Tioga Pass area is likely to increase these effects, but the planned limited size of any such development is unlikely to increase the impact beyond minor and adverse, given that a large amount of suitable habitat in the area would remain unaffected.

Cumulative Effects

Regional and parkwide planning efforts such as the Sierra Nevada Framework for Conservation and Collaboration (USFS), U.S. Forest Service plans for adjacent wilderness, the Fire Management Plan Update (NPS), and the Merced Wild and Scenic River Comprehensive Management Plan (NPS) could improve the size, integrity, and connectivity of suitable habitat for the white-tailed hare. These regional plans would have a long-term, moderate, beneficial effect on the white-tailed hare.

Park Rare Species

P L A N T S

El Portal

There are six park rare species that are found in the El Portal area: Indian paintbrush (*Castilleja foliolosa*), collinsia (*Collinsia linearis*), pitcher sage (*Lepechinia calycina*), Congdon's monkeyflower (*Mimulus congdonii*), Palmer's monkeyflower (*Mimulus palmeri*), and phacelia (*Phacelia platyloba*). These species would not be directly impacted by actions proposed in the *Final Yosemite Valley Plan/SEIS*.

There could be indirect effects on these species as a result of the increased human population in El Portal, which could promote additional foot traffic and possible trampling of these species. Non-native plant species would continue to invade undeveloped areas in El Portal. New construction can promote non-native species because it creates conditions that are favored by many non-native plants, such as disturbed soil. An increase in non-native plants could result in habitat loss and a competition for resources (i.e., light, water, and nutrients) for the rare plants in El Portal.

Overall, there would be a minor, adverse effect on these species as a result of an increased population in El Portal and an increase in non-native species as a result of new construction.

Yosemite Valley

Twelve park rare plant species are found in Yosemite Valley: sugar stick (*Allotropa virgata*), broad-leaved sundew (*Drosera rotundifolia*), stream orchid (*Epipactus gigantea*), fawn-lily (*Erythronium purpurascens*), boreal bedstraw (*Galium boreale* spp. *septentrionale*), Sierra laurel

(*Leucothoe davisiae*), false pimpernel (*Lindernia dubia* var. *anagallidea*), azure penstemon (*Penstemon azureus* spp. *angustissimus*), phacelia (*Phacelia tanacetifolia*), wood saxifrage (*Saxifraga mertensiana*), giant sequoia (*Sequoiadendron giganteum*), and ladies' tresses (*Spiranthes porrifolia*). Restoration of riparian and meadow habitat would have a moderate, beneficial impact on boreal bedstraw, false pimpernel, and ladies' tresses.

Removal of tennis courts at The Ahwahnee and relocation of the Superintendent's House (Residence 1) and restoration of these sites to California black oak woodland would have a long-term, major, negative impact on several giant sequoia trees that were planted in the area. Redesign of The Ahwahnee's parking lot could have adverse effects to additional planted giant sequoia trees, depending on final alignment of parking lots and driveways. There would be a negligible impact on the overall sustainability of giant sequoias, as there are three naturally occurring groves elsewhere in the park that would not be affected by the plan.

The remaining species (sugar stick, azure penstemon, phacelia, and wood saxifrage) would not be affected by actions in the Preferred Alternative.

Foresta

Five park rare plant species occur in the Foresta area: snapdragon (*Antirrhinum leptaleum*), Small's southern clarkia (*Clarkia australis*), goldenaster (*Heterotheca sessiliflora* ssp. *echioides*), inconspicuous monkeyflower (*Mimulus inconspicuus*), pansy monkeyflower (*Mimulus pulchellus*). These plants would not be directly impacted by construction of 14 beds or establishment of a stables operation in Foresta, but individual plants could be permanently removed by development of a parking facility. Increased levels of human activity in the area due to increased residential, operational, and visitor use could have indirect, adverse effects on all of these species. There could also be adverse effects on rare plant habitat as a result of non-native species encroachment associated with ground disturbance and landscaping activities, and horse trailers and vehicles that could spread non-native seeds in feed and manure. Overall, there would be a long-term, moderate, adverse effect on rare plant species in Foresta.

Hazel Green

One park rare plant species occurs at Hazel Green, Small's southern clarkia (*Clarkia australis*). This species, which occurs in open areas, could be directly affected by development of a transit and parking facility at Hazel Green. Plants could also be affected by picnicking, trampling, and random use of sites adjacent to parking and proposed lodging. This would result in a minor, adverse impact on this species.

Badger Pass

Two park rare species are found at Badger Pass: dwarf sandwort (*Minuartia pusilla*) and Yosemite ivesia (*Ivesia unguiculata*). There would be no direct effects on these plants, but there could be long-term minor adverse effects from increased visitor use in areas surrounding Badger Pass.

Wawona

Eight park rare species occur within the Wawona basin: snapdragon (*Antirrhinum leptaleum*), Child's blue-eyed Mary (*Collinsia childii*), round-leaved sundew (*Drosera rotundifolia*), Sierra sweet-bay (*Myrica hartwegii*), Bolander's skullcap (*Scutellaria bolanderi*), giant sequoia (*Sequoiadendron giganteum*), trillium (*Trillium angustipetalum*), and Hall's wyethia (*Wyethia elata*). The construction of new housing would result in the direct loss of a portion of the trillium population in this area. This would be a moderate, adverse effect on the trillium population in the area. Increased human use in this area during the spring and summer would have minor, indirect effects on all of the Wawona park rare species.

Big Oak Flat Entrance

There are no rare species in the vicinity of the Big Oak Flat Entrance Station.

South Entrance

One park rare species, Sierra sweet-bay (*Myrica hartwegii*), is located within the riparian areas adjacent to the current road alignment at the South Entrance. There would be no direct effects on this species as a result of proposed construction. There could be a long-term, minor, adverse effect on this species from increased visitor use in the area and associated foot traffic.

Tioga Pass Entrance

Thirteen park rare species occur within hiking distance of Tioga Pass: Sweetwater Mountains milkvetch (*Astragalus kentrophyta* var. *danaus*), black and white sedge (*Carex albonigra*), capitate sedge (*Carex capitata*), Congdon's sedge (*Carex congdonii*), alpine cerastium (*Cerastium beerianum*), Sierra claytonia (*Claytonia nevadensis*), draba (*Draba praelta*), desert fleabane (*Erigeron linearis*), rambling fleabane (*Erigeron vagus*), Dane's dwarf gentian (*Gentianella tenella* ssp. *tenella*), common juniper (*Juniperus communis*), snow willow (*Salix reticulata*), and groundsel (*Senecio serra* var. *serra*). One species, the common juniper, could be directly impacted by construction of a new or expanded entrance station at Tioga Pass. There could be indirect effects on all 13 park rare species from increased visitor use and associated foot traffic in the area. There could be increased hiking on Mt. Dana, which is within a day's hike from the Tioga Pass Entrance Station. The popular hike to the top of Mt. Dana is a cross-country path, without a formal route. Increased use on Mt. Dana could have a long-term, moderate, adverse impact on rare plant species on Mt. Dana.

CHAPTER VI. DETERMINATION OF EFFECTS ON FEDERALLY LISTED SPECIES

This determination of effects is based solely on the Preferred Alternative in the *Final Yosemite Valley Plan* as described in Chapter III of this document, and does not assume any potential mitigation measures. Mitigation measures are recommended in Chapter VII. The following criteria were used to develop determinations:

- No Effect – The project (or action) is located outside suitable habitat **and** there would be no disturbance or other direct or indirect impacts on the species.
- May Effect, Not Likely to Adversely Effect – The project (or action) occurs in suitable habitat or results in indirect impacts on the species, but the effect on the species is likely to be beneficial, discountable, or insignificant.
- May Effect, Likely to Adversely Effect – The project (or action) would have an adverse effect on a listed species as a result of direct, indirect, interrelated, or interdependent actions.

Determinations for Federally Listed Threatened or Endangered Species

SIERRA NEVADA BIGHORN SHEEP (*OVIS CANADENSIS SIERRAE*)

It is the determination of the National Park Service that actions that are proposed in the *Final Yosemite Valley Plan/SEIS* may affect, but are not likely to adversely affect, the Sierra Nevada bighorn sheep. The following conclusions have led to this determination:

- There would be no direct effects on habitat for the Sierra Nevada bighorn sheep.
- Indirect effects as a result of increased visitor use at Tioga Pass would be negligible, due to the steep and relatively inaccessible terrain used by the Sierra Nevada bighorn sheep.

VALLEY ELDERBERRY LONGHORN BEETLE (*DESMOCERUS CALIFORNICUS*)

It is the determination of the National Park Service that the actions proposed in the *Final Yosemite Valley Plan/SEIS* may affect, and are likely to adversely affect, the Valley elderberry longhorn beetle. The following conclusions have led to this determination:

- Elderberry plants grow within the project area. Based on the foregoing analysis, there is a likelihood that “take,” as defined in the Endangered Species Act, may occur.

Elderberry plants, the sole foodplant and habitat for the Valley elderberry longhorn beetle, are abundant in the Merced River canyon in the elevation range of the beetle. Elderberry plants would be avoided during construction wherever practicable.

CALIFORNIA RED-LEGGED FROG (*RANA AURORA
DRAYTONII*)

It is the determination of the National Park Service that actions that are proposed in the *Final Yosemite Valley Plan/SEIS* would not affect the California red-legged frog. The following conclusions have led to this determination:

- No populations of the California red-legged frog were found in the park in recent surveys, and it is unlikely that red-legged frogs will be found within Yosemite National Park (Fellers 1999).
- There are two main areas in Yosemite that would be suitable places to reintroduce the California red-legged frog, provided the bullfrog population is removed: Yosemite Valley and the Swamp Lake area (Fellers 1999). The Preferred Alternative would restore at least 135 acres of suitable habitat for the California red-legged frog in Yosemite Valley.

BALD EAGLE (*HALIAEETUS LEUCOCEPHALUS*)

It is the determination of the National Park Service that actions that are proposed in the *Final Yosemite Valley Plan/SEIS* may affect, but are not likely to adversely affect, the bald eagle. The following conclusions have led to this determination:

- Bald eagles are rarely seen within Yosemite National Park and are not known to nest in the park; however, riparian and meadow areas of Yosemite Valley may provide foraging habitat for transient eagles.
- Actions proposed in the *Final Yosemite Valley Plan/SEIS* would restore at least 135 acres of meadow and riparian habitat that could provide foraging habitat for transient eagles.
- Development and fragmentation in upland habitats would have negligible effects on this species.

CHAPTER VII. MANAGEMENT RECOMMENDATIONS AND MITIGATION

Avoidance and Protection Measures

AVOIDANCE AND PROTECTION MEASURES COMMON TO ALL SPECIAL-STATUS SPECIES

The following hierarchy would be employed to avoid, minimize, or compensate for adverse effects to special-status species.

- Avoid adverse effects on special-status species
- Minimize adverse effects on special-status species
- Mitigate/compensate for adverse effects on special-status species

Additional documentation, studies, and consultation would be conducted as appropriate prior to implementation of specific actions.

- Prior to construction, conduct surveys as necessary for special-status species in the vicinity of all new construction in Yosemite Valley, El Portal, Wawona, Foresta, Hazel Green, South Entrance, Big Oak Flat Entrance, Tioga Pass Entrance, and Badger Pass. Bridges and other structures will be surveyed prior to deconstruction. This will take place well in advance of the project design phase to assure that avoidance and minimization requirements can be met. Should additional state or federally listed species be found that were not documented in this Biological Assessment, consultation with the USFWS would be initiated.
- To the extent practicable, site and design facilities/actions to avoid adverse effects to special-status species. If avoidance is infeasible, minimize and compensate adverse effects to special-status as appropriate and in consultation with the appropriate resource agencies.
- Develop and implement restoration and/or monitoring plans as warranted. Plans should include methods for implementation, performance standards, monitoring criteria, and adaptive management techniques.
- Implement measures to reduce adverse effects of non-native plants and wildlife on special-status species.
- Implement stormwater management measures to reduce non-point source pollution discharge from roads, parking lots, and other impervious surfaces. This could include oil/sediment separators, street sweeping, infiltration beds, and use of permeable surfaces and vegetated or natural filters to trap or filter stormwater runoff.
- Use only plants native to Yosemite National Park in landscaping.
- Prepare and implement a noxious weed abatement program. This could include restoration of degraded habitats, use of hand labor to remove weeds, and use of herbicides.

- Implement measures to reduce adverse effects of non-native wildlife. This could include use of processed feeds and hay at stables to reduce food for cowbirds, trapping programs for cowbirds, and measures to eradicate bullfrogs from wetland habitats.
- To the extent practicable, site and design facilities/actions to avoid adverse effects to sensitive wildlife habitats or habitat features, especially during breeding seasons. If avoidance is infeasible, minimize and compensate adverse effects as appropriate.
- Minimize night lighting where practicable. Where night lighting is necessary, design lighting to be minimal, directed downward, and shielded.
- Educate the public on the dangers of intentional or unintentional feeding of park wildlife, and on inadvertent harassment through observation or pursuit.
- Implement standard noise abatement measures during park operations. Standard noise abatement measures could include the following elements: a schedule that minimizes effects to adjacent noise-sensitive uses, use of the best available noise control techniques wherever feasible, use of hydraulically or electrically powered impact tools when feasible, and location of stationary noise sources as far from sensitive areas as possible.
- To the extent practicable, site and design facilities to minimize objectionable noise elements.
- Allow natural processes to maintain the presence of very large, old trees, snags, large-diameter logs, and decaying wood across the landscape.
- Maintain conditions suitable for spotted owl prey base, including decadence features such as mistletoe brooms, cavities, tree deformities, fungus growth, and large, decaying oaks.

CONSTRUCTION - AND DEMOLITION - RELATED BEST MANAGEMENT PRACTICES

The following best management practices would be implemented, as appropriate, prior to, during, and/or after specific construction or demolition actions. Specific tasks would include, but are not limited to, the following:

- Implement a compliance monitoring program when sensitive resources have potential to be affected. The compliance monitoring program would oversee/enforce the below-referenced measures and include compliance strategies and reporting protocols.
- Implement a fencing and flagging program to protect special-status or sensitive habitats. This could include the following types of measures: using of high-visibility snow fences around protected elderberry shrubs, marking trees to be retained, using signs (e.g., “no refueling” signs) in areas of high sensitivity.
- Implement a native vegetation salvage program. This could include minimizing land disturbance, salvage and storage of topsoil, treatment of non-native species, erosion control, and revegetation.

- Implement a dust abatement program. Standard dust abatement measures could include the following elements: water or otherwise stabilize soils, cover haul trucks, employ speed limits on unpaved roads, minimize vegetation clearing, and revegetate after construction.
- Implement standard noise abatement measures during construction. Standard noise abatement measures could include the following elements: a schedule that minimizes effects to adjacent noise-sensitive uses, use of the best-available noise control techniques wherever feasible, use of hydraulically or electrically powered impact tools when feasible, and location of stationary noise sources as far from sensitive uses as possible.
- Implement a noxious weed abatement program. Standard measures could include the following elements: ensure construction-related equipment arrives on site free of mud or seed-bearing material, use only certified weed-free seeds and straw material, identify areas of noxious weeds pre-construction, treat noxious weeds or noxious weed topsoil prior to construction (e.g., topsoil segregation, storage, herbicide treatment), and revegetate with appropriate native species propagated from local genetic stock.
- Implement a natural resource protection program. Standard measures could include construction scheduling, biological monitoring, erosion and sediment control, protection of sensitive habitats, removal of all food-related items or rubbish to bear-proof containers, topsoil salvage, and revegetation. This could include specific construction monitoring by resource specialists, treatment, and reporting procedures.
- To the extent practicable, schedule project activities that generate high levels of noise and other disturbance (e.g., light) to occur during periods of the year and times of day when effects on species sensitive to such disturbance would be minimized.
- Implement a spill prevention and pollution control program (hazardous materials). Standard measures could include hazardous materials storage and handling procedures; spill containment, cleanup, and reporting procedures; and limitation of refueling and other hazardous activities to upland/nonsensitive sites.
- Implement an interpretation and education program. Continue signage and education programs to promote understanding among park visitors.
- Implement a tree protection plan as warranted. This could include measures such as avoiding the root zone (typically 1.5 times the tree canopy), using hand equipment for trenching within the root zone, reducing compaction within root-zones, and maintaining a natural grade.

SPECIES - SPECIFIC AVOIDANCE AND PROTECTION MEASURES

The following avoidance and protection measures are included to guide future actions and planning in the project area. These measures are based on current scientific protocols and agency recommendations. These measures are intended to be fluid and to change with increased knowledge about a particular species or suite of species or as new technologies become available and practicable.

The Valley elderberry longhorn beetle

- Mitigation measures prescribed in the Biological Opinion for this plan (rendered by the USFWS) will be applied to all potential actions. The Biological Opinion will be based on conservation guidelines developed by the U.S. Fish and Wildlife Service (USFWS 1999).
- All National Park Service personnel that coordinate construction work should be familiar with the locations and avoidance requirements for all elderberry shrubs within the construction zone.
- The contractor and all of the contractor's on-site personnel should be briefed on the locations of elderberry, avoidance requirements, and penalties for noncompliance.
- Elderberry plants within the project area should be individually fenced 20 feet from the dripline. The area would be signed before clearing and grubbing begins and before any large equipment is allowed access to the site.
- A qualified National Park Service staff member should be present for the duration of the project to ensure no unnecessary take of elderberry occurs. The staff member would have the authority to stop all activities should the potential for unnecessary take become apparent. He or she should report any violations to the USFWS.
- Any construction-related disturbance to the buffer zone (100 feet from the dripline) should be minimized and restored following construction.
- All potential development zones below 3,000 feet (in the typical elevation range of the Valley elderberry longhorn beetle) have been surveyed for elderberry plants. All project sites above 3,000 feet will be surveyed prior to site design for the presence or absence of beetle exit holes. In the unlikely event that exit holes are discovered in areas outside the typical range of the Valley elderberry longhorn beetle, mitigation measures as described in the Biological Opinion from the USFWS will be applied.

Special-Status Birds

- To minimize adverse effects on nesting birds, limit construction activities in nesting habitat during breeding season, which is typically March to August.
- Trees or structures that contain unoccupied nests (stick nests or tree cavities), but must be removed, should be removed prior to March 1, or after nesting season is over.
- Alternatively, if activities take place during the breeding season, a qualified biologist would conduct a pre-construction survey for individuals no more than one week prior to construction in March through August. If any special-status species is observed nesting, a determination should be made as to whether or not the Preferred Alternative will impact the active nest or disrupt reproductive behavior.
- If it is determined that the action will not impact an active nest or disrupt breeding behavior, construction will proceed without any restriction or mitigation measure.

- If it is determined that construction will impact an active nest or disrupt reproductive behavior, then avoidance strategies should be implemented. Construction could be delayed within 500 feet of such a nest, until a qualified biologist determines that the subject birds are no longer nesting or until any juvenile birds are no longer using the nest as their primary day and night roost.

Special-Status Aquatic Species

Implementation of the following reasonable and prudent measures would reduce or eliminate potential taking of special-status amphibians. These measures were abstracted from the USFWS Programmatic Biological Opinion for projects that may affect California red-legged frog though the Biological Opinion does not specifically apply to this project because no take of California red-legged frog is anticipated. Provisions listed below are considered reasonable and prudent for actions located within 100 feet of aquatic habitats:

- Work activities within potential special-status aquatic species habitat should be completed between July 1 and November 1 or during low-flow conditions.
- A qualified biologist should survey the site two weeks before the onset of activities. If special-status aquatic species, tadpoles, or eggs are found, the biologist will contact the appropriate agency(ies) to determine if moving any of these life-stages is appropriate. Surveys will follow the “Guidance on Site Assessment and Field Surveys for California Red-legged Frogs” developed by the U.S. Fish and Wildlife Service (USFWS 1997).
- A qualified biologist should conduct training sessions for all construction personnel before activities begin.
- Construction adjacent to aquatic habitats should be fenced to prohibit the movement of frogs into the construction area, and to control siltation and disturbance in aquatic habitats.
- All construction adjacent to or within aquatic habitats should be regularly monitored.
- All trash that may attract predators should be contained and regularly removed. Following construction, all trash and construction debris will be removed from work areas.
- All fueling and maintenance of vehicles and equipment should occur at least 20 meters (65 feet) from any aquatic habitat.
- The spread or introduction of invasive, non-native plant species should be avoided. When practicable, invasive plants in the project areas will be removed.
- The number and size of access routes, staging areas, and total area of activity should be limited to the minimum necessary to achieve the project goal.
- Best management practices should be implemented to control erosion.
- During dewatering, intakes should be completely screened with wire mesh not larger than 5 millimeters to prevent aquatic species from entering the pump system. Water would be released or pumped downstream at an appropriate rate to maintain downstream flows

during construction. Upon completion of construction activities, any barriers to flow will be removed in a manner that allows flow to resume with the least disturbance to the substrate.

- Where practicable, qualified biologists would permanently remove, from within the project area, any individuals of non-native species, such as bullfrogs, crayfish, and centrarchid fishes, to the maximum extent possible.
- The downstream construction boundary should be fenced to prohibit the movement of aquatic species into the construction area and to control creek siltation and disturbance to downstream riparian habitat. An enclosure fence should be installed in the creek channel both upstream and downstream of construction activities as appropriate. Fences should be installed at least six weeks prior to the commencement of any construction activities.
- Immediately after installation of the enclosure fence, a qualified biologist should inspect all areas within the fence for aquatic species.

Special-Status Bats

- A qualified biologist should conduct surveys to determine whether affected structures, mature trees, or other habitat (e.g., crevices) provide hibernacula, nursery colony, or roosting habitat.
- If surveys conducted during the fall do not reveal any bat species, then the action should occur within three days in order to prevent the destruction of any bats that move into the area after the survey.
- If the site is being used as a winter roost, then the action should occur either prior to hibernation (between September 1 and October 1) or after hibernation (January 15 to February 15).
- If spring surveys are conducted and reveal that the site is being used as a nursery colony, the action should not occur until after August 15, when the pups are weaned and are free-flying.

Other Special-Status Mammals

- Excavation sites (trenches or pits) would have suitable ramps for small mammals to exit these areas.
- A qualified biologist would be available to inspect all excavations before refilling occurs, ensuring that special-status species are passively relocated to avoid incidental take.
- Exclosure fencing could be erected prior to construction to ensure that no special-status species are within the construction area.
- To prevent mortality caused by motor vehicles, speed limits in primary fisher habitat should be low.

REPLY REFER

1-1-00-SP-1332

March 29, 2000

Memorandum

To: Lisa Acree, Resources Management, National Park Service, El Portal, California

From: Chief, Endangered Species Division, Sacramento Fish and Wildlife Office,
Fish and Wildlife Service, Sacramento, California

Subject: Species List for the Draft Yosemite Valley Plan

We are sending the enclosed list in response to your March 29, 2000, request for information about endangered and threatened species (Attachment A). These lists fulfill the requirement of the Fish and Wildlife Service (Service) to provide species lists under section 7(c) of the Endangered Species Act of 1973, as amended (Act).

The Service used the information in your letter to locate the proposed project on a U.S. Geological Survey (U.S. Geological Survey) 7.5 minute quadrangle map. The animal species on the Attachment A quad list are those species we believe may occur within, *or be affected by projects within*, the U.S. Geological Survey quads where your project is planned.

Any plants on the quad list are ones *that have actually been observed* in that quad. Plants may occur in a quad without having been observed there. Therefore we have included a species list for the whole county in which your project occurs. We recommend that you survey for any relevant plants shown on this list.

Fish and other aquatic species appear on your list if they are in the same watershed as your quad or if water use in your quad might affect them. Birds are shown regardless of whether they are resident or migratory. Relevant birds on the county list should be considered regardless of whether they appear on a quad list.

If a species has been listed as threatened or endangered by the State of California, but not by us nor by the National Marine Fisheries Service, it will appear on your list as a Species of Concern. *However you must*

contact the California Department of Fish and Game for official information about these species. Call (916) 322-2493 or write Marketing Manager, California Department of Fish and Game, Natural Diversity Data Base, 1416 Ninth Street, Sacramento, California 95814.

Some of the species listed in Attachment A may not be affected by the proposed action. A trained biologist or botanist, familiar with the habitat requirements of the listed species, should determine whether these species or habitats suitable for them may be affected. For plants, we recommend using the enclosed Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Species (Attachment C).

Some pertinent information concerning the distribution, life history, habitat requirements, and published references for the listed species is available upon request. This information may be helpful in preparing the biological assessment for this project, if one is required. Please see Attachment B for a discussion of the responsibilities Federal agencies have under section 7(c) of the Act and the conditions under which a biological assessment must be prepared by the lead Federal agency or its designated non-Federal representative.

Formal consultation, under 50 CFR § 402.14, should be initiated if you determine that a listed species may be affected by the proposed project. If you determine that a proposed species may be adversely affected, you should consider requesting a conference with our office under 50 CFR § 402.10. Informal consultation may be utilized prior to a written request for formal consultation to exchange information and resolve conflicts with respect to a listed species. If a biological assessment is required, and it is not initiated within 90 days of your receipt of this letter, you should informally verify the accuracy of this list with our office.

When a species is listed as endangered or threatened, areas of habitat considered essential to its conservation may be designated as *critical habitat*. These areas may require special management considerations or protection. They provide needed space for growth and normal behavior; food, water, air, light, other nutritional or physiological requirements; cover or shelter; and sites for breeding, reproduction, rearing of offspring, germination or seed dispersal. Although critical habitat may be designated on private or State lands, activities on these lands are not restricted unless there is Federal involvement in the activities or direct harm to listed wildlife.

If any species has proposed or designated critical habitat within a quad, this will be noted on the species list. Maps and boundary descriptions of the critical habitat may be found in the *Federal Register*. The information is also reprinted in the *Code of Federal Regulations* (50 CFR 17.95).

Candidate species are being reviewed for possible listing. Contact our office if your biological assessment reveals any candidate species that might be adversely affected. Although they currently have no protection under the Endangered Species Act, one or more of them could be proposed and listed before your project is completed. By considering them from the beginning, you could avoid problems later.

Your list may contain a section called *Species of Concern*. This term includes former *category 2 candidate species* and other plants and animals of concern to the Service and other Federal, state and private conservation agencies and organizations. Some of these species may become candidate species in the future.

If the proposed project will impact wetlands, riparian habitat, or other jurisdictional waters as defined by the U.S. Army Corps of Engineers (Corps), a Corps permit will be required, under section 404 of the

Clean Water Act and/or section 10 of the Rivers and Harbors Act. Impacts to wetland habitats require site specific mitigation and monitoring. You may request a copy of the Service's General Mitigation and Monitoring Guidelines or submit a detailed description of the proposed impacts for specific comments and recommendations. If you have any questions regarding wetlands, contact Mark Littlefield at (916) 414-6580.

We appreciate your concern for endangered species. Please contact Harry Mossman, Biological Technician, at (916) 414-6650, if you have any questions about the attached list or your responsibilities under the Endangered Species Act. For the fastest response to species list requests, address them to the attention of Mr. Mossman at this address. You may fax requests to him at 414-6710.

Sincerely,

Karen J. Miller
Chief, Endangered Species Division

ATTACHMENT A
Endangered and Threatened Species That May Occur in or be Affected by
Projects in the U.S.G.S. 7 ½ Minute Quads Listed at the End of This Report
Draft Yosemite Valley
Plan March 29, 2000

Listed Species

Mammals

Sierra Nevada (=California) bighorn sheep, *Ovis canadensis californiana* (E)

Birds

bald eagle, *Haliaeetus leucocephalus* (T)

Amphibians

California red-legged frog, *Rana aurora draytonii* (T)

Fish

delta smelt, *Hypomesus transpacificus* (T)

Paiute cutthroat trout, *Oncorhynchus* (=Salmo) *clarki seleniris* (T)

Central Valley steelhead, *Oncorhynchus mykiss* (T)

Sacramento splittail, *Pogonichthys macrolepidotus* (T)

Species of Concern

Mammals

Mono Basin mountain beaver, *Aplodontia rufa californica* (SC)

pygmy rabbit, *Brachylagus idahoensis* (SC)

spotted bat, *Euderma maculatum* (SC)

greater western mastiff-bat, *Eumops perotis californicus* (SC)

California wolverine, *Gulo gulo luteus* (CA)

Sierra Nevada snowshoe hare, *Lepus americanus tahoensis* (SC)

American (=pine) marten, *Martes americana* (SC)

Pacific fisher, *Martes pennanti pacifica* (SC)

Small-footed myotis bat, *Myotis ciliolabrum* (SC)

long-eared myotis bat, *Myotis evotis* (SC)

fringed myotis bat, *Myotis thysanodes* (SC)

long-legged myotis bat, *Myotis volans* (SC)

Yuma myotis bat, *Myotis yumanensis* (SC)

Mt. Lyell shrew, *Sorex lyelli* (SC)

Sierra Nevada red fox, *Vulpes vulpes necator* (CA)

Birds.

northern goshawk, *Accipiter gentilis* (SC)

Bell's sage sparrow, *Amphispiza belli belli* (SC)

little willow flycatcher, *Empidonax traillii brewsteri* (CA)

American peregrine falcon, *Falco peregrinus anatum* (D)

Harlequin duck, *Histrionicus histrionicus* (SC)

California spotted owl, *Strix occidentalis occidentalis* (SC)

Reptiles

northwestern pond turtle, *Clemmys marmorata marmorata* (SC)

southwestern pond turtle, *Clemmys marmorata pallida* (SC)

northern sagebrush lizard, *Sceloporus graciosus graciosus* (SC)

Amphibians

Yosemite toad, *Bufo canorus* (SC)

limestone salamander, *Hydromantes brunus* (CA)

Mount Lyell salamander, *Hydromantes platycephalus* (SC)

foothill yellow-legged frog, *Rana boylei* (SC)

mountain yellow-legged frog, *Rana muscosa* (SC)

Fish

Red Hills roach, *Lavinia symmetricus* (SC)

longfin smelt, *Spirinchus thlieichthys* (SC)

Invertebrates

Wawona riffle beetle, *Atractelmis wawona* (SC)

Merced Canyon shoulderband snail, *Helminthoglypta allynsmithi* (SC)

keeled sideband snail, *Monadenia circumcarinata* (SC)

Yosemite mariposa sideband snail, *Monadenia hillebrandi yosemitensis* (SC)

Bohart's blue butterfly, *Philotiella speciosa bohartorum* (SC)

Sierra pygmy grasshopper, *Tetrix sierrana* (SC)

Plants

Tiehm's rock-cress, *Arabis tiehmii* (SC)

Yosemite woolly-sunflower, *Eriophyllum nubigenum* (SC)

KEY:

- (E) *Endangered* Listed (in the Federal Register) as being in danger of extinction.
- (T) *Threatened* Listed as likely to become endangered within the foreseeable future.
- (P) *Proposed* Officially proposed (in the Federal Register) for listing as endangered or threatened.
- (PX) *Proposed Critical Habitat* Proposed as an area essential to the conservation of the species.
- (C) *Candidate* Candidate to become a *proposed* species.
- (SC) *Species of Concern* May be endangered or threatened. Not enough biological information has been gathered to support listing at this time.
- (D) *Delisted* Delisted. Status to be monitored for 5 years.
- (CA) *State-Listed* Listed as threatened or endangered by the State of California.

Critical Habitat

Area essential to the conservation of a species.
Endangered and Threatened Species that May Occur in or be Affected by
PROJECTS IN MARIPOSA COUNTY
March 29,2000

Listed Species

Birds

Aleutian Canada goose, *Branta canadensis leucopareia* (T)

bald eagle, *Haliaeetus leucocephalus* (T)

Reptiles

blunt-nosed leopard lizard, *Gambelia* (= *Crotaphytus*) *silae* (E)

Amphibians

California red-legged frog, *Rana aurora draytonii* (T)

Fish

delta smelt, *Hypomesus transpacificus* (T)

Central Valley steelhead, *Oncorhynchus mykiss* (T)

Sacramento splittail, *Pogonichthys macrolepidotus* (T)

Invertebrates

vernal pool fairy shrimp, *Branchinecta lynchi* (T)

Valley elderberry longhorn beetle, *Desmocerus californicus dimorphus* (T)

Plants

Mariposa pussy-paws, *Calyptridium pulchellum* (T)

fleshy owl's-clover, *Castilleja campestris ssp. succulenta* (T)

Proposed Species

Birds

mountain plover, *Charadrius montanus* (PT)

Candidate Species

Amphibians

California tiger salamander, *Ambystoma californiense* (C)

Fish

Central Valley fall/late fall-run chinook salmon, *Oncorhynchus tshawytscha* (C)

Species of Concern

Mammals

California wolverine, *Gulo gulo luteus* (CA)

Sierra Nevada red fox, *Vulpes vulpes necator* (CA)

pygmy rabbit, *Brachylagus idahoensis* (SC)

pale Townsend's big-eared bat, *Corynorhinus (=Plecotus) townsendii pallescens* (SC)

Pacific western big-eared bat, *Corynorhinus (=Plecotus) townsendii townsendii* (SC)

spotted bat, *Eudenna maculatum* (SC)

greater western mastiff-bat, *Eumops perotis californicus* (SC)

Sierra Nevada snowshoe hare, *Lepus americanus tahoensis* (SC)

American (=pine) marten, *Martes americana* (SC)

Pacific fisher, *Martes pennanti pacifica* (SC)

small-footed myotis bat, *Myotis ciliolabrum* (SC)

long-eared myotis bat, *Myotis evotis* (SC)

fringed myotis bat, *Myotis thysanodes* (SC)

long-legged myotis bat, *Myotis volans* (SC)

Yuma myotis bat, *Myotis yumanensis* (SC)

San Joaquin pocket mouse, *Perognathus inornatus* (SC)

Mt. Lyell shrew, *Sorex Iyelli* (SC)

Birds

Swainson's hawk, *Buteo Swainsoni* (CA)
little willow flycatcher, *Empidonax trailii brewsteri* (CA)
American peregrine falcon, *Falco peregrinus anatum* (D)
northern goshawk, *Accipiter gentilis* (SC)
tricolored blackbird, *Agelaius tricolor* (SC)
grasshopper sparrow , *Ammodramus savannarum* (S C)
Bell's sage sparrow, *Amphispiza belli belli* (SC)
short-eared owl, *Asio flammeus* (SC)
American bittern, *Botaurus lentiginosus* (SC)
ferruginous hawk, *Buteo regalis* (SC)
Lawrence's goldfinch, *Carduelis lawrencei* (SC)
Vaux's swift, *Chaetura vauxi* (SC)
olive-sided flycatcher, *Contopus cooperi* (SC)
black swift, *Cypseloides niger* (SC)
hermit warbler, *Dendroica occidentalis* (SC)
Pacific-slope flycatcher, *Empidonax difficilis* (SC)
Harlequin duck, *Histrionicus histrionicus* (SC)
least bittern, western, *Ixobrychus exilis hesperis* (SC)
loggerhead shrike, *Lanius ludovicianus* (SC)
Lewis' woodpecker, *Melanerpes lewis* (SC)
white-faced ibis, *Plegadis chihi* (SC)
rufous hummingbird, *Selasphorus rufus* (SC)
red-breasted sapsucker, *Sphyrapicus ruber* (SC)
Brewer's sparrow, *Spizella breweri* (SC)
California spotted owl, *Strix occidentalis occidentalis* (SC)
Bewick's wren, *Thryomanes bewickii* (SC)

Reptiles

northwestern pond turtle, *Clemmys marmorata marmorata* (SC)

southwestern pond turtle, *Clemmys marmorata pallida* (SC)

California horned lizard, *Phrynosoma coronatum frontale* (SC)

northern sagebrush lizard, *Sceloporus graciosus graciosus* (SC)

Amphibians

limestone salamander, *Hydromantes brunus* (CA)

Yosemite toad, *Bufo canorus* (SC)

Mount Lyell salamander, *Hydromantes platycephalus* (SC)

foothill yellow-legged frog, *Rana boylei* (SC)

mountain yellow-legged frog, *Rana muscosa* (SC)

western spadefoot toad, *Scaphiopus hammondi* (SC)

Fish

green sturgeon, *Acipenser medirostris* (SC)

river lamprey, *Lampetra ayresi* (SC)

Kern brook lamprey, *Lampetra hubbsi* (SC)

Pacific lamprey, *Lampetra tridentata* (SC)

longfin smelt, *Spirinchus thaleichthys* (SC)

Invertebrates

Wawona riffle beetle, *Atractelmis wawona* (SC)

Merced Canyon shoulderband snail, *Helminthoglyta allynsmithi* (SC)

Leech's skyline diving beetle, *Hydroporus leechi* (SC)

California linderiella fairy shrimp, *Linderiella occidentalis* (SC)

molestan blister beetle, *Lytta molesta* (SC)

Yosemite mariposa sideband snail, *Monadenia hillebrandi yosemitensis* (SC)

Bohart's blue butterfly, *Philotiella speciosa bohartorum* (SC)

Sierra pygmy grasshopper, *Tetrix sierrana* (SC)

Plants

- Merced clarkia, *Clarkia lingulata* (CA)
- Mariposa lupine, *Lupinus citrinus var. deflexus* (CA)
- Hoover's rosinweed, *Calycadenia hooveri* (SC)
- Mono Hot Springs evening-primrose, *Camissonia sierrae ssp. alticola* (SC)
- beaked clarkia, *Clarkia rostrata* (SC)
- Rawson's flaming-trumpet, *Collomia rawsoniana* (SC)
- Yosemite woolly-sunflower, *Eriophyllum nubigenum* (SC)
- Parry's horkelia, *Horkelia parryi* (SC)
- shaggy-hair lupine, *Lupinus spectabilis* (SC)
- Hetch Hetchy (slndr.stmmd.) monkeyflower, *Mimulus filicaulis* (SC)
- California beaked-rush, *Rhynchospora californica* (SC)
- parasol clover, *Trifolium bolanderi* (SC)
- Pleasant Valley mariposa, *Calochortus clavatus var. avius* (SC) *
- Congdon's lomatium, *Lomatium congdonii* (SC) *
- Mariposa daisy, *Erigeron mariposanus* (SC) **

Plan

Supplemental EIS

APPENDIX L – BIOLOGICAL OPINION

United States Department of the Interior

FISH AND WILDLIFE SERVICE
Sacramento Fish and Wildlife Office
2800 Cottage Way, Room West 2605
Sacramento, California 95825

IN REPLY REFER TO:
1-1-00-F-0196

September 7, 2000

Memorandum

To: Superintendent, Yosemite National Park, P.O. Box 577, Yosemite National Park, California

From: Acting Field Supervisor, Sacramento Fish and Wildlife Office, Sacramento, California

Subject: Formal Endangered Species Consultation on the Yosemite Valley Plan Environmental Impact Statement

This is in response to your May 8, 2000, request for formal consultation, pursuant to section 7(a) of the Endangered Species Act of 1973, as amended (Act), on the Yosemite Valley Plan. At issue are project effects to the threatened valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) (beetle), the Sierra Nevada bighorn sheep (*Ovis canadensis sierrae*), the bald eagle (*Haliaeetus leucocephalus*), and the California red-legged frog (*Rana aurora draytonii*). This response is in accordance with section 7 of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 et seq.) (Act). The Service received your request for formal consultation on May 11, 2000.

Based on our review of the proposed action, we concur with your determination that the project is not likely to adversely affect the Sierra Nevada bighorn sheep or the bald eagle. However, we cannot concur with your no effect determination for the California red-legged frog. The *Draft California Red-legged Frog Recovery Plan* has identified portions of the Tuolumne River watershed that occur with the boundary of Yosemite National Park as a core area, an area where recovery actions will be focused (U.S. Fish and Wildlife Service 2000). We agree there is no evidence to indicate that California red-legged frogs currently occur within the boundaries of Yosemite National Park. However, recovery actions could be implemented in the near future to allow recolonization of the area through natural or artificial means. The Service commends the National Park Service (NPS) for your willingness to remove exotic species including bullfrog

(*Rana catesbeiana*), crayfish, and centrachid fish to the maximum extent possible in potential future habitat for the red-legged frog. We also agree that the measures outlined under the Species-Specific Avoidance and Protection Measure of the biological assessment go a long way toward minimizing any negative affects to the California red-legged frog and other amphibian species from the implementation of the Yosemite Valley Plan. Therefore, the Service believes the project may affect but is not likely to adversely affect the California red-legged frog. Unless presented with new information, no further action would be necessary to comply with the Act for the California red-legged frog, Sierra Nevada bighorn sheep or bald eagle. The proposed action may adversely affect the valley elderberry longhorn beetle. This consultation will address potential impacts to the beetle.

As you know, the Service delisted the American peregrine falcon (*Falco peregrinus anatum*) on August 25, 1999. The continued recovery of the peregrine falcon is dependent upon Federal agencies continuing to carry out actions that benefit the species. In the Conservation Recommendations section below, the Service will provide recommendations to minimize disturbance to nesting peregrine falcons.

The Service has recently received petitions to list the California spotted owl (*Strix occidentalis occidentalis*), mountain yellow-legged frog (*Rana muscosa*), and Yosemite toad (*Bufo canorus*) as threatened and endangered species. The Service will make a determination within the next month whether or not these three petitions provide sufficient information to warrant a one-year status review that could lead to their eventual listing. We believe that it is in the best interest of the NPS to incorporate all practical actions that would minimize any impacts to these three species resulting from the implementation of the Yosemite Valley Plan. We are providing recommendations for reducing impacts to these three species in the Conservation Recommendations section of this biological opinion.

This biological opinion is based on information provided in: (1) the *Draft Yosemite Valley Plan Supplemental Environmental Impact Statement*, dated April 2000; (2) the *Biological Assessment Draft Yosemite Valley Plan Supplemental Environmental Impact Statement*, dated April 2000; (3) the *Revised Biological Assessment Draft Yosemite Valley Plan Supplemental Environmental Impact Statement*, dated June 2000; (4) the *Merced Wild and Scenic River Comprehensive Management Plan Biological Assessment*, dated June 2000; (5) additional information regarding the quantity, condition and location of elderberry plants that may be affected by the project received on July 6, 2000; and (6) additional information located in Service files. A complete administrative record is on file at the Sacramento Fish and Wildlife Office (SFWO).

CONSULTATION HISTORY

April 17, 2000. The Service received a letter from the NPS, requesting concurrence that the Merced River Wild and Scenic Comprehensive Management Plan would not likely adversely affect any federally-listed threatened or endangered species.

May 11, 2000. The Service received a request for the NPS for formal consultation on the *Yosemite Valley Plan Supplemental Environmental Impact Statement*.

July 6, 2000. The Service received additional information from the NPS including a revised biological assessment and information on the number, condition and location of elderberry plants that may be affected by the implementation of the Yosemite Valley Plan.

July 11, 2000. The Service sent a memo to the NPS concurring with the determination that the formalization of the Merced River Plan will not adversely affect threatened and endangered species. In addition, the memo stated that since the Merced River Plan was incorporated within the Yosemite Valley Plan, formal consultation for the Yosemite Valley Plan would address project related affects to threatened, endangered and sensitive species that could occur under the Merced River Plan.

August 15, 2000. The Service received the biological assessment for the Final Yosemite Valley Plan Supplemental Environmental Impact Statement.

BIOLOGICAL OPINION

GEOGRAPHIC LOCATION OF PROPOSED ACTION

A majority of the proposed project occurs within the Yosemite Valley area of Yosemite National Park. Additional features of the Yosemite Valley Plan would take place outside Yosemite Valley in El Portal, Foresta, Hazel Green, and Badger Pass.

DESCRIPTION OF THE PROPOSED ACTION

The preferred alternative proposes a number of actions to meet the goals of the 1980 *Yosemite National Park General Management Plan*. The preferred alternative aims to restore degraded areas and reduce development within the Merced River ecosystem and other highly valued natural and cultural resource environments. In addition, the preferred alternative would reduce traffic congestion, limit crowding, and expand orientation and interpretation services. The plan would move non-essential housing, administrative headquarters, offices, and other functions out of Yosemite Valley to areas within the park boundary including the El Portal Administrative Site.

A thorough description of the proposed project can be found in the Final Yosemite Valley Plan Supplemental Environmental Impact Statement. The following list summarizes most of the actions proposed under the preferred alternative:

- 1) Approximately 175 acres of disturbed or degraded land in Yosemite Valley would be restored to natural conditions;
- 2) Day use parking for Yosemite Valley would be consolidated through the construction of a 550 vehicle parking lot at Yosemite Village and the construction of Out-of-Valley day-visitor parking areas at Badger Pass, El Portal and Hazel Green or (Foresta);
- 3) Removal of one or two historic bridges affecting Merced River flow;

- 4) Reduction in the number of camp sites and lodging units in Yosemite Valley;
- 5) Relocation of employee housing from Yosemite Valley to El Portal and Wawona; and
- 6) Relocation of NPS and concessioner stables to McCauley Ranch in Foresta;

The revised biological assessment states that there are 213 elderberry plants in the project area, 124 which have stems over one inch in diameter at ground level. Elderberry plants are distributed in the following areas throughout the project site:

- 1) Hillside East/Hillside West - 17 elderberry plants, all stems less than one inch in diameter;
- 2) Village Center - 14 elderberry plants, all with stems greater than one inch in diameter. One plant with beetle exit holes;
- 3) Old El Portal - Six elderberry plants, five plants have stems greater than one inch in diameter. None of the plants have beetle exit holes;
- 4) Rancheria - 136 elderberry plants, 74 have stems greater than one inch in diameter. Two plants with beetle exit holes;
- 5) Middle Road - 22 elderberry plants, 14 have stems greater than one inch in diameter. Four plants have beetle exit holes;
- 6) Hennessey's Ranch - 10 elderberry plants, nine have stems greater than one inch in diameter. Four plants have beetle exit holes;
- 7) Sand Pit - Two elderberry plants, both with stems greater than one inch in diameter. No beetle exit holes; and
- 8) Railroad Flat - Six elderberry plants, all have stems greater than one inch in diameter.

STATUS OF THE SPECIES

On August 8, 1980, the valley elderberry longhorn beetle was listed as a threatened species (45 **FR** 52803). Two areas along the American River in the Sacramento metropolitan area have been designated as critical habitat for the beetle. In addition, an area along Putah Creek, Solano County, and the area west of Nimbus Dam along the American River Parkway, Sacramento County, are considered essential habitat, according to the Recovery Plan for the beetle (USFWS 1984). These areas support large numbers of mature elderberry shrubs with extensive evidence of use by the beetle.

The beetle is dependent on its host plant, elderberry (*Sambucus* sp.), which is a common component of the remaining riparian forests of the Central Valley. Use of the plants by the beetle, a wood borer, is rarely apparent. Frequently, the only exterior evidence of the shrub's use by the beetle is an exit hole created by the larva just prior to the pupal stage. Recent field work along the Consumnes River and in the Folsom Lake area indicates that larval galleries can be

found in elderberry stems with no evidence of exit holes; the larvae either succumb prior to construction of an exit hole or are not far enough along in the developmental process to construct an exit hole. Larvae appear to be distributed in stems which are 1.0 inch or greater in diameter at ground level. The *Valley Elderberry Longhorn Beetle Recovery Plan* (USFWS 1984) and Barr (1991) contain further details on the beetle's life history.

Population densities of the beetle are probably naturally low (USFWS 1984), and it has been suggested, based on the spatial distribution of occupied shrubs (Barr 1991), that the beetle is a poor disperser. Low density and limited dispersal capability may cause the beetle to be vulnerable to the negative effects of the isolation of small subpopulations due to habitat fragmentation.

ENVIRONMENTAL BASELINE

Extensive destruction of California's Central Valley riparian forests has occurred during the last 150 years due to agricultural and urban development (Katibah 1984, Katibah et al. 1984, Smith 1977, Thompson 1961). Based on a 1979 aerial survey, only about 102,000 acres out of an estimated 922,000 acres of Central Valley riparian forest remain (Katibah et al. 1981). More extreme figures were given by Frayer et al. (1989), who reported that approximately 85 percent of all wetland acreage in the Central Valley was lost before 1939, and that from 1939 to the mid-1980s, the acreage of wetlands dominated by forests and other woody vegetation declined from 65,400 acres to 34,600 acres. Differences in methodology may explain the differences between the studies. In any case, the historical loss of riparian habitat in the Central Valley strongly suggests that the range of the beetle has been reduced and its distribution greatly fragmented. Loss of non-riparian habitat where elderberry occurs (e.g., savanna and grassland adjacent to riparian habitat, oak woodland, mixed chaparral-woodland), and where the beetle has been recorded (Barr 1991), suggests further reduction of the beetle's range and increased fragmentation of its upland habitat.

The beetle's current distribution is patchy throughout the remaining habitat of the Central Valley from Redding to Bakersfield. Surveys conducted in 1991 (Barr 1991) found evidence of beetle activity at 28 percent of 230 sites with elderberry plants present. The beetle appears to be only locally common, found in population clusters which are not evenly distributed across available elderberry shrubs. Frequently only particular clumps or trees in the study areas were found to harbor the beetle. Plants used by the beetle usually show evidence of repeated use over a period of several years, but sometimes only one or two exit holes are present. Similar observations on the clustered distribution of exit holes were made by Jones and Stokes (1987). Barr (1991) noted that elderberry shrubs and trees with many exit holes were most often large, mature plants; young stands were seldom occupied.

As stated above, two areas are designated as critical habitat for the beetle. The American River Parkway (Parkway), extending from Nimbus Dam to the confluence with the Sacramento River, represents a 22-mile long corridor of mixed riparian forest and grassland confined by flood-control levees and urban development along its entire length. Elderberry shrubs occur throughout this corridor. With the exception of levee maintenance, the Parkway is managed primarily for recreation, including a bike path. Evidence of use by the beetle can be found throughout the Parkway.

Within the project area, elderberry plants are commonly found in areas below 3,000 feet in elevation, especially the El Portal area. Elderberry plants represent a subdominant species within interior live oak forests, interior live oak woodlands, blue oak woodlands, canyon live oak forests, mixed north slope forests, foothill pine/live oak/chaparral woodlands, northern mixed chaparral, interior live oak chaparral, and westside ponderosa pine forests in the project area.

To summarize, the Service believes that the beetle, though wide-ranging, is in long-term decline due to human activities which have resulted in widespread alteration and fragmentation of riparian habitats, and to a lesser extent, upland habitats, which support the beetle.

EFFECTS OF THE PROPOSED ACTION

Direct Effects

Up to 124 elderberry shrubs with stems measuring greater than one inch in diameter could be directly affected by the proposed project. A total of 651 stems large enough to harbor beetle larvae could be directly impacted. All beetle larvae inhabiting these shrubs/stems could be killed during the removal process.

Indirect Effects

Indirect effects to the beetle could result from habitat fragmentation through the removal of 124 shrubs in the proposed project area. Habitat fragmentation can inhibit dispersal and colonization of beetles between remaining habitat areas. Fragmentation may lead to population declines and localized extinctions by dividing a population into smaller, isolated subpopulations in restricted areas. These smaller populations may then be adversely affected by inbreeding depression, genetic drift, and other problems associated with small population size (Primack 1998).

CUMULATIVE EFFECTS

Cumulative effects include the effects of future State, Tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the Yosemite Valley Plan are not considered in this section, because they require separate consultation pursuant to section 7 of the Act.

The Service is not aware of specific projects that might affect the beetle or its habitat that are currently under review by State, county, or local authorities. Nevertheless, continued human population growth in the Central Valley, in general, is expected to drive further development of agriculture, cities, industry, transportation, and water resources in the foreseeable future. Some of these future activities will not be subject to Federal jurisdiction (and thus are considered to enter into cumulative effects), and are likely to result in loss of riparian and other habitats where elderberry shrubs and the beetle occur.

CONCLUSION

After reviewing the current status of the beetle, the environmental baseline for the action area, the effects of the proposed Yosemite Valley Plan, and the cumulative effects, it is the Service's biological opinion that the project, as proposed, is not likely to jeopardize the continued existence of the beetle. Critical habitat has been designated for the beetle. However, this action does not affect areas designated as critical habitat for the beetle, therefore, no destruction or adverse modification of critical habitat is anticipated .

INCIDENTAL TAKE STATEMENT

Section 9(a)(1) of the Act and Federal regulation pursuant to section 4(d) of the Act prohibit the take of endangered and threatened fish and wildlife species, respectively, without special exemption. Take is defined as harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harass is defined by the Service as an intentional or negligent act or omission which creates the likelihood of injury to a listed species by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering. Harm is defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by impairing behavioral patterns including breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the Act provided that such taking is in compliance with this Incidental Take Statement.

The measures described below are non-discretionary, and must be implemented by the NPS in order for the exemption in section 7(o)(2) to apply. The NPS has a continuing duty to ensure that the covered activity complies with the terms and conditions of this incidental take statement. If the NPS fails to adhere to the terms and conditions of the incidental take statement, the protective coverage of section 7(o)(2) may lapse.

AMOUNT OR EXTENT OF TAKE

The Service expects that incidental take of the valley elderberry longhorn beetle will be difficult to detect or quantify. The cryptic nature of these species and their relatively small body size make the finding of a dead specimen unlikely. The species occurs in habitats that make them difficult to detect. Due to the difficulty in quantifying the number beetles that will be taken as a result of the proposed action, the Service is quantifying take incidental to the project as the number of elderberry stems one inch or greater in diameter at ground level (beetle habitat) that could become unsuitable for beetles due to direct or indirect effects as a result of the action. Therefore, the Service estimates that 651 elderberry stems could become unsuitable for use by the beetle as a result of the proposed action.

Upon implementation of the following reasonable and prudent measures, incidental take associated with the Yosemite Valley Plan on the beetle in the form of harm, harassment, or mortality from habitat loss or direct mortality will become exempt from the prohibitions

described under section 9 of the Act for direct impacts; in addition, incidental take in the form of harm, harassment, or mortality associated with the Yosemite Valley Plan will be exempt from the prohibitions described under section 9 of the Act for indirect impacts as a result of the management activities described. The incidental take associated with the proposed action is hereby exempted from prohibitions of take under section 9 of the Act.

EFFECT OF THE TAKE

The Service has determined that this level of anticipated take is not likely to result in jeopardy to the beetle or result in destruction or adverse modification of critical habitat for the beetle.

REASONABLE AND PRUDENT MEASURES

The Service believes the following reasonable and prudent measure is necessary and appropriate to minimize incidental take of the beetle:

1. Minimize the effects of project impacts to the beetle and to elderberry shrubs (habitat) throughout the proposed project area.

TERMS AND CONDITIONS

In order to be exempt from the prohibitions of section 9 of the Act, the NPS must ensure compliance with the following terms and conditions, which implement the reasonable and prudent measure described above. These terms and conditions are non-discretionary.

1. The following terms and conditions implement reasonable and prudent measure one (1):
2. Confine clearing to the minimal area necessary to facilitate project activities.
3. All elderberry shrubs to be avoided within the vicinity of the proposed project would be flagged and surrounded with high-visibility fencing for the duration of construction activities.
4. Movement of heavy equipment to and from the project site shall be restricted to established roadways to minimize habitat disturbance.
5. Restore any damage occurring within 100 feet of elderberry shrubs that are not removed by the project.
6. Prevent the application of all pesticides within 100 feet of all retained elderberry shrubs with stems measuring 1 inch or greater in diameter at ground level.
7. Work crews shall be briefed on the status of the beetle, the need to protect its host plant (elderberries), requirements to avoid damaging elderberry shrubs, and possible penalties for not complying with identified avoidance and minimization measures.
8. To further compensate for impacts to beetles inhabiting 651 elderberry stems that would be lost or otherwise adversely affected due to activities associated with the Yosemite

Valley Plan, the NPS shall establish a 22.55 acre valley elderberry conservation area (conservation area), complete with a 100-foot buffer, within the park boundary in close proximity to one of the impact sites. Within the conservation area, the NPS would be required to establish 2,728 elderberry seedlings or cuttings and 1,096 associated native species plantings according to the Service's Conservation Guidelines for the Valley Elderberry Longhorn Beetle (enclosure). For the purposes of this consultation, the Service has assumed a worst case scenario where 651 stems measuring greater than one inch in diameter would be taken during the construction of the Yosemite Valley Plan (See **Appendix A** for a discussion and calculation of the worst case scenario).

9. The conservation area should be incorporated into the General Management Plan for Yosemite National Park as an area that will be managed specifically for the long-term protection of the valley elderberry longhorn beetle.
10. Transplant all elderberry shrubs with stems measuring one inch in diameter or greater at ground level, following the Service's July 9, 1999, Conservation Guidelines for the Valley Elderberry Longhorn Beetle, from all impacted sites to the conservation area.
11. Develop and implement a Service approved management plan for the conservation area. This plan should provide measures for insuring long-term protection and survival of all elderberry shrubs that are transplanted, planted or naturally occurring within the conservation area. In addition, the plan should include a monitoring program that conforms to the Service's July 9, 1999, Conservation Guidelines for the Valley Elderberry Longhorn Beetle.

Reasonable and prudent measures, with their implementing terms and conditions, are designed to minimize the impact of incidental take on a species that might result from the proposed action. The Service believes that no more than the number of beetles inhabiting 651 elderberry stems will be incidentally taken. If, during the course of the action, this level of incidental take is exceeded, such incidental take would represent new information requiring review of the reasonable and prudent measures provided. The Federal agency must immediately provide an explanation of the causes of the taking and review with the Service the need for possible modification of the reasonable and prudent measures.

REPORTING REQUIREMENTS

The Sacramento Fish and Wildlife Office is to be notified within three working days of the finding of any listed species or any unanticipated take of species addressed in this biological opinion. The Service contact person for this is the Division Chief for Endangered Species at (916) 414-6620.

Any dead or severely injured beetles found (adults, pupae, or larvae) shall be deposited in the Entomology Department of the California Academy of Sciences. The Academy's contact is the Senior Curator of Coleoptera at (415) 750-7239. All observations of valley elderberry longhorn beetles - live, injured, or dead - or fresh beetle exit holes shall be recorded on California Natural Diversity Data Base (NDDDB) field sheets and sent to California Department of Fish and Game, Wildlife Habitat Data Analysis Branch, 1416 Ninth Street, Sacramento, California 95814.

A post-construction compliance report prepared by a Service approved monitoring biologist(s) shall be forwarded to the Chief, Endangered Species Division, at the Sacramento Fish and Wildlife Office within 60 calendar days of the completion of each project. This report shall detail: (i) dates that construction occurred; (ii) pertinent information concerning the applicant's success in meeting project compensation measures; (iii) an explanation of failure to meet such measures, if any, and recommendations for remedial actions and request for approval from the Service, if necessary; (iv) known project effects on federally listed species, if any; (v) occurrences of incidental take of federally listed species, if any; and (vi) other pertinent information.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the Act directs Federal agencies to utilize their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities that can be implemented to further the purposes of the Act, such as preservation of endangered species habitat, implementation of recovery actions, or development of information and data bases.

1. The NPS should assist the Service in the implementation of the Recovery Plan for the Valley Elderberry Longhorn Beetle (U.S. Fish and Wildlife Service 1984).
2. To minimize disturbance to the peregrine falcon, the NPS should avoid any construction related or recreation related activity (i.e. rock climbing) within one mile of an eyrie during the peregrine falcon breeding season.
3. To minimize adverse impacts to the California spotted owl, the following measures should be incorporated into your project description:
4. For all project related activities, including building, road, and parking lot construction, recreation, and watershed restoration, with the potential for disturbance of reproductive behavior in or near suitable California spotted owl habitat, spotted owl surveys should be conducted to identify spotted owl use areas.
 - b. All project related activities that may disturb California spotted owl breeding activity should not occur within one quarter mile of spotted owl nest stands during the breeding season (February 15 to August 15).
 - c. Efforts should be made to retain all live conifers greater than 20 inches diameter at breast height.
 - d. Efforts should be made to retain all hardwoods greater than 10 inches diameter at breast height.
 - e. Efforts should be made to retain all snags with the project area.

4. To minimize potential impacts to and enhance essential habitat for the mountain yellow-legged frog and the Yosemite toad, the NPS should incorporate the following measures into the Yosemite Valley Plan and any future projects within the park that may affect these species:
 - a. Locate all project related recreation and construction activities including building, road, and parking lot construction, out of potential habitat for these species. Special consideration should be given when siting facilities within the Badger and Tioga Pass areas of Yosemite National Park.
 - b. Ensure that runoff from existing and future infrastructure, especially parking lots, does not enter aquatic habitats that may be occupied by these species.
 - c. Remove nonnative trout species from high mountain lakes and streams to allow the recolonization of historic habitat by these species.

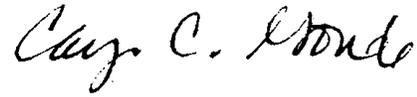

In order for the Service to be kept informed of actions minimizing or avoiding adverse effects or benefitting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION–CLOSING STATEMENT

This concludes formal consultation on the action outlined in the request. As provided in 50 CFR §402.16, reinitiation of formal consultation is required where discretionary Federal agency involvement or control over the action has been maintained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the agency action that may affect listed species or critical habitat in a manner or to an extent not considered in this opinion; (3) the agency action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in this opinion; or (4) a new species is listed or critical habitat designated that may be affected by the action. In instances where the amount or extent of incidental take is exceeded, any operations causing such take must cease pending reinitiation.

Please contact Jason Davis or Maria Boroja of this office at (916) 414-6640 if you have any questions.

Sincerely,

Cay C. Goude
Acting Field Supervisor

Sequencing

Final
Yosemite
Valley
Plan

Supplemental EIS

APPENDIX M – SEQUENCING

Introduction

The implementation of the *Yosemite Valley Plan* will occur over many years and will be accomplished sequentially. Each action related to developing replacement facilities outside Yosemite Valley, relocating functions, rehabilitating and/or removing structures, and redeveloping and restoring areas to natural conditions, is linked to other actions. The purpose of this appendix is to identify the general sequence of the implementation of elements in Alternative 2, the Preferred Alternative. As funding is secured and projects progress through site planning, compliance, and design, more specific implementation information will be available.

Summary of Major Actions

Alternative 2 of the *Final Yosemite Valley Plan/SEIS* includes over 250 actions. These actions have been sorted into nine series of projects, each of which leads to a target that supports the overall goals of the *Yosemite Valley Plan*. These series were developed through analyzing the relationships and links between the individual actions created by physical or operational constraints. As a result of these links, restoration, administration, and transportation actions occur in each of the nine series. These series of projects are not independent; they are often interlinked. The nine series are as follows:

RESOURCE STEWARDSHIP

The goal of this series is to restore former campgrounds, administrative, and lodging areas to natural conditions and to restore or maintain cultural areas. Natural and cultural restoration projects that are directly linked with other geographical or functional groupings can be found in another series.

INTERPRETATION, EDUCATION, AND ORIENTATION

The goal of this series is to expand Yosemite's interpretive services and education services. Project examples include converting the west end of the Yosemite Village area into museum and education space, and installing interpretive exhibits Valleywide. Visitor centers would also be provided near each of the park entrances.

CAMPGROUNDS

The goal of this series is to provide camping outside of the River Protection Overlay through rehabilitation of existing campgrounds and construction of new campgrounds, and to restore former campground areas to natural conditions. Camp 4 (Sunnyside Campground) is not included in this series, but is found in the Yosemite Lodge and Camp 4 series. Project examples include removing the concessioner stable and housing, and constructing a campground check station, amphitheater, campgrounds, and associated restoration to natural conditions.

Y O S E M I T E F A L L S

The goal of this series is to improve visitor experience through redevelopment and redesign of parking areas, bridges, trails, and exhibits and to restore areas to natural conditions in the vicinity of Lower Yosemite Fall.

Y O S E M I T E L O D G E A N D C A M P 4 (S U N N Y S I D E C A M P G R O U N D)

The goal of this series is to enhance the visitor experience and improve resource conditions through reconstruction of Yosemite Lodge, redesign and expansion of Camp 4 (Sunnyside Campground), and restoration of areas to natural conditions.

C U R R Y V I L L A G E

The goal of this series is to enhance the visitor experience through rehabilitation of existing lodging and the construction of new lodging at Curry Village, and to restore former housing and lodging areas to natural conditions. The new dormitories west of Curry Village are in the employee housing series. Project examples include relocating recreation facilities (ice rink, sports rentals, etc.), constructing new cabins, and rehabilitating the Pavilion and Meadow Deck areas (i.e., expanded grocery).

Y O S E M I T E V I L L A G E (V I S I T O R / T R A N S I T C E N T E R A N D M A I N T E N A N C E A R E A S)

The goal of this series is to improve visitor services and transit through the construction of a new visitor and transit center, and consolidated parking in Yosemite Village. Project areas, which are specifically interconnected, are the new visitor/transit center and the redevelopment of the NPS Operations Building (Fort Yosemite) area as a light maintenance area for shuttles, including relocating existing functions and facilities from both areas. While this series covers a majority of the Yosemite Village area, the interpretation and education services at the west end of the Yosemite Village area are included in another series.

C I R C U L A T I O N

The goal of this series is to reduce motor vehicle traffic in the Valley, restore former circulation routes to natural conditions, and improve non-vehicle circulation options. Project examples include expanding and improving the in-Valley shuttle system, developing an out-of-Valley shuttle system, constructing multi-use paved trails, converting Southside Drive to two-way traffic, and developing new picnic areas.

E M P L O Y E E H O U S I N G

The goal of this series is to relocate some employee housing out of the Valley, relocate some housing within the Valley, and to restore some former housing areas to natural conditions. The park would first strive to locate housing outside the park and administrative areas. If needed, project examples include constructing new housing and employee support facilities, and upgrading utility, roads, and pathway systems in new housing locations.

Determining Sequencing: Links Between Actions

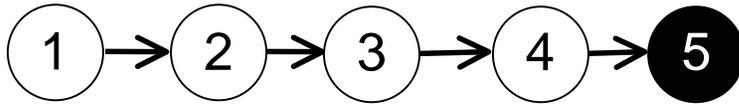

To determine the sequencing of projects, it is important to first establish the links that exist between the various individual actions. These links place requirements or limitations on the order in which projects can occur, and therefore guide the sequencing of actions. Some links are caused by physical constraints, such as the need to first remove structures in areas designated for reuse, prior to constructing new facilities in the same location or prior to designated restorations. Some links are caused by operational goals, such as the desire to minimize disruption to the visitor experience. For example, the existing visitor center would not be removed until a new one is built. Collectively, these links form ordered categories of actions that must be taken for each series to be completed. While there are some variations in the order of actions for specific projects, generally, they fall into the following sequence:

- **One:** Site planning, design work, and possibly regulatory compliance (e.g., wetland delineation) must be completed (see Introduction for Chapter 2 for more information on compliance)
- **Two:** Constructing new, replacement facilities prior to removing old facilities; relocating functions to the new facilities in a method designed to minimize impacts on the visitor experience
- **Three:** Removing or rehabilitating structures in the area
- **Four:** Providing any additional support facilities and functions that are required for the project to be fully operational
- **Five:** The major actions to complete the series can be accomplished to achieve the stated goal

The evolution of a series of projects is best seen through the example on the following page. Following the example, there are nine charts showing the general sequencing for the series of projects in Alternative 2.

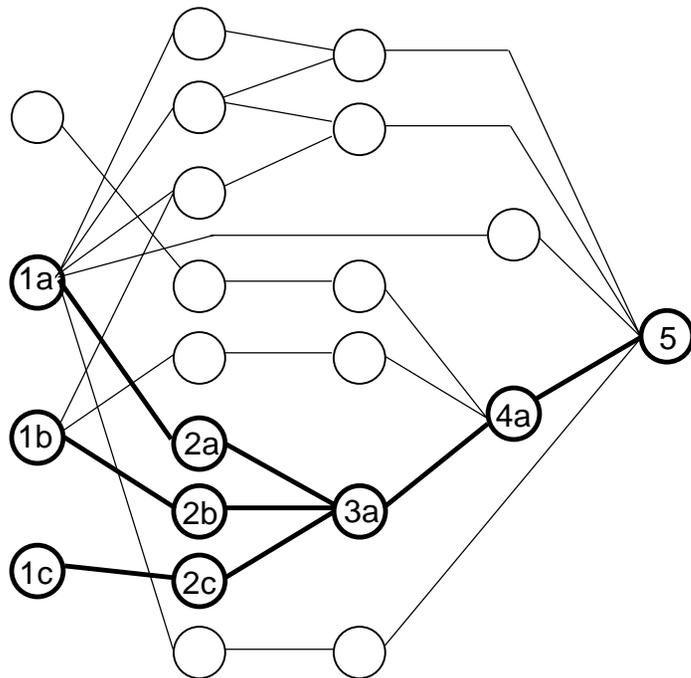

Example: Yosemite Village (Visitor/Transit Center and Maintenance Area)

What is an example of the categories leading to the completion of major actions?

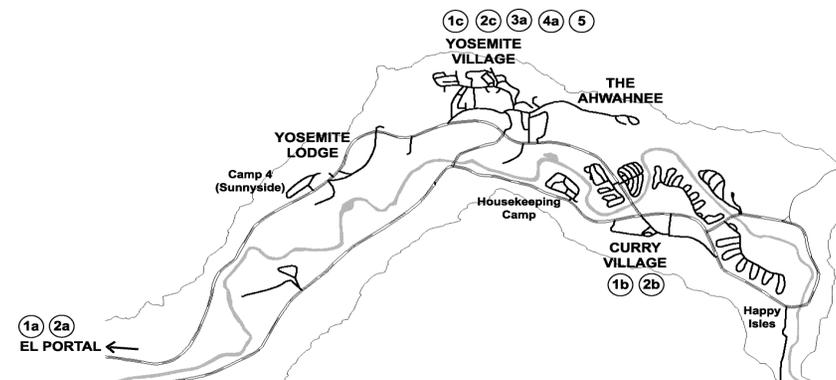

- 1 Conduct necessary site planning, design work, and regulatory compliance
- 2 Construct replacement facilities for displaced functions
- 3 Remove or rehabilitate current facilities in the location of new site
- 4 Construct support facilities for new visitor center and transit operations
- 5 Construct new visitor/transit center in Yosemite Village

The diagram below displays the individual actions within the five categories as a series of projects leading to the end goal. Example links are highlighted and explained to the right.

- 1a El Portal site planning
- 1b Curry Village site planning
- 1c Yosemite Village site planing
- 2a Construct replacement administrative offices
- 2b Construct replacement campground maintenance shops
- 2c Construct replacement firehouse
- 3a Rehabilitate or remove NPS maintenance facilities, firehouse, and offices
- 4a Construct new light maintenance shuttle facilities in NPS maintenance area
- 5 Construct new visitor/transit center

What areas of the park are affected by the sample shown? The graphic below shows how sequenced actions impact several areas in El Portal and the Valley.

Resource Stewardship (Natural and Cultural)

<p>1</p> <p>Conduct necessary site planning/design work/regulatory compliance for locations of new structures and circulation routes</p>	<p>2</p> <p>Construct replacement facilities or realign infrastructure to allow for removals prior to restoration projects</p>	<p>3</p> <p>Remove specified functions and facilities to allow for the restoration of areas</p>	<p>4</p> <p>Create facilities and plans to support Valley restoration efforts</p>	<p>5</p> <p>Restore former campgrounds, administrative, and lodging areas to natural conditions and restore or maintain cultural areas</p>
<p>Conduct site planning for the Curry Village and campground areas</p>	<ul style="list-style-type: none"> ▪ Create replacements for the utilities which are currently in meadows and River Protection Overlay areas ▪ Realign Curry Village Road to allow removal of secondary roads through meadows 	<p>Remove the following functions and facilities:</p> <ul style="list-style-type: none"> ▪ Utilities from Upper and Lower River Campgrounds and southern Ahwahnee Meadow ▪ Ahwahnee and Stoneman Meadow roads ▪ Curry Orchard access road ▪ Housekeeping lodging (164 units) ▪ Relocate Superintendent's House (Residence 1) ▪ Old sewer plant, bulk fuel storage, and sand pit areas in El Portal ▪ The Ahwahnee tennis courts and administrative area east of The Ahwahnee ▪ Temporary Happy Isles snack stand 	<ul style="list-style-type: none"> ▪ Build bridge crossings to re-establish cut-off river channels south of Ahwahnee Bridge ▪ Construct multi-use paved trail segments to reroute circulation around restoration areas ▪ Evaluate additional roads for possible realignment to restore natural water flows ▪ Conduct a Visitor Experience Resource Protection study 	<p>Restore the following areas to natural conditions:</p> <ul style="list-style-type: none"> ▪ Upper and Lower River Campgrounds, North Pines, and a portion of Lower Pines Campgrounds ▪ Former Housekeeping lodging area ▪ Tennis courts and administrative area at The Ahwahnee ▪ Bulk fuel, old sewer plant, and sand pit areas in El Portal ▪ Ahwahnee and Stoneman Meadows <p>Restore or maintain the following cultural areas:</p> <ul style="list-style-type: none"> ▪ Historic landscapes in Yosemite Village area ▪ Lamon and Hutchings Orchards, without further cultivation

Note: In some cases, actions in Category 4 may actually need to be accomplished before removals in Category 3 to ensure that services and operations are not interrupted. It is not always necessary to complete every action in one category prior to beginning actions in later categories, and actions in different categories may occur simultaneously.

Interpretation, Education and Orientation

Conduct necessary site planning, design work, and regulatory compliance for locations of new structures and circulation routes

Create replacement facilities for functions being displaced by the rehabilitation of the Visitor Center, auditoriums and administrative buildings

Remove functions formerly located in the Valley Visitor Center and administrative buildings to allow for rehabilitation into an museum and Interpretation and Education services

Create facilities and plans to support the new Interpretation and Education Complex and expanded interpretive services

Expand Yosemite's interpretive services through the development of west end of mall for new Interpretation and Education services and creation of visitor centers near all park entrances

<p>Conduct site planning for the following:</p> <ul style="list-style-type: none"> ▪ El Portal ▪ Yosemite Village ▪ Areas for new visitor centers near entrance stations 	<p>Construct space in El Portal for the following:</p> <ul style="list-style-type: none"> ▪ National Park Service headquarters ▪ Interpretive administrative support ▪ Administration and supervision <p>Construct space in Yosemite Village for the following:</p> <ul style="list-style-type: none"> ▪ New Visitor/Transit Center ▪ Valley district operations (to be located in both the new district office building and the new firehouse building) ▪ Museum collections 	<p>Remove the following functions from the Visitor Center and administrative buildings:</p> <ul style="list-style-type: none"> ▪ National Park Service headquarters ▪ Interpretive administrative support ▪ Valley district operations and administration (including law enforcement, wilderness, etc.) ▪ Some museum collections 	<p>To support expanded interpretive services:</p> <ul style="list-style-type: none"> ▪ Develop and install valleywide interpretive exhibits and new interpretive trails ▪ Rehabilitate Yosemite Village gathering and program area ▪ Prepare accessibility plan to outline improvement to visitor facilities 	<ul style="list-style-type: none"> ▪ Expand interpretive services in the Valley ▪ Create a new interpretive and education services through rehabilitation of current visitor center, National Park Service headquarters, and Museum/Valley District buildings (including museum) ▪ Construct new visitor centers near Arch Rock, South, Tioga, and Big Oak Flat Entrance Stations
---	---	---	---	--

Note: In some cases, actions in Category 4 may actually need to be accomplished before removals in Category 3 to ensure that services and operations are not interrupted. It is not always necessary to complete every action in one category prior to beginning actions in later categories, and actions in different categories may occur simultaneously.

Campgrounds

Conduct necessary site planning, design work, and regulatory compliance for locations of new structures and circulation routes

Construct replacement facilities for functions being removed or realigned to allow for restoration and rehabilitation of campgrounds

Remove functions and facilities in the campgrounds area to allow for redevelopment or restoration

Construct support facilities for rehabilitated and new campgrounds

Provide camping outside of the River Protection Overlay through the rehabilitation of existing and construction of new campgrounds, and restore former campground areas to natural conditions

<p>Conduct site planning for the Curry Village, campgrounds, and Foresta areas</p>	<p>Create replacements for the following:</p> <ul style="list-style-type: none"> ▪ Backpackers and Group Campgrounds ▪ Campground utilities ▪ Campground amphitheater ▪ Stock staging areas and corrals ▪ Realign Curry Village Road from Southside Drive to campgrounds ▪ Employee housing <p>Create replacement in Foresta or other area for the following:</p> <ul style="list-style-type: none"> ▪ Volunteer group campgrounds ▪ Concessioner administrative stable (possibly through relocation of historic structures) 	<p>Remove the following functions and facilities:</p> <ul style="list-style-type: none"> ▪ Concessioner stable and kennels ▪ Employee housing at Boys Town and stable area ▪ Current campground check-in kiosk ▪ Backpackers, Group and Yellow Pine Campgrounds ▪ Current RV dump station 	<ul style="list-style-type: none"> ▪ Construct a new campground check station and maintenance/ administrative office, including an RV dump station, to support rehabilitated and new campgrounds ▪ Reconstruct wilderness parking area to support backcountry camping 	<ul style="list-style-type: none"> ▪ Construct new campgrounds at Tenaya Creek and new sites at Upper Pines ▪ Rehabilitate Upper and Lower Pines Campgrounds ▪ Restore to natural conditions former Backpackers, Group and Yellow Pine Campgrounds and former concessioner stable and housing area
--	--	--	---	---

Note: In some cases, actions in Category 4 may actually need to be accomplished before removals in Category 3 to ensure that services and operations are not interrupted. It is not always necessary to complete every action in one category prior to beginning actions in later categories, and actions in different categories may occur simultaneously.

Yosemite Falls

Conduct necessary site planning, design work, and regulatory compliance for locations of new structures and circulation routes

Create replacement facilities for functions being displaced by realigned circulation and restoration/redevelopment of parking areas

Remove functions and facilities in the Yosemite Falls area to allow for restoration and redevelopment of parking areas

Construct support facilities for redesigned Yosemite Falls area

Improve visitor experience through redevelopment and redesign of parking areas, bridges, trails, and exhibits, and restore areas to natural conditions in the vicinity of Lower Yosemite Falls

<p>Finish site planning for Yosemite Falls area in the vicinity of Lower Yosemite Fall</p>	<p>Create replacements for the following:</p> <ul style="list-style-type: none"> ▪ Tour bus parking (goes to the new light maintenance area) ▪ Visitor parking (goes to the consolidated parking area for the new transit center) 	<p>Remove the following functions and facilities:</p> <ul style="list-style-type: none"> ▪ Current bus and visitor parking areas ▪ Existing restroom facilities ▪ Pedestrian bridge over Yosemite Creek 	<ul style="list-style-type: none"> ▪ Construct a new restroom facility and shuttle bus stop to support the visitor experience at the redesigned Yosemite Falls area ▪ Construct new vehicle bridge over Yosemite Creek and realign Northside Drive 	<ul style="list-style-type: none"> ▪ Partially redevelop and partially restore to natural conditions the former Yosemite Falls parking area (including the protection of a prehistoric village) ▪ Redesign the Lower Yosemite Fall trails, bridges, and interpretive exhibits
--	---	--	--	---

Note: In some cases, actions in Category 4 may actually need to be accomplished before removals in Category 3 to ensure that services and operations are not interrupted. It is not always necessary to complete every action in one category prior to beginning actions in later categories, and actions in different categories may occur simultaneously.

Yosemite Lodge and Camp 4 (Sunnyside Campground)

Conduct necessary site planning, design work, and regulatory compliance for locations of new structures and circulation routes

Create replacement facilities for functions being removed to allow for Yosemite Lodge reconstruction or circulation realignment

Remove functions and facilities in Yosemite Lodge area to allow for Lodge reconstruction

Construct new or rehabilitate facilities to support guest lodging at Yosemite Lodge and Camp 4

Enhance visitor experience and improve resources through reconstruction of Yosemite Lodge, redesign and expansion of Camp 4 and restore areas to natural conditions

<p>Conduct revised site planning for Yosemite Lodge and Camp 4</p>	<p>Create replacements for the following:</p> <ul style="list-style-type: none"> ▪ Employee housing 	<p>Remove the following facilities:</p> <ul style="list-style-type: none"> ▪ Employee housing ▪ Maple, Juniper, Laurel, and Alder motel units for redevelopment ▪ Birch motel unit when it reaches obsolesce ▪ Hemlock motel unit for restoration ▪ Parking and utilities associated with building removals 	<ul style="list-style-type: none"> ▪ Construct parking and utilities to support reconstructed lodging and expanded camping ▪ Redesign or rehabilitate the Cliff Room, Mountain Bar, gift store, existing registration building, and amphitheater at Yosemite Lodge to support guest lodging ▪ Construct new vehicular bridge over Yosemite Creek and realign Northside Drive 	<ul style="list-style-type: none"> ▪ Reconstruct Yosemite Lodge ▪ Redesign and expand Camp 4 ▪ Restore areas south of realigned Northside Drive and between proposed Indian Cultural Center and Camp 4 to natural conditions
--	--	--	---	---

Note: In some cases, actions in Category 4 may actually need to be accomplished before removals in Category 3 to ensure that services and operations are not interrupted. It is not always necessary to complete every action in one category prior to beginning actions in later categories, and actions in different categories may occur simultaneously.

Curry Village

1
Conduct necessary site planning, design work, regulatory compliance for locations of new structures and circulation routes

2
Create replacement facilities for functions being removed to allow for lodging redevelopment and restoration, or realign circulation

3
Remove functions and facilities in Curry Village to allow for the redevelopment and restoration of the area

4
Construct new or rehabilitate existing facilities in Curry Village to support guest lodging

5
Enhance visitor experience through the rehabilitation of existing and construction of new lodging at Curry Village, and restore former housing and lodging areas to natural conditions

<p>Conduct site planning for the Curry Village and campground areas</p>	<p>Create replacements for the following:</p> <ul style="list-style-type: none"> ▪ Ice rink/recreational facility ▪ Employee housing ▪ Curry Village utilities 	<p>Remove the following functions and facilities:</p> <ul style="list-style-type: none"> ▪ Existing ice rink ▪ Employee housing at Huff House, the Terrace, and Cooks' Cabins ▪ Selected visitor tent cabins 	<ul style="list-style-type: none"> ▪ Redesign and/or rehabilitate Curry Pavilion, the pool, and the amphitheater to support guest lodging ▪ Construct a satellite fire house to support Curry Village area ▪ Realign Curry Village Road from Southside Drive to campgrounds 	<p>Rehabilitate existing or construct new lodging at Curry Village:</p> <ul style="list-style-type: none"> ▪ Rehabilitate cabins without baths and cabins with baths; construct new cabins with baths ▪ Rehabilitate historic studios into lodging <p>Restore former housing and lodging areas to natural conditions:</p> <ul style="list-style-type: none"> ▪ Terrace housing area ▪ Visitor tent cabin area
---	---	---	--	---

Note: In some cases, actions in Category 4 may actually need to be accomplished before removals in Category 3 to ensure that services and operations are not interrupted. It is not always necessary to complete every action in one category prior to beginning actions in later categories, and actions in different categories may occur simultaneously.

Yosemite Village (Visitor/Transit Center and Maintenance Area)

Conduct necessary site planning, design work, regulatory compliance for locations of new structures and circulation routes

Create replacement facilities for functions being displaced from the Yosemite Village area

Remove functions and facilities in the location of the new Visitor/Transit Center and maintenance area

Construct functions and facilities to support the new visitor center and transit operations

Improve visitor services and transit through construction of a new Visitor Center, consolidated parking and Transit Facility in Yosemite Village

<p>Conduct site planning for the following areas:</p> <ul style="list-style-type: none"> ▪ Yosemite Village ▪ Curry Village ▪ El Portal ▪ Foresta 	<p>In Yosemite Village create space for relocation of:</p> <ul style="list-style-type: none"> ▪ Valley district operations ▪ Fire station/emergency medical services ▪ Some concessioner functions in rehabilitated concessioner's warehouse ▪ Art Activity Center <p>In Curry Village create space for relocation of:</p> <ul style="list-style-type: none"> ▪ Campground maintenance ▪ Fire station ▪ Main grocery (through remodeling of Curry Pavilion) <p>In El Portal or other location create space for relocation of:</p> <ul style="list-style-type: none"> ▪ Parkwide administration, supervision, and storage ▪ Jail and public garage ▪ Concessioner's headquarters and short-term warehousing ▪ Employee housing <p>In Foresta create space for relocation of:</p> <ul style="list-style-type: none"> ▪ NPS administrative stable (if viable) ▪ Parkwide Trails Operations 	<p>Remove the following functions and facilities from the Yosemite Village area:</p> <ul style="list-style-type: none"> ▪ Concessioner's headquarters and associated out buildings ▪ Village Store ▪ Village Garage and fire station ▪ Art Activity Center (former bank building) ▪ Employee housing <p>Remove the following functions and facilities from the maintenance area:</p> <ul style="list-style-type: none"> ▪ NPS Operations Building, firehouse, and associated outbuildings ▪ NPS administrative stable ▪ Employee housing 	<p>Construct the following facilities to support visitor experience in the Visitor/Transit Center area:</p> <ul style="list-style-type: none"> ▪ Food service ▪ Retail ▪ Recycling center <p>Construct the following facilities to support transit operations:</p> <ul style="list-style-type: none"> ▪ Shuttle light maintenance in Valley NPS maintenance area ▪ Shuttle heavy maintenance in El Portal ▪ Shuttle fueling and charging stations ▪ Bus day and night parking areas 	<p>Construct the following new facilities at Yosemite Village:</p> <ul style="list-style-type: none"> ▪ Visitor Center ▪ Transit Center ▪ Consolidated parking with a picnic area, including restoration of some existing parking areas
---	--	--	--	--

Note: In some cases, actions in Category 4 may actually need to be accomplished before removals in Category 3 to ensure that services and operations are not interrupted. It is not always necessary to complete every action in one category prior to beginning actions in later categories, and actions in different categories may occur simultaneously.

Circulation

Conduct necessary site planning, design work, regulatory compliance for locations of new structures and circulation routes

Construct facilities or acquire equipment necessary for the replacement or expansion of current circulation methods in the valley

Remove circulation components to allow those locations to be restored to natural conditions

Create systems and facilities to support the reduction of vehicle traffic and changes in circulation options

Reduce vehicle traffic in the Valley, restore former circulation routes to natural conditions, and improve non vehicle circulation options

<p>Conduct site planning for the following areas:</p> <ul style="list-style-type: none"> ▪ El Portal ▪ Foresta ▪ Yosemite Village ▪ Valleywide transportation 	<p>Construct or acquire the following shuttle system facilities to replace or expand current visitor circulation methods:</p> <ul style="list-style-type: none"> ▪ Out-of-Valley parking at El Portal, Badger Pass, and Hazel Green (or Foresta) ▪ New shuttle buses ▪ New Transit Center ▪ Employee housing for shuttle operators <p>Construct multi-use paved trail segments to replace circulation routes at bridge removal sites</p>	<p>Remove the following circulation components:</p> <ul style="list-style-type: none"> ▪ Curry Orchard parking ▪ Selected turnouts and parking lanes throughout the Valley ▪ Scattered parking areas ▪ Sugar Pine Bridge ▪ Stoneman Bridge (pending further evaluation) ▪ Ahwahnee Meadow Road 	<p>Create the following systems to support the reduction of vehicle traffic:</p> <ul style="list-style-type: none"> ▪ New shuttle stops and upgrades on existing shuttle stops, including lockers, bike racks, and new signs ▪ Employee transit system ▪ Traffic information and transportation management system <p>Remove and restore some existing picnic areas and create new picnic areas to better align picnicking options with multi-use paved paths and new shuttle routes</p>	<p>Reduce vehicle traffic in the Valley through:</p> <ul style="list-style-type: none"> ▪ Implementation of the out-of-Valley shuttle system ▪ Implementation of the improved and expanded in-Valley shuttle system ▪ Active management of traffic flow into the Valley <p>Restore former circulation routes to natural conditions at the former Curry Orchard parking, Sugar Pine Bridge, Stoneman Bridge (pending further evaluation), and Ahwahnee Meadow Road locations</p> <p>Improve nonvehicle circulation routes through:</p> <ul style="list-style-type: none"> ▪ Completion of the Valley loop multi-use paved trail ▪ Conversion of Southside Drive into a 2-way road to allow for conversion of Northside Drive into a multi-use paved trail
---	--	--	--	---

Note: In some cases, actions in Category 4 may actually need to be accomplished before removals in Category 3 to ensure that services and operations are not interrupted. It is not always necessary to complete every action in one category prior to beginning actions in later categories, and actions in different categories may occur simultaneously.

Employee Housing

Conduct necessary site planning, design work, and regulatory compliance for locations of new structures and circulation routes

Create replacement facilities for functions being removed for housing projects

Remove functions and facilities in employee housing areas to allow for adaptive reuse, new construction, or restoration of existing locations

Construct functions and facilities to support housing development in El Portal, Wawona, and the Valley

Relocate employee housing out-of-Valley, relocate some within the Valley and restore some former housing areas to natural conditions

<p>For in-Valley housing, conduct site planning for the Curry Village and Village areas</p> <p>For out-of-Valley housing, first, strive to find housing outside the park and administrative areas. If no private housing is found, conduct site planning for the following areas:</p> <ul style="list-style-type: none"> ▪ El Portal ▪ Wawona ▪ Foresta 	<ul style="list-style-type: none"> ▪ Create replacement offices for Yosemite Institute ▪ Some current housing locations will be replaced with the final housing projects ▪ Once site plans are developed, additional replacement needs may be identified 	<p>Remove the following facilities:</p> <ul style="list-style-type: none"> ▪ Hennessey’s Ranch Trailer Village and modular housing ▪ Yosemite Institute office from El Portal Hotel ▪ El Portal Motor Inn cabins ▪ Ahwahnee tent cabins ▪ Cascades housing ▪ Lost Arrow housing ▪ House behind Visitor’s Center ▪ Hospital Row apartments ▪ Remove housing from Arch Rock but adaptively reuse historic structures 	<ul style="list-style-type: none"> ▪ Upgrade utilities and water sources in El Portal and Wawona to support increased usage ▪ Construct employee transit system, commuter lots, and circulation routes at new housing locations ▪ Construct housing support facilities such as wellness centers, cafeterias, and support offices at new housing developments 	<p>Construct new housing complexes in the following locations</p> <ul style="list-style-type: none"> ▪ El Portal ▪ Wawona ▪ Curry Village ▪ Hospital Row dorms ▪ Foresta homes <p>Restore to natural conditions former housing areas at:</p> <ul style="list-style-type: none"> ▪ Ahwahnee tent area ▪ Cascades <p>Rehabilitate:</p> <ul style="list-style-type: none"> ▪ Ahwahnee dorm ▪ Arch Rock
--	---	---	---	--

Note: In some cases, actions in Category 4 may actually need to be accomplished before removals in Category 3 to ensure that services and operations are not interrupted. It is not always necessary to complete every action in one category prior to beginning actions in later categories, and actions in different categories may occur simultaneously.

Implementation

As the implementation of the *Final Yosemite Valley Plan/SEIS* moves forward, the following principles will apply:

- Disruption to the visitor experience will be minimized
- Implementation plans will recognize that additional regulatory compliance may be necessary
- Temporary solutions will be placed only in previously disturbed areas
- Sequencing will take into consideration fiscal responsibility
- The final implementation plan will strive for a mix between site planning, restoration, demolition, and construction activities.

Funding

The following funding table provides an indication of possible funding sources to complete the actions in the *Final Yosemite Valley Plan/SEIS*. As indicated in the plan, opportunities will be sought to develop facilities outside the park if possible (e.g., housing, visitor centers near park entrances, etc.) and thus funding may not be required as indicated below.

Description	Flood Recovery Appropriation	Concession Related & Capital Improvement Fund	Private Fundraising	Anticipated Fee Demo Program through 2004	Line Item or Other Sources	Alt 2 Costs
Resource Stewardship	3.4		12.0	1.3	11.8	28.5
Visitor Experience/ Facilities	54.5				59.1	113.6
Transportation and Circulation	11.6		3.0	27.5	31.3	73.4
Administration/ Infrastructure	0.6	10.0		20.0	20.5	51.1
Employee Housing	36.5				138.6	175.1
Fund Source Total	106.6	10.0	15.0	48.8	261.3	441.7

(Figures are in millions of dollars)

Findings*

Final
Yosemite
Valley
Plan

Supplemental EIS

APPENDIX N – FLOODPLAIN STATEMENT OF FINDINGS FOR THE *FINAL YOSEMITE VALLEY PLAN/SEIS*

This Floodplain Statement of Findings is included in this document for public review to meet the obligations of Executive Order 11988 (*Floodplain Management*) and the NPS Floodplain Management Guideline 1993.

Introduction

The National Park Service has prepared the *Final Yosemite Valley Plan/Supplemental Environmental Impact Statement (SEIS)* to provide direction and propose specific actions to preserve Yosemite Valley's natural, cultural, and scenic resources, and to provide opportunities for high-quality, resource-based experiences for visitors. It is based on the broad goals of the 1980 *General Management Plan* for Yosemite National Park. The purpose of this Floodplain Statement of Findings is to review the *Final Yosemite Valley Plan/SEIS* in sufficient detail to:

- Provide an accurate and complete description of the flood hazard assumed by implementation of the proposed action (without mitigation)
- Provide an analysis of the comparative flood risk among alternative sites
- Describe the effects on floodplain values associated with the proposed action
- Provide a thorough description and evaluation of mitigation measures developed to achieve compliance with Executive Order 11988 (*Floodplain Management*) and the NPS Floodplain Management Guideline 1993

Floodplain Extent

The best available data were used to determine the extent of existing floodplain boundaries and water surface characteristics of the Merced River. The Stantec (2000) and Cella Barr Associates (1998) model was used to analyze the extent of the 2-, 10-, 25-, and 100-year floodplains in the east end of Yosemite Valley between Happy Isles and the west end of Yosemite Lodge. The line that delineates the January 1997 flood extent was used to determine the 100-year floodplain in the west end of Yosemite Valley from the west end of Yosemite Lodge to Pohono Bridge. The U.S. Army Corps of Engineers Merced River study (1998) was used to determine the 100-year and 500-year floodplain in El Portal. The U.S. Army Corps of Engineers floodplain map (1981b) was used to determine the 100-year and 500-year floodplains in Wawona.

The Proposed Action

The *Final Yosemite Valley Plan/SEIS* aims to restore degraded areas and reduce development within the Merced River ecosystem and other highly valued natural and cultural resource environments. It strives to reduce traffic congestion and supports the use of alternative fuels to reduce mobile sources of air pollution. It presents alternatives to expand orientation and interpretation services. It proposes to move nonessential housing, administrative headquarters, offices, and other functions out of Yosemite Valley. Many of these functions would move to the

El Portal Administrative Site on the western boundary of the park. The plan proposes options for the size and placement of parking areas, both within and outside of Yosemite Valley. Attachment A of this Statement of Findings lists the nonexempted actions in the floodplain that are proposed in the *Final Yosemite Valley Plan/SEIS*.

EXISTING STRUCTURES IN THE FLOODPLAIN

The NPS Floodplain Management Guideline 1993 divides actions into the following three groups:

- Class I Actions – include administrative, residential, warehouse and maintenance buildings, and nonexempted (overnight) parking lots
- Class II Actions – those that would create “an added disastrous dimension to the flood event.” Class II actions include schools, clinics, emergency services, fuel storage facilities, large sewage treatment plants, and structures such as museums that store irreplaceable records and artifacts.
- Class III Actions – Class I or Class II Actions that are located in high hazard areas such as those subject to flash flooding.

The regulatory floodplain for Class I actions is the 100-year floodplain. The regulatory floodplain for Class II Actions is the 500-year floodplain. There are no Class III actions in the project area.

Most existing structures in the regulatory floodplain in Yosemite Valley are Class I actions. These structures include five motel units at Yosemite Lodge, the Concessioner Headquarters Building at Yosemite Village, Indian Creek employee housing, 248 units at Housekeeping Camp, the Superintendent’s House (Residence 1), and the concessioner stable. The regulatory floodplain for the museum collection, a Class II action, is the 500-year floodplain. The museum collection is currently housed outside of the 100-year floodplain in Yosemite Village in Yosemite Valley. It may be in the 500-year floodplain, though current data are not available.

The Cascades Diversion Dam is located west of Pohono Bridge in Yosemite Valley. This dam was constructed as part of a small hydroelectric plant. Though the plant is no longer functional, the dam remains in place. Safety engineers have classified the dam as a “high hazard potential structure.”

Most existing structures that are found in the regulatory floodplain in El Portal are Class I actions. These structures include the El Portal Market, the Motor Inn (employee housing), the warehouse complex, and the ranger station. There are two existing Class II actions in the regulatory floodplain in El Portal: the gas station (currently not in use) and the bulk fuel storage facility.

In Wawona, parts of the Pioneer Yosemite History Center are in the regulatory floodplain.

PROPOSED ACTIONS

Under the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS*, all existing nonexempted facilities in Yosemite Valley would be removed from the floodplain except for the following:

- New overnight parking at Yosemite Lodge

- Three Ahwahnee Row houses (all of the Ahwahnee Row houses would remain, but only three are within the regulatory floodplain)
- New visitor services and a transit center at Yosemite Village in the vicinity of the Concessioner Headquarters Building
- 84 units at Housekeeping Camp
- The Yosemite Museum collection

Under the Preferred Alternative in the Final Yosemite Valley Plan/SEIS, the following facilities would remain or could be placed in the floodplain in El Portal:

- Hennessey's Ranch – Mobile homes would be removed from the site and replaced with high-density housing.
- Village Center – This area has been designated for necessary support facilities and commercial services and could also support parking. Parts of this area are in the regulatory floodplain. The exact placement of new and replacement facilities will be determined in subsequent site design. New development could include a community center, post office, enlarged grocery store/deli, laundry, recreation facilities, hair salon, medical clinic, and office spaces.
- The NPS warehouse at Railroad Flat
- The gas station

In Wawona, parts of the Pioneer Yosemite History Center would remain in the regulatory floodplain.

General Characteristics of Flooding in the Area

Floods on the Merced River are of two general types: those that occur during the late fall and winter (November through March) primarily as the result of intense rainfall, and those that occur during the spring and early summer resulting from snowmelt. At the beginning of the wet season the ground is extremely dry, and about 3 to 5 inches of precipitation is required to satisfy the retention storage capacity of the soil before any significant runoff occurs. Later in the season, when the ground may be very wet and there may be a moderate snow cover at the higher elevations, heavy rainfall over the basin causes large flood runoff. An intense storm with a high freezing level may result in flood runoff from almost the entire basin, with as much as 2 inches of snowmelt augmenting the rainfall. Most of the runoff from the Merced River basin occurs from November through July.

Yosemite Valley has a well-developed, relatively wide floodplain that is confined by steep valley walls. The Merced River in Yosemite Valley has a relatively mild slope, with an average of 0.1%. In the middle reach of the Merced River in Yosemite Valley, downstream of Clark's Bridge to the El Capitan moraine, the river flows through a shallow channel approximately 100 to 300 feet wide. Typically, the main channel in this reach has the capacity to convey between 2- and 5-year flow events within the existing channel banks (Stantec 2000). Historic discharge in the river, measured at the Pohono Bridge gauging station, has ranged from a high of about 25,000 cubic

feet per second to a low of less than 10 cubic feet per second. The mean daily discharge rate is about 600 cubic feet per second.

The low flow channel in the middle reach of Yosemite Valley meanders across a broad floodplain and through a series of bends and divides. During 25- and 100-year floods, waters substantially overflow the meandering low-flow channel path and flow straight down the Valley (Stantec 2000). Near Yosemite Lodge and downstream to the El Capitan moraine, flood waters back up against the moraine and tend to be deep and slow. This backwater influence, which reduces flow velocities and increases flow depths, extends about 4.5 miles upstream of the El Capitan moraine past Sentinel Bridge (Stantec 2000). Flow velocities in this backwater area for 2- and 10-year events are actually higher than for 25- and 100-year events in both channel and overbank areas due to the backwater influence (Stantec 2000).

The river channel in El Portal is steep and flow velocities are high. Some lateral shifting can occur during large floods. Flow volumes are not available but should be slightly larger than those of the Pohono Bridge gauging station. The levee at the east edge of Hennessey's Ranch (Trailer Village and Abbieville) prevents water from entering the site and is effective for containing floods that have less than a 100-year recurrence interval.

The floodplain in Wawona along the South Fork is an elongated alluvial valley. The river channel can shift laterally during large floods. In Wawona, upstream of the Big Creek confluence, the average annual flow was 174 cubic feet per second between 1958 and 1968, as measured at the Wawona gauging station, with an estimated maximum flow of 15,000 cubic feet per second in December 1955.

Justification for Use of the Floodplain

NEW DEVELOPMENT

Overnight Parking at Yosemite Lodge. During site design planning, should no reasonable alternative be identified for overnight parking outside of flood limits for the Yosemite Lodge, overnight parking would be placed within the 100-year floodplain. The Yosemite Lodge area is constrained by natural boundaries as well as by development boundaries. If necessary, overnight parking would be placed in a previously developed area that once served as the site of concessioner employee dormitories. The dormitories were removed after the January 1997 flood because of extensive flood damage.

In high flood conditions similar to those of the January 1997 flood, there would be slow water movement in the potential parking area. The new parking would have a minimal effect on flood characteristics during high water levels in relation to previous dormitory structures. The new parking area would prevent the establishment of floodplain-related natural communities such as riparian areas, wetlands, and meadows.

Hennessey's Ranch (Trailer Village and Abbieville). The National Park Service has determined that the El Portal Administrative Site will serve as the principal location for National Park Service employee housing in the *Final Yosemite Valley Plan/SEIS*. This decision was based on a thorough evaluation of potential environmental impacts, and on clear and overwhelming public comment and endorsement. The El Portal Administrative Site lies at the bottom of a steep river

canyon. Available building space is at a premium due limits imposed by the steep terrain, flood dangers, and natural and cultural resources.

The National Park Service evaluated all potential building sites in El Portal and identified seven potential sites for employee housing: Hennessey's Ranch, Hillside West, Hillside East, Village Center, Rancheria Flat, Old El Portal, and Riverside. In the Preferred Alternative of the *Final Yosemite Valley Plan/SEIS*, employee housing would be built at all of these sites except for Riverside. Riverside was removed from consideration for housing for the following reasons: the site contains significant cultural resources; a bridge would need to be constructed to access the site; evacuation would be difficult if the bridge failed during a flood; the site is subject to river erosion; potential impacts to threatened and endangered species could occur; and the site contains high-quality wildlife habitat. All of the remaining potential housing sites are necessary to support the large number of employee housing proposed in El Portal. There are no reasonable alternatives to these six remaining sites, including Hennessey's Ranch.

Village Center. This area has been designated for necessary support facilities and commercial services and could also support parking. Parts of this area are in the floodplain. New development could include a community center, post office, enlarged grocery store/deli, laundry, recreation facilities, hair salon, medical clinic, office spaces, and a gas station. If day-visitor parking were to be developed, this action would be exempted from the NPS *Floodplain Management Guideline* (1993c). Should other facilities be developed in the regulatory floodplain, a subsequent Floodplain Statement of Findings would be developed as a part of future compliance.

EXISTING DEVELOPMENT

Ahwahnee Row Houses (Three Houses in Floodplain). These houses would not be removed because they are important contributing elements to the Yosemite Valley cultural landscape.

Housekeeping Camp. Currently, 248 units at Housekeeping Camp are within the 100-year floodplain. These units are available seasonally, and the area is closed for overnight use in the winter. In the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS*, 84 units at Housekeeping Camp would remain in the floodplain along with six miscellaneous structures (such as bathrooms and the store). The 164 units that are closest to the Merced River would be removed from the floodplain.

Housekeeping Camp has had a long history of traditional use. Housekeeping Camp provides a unique opportunity in Yosemite Valley for a rustic camping experience with "developed camping shelters" that eliminate the need to purchase large amount of camping equipment. Housekeeping Camp is the only place in Yosemite Valley where overnight visitors can cook their own food, other than the campgrounds.

Housekeeping Camp is closed during the winter, when most high-flow events have occurred. There would be sufficient time to evacuate visitors in the unlikely event that evacuation would be necessary. To preserve the floodplain values in areas close to the river while still preserving the unique visitor experience, the 164 units that are closest to the Merced River would be removed and 84 units would remain within the floodplain. The remaining units would have little effect on flood attributes.

The Yosemite Museum Collection. The museum collection would remain in Yosemite Village in proximity to museum exhibit space. This would allow staff to easily move collection objects to and from exhibit space, allow users of the research library to easily access the collection, and protect the collection from risks involved with transfer to another location.

Some parts of the museum collection, in particular the Native American collection, were collected, made, or are strongly associated with the Valley. These articles have more intrinsic value to American Indian and other groups when stored in the Valley.

The NPS Warehouse Complex at Railroad Flat in El Portal. When the first phases of this extensive warehouse/office complex were planned and constructed in 1994 and 1995, U.S. Army Corps of Engineers map data determined that most of the complex would be out of the floodplain. New information based on data from the January 1997 flood (USCOE 1998) has revised this determination to indicate that most of the complex is in the 100-year floodplain. A Statement of Findings would be developed as part of the El Portal design concept process to provide an accurate description of flood hazards at the site and identify necessary mitigation.

The Gas Station in El Portal. There is an immediate need for a gas station in El Portal to serve local residents (numbering about 1,000) and National Park Service and park partner employees who work in El Portal. The closest gas stations to El Portal are located in Midpines and Crane Flat, both of which are about a 30-minute drive from El Portal under good driving conditions. The location of the gas station would be re-evaluated during specific site design process for El Portal.

The Pioneer Yosemite History Center in Wawona. Parts of this interpretive site are located in the regulatory floodplain. Four buildings in the Pioneer Yosemite History Center are listed on the National Register of Historic Places (Jorgensen Studio, Hodgdon Homestead Cabin, Superintendent's House (Residence 1), and Yosemite Transportation Company Office). Whether a historic building retains its original location is an important consideration when assessing its eligibility for the National Register. The buildings would be left in their current locations because moving them would affect their historic integrity and possibly their National Register status.

R E D E V E L O P M E N T

Visitor Services and Transit Center at Yosemite Village. Several areas in Yosemite Valley have been zoned to concentrate intensive visitor use in order to protect the renowned qualities of Yosemite Valley, while still providing services for the public. In the Preferred Alternative in the *Final Yosemite Valley Plan/SEIS*, Yosemite Village would be a major parking area and transportation hub as well as the site for the visitor center. The placement of the visitor center near the transportation hub would ensure that visitors have easy access to orientation tools to help them understand the park, as well as transportation connections to other areas.

Parts of the Yosemite Village area fall within floodplain boundaries, particularly in the vicinity of the existing Concessioner Headquarters Building. Visitor services and a transit center are proposed for redevelopment in this area. Site-specific design has not been completed, and the specific nonexempted actions that would fall within floodplain boundaries are not known. If day-visitor parking were developed, this action would be exempted from the NPS *Floodplain*

Management Guideline (1993c). Should structures to support visitor services be proposed within the floodplain, a subsequent Floodplain Statement of Findings would be developed as a part of future compliance.

Description of Site-Specific Flood Risk

Y O S E M I T E V A L L E Y

Floods of consequence in Yosemite Valley always occur with some warning. It takes a prolonged period of intense rain for at least 24 hours to create flood conditions. Risks to humans can typically be mitigated by warning and evacuation.

In Yosemite Valley, the character of flooding varies in different locations because of local hydraulic controls. From Clark's Bridge to Housekeeping Camp in the east Valley, the Merced River floods areas outside the main river channel with shallow, swift flows that cut across meander bends. Near Yosemite Lodge and downstream to the El Capitan moraine, flood waters back up against the moraine and dense vegetation. Flood waters in this area are of low velocity and significant depths. At Housekeeping Camp, velocities are relatively higher with lower depths.

The historic discharge in the river, measured at the Pohono Bridge gauging station, has ranged from a high of about 25,000 cubic feet per second to a low of less than 10 cubic feet per second. The mean daily discharge rate is about 600 cubic feet per second.

E L P O R T A L

The El Portal area is located in an extremely high energy, bedrock-controlled reach with little high floodplain suitable for development. Due to high flood velocities, infrastructure and developments must be located above flood levels or be massively armored. Evacuation of flood-prone areas should be mandatory during flood events of any appreciable size (National Park Service 1997g).

W A W O N A

Floods of consequence in Wawona always occur with some warning. It takes a prolonged period of intense rain for at least 24 hours to create flood conditions. Risks to humans can typically be mitigated by warning and evacuation.

Design Or Modifications To Minimize Harm To Floodplain Values Or Risks To Life And Property

G E N E R A L M I T I G A T I O N

The design of all new structures would incorporate methods for minimizing flood damage, as contained in the National Flood Insurance Program "Floodplain Management Criteria for Flood-Prone Areas" (CFR 44, 60.3) and in accordance with any local, county, or state requirements for flood-prone areas. Furthermore, the park staff would maintain an active flood evacuation plan. The plan details responsibilities of individual park employees for advanced

preparedness measures; removing or securing park property; records and utility systems; monitoring communication; and conducting rescue and salvage operations.

Impacts on the site's resources would be minimized and mitigated. The design for impermeable areas would provide for appropriate drainage to ensure that natural resources are not further degraded by associated runoff following hydrologic events.

Housekeeping Camp, Ahwahnee Row Houses, and Ahwahnee Cottage

- Plans would be made for timely and safe evacuation of Housekeeping Camp and the Ahwahnee Row houses in times of rising water.

S I T E - S P E C I F I C M I T I G A T I O N – S U B S E Q U E N T S T A T E M E N T
O F F I N D I N G S N E C E S S A R Y

Overnight Parking at Yosemite Lodge

- Site-specific design has not been completed for this area, and specific overnight parking needs have not been determined. If overnight parking were developed, a subsequent Floodplain Statement of Findings would be developed as a part of future compliance.
- Design of overnight parking would allow minimal resistance to flood waters to minimize impacts on natural flood processes.
- Plans would be made for timely evaluation of the lodge area in times of rising water. Evacuation routes would be outside the flood levels, along surfaced pedestrian/bicycle routes that are wide enough for vehicles.

Parking and Visitor Services at Yosemite Village

- Site-specific design has not been completed for this area, and it is not possible to determine the specific nonexempted actions that would fall within floodplain boundaries. If day-visitor parking were developed, this action would be exempted from the NPS *Floodplain Management Guideline* (1993c). Should structures to support visitor services be proposed within the floodplain, a subsequent Floodplain Statement of Findings would be developed as a part of future compliance.
- Plans would be made for timely and safe evaluation of the Yosemite Village area in times of rising water.

Yosemite Museum Collection

- The site-specific location and plans for the museum collection have not been determined. A subsequent Floodplain Statement of Findings would be developed as a part of future compliance.

- All museum storage facilities would have permanent foundations and finished floor elevations above the current 500-year flood high-water line and be engineered to withstand inundation.

The Village Center in El Portal

- Site-specific locations for necessary support facilities and commercial services have not been determined. A Floodplain Statement of Findings would be developed as part of future site design and compliance.

The Gas Station in El Portal

- The site-specific location for the gas station in El Portal has not been determined. A subsequent Floodplain Statement of Findings would be developed as a part of future site design and compliance.
- Facilities would be built to avoid or withstand the 500-year flood.

Hennessey's Ranch

- The site-specific design for employee housing at Hennessey's Ranch has not been developed. A subsequent Floodplain Statement of Findings would be developed as a part of future site design and compliance.
- As many structures as possible would be built on the high island in the center of the area outside of the 100-year floodplain.
- All dwellings would have permanent foundations and finished floor elevations above the current 100-year flood high-water line and be engineered to withstand inundation.
- The existing levee would be rebuilt to withstand the 100-year flood.
- A "community open space" or riparian buffer zone would be left adjacent to the river. This would retain more space for the Merced River to spread out horizontally, and the levee would not need to be as high.
- Along with raising the levee, appropriate measures would be taken to prevent flood waters from entering the area via the Highway 140 corridor below the highway bridge.
- An emergency evacuation plan would be developed. The plan would designate a specific river stage at which evacuation of people would begin.

The NPS Warehouse Complex at Railroad Flat

- New information developed after the complex was constructed shows that a large part of the complex is within the 100-year floodplain. A Statement of Findings would be developed as part of the El Portal design process to provide an accurate description of flood hazards at the site and identify necessary mitigation. Mitigation measures would be evaluated for this area, including raising the elevation of the building and constructing a floodwall.
- An emergency evacuation plan would be developed. The plan would designate a specific river stage at which evacuation of people would begin.

Conclusion

The Preferred Alternative would substantially reduce potentially hazardous conditions associated with flooding by relocating facilities out of the floodplain in Yosemite Valley. Facilities that would be removed from the floodplain include five motel units at Yosemite Lodge, Indian Creek employee housing, 164 units at Housekeeping Camp, the Superintendent's House (Residence 1), three Ahwahnee Row houses, and the concessioner stable. The Preferred Alternative would have beneficial impacts on floodplain values by linking river-associated wetlands and meadows that have been degraded or fragmented into one large and dynamic, river-governed ecosystem. However, the National Park Service has determined that there is no practicable alternative to maintaining the following within the regulatory floodplain: overnight parking at Yosemite Lodge, three Ahwahnee Row houses, new visitor services and a transit center at Yosemite Village, and 84 units at Housekeeping Camp. In El Portal, there is no practicable alternative to high-density employee housing at Hennessey's Ranch; support facilities, commercial services, and parking at Village Center; the National Park Service warehouse at Railroad Flat; and the gas station in the regulatory floodplain. These facilities are not within areas subject to frequent flooding, and with the early warning system and evacuation plan in use, the risk to human safety would be minimized.

The National Park Service concludes that the Preferred Alternative would reduce the impacts of potentially hazardous conditions associated with flooding in Yosemite Valley. Mitigation and compliance with regulations and policies to prevent impacts to water quality, floodplain values, and loss of property or human life would be strictly adhered to during and after the construction. Individual permits with other federal and cooperating state and local agencies would be obtained prior to construction activities. No long-term adverse impacts would occur from the proposed actions. Therefore, the National Park Service finds the Preferred Alternative to be acceptable under Executive Order 11988 for the protection of floodplains.

Scot Miller

The cover photographs for all volumes of this document were taken by nature and scenic photographer Scot Miller. Since his first visit to Yosemite in 1990, Miller has tried to capture the magnificence and grandeur of the park. Through his photography he hopes to inspire others to have an appreciation and understanding of Yosemite's uniqueness, along with its value as a national treasure worth preserving for future generations. He currently lives in Carrollton, Texas.

Lawrence Ormsby

The illustrations in this document were drawn in pencil and pen and ink by Lawrence Ormsby, partner in Ormsby and Thickstun Interpretive Design. For more than two decades, Ormsby has worked with National Park Service interpreters and historians to prepare illustrations for interpretive publications and exhibits. This year he received the National Park Service Director's Award for his illustration and cartography work in *A Land in Motion: California's San Andreas Fault*. He currently lives in Cave Creek, Arizona.

List Of Comments

1.	The Yosemite Valley Plan should establish a car-pool system for Yosemite National Park visitors	347
2.	The National Park Service should implement Alternative 2 of the Yosemite Valley Plan.....	78
3.	The Yosemite Valley Plan should emphasize the protection of the Merced River corridor	103
4.	The Yosemite Valley Plan should limit the number of people allowed to visit Yosemite National Park.....	161
5.	The Yosemite Valley Plan should clarify the implementation timeframe for the day-visitor reservation system	337
6.	The Yosemite Valley Plan should clarify the connection between the day-visitor reservation system and the campground reservation system.....	337
8.	The Yosemite Valley Plan should not reduce the number of parking spaces in Yosemite Valley.....	308
10.	The National Park Service should select the No Action Alternative of the Yosemite Valley Plan.....	77
11.	The Yosemite Valley Plan should require the retention of bridges in Yosemite Valley.....	297
12.	The Yosemite Valley Plan should retain historic bridges in Yosemite Valley	144
13.	The Yosemite Valley Plan should establish additional campsites in Yosemite Valley.....	216
15.	The Yosemite Valley Plan should encourage the development of moderately priced food services in Yosemite National Park.....	266
16.	The National Park Service should not proceed with the Yosemite Valley Plan until the Merced River Plan is completed.....	27
17.	The Yosemite Valley Plan should increase shuttle services for Yosemite National Park visitors	354
18.	The Yosemite Valley Plan should prohibit conference services in Yosemite Valley.....	265
19.	The Yosemite Valley Plan should not provide for recreational vehicle hookups in Yosemite Valley.....	231
20.	The Yosemite Valley Plan should not require the development of a visitor center in Yosemite Valley.....	196
21.	The Yosemite Valley Plan should emphasize overnight accommodations in Yosemite Valley.....	208
22.	The Yosemite Valley Plan should require that concessioner campgrounds be separated from public campgrounds in Yosemite Valley	226
24.	The Yosemite Valley Plan should restrict the use of generators in Yosemite Valley campgrounds.....	231
25.	The Yosemite Valley Plan should not require the construction of Yellow Pine Campground in Foresta.....	223
26.	The Yosemite Valley Plan should increase camping opportunities outside Yosemite Valley.....	221
29.	The Yosemite Valley Plan should retain Northside Drive for motor vehicle traffic.....	282
30.	The Yosemite Valley Plan should require the closure of Northside Drive to motor vehicle traffic.....	284
31.	The Yosemite Valley Plan should limit parking in Yosemite Valley.....	315
32.	The Yosemite Valley Plan should prohibit the construction of transfer facilities in Yosemite Valley.....	318
35.	The Yosemite Valley Plan should not limit the number of vehicles allowed into Yosemite Valley.....	333
36.	Concern: The National Park Service should consider transportation alternatives which address the seasonal fluctuations in traffic volume.....	335

38.	The Yosemite Valley Plan should restrict stock use in Yosemite Valley.....	182
40.	The Yosemite Valley Plan should not emphasize natural restoration and preservation in Yosemite Valley.....	83
41.	The Yosemite Valley Plan should establish low-impact transportation alternatives for Yosemite Valley.....	341
42.	The Yosemite Valley Plan should not eliminate employee housing units from Yosemite Valley.....	389
43.	The Yosemite Valley Plan should establish a convenient, affordable public transportation system for Yosemite National Park visitors.....	350
45.	The Yosemite Valley Plan should restrict the number of vehicles allowed into Yosemite National Park.....	334
46.	The Yosemite Valley Plan should require the removal of orchards in Yosemite Valley.....	142
47.	The Yosemite Valley Plan should promote the needs of future generations.....	14
48.	The Yosemite Valley Plan should balance conservation with visitor enjoyment.....	16
49.	The Yosemite Valley Plan should require decreased development in Yosemite Valley.....	15
50.	The Yosemite Valley Plan should adhere to the principles contained in the 1980 General Management Plan.....	24
51.	The National Park Service should clarify the close of comment date for the Yosemite Valley Plan.....	56
52.	The National Park Service should ensure that employee housing in Foresta meets specific construction and design criteria.....	395
53.	The Yosemite Valley Plan should retain Yosemite National Park Headquarters in Yosemite Valley.....	378
54.	The Yosemite Valley Plan should provide visitor access trails and viewing areas for heavily used sites in Yosemite Valley.....	175
55.	The Yosemite Valley Plan should ensure access to Yosemite Valley for all people.....	159
56.	The Yosemite Valley Plan should prohibit the construction of parking facilities outside of Yosemite Valley.....	324
57.	The Yosemite Valley Plan should require improvements to the trail system in Yosemite Valley.....	291
58.	The Yosemite Valley Plan should emphasize preservation of natural resources in Yosemite Valley.....	84
59.	The Yosemite Valley Plan should clarify whether the travel restrictions for campers in Yosemite Valley also apply to overnight lodgers.....	338
60.	The Yosemite Valley Plan should require restoration of the Yosemite Valley Railroad.....	345
61.	The National Park Service should modify Alternative 2 of the Yosemite Valley Plan.....	78
62.	The National Park Service should not select Alternative 2 of the Yosemite Valley Plan.....	79
63.	The National Park Service should modify Alternative 5 of the Yosemite Valley Plan.....	81
64.	The Yosemite Valley Plan should address the needs of religious and spiritual groups in Yosemite Valley.....	258
65.	The Yosemite Valley Plan should establish multi-use facilities in Yosemite Valley.....	257
67.	The National Park Service should ensure safe access to public areas in Yosemite Valley.....	174
68.	The Yosemite Valley Plan should limit commercial tour bus operations in Yosemite Valley.....	359
69.	The Yosemite Valley Plan should limit commercial facilities in Yosemite Valley.....	264
71.	The Yosemite Valley Plan should retain rustic lodging units in Yosemite Valley.....	243
72.	The Yosemite Valley Plan should reduce the number of Housekeeping Camp lodging units.....	245
73.	The Yosemite Valley Plan should relocate rather than remove the Housekeeping Camp units eliminated for protection of the Merced River.....	244

74.	The Yosemite Valley Plan should emphasize air quality protection in Yosemite Valley.....	124
75.	The Yosemite Valley Plan should include a comparative analysis of gasoline and alternative fuels emission impacts on Yosemite Valley.....	127
76.	The Yosemite Valley Plan should establish tent-only campgrounds in Yosemite Valley.....	225
78.	The Yosemite Valley Plan should establish a group campground in Yosemite Valley	234
79.	The Yosemite Valley Plan should provide for some first-come, first-served campgrounds in Yosemite Valley	213
80.	The National Park Service should conduct a safety analysis of proposed changes to Southside Drive traffic circulation	286
81.	The Yosemite Valley Plan should retain existing traffic circulation patterns in Yosemite Valley.....	275
82.	The National Park Service should retain the tennis courts at Ahwahnee Lodge	189
83.	The National Park Service should emphasize affordability of overnight accommodations in the Yosemite Valley Plan.....	210
84.	The Yosemite Valley Plan should address enforcement of parking regulations in Yosemite Valley.....	329
85.	The Yosemite Valley Plan should restrict campfires in Yosemite Valley	214
86.	The Yosemite Valley Plan should provide adequate facilities for stock users in Yosemite Valley.....	178
87.	The Yosemite Valley Plan should allow stock use in Yosemite National Park	176
89.	The Yosemite Valley Plan should retain medical and dental facilities in Yosemite Valley	267
90.	The Yosemite Valley Plan should require the implementation of the Yosemite Falls Project	34
91.	The Yosemite Valley Plan should require the construction of parking facilities outside of Yosemite Valley.....	320
92.	The Yosemite Valley Plan should address potential increased diesel emission impacts in Yosemite Valley under proposed actions.....	126
93.	The Yosemite Valley Plan should address air pollution impacts on vegetation in Yosemite Valley.....	130
94.	The Yosemite Valley Plan should not make public transportation mandatory for visitors to Yosemite Valley.....	351
95.	The Yosemite Valley Plan should emphasize resource protection	14
96.	The Yosemite Valley Plan should not require the replacement of facilities lost to floods in Yosemite Valley.....	205
97.	The Yosemite Valley Plan should retain the existing campsites located in the Lower Pines Campground.....	223
98.	The Yosemite Valley Plan should provide for adequate recreational vehicle campsites in Yosemite Valley.....	229
99.	The Yosemite Valley Plan should retain vehicle service facilities in Yosemite Valley	268
100.	The Yosemite Valley Plan should establish controls for domestic animals in Yosemite Valley.....	262
101.	The Yosemite Valley Plan should acknowledge the value of human cultural sites in Yosemite Valley.....	134
102.	The Yosemite Valley Plan should not implement the Yosemite Creek Bridge Project	301
103.	The Yosemite Valley Plan should clarify the rationale for eliminating parking lots in Yosemite Valley.....	307
104.	The Yosemite Valley Plan should establish an intensive trout management program for the Merced River	120
105.	The Yosemite Valley Plan should require environmentally sound construction practices in Yosemite Valley.....	255

106.	The Yosemite Valley Plan should detail the impacts of relocating the commercial stables to Foresta.....	185
107.	The Yosemite Valley Plan should prohibit the sale of alcoholic beverages in Yosemite Valley	267
108.	The Yosemite Valley Plan should require the removal of all private concessions from Yosemite Valley	264
109.	The Yosemite Valley Plan should limit the number of overnight accommodations in Yosemite Valley	209
110.	The Yosemite Valley Plan should provide for the construction of visitor centers in gateway communities	196
111.	The Yosemite Valley Plan should provide for clergy housing in Yosemite Valley.....	258
112.	The Yosemite Valley Plan should provide drinking water at trailheads in Yosemite Valley.....	259
113.	The Yosemite Valley Plan should prohibit the construction of traffic check stations in west Yosemite Valley	330
114.	The National Park Service should reconsider incorporating YARTS into the Yosemite Valley Plan.....	364
115.	The National Park Service should extend the final decision date of the Yosemite Valley Plan.....	55
116.	The Yosemite Valley Plan should contain specific implementation time lines	44
117.	The Yosemite Valley Plan should retain cabin lodging units in Yosemite Valley	250
118.	The National Park Service should consult with accessibility design experts regarding the Yosemite Valley Plan.....	62
119.	The Yosemite Valley Plan should require a reduction in the number of Curry Village tent cabins.....	246
120.	The Yosemite Valley Plan should retain the Yosemite Lodge in its current condition	253
121.	The National Park Service should select Alternative 3 of the Yosemite Valley Plan	79
122.	The National Park Service should select Alternative 4 of the Yosemite Valley Plan	80
123.	The National Park Service should involve people with disabilities and mobility limitations in accessibility planning for Yosemite Valley	163
124.	The Yosemite Valley Plan should clarify operational details of off-season shuttle bus service in Yosemite Valley.....	357
125.	The National Park Service should improve education and orientation programs in Yosemite Valley	192
126.	The National Park Service should allow vehicle access to Mirror Lake	281
127.	The Yosemite Valley Plan should provide sufficient lane width on Southside Drive to accommodate motor vehicles and bicycles	288
128.	The National Park Service should restrict motorized recreational activities in Yosemite Valley	186
129.	The Yosemite Valley Plan should emphasize lodging accommodations in Yosemite Valley	236
130.	The Yosemite Valley Plan should restrict parking to recognized parking areas in Yosemite National Park	316
131.	The National Park Service should build underground parking facilities in Yosemite Valley	314
132.	The National Park Service should re-evaluate the connections between traffic congestion and the amount of overnight accommodations in Yosemite Valley.....	209
136.	The Yosemite Valley Plan should require overnight visitors to use public transportation in Yosemite Valley	338
137.	The Yosemite Valley Plan should establish a day-visitor reservation system in Yosemite Valley	337

138.	The National Park Service should clarify how the Yosemite Valley Plan will affect visitors with disabilities.....	164
139.	The National Park Service should provide orientation opportunities and visitor services at the proposed out-of-Valley parking facilities	194
140.	The Yosemite Valley Plan should require the removal of public swimming pools from Yosemite Valley.....	190
141.	The National Park Service should consolidate the research library, museum collection, and archives in Wawona	201
142.	The National Park Service should improve the hiking trail system in Yosemite Valley.....	173
143.	The National Park Service should evaluate the feasibility of auto-free time periods in Yosemite Valley.....	333
144.	The Yosemite Valley Plan should emphasize affordability in new accommodations at Yosemite Lodge.....	253
145.	The National Park Service should evaluate the need for winter commercial attractions in Yosemite Valley.....	204
146.	The Yosemite Valley Plan should encourage the development of retail services outside Yosemite Valley.....	205
147.	The Yosemite Valley Plan should establish a recreational vehicle campground in the west end of Yosemite Valley.....	229
148.	The National Park Service should establish new picnic facilities in Yosemite Valley	188
149.	The National Park Service should re-establish day camp facilities for children in Yosemite Valley.....	259
150.	The National Park Service should establish an accessible grocery store for campers in Yosemite Valley.....	266
151.	The Yosemite Valley Plan should establish additional walk-in or walk-to campgrounds in Yosemite Valley.....	232
152.	The National Park Service should maintain a continuous ranger presence in Yosemite Valley campgrounds	215
153.	The National Park Service should establish a gas station outside the Yosemite Village area.....	268
154.	The National Park Service should relocate the commercial river rafting facility to the Lower River Campground area	172
155.	The Yosemite Valley Plan should provide sufficient evidence that no suitable employee housing sites are available outside of Yosemite National Park	403
156.	The Yosemite Valley Plan should establish reduced speed limits on Southside Drive	329
157.	The Yosemite Valley Plan should require the construction of a new road to East Valley campgrounds.....	280
158.	The Yosemite Valley Plan should not propose the construction of parking facilities in undeveloped areas of Yosemite Valley.....	317
159.	The National Park Service should recognize the shortcomings of shuttle bus transportation for Yosemite National Park visitors	355
160.	The Yosemite Valley Plan should prohibit the relocation of Northside Drive in the Yosemite Lodge area	284
161.	The Yosemite Valley Plan should specify design requirements for proposed parking facilities both inside and outside of Yosemite Valley.....	303
162.	The National Park Service should consider the impacts of mandatory public transportation on Yosemite National Park visitors	351
163.	The Yosemite Valley Plan should require specific features in the design of lodging units	241
164.	The Yosemite Valley Plan should not establish employee housing in El Portal	405

165.	The Yosemite Valley Plan should eliminate employee housing in the Yosemite Lodge area.....	393
166.	The National Park Service should consider congestion-reducing measures in Yosemite Valley that are less costly than those currently proposed	273
167.	The Yosemite Valley Plan should address safety of public transportation vehicles in Yosemite Valley	352
168.	The Yosemite Valley Plan should require the removal of bridges from Yosemite Valley	87
169.	The National Park Service should clarify how the Yosemite Valley Plan complies with the Wild and Scenic Rivers Act	36
170.	The Yosemite Valley Plan should require the removal of all employee housing in Yosemite Valley	388
171.	The National Park Service should establish an emergency response plan for Yosemite Valley	261
172.	The Yosemite Valley Plan should prohibit enlarging the parking area at Tunnel View (Inspiration Point).....	325
173.	The Yosemite Valley Plan should emphasize the use of small, unobtrusive parking lots throughout Yosemite Valley.....	317
174.	The Yosemite Valley Plan should require that some roads in Yosemite Valley be replaced with pedestrian and bicycle trails.....	292
175.	The Yosemite Valley Plan should establish housing in Wawona only for those employees who work in the southern portion of Yosemite National Park.....	397
176.	The National Park Service should implement a traveler information and traffic management system in Yosemite National Park.....	364
177.	The National Park Service should examine the effects of locating employee housing in El Portal on the community and its infrastructure	404
178.	The National Park Service should clarify whether the Yosemite Valley Plan will be applied seasonally or perennially	19
179.	The National Park Service should consider location and public transportation accessibility when scheduling Yosemite Valley Plan public meetings.....	60
180.	The National Park Service should develop an alternative that protects the natural resources of Yosemite Valley	66
181.	The National Park Service should clarify the Yosemite Valley Plan’s management direction regarding floodplain development.....	95
182.	The Yosemite Valley Plan should cite data supporting the conclusion that transportation system proposals will enhance visitor experience in Yosemite National Park	272
183.	The Yosemite Valley Plan should address the cumulative environmental impacts of implementing transportation system proposals in Yosemite National Park	270
184.	The National Park Service should conduct an evaluation of the Yosemite Valley planning process	22
185.	The National Park Service should provide a concise executive summary of the Yosemite Valley Plan.....	57
186.	The Yosemite Valley Plan should establish employee housing in Wawona	395
187.	The National Park Service should extend the public comment period for the Yosemite Valley Plan.....	55
188.	The National Park Service should provide timely responses to public information requests regarding the Yosemite Valley Plan	61
189.	The National Park Service should not increase entrance fees to Yosemite National Park.....	166
190.	The Yosemite Valley Plan should limit international visitors’ access to Yosemite National Park	162

192.	The National Park Service should improve its analysis of the impacts of the Yosemite Valley Plan on communities outside Yosemite Valley.....	370
193.	The National Park Service should construct bike path dividers along Northside and Southside Drives rather than change traffic circulation patterns.....	285
195.	The Yosemite Valley Plan should include clear documentation supporting air quality findings regarding Yosemite Valley	125
196.	The Yosemite Valley Plan should include measures to inform the public of potential health threats resulting from vehicle emissions in Yosemite Valley.....	129
197.	The Yosemite Valley Plan should include an analysis of health risks to Yosemite National Park visitors resulting from diesel emission exposure	128
198.	The National Park Service should clarify how Outstandingly Remarkable Values were established for Yosemite Valley and Merced River planning efforts.....	28
199.	The National Park Service should schedule additional Yosemite Valley Plan public meetings	60
200.	The Yosemite Valley Plan should not establish employee housing in Wawona.....	397
201.	The National Park Service should consider the effects of locating employee housing outside Yosemite Valley on employee recruitment and retention	388
203.	The Yosemite Valley Plan should retain existing visitor service facilities and amenities in Yosemite Valley.....	207
204.	The Yosemite Valley Plan should require the consolidation of commercial development in one area of Yosemite Valley.....	206
205.	The National Park Service should consider establishing campgrounds within the Yosemite Valley floodplain for seasonal use.....	221
206.	The Yosemite Valley Plan should require that visitor amenities be located conveniently for campground users in Yosemite Valley.....	215
207.	The Yosemite Valley Plan should relocate the proposed South Camp campground to the North Pines Campground area.....	224
208.	The Yosemite Valley Plan should establish a new campground at the present concessioner stable location	224
209.	The Yosemite Valley Plan should restrict the size of recreational vehicles permitted in Yosemite Valley.....	230
210.	The Yosemite Valley Plan should establish campgrounds for small recreational vehicles in Yosemite Valley	230
211.	The Yosemite Valley Plan should establish additional drive-in campgrounds in Yosemite Valley.....	226
212.	The Yosemite Valley Plan should retain Yellow Pine campground as a group site.....	234
213.	The Yosemite Valley Plan should not establish new lodging accommodations in Yosemite Valley.....	237
214.	The Yosemite Valley Plan should require the construction of parking facilities in Yosemite Valley.....	312
215.	The Yosemite Valley Plan should prohibit improvements to the El Portal Road.....	290
216.	The National Park Service should allow bicycles and wheelchairs on transit buses in Yosemite Valley.....	358
217.	The Yosemite Valley Plan should retain commercial trail ride operations in Yosemite Valley.....	177
218.	The National Park Service should remove the Ahwahnee Hotel from the highly valued resource area	254
219.	The National Park Service should build a natural history museum outside of Yosemite Valley.....	200
220.	The National Park Service should remove the Ansel Adams Gallery from Yosemite Valley.....	202

221.	The Yosemite Valley Plan should reflect the needs of all user groups in Yosemite Valley	58
223.	The National Park Service should allow special provisions for clean air vehicle users in Yosemite Valley	348
224.	The Yosemite Valley Plan should retain longstanding recreational facilities in Yosemite Valley	169
225.	The Yosemite Valley Plan should comply with the Organic Act of 1916.....	42
228.	The Yosemite Valley Plan should retain roadside parking in Yosemite Valley	310
229.	The Yosemite Valley Plan should clarify the negative impacts of bridges on the Merced River.....	87
230.	The National Park Service should reassess the Yosemite Valley Plan’s requirement for the restoration of oak populations in Yosemite Valley.....	114
232.	The National Park Service should work with CALTRANS to construct a combined Yosemite National Park entrance and visitor center at Yosemite Junction.....	198
233.	The Yosemite Valley Plan should protect meadow, black oak, and riparian areas from pedestrian traffic	112
234.	The National Park Service should create a plan that equitably distributes access to opportunities in Yosemite Valley	160
235.	The Yosemite Valley Plan should assign vehicles to specific parking lots during peak times and seasons.....	310
236.	The Yosemite Valley Plan should require noise abatement devices on all buses in Yosemite Valley	368
237.	The National Park Service should consider a rotation system for restoration of campgrounds in Yosemite Valley	214
239.	The Yosemite Valley Plan should require environmentally responsible techniques for the removal of Cascades Diversion Dam	93
240.	The Yosemite Valley Plan should not link dam removal to road widening.....	93
241.	The National Park Service should use a sequential, cost-based approach to the development of alternatives for the Yosemite Valley Plan	68
242.	The Yosemite Valley Plan should re-evaluate the amount of day-visitor parking available in Yosemite Valley	308
243.	The Yosemite Valley Plan should limit the number of lodging units added to the Yosemite Lodge complex	251
244.	The National Park Service should consider nonwilderness trails along the western edge of Yosemite National Park for bike use	295
245.	The Yosemite Valley Plan should provide adequate bicycle access routes to and within Yosemite National Park	294
246.	The Yosemite Valley Plan should establish nonpaved, multi-use trails in Yosemite National Park	293
247.	The National Park Service should eliminate entrance fees for bicyclists in Yosemite Valley	166
248.	The Yosemite Valley Plan should restrict rock climbing in areas visible from the Valley floor.....	170
249.	The Yosemite Valley Plan should prohibit the construction of a gym in Yosemite National Park	269
250.	The Yosemite Valley Plan should clarify which employees will be provided housing in Yosemite National Park	385
251.	The Yosemite Valley Plan should establish a trash collection program for all visitors in Yosemite National Park	381
252.	The Yosemite Valley Plan should remove all facilities in the 100-year floodplain.....	96

253.	The Yosemite Valley Plan should require day visitors to use buses to access Yosemite Valley.....	338
254.	The Yosemite Valley Plan should establish a Class I bike path along Southside Drive	294
255.	The National Park Service should build a wilderness permit kiosk in Yosemite Valley	260
256.	The National Park Service should extend the vehicle free zone to the lower end of El Cap Meadows	333
257.	The National Park Service should improve maintenance and upkeep of employee housing	386
258.	The Yosemite Valley Plan should designate more parking spaces for motorcycles.....	305
260.	The Yosemite Valley Plan should retain the Superintendent's residence in Yosemite Valley.....	140
261.	The National Park Service should eliminate controlled burning in Yosemite National Park	116
262.	The National Park Service should consider moving the Yosemite Valley Firehouse out of the rock fall zone	262
263.	The National Park Service should retain the chapel in Yosemite Valley	258
264.	The National Park Service should consider the relocation of the Art Activity Center in Yosemite Valley.....	199
265.	The Yosemite Valley Plan should retain the Church Bowl Picnic Area as a religious site.....	259
266.	The Yosemite Valley Plan should retain Curry Orchard.....	140
267.	The Yosemite Valley Plan should require that bicycle trails be segregated from vehicles and roads in Yosemite Valley.....	294
269.	The Yosemite Valley Plan should require a parkwide bicycle trail system in Yosemite National Park	294
271.	The Yosemite Valley Plan should address the potential safety hazards of bicycle traffic in Yosemite Valley.....	345
272.	The Yosemite Valley Plan should address the need for bicycle shuttle services	345
273.	The Yosemite Valley Plan should address the noise pollution effects of diesel buses in Yosemite Valley.....	368
274.	The National Park Service should restore Yosemite National Park Service lands in Wawona.....	84
275.	The Yosemite Valley Plan should require the removal of the Cascade Diversion Dam and riprap along the Merced River	92
276.	The National Park Service should reconsider closing the El Portal Trailer Court.....	404
277.	The National Park Service should construct visitor centers at Yosemite National Park entrances.....	197
278.	The National Park Service should not adopt a 150 foot-wide protective zone along the Merced River	154
279.	The National Park Service should explain why the gas station was removed from Yosemite Valley.....	269
280.	The National Park Service should consider employee housing sites outside of Yosemite National Park	403
282.	The Yosemite Valley Plan should retain an ice rink in Yosemite National Park	191
283.	The National Park Service should return ownership and stewardship of Yosemite Valley to the State of California.....	17
284.	The Yosemite Valley Plan should require the restructuring of bridges in Yosemite Valley	89
285.	The Yosemite Valley Plan should not designate specific trails for the exclusive use by one user group	174
286.	The Yosemite Valley Plan should retain trails used historically in Yosemite Valley	175
287.	The Yosemite Valley Plan should allow grazing in meadows in Yosemite National Park	115

288.	The Yosemite Valley Plan should require a reservation system for horse campsites and staging areas in Yosemite Valley	181
289.	The Yosemite Valley Plan should substantiate claims that horse camps and stables in Yosemite Valley cause undesirable effects.....	180
290.	The Yosemite Valley Plan should clarify when additional environmental review will be required for implementation of specific projects	46
291.	The Yosemite Valley Plan should clarify the scope of the proposed action in order to identify whether the range of alternatives is sufficient.....	69
292.	The Yosemite Valley Plan should include a comprehensive implementation program.....	44
293.	The Yosemite Valley Plan should explicitly link implementation activities to the goals of the plan	45
294.	The Yosemite Valley Plan should prioritize implementation activities based on their ability to accomplish the goals of the Plan.....	45
295.	The Yosemite Valley Plan should contain a specific plan for the transition to the use of cleanest and quietest transit vehicles.....	349
296.	The Yosemite Valley Plan should establish specific goals and targets for reducing use of current diesel technology.....	349
297.	The Yosemite Valley Plan should include an analysis of measures to ensure shuttles remain affordable.....	356
298.	The National Park Service should adopt actions that best achieve the 1980 General Management Plan resource protection and restoration goals for Yosemite Valley.....	25
302.	The Yosemite Valley Plan should require that the Lower and Upper River Campgrounds be reopened.....	222
304.	The Yosemite Valley Plan should restrict recreational vehicle use in Yosemite National Park	336
305.	The National Park Service should change the priorities of the Yosemite Valley Plan	15
306.	The Yosemite Valley Plan should only allow low-impact camping in Yosemite Valley	232
307.	The National Park Service should ensure that adequate information about Yosemite National Park is available via the telephone or the Internet	382
308.	The Yosemite Valley Plan should ensure that new bridges accommodate pedestrians.....	300
309.	The Yosemite Valley Plan should relocate the pastor residence from Wawona to Yosemite Valley	258
310.	The Yosemite Valley Plan should clarify how increases in concessioner services comply with the National Park Service's mandate to preserve and protect Yosemite National Park.....	382
311.	The National Park Service should require Yosemite Concessions Services to adequately monitor and police its own staff	383
314.	The National Park Service should require that the Yosemite National Park Superintendent live in the Superintendent's residence	392
315.	The National Park Service should increase the number of rangers in Yosemite National Park	382
316.	The Yosemite Valley Plan should require the removal of Le Conte Memorial Lodge from Yosemite Valley	143
317.	The Yosemite Valley Plan should designate Merced River put-ins and take-outs.....	172
318.	The Yosemite Valley Plan should include detailed information regarding transit vehicle emission factors.....	126
319.	The National Park Service should reduce congestion in Yosemite Valley through promoting the use of backcountry areas	207
320.	The National Park Service should build a tram from Yosemite Valley to Glacier Point	346
321.	The National Park Service should install food storage boxes along backcountry trails	260

322.	The Yosemite Valley Plan should exempt skiers from paying entry fees to Yosemite National Park	186
323.	The National Park Service should revise the 1980 General Management Plan for Yosemite National Park	26
324.	The National Park Service should improve road signage in Yosemite Valley	328
325.	The National Park Service should improve the maintenance of public facilities in Yosemite Valley	256
326.	The Yosemite Valley Plan should require an increase in size of Camp 4 (Sunnyside Campground)	223
327.	The Yosemite Valley Plan should provide for high-density valet parking in Yosemite Valley	314
328.	The Yosemite Valley Plan should require that dorms in Wawona be constructed on the north side of the river	396
329.	The National Park Service should consider a sixth alternative for the Yosemite Valley Plan	73
330.	The National Park Service should rebuild a dormitory behind the Wawona Hotel	396
331.	The Yosemite Valley Plan should retain The Ahwahnee in its current condition	253
